Lenze

Overview of technical documentation for Servo Drives 9400

Project planning, selection & ordering

- ☐ 9400 hardware manual
- 🖹 Catalogue / electronic catalogue (DSC - Drive Solution Catalogue)

Mounting & wiring

- 🖹 MA 9400 StateLine/HighLine
- 🖹 MA for the communication module
- 🖹 MA for the extension module
- 🖹 MA for the safety module
- 🖹 MA for the accessories
- 🖹 MA for remote maintenance components

Parameter setting

- 🖹 BA keypad
- ☐ SW for the »Engineer« Lenze software
- ☐ **SW - controller** (9400 StateLine/HighLine/PLC) ← **This documentation**
- ☐ SW for the regenerative power supply module
- ☐ KHB for the communication module
- ☐ SW for the extension module
- ☐ SW for the safety module
- ☐ SW for the Lenze technology application
- ☐ SW for the 9400 function library

Configuring & programming

- ☐ SW for the »Engineer« Lenze software
- ☐ SW for the »PLC Designer« Lenze software
- ☐ **SW - controller** (9400 HighLine/PLC) ← **This documentation**
- ☐ KHB for the communication module
- ☐ SW for the extension module
- ☐ SW for the safety module
- ☐ SW for the Lenze technology application
- ☐ SW for the 9400 function library

Drive commissioning

- 🖹 Commissioning guidelines
- ☐ **SW - controller** (9400 StateLine/HighLine/PLC) ← **This documentation**
  - → Chapter "Commissioning" (📖 25)
  - → Chapter "Oscilloscope" (📖 585)
  - → Chapter "Diagnostics & fault analysis" (📖 608)
- ☐ Remote maintenance manual

Networking

- ☐ KHB for the communication medium used

Legend:

- 🖹 Printed documentation
- ☐ Online documentation (PDF/Engineer online help)

Abbreviations used:

BA	Operating instructions
KHB	Communication manual
MA	Mounting instructions
SW	Software manual

Contents

1 About this document 13
1.1 Conventions used 15
1.2 Terminology used 16
1.3 Definition of the notes used 17

2 Introduction 18
2.1 Parameter setting, configuring, or programming? 18
2.1.1 Basic functionalities 19
2.1.2 Technology applications 19
2.2 Communicating with the controller 20
2.2.1 Going online via diagnostic adapter 20
2.2.2 Going online via system bus (CAN on board) 23
2.2.3 Use of other communication interfaces 23
2.3 Signal types & scaling 24

3 Commissioning 25
3.1 General notes 26
3.2 Notes on commissioning using the keypad 27
3.3 Initial commissioning 28
3.4 Standard set-up 29
3.5 Controller replacement 30
3.6 Motor replacement 30

Contents

4 Drive interface 31
4.1 Machine parameters 32
4.1.1 Mains voltage 33
4.1.2 Gearbox ratio 34
4.1.3 Motor mounting direction 35
4.1.4 Feedback configuration 35
4.1.5 Unit/user-defined unit 36
4.1.6 Traversing range 37
4.1.7 Feed constant 39
4.1.8 Resolution of an encoder revolution 40
4.1.9 Max. position, speed, and acceleration that can be displayed internally 43
4.2 Device commands 45
4.2.1 Load Lenze setting 47
4.2.2 Load start parameters 48
4.2.3 ENP:Load plant data 49
4.2.4 Activate application 50
4.2.5 Save selected application 51
4.2.6 Save start parameters 52
4.2.7 Delete logbook 54
4.2.8 Archive logbook 55
4.2.9 Start application 56
4.2.10 Stop application 57
4.2.11 Reset program 58
4.2.12 Delete program 59
4.2.13 Restart program 60
4.2.14 Reset runtime measurement 61
4.2.15 Inhibit controller 63
4.2.16 Enable controller 64
4.2.17 Reset error 65
4.2.18 Activate quick stop 66
4.2.19 Reset quick stop 67
4.2.20 Identify pole position (360°) 68
4.2.21 Identify pole position (min. motion) 69
4.2.22 Resolver error identification 71
4.2.23 Load Lenze INV characteristic 72
4.2.24 Calculate inv. characteristic 73
4.2.25 Determine motor parameters 74
4.2.26 Calculate current controller parameters 75
4.2.27 Calculate speed controller parameters 77
4.2.28 CAN on board: Reset Node 78
4.2.29 CAN module: Reset node 79
4.2.30 CAN on board: Pred.Connect.Set 80
4.2.31 CAN module: Pred.Connect.Set 81
4.2.32 CAN on board: Identify node 82
4.2.33 CAN module: Identify node 83
4.2.34 Unbind/bind Ethernet module MXI1 84
4.2.35 Unbind/bind Ethernet module MXI2 85
4.2.36 Activate parameter set 1 ... 4 86
4.2.37 Activate parameter set 1 ... 4 88
4.2.38 Load cam data 90
4.2.39 Save cam data 92
4.2.40 Calculate cam data 94
4.2.41 Calculate cam data checksum 95
4.2.42 Format file system 96
4.2.43 Restore file system 97

Contents

4.2.44 Prepare firmware update ____ 98
4.2.45 Restart controller ____ 99
4.3 Device states ____ 100
4.3.1 "Initialisation active" state ____ 102
4.3.2 "Safe torque off active" state ____ 103
4.3.3 "Device is ready to switch on" state ____ 103
4.3.4 "Device is switched on" state ____ 104
4.3.5 "Operation" state ____ 104
4.3.6 "Warning active" ____ 105
4.3.7 "Warning locked active" ____ 105
4.3.8 "Quick stop by trouble active" state ____ 105
4.3.9 "Trouble active" state ____ 106
4.3.10 "Fault active" state ____ 106
4.3.11 "System fault active" state ____ 106
4.4 Automatic restart after mains connection/trouble... ____ 107
4.5 Behaviour after task overflow ____ 109
4.6 Device output power ____ 110
4.6.1 Switching frequency ____ 110
4.6.2 Monitoring of the device utilisation ____ 111
4.6.3 Operation with increased continuous power ____ 112
4.7 Internal interfaces | "LS_DriveInterface" system block ____ 113
4.7.1 Status signals ____ 116
4.7.2 Monitoring of external events ____ 117

5 Motor interface 118
5.1 General information 120
5.1.1 Reading out motor data from the controller 120
5.1.2 Selecting a motor from the motor catalogue in the »Engineer« 121
5.1.3 Displaying/editing motor data in »Engineer« 122
5.2 Select motor control 124
5.3 Adjusting motor and controller to each other 126
5.3.1 Accepting/adapting plant parameters 127
5.3.2 Parameterising motor encoder 129
5.3.3 Pole position identification 131
5.3.4 Optimising the switching performance of the inverter 138
5.3.5 Determining the motor parameters 141
5.4 Servo control (SC) 145
5.4.1 Optimising the control mode 146
5.4.2 Signal flow (servo control for synchronous motor) 162
5.4.3 Signal flow (servo control for asynchronous motor) 164
5.5 Sensorless vector control (SLVC) 166
5.5.1 Basic settings 167
5.5.2 Optimising motor parameters 169
5.5.3 Optimising the control mode 175
5.5.4 Signal flow 183
5.6 V/f control (VFCplus) 184
5.6.1 Basic settings 184
5.6.2 Optimising the control mode 191
5.6.3 Signal flow 199
5.7 V/f control (VFCplus) 200
5.7.1 Signal flow 201
5.8 Parameterisable additional functions 203
5.8.1 Correction of the stator leakage inductance... 204
5.8.2 Field weakening for synchronous machines 209
5.8.3 Flying restart function 212
5.8.4 DC-injection braking 215
5.9 Monitoring 217
5.9.1 Signal flow 217
5.9.2 Motor monitoring (I^2xt) 218
5.9.3 Motor temperature monitoring 225
5.9.4 Motor phase failure monitoring 229
5.9.5 Maximum current monitoring 233
5.10 Internal interfaces | "LS_MotorInterface" system block 234

Contents

6 Encoder evaluation 239
6.1 Internal interfaces | "LS_Feedback" system block 240
6.1.1 Use of an external position encoder 242
6.2 Signal flow 243
6.3 Parameter setting 243
6.3.1 Controller configuration 246
6.3.2 System with motor encoder 248
6.3.3 System with motor encoder and position encoder 249
6.3.4 Position feedback with a linear distance measuring device 251
6.3.5 Adaptation of the resolver evaluation dynamics 253
6.3.6 Parameterisation of an unknown Hiperface® encoder 254
6.3.7 Parameterisation of a Hiperface® encoder with increased initialisation time 254
6.3.8 Use of an SSI encoder at X8 255
6.3.9 Rotative encoder with SSI protocol 261
6.3.10 Provision of the encoder signal of input X8 263
6.3.11 Resolver error compensation 266
6.3.12 Encoder angular drift monitoring 267

7 Braking operation 269
7.1 Parameter setting 270
7.1.1 Setting the voltage threshold for braking operation 270
7.2 Monitoring 271
7.2.1 Overcurrent protection 271
7.2.2 Ixt utilisation - brake transistor 272
7.2.3 I2t utilisation - brake resistor 273
7.2.4 Overvoltage in the DC bus 275

8 I/O terminals 276
8.1 Overview 276
8.2 Analog inputs 277
8.2.1 Terminal assignment/electrical data 277
8.2.2 Parameter setting 278
8.2.3 Reconfiguring analog input 1 into current input 278
8.2.4 "LS_AnalogInput" system block 279
8.3 Analog outputs 280
8.3.1 Terminal assignment/electrical data 280
8.3.2 Parameter setting 281
8.3.3 "LS_AnalogOutput" system block 281
8.4 Digital inputs 282
8.4.1 Terminal assignment/electrical data 282
8.4.2 Parameter setting 282
8.4.3 "LS_DigitalInput" system block 283
8.5 Digital outputs 284
8.5.1 Terminal assignment/electrical data 284
8.5.2 Parameter setting 284
8.5.3 "LS_DigitalOutput" system block 285
8.6 "State bus" monitoring function 286
8.6.1 Detecting the current state 287
8.6.2 Setting the state bus to the "Error" state 287
8.7 Touch probe detection 288
8.7.1 Actual value interpolation (principle) 288
8.7.2 Dead time compensation 290
8.7.3 "LS_TouchProbe1...8" system block 291
8.7.4 "LS_TouchProbeMotor" system block 292
8.7.5 "LS_TouchProbeLoad" system block 292
8.8 Configure exception handling of the outputs 293

Contents

9 "CAN on board" system bus 295
9.1 General information 296
9.1.1 General data and application conditions 297
9.1.2 Supported protocols 297
9.1.3 Communication time 298
9.2 Possible settings by DIP switch 299
9.2.1 Setting the node address 299
9.2.2 Setting the baud rate 300
9.3 LED status displays for the system bus 301
9.4 Structure of the CAN data telegram 302
9.4.1 Identifier 302
9.4.2 User data 304
9.5 Communication phases/network management 305
9.5.1 State transitions 306
9.5.2 Network management telegram (NMT) 307
9.5.3 Parameterising the controller as CAN master 308
9.6 Process data transfer 309
9.6.1 Identifiers of the process data objects 310
9.6.2 Transmission type 311
9.6.3 Masking of the TPDOs for event control 312
9.6.4 Monitoring of the RPDOs for data reception 312
9.6.5 Synchronisation of PDOs via sync telegram 313
9.7 Parameter data transfer 318
9.7.1 Identifiers of the parameter data objects 319
9.7.2 User data 319
9.7.3 Parameter data telegram examples 325
9.8 Diagnostics 330
9.9 Monitoring 331
9.9.1 Node guarding protocol 331
9.9.2 Heartbeat protocol 337
9.9.3 Emergency telegram 341
9.10 CANopen objects implemented 342
9.11 System block "LS_SyncInput" 367
9.11.1 Behaviour of the status signal bSyncInsideWindow 368

10 Safety engineering 369
10.1 Integration into the application 370
10.2 Selecting the required safety module 371
10.3 System block "LS_SafetyModuleInterface" 371
10.3.1 Status information 373
10.3.2 I/O status information 374
10.3.3 Control information 374

Contents

11 Basic drive functions 377
11.1 General information 378
11.1.1 Internal state machine 378
11.1.2 Function states 380
11.1.3 Interrupting/replacing states 382
11.1.4 Priorities 383
11.1.5 Requesting control via a basic function 384
11.1.6 Start acceleration/acceleration reduction when the basic function changes 385
11.1.7 Setting the S-ramp time 387
11.2 Stop 389
11.2.1 Internal interfaces | "LS_Stop" system block 390
11.2.2 Parameter setting 391
11.2.3 Behaviour of the function (example) 392
11.3 Quick stop 393
11.3.1 Internal interfaces | "LS_Quickstop" system block" 393
11.3.2 Parameter setting 394
11.3.3 Activate/deactivate quick stop 396
11.3.4 DC-injection braking 397
11.4 Manual jog 400
11.4.1 Internal interfaces | "LS_ManualJog" system block" 401
11.4.2 Parameter setting 404
11.4.3 Executing manual jogging 406
11.5 Manual job, encoderless 412
11.5.1 Parameter setting 413
11.5.2 Carrying out encoderless manual jogging 414
11.5.3 Internal interfaces | "LS_ManualJogOpenLoop" system block 419
11.6 Homing 421
11.6.1 Internal interfaces | "LS_Homing" system block 423
11.6.2 Parameter setting 425
11.6.3 Overview of the Lenze homing modes 432
11.6.4 Overview of DS402 homing modes 445
11.6.5 Execute homing 476
11.7 Positioning 479
11.7.1 Internal interfaces | "LS_Positioner" system block 480
11.7.2 Parameter setting 485
11.7.3 Carrying out positioning 487
11.8 Position follower 490
11.8.1 Internal interfaces | "LS_PositionFollower" system block 491
11.8.2 Signal flow 492
11.8.3 Parameter setting 493
11.8.4 Activating setpoint interface 495
11.9 Speed follower 496
11.9.1 Internal interfaces | "LS_SpeedFollower" system block 496
11.9.2 Signal flow 498
11.9.3 Parameter setting 499
11.9.4 Activating setpoint interface 500
11.10 Torque follower 501
11.10.1 Internal interfaces | "LS_TorqueFollower" system block 502
11.10.2 Signal flow 503
11.10.3 Parameter setting 504
11.10.4 Activating setpoint interface 505
11.11 Limiter 506
11.11.1 Internal interfaces | "LS_Limiter" system block 506
11.11.2 Parameter setting 511

Contents

11.12 Brake control _____ 521
11.12.1 Internal interfaces | "LS_Brake" system block _____ 523
11.12.2 Parameter setting _____ 526
11.12.3 Mode 0: Brake control is switched off _____ 542
11.12.4 Mode 1/11: Direct control of the brake _____ 543
11.12.5 Mode 2/12: Automatic control of the brake _____ 544
11.12.6 Mode 22: Automatic DC-injection braking _____ 549
11.12.7 Grinding the brake _____ 552
11.12.8 Carrying out brake test _____ 554
11.12.9 Control of two motor holding brakes _____ 556
11.13 Cam data management _____ 557
11.13.1 "Online" tab for cam data management _____ 558
11.13.2 Internal interfaces | "LS_CamInterface" system block _____ 563
11.13.3 Parameter setting _____ 565
11.13.4 Product/track change-over _____ 572
11.13.5 Invalid cam data due to changed machine parameters _____ 573
11.13.6 Behaviour after mains switching _____ 574
11.14 Pole position identification _____ 575
11.14.1 Internal interfaces | System block "LS_PolePositionIdentification" _____ 576
11.14.2 Parameter setting _____ 578
11.14.3 Execution of the pole position identification _____ 578
11.14.4 Signal characteristics _____ 580
11.14.5 Deactivating a known pole position _____ 582

Contents

12 Oscilloscope 585
12.1 Functional description 586
12.2 Technical data 586
12.3 Operation 587
12.3.1 User interface 588
12.3.2 Selecting the signal sources to be recorded 590
12.3.3 Selecting the recording time/sample rate 592
12.3.4 Selecting the trigger condition 593
12.3.5 Start recording 595
12.3.6 Cyclic recording 595
12.3.7 Adjusting the representation 596
12.3.8 Cursor function: Reading individual measured values 598
12.3.9 Last settings 598
12.4 Managing oscillograms (measured data records) 599
12.4.1 Commenting the oscillogram 599
12.4.2 Saving the oscillogram in a file 600
12.4.3 Loading the oscillogram file 601
12.4.4 Importing settings from another loaded oscillogram 602
12.4.5 Overlay function 603
12.4.6 Deleting an oscillogram file saved in the project 604
12.5 Variables of the motor control (oscilloscope signals) 605

Contents

13 Diagnostics & fault analysis 608
13.1 LED status display 608
13.1.1 LED status displays for the device state 609
13.2 Drive diagnostics with the »Engineer« 610
13.3 Drive diagnostics via keypad/bus system 611
13.4 Logbook 613
13.4.1 Functional description 614
13.4.2 Filtering logbook entries 614
13.4.3 Reading out logbook entries 615
13.4.4 Exporting logbook entries to a file 616
13.5 Monitoring 617
13.5.1 Setting the error response 618
13.6 Maloperation of the drive 619
13.7 Error messages of the operating system 620
13.7.1 Structure of the error number (bit coding) 620
13.7.2 Reset error message 625
13.7.3 Short overview (A-Z) 626
13.7.4 Cause & possible remedies 634

14 Parameter reference 724
14.1 Structure of the parameter descriptions 725
14.1.1 Data type 725
14.1.2 Parameters with read-only access 725
14.1.3 Parameters with write access 726
14.1.4 Parameter attributes 730
14.1.5 Abbreviations used in parameter & selection texts 730

1 About this document

Danger!

The Servo Drives 9400 HighLine are a source of danger which may cause death or serious personal injury.

In order to ensure protection against this danger, observe the safety instructions before switching on the Servo Drives 9400 HighLine.

Please read the safety instructions in the **mounting instructions** and **hardware manual** of the Servo Drives 9400 HighLine. Both instructions are included in the scope of supply.

Target group

This documentation addresses to all persons who want to parameterise, configure, and diagnose the Servo Drives 9400 HighLine by means of the engineering software L-force »Engineer« and the keypad.

Information regarding the validity

The information in this documentation are valid for the following standard devices:

Product range	Type designation	From software version
Servo Drives 9400	E94AxHExxxx	1.5

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the 9400 HighLine and the software version of the engineering tools installed (»Engineer« or »EASY Starter«), the screenshots in this documentation may differ from what actually appears on the screen.

Document history

Version			Description
15.0	04/2019	TD06	New codes C02606 and C02872, error corrections
12.0	07/2018	TD06	Extended oscilloscope functions, error corrections
11.0	11/2016	TD06	Extended oscilloscope functions, error corrections
10.0	11/2013	TD05	Error corrections; parameter reference V12.00.xx
9.0	12/2012	TD06	Extended by new functions for 9400 HighLine V11
8.0	12/2011	TD06	Extended by new functions for 9400 HighLine V10
7.1	10/2010	TD06	Error corrections & supplements
7.0	04/2010	TD06	Extended by new functions for 9400 HighLine V8
6.1	08/2009	TD05	Error corrections & supplements
6.0	08/2009	TD05	Extended by new functions for 9400 HighLine V7
5.2	01/2009	TD05	Error corrections & supplements
5.1	12/2008	TD05	Error corrections
5.0	11/2008	TD05	Extended by new functions for 9400 HighLine V5
4.1	07/2008	TD05	New main chapter: "CAN on board" system bus
4.0	06/2008	TD05	Supplemented with new functions for 9400 HighLine V4
3.0	11/2007	TD05	Supplemented with new functions for 9400 HighLine V3
2.0	05/2007	TD05	Extended edition
1.0	12/2006	TD05	First edition for 9400 HighLine V1.5

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Highlighting	Examples/notes
Numeric notation		
Decimal separator	Point	The decimal point is always used. For example: 1234.56
Text		
Version information	Blue text colour	All information applying to from a certain software version of Servo Drives 9400 HighLine is marked accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze PC software »PLC Designer«...
Window	*italics*	The *Message window*... / The dialog box *Options*...
Variable names		By setting *bEnable* to TRUE...
Control element	**Bold**	The **OK** button... / the **Copy** command... / the **Characteristics** tab... / the **Name** input field...
Sequence of menu commands		If several commands must be used in sequence to carry out a function, the individual commands are separated by an arrow: Select **File→Open** to...
Shortcut	**<bold>**	Use **<F1>** to open the online help.
		If a shortcut is required for a command to be executed, a "+" has been put between the key identifiers: With **<Shift>+<ESC>** ...

Program code	`Courier`	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**`Courier bold`**	
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse-click in this online documentation.
Symbols		
Page reference	(📖 15)	Optically highlighted reference to another page. It is activated with a mouse-click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Terminology used

Term	Meaning	
Engineering Tools	Software solutions for easy engineering in all project stages	
		»EASY Navigator« – ensures easy operator guidance • All convenient Lenze Engineering tools at a glance • Tools can be quickly selected • The clear structure simplifies the engineering process from the start
		»EASY Starter« – easy-to-use tool for service technicians • Specifically designed for commissioning and maintaining Lenze devices • Graphic user interface with very few icons • Easy to run online diagnostics, set parameters and perform commissioning • No risk of accidentally changing an application • Loading off-the-shelf applications onto the device
		»Engineer« – multi-device engineering • For all products in our L-force portfolio • Practical user interface • Graphic interfaces make it easy to navigate • Can be applied in every phase of a project (project planning, commissioning, production) • Parameter setting and configuration
L-force Controller	The L-force Controller is the central component of the automation system which controls the Logic and Motion functionalities (by means of the runtime software). The L-force Controller uses the fieldbus to communicate with the field devices.	
Engineering PC	The Engineering PC and the installed Engineering tools serve to configure and parameterise the system. The Engineering PC uses Ethernet to communicate with the L-force Controller.	
Code	"Container" for one or several parameters by means of which you can parameterise or monitor Servo Drives 9400 HighLine.	
Subcode	If a code contains several parameters, they are stored in "subcodes". This manual uses a slash "/" as a separator between code and subcode (e.g. "C00118/3").	
Function block editor	Graphical interconnection tool which is provided for Servo Drives 9400 HighLine in the MotionControl HighLevel and TopLevel license level in the »Engineer« on the **FB editor** tab and by means of which the technology applications supplied can also be reconfigured and extended by individual functions.	
Function block	A function block (FB) can be compared with an integrated circuit that contains a certain control logic and provides one or several values when being executed. • An instance (reproduction, copy) of the function block is always inserted into the circuit. • It is also possible to insert several instances of a function block into a circuit. • Each instance has an unequivocal identifier (the instance name) and a processing number that defines the position in which the function block is calculated during the task cycle.	

1.3 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Structure of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

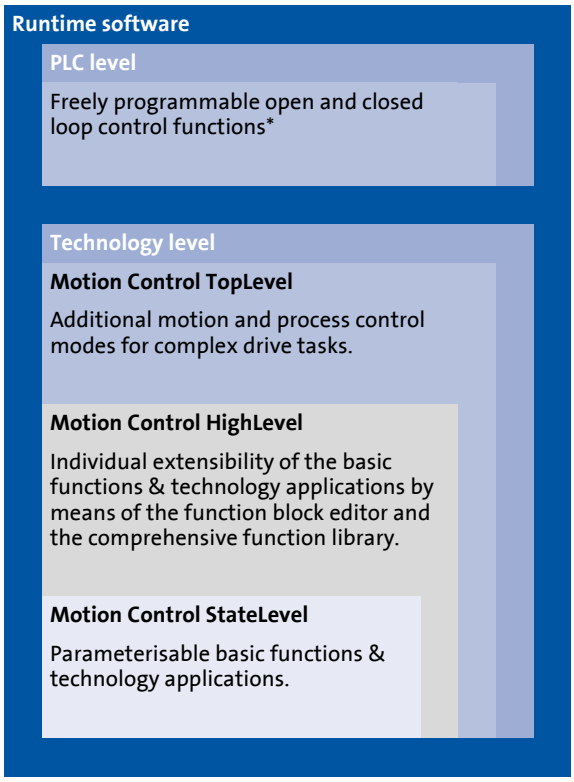
Pictograph	Signal word	Meaning
	Danger!	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	Danger!	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
STOP	**Stop!**	**Danger of damage to material assets** Reference to a possible danger that may result in the damage to material assets if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	Note!	Important note to ensure trouble-free operation
	Tip!	Useful tip for easy handling
		Reference to another document

2 Introduction

The basis of every **L-force** application is an easy and quick parameter setting of prepared technology applications and solutions*.



This chapter contains basic information on the runtime software model of **L-force** and on how you can establish an online connection between the PC and controller for parameter setting with »Engineer« very easily.

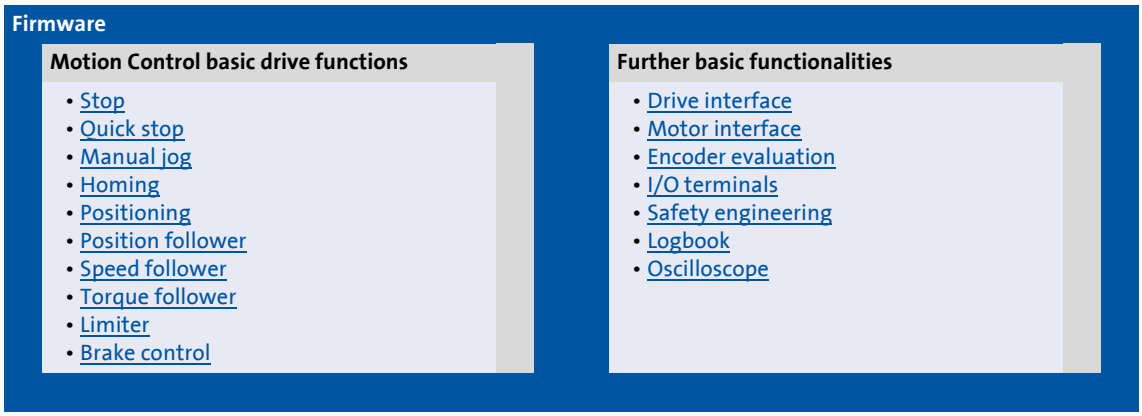
At the end of this chapter you will find an overview of the different signal types & scaling which serve to process physical values (e.g. a speed or position) within the application.

* In preparation!

2.1 Parameter setting, configuring, or programming?

The graded runtime software model of **L-force** provides a simple and consistent solution for motion and process tasks as well as for complex machine functions:

Programming*

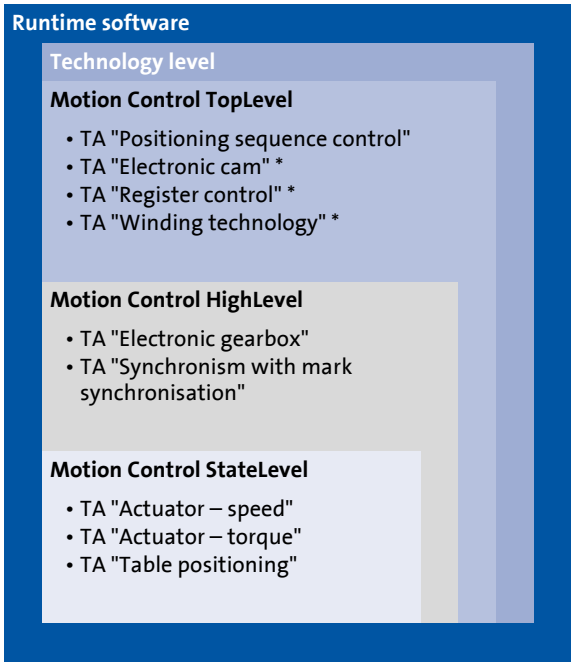


Configuration
The HighLevel and TopLevel licenses enable you to extend the provided technology applications by individual functions using the graphic function block editor of »Engineer«. Here you can access the comprehensive function libraries of Lenze which among other things contain process controllers, arithmetic functions, logic blocks, and ramp generators and integrators.

Parameter setting
The StateLevel license includes a range of technology applications which can be put into operation easily with a keypad or via dialogs in »Engineer«.

* In preparation!

2.1.1 Basic functionalities



Important basic drive functions and further basic functions are implemented in the firmware of the controller and thus are always provided, irrespective of the runtime software licence available.

2.1.2 Technology applications

Technology applications (TAs) are applications prepared by Lenze which can serve as a basis for solving typical applications.

- The technology applications available for the Servo Drives 9400 can be selected in »Engineer« from the application catalogue.

Each higher license contains additional technology applications for further application fields.

* In preparation!

Tip!

Detailed information about the individual technology applications can be found in the corresponding software manuals.

2.2 Communicating with the controller

The following interfaces/communication modules can be used to establish communication between the PC and controller:

- Diagnostic interface X6/Going online via diagnostic adapter
- CAN on board interface/Going online via system bus (CAN on board) (📖 23)
- Optional interfaces which are provided by corresponding communication modules in the module slots MXI1/MXI2 of the controller.

Note!

For communication with the controller, at least the control electronics of the controller must be supplied with 24 V low voltage via plug X2. For detailed information, please see the Mounting Instructions for the controller.

Stop!

If you change parameters in the »Engineer« while the controller is connected online, the changes will be directly accepted by the controller!

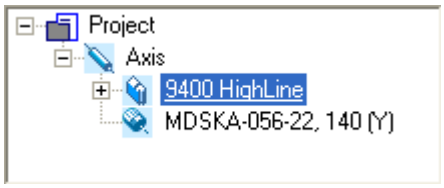
Tip!

Detailed information about the individual interfaces can be found in the corresponding Communication Manuals (KHB).

2.2.1 Going online via diagnostic adapter

For initial commissioning of the controller you can for instance use the diagnostic adapter offered by Lenze:

Note!



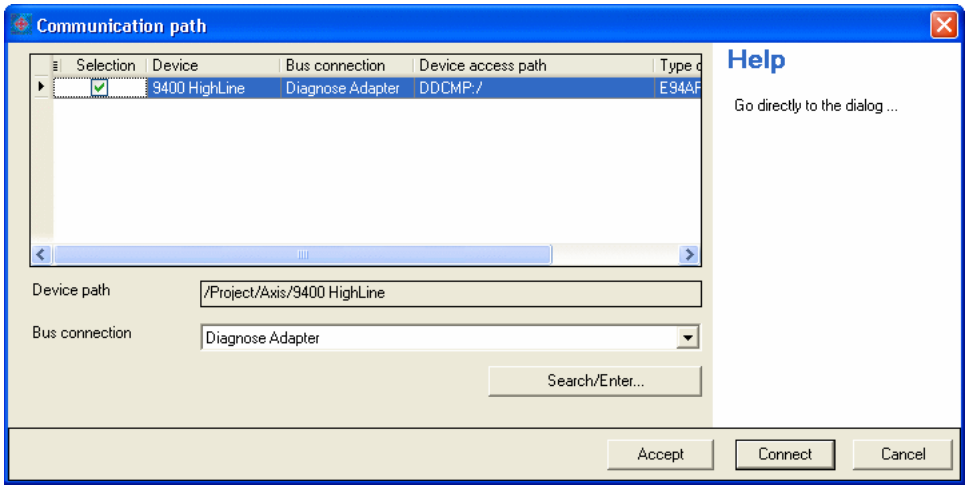
Please observe the documentation for the diagnostic adapter!

Preconditions:

- The diagnostic adapter is connected to the controller at the diagnostic interface X6 and to the PC at a free USB port.
- The driver required for the diagnostic adapter is installed.
- The control electronics of the controller is supplied with 24 V low voltage via plug X2.

How to build up an online connection via the diagnostic adapter:

1. Select the 9400 HighLine controller to which you want to build up an online connection in the *Project view* of the »Engineer«:



2. Click the icon.

   If the changes you have made on the project have not been accepted yet, first a query on whether an update is to be carried out is effected.

   If an update is to be carried out:
   - Click **Yes** to open the *Build project* dialog box.
   - Click **Build** in the *Build project* dialog box to update the changed project elements.
   - After the update a note is shown, saying whether the update was carried out successfully.

If no communication path was configured yet for the controller selected, the *Communication path* dialog box is shown after the update has been carried out:

- The "Diagnostic adapter" bus connection is already preset.

3. Click on **Connect**.
   - The dialog box is closed and the online connection with the controller is built up.
   - In the *Project view* a yellow icon indicates the online connection with the controller:

Now you can use the icons and to easily build up and end a connection with the controller. The communication settings are only required when communication with a controller is built up for the first time.

- If you want to change the configured communication path, select the command **Online → Set communication path and go online** to open the *Communication path* dialog box and change the settings.
- When an online connection has been established, the »Engineer« displays the current parameter settings of the controller with a yellow background colour.

2.2.2 Going online via system bus (CAN on board)

As an alternative to the diagnostic adapter, you can use the integrated system bus interface (CAN on board, terminal X1) of the controller for communication.

- Lenze offers the following communication accessories for connection to the PC:

Communication accessories	PC interface
PC system bus adapter 2173 incl. connection cable and voltage supply adapter • for DIN keyboard connection (EMF2173IB) • for PS/2 keyboard connection (EMF2173IBV002) • for PS/2 keyboard connection with electrical isolation (EMF2173IBV003)	Parallel interface (LPT port)
PC system bus adapter 2177 incl. connection cable (EMF2177IB)	USB (Universal Serial Bus)

Note!

- For detailed information about the PC system bus adapter, please see the "CAN Communication Manual".
- Please observe the documentation for the PC system bus adapter!
- The online connection is established as described in the previous chapter "Going online via diagnostic adapter", only that this time the entry "CAN system bus" is to be selected in the **Bus connection** list field of the *Communication path* dialog box. (📖 21)

2.2.3 Use of other communication interfaces

The controller can be extended by further communication interfaces, if required, e.g. Ethernet, ETHERNET Powerlink, or PROFIBUS.

- For this the controller is provided with the module slots MXI1 and MXI2 for accepting communication modules.
- Detailed information on this subject can be found in the Hardware Manual and Communication Manual for the corresponding communication system.

2.3 Signal types & scaling

It is very helpful for the parameterisation & configuration of the controller to know the signal types and their scaling listed below, which serve to process physical quantities (e.g. a speed or position) within the function block interconnection.

Note!

From software version V3.0 the resolution of an encoder revolution can be parameterised in C00100 (Lenze setting: 16 bits/encoder revolution).

▸ Resolution of an encoder revolution (📖 40)

Signal type (data type)	Connection symbol in the FB editor	Resolution	Value range (external)	Decimal positions/ signal type suffix in the identifier	
Scaled (INT)	○	16 bits	± 199.99 %	2	_a
Scaled (DINT)	●	32 bits	± 200.00 %	2	_n
Speed (INT)	◁ / ▷	16 bits	± 30000.0 rpm	1	_v
Speed (DINT)	◆	32 bits	± 480000.0 rpm	1	_s
Position/angle (DINT)	◀ / ▶	32 bits	-2^{31} ... 2^{31}-1 increments	3	_p
Digital (BOOL)	□	1 bit	0 ≡ FALSE; 1 ≡ TRUE	0	
Acceleration (DINT)	■	32 bits	± 7.69 * 10^9 rpm/s	3	_x
Time	■	28 bits	0 ... 268435.456 s	3	
Other (BYTE)	■	8 bits	0 ... 255	0	
Other (WORD)	■	16 bits	0 ... 65535	0	
Other (DWORD)	■	32 bits	0 ... 4294967295	0	
Other (INT)	■	16 bits	-32768 ... 32767	0	
Other (DINT)	■	32 bits	-2147483648 ... 2147483647	0	

Scaling of physical units

Signal type	Connection symbol in the FB editor	Resolution	Standardisation	
			External value	≡ internal value
Scaled (INT)	○	16 bits	100 %	≡ 2^{14} ≡ 16384
Scaled (DINT)	●	32 bits	100 %	≡ 2^{30} ≡ 1073741824
Speed (INT)	◁ / ▷	16 bits	15000 rpm	≡ 2^{14} ≡ 16384
Speed (DINT)	◆	32 bits	15000 rpm	≡ 2^{26} ≡ 67108864
Position/angle (DINT)	◀ / ▶	32 bits	1 encoder revolution	≡ 2^{16} increments
Acceleration (DINT)	■	32 bits	15000000 rpm/s	≡ 2^{22} ≡ 4194304

3 Commissioning

This documentation contains detailed information on parameter setting and configuration of the controller. Sequential reading is not required.

In order to obtain the information relevant for initial commissioning, this chapter describes different commissioning scenarios which can also be used as a guide through this manual:

A. Initial commissioning (📖 28)
   - **Target:** Adapting the controller to the electromechanics and the control system.

B. Standard set-up (📖 29)
   - **Target:** Taking over the application and parameter set of an already preconfigured "Engineer" project into several controllers.

C. Controller replacement (📖 30)
   - **Target:** Replacing a controller which has failed in a running system by a replacement device using the "old" memory module.

D. Motor replacement (📖 30)
   - **Target:** Replacing a motor which has failed in a running system.

3.1 General notes

Note!

Some parameters of the controller have a setting range depending on the device type.

If parameterisation is carried out offline or if the memory module is exchanged between different 9400 HighLine device types, always check the settings of the parameters listed in the following table and adapt them, if required, to prevent a parameter error after the parameter set download or module change!

Parameters	Info	Lenze setting
C00018	Switching frequency	8 kHz variable
C00022	Maximum current ▸ Accepting/adapting plant parameters (📖 127)	0.00 A
C00173 C00174	Mains voltage and undervoltage threshold (LU) ▸ Machine parameters (📖 32)	400/415 V, LU = 285 V

Tip!

The rated data of the different device types can be found in the Hardware Manual in the "Rated data" chapter.

Term definition of "Plant parameters"

The term "plant parameters" which is frequently used in the following chapters summarises all parameters which result from the combination of motor and load. They characterise the transfer behaviour of the entire controlled system including the desired monitoring functions. The plant parameters depend on the application in which the controller and motor are used.

3.2 Notes on commissioning using the keypad

For a motor with an electronic nameplate (ENP)

- A display of the plant parameters offered by ENP via keypad is not provided. The plant parameters must be edited and optimised individually.
- To avoid that the motor starts unintentionally without adjusting the plant parameters, the maximum current in the Lenze setting is set to "0 A" in C00022.
- After setting the plant parameters, they have to be saved on the memory module of the controller with mains failure protection, just as the motor data that have been read out from the ENP (C00002 = "11: Save start parameters").

For a motor without an electronic nameplate (ENP)

- The motor data and plant parameters must be edited and set individually.
- To avoid that the motor starts unintentionally without adjusting the plant parameters, the maximum current is set to "0 A" in C00022 by the factory.
- After setting the motor data and plant parameters, they have to be saved on the memory module of the controller with mains failure protection (C00002 = "11: Save start parameters").

Commissioning of the application

- The application must already be stored on the memory module of the controller. Otherwise commissioning by only using the keypad is not possible.
- All application parameters which deviate from the factory adjustment have to be edited individually. For this the project planner has to provide a corresponding list to the commissioner (including the motor and plant data).
- In the case of a standard set-up, a pole position identification may have to be carried out for synchronous motors of a third party manufacturer or Lenze synchronous motors with a Stegmann absolute value encoder.
- After setting the parameters, they have to be saved on the memory module of the controller with mains failure protection (C00002 = "11: Save start parameters").

Tip!

Detailed information on the individual technology applications can be found in the corresponding Software Manual for the technology application and the »Engineer« online help in the chapter "L-force Servo Drives 9400 → Technology applications".

3.3 Initial commissioning

Worksteps	
Parameterising motor control:	
1	Read out the motor data of the controller or select them via the »Engineer« motor catalogue. • If the motor connected to the controller is provided with an electronic nameplate (ENP), all motor data are automatically read out from the ENP and a selection in the motor catalogue is not required. ▸ Reading out motor data from the controller (📖 120) • If a motor without ENP or a motor by a third-party manufacturer is used, the selection is carried out via the »Engineer« motor catalogue. ▸ Selecting a motor from the motor catalogue in the »Engineer« (📖 121)
2.	Select motor control. (📖 124) • Servo control is preset for the synchronous motor.
3	Adjusting motor and controller to each other (📖 126)
4	Carry out settings for selected motor control. • For this see description for the corresponding motor control: • Servo control (SC) • Sensorless vector control (SLVC) (from software version V3.0) • V/f control (VFCplus) (from software version V3.0) • V/f control (VFCplus) (from software version V3.0)
Parameterise/configure application:	
5	Load & parameterise technology application.
ℹ	Detailed information on the individual technology applications can be found in the corresponding Software Manual for the technology application and the »Engineer« online help in the chapter "L-force Servo Drives 9400 → Technology applications".
6	If required, reconfigure the interconnection of the technology application with the function block editor.
Optimise control mode:	
7	Optimise control mode of the selected motor control. • By means of traversing profile from the application and oscilloscope. • For this see description for the corresponding motor control: • Servo control (SC) • Sensorless vector control (SLVC) (from software version V3.0) • V/f control (VFCplus) (from software version V3.0) • V/f control (VFCplus) (from software version V3.0)
Save project and parameter set:	
8	Execute device command C00002 = "11: Save start parameters".
9	Save »Engineer« project.

More (optional) worksteps

Worksteps	
Establish network:	
1	Insert network and machine application into the »Engineer« project.
2.	Interconnect port blocks reasonably to each other within the machine application.
3	Configure network (set addresses, baud rate, and process data channels in a reasonable manner).
4	Establish communication with the control system.
5	Establish communication with other drive components (e.g. HMIs, I/O extensions and other controllers).

Worksteps	
Check & optimise application/DC-bus operation:	
1	Traverse axis in manual operation. • See chap. Basic drive functions ▸ Manual jog (📖 400)
2.	Check area boundaries (path, speed, torque).
3	Traverse axis in automatic operation with set-up speed, possibly together with coupled axes.
4	Check coupling with other movements (master/slave axes, tools, ...).
5	Optimisation of the process at higher speeds.
6	Recording of typical signal characteristics using the oscilloscope function for the documentation. • See chapter Oscilloscope (📖 585)
Save & archive project and parameter set:	
1	Execute device command C00002 = "11: Save start parameters".
2.	Save »Engineer« project.
3	Deposit a backup copy of the »Engineer« project, e.g. on CD ROM, in the control cabinet.

3.4 Standard set-up

Worksteps	
Transfer application and parameter set to the controller:	
1	Transfer the application preconfigured in »Engineer« and the corresponding parameter set to the memory module of the controller.
2.	Execute device command C00002 = "11: Save start parameters".
For a motor with an electronic nameplate (ENP):	
3	Restart controller with connected motor to read out the motor data from the electronic nameplate (ENP). • Either by switching off/switching on again the voltage supply or by means of device command C00002 = "11000: Restart controller". • See chap. Motor interface ▸ Reading out motor data from the controller (📖 120)
4	Execute device command C00002 = "11: Save start parameters".
For a motor without an electronic nameplate (ENP):	
	**Note:** The motor is operated with the motor data and plant parameters identified during initial commissioning. ▸ Adjusting motor and controller to each other (📖 126)

3.5 Controller replacement

Scenario: The controller has failed in a running system.

Note!

For the procedure described in the following it is assumed that the memory module and possibly available extension modules in the controller, as well as the motor are not affected by the failure and that all parameters have been saved with mains failure protection.

Worksteps	
Replacement of the controller:	
1	Replace controller. **See Mounting Instructions for the controller!**
2.	Insert the memory module of the failed controller into the replacement device.
3	If further extension modules are plugged into the failed controller, they must be inserted into the replacement device as well.
Further steps are not required since all data required are on the memory module.	

3.6 Motor replacement

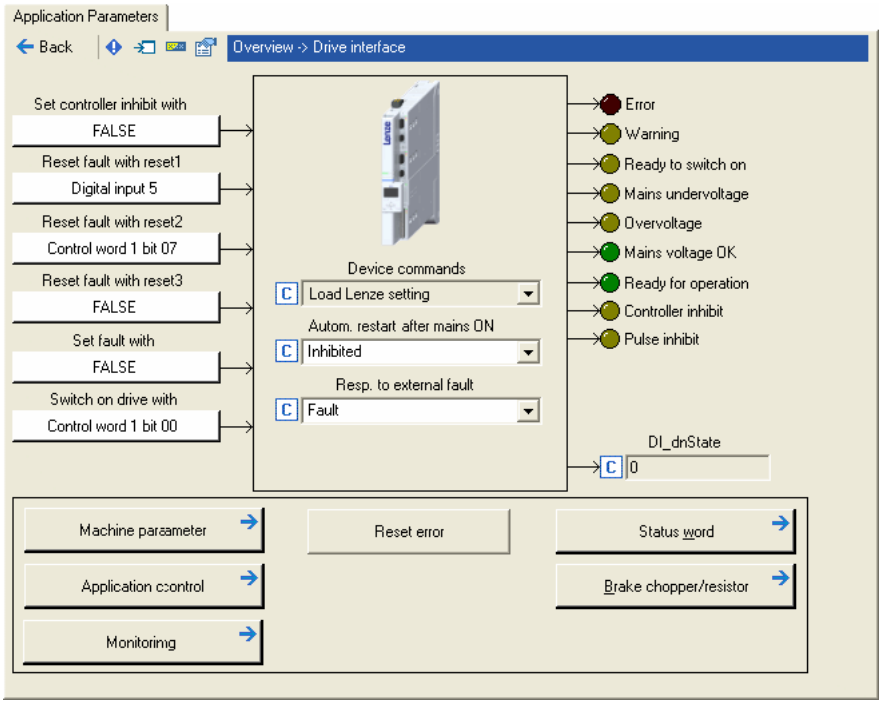
Scenario: The motor has failed in a running system.

Note!

For the procedure described in the following it is assumed that the controller is not affected by the failure.

Worksteps	
Replacement of the motor:	
1	Replace the motor. **See Mounting Instructions for the controller!**
	Note: The motor connection on the controller is accessible without having to remove the standard device from the installation backplane.
For a motor with an electronic nameplate (ENP):	
2.	Restart controller with connected motor to read out the motor data from the electronic nameplate. • Either by switching off/switching on again the voltage supply or by means of device command C00002 = "11000: Restart controller". • See chap. Motor interface ▸ Reading out motor data from the controller (📖 120)
3	Execute device command C00002 = "11: Save start parameters".
For a motor without an electronic nameplate (ENP):	
	Note: The motor is operated with the motor data and plant data from the memory module.

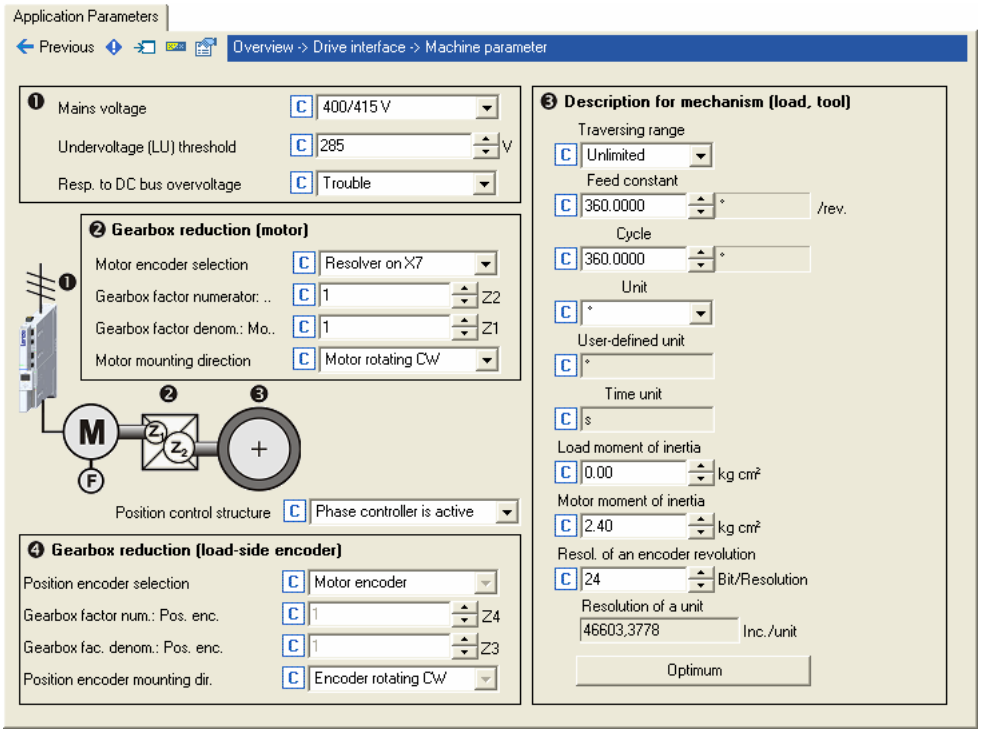
4 Drive interface



This chapter provides you with information on the drive interface via which you can control the drive controller into specific states and call different pieces of status information of the controller. Furthermore the machine constants for the motor end are entered via the drive interface.

How to get to the dialog for setting the drive interface parameters:

1. Go to the *Project view* of the »Engineer« and select the 9400 HighLine controller.
2. Select the **Application parameters** tab from the *Workspace*.
3. Click the following button of the *Overview* dialog level:



Parameterisation dialog in the »Engineer«

- The white buttons indicate the configuration of the drive interface inputs. ▸ Internal interfaces | "LS_DriveInterface" system block (📖 113)
  - The assignment is predefined by the technology application selected (in the example "Actuating drive – speed"). If required, this assignment configuration can be changed by clicking the corresponding buttons.
- If you click a button marked with the ➔ symbol, you go one level deeper in the corresponding parameterisation dialog.

4.1 Machine parameters

The global machine constants ("machine parameters") are set in the »Engineer» on the **Application parameters** tab in the dialog level *Overview* ➞ *Drive interface* ➞ *Machine parameters*:

Tip!

Detailed information on the different machine parameters can be obtained from the following subchapters.

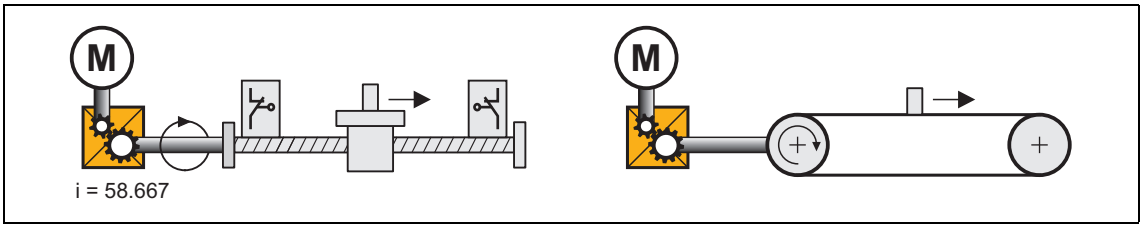
4.1.1 Mains voltage

Via the **Mains voltage** list field (C00173) the mains voltage for the controller is set.

- If you set a mains voltage with an adjustable threshold for undervoltage ("LU adjustable"), this undervoltage threshold can be set in the **Undervoltage threshold (LU)** input field (C00174).
- In the **Resp. to DC-bus overvoltage** list field (C00600) you can select the response that is to be effected when a DC-bus overvoltage occurs.

Note!

Changing the setting in C00173 also affects the permissible device utilisation!



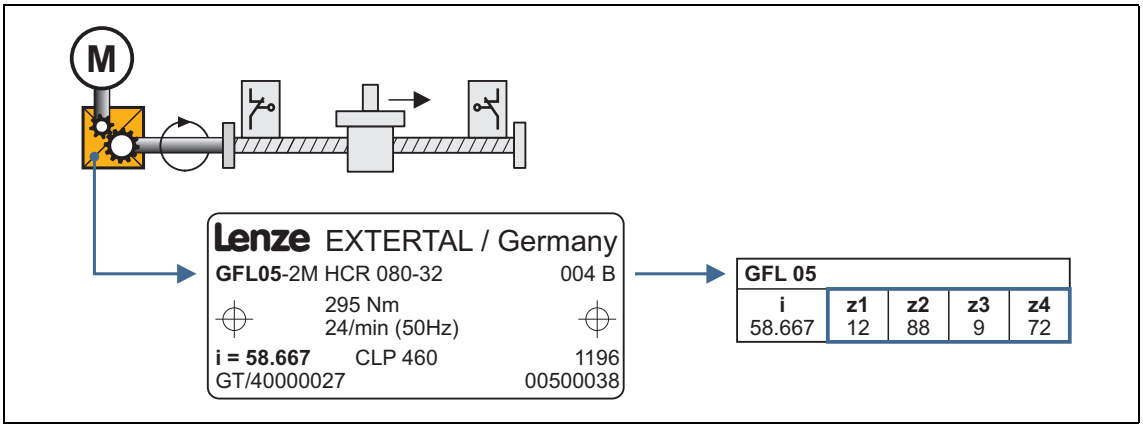
Tip!

In the chapter "Rated data" of the hardware manual the device types and their permissible device utilisation at a certain mains voltage and switching frequency are specified.

See also: ▸ Monitoring of the device utilisation (📖 111)

4.1.2 Gearbox ratio

The gearbox ratio indicates the number of revolutions of the motor axis it takes for exactly one revolution of the load axis (e.g. spindle or drive roll) to take place.



[4-1] Schematic diagram of gearbox ratio

- In the example shown in illustration [4-1] one revolution of the spindle is carried out at exactly 58,667 revolutions of the motor axis.

Specification of the gearbox ratio

- The gearbox ratio is to be defined in the form of a quotient (numerator/denominator); the data required can be found in the technical data for the gearbox:

[4-2] Example: Technical data relating to the gearbox (from gearbox catalogue)

Tip!

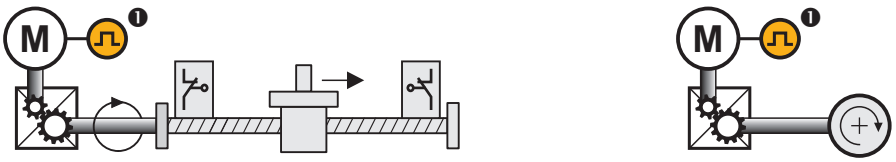
In order to specify the gearbox ratio exactly, use the number of teeth indicated on the data sheet or in the catalogue, if possible, instead of the information on the nameplate (see following calculation).

In C02531/1 the gearbox factor is displayed in decimal format.

Example calculation on the basis of the technical gearbox data:

Gearbox factor numerator (C02520)	=	$z2 \times z4$ =	88×72	= 6336
Gearbox factor denominator (C02521)	=	$z1 \times z3$ =	12×9	= 108

[4-3] Sample calculation



4.1.3 Motor mounting direction

Depending on the motor mounting position, you can carry out an inversion of the direction of rotation via the **Motor mounting direction** list field (C02527), if required:

- C02527 = "0": Clockwise rotating motor ≡ positive machine direction.
- C02527 = "1": Counter-clockwise rotating motor ≡ positive machine direction.

4.1.4 Feedback configuration

In most cases the system only has one motor encoder, i.e. no separate position encoder is installed on the load side. The motor position (angle of rotation) and motor speed are detected via the motor encoder selected in C00495 and converted with regard to the load side.

❶ Motor encoder

[4-4] Schematic diagram - feedback with position encoder = motor encoder

The actual position and speed values on the machine side result from the conversion via the Gearbox ratio on the motor side and the Feed constant.

Tip!

Detailed information on the parameterisation of the feedback systems for the motor control can be found in the chapter "Encoder evaluation". (📖 239)

4.1.5 Unit/user-defined unit

Via these machine parameters you define the real unit of the machine in which the feed constant and the parameters for a travel profile must be specified (e.g. position, speed, acceleration, and deceleration).

- If you for instance set the unit "mm" for a linear axis, the position must be specified in [mm] and the speed in [mm/s].
- By means of the user-defined unit, significant production units, like for example "bottles" can also be set.
  - For this, select the "User-defined" entry as unit in C02525 and then enter the desired user-defined unit in C02526.

Note!

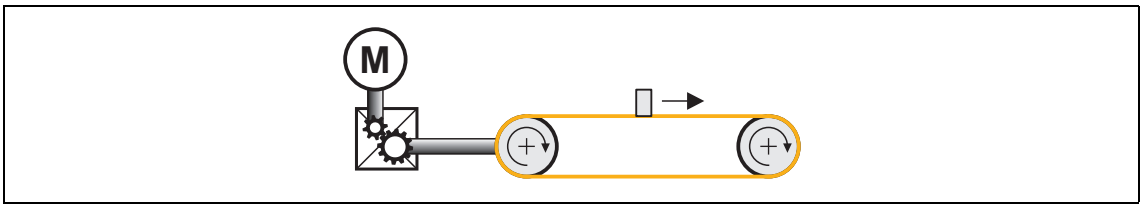
In this documentation the term "unit" in the parameter unit data only serves as a wildcard for the real unit of the machine.

Display parameter

Parameters	Info
C02534	Time unit used
C02535	Unit used
C02537	Speed unit
C02538	Acceleration unit
Greyed out = display parameter	

4.1.6 Traversing range

The selection of the traversing range ("Unlimited", "Limited", or "Modulo") in the **Traversing range** list field (C02528) serves to define the machine measuring system.



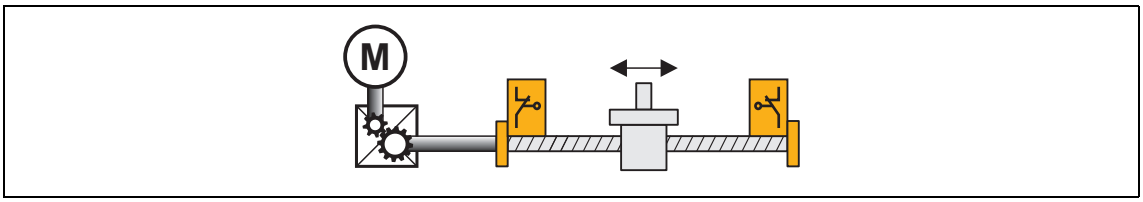
Note!

A change-over of the traversing range results in a loss of the reference information!

"Unlimited" traversing range

The drive can rotate continuously in one direction.

- By referencing and activating the software limit positions the traversing range can be limited.
- For positioning with absolute travel command the home position must be known.

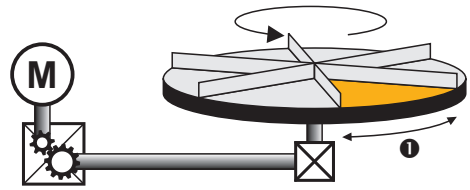


[4-5] Unlimited traversing range, taking the "feed control tape" as an example

"Limited" traversing range

The travel range is limited by positive and negative position limits (mechanical limits/travel range limit switches/software limit positions). ▸ Limiter (📖 506)

- After a defined distance the drive must travel in the opposite direction again.
- For positioning in the limited traversing range the home position must be known.
- The software limit positions are basically monitored with regard to the maximum value range that can be represented internally ($\pm 2^{31}$ increments), even if monitoring has been deactivated via C02700.
- An overflow of the value range results in a loss of the reference information.

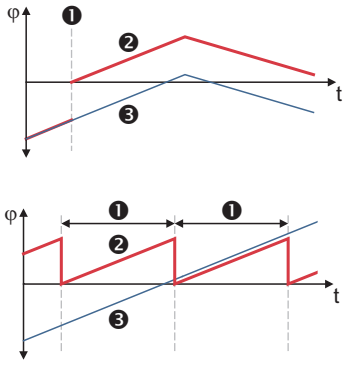


[4-6] Example: Limited traversing range - "spindle drive" (linear axis)

"Modulo" traversing range

The measuring system is repeated.

- If the cycle set in C02536 is exceeded, a defined overflow occurs. In a rotative system, the cycle typically corresponds to a revolution or tool distance.
- For positioning in the "Modulo" traversing range the home position must be known.
- Software limit positions are not effective.
- Absolute targets can be approached by exceeding the measuring system limit, e.g. from 10° to 350°.



❶ C02536: Cycle (illustration = 60°)

[4-7] Example: Modulo traversing range - "rotary table""

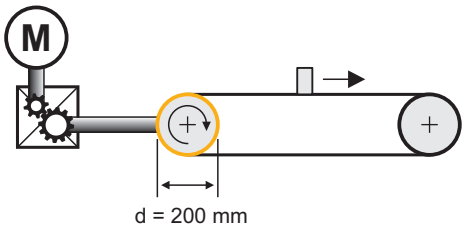
Dependencies - traversing range/basic drive functions

- The following table lists the different dependencies between the selected traversing range and the basic drive functions.

Basic drive function	Traversing range		
	Unlimited	Limited	Modulo
Position data for Encoder evaluation	Continuously	Continuously	Clocked
Position data for Position follower	Absolute	Absolute	Absolute (in time)
Positioning modes for Positioning	1, 2, 5, 6, 7, 8	1, 2, 5, 6, 7, 8	5, 6, 11 ... 16
Restrictions for Homing	None	None	Home position must be in time
Limit positions (Limiter)	Permitted	Permitted	Not permitted

Example 1: Unlimited/limited position display

❶ Reference setting
❷ Position in the machine measuring system
❸ Position in the motor measuring system



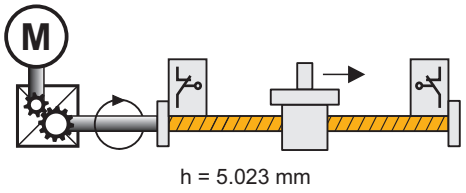
Example 2: Modulo position display

❶ Cycle
❷ Position in the machine measuring system
❸ Position in the motor measuring system

4.1.7 Feed constant

The feed constant corresponds to the movement of the machine during one revolution of the gearbox output shaft.

- The entry in the **Feed constant** field (C02524) is made in the unit defined in C02525 relating to one revolution.
- In the case of a conveyor drive, the feed constant is obtained from the drive roll's circumference, which, in the following example, is calculated on the basis of the indicated diameter:



d = diameter

$$\text{Feed constant} = \pi \cdot d \frac{[\text{Unit}]}{\text{Revolution}} = \pi \cdot 200 \frac{\text{mm}}{\text{Revolution}} = 628.3185 \frac{\text{mm}}{\text{Revolution}}$$

[4-8] Schematic diagram: Feed constant for a conveyor driver

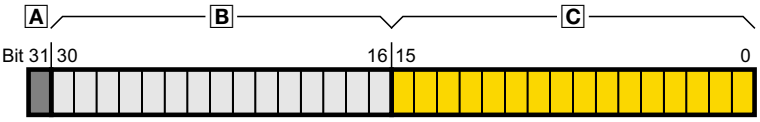
- In the case of a spindle drive (linear axis), the feed constant is derived from the leadscrew pitch. The feed constant indicates the distance the slide travels during one revolution of the spindle (in the following example: 5.023 mm).

h = leadscrew pitch (can be obtained from the technical data of the linear axis)

[4-9] Schematic diagram: Feed constant for a spindle drive

- In the case of a rotary table and its specification as an angle, the feed constant is = 360°/ revolution.

4.1.8 Resolution of an encoder revolution

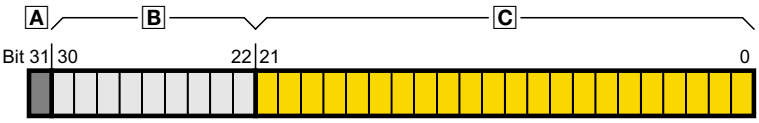


The following applies to software versions lower than V3.0:

The resolution of an encoder revolution and hence of a position value is constantly set to 16 bits/revolution, which corresponds to 65536 increments/revolution. At this resolution, the traversing range comprises ±32767 revolutions.

The following applies from software version V3.0:

C00100 serves to adjust the resolution to the application.



- The default resolution of 16 bits/revolution is sufficient for standard applications.

A Sign bit
B Number of revolutions: 15 bits ≡ ±32767 revolutions
C Resolution of one encoder revolution: 16 bits ≡ 65536 increments/revolution

[4-10] Example: standard resolution (16 bits/revolution)

- For more significant applications, a higher resolution of the position values can clearly improve the control properties and positioning accuracies:
  - Finer resolution of the position targets → improved positioning accuracy
  - Finer quantisation of setpoints and actual values → better control quality
  - Higher loop gain adjustable → less following errors
- However, a higher resolution at the same time causes a restricted number of encoder revolutions, and only smaller traversing distances can be displayed.

A Sign bit
B Number of revolutions: 9 bits ≡ ±512 revolutions
C Resolution of one encoder revolution: 22 bits ≡ 4194304 increments/revolution

[4-11] Example: Higher resolution (22 bits/revolution) with a restricted traversing range

Tip!

In the following subchapter "Determining the optimum resolution" (📖 42) it is described how you can determine the optimum resolution of the position values.

Note!

The position values (e.g. setpoints, actual values, parameters, ...) in the signal flow always use the resolution set in C00100. In this connection it is irrelevant which resolution is delivered directly by the encoder.

Multi-axis systems

In an interconnection via the electrical shaft, at least two measuring systems (master and slave) are available in the drive.

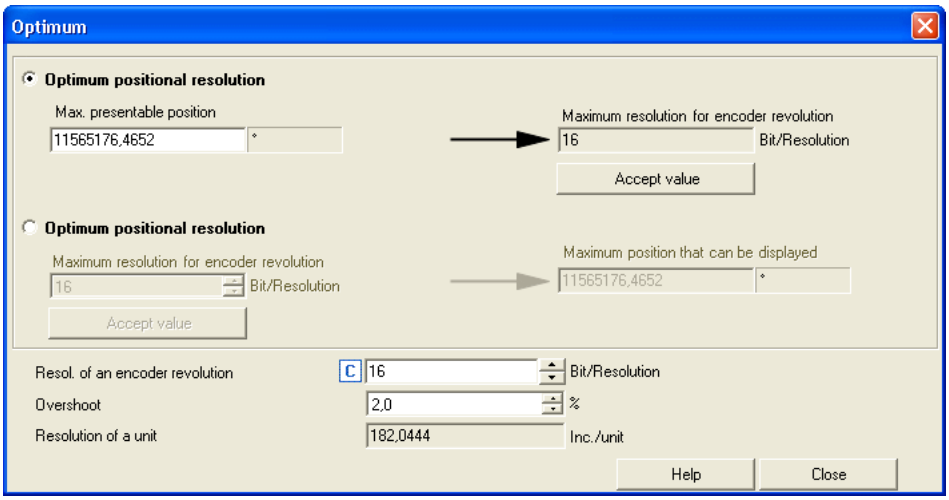
- Each measuring system is provided with an individual setting of the resolution.
- The machine parameters (gearbox factors, feed constants, encoder resolution and cycle) for the master measuring system or master value must be set identically for all drives in the system.

Technology applications "Electronic gearbox" and "Synchronism"

For these two technology applications the machine parameters of the master measuring system are defined on the *Application parameters* tab in the "Master value scaling" dialog level.

Electronic cam

The machine parameters of the master measuring system for electronic cams can be defined on the *Measuring systems* tab for the electrical shaft.



4.1.8.1 Determining the optimum resolution

This function extension is available from software version V3.0!

How to determine the optimum resolution:

In the dialog level *Overview* ➞ *Drive interface* ➞ *Machine parameters:*

1. Set gearbox factors.
2. Set real unit of the machine.
3. Set feed constant.
4. Click the **Optimum positional resolution** button.
   - The *Optimum positional resolution* dialog box is displayed:

5. Go to the **Max. presentable position** input field and enter the highest position which is to be entered in a parameter during operation.
   - If required, set a reserve in the **Overshoot** input field to take into account possible following errors (overshoot of actual values).

   Then the maximum resolution for the position entered is shown in the **Maximum resolution for encoder revolution** field.
6. Click **Accept value** to accept the displayed resolution in C00100.
7. Click **Close** to close the dialog box again.

Tip!

In order to display the position that can be maximally represented for a defined resolution, activate the second option **Determine max. presentable position**. Then you can set the resolution for which the maximally presentable position is to be displayed in the **Maximum resolution for encoder revolution** input field.

4.1.9 Max. position, speed, and acceleration that can be displayed internally

By setting the following machine parameters, the connection between the real units (application units) of the machine and the internal units in the controller is described:

- Gearbox ratio (C02520, C02521, C02522, C02523)
- Feed constant (C02524)
- Resolution of an encoder revolution (C00100)

Possibly the defined values for position, speed, and acceleration cannot be represented in the internal units by the numerical 32-bit format used.

- The following display parameters show the values that can be maximally displayed:

Parameters	Info	Lenze setting	
		Value	Unit
C02539	Maximum position that can be displayed	-	Unit
C02540	Speed that can be maximally displayed	-	Unit/s
C02541	Acceleration that can be maximally displayed	-	Unit/s^2
Greyed out = display parameter			

Response if a value that cannot be displayed internally is entered

If a position, speed, or acceleration which cannot be represented internally is defined via parameters, the value defined is limited to the maximum value that can be represented internally (±2147483647).

The following only applies to software version V3.0:

- If a position, speed, or acceleration which cannot be represented internally is defined via parameters, the value defined is rejected.
- If an internal counter overflow of a parameter value due to a subsequent change of the machine parameters for the gearbox ratio, feed constant, or resolution of an encoder revolution is detected, the "Fault" error response is triggered and a corresponding error message is entered in the logbook of the controller:

Error number	Error message
0x00B8001A	Int. overflow C02620 (manual speed 1)
0x00B8001B	Int. overflow C02621 (manual speed 2)
0x00B8001C	Int. overflow C02622 (manual acceleration)
0x00B8001D	Int. overflow C02624 (manual deceleration)
0x00B80020	Int. overflow C02701/1 (positive SW limit position)
0x00B80021	Int. overflow C02701/2 (negative SW limit position)
0x00B80022	Int. overflow C02703 (maximum speed)
0x00B80023	Int. overflow C02705 (maximum acceleration)
0x00B80024	Int. overflow C02708/1 (limited speed 1)
0x00B80025	Int. overflow C02708/2 (limited speed 2)
0x00B80026	Int. overflow C02708/3 (limited speed 3)
0x00B80027	Int. overflow C02708/4 (limited speed 4)
0x00B80028	Int. overflow C02710/1 (decel. limited speed 1)
0x00B80029	Int. overflow C02710/2 (decel. limited speed 2)
0x00B8002A	Int. overflow C02710/3 (decel. limited speed 3)
0x00B8002B	Int. overflow C02710/4 (decel. limited speed 4)
0x00B8002C	Int. overflow C02713 (maximum distance manual jog)
0x00B8002D	Int. overflow C02642 (home position)
0x00B8002E	Int. overflow C02643 (homing: target position)
0x00B8002F	Int. overflow C02644 (homing: speed 1)
0x00B80030	Int. overflow C02645 (homing: acceleration 1)
0x00B80031	Int. overflow C02646 (homing: speed 2)
0x00B80032	Int. overflow C02647 (homing: acceleration 2)
0x00B80033	Int. overflow C02670 (positioning: tolerance for target position)

Tip!

Possible measures for error correction:

- Plausibility check of the machine parameters set for gearbox ratio, feed constant, or resolution of an encoder revolution.
- Set parameters with a counter overflow to a value which can also be represented internally.

4.2 Device commands

In the following subchapters the device commands of the controller are described, which are provided in C00002 and which can be executed by means of »Engineer« or alternatively with the keypad when an online connection has been established.

Note!

Before switching off the supply voltage after a device command has been executed, check the successful execution of the device command via the status display in C00003!

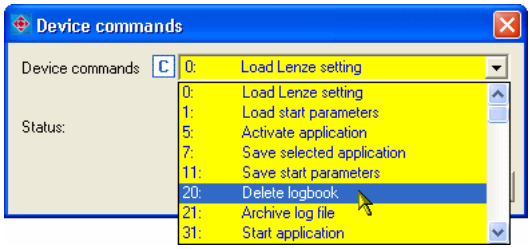
The meaning of the status display in C00003 can be obtained from the subchapter for the corresponding device command.

Activating frequently required device commands via the toolbar

The simplest way to execute the frequently required device commands is directly via the *Toolbar* of »Engineer« when an online connection has been established.

Symbol	Job title
	Enable controller
	Inhibit controller
	Start application
	Inhibit controller and Stop application

Note!



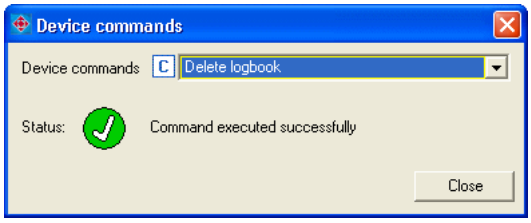
Device commands that can be executed via the *Toolbar* of the »Engineer« always affect the element currently selected in the *Project view* including all subelements!

- If no controller but a system module is selected in the *Project view*, the corresponding device command will be activated in all lower-level controllers having an online connection with the »Engineer«.

Before the desired action is carried out, a confirmation prompt appears first, asking whether the action is really to be carried out.

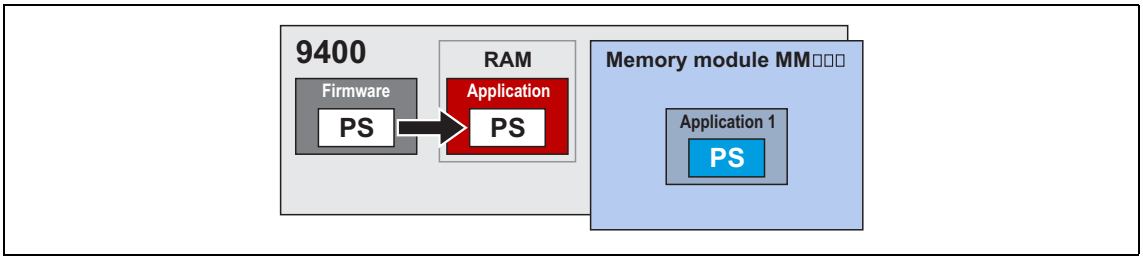
Activating device commands via the "Device commands" dialog box

All device commands of the controller are available in »Engineer« in the *Device Commands* dialog box:



- The *Device commands* dialog box can be opened by clicking on the **Device commands** list field on the **Application parameters** tab in the dialog level *Overview* → *Drive interface*.
- The *Device commands* dialog box can also be opened by clicking the setting of C00002 on the **All parameters** tab.

Note!



If you click a device command in the list field of the *Device commands* dialog box, the corresponding device command is executed immediately!

- During and after the execution of the device command, the processing status is displayed in the *Device Commands* dialog box:

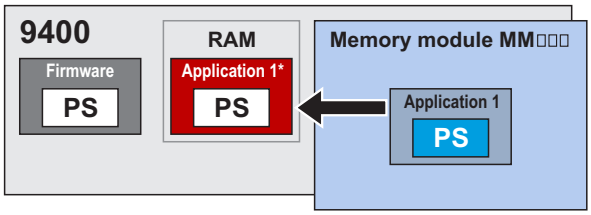
4.2.1 Load Lenze setting

The C00002 = "0: Load Lenze setting" device command is used to reset the parameters of the active application to the Lenze setting, which is stored in the controller firmware:

[4-12] "Load Lenze setting" function

- Only possible when the application has stopped and the controller is inhibited.
- All parameter changes made since the last saving of the parameter set will get lost!
- This device command only affects the settings of the operating system, application and module parameters, the active application or the configuration selected with the function block editor remains unchanged.

Possible status displays for this device command



Status (C00003)		Meaning
	34050	Device command in process
	0	Device command executed successfully
	1	General error
	39424	CAN fault
	...	...
	39679	CAN fault

Related device commands

- Load start parameters (📖 48)
- Save start parameters (📖 52)

4.2.2 Load start parameters

Via C00002 = "1: Load start parameters" the start parameters of the active application can be reloaded from the memory module to the controller:

* In this example, application 1 is the active application

[4-13] "Load start parameters" function

- Only possible when the application has stopped and the controller is inhibited.
- All parameter changes made since the last saving of the parameter set will get lost!
- This device command only affects the settings of the operating system, application and module parameters, the active application or the configuration selected with the function block editor remains unchanged.

Possible status displays for this device command

Status (C00003)		Meaning
	99586	Device command in process
	65536	Device command executed successfully
	65537	General error
	99371	Fault while reading the parameter set partition
	99374	No memory module available
	104960	CAN fault
	...	...
	105215	CAN fault

Related device commands

- Save start parameters (📖 52)
- Load Lenze setting (📖 47)

4.2.3 ENP:Load plant data

If the Lenze motor connected to the controller is provided with an electronic nameplate (ENP), all motor data are automatically read out from the electronic nameplate of the motor when the controller is switched on for the first time and are temporarily stored in the controller at first.

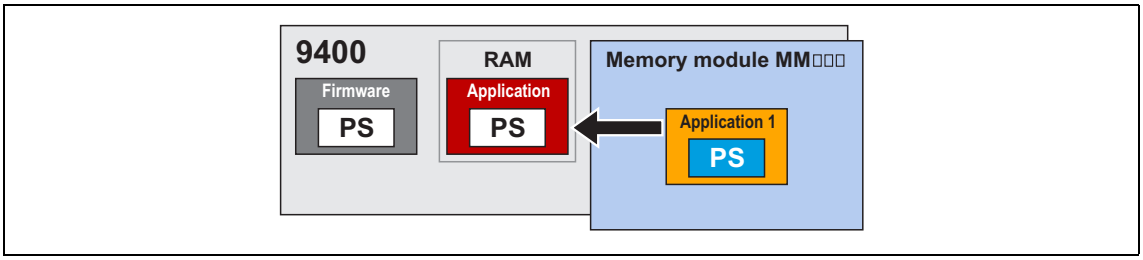
With the device command C00002 = "2: ENP: Load plant data" the motor data can be reread from the electronic nameplate (ENP) of the motor.

- Only possible when the application has stopped and the controller is inhibited.
- For a permanent acceptance of the motor data, the parameter set must be saved. ▸ Save start parameters (📖 52)
- The following plant data are read out from the ENP:

Parameters	Info
C00022	Maximum current
C00070	Speed controller gain
C00071	Speed controller reset time
C00596	Threshold max. speed reached

Note!

The two pieces of plant data C00011 and C00497 listed in the following table are not read out from the ENP and thus have to be checked and, if required, set manually after this device command has been executed!



Parameters	Info
C00011	Reference speed motor
C00497	Speed act. val. time const.

Possible status displays for this device command

Status (C00003)		Meaning
	165122	Device command in process
	131072	Device command executed successfully
	131073	General error

4.2.4 Activate application

Use the device command C00002 = "5: Activate application" to activate the application archived on the memory module.

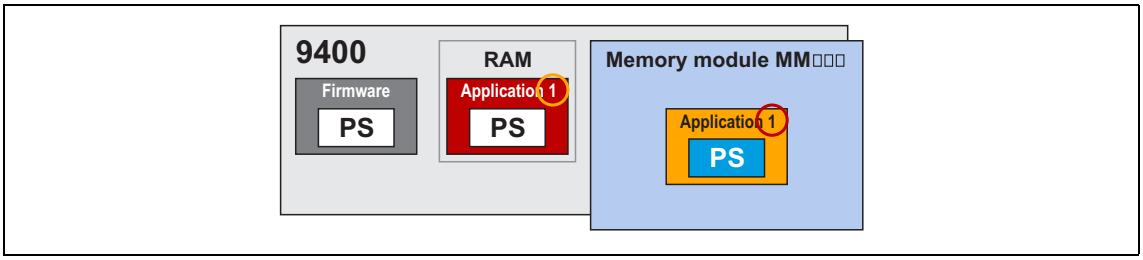
[4-14] "Activate application" function

- Only possible when the application has stopped and the controller is inhibited.
- Whether the application is started at the same time, depends on the auto-start setting selected in C02104.
- After mains switching, the preset application will be loaded into the controller.
- The number of the currently active application is displayed with "1" in C00007 after the download via the »Engineer«.

Note!

When the application is activated, the corresponding start parameter set is loaded automatically and parameter settings executed before will get lost unless the parameter set was saved before!

Possible status displays for this device command



Status (C00003)		Meaning
	361730	Device command in process
	327680	Device command executed successfully
	327681	General error

Related device commands

- Save selected application (📖 51)
- Start application (📖 56) / Stop application (📖 57)

4.2.5 Save selected application

With the device command C00002 = "7: Save selected application" the active application can be defined as start application.

[4-15] "Save selected application" function

- When this device command is executed, the parameter set is also saved automatically.
- The number of the currently active application is displayed in C00007.

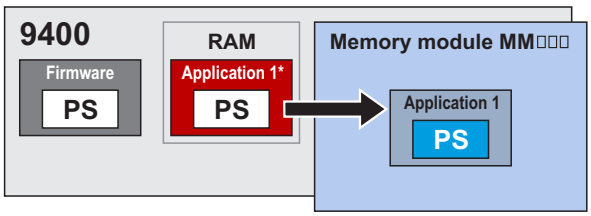
Note!

The application "0" (Lenze setting) is intended for the Lenze service.

During initial commissioning, the download with the Engineer causes the application "1" archived on the memory module to be defined as start application.

Possible status displays for this device command

Status (C00003)		Meaning
	492802	Device command in process
	458752	Device command executed successfully
	458753	General error



Related device commands

- Activate application (📖 50)
- Start application (📖 56)
- Stop application (📖 57)

4.2.6 Save start parameters

Controller parameter changes made via »Engineer« or keypad will get lost after mains switching of the controller or loading of another application unless the settings have been explicitly saved.

With the device command C00002 = "11: Save start parameters" the current parameter settings of the active application can be saved with mains failure protection in the memory module of the controller:

* In this example, application 1 is the active application

[4-16] "Save start parameters" function

Tip!

With the keypad this device command can be executed via the left function key if it is currently assigned with the SAVE function.

Note!

The saving process can take several seconds. Before you switch off the supply voltage after having executed this device command, therefore be absolutely sure to check via the status display in C00003 whether the device command has been executed successfully!

Saving of the cam data

From software version V4.0, this device command also includes the powerfail-proof saving of the cam data on the memory module.

- The saving process is only carried out if the cam data in the controller and the memory module differ from each other (based on the time stamp/GUID of the cam data).
- For saving the cam data, you do not need to enter a possibly existing user password (C02900).
- The C00002 = "502: Save Cam Data" device command remains available. ▸ Save cam data (📖 92)

Possible status displays for this device command

Status (C00003)		Meaning
	754946	Device command in process
	720896	Device command executed successfully
	720897	General error
	754718	Fault while writing into a file
	754734	No memory module available
	761857	Access to file has been denied since the file is already accessed from another position
	761861	I/O fault when accessing the file system
	761868	RAM is full
	761869	Access authorisation denied
	761884	No free memory on the memory module

Related device commands

- Load start parameters (📖 48)

4.2.7 Delete logbook

The C00002 = "20: Delete logbook" device command is used to delete all entries in the logbook.

Tip!

To display the logbook in the »Engineer«, click the **Logbook** button on the **Diagnostics** tab.

In the *Logbook* dialog box, it is also possible to delete all logbook entries by clicking the **Delete** button.

Further information on the logbook can be found in the chapter "Diagnostics & fault analysis". (📖 608)

Possible status displays for this device command

Status (C00003)		Meaning
	1344770	Device command in process
	1310720	Device command executed successfully
	1310721	General error

Related device commands

- Archive logbook (📖 55)

4.2.8 Archive logbook

The C00002 = "21: Archive logbook" device command is used to archive the entries in the logbook.

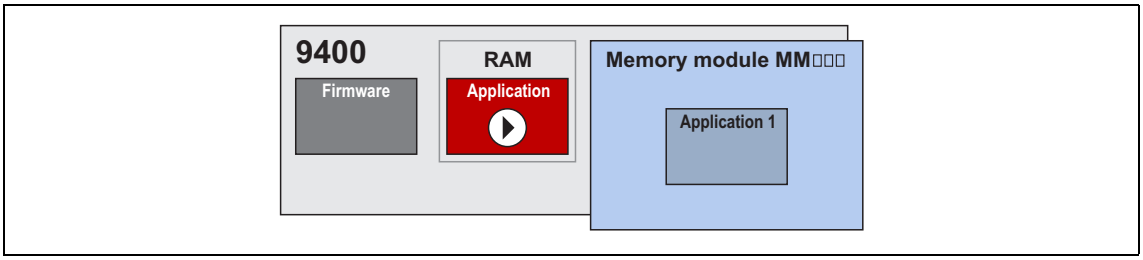
Tip!

To display the logbook in the »Engineer«, click the **Logbook** button on the **Diagnostics** tab.

You can also export all entries available in the logbook into a file (*.log) by clicking the **Export** button in the *Logbook* dialog box.

Further information on the logbook can be found in the chapter "Diagnostics & fault analysis". (📖 608)

Possible status displays for this device command



Status (C00003)		Meaning
	1410306	Device command in process
	1376256	Device command executed successfully
	1376257	General error

Related device commands

- Delete logbook (📖 54)

4.2.9 Start application

The C00002 = "31: Start application" device command is used to start the active application in the controller.

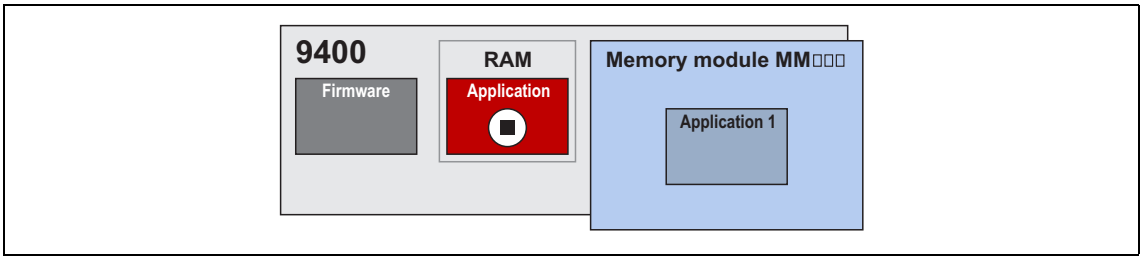
[4-17] "Start application" function

- The number of the currently active application is displayed with "1" in C00007.
- The current program status is displayed in C02108.
- The active function state of the application is displayed in C02530.

Tip!

This device command can also be activated via the icon in the *Toolbar*.

Possible status displays for this device command



Status (C00003)		Meaning
	2065666	Device command in process
	2031616	Device command executed successfully
	2031617	General error

Related device commands

- Stop application (📖 57)
- Activate application (📖 50)
- Save selected application (📖 51)

4.2.10 Stop application

The C00002 = "32: Stop application" device command can be used to stop the application started in the controller again.

[4-18] "Stop application" function

- Only possible when the controller is inhibited.

Tip!

Via the icon in the *Toolbar* the controller can be inhibited, and at the same time the application in the controller can be stopped.

Possible status displays for this device command

Status (C00003)		Meaning
	2131202	Device command in process
	2097152	Device command executed successfully
	2097153	General error

Related device commands

- Start application (📖 56)
- Inhibit controller (📖 63)
- Activate application (📖 50)
- Save selected application (📖 51)

4.2.11 Reset program

The C00002 = "33: Reset program" device command is used to reset the application program in the controller.

- All variables are reset to their initialisation value.
- The situation corresponds to the start of a new program loaded into the control (cold start).

Possible status displays for this device command

Status (C00003)		Meaning
	2196738	Device command in process
	2162688	Device command executed successfully
	2162689	General error

Related device commands

- Delete program (📖 59)
- Restart program (📖 60)

4.2.12 Delete program

The C00002 = "34: Delete program" device command is used to delete the application program in the controller and reset the controller to its original state.

- All variables are reset to their initialisation value.

Possible status displays for this device command

Status (C00003)		Meaning
	2262274	Device command in process
	2228224	Device command executed successfully
	2228225	General error

Related device commands

- Reset program (📖 58)
- Restart program (📖 60)

4.2.13 Restart program

The C00002 = "35: Restart program" device command is used to restart the application program in the controller.

- All variables except the RETAIN variables are reset to their initialisation value.
- The situation corresponds to a power failure or switching the controller off/on (warm start) while the program is running.

Possible status displays for this device command

Status (C00003)		Meaning
	2327810	Device command in process
	2293760	Device command executed successfully
	2293761	General error

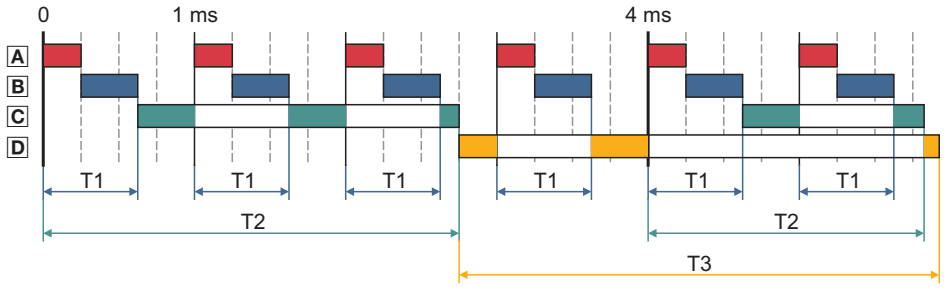
Related device commands

- Reset program (📖 58)
- Delete program (📖 59)

4.2.14 Reset runtime measurement

When the application is started, the controller continuously carries out a runtime measurement for the interval-controlled application task, the interval-controlled user task, and the free-running idle task and displays the current and maximum task runtimes via parameters.

The C00002 = "36: Reset runtime measurement" device command is used to reset the runtime measurement, i.e. the memory for the maximum values is reset to "0".



Possible status displays for this device command

Status (C00003)		Meaning
	2393346	Device command in process
	2359296	Device command executed successfully
	2359297	General error

Note!

The runtime measurement is also reset by the following actions:
- Start application
- Reset/delete/restart program

Example for runtime measurement

A System task B Application task (here: task interval = 1 ms) C User task (here: task interval = 4 ms) D Free-running idle task	T1 = runtime of the application task T2 = runtime of the user task T3 = runtime of the idle task

[4-19] Example: Runtimes of the different tasks

Display parameter

Parameters	Info	Lenze setting	
		Value	Unit
C02121/1	Current runtime - application task	-	µs
C02121/2	Maximum runtime - application task	-	µs
C02122/1	Current runtime - user task	-	µs
C02122/2	Maximum runtime - user task	-	µs
C02123/1	Current runtime - idle task	-	µs
C02123/2	Maximum runtime - idle task	-	µs
Greyed out = display parameter			

4.2.15 Inhibit controller

The C00002 = "41: Inhibit controller" device command is used to inhibit the controller ("controller inhibit"), i.e. the power output stages in the controller are inhibited and the speed/current and position controllers of the motor control are reset. The motor becomes torqueless and coasts unless it is already at standstill.

- The controller can also be inhibited by other sources, e.g. via the digital input RFR or through the application.
- C00158 provides a bit coded representation of all active sources/triggers of a controller inhibit.

Note!

This device command has no status display in C00003, i.e. the display remains unchanged showing the previous device command status.

Tip!

This device command can also be activated via the icon in the *Toolbar*.

Related device commands

- Enable controller (📖 64)

4.2.16 Enable controller

The C00002 = "42: Enable controller" device command is used to re-enable an inhibited controller.

Note!

Please note that the controller will only be enabled if all sources for controller inhibit are reset!

- C00158 provides a bit coded representation of all active sources/triggers of a controller inhibit.

This device command has no status display in C00003, i.e. the display remains unchanged showing the previous device command status.

Tip!

This device command can also be activated via the icon in the *Toolbar*.

Related device commands

- Inhibit controller (📖 63)

4.2.17 Reset error

The C00002 = "43: Reset error" device command is used to acknowledge an error message if the error cause has been eliminated and the error is thus no longer pending.

Tip!

An error message can also be acknowledged by activating the **Reset error** button in the **Diagnostics** tab.

Further information on error messages can be found in the chapter "Diagnostics & fault analysis". (608)

Note!

This device command has no status display in C00003, i.e. the display remains unchanged showing the previous device command status.

4.2.18 Activate quick stop

The C00002 = "45: Activate quick stop" device command is used to activate the basic function "Quick stop", i. e. the drive is brought to standstill within the deceleration time set, irrespective of the setpoint defined.

- Quick stop can also be activated by other sources, e.g. by the application.
- C00159 displays a bit code of active sources/causes for the quick stop.

Note!

The activation of quick stop may cause following errors in superimposed controls (e.g. synchronous or position control). If several drives execute a coordinated movement, the quick stop function should therefore only be used for the motion master (master drive) in order to maintain the coordination.

This device command has no status display in C00003, i.e. the display remains unchanged showing the previous device command status.

Tip!

In contrast to the "stop" function, quick stop is required for a stop in the event of an error. Thus, quick stop can also be set as an error response ("quick stop by trouble) for many monitoring functions. Detailed information on this can be found in the chapter "Diagnostics & fault analysis". (📖 608)

Related device commands

▸ Reset quick stop (📖 67)

4.2.19 Reset quick stop

The C00002 = "46: Reset quick stop" device command is used to exit an active quick stop again.

Note!

Please note that the quick stop is only exited if all sources for quick stop are reset!

- C00159 displays a bit code of active sources/causes for the quick stop.

This device command has no status display in C00003, i.e. the display remains unchanged showing the previous device command status.

Related device commands

- Activate quick stop (📖 66)

4.2.20 Identify pole position (360°)

If no absolute value encoder is connected, or a synchronous motor of a third-party manufacturer is driven by the controller, the C00002 = "51: Identify pole position (360°)" device command is used to determine the pole position with regard to the motor encoder currently activated in C00495.

- The function can only be activated if the controller is inhibited. Then the execution of the function starts automatically as soon as the controller inhibit is deactivated again.
- During the pole position identification, the motor carries out one electrical revolution. This leads to a mechanical rotation of the motor shaft.
- The determined pole position is indicated under code C00058.

Note!

From software version V4.0 the response parameterised in C00640 (Lenze setting: "Fault") is triggered and the error message "Pole position identification cancelled" is entered in the logbook of the controller if the pole position identification process is aborted.

Tip!

Detailed information on the pole position identification can be found in the chapter "Motor interface", subchapter "Pole position identification". (📖 131)

Possible status displays for this device command

Status (C00003)		Meaning
	3376386	Device command in process
	3342336	Device command executed successfully
	3342337	General error
	3382023	Pole position identification cannot be executed because of wrong motor type (asynchronous motor).
	3382024	Pole position identification has been aborted
	3382025	Pole position identification cannot be executed because another identification is already active.
	3382026	Identification of pole position cannot be executed because U-rotation or I-rotation test mode is active.
	3382027	Identification of pole position cannot be executed because current controller optimisation mode is active.
	3382033	Pole position identification cannot be executed because the motor is blocked (e.g. by a mechanical brake), a motor phase is not connected, or a phase shifter is in the motor cable.
	3382047	Pole position identification cannot be executed because an error or trouble is active.
	3382065	Pole position identification cannot be executed because either the entire motor or a motor phase is not connected. • This error message is only available from software version V3.0 onwards.

Related device commands

- Identify pole position (min. motion) (📖 69)

4.2.21 Identify pole position (min. motion)

If no absolute value encoder is connected, or a synchronous motor of a third-party manufacturer is driven by the controller, the C00002 = "52: Identify pole position (min. motion)" device command is used to determine the pole position with respect to the motor encoder currently activated in C00495.

- The function can only be activated if the controller is inhibited. Then the execution of the function starts automatically as soon as the controller inhibit is deactivated again.
- During the pole position identification, the rotor aligns itself. This is compensated by a position control.
- The determined pole position is indicated under code C00058.

Note!

From software version V4.0 the response parameterised in C00640 (Lenze setting: "Fault") is triggered and the error message "Pole position identification cancelled" is entered in the logbook of the controller if the pole position identification process is aborted.

Tip!

Detailed information on the pole position identification can be found in the chapter "Motor interface", subchapter "Pole position identification". (📖 131)

Possible status displays for this device command

Status (C00003)		Meaning
	3441922	Device command in process
	3407872	Device command executed successfully
	3407873	General error
	3447559	Pole position identification cannot be executed because of wrong motor type (asynchronous motor).
	3447560	Pole position identification has been aborted
	3447561	Pole position identification cannot be executed because another identification is already active.
	3447562	Identification of pole position cannot be executed because U-rotation or I-rotation test mode is active.
	3447563	Identification of pole position cannot be executed because current controller optimisation mode is active.
	3447569	Pole position identification cannot be executed because the motor is blocked (e.g. by a mechanical brake), a motor phase is not connected, or a phase shifter is in the motor cable. • This error message is only available from software version V4.0 onwards.
	3447583	Pole position identification cannot be executed because an error or trouble is active.
	3447597	Identification of pole position cannot be executed because the rotor has moved too strongly.
	3447601	Pole position identification cannot be executed because either the entire motor or a motor phase is not connected. • This error message is only available from software version V3.0 onwards.

Related device commands

- Identify pole position (360°) (📖 68)

4.2.22 Resolver error identification

This function extension is available from software version V7.0!

The C00002 = "59: Resolver error identification" device command serves to detect resolver errors which are caused when sine and cosine tracks do not magnetise orthogonally. The identified resolver errors serve to compensate the resolver errors.

- Only possible with servo control.

Tip!

Detailed information on the resolver error compensation can be found in the chapter "Encoder evaluation" in the subchapter "Resolver error compensation". (📖 266)

Possible status displays for this device command

Status (C00003)		Meaning
	3900674	Device command in process
	3866624	Device command executed successfully
	3866625	General error
	3906358	Resolver error identification cannot be executed since the wrong control type is active (no servo control).
	3906359	Resolver error identification cannot be executed since an error or trouble is active.
	3906360	Resolver error identification cannot be executed because another identification is already active.
	3906361	Resolver error identification cannot be executed because of too small speed (< 500 rpm).

4.2.23 Load Lenze INV characteristic

This function extension is available from software version V4.0!

If determination of the so-called "inverter error characteristic" is not possible with the device command "Calculate inv. characteristic" or leads to incorrect results, the device command C00002 = "70: Load Lenze INV characteristic" can be used to load a characteristic which is typical of the device in question.

- Only possible when the controller is inhibited.

Tip!

Detailed information about the determination of the inverter error characteristic can be found in the chapter "Motor interface" in the subchapter "Optimising the switching performance of the inverter". (📖 138)

Possible status displays for this device command

Status (C00003)		Meaning
	4621570	Device command in process
	4587520	Device command executed successfully
	4587521	General error

Related device commands

- Calculate inv. characteristic (📖 73)

4.2.24 Calculate inv. characteristic

If a motor of a third-party manufacturer with unknown motor parameters is driven by the controller, the C00002 = "71: Determine inverter characteristic" device command can be used to determine the so-called "Inverter error characteristic" for optimising the inverter switching performance.

Tip!

Detailed information about the determination of the inverter error characteristic can be found in the chapter "Motor interface" in the subchapter "Optimising the switching performance of the inverter". (📖 138)

From software version V4.0: If the inverter error characteristic cannot be determined by means of this device command, or if the results of the determination are incorrect, the device command "Load Lenze INV characteristic" can be used to load a characteristic typical of the device. (📖 72)

Possible status displays for this device command

Status (C00003)		Meaning
	4687106	Device command in process
	4653056	Device command executed successfully
	4653057	General error
	4692754	The calculation of the inverter characteristic cannot be started since the current controller test mode is active.
	4692755	The calculation of the inverter characteristic cannot be started since the V/f test mode is active.
	4692756	The calculation of the inverter characteristic cannot be started since the pole position identification is active.
	4692757	Calculation of the inverter characteristic has been aborted.
	4692758	Calculation of the inverter characteristic has been interrupted by error.
	4692789	Determined inverter error characteristic exceeds internal limits. • This situation can for instance occur if the motor power is very much lower than the device power. • This error message is only available from software version V5.0 onwards.

Related device commands

- Load Lenze INV characteristic (📖 72)

4.2.25 Determine motor parameters

The C00002 = "72: Determine motor parameters" device command is used to automatically determine the motor parameters for a third-party motor that are listed in the following table – if they are not known:

Parameters	Info	ASM	SM
C00079	Motor magnetising inductance	☑	
C00082	Motor rotor resistance	☑	
C00084	Motor stator resistance	☑	☑
C00085	Motor stator leakage inductance	☑	☑
C00091	Motor cosine phi	☑	
C00092	Motor magnetising current	☑	

Tip!

Detailed information about the automatic determination of the motor parameters can be found in the chapter "Motor interface" in the subchapter "Determining the motor parameters". (📖 141)

Possible status displays for this device command

Status (C00003)		Meaning
	4752642	Device command in process
	4718592	Device command executed successfully
	4718593	General error
	4758290	Motor identification cannot be started since the current controller test mode is active.
	4758291	Motor identification cannot be started since the V/f test mode is active.
	4758292	Motor identification cannot be started because pole position identification is active.
	4758293	Motor identification has been aborted.
	4758294	Motor identification has been aborted by fault.
	4758332	Motor identification aborted due to inconsistent motor parameters. • This error message is only available from software version V7.0 onwards.

4.2.26 Calculate current controller parameters

This function extension is available from software version V5.0 onwards!

The device command C00002 = "77: Calculate current controller parameters" is used to calculate the gain and the reset time of the current controller for a third-party motor.

Precondition: The two motor parameters "stator resistance" (C00084) and "stator leakage inductance" (C00085) either have been parameterised manually on the basis of the manufacturer information before, or have been determined automatically via the device command "Determine motor parameters".

Note!

For a Lenze motor the calculation and the subsequent optimisation of the current controller parameters is not required, as the correct current controller parameters are accepted from »Engineer« motor catalogue.

The device command is no identification procedure for determining the current controller parameters!

- The calculation is carried out according to the following formulas:

$$\text{Gain} = \frac{\text{Stator leakage inductance}}{340\ \mu\text{s}}$$

$$\text{Reset time} = \frac{\text{Stator leakage inductance}}{\text{Stator resistance}}$$

- After the device command has been executed successfully (see status in C00003), the two calculated values are set in C00075 and C00076. They serve as starting values for a subsequent optimisation of the current controller in the test mode.
- In the event of an error, codes C00075 and C00076 are not altered.

Tip!

Detailed information on the optimisation of the current controller in the test mode can be found in the chapter "Motor interface" in the subchapter for the respective motor control:

- Servo control (SC) ▸ Optimise current controller (📖 147)
- Sensorless vector control (SLVC) ▸ Optimise current controller (📖 181)
- V/f control (VFCplus) ▸ Optimise current controller (📖 196)

Possible status displays for this device command

Status (C00003)		Meaning
	5080322	Device command in process
	5046272	Device command executed successfully
	5046273	General error
	5086002	At least one calculated value is outside the valid setting range.
	5086003	Stator resistance (C00084) too small (zero).

Related device commands

- Determine motor parameters (📖 74)
- Calculate speed controller parameters (📖 77)

4.2.27 Calculate speed controller parameters

This function extension is available from software version V5.0 onwards!

The device command C00002 = "78: Calculate speed controller parameters" is used to calculate the gain, reset time, and rate time of the speed controller.

Precondition: The moments of inertia for the motor (C00273/1) and load (C00273/2) have been parameterised correctly before.

Note!

The device command is no identification procedure for determining the speed controller parameters!

- The calculation is carried out according to the following formulas, taking the actual speed value filter time constant into consideration (C00497):

$$\text{Gain} = \frac{\text{Moment of inertia of motor+load}}{4 \cdot (\text{Actual speed value filter time constant} + 500\ \mu\text{s})} \cdot \frac{2\pi}{60}$$

$$\text{Reset time} = 4^2 \cdot (\text{Actual speed value filter time constant} + 500\ \mu\text{s})$$

$$\text{Rate time} = 0\ \text{ms}$$

- After the device command has been executed successfully (see status in C00003), the calculated values are set in the corresponding codes:
  - C00070: Speed controller gain
  - C00071: Speed controller reset time
  - C00072: Speed controller rate time
- In the event of an error, these codes are not altered.

Possible status displays for this device command

Status (C00003)		Meaning
	5145858	Device command in process
	5111808	Device command executed successfully
	5111809	General error
	5151540	At least one calculated value is outside the valid setting range.

Related device commands

▸ Calculate current controller parameters (📖 75)

4.2.28 CAN on board: Reset Node

The C00002 = "91: CAN on board: reset node" device command is used to reinitialise the CANopen system bus interface of the controller ("CAN on board"), which is required, for instance, after the data transfer rate, node address, or identifiers have been changed.

Tip!

For detailed information about the "CAN on board" CANopen system bus interface, please see the "CAN" Communication Manual.

Possible status displays for this device command

Status (C00003)		Meaning
	5997826	Device command in process
	5963776	Device command executed successfully

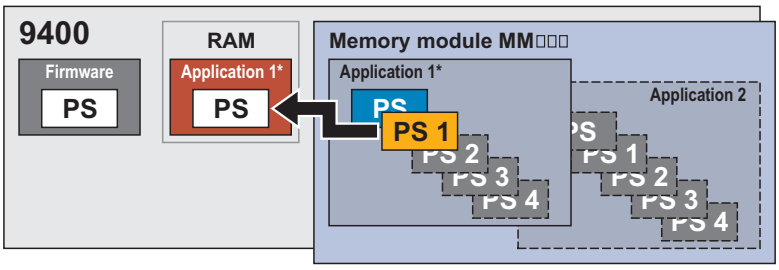
4.2.36 Activate parameter set 1 ... 4

In addition to the start parameters, up to four further parameter sets can be stored in the memory module for each application. Like this you can for instance define different controller settings for an application, which are then simply activated via device command, if required.



The following device commands can be used to activate the parameter set 1 ... 4 for the active application (if available on the memory module):

C00002 = "201: Activate parameter set 1"

C00002 = "202: Activate parameter set 2"

C00002 = "203: Activate parameter set 3"

C00002 = "204: Activate parameter set 4"

* In this example, application 1 is the active application

[4-20] Example: "Activate parameter set 1" function

- Only possible when the application has stopped and the controller is inhibited.
- All parameter changes of the previously active parameter set carried out since the last saving will get lost!
- These device commands only affect the settings of the operating system, application, and module parameters; the active application, or a configuration selected with the function block editor remain unchanged.

Possible status displays for these device commands

Status (C00003)					Meaning
	for command 201	for command 202	for command 203	for command 204

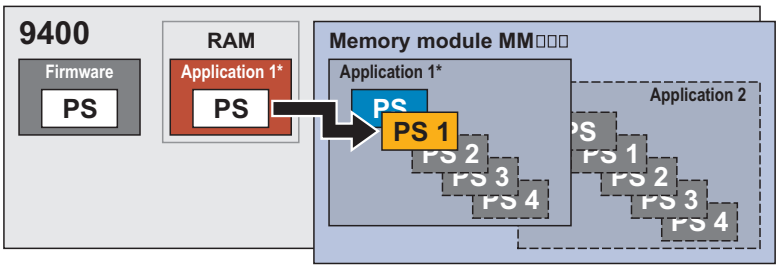
	13213724	13279260	13344796	13410332	No free memory on the memory module

Related device commands

- Activate parameter set 1 ... 4 (📖 88)

4.2.37 Activate parameter set 1 ... 4

In addition to the start parameters, up to four further parameter sets can be stored in the memory module for each application. Like this you can for instance define different controller settings for an application, which are then simply activated via device command, if required.



The following device commands are used to archive the current parameter settings of the controller for the active application in the memory module as parameter set 1 ... 4:

C00002 = "301: Archive parameter set 1"

C00002 = "302: Archive parameter set 2"

C00002 = "303: Archive parameter set 3"

C00002 = "304: Archive parameter set 4"

* In this example, application 1 is the active application

[4-21] Example: "Archive parameter set 1" function

- Previously archived parameter settings will be overwritten with the current parameter settings!

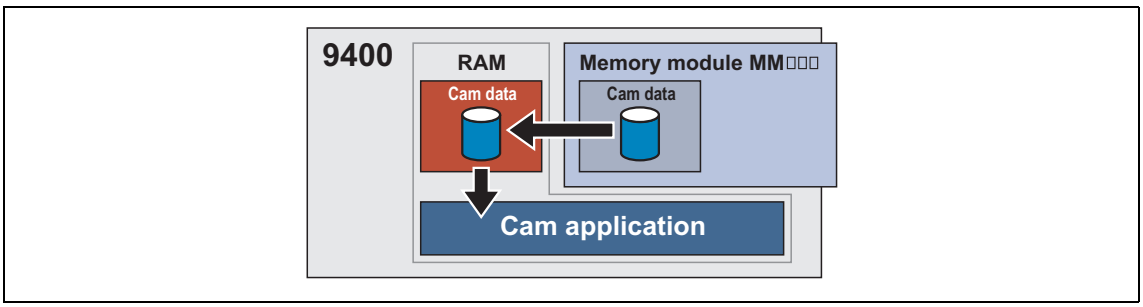
4.2.38 Load cam data



This function extension is available from software version V3.0!

The C00002 = "501: Load cam data" device command serves to reload cam data from the memory module into the controller.

Note!

If you transfer the parameter set or the application from »Engineer« to the controller, the cam data are also transferred automatically to the controller.

- The new/altered cam data are accepted in the controller according to the online change mode set.
- Thus, normally this device command does not need to be executed manually.

[4-22] "Load cam data" function

- Only possible when the application has stopped and the controller is inhibited.
- If the cam data are provided with an access protection, the user password has to be entered in C02900 first.

Tip!

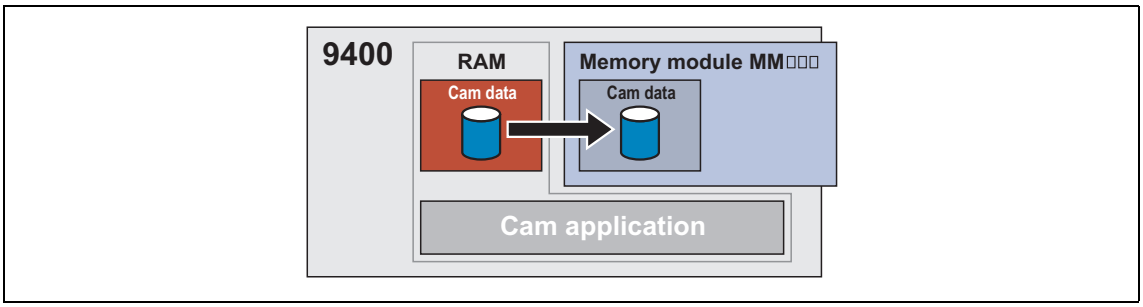
Detailed information on the online change mode and the access protection can be found in the chapter "Basic drive functions", subchapter "Cam data management". (📖 557)

Procedure

1. The cam data are completely loaded from the memory module into the main memory of the controller.
2. The present cam data in the application unit are converted to the internal unit [increments] and are reorganised.
3. The processed cam data are stored in a separate main memory that can be accessed by the cam application.

Possible status displays for this device command

Status (C00003)		Meaning
	32867586	Device command in process
	32833536	Device command executed successfully
	32833537	General error
	32875521	No cam data available on the memory module
	32875523	Loading of the cam data failed
	32875525	Checksum error
	32875542	Wrong password entered
	32875545	The cam functionality is deactivated



Related device commands

- Save cam data (📖 92)
- Calculate cam data (📖 94)
- Calculate cam data checksum (📖 95)

4.2.39 Save cam data

This function extension is available from software version V3.0!

The C00002 = "502: Save cam data" device command serves to save the cam data available in the main memory of the controller with mains failure protection in the memory module.

[4-23] "Save cam data" function

- This function is executed in the background and is also possible when the controller is enabled and the application is running.
  - However, this function is only executed if valid cam data are available.
  - The cam data can also be saved if previously no cam data have been available on the memory module.
- While the function is executed, no online change and no change of the cam data via parameters can be carried out.

For software versions lower than V4.0 the following applies:

- If the cam data are provided with an access protection, the user password has to be entered in C02900 first.

The following applies from software version V4.0:

- For saving the cam data, you do not need to enter a possibly existing user password (C02900).

Tip!

Detailed information on the access protection can be found in the chapter "Basic drive functions", subchapter "Cam data management". (📖 557)

Possible status displays for this device command

Status (C00003)		Meaning
	32933122	Device command in process
	32899072	Device command executed successfully
	32899073	General error
	32941057	No cam data to be saved are available in the RAM of the controller
	32941060	Saving of the cam data failed
	32941078	Wrong password entered
	32941081	The cam functionality is deactivated

Related device commands

- Load cam data (📖 90)
- Calculate cam data (📖 94)
- Calculate cam data checksum (📖 95)

4.2.40 Calculate cam data

This function extension is available from software version V3.0!

The C00002 = "503: Calculate cam data" device command converts the cam data stored in the main memory of the controller to the internal format and makes them available to the application. This, for instance, is necessary if one or more machine parameters affecting the internal scaling of cam data have been changed.

- The status signal *bNewDataAvailable* of the basic drive function "Cam data management" (**LS_CamInterface** system block) is set to TRUE and the cam data are accepted automatically or manually depending on the online change mode set. After successful data acceptance, the status signal *bNewDataAvailable* is automatically reset to FALSE.
- The user password does not have to be entered in C02900.
- While the function is executed, no online change and no change of the cam data via parameters can be carried out.
- This function is executed in the background and can also be activated when the controller is enabled and the application is running.

Tip!

Detailed information on the cam functionality can be found in the chapter "Basic drive functions", subchapter "Cam data management". (📖 557)

Possible status displays for this device command

Status (C00003)		Meaning
	32998658	Device command in process
	32964608	Device command executed successfully
	32964609	General error
	33006617	The cam functionality is deactivated

Related device commands

- Load cam data (📖 90)
- Save cam data (📖 92)
- Calculate cam data checksum (📖 95)

4.2.41 Calculate cam data checksum

This function extension is available from software version V3.0!

The C00002 = "504: Calculate cam data checksum" device command is used to recalculate the checksum of the cam data available in the main memory of the controller. This is required if the cam data in the main memory of the controller have been changed via parameters. Afterwards the cam data can be converted to the internal format using the "503: Calculate cam data" device command, or they can be saved with mains failure protection in the memory module using the "502: Save cam data" device command.

- The user password does not have to be entered in C02900.
- This function is executed in the background and can also be activated when the controller is enabled and the application is running.

Tip!

Detailed information on the cam functionality can be found in the chapter "Basic drive functions", subchapter "Cam data management". (📖 557)

Possible status displays for this device command

Status (C00003)		Meaning
	33064194	Device command in process
	33030144	Device command executed successfully
	33030145	General error
	33072153	The cam functionality is deactivated

Related device commands

- Load cam data (📖 90)
- Save cam data (📖 92)
- Calculate cam data (📖 94)

4.2.42 Format file system

The C00002 = "1030: Format file system" device command is used to format the file system in the memory module.

Note!

By means of this device command all folders and files in the file system of the memory module are irrevocably deleted!

The application has to be downloaded again with »Engineer«.

Possible status displays for this device command

Status (C00003)		Meaning
	67536130	Device command in process
	67502080	Device command executed successfully
	67502081	General error

Related device commands

- Restore file system (📖 97)

4.2.43 Restore file system

The C00002 = "1040: Restore file system" device command is used to execute a low level formatting of the file system in the memory module.

Note!

By means of this device command all folders and files in the file system of the memory module and all pieces of internal information for the management of the file system are irrevocably deleted!

This device command has no status display in C00003, i.e. the display remains unchanged showing the previous device command status.

Stop!

The low level formatting of the file system by the user is only intended for the exceptional case when the standard formatting of the file system via the C00002 = "1030: Format file system" device command is no longer possible, e.g. due to damaged internal management information.

Related device commands

- Format file system (📖 96)

4.2.44 Prepare firmware update

Note!

For Lenze service only!

The C00002 = "10000: Prepare firmware update" device command is used to set the controller to the firmware update mode to update the firmware, if required, using the corresponding software.

- Only possible when the application has stopped and the controller is inhibited.

Possible status displays for this device command

Status (C00003)		Meaning
	655394050	Device command in process
	655360000	Device command executed successfully
	655360001	General error

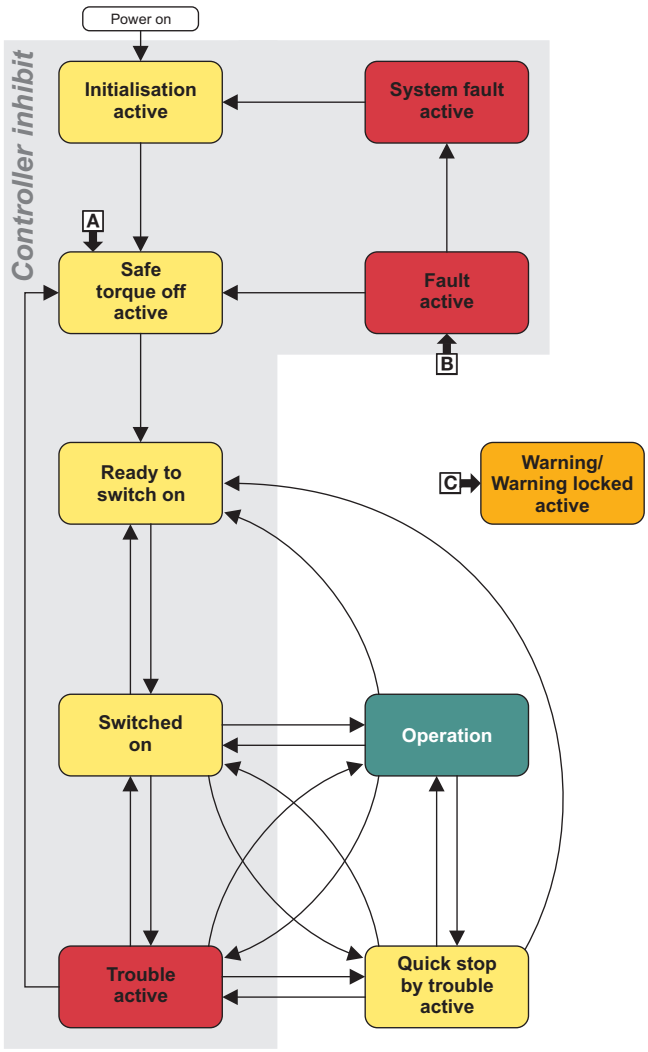
4.2.45 Restart controller

The C00002 = "11000: Restart controller" device command is used to restart the controller via parameter setting.

- Only possible when the application has stopped and the controller is inhibited.

Possible status displays for this device command

Status (C00003)		Meaning
	720930050	Device command in process
	720896001	General error



Note!

Due to the restart at the successful execution of the device command, this status is no longer displayed in C00003.

If this device command is used, the message "Undervoltage in the DC bus (0x007b000f)" may appear in the logbook.

4.3 Device states

The state control of the drive is controlled internally via a state machine which can adopt the following "device states":

A, B	From all states
C	"Warning active" or "Warning locked active" contradicts the definition of a device status. It is a message which is intended to draw attention to a device status for which there is a reason for a warning. "Warning active"/"Warning locked active" can occur simultaneously with other states.

[4-24] Device state machine

Note!

The device states of the controller must not be confused with the function states of the Basic drive functions. (📖 377)

- In the device state "Operation" the Basic drive functions define the motion control of the drive.

Display parameters for diagnostic purposes

- In C00183 the current device state is shown.
- In C00150 (status word 1) the current device state is shown in a bit coded manner via bits 8 ... 11:

Bit 11	Bit 10	Bit 9	Bit 8	Meaning
0	0	0	0	"Initialisation active" state
0	0	0	1	"Device is ready to switch on" state
0	0	1	0	-
0	0	1	1	"Device is switched on" state
0	1	0	0	-
0	1	0	1	-
0	1	1	0	"Operation" state
0	1	1	1	"Trouble active" state
1	0	0	0	-
1	0	0	1	-
1	0	1	0	"Quick stop by trouble active" state
1	0	1	1	"Safe torque off active" state Observe LED on the safety module!
1	1	0	0	"Fault active" state
1	1	0	1	-
1	1	1	0	-
1	1	1	1	-
x	x	x	x	Displayed message "Warning active" or "Warning locked active" The displayed message can occur at the same time as the device states "Device is ready to switch on", "Device is switched on" and "Operation", if a monitoring component responds for which the error response "Warning" has been parameterised.

- C02530 displays the active function state.

LED status display

The control of the two LEDs "DRIVE READY" and "DRIVE ERROR" in the middle of the controller's front panel depends on the device state. ▸ LED status displays for the device state (📖 609)

Influence of the status signals of the SB LS_DriveInterface by the device state

Device status	Status signals (Outputs of the SB LS_DriveInterface)						
	DI_bReady	DI_bFail Active	DI_bImp Active	DI_bCInh Active	DI_bWarning Active	DI_bReady ToSwitchOn	DI_bOperation Enabled
Initialisation active	FALSE	FALSE	**TRUE**	**TRUE**	FALSE	FALSE	FALSE
Safe torque off active	FALSE	FALSE	**TRUE**	**TRUE**	**TRUE**/FALSE	FALSE	FALSE
Device is ready to switch on	FALSE	FALSE	**TRUE**	**TRUE**	**TRUE**/FALSE	**TRUE**	FALSE
Device is switched on	**TRUE**	FALSE	**TRUE**	**TRUE**	**TRUE**/FALSE	FALSE	FALSE
Operation	**TRUE**	FALSE	FALSE	FALSE	**TRUE**/FALSE	FALSE	**TRUE**
Warning active	**TRUE**/FALSE	**TRUE**/FALSE	**TRUE**/FALSE	**TRUE**/FALSE	**TRUE**	**TRUE**/FALSE	**TRUE**/FALSE
Warning locked active	**TRUE**/FALSE	**TRUE**/FALSE	**TRUE**/FALSE	**TRUE**/FALSE	**TRUE**	**TRUE**/FALSE	**TRUE**/FALSE
Quick stop by trouble active	FALSE	**TRUE**	FALSE	FALSE	**TRUE**/FALSE	FALSE	FALSE
Trouble active	FALSE	FALSE	**TRUE**	**TRUE**	**TRUE**/FALSE	FALSE	FALSE
Fault active	FALSE	**TRUE**	**TRUE**	**TRUE**	**TRUE**/FALSE	FALSE	FALSE
System fault active	FALSE	**TRUE**	**TRUE**	**TRUE**	**TRUE**/FALSE	FALSE	FALSE

▸ Internal interfaces | "LS_DriveInterface" system block (📖 113)

4.3.1 "Initialisation active" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
OFF	OFF	10: Initialisation active

This is the status of the controller directly after switching on the supply voltage.

- In this device state the operating system is initialised.
- The monitoring functions are not active yet.
- Communication is not possible yet.
- The controller cannot be parameterised yet and no device commands can be carried out yet.
- When the device initialisation is completed, the device state is automatically changed to "Safe torque off active".

4.3.2 "Safe torque off active" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
	OFF	101: Safe torque off active

This device state becomes active if the controller receives the "Safe torque off" request by the safety module.

- "Drive is torqueless" (0x00750003) is entered in the logbook.
- If no corresponding request by the safety module is available, a change to the subsequent state "Device is ready to switch on" is effected.

Note!

The "Safe torque off active" status is also passed through after an error has been acknowledged (see illustration [4-24]).

4.3.3 "Device is ready to switch on" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
	OFF	"Device is ready to switch on"

This is the device state of the controller directly after the initialisation has been completed and where no DC-bus voltage is applied yet.

- The bus systems are running and the terminals and encoders are evaluated.
- The monitoring functions are active.
- The controller can be parameterised and device commands can be executed to a limited extent.
- The functions of the user task can be used.
  - Precondition: The application has started (status display in C02108).
- The basic drive functions cannot be used yet.

Note!

The "Device is ready to switch on" status is not only activated after mains connection but also after reset of "Trouble", "Fault", or "Safe torque off active".

- In order to change from the "Device is ready to switch on" to the "Device is switched on" status when C00142 = "0: inhibited", at least one of the controller inhibit sources must be active.
- When C00142 = "1: Enabled", the "Device is ready to switch on" status directly changes to the "Device is switched on" status.

Danger!

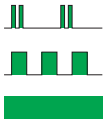
If automatic restart is enabled (C00142 = "1: Enabled"), the drive can restart automatically from the "Trouble" and "Safe torque off" device states when the trouble or request for "Safe torque off active" has been eliminated!

▸ Automatic restart after mains connection/trouble... (📖 107)

4.3.4 "Device is switched on" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
	OFF	90: Drive is switched on

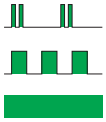
The drive is in this device status if the DC bus voltage is applied and the controller is still inhibited by the user (controller inhibit).



- The bus systems are running and the terminals and encoders are evaluated.
- The monitoring functions are active.
- The controller can be parameterised and device commands can be executed to a limited extent.
- The functions of the user task can be used.
  - Precondition: The application has started (status display in C02108).
- The basic drive functions cannot be used yet.
- If the controller is enabled, the motor builds up a torque.

4.3.5 "Operation" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
	OFF	0: Operation



In this device state the motor follows its setpoint according to the basic drive function selected.

4.3.6 "Warning active"

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
		1: Operation/warning active

This displayed message can occur at the same time as the device states "Device is ready to switch on", "Device is switched on" and "Operation", if a monitoring component responds for which the error response "Warning" has been parameterised.

4.3.7 "Warning locked active"

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
		2: Operation/warning locked active

This displayed message can occur at the same time as the device states "Device is ready to switch on", "Device is switched on" and "Operation", if a monitoring element responds for which the error response "Warning locked" has been parameterised.

Note!

Do not use this error response if a higher-level control unit with the CANopen device profile CiA402 (e.g. 9400 ServoPLC) is used.

4.3.8 "Quick stop by trouble active" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
		151: Quick stop by trouble active

This device state becomes active as soon as a monitoring function responds for which the "Quick stop by trouble" error response has been parameterised.

- The drive is decelerated to standstill with torque within the deceleration time parameterised for quick stop independently of the defined setpoint and can be kept there.
- The device status can only be abandoned by acknowledging the error if the error cause is removed.
- It is also possible to skip to the "Device is switched on" state during the error status by setting controller inhibit, as controller inhibit has a higher priority. As long as the error is still available and has not been acknowledged, a change back to the "Quick stop by trouble active" state is effected when the controller is enabled afterwards.

4.3.9 "Trouble active" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
OFF		104: Trouble active

This device state becomes active as soon as a monitoring function responds for which the "Trouble" error response has been parameterised.

- The motor has no torque (is coasting).
- The device state is automatically exited if the error cause is eliminated:
  - "Trouble active" state < 500 ms: Return to the original device state.
  - "Trouble active" state > 500 ms: Return via the device state "Safe torque off active".

4.3.10 "Fault active" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
OFF		102: Fault active

This device state becomes active as soon as a monitoring function responds for which the "Fault" error response has been parameterised.

4.3.11 "System fault active" state

LED DRIVE READY	LED DRIVE ERROR	Display in C00183
OFF		20: System fault active

This device status becomes active if a system fault occurs.

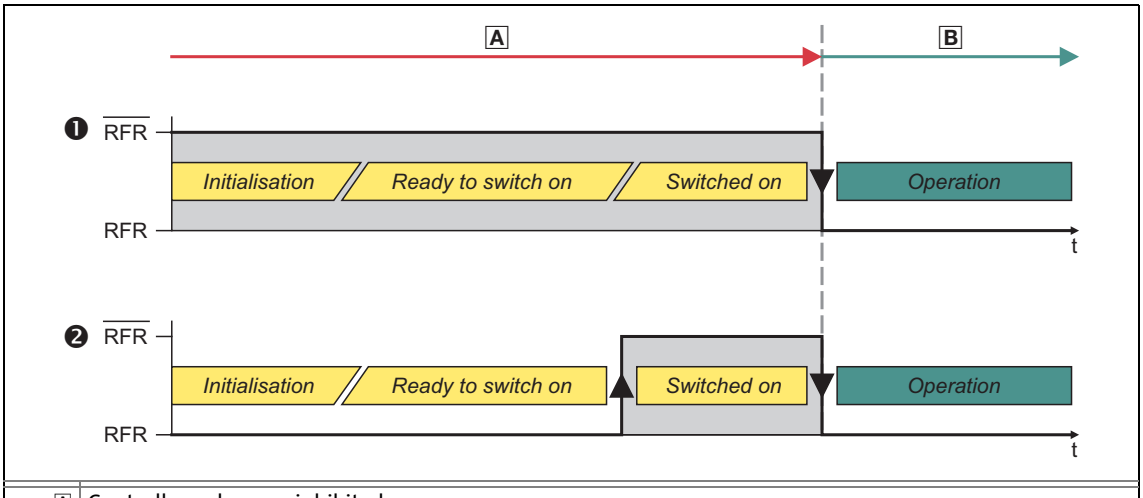
- The device state can only be exited by mains switching.

4.4 Automatic restart after mains connection/trouble...

.../Fault/"Safe torque off active"

In C00142, the starting performance of the controller after mains connection and reset of "Trouble", "Fault", or "Safe torque off active" can be parameterised.

Danger!



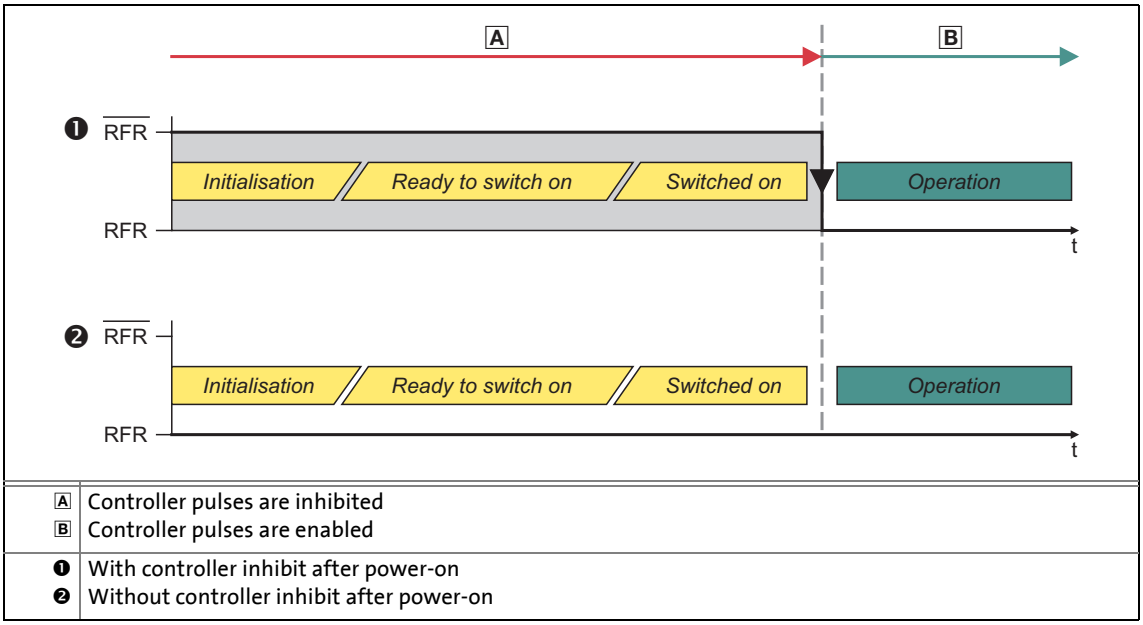
If automatic restart is enabled (C00142 = "1: Enabled"), the drive can restart automatically from the "Trouble" and "Safe torque off" device states when the trouble or request for "Safe torque off active" has been eliminated!

Note!

From software version V4.0 the automatic restart is inhibited in the Lenze setting! Set the selection "1: Enabled" in C00142 to obtain the former behaviour.

Auto-start option 0: Auto restart inhibited after mains connection

Controller inhibit always has to be set if the controller is to change from the "Ready to switch on" state to the "Switched on" state after mains connection or reset of "Trouble", "Fault", or "Safe torque off active". The following change to the "Operation" state is performed when the controller is enabled:



A	Controller pulses are inhibited
B	Controller pulses are enabled
❶	With controller inhibit after power-on
❷	Without controller inhibit after power-on

[4-25] State change when auto-restart is inhibited (C00142 = "0: Inhibited")

Auto-start option 1: Auto restart enabled after mains connection

The following illustration shows the state changes for the auto-start option 1 and their relationship to controller inhibit:

A	Controller pulses are inhibited
B	Controller pulses are enabled
❶	With controller inhibit after power-on
❷	Without controller inhibit after power-on

[4-26] State change when auto-restart is enabled (C00142 = "1: Enabled")

4.5 Behaviour after task overflow

Up to software version V5.0 the following applies:

- After a task overflow in the application or user task the "Error" response is effected.

The following applies from software version V5.0:

- In C02111 the error response after a task overflow in the application or user task can be parameterised. The Lenze setting "Error" corresponds to the previous behaviour of the controller with software versions lower than V5.0.

Tip!

For a hoist for instance the "Quick stop by trouble" error response with engagement of the brake can be set, so that the drive is brought to standstill within the shortest time possible.

From »Engineer« version 2.10 onwards, the function block editor can also be used to configure the behaviour of the analog and digital outputs and that of the brake control and the output ports after a task overflow in order to adapt it to the respective application.
▸ Configure exception handling of the outputs (📖 293)

4.6 Device output power

The parameters described in the following subchapters influence the output power of the controller.

4.6.1 Switching frequency

The controller uses a pulse-width modulation to generate its output voltage. The switching frequency is used to change the control factor of the pulse-width modulation.

Automatic switching frequency reduction

In the Lenze setting, the "variable" switching frequency "8 kHz" has been selected in C00018, which means that the controller automatically reduces the switching frequency depending on the setpoint current.

- Depending on the current amount, it is changed down to an assigned switching frequency.
- The switching thresholds are device-dependent (see 9400 hardware manual, chapter "Rated data").
- If a fixed switching frequency is selected in C00018 instead of a variable one, there is no switching frequency changeover, however, (due to the field frequency range 0...5 Hz) it can only be traversed at a low continuous current and low maximum currents (see 9400 hardware manual, chapter "Rated data").

Note!

If parameterisation is carried out offline or if the memory module is exchanged between different 9400 HighLine device types, always check the setting of the switching frequency in C00018 and adapt it, if required, to prevent a parameter error after the parameter set download or module change!

The maximum output frequency of the controller is limited to 1/8 of the switching frequency selected in C00018! (See the following table.)

Switching frequency (C00018):		1 kHz	2 kHz	4 kHz	8 kHz	16 kHz
Maximum output frequency:		125 Hz	250 Hz	500 Hz	1000 Hz	1999 Hz
Motor - number of pole pairs:		Maximum speed [rpm]				
	1	7500	15000	30000	60000	120000
	2	3750	7500	15000	30000	60000
	3	2500	5000	10000	20000	40000
	4	1875	3750	7500	15000	30000
	5	1500	3000	6000	12000	24000
	6	1250	2500	5000	10000	20000

Tip!

If a load profile and a fixed setting of the switching frequency (e. g. 8 kHz fixed) are given, an I x t disconnection due to a high device utilisation can be avoided by selecting the variable setting for the same switching frequency instead. ▸ Monitoring of the device utilisation

Reduced switching losses through switching frequency reduction

The advantage of a switching frequency reduction are the reduced switching losses in the controller, which are monitored via an I x t evaluation.

- A reduced switching frequency enables a greater current-time area at the output than it would be the case with a higher switching frequency. However, depending on the process, you always have to make a compromise between the torque ripple and the output power.

4.6.2 Monitoring of the device utilisation

In C00064 the device utilisation (I x t) is displayed over the last 180 seconds in [%].

- If the value displayed in C00064 exceeds the warning threshold set in C00123, the error message "device utilisation Ixt > C00123" is output and the fault response set in C00604 occurs (default setting: "Warning").
- If the value displayed in C00064 exceeds 100 %, the error message "device utilisation Ixt > 100 %" is output and the "Fault" error response occurs.
  - The fault can only be reset if the value displayed in C00064 is < 95 % again.

4.6.3 Operation with increased continuous power

This function extension is available from software version V3.0!

If required, operation with an increased continuous power for the switching frequencies 1 kHz and 2 kHz can be activated in C01199 for controllers from the device size 8S, if the following requirements are met:

- Controller is of E94AxxE1454 ... E94AxxE6954 type (device size 8S ... 10).
- The maximum current (C00022) is < 150 % of the rated device current.

Stop!

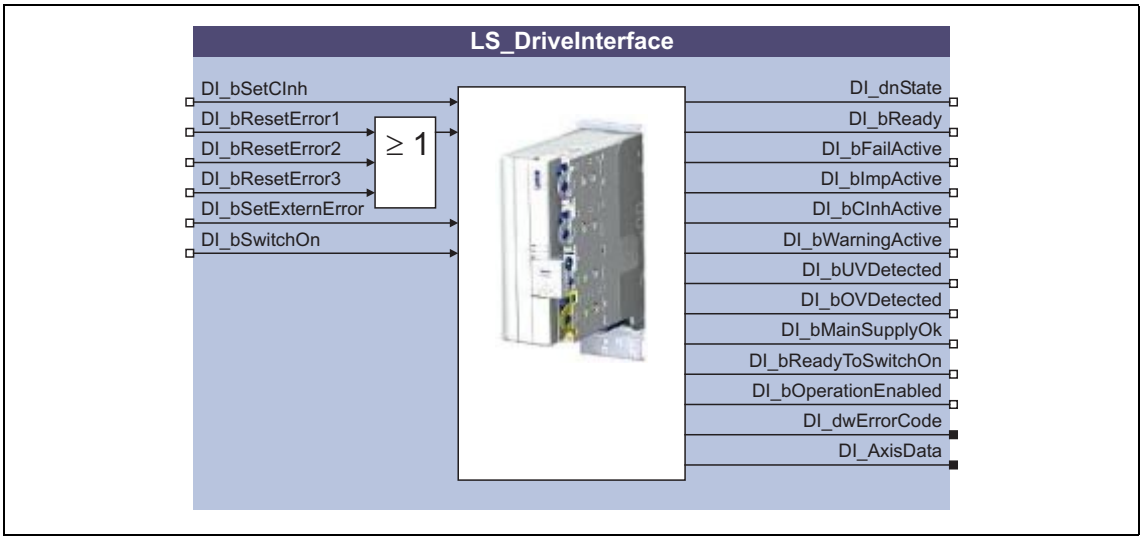
During operation with increased continuous power, the max. permissible ambient temperature is reduced to 40 °C.

The overload current must be reduced. An overload current of 180 % for 10 s is no longer permissible during operation with increased continuous power.

Note!

To activate operation with increased continuous power, controller inhibit must be set in the controller.

The "activated" setting in C01199 is automatically reset to "deactivated" (without error message) if the previously mentioned requirements are not (no longer) met.



- This is also the case if the memory module is plugged into a controller of the small design 8 (device exchange).

Tip!

The permissible output currents and overload factors for operation with increased continuous power for different device types can be found in the Hardware Manual in the "Rated data" chapter.

4.7 Internal interfaces | "LS_DriveInterface" system block

The **LS_DriveInterface** system block provides the internal interfaces to the drive interface in the function block editor.

Inputs

Identifier DIS code | data type	Information/possible settings	
DI_bSetCInh C02549/1 | BOOL	Set/remove controller inhibit • The controller can be inhibited by different sources, e.g. via the digital input RFR or using the device command "Inhibit controller". (📖 63) • The bit code under C00158 shows the source that inhibited the controller.	
	TRUE	Set controller inhibit. • The power output stages in the controller are inhibited and the speed, current, and position controller of the motor control are reset.
	TRUE↘FALSE	Remove controller inhibit. • Please note that the controller will only be enabled if all sources for controller inhibit are reset!
DI_bResetError1 C02548/1 | BOOL DI_bResetError2 C02548/2 | BOOL DI_bResetError3 C02548/3 | BOOL	Reset (acknowledge) error message • This function resets an active error message if the cause of the error message has been eliminated. • The three inputs are linked via a logic OR gate.	
	TRUE	Reset (acknowledge) error message.
DI_bSetExternError C02548/4 | BOOL	Activation of "External error" error message ▸ Monitoring of external events (📖 117)	
	TRUE	Activate error message with the response selected in C00581.
DI_bSwitchOn C02549/4 | BOOL	Deactivate switch-on inhibit • If the automatic restart is inhibited (C00142 = "0"), the state machine remains in the "Device is ready to switch on" state after mains switching. ▸ "Device is ready to switch on" state (📖 103)	
	FALSE↗TRUE	The switch-on inhibit is deactivated and the controller changes to the device state "Device is switched on".

Outputs

Identifier DIS code | data type	Value/meaning	
DI_dnState C02547 | DINT	Status (bit coded)	
	Status signals of the currently enabled basic function (if available):	
	Bit 0	-
	Bit 1	Basic function is active (signal *bActive*).
	Bit 2	Basic function is completed (signal *bDone*).
	Bit 3	Acceleration/deceleration phase is active (signal *bAccDec*).
	Bit 4	-
	Bit 5	CCW rotation is active (signal *bCcw*).
	Bit 6	-
	Bit 7	Reference known.
	Bit 8	Brake is open.
	Bit 9	Waiting for clutch condition.
	Bit 10	Zero crossing detected or position = "0".
	Bit 11	-
	Bit 12	-
	Bit 13	-
	Bit 14	-
	Bit 15	Fault in active basic function (group signal).
	Status signals of the internal state machine for the basic functions:	
	Bit 16	Torque follower active.
	Bit 17	Speed follower active.
	Bit 18	Position follower active.
	Bit 19	Setpoint follower is active (group signal for bit 16 ...18).
	Bit 20	Positioning active.
	Bit 21	Homing active.
	Bit 22	Manual jog active.
	Bit 23	Brake test is active.
	Bit 24	Drive at standstill.
	Bit 25	Drive is stopped.
	Bit 26	Quick stop active.
	Bit 27	-
	Bit 28	Controller is not ready.
	Bit 29	Initialisation
	Bit 30	State "Fault active" (signal *DI_bFailActive*).
	Bit 31	State machine is not ready to receive setpoints. (Group signal for bit 28 ... 30)
DI_bReady C02549/6 | BOOL	Status signal "controller is ready for operation"	
	TRUE	The controller is ready for operation.
DI_bFailActive C02549/7 | BOOL	Status signal "Error active - acknowledgement required"	
	TRUE	Monitoring with the "Fault" or "Quick stop by trouble" error response has responded and the controller is in the device state "Fault active" or "Quick stop by trouble active". For exiting the device state the fault has to be acknowledged, e. g. via the input *DI_bErrorReset1...3*.

Identifier DIS code | data type	Value/meaning	
DI_bImpActive C02549/8 | BOOL	Status signal "Pulse inhibit set"	
	TRUE	The power output stages are switched to high impedance.
DI_bCInhActive C02549/9 | BOOL	Status signal "Controller inhibit active"	
	TRUE	The controller inhibit is active.
DI_bWarningActive C02549/10 | BOOL	Status signal "Warning active"	
	TRUE	There is a warning in the drive controller.
DI_bUVDetected C02549/11 | BOOL	Status signal "Undervoltage detected" • The threshold for this monitoring function depends on the setting under C00173.	
	TRUE	Undervoltage detected in DC bus.
DI_bOVDetected C02549/12 | BOOL	Status signal "Overvoltage detected" • The threshold for this monitoring function depends on the setting under C00173.	
	TRUE	Overvoltage detected in DC bus.
DI_bMainSupplyOk C02549/13 | BOOL	Status signal "Mains voltage is applied"	
	TRUE	A voltage is applied to the mains voltage inputs L1, L2 and L3.
DI_bReadyToSwitchOn C02549/14 | BOOL	Status signal "Controller ready to switch on"	
	TRUE	The controller has completed the initialisation and is in the "Device is ready to switch on" device state.
DI_bOperationEnabled C02549/15 | BOOL	Status signal "Operation is enabled"	
	TRUE	The controller is in the "Operation" device state and the motor follows its setpoint according to the selected basic drive function or is at standstill due to stop or quick stop.
DI_dwErrorCode DWORD	Error number of the current error message ▸ Error messages of the operating system (📖 620)	
DI_AxisData	Data structure, which contains all required machine constants.	

4.7.1 Status signals

The following representation shows which status signals of the drive interface are set to TRUE in different typical cases:

Case 1:
Application has been transmitted to the controller.
No mains voltage available (LU fault).
Controller is inhibited (via RFR terminal).

Case 2:
Mains voltage has been connected.

Case 3:
Controller inhibit has been deactivated.

Case 4:
Error active.

Case 5:
Quick stop by trouble is active

Status	Case 1	Case 2	Case 3	Case 4	Case 5	Status signal (output)
Ready for operation		○	●			*DI_bReady*
Fault active				●	●	*DI_bFailActive*
Pulse inhibit active	●	○		●		*DI_bImpActive*
Controller inhibit active	●	○		●		*DI_bCInhActive*
Warning is active						*DI_bWarningActive*
Undervoltage detected	●					*DI_bUVDetected*
Overvoltage detected						*DI_bOVDetected*
Mains supply is ok		○	●	●	●	*DI_bMainSupplyOk*
Ready to switch on						*DI_bReadyToSwitchOn*
Operation enabled			●			*DI_bOperationEnabled*

4.7.2 Monitoring of external events

Use the input *DI_bSetExternError* of the LS_DriveInterface system block to monitor external events by means of corresponding logic operations and activate the error message "External error" in the controller.

Parameterising a response to an external error

The controller response to the error message "External error" can be selected under C00581.

Activation of "External error" error message

The error message "External error" is activated by setting the input *DI_bSetExternError* to TRUE.

- After this, the error number for the error message "External error" "0x20750000" (when "Fault" has been selected as response) will be stored in the internal fault memory (C00168).

Reset error message

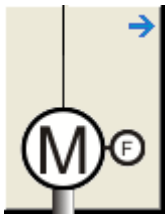
The error message "External error" and other active error messages are reset by setting the input *DI_bResetError* to TRUE.

- If the input *DI_bSetExternError* is still set to TRUE, the reset will not be carried out.
- Error messages can only be reset if the cause of the error has been eliminated.

5 Motor interface

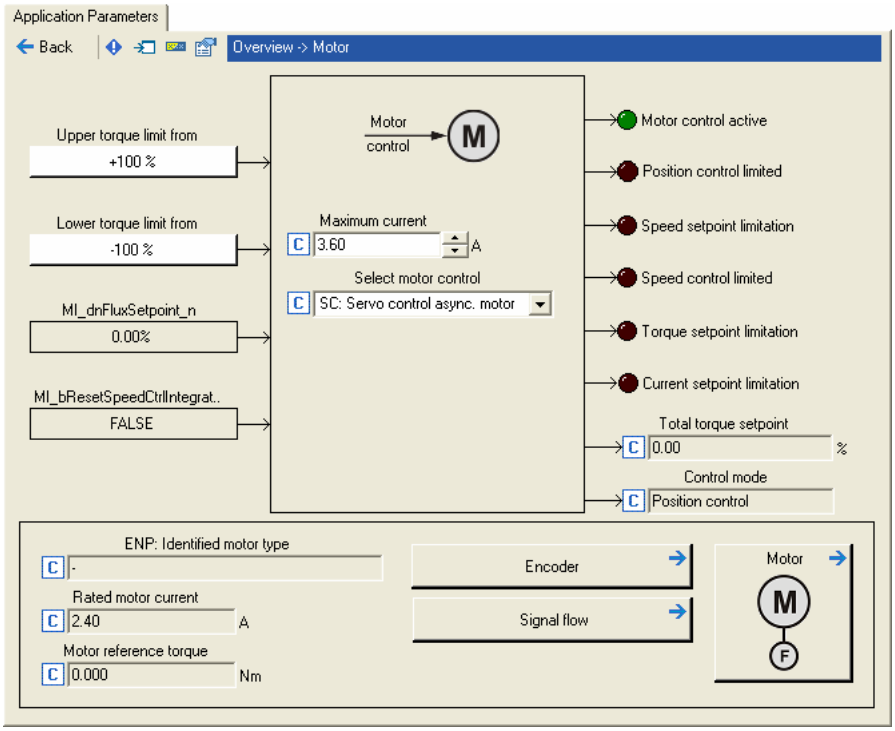
This chapter provides you with information on initial commissioning of the motor and the parameterisation of the internal motor control of the controller.

Note!



The motor interface contains all control functions that are not provided by other basic drive functions.

To select application-specific setpoints, the motor interface can be extended by appropriate interfaces using the basic functions "Speed follower", "Torque follower" and "Position follower".



The application-specific conditioning of the encoder signals is executed with the basic function "Encoder evaluation".

How to get to the dialog for setting the motor interface parameters:

1. Go to the *Project view* of the »Engineer« and select the 9400 HighLine controller.
2. Select the **Application parameters** tab from the *Workspace*.
3. Click the following button of the *Overview* dialog level:

Parameterisation dialog in the »Engineer«

- The white buttons indicate the configuration of the motor interface inputs. ▸ Internal interfaces | "LS_MotorInterface" system block (📖 234)
  - The configuration is predefined by the technology application selected (in this example "Actuating drive – speed"). If required, this configuration can be changed by clicking the corresponding buttons.
- If you click a button marked with the ➔ symbol, you go one level deeper in the corresponding parameterisation dialog.

5.1 General information

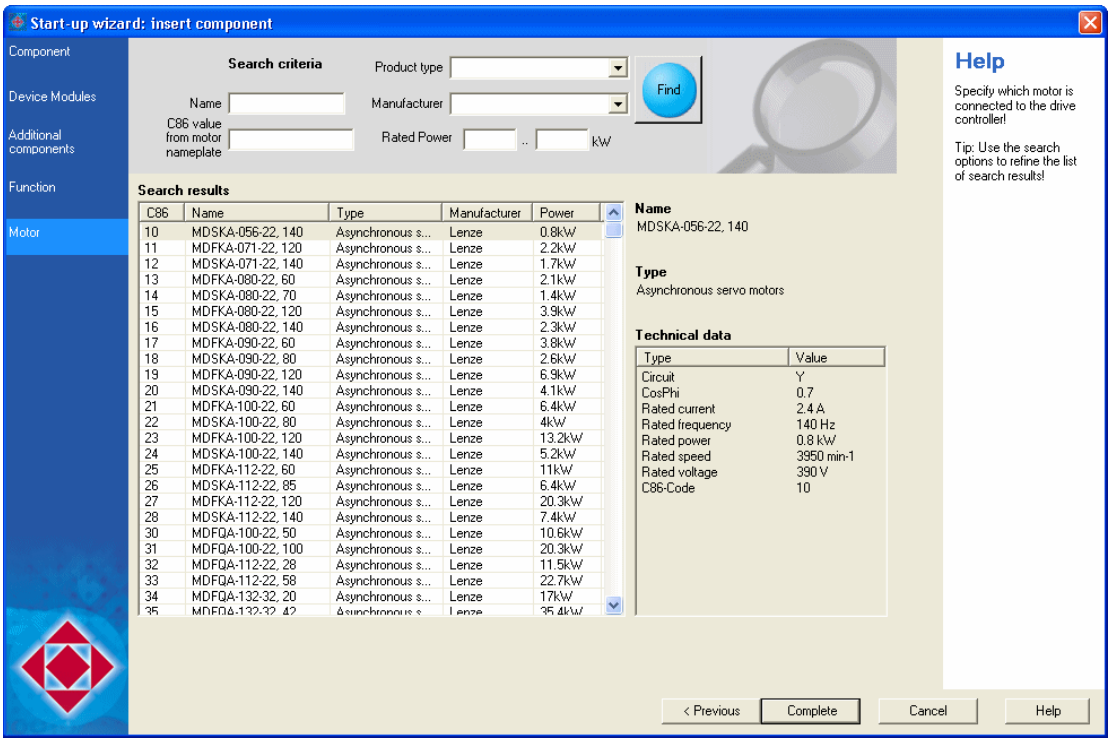
5.1.1 Reading out motor data from the controller

If the Lenze motor connected to the controller has an electronic nameplate (ENP), the motor does not need to be selected in the »Engineer« motor catalogue.

- With the first switch-on of the controller all motor data are automatically read out from the electronic nameplate of the motor and at first are saved temporarily within the controller.
- For a permanent acceptance of the motor data, the parameter set must be saved (C00002 = "11: Save start parameters").
- If there is an online connection between »Engineer« and the controller, the motor data can be accepted from the controller to the »Engineer« project.

How to read out the motor data from the controller:

1. Establish an online connection between »Engineer« and controller.
2. Select the **Application parameters** tab and change to the *Overview* ➞ *Motor* ➞ *Motor* dialog level.
3. Click on the **From Drive** button.
   - Then the motor data are read out of the controller and directly written into the corresponding codes of the »Engineer« project.



Display parameters for electronic nameplate (ENP)

Parameters	Info	Lenze setting	
		Value	Unit
C00186	ENP: Identified motor type	-	
C00187	ENP: Identified serial number	-	
C00188	ENP: Status	-	

5.1.2 Selecting a motor from the motor catalogue in the »Engineer«

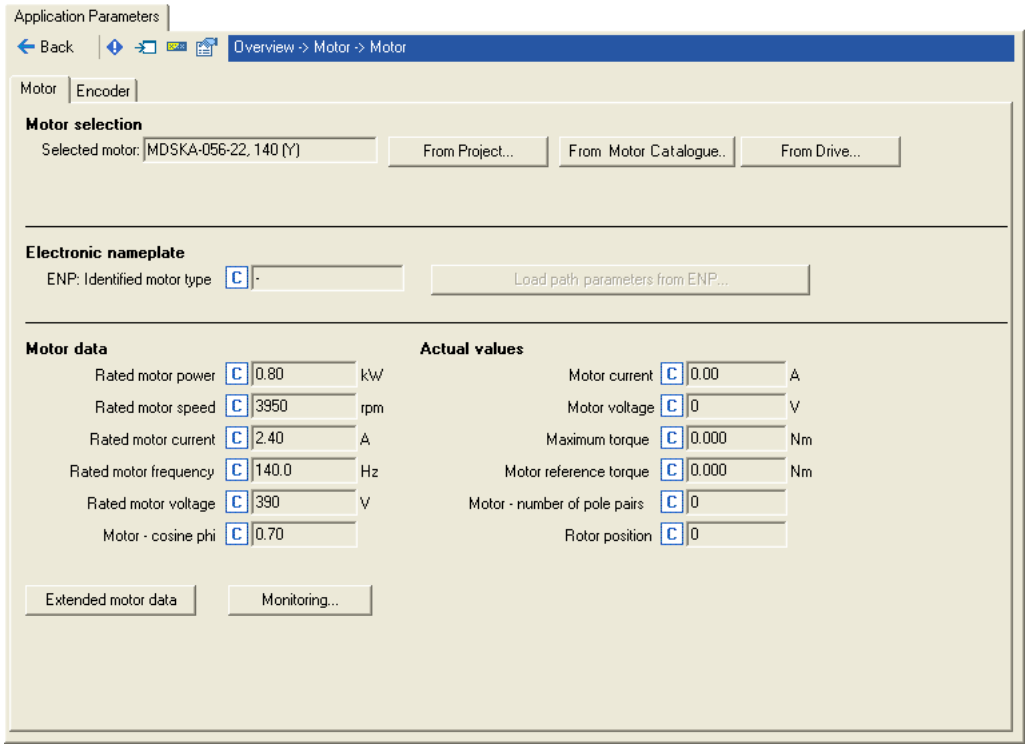
If the Lenze motor does not have an electronic nameplate (ENP) or if a motor of a third-party manufacturer is used, select the motor in »Engineer« via the motor catalogue and transfer the motor data to the controller.

- If a checkmark is set in the **Motor** control field in the "Other components" dialog when the controller is inserted into the project, the motor for the controller can be selected from the motor catalogue in another dialog:

- Alternatively, the motor can be inserted into the project at a later time via the **Insert a component** command.

Tip!

If a third party manufacturer's motor is used, select a Lenze motor from the motor catalogue first which is similar in terms of current, voltage and speed rating. Adapt the preselected motor data exactly to the real motor afterwards.



▸ Displaying/editing motor data in »Engineer« (📖 122)

5.1.3 Displaying/editing motor data in »Engineer«

The term "Motor data" combines all parameters that only depend on the motor. They solely characterise the electrical behaviour of the machine.

- The motor data do not depend on the application in which the controller and motor are used.
- The motor data are, if available in »Engineer« via electronic nameplate or motor catalogue, accepted by the controller without confirmation prompt.

In »Engineer« the motor data are shown on the **Application parameters** tab in the dialog level *Overview→Motor→Motor*:

- If you use a motor of a third-party manufacturer, the displayed motor data can be adapted exactly to the existing motor by clicking the **From Project** button and then selecting the "Own motor settings" entry in the **Motor selection** dialog box.
- Via the **From Motor Catalogue** button, the motor catalogue can be opened to select another motor. ▸ Selecting a motor from the motor catalogue in the »Engineer« (📖 121)
- If an online connection has been established, the motor data set in the controller can be accepted in »Engineer« via the button **From Drive**. ▸ Reading out motor data from the controller (📖 120)

Overview of motor data

Parameters	Info	Lenze setting *	
		Value	Unit
C00052	Motor voltage	-	V
C00054	Motor current	-	A
C00057/1	Maximum torque	-	Nm
C00057/2	Motor reference torque	-	Nm
C00059	Motor - number of pole pairs	-	
C00060	Motor pole angle	-	
C00079	Motor magnetising inductance	-	mH
C00081	Rated motor power		kW
C00082	Motor rotor resistance	-	Ohm
C00083	Motor rotor time constant	-	ms
C00084	Motor stator resistance		Ohm

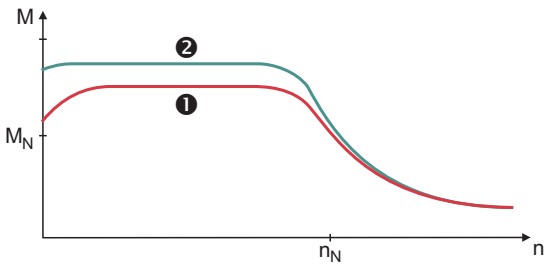
C00087	Rated motor speed		rpm
C00088	Rated motor current		A
C00089	Rated motor frequency		Hz
C00090	Rated motor voltage		V
C00091	Motor cosine phi		
C00092	Motor magnetising current	-	A
C00128/1	Therm. time constant coil		min
C00128/2	Therm. time constant plates		min
C00273/1	Motor moment of inertia		kg cm²
C01190	Motor thermal sensor		
C01191/1	Spec. characteristic: temperature		°C
C01191/2	Spec. characteristic: temperature		°C
C01192/1	Spec. characteristic: resistance		Ohm
C01192/2	Spec. characteristic: resistance		Ohm
Greyed out = display parameter		* depending on the selected motor type	

Note!

If the motor has been selected via the »Engineer« motor catalogue, or if the motor data have been adapted offline in »Engineer«, all motor data have to be transferred to the controller afterwards when an online connection has been established and have to be saved in the memory module with mains failure protection (device command C00002 = "11: Save start parameters").

5.2 Select motor control



In C00006 the motor control is selected; the default is the servo control for synchronous motors.

Function extension from software version V3.0:

From software version V3.0, alternatively to the servo control also the V/f control and the sensorless vector control are provided as control types in C00006:

Open/closed loop control		Detailed information
1	**SC: Servo control for synchronous motor**	▸ Servo control (SC) (📖 145)
2	SC: Servo control for asynchronous motor	
4	SLVC: sensorless vector control	▸ Sensorless vector control (SLVC) (📖 166)
6	VFCplus: V/f control open loop	▸ V/f control (VFCplus) (📖 184)
7	VFCplus: V/f control closed loop	▸ V/f control (VFCplus) (📖 200)

- The V/f control is the classic operating mode for standard applications.
- Compared to the V/f control, improved drive characteristics can be achieved with sensorless vector control by:
  - a higher torque across the entire speed range
  - a higher speed accuracy and a higher concentricity factor
  - Higher efficiency

❶ V/f control
❷Sensorless vector control

[5-1] Comparison of V/f control and sensorless vector control

Note!

Sensorless vector control (SLVC) is only approved for powers up to 55 kW and horizontal applications (no hoists or lifting equipment)!

For the V/f control and sensorless vector control the following table helps with the selection of the correct control type:

	Selection of the motor control in C00006			
	Motor cable shielded ≤ 50 m unshielded ≤ 100 m		**Motor cable** shielded > 50 m unshielded > 100 m	
	recommended	Alternatively	recommended	Alternatively
Single drives				
With motor filter	6 / 7	-	6 / 7	-
With constant load	4	6 / 7	6 / 7	-
With extremely alternating loads	4	6 / 7	6 / 7	-
With high starting duty	4	6 / 7	6 / 7	-
Positioning and infeed drives	4	6 / 7	6 / 7	-
Winders/unwinders dancer	6 / 7	-	6 / 7	-
Pump and fan drives *	6 / 7	-	6 / 7	-
Three-phase reluctance motors	6 / 7	-	6 / 7	-
Three-phase sliding rotor motors	6 / 7	-	6 / 7	-
Three-phase AC motors with firmly assigned voltage/frequency characteristic	6 / 7	-	6 / 7	-
Vertical drive/hoist (up to 55 kW)	6 / 7 (with VCC**)	-	6 / 7 (with VCC**)	-
* For this application, we recommend a square-law voltage characteristic (C00950 = "1") ** VCC = voltage vector control				
Group drives Depending on the resulting motor cable length: $I_{res} = \sqrt{i} \cdot (I_1 + I_2 + ... + I_i)$				
Identical motors and loads	4	6 / 7	6 / 7	-
Different motors and/or alternating loads	6 / 7	-	6 / 7	-

Note!

For operation with motor encoder, we recommend to use the servo control!

For operation with motor filter, always use the V/f control!

5.3 Adjusting motor and controller to each other

This "initial commissioning" of the motor is required if no motor data suitable for the application is available yet in the memory module of the controller and in the »Engineer« project .

- The following step-by-step instructions can be used as a "check list" to correctly adjust the motor and controller to each other.
- Detailed information on the individual steps can be found in the following subchapters.

Worksteps		Motor control*		
		SC	SLVC	VFC plus
1	Accepting/adapting plant parameters. (📖 127)	●	●	●
2.	Parameterising motor encoder. (📖 129) • Only required for the control types with speed feedback (servo control and V/f control).	●		(●)
3	Pole position identification. (📖 131) • Only required: • For servo control with synchronous motor of a third-party manufacturer. • For servo control with synchronous motor and use of incremental encoders (TTL or sin/cos encoders as well as multi-pole pair resolvers). • After changes of the motor feedback system, e.g. encoder exchange.	(●)		
4	Optimising the switching performance of the inverter. (📖 138) • Only required for servo control if the motor parameters are to be defined by a motor from a third-party manufacturer! • Always required for sensorless vector control and open loop V/f control! • An optimum drive performance can only be achieved with the sensorless operating modes if the voltage errors in the inverter are compensated as exactly as possible.	(●)	●	●
5	Determining the motor parameters. (📖 141) • Only required for servo control if the motor parameters are to be defined by a motor from a third-party manufacturer! • Always required for sensorless vector control! • An optimum drive performance can only be achieved with the sensorless vector control if the motor parameters correspond to the real motor as exactly as possible.	(●)	●	

* SC = servo control SLVC = sensorless vector control VFCplus = V/f control

5.3.1 Accepting/adapting plant parameters

The "plant parameters" summarise all parameters which result from the combination of motor and load. These characterise the transfer behaviour of the entire controlled system including the required monitoring modes.

- The plant parameters depend on the application in which the controller and motor are used.
- When a Lenze motor is selected in the »Engineer«, plant parameters are suggested for this motor for a load-free operation.

Overview of plant parameters

Parameters	Info	Lenze setting		Motor control*		
		Value	Unit	SC	SLVC	VFC plus
C00011	Reference speed motor	3000	rpm	●	●	●
C00022	Maximum current	0.00	A	●	●	●
C00070	Speed controller gain	0.500	Nm/rpm	●	●	●[1]
C00071	Speed controller reset time	24.0	ms	●	●	●[1]
C00072	Speed controller rate time	0.00	ms	●		
C00497	Speed act. val. time const.	2.0	ms	●	●	●
C00596	Threshold max. speed reached	6500	rpm	●	●	●

* SC = servo control SLVC = sensorless vector control VFCplus = V/f control open loop [1] Only for V/f control closed loop

Note!

If plant data have been adapted offline in »Engineer«, all plant data have to be transferred to the control afterwards when an online connection has been established and have to be saved in the memory module with mains failure protection (device command C00002 = "11: Save start parameters").

Reference speed motor

In C00011 the reference speed of the motor must be set.

Note!

From the perspective of the application it has to be ensured that a maximum of 100 % of the reference speed set in C00011 is requested as speed setpoint.

When using MCS motors, please observe the following:

The controller with software version V01.xx does not support a field weakening control for synchronous motors, so that for this version the operation of MCS motors at the voltage limit may present an undefined behaviour.

Therefore it should be detected whether the motor used exceeds the voltage limit within the desired operating range up to the maximum current/reference speed. If so, the reference speed must be reduced to a value permissible with regard to voltage.

Maximum current

In C00022 the required maximum current must be set.

- To avoid that the motor starts unintentionally without adjusting the plant data, the maximum current in the Lenze setting is set to "0 A" in C00022.

Ultimate motor current I_{ULT}

C00620 serves to check the set ultimate motor current I_{ULT}.

Note!

When you select a Lenze motor from the catalogue and transfer the plant parameters of the motor to the controller, the setting in C00620 is automatically adjusted to the selected motor.

The ultimate motor current I_{ULT} is a limit value to protect the motor from destruction or influence of the rated data.

- This limit value must not be travelled cyclically in the drive process.
- The maximum current parameterisable in C00022 should have a sufficient distance from this limit value.
- If the instantaneous value of the motor current exceeds the limit value set in C00620 the response set in C00619 is executed for motor protection (Lenze setting: Fault).

Maximum motor speed

Adapt the maximum motor speed in C00596 and select the error response required when this speed limit has been reached in C00607.

5.3.2 Parameterising motor encoder

Note!

Only required for servo control and closed loop V/f control!

Tip!

Detailed information on the encoder evaluation and on the use of a separate position encoder can be found in the following main chapter "Encoder evaluation". (📖 239)

- The motor encoder can be parameterised on the **Application parameters** tab of »Engineer« in the *Overview* → *Motor* → *Encoder* dialog level.
- The following table shows the required settings for different encoder types:

Encoder type: Motor type:	**Resolver** Tamagawa MCS MCA MDxKS MDXMA	**CDD50** MCA	**ITD21** MDFQA LMR	**ITD22** MDFQA LMR	**SEK...** **SEL...**	**SKS...** **SKM...**	**SCS70** **SCM70** MDxKS	**SRS50** **SRM50** MCS MCA	**ECN1313** **EQN1325** MCS MCA	**EQI1329** MCS MCA
C00495 Motor encoder selection	0 Resolver	1 Encoder								
C00080 Number of resolver pole pairs	1	-	-	-	-	-	-	-	-	-
C00422 Encoder type	-	0 Incremental encoder (TTL signal)		1 Sin/cos encoder	2 Absolute value encoder (Hiperface)				3 Absolute value encoder (EnDat)	
C00420 Number of encoder increments	-	2048			16	128	512	1024	2048	32
C00421 Encoder voltage	-	5 V			8 V				5 V	

Danger!

If the encoder/resolver is used as motor encoder:
In case of error, safe operation of the motor is no longer guaranteed!

When servo control is used:

- For the (open circuit) monitoring of the encoder/resolver for reasons of safety always the "Fault" response (Lenze setting) should be set!

When V/f control is used:

- For this type of motor control, the drive basically is to coast down after an encoder failure and may not stop, therefore the "Warning" response is to be set for the (open circuit) monitoring in this case!

Short overview: Parameters for setting the response to (open circuit) monitoring

Parameters	Info	Lenze setting
C00580	Resp. to encoder open circuit	Error
C00586	Resp. to resolver open circuit	Error
C00601	Resp. to encoder comm. error	Error

5.3.3 Pole position identification

Note!

Only required:

- For servo control with synchronous motor of a third-party manufacturer.
- For servo control with synchronous motor and use of incremental encoders (TTL or sin/cos encoders as well as multi-pole pair resolvers).
- After changes of the motor feedback system, e.g. encoder exchange.

For the control of permanent-magnet synchronous machines, the pole position – the angle between the motor phase U and the field axis of the rotor – must be known.

- For Lenze motors with absolute value encoder or resolver, the pole position is already set correctly in C00058/1...3.
- When incremental encoders (TTL or sin/cos encoders) are used, a pole position identification (PPI) is always required after mains switching, even with Lenze motors.
- The controller can also evaluate multi-pole-pair resolvers.
  - When the number of motor pole pairs is an integer multiple of the number of pole pairs of the resolver, a pole position identification must only be executed once.
  - When the number of motor pole pairs is no integer multiple of the number of pole pairs of the resolver, a pole position identification must be executed after every mains switching.
- The device commands "Identify pole position (360°)" and "Identify pole position (min. motion)" serve to determine the pole position for the motor encoder currently activated in C00495 (see the following instructions).

Danger!

The machine must not be braked or blocked during the pole position identification! For this reason, the pole position identification is not permitted for hanging loads!

During the pole position identification the rotor aligns itself. The motor shaft moves by max. one electrical revolution which causes the corresponding movement of the connected mechanical components!

Stop!

Check the correct parameterisation of the max. motor current monitoring (C00619 and C00620) before carrying out the pole position identification to prevent the motor from being permanently damaged.

Note!

As of software version V4.0:

If the pole position identification is aborted, the response parameterised in C00640 is activated (Lenze setting: "Fault").

- Pay attention to this changed behaviour in the Lenze setting when updating the firmware of existing systems!
- If this behaviour is not wanted, deactivate the monitoring by selecting "0: No response" in C00640.

The pole position identification can be adjusted to the respective machine and the prevailing moments of inertia by means of parameters.

- In the Lenze setting of the parameters, the pole position identification remains the same as in software versions < V4.0.

▸ Adjustment of the pole position identification (📖 135)

How to execute the pole position identification:

1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Execute device command C00002 = "51: Identify pole position (360°)" or

   device command C00002 = "52: Identify pole position (min. motion)".

   The procedure starts with controller enable, if
   - a synchronous machine is selected,
   - no other identification is active,
   - no error has occurred, and
   - no test mode is activated.

   If one of the above conditions is not met, the procedure is cancelled and the corresponding device command status is indicated under C00003.

   Note:
   By means of controller inhibit, the procedure started can be cancelled anytime, if required, without carrying out a change in C00058.

   For detailed information about the corresponding procedure, please see the following sections:

Tip!

For controller enable all sources for controller inhibit must be reset. In C00158 the sources for controller inhibit are displayed in a bit-coded manner.

The status of the device command activated under C00002 is indicated under C00003.

Procedure for "pole position identification 360°"

If all conditions are met, the motor is energised with a direct current corresponding to the lower of the following two values:

$\sqrt{2}$ · Rated device current

or

$\sqrt{2}$ · Rated motor current

- The rotor is aligned through the current flow. This is absolutely necessary for the procedure.
- To ensure that the torque-neutral axis is not accidentally energised and the rotor stops, a 45° current vector is (electrically) generated for a short instant and then (electrically) switched back to 0° (≡ phase U).
  - Then a DC current of the above-mentioned value could be measured in this motor phase.

The next steps of the procedure depend on the feedback system used:

- If an absolute value encoder with Hiperface or EnDat protocol is used, the encoder position is set to zero and the procedure is cancelled.
- If a resolver or an optical encoder without absolute track is used, the difference between the preselected current angle and the mechanical rotor angle is determined. After this, the current vector is (electrically) turned by another 22.5° and the difference between current angle and rotor angle is determined once again.
  - The procedure is repeated 16 times. This corresponds to one electrical revolution. The machine rotates by 360° (mech.)/pole pair number.
  - Take the average value of the 16 measurements to compensate for asymmetries.

Procedure for "pole position identification with minimal movement"

If all conditions are met, the motor current is increased step by step to the smaller of the following two values:

25 % · $\sqrt{2}$ · Rated device current

or

25 % · $\sqrt{2}$ · Rated motor current

- By the current flow the rotor aligns itself, which, however, is compensated by a position control.
- If the rotor moves electrically by more than 20°, a fault message is output and the value measured is rejected. This may occur in the case of motors with a noticeable detent torque.
- In order to detect a non-permissible blocking of the machine, a positive and negative test angle (± 20°) relative to the current position are defined after the identification. The machine must align itself to these two test angles within a tolerance of 25 %.

Note!

In this procedure it is not written back into an optical absolute value encoder and all feedback systems are treated the same way.

Unlike in the "pole position identification 360°" procedure where, when an optical absolute value encoder is used, a "0" is entered into the encoder and into C00058/2, for this procedure nothing needs to be entered into the encoder and the identification result is entered into C00058/2.

After successful completion...

...the controller is inhibited automatically and the pole position determined for the activated feedback system is set in the corresponding subcode of C00058.

- For a permanent acceptance of the identified pole position, the parameter set must be saved (C00002 = "11: Save start parameters").
- The next controller inhibit and subsequent controller enable serve to cancel the controller inhibit automatically set by the procedure (e.g. by first executing the device command C00002 = "41: Inhibit controller" and then executing the device command C00002 = "42: Enable controller").

In the event of an error

If an error occurs during the procedure or the pulse inhibit gets active (e.g. due to short-time undervoltage), the procedure is terminated with controller inhibit without making a change in C00058.

If the machine was braked or blocked during the procedure, this will be recognised at the end of the measurement and no change is made in C00058.

As of software version V4.0, the response parameterised in C00640 (Lenze setting: "Fault") is triggered and the error message "Pole position identification cancelled" is entered in the logbook of the controller if the pole position identification process is aborted.

Tip!

From software version V7.0 onwards, the pole position identification is additionally available as a basic function in the form of the LS_PolePositionIdentification system block.

Basic drive functions: ▸ Pole position identification (📖 575)

5.3.3.1 Adjustment of the pole position identification

This function extension is available from software version V4.0!

The two procedures for Pole position identification (PPI) described in the previous sections can be adjusted to the respective machine and the prevailing moments of inertia by means of the parameters described below.

In the Lenze setting of the parameters, the pole position identification remains the same as in software versions < V4.0.

Note!

The two procedures for the pole position identification should give the same results. But, due to e.g. friction, bearing forces and a trapezoidal field pattern, the results may differ. A proportional increase of the current amplitude in C00641 or C00646 can counteract this deviation.

Parameters for the pole position identification 360°

Parameters	Info	Lenze setting	
		Value	Unit
C00641	PLI 360° current amplitude	100	%
C00642	PLI 360° ramp time	100	%
C00643	PLI 360° traversing direction	Clockwise rotating field	
C00644	PolePosId 360° fault tol.	0	°

- The current amplitude can be adjusted proportionally in C00641.
  - For large machines and high mass inertia values or for linear direct drives, the current amplitude usually has to be increased.
  - The Lenze setting "100 %" corresponds to the smaller of the two following values:

$\sqrt{2}$ · Rated device current

or

$\sqrt{2}$ · Rated motor current

Stop!

If there is no temperature monitoring in the motor and/or the I^2xt motor monitoring and the maximum current monitoring are not parameterised correctly, the motor might be damaged permanently when the current amplitude is set too high (e.g. to the maximum value!

▸ Motor monitoring (I^2xt) (📖 218)
▸ Maximum current monitoring (📖 233)

Note!

If the current amplitude is set to 100 % in C00641 >, the device utilisation (Ixt) monitoring and/or one of the motor monitoring functions may respond and cause the abort of the pole position identification.

- The ramp time can be adjusted proportionally in C00642.
  - For large machines and high mass inertia values, the ramp time usually has to be increased.
  - For small machines, a reduction of the ramp time can speed up the pole position identification process.
- In some situations it may be helpful to reverse the travel direction (C00643) for the pole position identification (e.g. for linear motor at the end stop).
- The "pole position identification 360°" procedure comprises a plausibility check. If the rotor position determined via the encoder system does not correspond to the controlled output position:
  - the pole position identification procedure is aborted.
  - the response parameterised in C00640 (Lenze setting: "Fault") is activated.
  - the error message "Pole position identification cancelled" is entered into the logbook of the controller.
- The preset fault tolerance for the plausibility check can be changed via C00644.

Parameters for the pole position identification with minimal movement

Parameters	Info	Lenze setting	
		Value	Unit
C00646	PLI min. motion current amplitude	100	%
C00647	PolePosId min.mov. cur.rise rate	100	%
C00648	PolePosId min.mov. gain Vp	0	
C00649	PolePosId min.mov. reset time Tn	62.5	ms
C00650	PLI min. motion max. perm. motion	20	°

- The current amplitude can be adjusted proportionally in C00646.
  - For large machines and high mass inertia values or for linear direct drives, the current amplitude usually has to be increased.
  - The Lenze setting "100 %" corresponds to the smaller of the two following values:

$$25\ \% \cdot \sqrt{2} \cdot \text{Rated device current}$$

or

$$25\ \% \cdot \sqrt{2} \cdot \text{Rated motor current}$$

Stop!

If there is no temperature monitoring in the motor and/or the I^2xt motor monitoring and the maximum current monitoring are not parameterised correctly, the motor might be damaged permanently when the current amplitude is set too high (e.g. to the maximum value!

- Motor monitoring (I^2xt) (📖 218)
- Maximum current monitoring (📖 233)

Note!

If the current amplitude is set to 400 % in C00646 >, the device utilisation (Ixt) monitoring and/or one of the motor monitoring functions may respond and cause the abort of the pole position identification.

- The rate of the current rise for the pole position identification can be adjusted proportionally in C00647. The Lenze setting "100 %" corresponds to the fixed rise rate setting of the software versions < V4.0.
- The P component of the PI controller for the pole position identification can be adjusted in C00648. With the Lenze setting "0", the PI controller continues to work as an I controller (as in the previous software versions).
- The I component of the PI controller for the pole position identification can be adjusted in C00649. Please observe the following notes:
  - The variable *Position.dnActualMotorPos* can be used to monitor the deviation of the position from the start position with the Oscilloscope function in »Engineer«.
  - In order to be able to compensate a position deviation faster, first the reset time in C00649 should be reduced. If this does not result in the desired behaviour, the proportional gain can be increased in C00648.
  - Ensure that the position control does not get unstable. We therefore recommend to use an I controller.
- The pole position identification comprises a monitoring function for the follow-up control. If a movement greater than the permissible movement set in C00650 is detected by the encoder system:
  - the pole position identification procedure is aborted.
  - the response parameterised in C00640 (Lenze setting: "Fault") is activated.
  - the error message "Pole position identification cancelled" is entered into the logbook of the controller.
- In order to detect a non-permissible blocking of the machine, a positive and negative test angle relative to the current position are defined after the identification. The machine must align itself to these two test angles within a tolerance of 25 %. The size of the test angle corresponds to the max. permissible movement set in C00650.

5.3.4 Optimising the switching performance of the inverter

Note!

Only required for servo control if the motor parameters are to be defined by a motor from a third-party manufacturer!

Always required for sensorless vector control and open loop V/f control!

- An optimum drive performance can only be achieved with the sensorless operating modes if the voltage errors in the inverter are compensated as exactly as possible.

An inverter generates a pulse-width-modulated, three-phase voltage system. Due to the design of the inverter, current-dependent and switching frequency-dependent losses inside of the inverter falsify the voltage that is output. As the voltage that is output is not measured, the losses have to be compensated by a suitable feedforward control. This compensation is based on an inverter error characteristic.

Among other things, the inverter error characteristic depends on the length of the motor cable and at least has to be individually determined once for the connected motor by means of the device command "Calculate inv. characteristic". For an automatic determination of the motor parameters, this ensures that the current has a sinusoidal form.

Danger!

This procedure may only be carried out during commissioning, not during operation!

- During the procedure the motor is energised so that:
  - it cannot be excluded that the connected mechanical components may move!
  - the windings heat up.
    If you repeat the procedure, ensure that the motor is not thermally overloaded (particularly if no temperature feedback is used).

For software versions lower than V4.0 the following applies:

- If the automatic brake operation is used, ensure that no basic function is requested or that the application is stopped before this procedure is called. Otherwise the applied holding brake could be released!
- For positioning applications you have to observe that the absolute position and the home position will get lost when this procedure is called. The loss of the home position is not signalled to the application. The following sequence has to be observed for positioning applications: 1.) Execute identification → 2.) Save parameter set → 3.) Restart controller → 4.) Execute homing procedure.

Note!

For devices of the types 6 + 7 the Ixt monitoring may be activated during the inverter error characteristic is determined.

Remedy: Only start identification at a device utilisation (C00066) of 0 % and/or reduce rated motor current (C00088) and reset it to the original value after the identification.

How to determine the inverter error characteristic:

1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Execute device command C00002 = "71: Calculate inv. error characteristic".
3. The detection of the inverter error characteristic starts with the C00002 = "42: Enable controller" device command (or, alternatively, with the controller enable via terminal RFR).

   Notes:
   - By means of controller inhibit, the started procedure can be cancelled anytime, if required. Characteristic values that have already been determined in this case are rejected. Details on the procedure can be seen from the "Procedure" section below.
   - After successful termination, the detected characteristic is set in the controller. The inverter error characteristic must only be detected again if the controller, motor, or motor cable has changed e.g. due to an exchange.

   The following device commands are used to terminate the successful procedure:
4. Device command C00002 = "11: Save start parameters" for a permanent acceptance of the characteristic.
5. Device command C00002 = "41: Inhibit controller"
6. Device command C00002 = "42: Enable controller"

Tip!

For controller enable all sources for controller inhibit must be reset. In C00158 the sources for controller inhibit are displayed in a bit-coded manner.

The status of the device command activated under C00002 is indicated under C00003.

Procedure

The detection of the inverter characteristic is started if

- no other identification is active,
- no error has occurred, and
- no test mode is activated.

If one of the above conditions is not met, the procedure is cancelled and the corresponding device command status is indicated under C00003.

If all conditions are met, the motor is energised with a maximum direct current corresponding to the lower of the following two values:

$\sqrt{2} \cdot$ Rated device current

or

$\sqrt{2} \cdot 1.8 \cdot$ Rated motor current

Rated motor current, see C00088

- Ideally, the first value should be reached, the second value is to ensure that the load on the machine is not too high during this test.

During the procedure, the motor current rises up to the specified maximum value and falls back to "0" to repeat the cycle with a negative current sign.

- The maximum value is reached four times.
- The switching frequency is set to rated switching frequency and after the procedure, it is reset to the original value.
  - If the switching frequency should be changed later during operation, the characteristic will be adapted to the current switching frequency.

In the event of an error

If an error occurs during the procedure or the pulse inhibit gets active (e.g. due to short-time undervoltage), the procedure is terminated with controller inhibit and the detected characteristic is not considered.

Tip!

From software version V4.0: If it is not possible to determine the so-called "Inverter error characteristic", or if the results of the determination are incorrect, the device command C00002 = "70: Load Lenze inverter characteristic" can be used to load a characteristic typical for the device. ▸ Load Lenze INV characteristic (📖 72)

5.3.5 Determining the motor parameters

Note!

Only required for servo control if the motor parameters are to be defined by a motor from a third-party manufacturer!

Always required for sensorless vector control!

- An optimum drive performance can only be achieved with the sensorless vector control if the motor parameters correspond to the real motor as exactly as possible.

To control an electrical machine, the motor parameters must be known.

- The motor parameters for Lenze motors are known and are already set accordingly by selecting them from the »Engineer« motor catalogue or reading out the ENP.
- The device command "Determine motor parameters" is used to automatically determine the motor parameters for a third-party motor that are listed in the following table – if they are not known:

Parameters	Info	ASM	SM
C00079	Motor magnetising inductance	☑	
C00082	Motor rotor resistance	☑	
C00084	Motor stator resistance	☑	☑
C00085	Motor stator leakage inductance	☑	☑
C00091	Motor cosine phi	☑	
C00092	Motor magnetising current	☑	

Danger!

This procedure may only be carried out during commissioning, not during operation!

- During the procedure the motor is energised so that:
  - it cannot be excluded that the connected mechanical components may move!
  - the windings heat up.
    If you repeat the procedure, ensure that the motor is not thermally overloaded (particularly if no temperature feedback is used).

For software versions lower than V4.0 the following applies:

- If the automatic brake operation is used, ensure that no basic function is requested or that the application is stopped before this procedure is called. Otherwise the applied holding brake could be released!
- For positioning applications you have to observe that the absolute position and the home position will get lost when this procedure is called. The loss of the home position is not signalled to the application. The following sequence has to be observed for positioning applications: 1.) Execute identification → 2.) Save parameter set → 3.) Restart controller → 4.) Execute homing procedure.

Prerequisites

- For the automatic determination of the motor parameters it is required that first the switching performance of the inverter has been optimised successfully, to ensure that the current has a sinusoidal form. ▸ Optimising the switching performance of the inverter (📖 138)

- The motor parameters listed in the following table are excluded from the automatic determination and must therefore be adapted to the motor used (see motor nameplate before the determination.

Parameters	Info
C00081	Rated motor power
C00084	Motor stator resistance (Default setting is used as starting value for the automatic determination.)
C00087	Rated motor speed
C00088	Rated motor current (The current amount for the procedure is derived from this specification)
C00089	Rated motor frequency
C00090	Rated motor voltage

Note!

For devices of the types 9 + 10 (from 132 kW) the automatic determination of the motor parameters may fail and a corresponding status display is output.

Remedy: Parameterise the motor parameters manually by means of the manufacturer's data sheet.

How to determine the motor parameters:

1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Execute device command C00002 = "72: Determine motor parameters".

   The procedure starts with controller enable, if
   - no other identification is active,
   - no error has occurred, and
   - no test mode is activated.

   If one of the above conditions is not met, the procedure is cancelled and the corresponding device command status is indicated under C00003.

   Note:
   By means of controller inhibit, the started procedure can be cancelled anytime, if required, without altering the codes for the motor parameters.

   For detailed information about the procedure, please see the following section "Sequence".

Tip!

For controller enable all sources for controller inhibit must be reset. In C00158 the sources for controller inhibit are displayed in a bit-coded manner.

The status of the device command activated under C00002 is indicated under C00003.

Procedure

If all conditions are met, the impedance of the controlled system is determined for approx. 30 different frequencies. These values are used to determine the electrical machine parameters by means of a mathematical procedure.

- Since the procedure starts with very low frequencies and always considers several complete periods, the whole process takes approx. 3 minutes.
- During the procedure, the motor is energised with a current, the r.m.s. value of which corresponds to the lower of the following two values:

Rated device current or $\frac{1}{2}$ · Rated motor current

After the parameters have been extracted from the impedance, they are checked for consistency with the required rated values. If an inconsistent parameter set is detected, is this an indication of faulty rated values on the nameplate.

Note!

During the procedure, the motor should not rotate.

With synchronous machines, this cannot always be ensured. Although the current flow is produced in the torque-neutral axis, asymmetries in the machine lead to a rotation of the rotor.

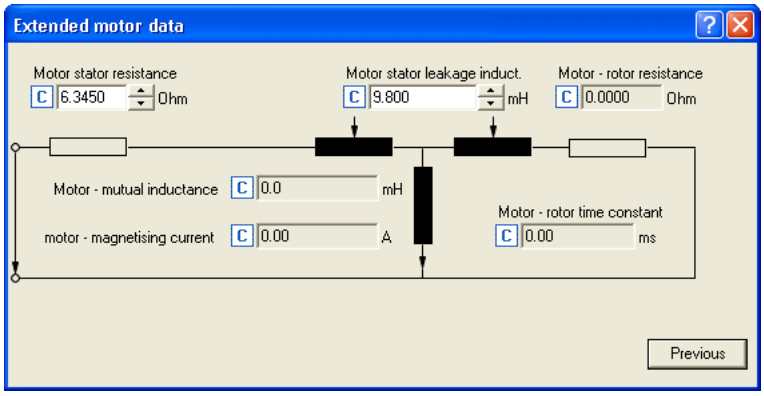
- In such a case, the measurement would be useless and would have to be repeated.
- As a remedy, we recommend to use a holding brake.

With asynchronous machines, slight rotations might possibly occur. Their influence on the measurements is, however, not worth mentioning.

- In case of uncertainties, the measurement should be repeated several times to check if the results for the stator resistance, the leakage inductance of the stator and the rotor resistance differ widely. This should not be the case.
- The mutual inductance and the cos(φ) values are not that important for the diagnostics, because they are strongly non-linear.

After successful completion...

...controller inhibit is set automatically and the motor data determined are set in the corresponding codes.



- For a permanent acceptance of the settings, the parameter set must be saved (C00002 = "11: Save start parameters").
- With the device command C00002 = "42: Enable controller" the controller inhibit set automatically during the procedure can be deactivated again.

In the event of an error

If an error occurs during the procedure or the pulse inhibit gets active (e.g. due to short-time undervoltage), the procedure is terminated with controller inhibit without changing the codes for the motor parameters.

Display and manual adjustment of motor data

In »Engineer« you can have an equivalent circuit diagram with the motor parameters displayed by clicking on the **Further motor data...** button on the **Application parameters** in the dialog level *Overview→Motor→Motor*:

- The representation of the equivalent circuit diagram depends on the motor control selected (C00006).
- The motor stator resistance (C00084) and motor stator leakage inductance (C00085) can be altered directly via the input fields in the equivalent circuit diagram.
- The motor magnetising current (C00092) is displayed as comparison value to the motor current (C00054).
  - The motor magnetising current must especially be observed in case of a no-load operation, both at standstill and with rated speed.
  - The motor magnetising current is directly calculated from the rated motor current (C00088) and the motor power factor (C00091).
- The mutual motor inductance can be indirectly adapted via the parameter Lh adjustment (C02861) in the range of 50 ... 200 %. The mutual motor inductance evaluated in percent is shown in C00079.
- The motor rotor resistance can be indirectly adapted via the parameter Rr adjustment (C02860) in the range of 50 ... 200 %. The motor rotor resistance evaluated in percent is shown in C00082.

5.4 Servo control (SC)

In the Lenze setting the servo control for synchronous motors is selected in C00006.

After the motor and controller are optimally adjusted to each other, no more basic settings are required for servo control.

Tip!

How to optimise the control behaviour and adjust it to the concrete application is described in the chapter "Optimising the control mode". (📖 146)

From software version V2.0 the parameterisable additional function "Field weakening for synchronous machines" is provided for the servo control. (📖 209)

5.4.1 Optimising the control mode

The "optimisation steps" given in the following table serve to further optimise the control behaviour of the servo control and adjust it to the concrete application.

- Detailed information on the individual steps can be found in the following subchapters.

Optimisation steps	
1	Optimise current controller. (📖 147) • The current controller should always be optimised if a motor of a third-party manufacturer with unknown motor data is used!
	Parameterise selected technology application in »Engineer« and load it into the controller. • See description of the corresponding technology application. • During operation (with setpoint selection) further steps can be carried out to optimise the motor control:
2.	Optimising the speed controller. (📖 150) • Via running a typical speed profile and recording the ramp response of the speed controller with the oscilloscope.
3	If the speed controller optimisation did not achieve the intended result:
	Set current setpoint filter (band-stop filter). (📖 153) • In order to suppress or damp (mechanical) resonant frequencies, two current setpoint filters are integrated in the speed control loop of the controller which are switched off in the default setting but can be parameterised accordingly, if required.
	Then readjust the speed controller: Optimising the speed controller. (📖 150)
4	Optimising phase controller. (📖 156) • Via running a typical speed profile and recording the ramp response of the phase controller with the oscilloscope.
5	Optimising response to setpoint changes. (📖 157) • Via running a typical speed profile and recording the inputs and outputs of the speed controller with the oscilloscope.
6	Setting the field weakening for asynchronous machines. (📖 159) • By means of traversing a speed profile $0 \leftrightarrow n_{max}$ and recording the speed, flow, and D-current setpoints/ actual values with the oscilloscope.
7	Save »Engineer« project.

Tip!

To run a typical speed profile for optimising the motor control, you can also use the basic function "manual jog" with suitably adapted manual jog parameters if this basic function is supported by the technology application selected. ▸ Manual jog (📖 400)

5.4.1.1 Optimise current controller

Note!

The current controller should always be optimised if a motor of a third-party manufacturer with unknown motor data is used!

An optimisation of the current controller is useful, as the two controller parameters gain (C00075) and reset time (C00076) depend on the maximum current required and the switching frequency set.

For this purpose, the controller parameters only need to be adapted once at a fixed switching frequency.

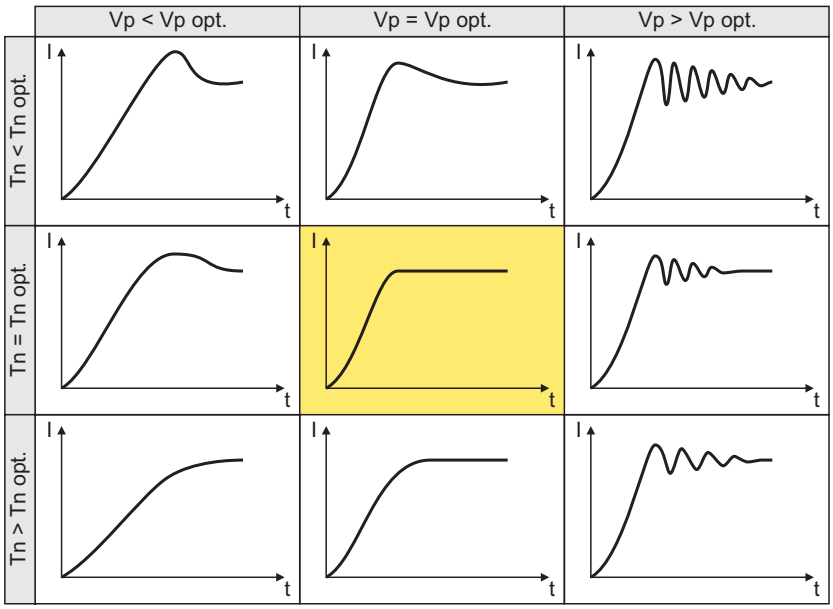
We recommend to select a switching frequency

- as low as possible if the controller is to be operated frequently at the maximum current limit.
- of 8 kHz (up to and including model 7) or 4 kHz (from model 8 onwards) if the maximum current limit will not be reached or will only be reached rarely.

The controller parameters are then automatically adapted to the other switching frequencies.

In a test mode you can select current setpoint step-changes and optimise the setting of both control parameters by evaluating the step responses.

- The starting values for gain and reset time can be calculated with the following formula:



$$\text{Gain} = \frac{\text{Stator leakage inductance}}{340\ \mu\text{s}}$$

$$\text{Reset time} = \frac{\text{Stator leakage inductance}}{\text{Stator resistance}}$$

How to optimise the current controller in the test mode:

1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Set a fixed switching frequency using C00018. Observe the above mentioned recommendations.
3. Activate one of the two following optimisation modes for the current controller:
   - C00398 = "3: Current controller optimisation mode":
     After controller enable, the motor is supplied with current as long as the controller is enabled.
   - From software version V7.0:
     C00398 = "4: Current controller optimisation mode pulse":
     The motor is supplied with voltage for 50 ms after controller enable. Due to this time limit, the load of the machine is reduced. Afterwards, the controller is inhibited automatically.
4. Select the effective value of the current setpoint step change under C00022.
   - The peak value of the measurable motor current will be 1.41 times higher.
5. Enable the controller for a short time and measure the step response of the motor current in the motor phases using the oscilloscope and clamp-on ammeters or record the field-oriented direct-axis current using the Oscilloscope function in »Engineer«. (📖 585)
   - Variable of the motor control to be recorded:
     Current.dnActualDirectCurrent (field-oriented direct-axis current)

6. Evaluate the step response:

7. Change the gain Vp under C00075 and the reset time Tn under C00076.
8. Repeat steps 4 ... 6 until the optimum step response of the motor current is reached.
   - In the optimised state the current rise time typically is 0.5 ... 1 ms.
   - If the adjustment results are not satisfactory, the decoupling network can be additionally activated via the setting C00074 = "1". After this, repeat the steps 2 ... 6.
   - In case of MCS, satisfying results may only be achieved with a current-dependent correction of the current controller parameters based on the saturation behaviour of the motor stator leakage inductance. For this purpose, it is required to use a motor with an electronic nameplate (ENP) or to set the saturation characteristic manually. ▸ Correction of the stator leakage inductance... (📖 204)
9. After the optimisation has been completed, deactivate the test mode again (C00398 = "0: Test mode deactivated").
10. Save parameter set (C00002 = "11: Save start parameters").

5.4.1.2 Optimising the speed controller

The speed controller is designed as PID controller.

Gain setting

The proportional gain Vp is selected under C00070:

1. Select the speed setpoint.
2. Increase C00070 until the drive becomes unstable (observe motor noises).
3. Reduce C00070 until the drive becomes stable again.
4. Reduce C00070 to approx. half the value.

Reset time setting

The reset time Tn is selected under C00071:

1. Reduce C00071 until the drive becomes unstable (observe motor noises).
2. Increase C00071 until the drive is stable again.
3. Increase C00071 to approx. double the value.

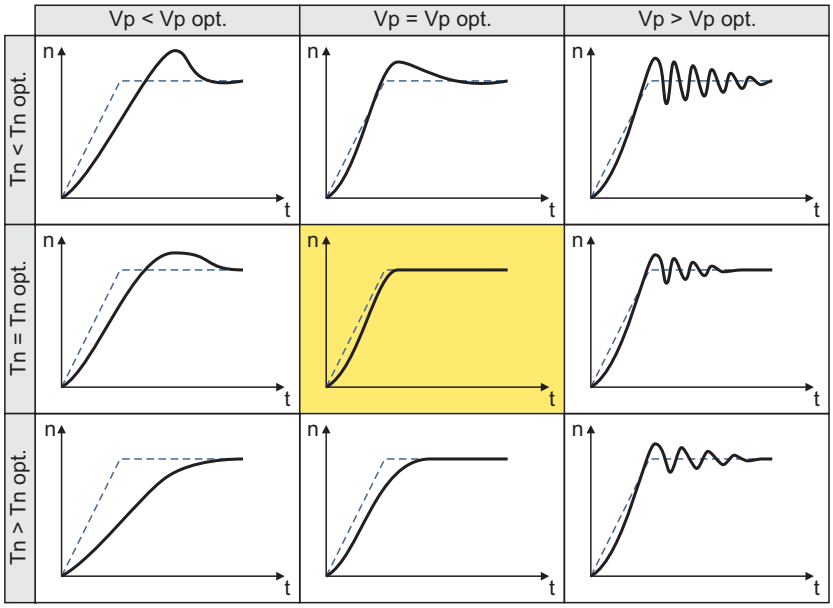
Rate time setting

The rate time Td is selected under C00072:

- Increase C00072 during operation until an optimum control behaviour is reached.

Using the ramp response for setting the speed controller

When operation of the mechanics at the stability limit is not possible, the ramp response can be used to set the speed controller. The proceeding is similar to optimising the current controller.



Stop!

If the controller parameters are preset unfavourably, the control can tend to heavy overshoots up to instability!

- Following and speed errors can adopt very high values.
- If the mechanics are sensitive, the corresponding monitoring functions are to be activated.

How to optimise the speed controller setting by means of the ramp response:

1. Run a typical speed profile and record the ramp response of the speed with the Oscilloscope. (📖 585)
   - Motor control variables to be recorded:
     Speed.dnSpeedSetpoint (speed setpoint)
     Speed.dnActualMotorSpeed (actual speed value)
2. Evaluate the ramp response:

   - Solid line = ramp response (actual speed value)
   - Dash line = speed setpoint
3. Change the gain Vp under C00070 and the reset time Tn under C00071.
4. Repeat steps 1 ... 3 until the optimum ramp response is reached.
5. Save parameter set (C00002 = "11").

Setting of actual speed filter

In order to maximise the dynamics of the speed control loop, the actual speed filter should be operated with a time constant as low as possible (C00497). The lower the time constant the higher the gain of the speed controller. Since actual value filters have the task to dampen measuring errors or interference components, it must be found a compromise between filter task and the resulting delay.

If a Lenze motor is selected from the motor catalogue, a time constant is automatically preset in C00497 which serves to operate the motor even with a faulty detection (e.g. in case of a bad shield connection).

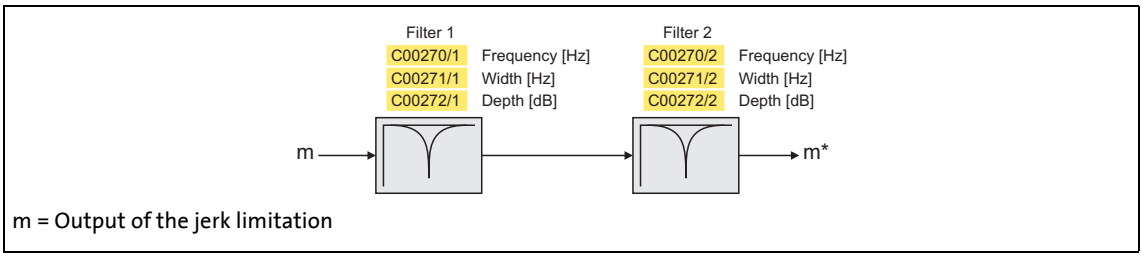
When using EMC-compliant systems or high-quality encoders, you can reduce the preset time constant considerably. For this purpose, the running noise of the motor can be used for setting C00497 at constant speed.

If this is not possible, e.g. due to a too loud environment or because the motor is too far away, the noise of the actual speed value or the setpoint torque value can be used for evaluation by means of the Oscilloscope. Please observe that the speed controller gain Vp (C00070) in is used for the torque setpoint.

Dynamics of the actual value detection

Another element which influences the maximally achievable control dynamics, is the dynamics of the actual value detection itself. In case of optical encoders, the time delay by the actual value detection does not need to be considered. This does not apply to resolvers.

The resolver evaluation of the controller is adapted to the resolver types mounted in Lenze motors and offers a good compromise between the dynamic performance and interference suppression. If the resolver is used as a speed feedback system, the dynamic performance of the resolver evaluation determines, among other things, the maximum speed controller gain by means of which stable operation is possible.



From software version V5.0 onwards, it is possible to increase the dynamics of the resolver evaluation in C00417 in an EMC-compliant system (with low interference) without a quality loss in the speed signal.

▸ Adaptation of the resolver evaluation dynamics (📖 253)

5.4.1.3 Set current setpoint filter (band-stop filter)

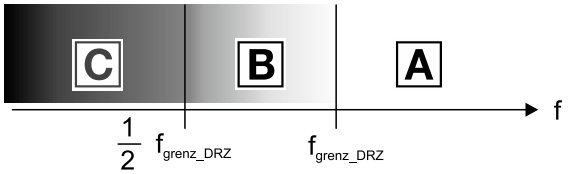
Due to the high dynamic performance or the high limit frequency of the closed current control loop, mechanical natural frequencies can be excited, which can result in resonance and thus cause the speed control loop to become unstable.

In order to suppress or damp these resonant frequencies, two current setpoint filters are integrated in the speed control loop of the controller, which need to be parameterised. In the Lenze setting, these filters are switched off:

[5-2] Optional current setpoint filters (filter cascade) in the speed control loop

Overview of parameters for current setpoint filter

Parameters	Info	Lenze setting	
		Value	Unit
C00270/1	Freq. - current setpoint filter 1	200.0	Hz
C00270/2	Freq. - current setpoint filter 2	400.0	Hz
C00271/1	Width current setp. filter 1	20.0	Hz
C00271/2	Width current setp. filter 2	40.0	Hz
C00272/1	Depth current setp. filter 1	0	dB
C00272/2	Depth current setp. filter 2	0	dB



Use of the current setpoint filters depending on the resonant frequency

Stop!

If the filter parameters are set incorrectly, the impaired closed-loop control can respond with too large overshoots and cause the controller to become unstable, e.g. if the filter width is set to a value more than twice as large as the filter frequency.

After setting the filter parameters, the drive behaviour during stop and quick stop (QSP, Fail-QSP) must be checked. If impairments exist,

- the drive that is still running must either be coasted down by activating the controller inhibit or immediately be brought to a standstill via a brake.
- the speed controller must be optimised again afterwards.
- the test procedure must be repeated.

A Normal and intended use of the current setpoint filter
B Use of the current setpoint filter is only partially suitable
C The current setpoint filter should not be used

[5-3] Use of the current setpoint filter depending on the resonant frequency

- Resonant frequencies ≥ f_{limit_SPEED} = 70 Hz ... 110 Hz

This filter is suitable for use with resonant frequencies in the range around or above the limit frequency of the speed controller.

- Resonant frequencies < f_{limit_SPEED}

Please follow the Lenze recommendation and select suitable speed profiles, S-ramp or S-rounding, for avoiding resonances.

Setting of the current setpoint filter

Since the frequency response of the speed controlled system is only rarely known to such an extent that the current setpoint filters can be adjusted to the controlled system in the run-up, the following example describes an experimental procedure for setting the current setpoint filters:

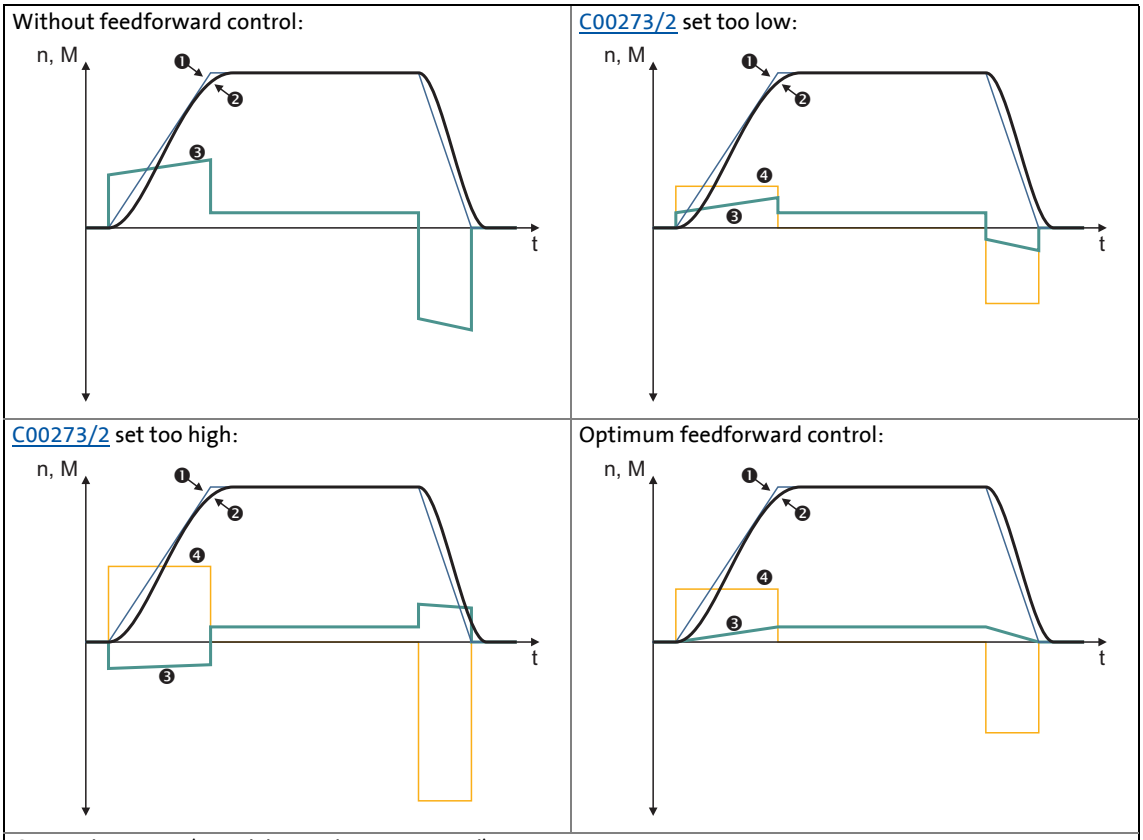
How to set the current setpoint filters:

1. Adjust the current control loop.
2. Go to C00071 and adapt the reset time of the speed controller to the filter time constant of the speed filter (C00497) and the equivalent time constant of the current control loop: C00071 = 16 * (C00497 + 200 µs)

   Note: The setting of C00071 incorporates the equivalent time constant of the current control loop. The indicated 200 µs are typical in a power range of up to 20 kW. Beyond it, higher time constants may occur.
3. Slowly increase the proportional gain in C00070 until the speed control loop starts to become unstable (acoustic determination or measuring of the motor current).
4. Measure the oscillation frequency using an oscilloscope (observe current or speed).
5. Set the measured oscillation frequency in C00270/1 as filter frequency.
6. Set "50%" of the filter frequency in C00271/1 as filter width.
   - Example: filter frequency = 200 Hz → filter width = 100 Hz.
7. Set "40 dB" in C00272/1 as filter depth.
   - If the filter depth is set to "0 dB" (default setting), the filter is not active.
8. Further increase the proportional gain in C00070 until the speed control loop starts to become unstable again.
   - If the oscillation frequency has changed now, readjust the filter frequency by trimming. The use of a second filter is ineffective here.
   - If the oscillation frequency remains the same, readjust the filter depth and/or the filter width by trimming (the first reduces the amplitude, the second lets the phase rotate faster).
   - Repeat step 8 until the desired behaviour or the limit of a sensible speed controller gain has been reached.
9. Save parameter set (C00002 = "11: Save start parameters").

Note!

Readjust the speed controller after setting the current setpoint filter. ▸ Optimising the speed controller. (📖 150)



5.4.1.4 Optimising phase controller

How to optimise the phase controller setting by means of the ramp response:

1. Run a typical speed profile and record the ramp response of the phase controller with the Oscilloscope. (📖 585)
   - Motor control variables to be recorded:
     Speed.dnSpeedSetpoint (speed setpoint)
     Speed.dnActualMotorSpeed (actual speed value)
     Speed.dnOutputPosCtrl (phase controller output)
     Position.dnEncounteringError (following error)
2. Adjust the gain Vp of the phase controller under C00254 and repeat oscilloscope recording until the intended following error behaviour is reached and the motor runs sufficiently smoothly during the constant travel phase.
3. Save parameter set (C00002 = "11: Save start parameters").

5.4.1.5 Optimising response to setpoint changes

Setting the load moment of inertia under C00273/2 does not always provide the optimum torque feedforward control. Depending on the application, an adjustment of the setting under C00273/2 may be necessary to optimise the response to position/speed setpoint changes by means of the torque feedforward control.

[5-4] Typical signal characteristics for different settings of the load moment of inertia

Apart from the load moment of inertia, effects can be compensated with C00273/2, which in the closed speed control loop are identified by the speed controller. These for example include the friction torques.

Below you will find a description of a procedure for optimising the feedforward control behaviour starting from the system's moment of inertia.

How to optimise the torque feedforward control:

1. Run a typical speed profile and record the inputs and outputs of the speed controller with the Oscilloscope. (📖 585)
   - Motor control variables to be recorded:
     Speed.dnSpeedSetpoint (speed setpoint)
     Speed.dnActualMotorSpeed (actual speed value)
     Torque.dnOutputSpeedCtrl (speed controller output)
     Torque.dnTotalTorqueAdd (torque feedforward control)
   - Application variable to be recorded (if available):
     L_LdMonitFollowError1.dnFollowErrorIn_p (following error)

It is essential for optimising the response to setpoint changes to monitor the speed controller output (*Torque.dnOutputSpeedCtrl*) and the torque feedforward control (*Torque.dnTotalTorqueAdd*). The effect of the feedforward control can also be observed in the following error.

2. Select the signal source required for the torque setpoint (feedforward control path) under C00276.
3. Estimate the load moment of inertia and set it under C00273/2 with regard to the motor end (i.e. considering the gearbox factors).
4. Repeat the oscilloscope recording (see step 1).

   Now the oscillogram should show that part of the required torque is generated by the feedforward control (*Torque.dnTotalTorqueAdd*) and the speed controller output signal (*Torque.dnOutputSpeedCtrl*) should be correspondingly smaller. The resulting following error decreases.
5. Change the setting under C00273/2 and repeat the oscilloscope recording until the intended response to setpoint changes is reached.
   - The optimisation could aim at the speed controller being completely relieved (see signal characteristics in Fig. [5-4]).
6. Save parameter set (C00002 = "11: Save start parameters").

5.4.1.6 Setting the field weakening for asynchronous machines

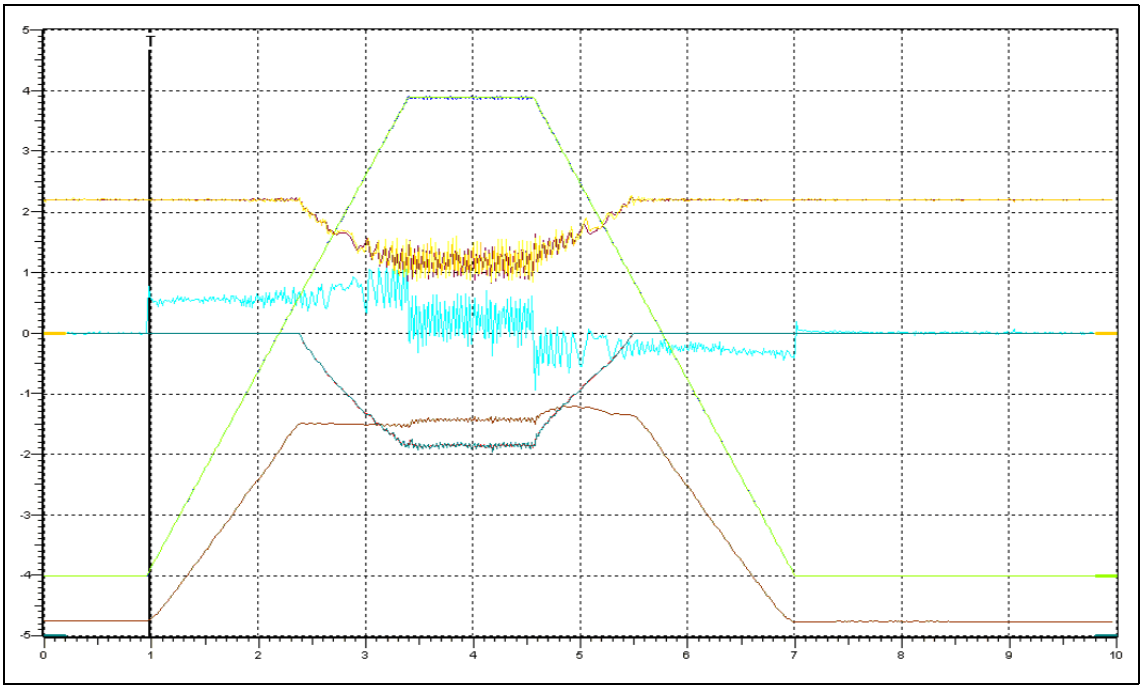
For the following setting instructions it is assumed that the drive has been adjusted in the base speed range (inverter error characteristic, motor parameters, current controller, speed controller, current setpoint filter, angle controller, torque feedforward control) and is running satisfactorily to the rated motor speed.

How to set the field weakening for an asynchronous machine:

1. Set the desired maximum speed (with field weakening) in C00011.
2. Carry out the following basic setting for the controller parameters for third-party motors:
   - Field controller gain (C00077) = 1 / (2 * C00082 * 500 µs)
   - Field controller reset time (C00078) = motor rotor time constant (C00083)
   - Field weakening controller gain (C00577) = 0 [Vs/V]
   - Field weakening controller reset time (C00578)
     = 4 ms / (0.3 ... 1.0 * 60) * C00059 * 2π * C00011 [rpm] * s
     (with factor 0.3 ... 1.0 for motor with rated power of 400 kW ... 0.4 kW)

   Optimising the static behaviour in the field weakening range:
3. By means of speed ramp (acceleration time several seconds), slowly accelerate to the field weakening range up to maximum speed (C00011),and decelerate to speed 0 again and record the signal characteristic using the Oscilloscope (see example oscillogram [5-5]).
   - From the entry into the field weakening range, the flow setpoint (output of the field weakening controller) should decrease with 1/n. Influences of the DC-bus voltage may be seen in the flow setpoint. The signal characteristic should preferably be "smooth".
   - From the entry into the field weakening range, the D-current setpoint (output of the field controller) should always decrease with 1/n. In the signal characteristic no heavy vibrations may occur.

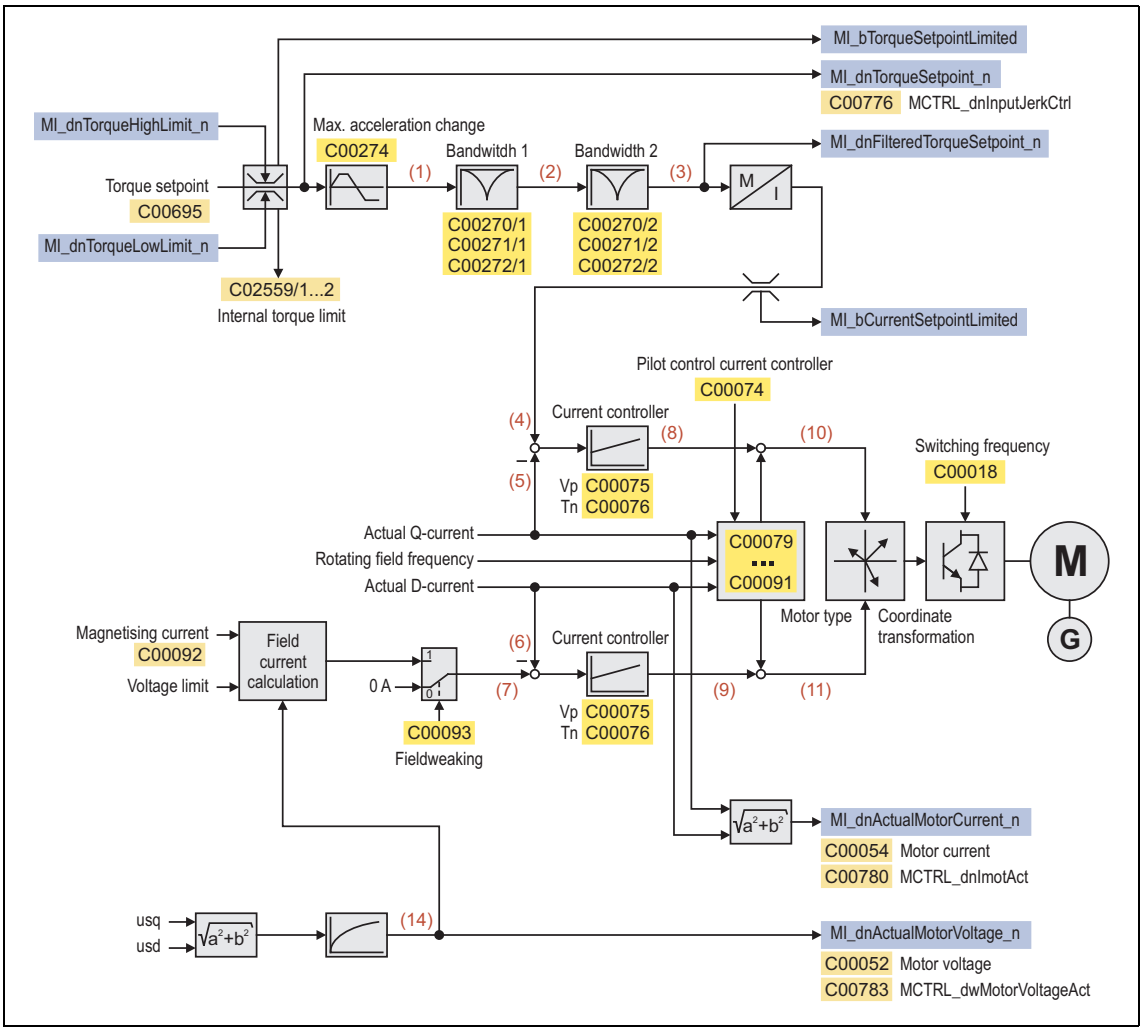
Optimising the dynamic behaviour in the field weakening range:



4. Adapt the dynamic performance to the behaviour required for the machine application.
5. Repeat the recording of the speed characteristic and record the small signal range in the field weakening range ($n_1 \leftrightarrow n_2$).
   - If the flow setpoint is adapted to the speed too slowly, increase the dynamic performance of the field weakening controller: reduce the reset time (C00578) in small steps, the gain (C00577) should remain set to 0 [Vs/V] for most machines.
   - If the flow setpoint in the field weakening range falls "too early" with $1/n^2$ (stability limit of the machine reached), the leakage inductance of the motor (C00085) may be reduced a bit.
   - If the actual flow value follows the flow setpoint too slowly, increase the dynamic performance of the field controller: increase gain (C00077), reduce reset time (C00078).
   - If the actual D-current value does not correspond enough to the D-current setpoint, the dynamic performance of the current controller has to be adapted. ▸ Optimise current controller (📖 147)
   - If the motor speed does not feature the desired characteristic, the speed controller has to be readjusted with maximum speed in the field weakening range. ▸ Optimising the speed controller (📖 150)

Checking the motor parameters:

6. Carry out dynamic measurement in the range $-n_{Max} \leftrightarrow +n_{Max}$ and record the motor speed using the Oscilloscope.
   - The objective is a preferably linear speed characteristic.
   - In particular check the ranges around the rated motor speed and speed 0 and, if required, improve them by adjusting R_R (C02860) or L_H (C02861)!



Example oscillogram

	Ch	Variable of the motor control	Unit	1/Div	Offset	Position
	1	Speed.dnActualMotorSpeed (current speed)	rpm	1k	0	-4
	2	Voltage.dnActualMotorVoltage (current motor voltage)	V	100	0	-5
	3	Torque.dnActualMotorTorque (current motor torque)	Nm	500m	0	0
	4	Speed.dnSpeedSetpoint (speed setpoint)	rpm	1k	0	-4
	5	Common.dnFluxSet (flux setpoint)	%	20	0	-5
	6	Common.dnActualFlux (actual flux value)	%	20	0	-5
	7	Current.dnDirectCurrentSet (D-current setpoint)	A	1	0	0
	8	Current.dnActualDirectCurrent (actual D-current value)	A	1	0	0

5.5 Sensorless vector control (SLVC)

This function extension is available from software version V3.0!

If this motor control mode is set in C00006, a considerably higher torque and a lower current consumption in idle state can be achieved compared to the V/f control mode.

Note!

Observe the following application limits of the sensorless vector control:

- Only approved for power up to 55 kW and horizontal applications (no hoists or lifting equipment)
- For single drives only
- For asynchronous motors only
- Not suitable for operation in generator mode/braking operation (e. g. unwinders)

Tip!

For vertical drives/hoists, use the servo control (with feedback), or the V/f control with activated voltage vector control (VVC), which supports vertical drives/hoists up to 55 kW.

5.5.1 Basic settings

After the motor and controller have been optimally adjusted to each other, the "initial commissioning steps" described in the following table are sufficient for a quick initial commissioning.

- Detailed information on the individual steps can be found in the following subchapters.

Initial commissioning steps	
1	Parameterising speed and torque controller. (📖 168)
2.	Additional "flying restart" function: • In the Lenze setting, this parameterisable additional function is activated. • If the flying restart function is not required, deactivate this function. ▸ Flying restart function (📖 212)  **Only deactivate the flying restart if it is ensured that the drive is always at standstill in the case of controller enable!**
3	Additional "DC-injection braking" function: • In the Lenze setting, this parameterisable additional function is deactivated. • If DC-injection braking is required, activate this function. ▸ DC-injection braking (📖 215)

Tip!

A precise adjustment of the motor parameters for an improved concentricity factor and stability is described in the chapter "Optimising motor parameters". (📖 169)

How to optimise the control behaviour and adjust it to the concrete application is described in the chapter "Optimising the control mode". (📖 175)

Parameterisable additional functions are described correspondingly in the chapter "Parameterisable additional functions". (📖 203)

5.5.1.1 Parameterising speed and torque controller

Short overview: Parameters for controller settings

Parameters	Info	Lenze setting	
		Value	Unit
C00070	Speed controller gain	0.500	Nm/rpm
C00071	Speed controller reset time	24.0	ms
C00987	SLVC: Torque controller gain	0.5000	Hz/A
C00988	SLVC: Torque controller reset time	10.00	ms

Typical controller settings

The following table contains typical guide values concerning the setting of the speed and torque control for different device types/motor powers:

Device type	Motor power	Speed controller		Torque controller	
E94ASx	(4-pole standard ASM)	Gain C00070 [Nm/rpm]	Reset time C00071 [ms]	Gain C00987 [Hz/A]	Reset time C00988 [ms]
E0024	0.37 kW	0.0122	50.00	5.0833	10.00
E0034	0.75 kW	0.0138	50.00	3.0500	10.00
E0044	1.50 kW	0.0264	50.00	1.9818	10.00
E0074	3.00 kW	0.0411	50.00	1.1077	10.00
E0134	5.50 kW	0.0674	50.00	0.5965	10.00
E0174	7.50 kW	0.1183	50.00	0.3303	10.00
E0244	11.00 kW	0.1183	50.00	0.3303	10.00
E0324	15.00 kW	0.2244	50.00	0.2368	10.00
E0474	22.00 kW	0.3442	50.00	0.1547	10.00
E0594	30.00 kW	1.1503	50.00	0.1232	10.00
E0864	45.00 kW	1.7400	50.00	0.0817	10.00
E1044	55.00 kW	2.1712	50.00	0.0661	10.00

[5-8] Typical controller settings

The gain for the field current controller (C00985) and the gain for the cross current controller (C00986) are initially set to "0.00".

5.5.2 Optimising motor parameters

Although the motor parameters have been determined before as described in the chapter "Adjusting motor and controller to each other", an additional optimisation may be required in the following cases using the adjustment processes described in this chapter:

- When the concentricity factor in the lowest speed range is to be improved.
- When the stability in the lower speed range is to be improved.
- When the rated torque is not reached in the rated point, i. e. at rated speed and rated current.
- When a too high magnetising current is injected in idle state.

General information on the motor parameter adjustment

The motor stator resistance can generally always be adjusted with a passive load since the motor is stopped when this parameter is set.

An optimisation of the mutual motor inductance, however, is only sensible when the motor rotates in the medium speed range. In the majority of cases, the no-load operation is sufficient for this adjustment. In contrast to the rated operation, the no-load operation is also possible for initial commissioning in many applications.

The motor rotor resistance can only be adjusted exactly if the current motor speed is available. Thus, for this adjustment only applications are considered where a speed measurement is possible, even with a manual tachometer. If, under operating conditions (e.g. at rated load), the motor consumes more than the rated motor current indicated, an adjustment can also be executed by reducing the mutual motor inductance.

Note!

To execute the adjustment processes described in the following subchapters, the controller must always be enabled!

5.5.2.1 Motor power factor

Together with the rated motor current, the motor power factor (C00091) defines the motor magnetising current (C00092) and thus the current consumption of the controller in idle state.

Note!

The following adjustment of the motor power factor should be executed after the motor parameters have been determined and when the value set in C00091 deviates more than 10 % from the data on the motor nameplate.

If the setting of the motor power factor in C00091 is changed, the setting of the mutual motor inductance also changes in C00079.

For the adjustment of the motor power factor, first the motor current in idle state at rated speed is determined in the control type "V/f control". Afterwards the motor power factor is set in the control type "Sensorless vector control" so that the motor magnetising current corresponds to the previously determined no-load current.

How to adjust the motor power factor:

1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Select the control type VFCplus: V/f control" in C00006.
3. Select setpoint speed 0 rpm
4. Enable controller.
5. Slowly increase setpoint speed to rated speed (no field weakening) and then keep it at rated speed constantly.
6. Take down the motor current displayed in C00054.
7. Slowly reduce the setpoint speed to 0 rpm again.
8. inhibit inverter.
9. Go to C00006 and select the "SLVC: Sensorless vector control" again.
10. Set Lh adjustment in C02861 to 100 %.
11. Set the motor power factor (C00091) so that the following applies:
    motor magnetising current (C00092) ≈ motor current taken down before.
12. Save parameter set (C00002 = "11: Save start parameters").

5.5.2.2 Motor stator resistance

For the adjustment of the motor stator resistance, first the motor current at standstill (without load of the motor) is compared to the motor magnetising current. Afterwards the setting of the motor stator resistance is changed step by step until the motor current stably reaches the motor magnetising current.

How to adjust the motor stator resistance:

1. Select setpoint speed 0 rpm or activate quick stop.
2. Enable controller.
3. Compare the motor current displayed in C00054 with the motor magnetising current displayed in C00092.
4. inhibit inverter.
5. If motor current > motor magnetising current:
   - Reduce the motor stator resistance stepwise in C00084.

   If motor current < motor magnetising current:
   - Increase the motor stator resistance stepwise in C00084.
6. Repeat steps 2 ... 5 until the following applies: Motor current ≈ motor magnetising current.
7. Save parameter set (C00002 = "11: Save start parameters").

5.5.2.3 Motor magnetising inductance

Adjustment at rated operation

This adjustment is executed at rated speed and a defined load (e.g. measuring brake) which serves to define the rated torque. A condition for the adjustment is to know the real load torque. The motor current is compared to the rated current. At rated load, these two values should be almost identical.

If an adjustment at rated operation is not possible, alternatively execute the adjustment at no-load operation (see the following section "Adjustment at no-load operation").

How to adjust the mutual motor inductance at rated operation:

1. Set the maximum current in C00022 to 110 % of the rated motor current (C00088).
2. Select setpoint speed 0 rpm
3. Enable controller.
4. Slowly increase setpoint speed to rated speed (no field weakening) and then keep it at rated speed constantly.
5. Apply rated load to the motor.
6. Compare the motor current displayed in C00054 with the rated motor current displayed in C00088.
7. If motor current > rated motor current:
   - Reduce the mutual motor inductance stepwise and indirectly via the Lh adjustment in C02861 until the following applies: motor current ≈ rated motor current.

   If motor current < rated motor current:
   - Increase the mutual motor inductance stepwise and indirectly via the Lh adjustment in C02861 until the following applies: motor current ≈ rated motor current.
8. Unload the motor again and slowly reduce the setpoint speed to 0 rpm again.
9. inhibit inverter.
10. Save parameter set (C00002 = "11: Save start parameters").

Adjustment at no-load operation

If an adjustment at rated operation is not possible, alternatively execute the adjustment at no-load operation.

For the adjustment of the mutual motor inductance in no-load operation, first the motor current is compared to the motor magnetising current at a setpoint speed of approx. 75 % of the rated speed (without load of the motor). Afterwards the setting of the mutual motor inductance is changed step by step until the motor current just, but stably reaches the motor magnetising current.

How to adjust the mutual motor inductance at no-load operation:

1. Select setpoint speed 0 rpm
2. Enable controller.
3. Slowly increase the setpoint speed to approx. 75 % of the rated speed and keep this value constant.
   - If the controller oscillates, check the speed controller.
4. Compare the motor current displayed in C00054 with the motor magnetising current displayed in C00092.
5. If motor current > motor magnetising current:
   - Reduce the mutual motor inductance stepwise and indirectly via the Lh adjustment in C02861 (based on 100 %) until the following applies:
     motor current < motor magnetising current

   If motor current << motor magnetising current:
   - Increase the mutual motor inductance stepwise and indirectly via the Lh adjustment in C02861 (based on 100 %) until the following just applies:
     motor current < motor magnetising current
6. Slowly reduce the setpoint speed to 0 rpm again.
7. inhibit inverter.
8. Save parameter set (C00002 = "11: Save start parameters").

5.5.2.4 Motor rotor resistance

This adjustment is carried out at a setpoint speed of approx. 75 % of the rated speed and with a defined load (e. g. measuring brake). The precondition for the adjustment is that the actual speed is known (e. g. by the use of a manual tachometer). At constant setpoint speed first the actual speed is measured while the machine is unloaded. Afterwards the motor is loaded at the same setpoint speed until the rated torque is reached (rated current). The speed measured should preferably correspond in idle state and at rated speed.

How to adjust the motor rotor resistance:

1. Select setpoint speed 0 rpm
2. Enable controller.
3. Slowly increase the setpoint speed to approx. 75 % of the rated speed and keep this value constant.
4. Measure actual speed n_{Idle} (e.g. using a manual tachometer) and take it down.
5. Increase load of the motor until the motor current displayed in C00054 corresponds to the rated current.
6. Measure actual speed n_{Load}.
7. If $n_{Load} < n_{Idle}$:
   - Reduce motor rotor resistance stepwise and indirectly via the Rr adjustment in C02860 until the following applies: $n_{Load} \approx n_{Idle}$.

   If $n_{Load} > n_{Idle}$:
   - Increase motor rotor resistance stepwise and indirectly via the Rr adjustment in C02860 until the following applies: $n_{Load} \approx n_{Idle}$.
8. Unload the motor again and slowly reduce the setpoint speed to 0 rpm again.
9. inhibit inverter.
10. Save parameter set (C00002 = "11: Save start parameters").

5.5.3 Optimising the control mode

A manual optimisation of the controller settings may be required for very dynamic applications and in the field weakening range.

Note!

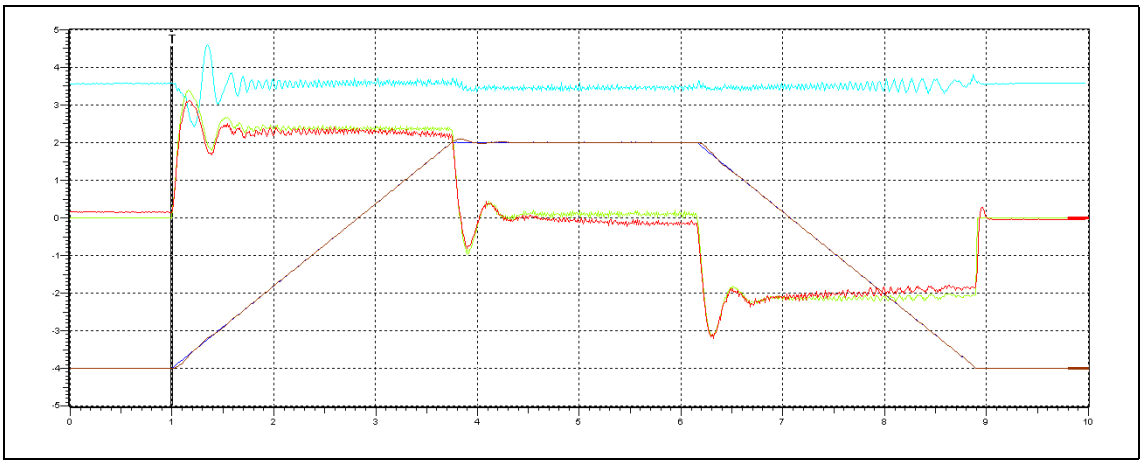
The processes for optimising the controller settings described in the following subchapters can only be executed while the drive is rotating and never when being at standstill!

For all optimisation processes the magnetisation phase has to be completed!

Based on the typical controller settings which are listed in the chapter "Parameterising speed and torque controller" in table [5-8], first the field feedforward control and the speed controller are optimised in the base speed range. Afterwards, the torque controller is optimised in the field weakening range.

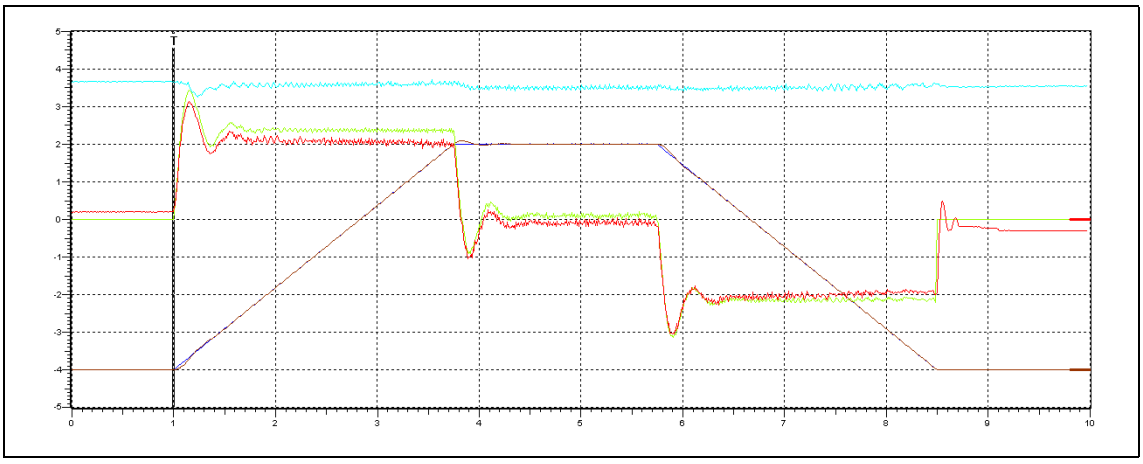
For optimisation, a suitable speed ramp must be selected for the drive and the acceleration must be recorded, e.g. using the Oscilloscope function in »Engineer«. (📖 585)

Short overview: Parameters for controller settings



Parameters	Info	Lenze setting	
		Value	Unit
C00070	Speed controller gain	0.500	Nm/rpm
C00071	Speed controller reset time	24.0	ms
C00985	SLVC: Field controller gain	0.00	
C00986	SLVC: Cross current controller gain	0.00	
C00987	SLVC: Torque controller gain	0.5000	Hz/A
C00988	SLVC: Torque controller reset time	10.00	ms

5.5.3.1 Optimising field feedforward control



To optimise the field feedforward control, the drive must be accelerated in the base speed range with slow setpoint ramps (e.g. acceleration time = 5 s) to speed values below the rated speed and then decelerated again.

- If the field current oscillates at the beginning of the acceleration and at the end of the deceleration (Current.dnActualDirectCurrent), these oscillations can be reduced by increasing the gain for the field current controller in C00985.

	Ch	Variable of the motor control	Unit	1/Div	Offset	Position
	1	Speed.dnSpeedSetpoint (speed setpoint)	rpm	0.2k	0	-4
	2	Speed.dnActualMotorSpeed (current speed)	rpm	0.2k	0	-4
	3	Current.dnActualDirectCurrent (actual field current)	A	10	0	0
	4	Current.dnQuadratureCurrentSet (cross current setpoint)	A	10	0	0
	5	Current.dnActualQuadratureCurrent (actual cross current)	A	10	0	0

[5-9] Oscillogram 1: speed ramp (motor 55 kw) – field controller gain = 0.00

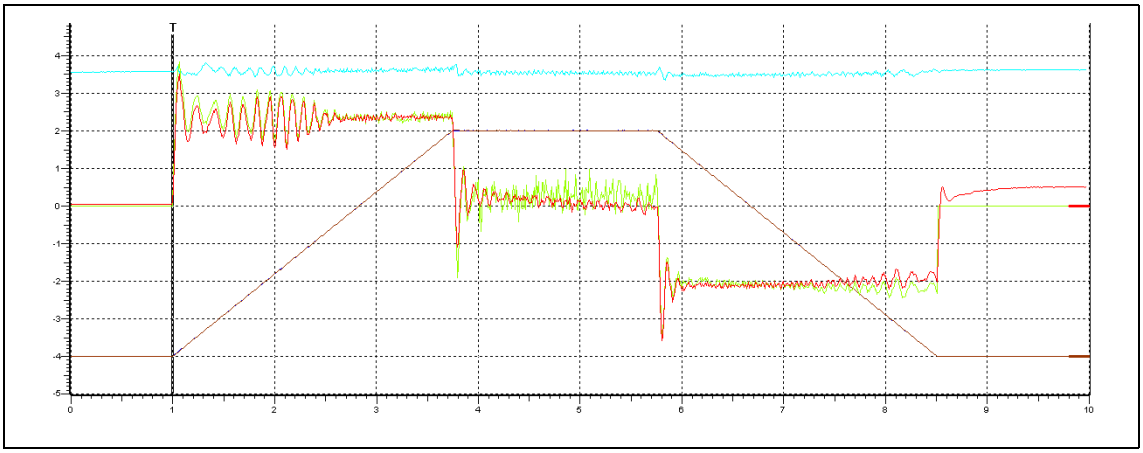
[5-10] Oscillogram 2: speed ramp (motor 55 kw) – field controller gain = 2.00

5.5.3.2 Optimising the speed controller

To optimise the speed controller, the drive must be accelerated in the base speed range with slow setpoint ramps (e.g. acceleration time = 5 s) to speed values below the rated speed and then decelerated again.

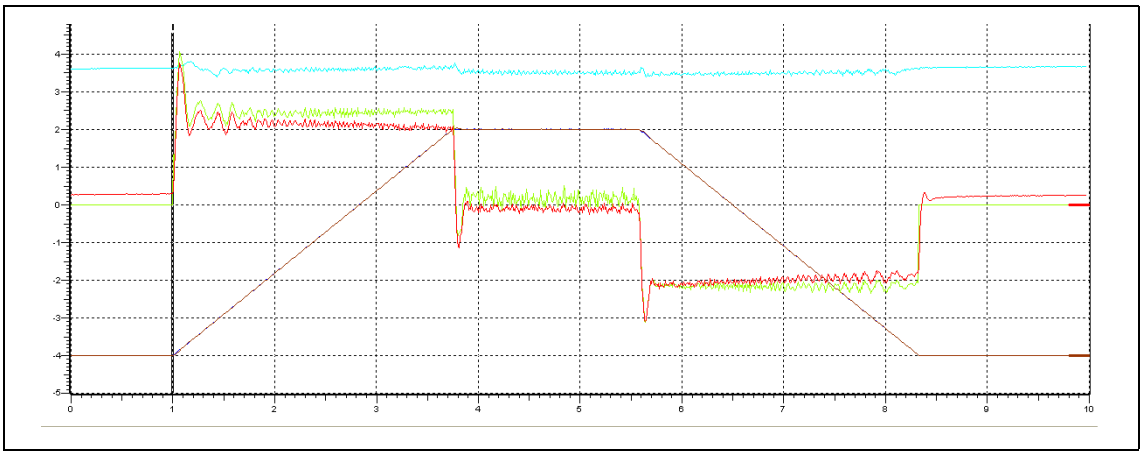
Gain optimisation

The proportional gain Vp is selected under C00070:



1. Increase C00070 until the drive oscillates slightly (see picture [5-11]).
2. Reduce C00070 until the drive runs stable again (see picture [5-12]).
3. Reduce C00070 to approx. half the value.

Optimise the reset time



The reset time Tn is selected under C00071:

1. Reduce C00071 until the drive oscillates slightly.
2. Increase C00071 until the drive is stable again.
3. Increase C00071 to approx. double the value.

	Ch	Variable of the motor control	Unit	1/Div	Offset	Position
	1	Speed.dnSpeedSetpoint (speed setpoint)	rpm	0.2k	0	-4
	2	Speed.dnActualMotorSpeed (current speed)	rpm	0.2k	0	-4
	3	Current.dnActualDirectCurrent (actual field current)	A	10	0	0
	4	Current.dnQuadratureCurrentSet (cross current setpoint)	A	10	0	0
	5	Current.dnActualQuadratureCurrent (actual cross current)	A	10	0	0

[5-11] Oscillogram 1: speed ramp (motor 55 kw) – speed controller gain = 15.49

[5-12] Oscillogram 2: speed ramp (motor 55 kw) – speed controller gain = 7.49

Setting of actual speed filter

In order to maximise the dynamics of the speed control loop, the actual speed filter should be operated with a time constant as low as possible (C00497). The lower the time constant the higher the gain of the speed controller. Since actual value filters have the task to dampen measuring errors or interference components, it must be found a compromise between filter task and the resulting delay.

If a Lenze motor is selected from the motor catalogue, a time constant is automatically preset in C00497 which serves to operate the motor even with a faulty detection (e.g. in case of a bad shield connection).

When using EMC-compliant systems or high-quality encoders, you can reduce the preset time constant considerably. For this purpose, the running noise of the motor can be used for setting C00497 at constant speed.

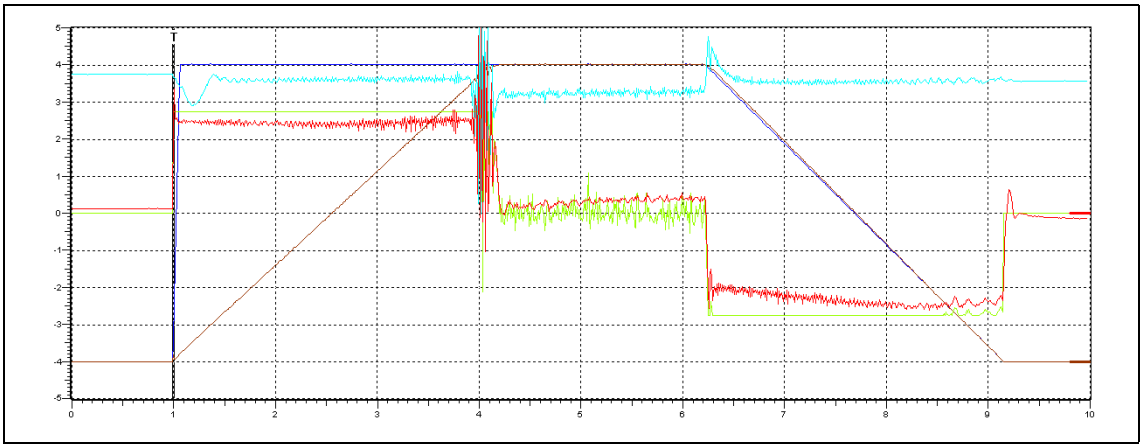
If this is not possible, e.g. due to a too loud environment or because the motor is too far away, the noise of the actual speed value or the setpoint torque value can be used for evaluation by means of the Oscilloscope. Please observe that the speed controller gain Vp (C00070) in is used for the torque setpoint.

5.5.3.3 Optimising torque controller

To optimise the torque controller a steep speed ramp is required which reaches into the field weakening range (e.g. 1.2 * rated speed). For this purpose, the drive must be operated at its current and voltage limit.

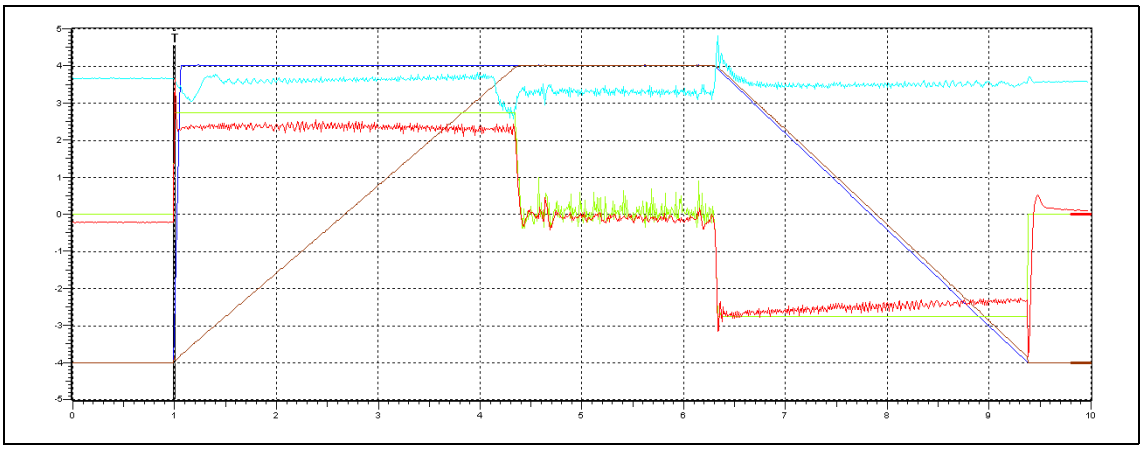
Stop!

Reduce the maximum current in C00022 for this adjustment to approx. 130 % of the motor magnetising current (C00092) to prevent shocks on the drive!



Note!

If no field weakening operation is required, the adjustment must be executed in the base speed range.



The gain (C00987) and reset time (C00988) of the torque controller are to be set so that the actual cross current can preferably follow the cross current setpoint.

- If oscillations occur during the cross current (see illustration [5-13]), the gain (C00987) is to be reduced until the drive is stable again (see illustration [5-14]).
- Afterwards the reset time (C00988) can be reduced as long as the drive accelerates in a stable way.

	Ch	Variable of the motor control	Unit	1/Div	Offset	Position
	1	Speed.dnSpeedSetpoint (speed setpoint)	rpm	0.2k	0	-4
	2	Speed.dnActualMotorSpeed (current speed)	rpm	0.2k	0	-4
	3	Current.dnActualDirectCurrent (actual field current)	A	10	0	0
	4	Current.dnQuadratureCurrentSet (cross current setpoint)	A	10	0	0
	5	Current.dnActualQuadratureCurrent (actual cross current)	A	10	0	0

[5-13] Oscillogram 1: speed ramp (motor 55 kw) – torque controller gain = 0.0661

[5-14] Oscillogram 2: speed ramp (motor 55 kw) – torque controller gain = 0.0361

5.5.3.4 Optimise current controller

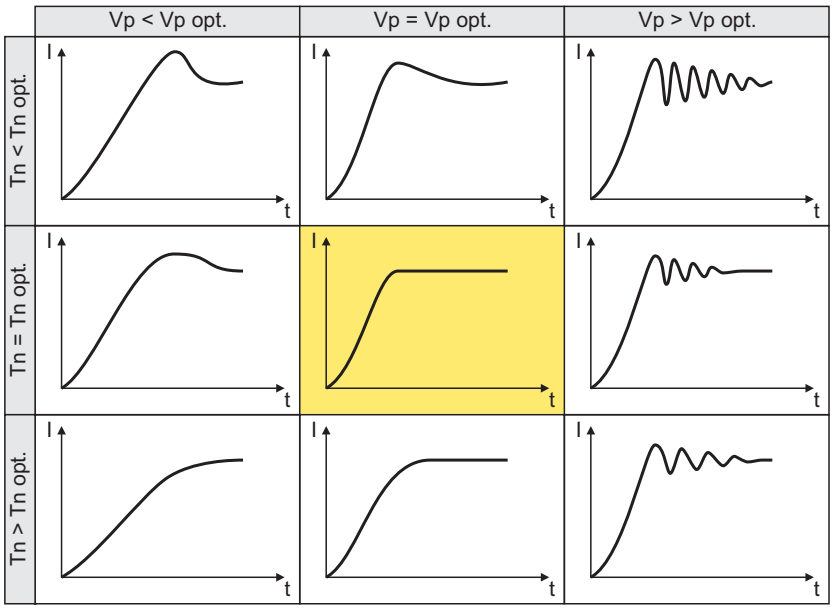
Note!

Only required for sensorless vector control if one of the following functions is used.

- Flying restart function (📖 212)
- DC-injection braking (📖 215)

In a test mode you can select current setpoint step-changes and optimise the parameter settings of the current controller (gain and reset time) by evaluating the step responses.

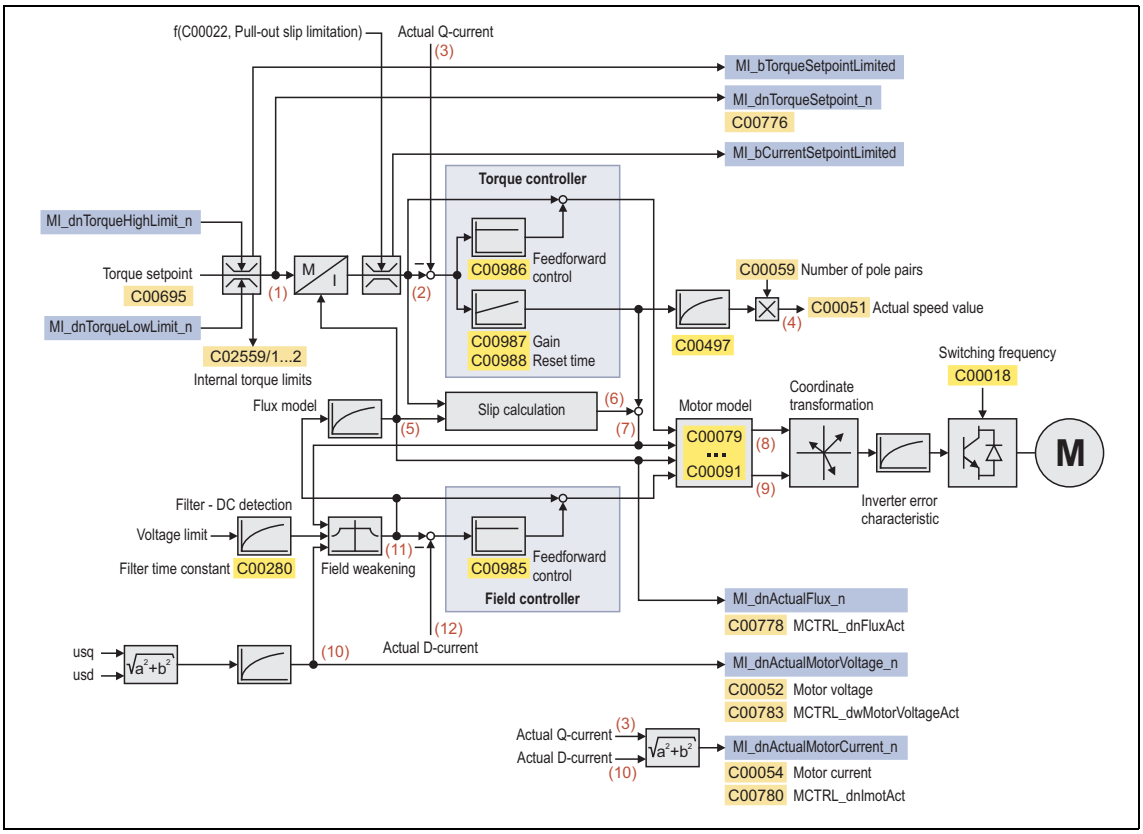
- The starting values for gain and reset time can be calculated with the following formula:



$$\text{Gain} = \frac{\text{Stator leakage inductance}}{340\ \mu\text{s}}$$

$$\text{Reset time} = \frac{\text{Stator leakage inductance}}{\text{Stator resistance}}$$

How to optimise the current controller in the test mode:



1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Activate one of the two following optimisation modes for the current controller:
   - C00398 = "3: Current controller optimisation mode":
     After controller enable, the motor is supplied with current as long as the controller is enabled.
   - From software version V7.0:
     C00398 = "4: Current controller optimisation mode pulse":
     The motor is supplied with voltage for 50 ms after controller enable. Due to this time limit, the load of the machine is reduced. Afterwards, the controller is inhibited automatically.
3. Select the effective value of the current setpoint step change under C00022.
   - The peak value of the measurable motor current will be 1.41 times higher.
4. Enable the controller for a short time and measure the step response of the motor current in the motor phases using the oscilloscope and clamp-on ammeters or record the field-oriented direct-axis current using the Oscilloscope function in »Engineer«. (📖 585)
   - Variable of the motor control to be recorded:
     Current.dnActualDirectCurrent (field-oriented direct-axis current)

5. Evaluate the step response:

6. Change the gain Vp under C00075 and the reset time Tn under C00076.
7. Repeat steps 4 ... 6 until the optimum step response of the motor current is reached.
   - In the optimised state the current rise time typically is 0.5 ... 1 ms.
8. After the optimisation has been completed, deactivate the test mode again (C00398 = "0: Test mode deactivated").
9. Save parameter set (C00002 = "11: Save start parameters").

5.5.4 Signal flow

[5-15] Signal flow - sensorless vector control

Internal variables of the motor control (oscilloscope signals)

- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(1)	Torque.dnTorqueSetpoint	Torque setpoint
(2)	Current.dnQuadratureCurrentSet	Q current setpoint
(3)	Current.dnActualQuadratureCurrent	Actual Q current
(4)	Speed.dnActualMotorSpeed	Actual speed value
(5)	Common.dnActualFlux	Actual flux value
(6)	Frequency.dnActualSlipFrequency	Actual slip frequency
(7)	Frequency.dnActualRotatingFieldFrequency	Current field frequency
(8)	Voltage.dnQuadratureVoltage	Q voltage
(9)	Voltage.dnDirectVoltage	D voltage
(10)	Voltage.dnActualMotorVoltage	Current motor voltage
(11)	Current.dnDirectCurrentSet	D current setpoint
(12)	Current.dnActualDirectCurrent	Actual D current

5.6 V/f control (VFCplus)

This function extension is available from software version V3.0!

If this motor control mode is set in C00006, the output voltage of the controller follows a firmly defined characteristic.

Note!

The operation of vertical drives/hoists is only supported up to 55 kW by the V/f control!

5.6.1 Basic settings

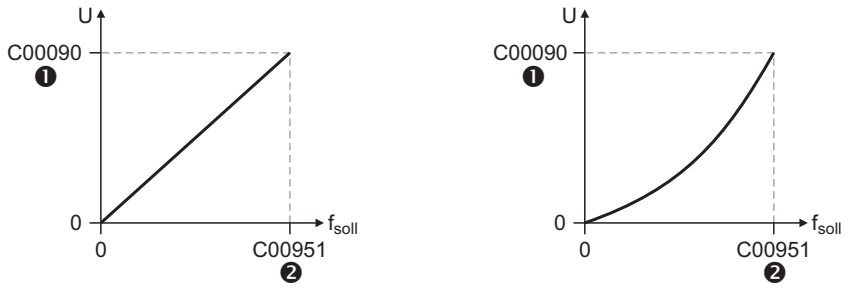
After the motor and controller have been optimally adjusted to each other, the "initial commissioning steps" described in the following table are sufficient for a simple characteristic control.

- Detailed information on the individual steps can be found in the following subchapters.

Initial commissioning steps	
1	Defining the V/f characteristic. (📖 185)
2.	Setting the voltage boost. (📖 186)
3	Parameterising load adjustment. (📖 188)
4	Activating voltage vector control. (📖 189) • The *Voltage Vector Control* (VCC), which can be activated, serves to provide a torque at low field frequencies. This task is executed by a current controller the output voltage of which is added to the voltage from the characteristic.
5	Defining the current limit (Imax controller). (📖 190)
6	Additional "flying restart" function: • In the Lenze setting, this parameterisable additional function is activated. • If the flying restart function is not required, deactivate this function. ▸ Flying restart function (📖 212) STOP **Only deactivate the flying restart if it is ensured that the drive is always at standstill in the case of controller enable!**
7	Additional "DC-injection braking" function: • In the Lenze setting, this parameterisable additional function is deactivated. • If DC-injection braking is required, activate this function. ▸ DC-injection braking (📖 215)

Tip!

How to optimise the control behaviour and adjust it to the concrete application is described in the chapter "Optimising the control mode". (📖 191)



Parameterisable additional functions are described correspondingly in the chapter "Parameterisable additional functions". (📖 203)

5.6.1.1 Defining the V/f characteristic

Linear/square-law characteristic

C00950 serves to select the shape of the characteristic to adjust the characteristic to different load profiles:

- Linear characteristic for drives with constant load torque over the speed.
- Square-law characteristic for drives with a linear or square-law load torque over the speed:
  - Square-law V/f characteristics are mostly used in centrifugal pump and fan drives. However, it must be checked in each individual case if your pump or fan drive can be used in this operating mode!
  - If your pump or fan drive is not suitable for operation with a square-law V/f characteristic, you have to use the linear or user-definable V/f characteristic or the sensorless vector control instead of the V/f control.

❶ C00090: Rated motor voltage
❷ C00951: V/f base frequency

[5-16] Linear/square-law V/f characteristic

- The calculation of the characteristic considers the rated motor voltage (C00090) and the V/f base frequency (C00951).

Short overview: Parameters for V/f characteristic

Parameters	Info	Lenze setting	
		Value	Unit
C00950	VFC: V/f characteristic shape	Linear (V/f)	
C00951	VFC: V/f base frequency	50	Hz
C00952/1...11	VFC: Frequency interpol. point n	▸ Defining a user-defined V/f characteristic (📖 192)	
C00953/1...11	VFC: Voltage interpol. point n		
C00954/1...11	VFC: Activat. interpol. point n		

5.6.1.2 Setting the voltage boost

C00960 and the *MI_dnBoostSet_n* input of the motor interface serve to define a constant, load independent voltage boost at low speeds (below the V/f rated frequency) or at motor standstill to optimise the starting performance.

Stop!

If the motor is operated at standstill for a longer time - especially in case of smaller motors - the motor can be destroyed by overtemperature!

- Connect the thermal contact (NC contact), PTC, or KTY of the motor and activate the motor temperature monitoring of the controller.
- Operate self-ventilated motors with a blower, if required.

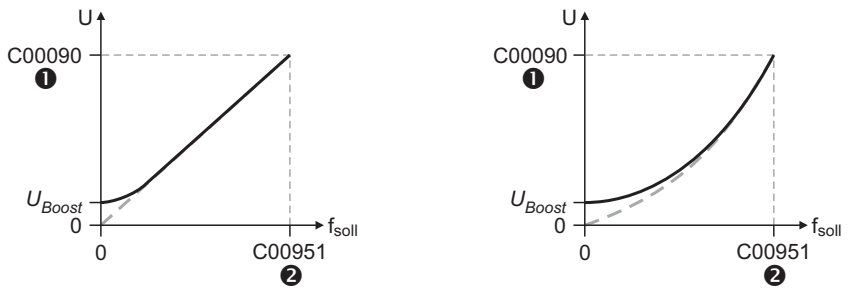
Note!

When device types > BF7 are used, the voltage boost only functions in a restricted way due to the hardware properties!

Depending on the required starting torque, the voltage boost must be set so that the required motor current will be available after controller enable (starting current ~ V_{min}).

Tip!

The required voltage can be calculated by multiplying the stator resistance by the rated magnetising current:



$$U_{min} = R_S \cdot I_{mN}$$

Optionally, the voltage can be determined empirically by increasing the value for the voltage boost until the rated magnetising current flows.

Calculate voltage boost V_{Boost}	
$U_{Boost} = MI_dnBoostSet_n \cdot \frac{1000V}{100\ \%} + C00960$	
MI_dnBoostSet_n	The value for the *MI_dnBoostSet_n* input is a voltage related to 1000 V given in [%]. ▸ Internal interfaces | "LS_MotorInterface" system block
C00960	In C00960, the voltage must be set directly in [V]. Notes: • Only positive voltage values can be selected, negative values are limited to 0 V. • The voltages in C00960 and the relative *MI_dnBoostSet_n* value are to be understood as peak values of the phase voltage.

The resulting voltage V is calculated from the geometrical addition of V_{Boost} and the characteristic voltage:

$$U = \sqrt{U_{Characteristic}^2 + U_{Boost}^2}$$

❶ C00090: Rated motor voltage
❷ C00951: V/f base frequency

[5-17] Voltage boost at linear/square-law V/f characteristic

Short overview: Parameters for voltage boost

Parameters	Info	Lenze setting	
		Value	Unit
C00960	VFC: V/f voltage boost	0	V

Tip!

For magnetising the motor, consider a sufficient time from the controller enable to the start of the speed ramp function generator.

- The bigger the motor the longer the time required for magnetisation. A motor with a power of 90 kW requires up to 2 seconds.

5.6.1.3 Parameterising load adjustment

C00962 serves to parameterise a load adjustment in [%] proportionally to the rated torque to obtain a correspondingly "rigid "drive behaviour even after the starting action.

- When starting torque = rated torque, a load adjustment of 50 % is suitable for most applications.

Stop!

If the load adjustment is too high, the motor current may increase in idle state and the motor may overheat!

The C00961 parameter serves to adjust the characteristic depending on the load at CW and CCW rotation:

Setting in C00961	Info
0: CW rotation in motor mode/CCW rotation in motor mode	The motor operates in motor mode in both directions.
1: CW rotation in motor mode/CCW rotation in generator mode	Application example: Hoist without counterweight
2: CW rotation in generator mode/CCW rotation in motor mode	Application example: Dancer-controlled unwinder

Short overview: Parameters for load adjustment

Parameters	Info	Lenze setting	
		Value	Unit
C00961	VFC: Load - cw/ccw-operation	CW: mot. / CCW: mot.	
C00962	VFC: Load adjustment	20.00	%

5.6.1.4 Activating voltage vector control

The *Voltage Vector Control* (VCC), which can be activated, is an alternative to the voltage boost. The voltage vector control is used if a high starting torque has to be ensured. The voltage vector control ensures that the motor current required for this purpose is available in the zero speed range.

Note!

A disadvantage of the voltage vector control is the increased current at low speeds. This causes higher losses and thus an increased heating of the machine.

The voltage vector control is activated by defining a current setpoint in C00957 and can be deactivated again by setting "0.0 A".

- The voltage vector control is additive to the voltage boost.
  ▸ Setting the voltage boost (📖 186)
- When the current setpoint is defined, provide a reserve of 20 % to prevent a motor stalling caused by sudden additional loads.
- Example for starting torque = rated motor torque:
  The current setpoint must be parameterised in C00957 to approx. 120 % of the load current.

Setting of the controller parameters

For the gain (C00958) and the reset time (C00959), accept the values that have been detected for the current controller gain (C00075) and reset time (C00076) in the test mode. ▸ Optimise current controller (📖 196)

Since the voltage vector control controls the current value which has a higher background noise due to its calculation, the reset time might possibly be increased.

Short overview: Parameters for voltage vector control

Parameters	Info	Lenze setting	
		Value	Unit
C00957	VFC: VVC current setpoint	0.00	A
C00958	VFC: VVC gain	0.00	V/A
C00959	VFC: VVC reset time	2000.00	ms

Tip!

For controllers with a power > 55 kW we recommend to use the voltage vector control for horizontal drives for improving the smooth running characteristics.

5.6.1.5 Defining the current limit (Imax controller)

The current limit for the Imax controller is defined by the maximum current which must be set in C00022. If the motor current exceeds the value set in C00022, the Imax controller gets active.

- The Imax controller changes the field frequency so that the motor current does not exceed the current limit. In motor mode, the frequency is reduced and in generator mode it is increased.
- Gain and reset time of the Imax controller can be parameterised in C00963 and C00964.

Short overview: Parameters for Imax controller

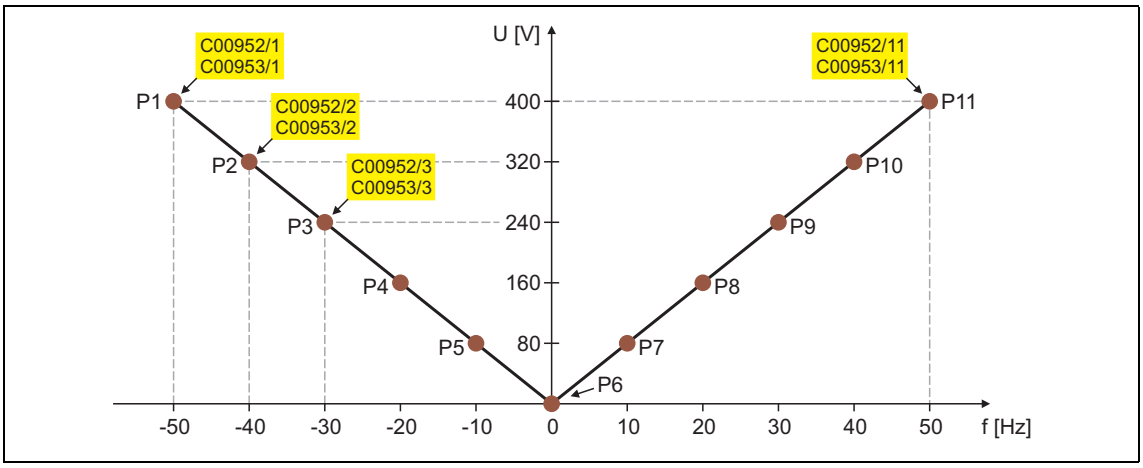
Parameters	Info	Lenze setting	
		Value	Unit
C00022	Maximum current	0.00	A
C00963	VFC: Gain - Imax controller	0.001	Hz/A
C00964	VFC: Reset time - Imax controller	100.0	ms

Optimising the Imax controller

- If oscillations occur during operation at the current limit, the Imax controller has to be decelerated:
  - Reduce gain (C00963)
  - Increase reset time (C00964)
- If the Imax controller does not operate fast enough after having exceeded the current limit, it must be accelerated:
  - Increase gain (C00963)
  - Reduce reset time (C00964).

5.6.2 Optimising the control mode

The "optimisation steps" given in the following table serve to further optimise the control behaviour of the V/f control and adjust it to the concrete application.



- Detailed information on the individual steps can be found in the following subchapters.

Optimisation steps	
1	Defining a user-defined V/f characteristic. (📖 192) • Individual adjustment of the motor magnetisation to the concrete application if linear and square-law characteristics are not suitable.
2.	Parameterising slip compensation. (📖 193)
3	Parameterising oscillation damping. (📖 194)
4	When the flying restart function is used: Optimise flying restart process. ▸ Flying restart function (📖 212)
5	Optimise current controller. (📖 196) • Only required if one of the following functions is used: • Voltage vector control (📖 189) • Flying restart function (📖 212) • DC-injection braking (📖 215)
6	Save »Engineer« project.

5.6.2.1 Defining a user-defined V/f characteristic

To individually adjust the motor magnetisation to the real application, a user-definable characteristic can be selected in C00950 if the linear and square-law characteristic are not suitable.

- The interpolation points (voltage/frequency values) of this characteristic are selected via the 11 subcodes of C00952 and C00953.
- If less interpolation points are required, the interpolation points that are not needed have to be deactivated via the subcodes of C00954.
- In the Lenze setting the 11 grid points represent a linear characteristic:

	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	P11
V	400 V	320 V	240 V	160 V	80 V	0 V	80 V	160 V	240 V	320 V	400 V
f	-50 Hz	-40 Hz	-30 Hz	-20 Hz	-10 Hz	0 Hz	10 Hz	20 Hz	30 Hz	40 Hz	50 Hz

[5-18] User-definable characteristic (Lenze setting)

5.6.2.2 Parameterising slip compensation

The slip compensation serves to automatically compensate a load-dependent speed loss. In order that the slip compensation can operate correctly, the rated slip of the motor is required. This is calculated from the rated frequency (C00089) and the rated speed (C00087), thus both parameters must be parameterised correctly.

- A percentage adjustment of the calculated slip can be made in C00965, e.g. when the real motor data deviate from the data given on the nameplate. A value of 100 % in C00965 corresponds to the rated slip of the machine.
- The time behaviour of the slip compensation can be parameterised in C00966.

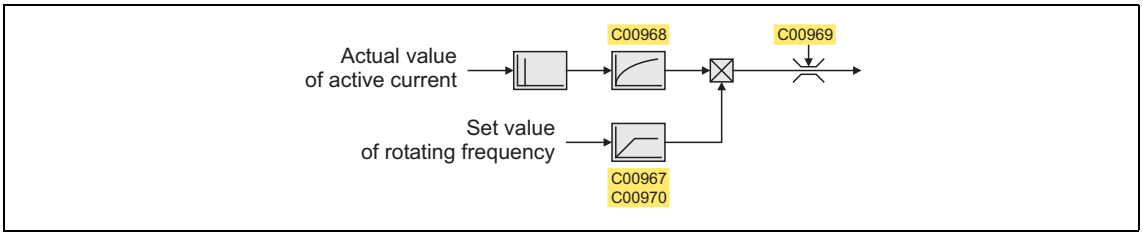
Short overview: Parameters for slip compensation

Parameters	Info	Lenze setting	
		Value	Unit
C00965	VFC: Gain - slip compensation	0.00	%
C00966	VFC: Time const. slip comp.	2000	ms

5.6.2.3 Parameterising oscillation damping

The oscillation damping serves to reduce the oscillations during no-load operation which are caused by energy oscillating between the mechanical system (mass inertia) and the electrical system (DC bus). Furthermore, the oscillation damping can also be used to compensate resonances.

Note!



Observe the following restrictions:

- Oscillations occurring sporadically cannot be damped.
- Damping is possible only for constant oscillations at a steady-state operating point.
- Oscillation damping is not suitable for oscillations occurring during dynamic processes (e.g. accelerations or load changes).

Job title

The determination of the oscillation is based on the active current. In order to obtain the alternating component of the active current, this current is differentiated. This signal is then passed through a PT1 filter.

- The base frequency of the PT1 filter has to be set in such a way that the oscillation can be damped and higher-frequency components are filtered out of the signal. For this purpose the time constant (C00968) is used.
- C00967 serves to parameterise the gain of the oscillation signal. The maximum amplitude of the frequency change determined by the oscillation damping is set via C00969.
- Oscillation damping is only active if the setpoint speed is greater than 10 rpm and the DC-bus voltage exceeds a value of 100 V.
- In the lower speed range, the oscillation damping may have a negative impact on the concentricity factor.
  - Therefore from software version V5.0 a ramp end frequency can be set in C00970, up to which the gain of the oscillation damping (C00967) from 10 rpm is slowly increased with increasing rotational frequency.

Identification of the oscillation

Before the oscillation damping can be parameterised, the oscillation has to be identified. One way is to examine the motor current while oscillation damping is switched off (C00967 = 0 %). At steady-state operation, a constant current flows. If the drive oscillates, these oscillations are also visible on the motor current. It is therefore possible to determine the frequency and the amplitude of the oscillation from the alternating component of the motor current. In the following, this alternating component is referred to as "current oscillation".

Parameter setting

- The time constant (C00968) is determined from the reciprocal value of twice the frequency of the current oscillation:

$$\text{Time constant} = \frac{1}{2 \cdot \text{Oscillation frequency}}$$

- The gain factor (C00967) is calculated with the following formula based on the relationship between the amplitude of the current oscillation and the maximum device current:

$$\text{Gain} = \frac{\text{Current amplitude}}{\sqrt{2} \cdot \text{Maximum device current (C00789)}} \cdot 100\ \%$$

- The maximum oscillation frequency (C00969) serves to the absolute limitation of the oscillation frequency calculated before it is added to the field frequency. It can be derived from the amplitude of the current oscillation, the rated motor current, and the slip frequency of the motor connected:

$$\text{Max. frequency} = \frac{2 \cdot \text{Amplitude of the current oscillation}}{\text{Rated motor current}} \cdot \text{Rated slip frequency}$$

- From software version V5.0: The ramp end frequency (C00970) defines the rotational frequency from which the gain factor is to have reached its nominal value (C00967).
  - The ramp end frequency refers to the rated motor frequency in percent (C00089).
  - Below a speed of 10 rpm, the oscillation damping remains deactivated.
  - For machines with a power greater than 55 kW a ramp end frequency of 20 % is recommended.

Short overview: Parameters for oscillation damping

Parameters	Info	Lenze setting	
		Value	Unit
C00967	VFC: Gain - oscillation damping	20	%
C00968	VFC: Time const. - oscill. damp.	5	ms
C00969	VFC: Limitation - oscillation damping	0.2	Hz
C00970	VFC: Ramp end freq. - oscillation damping	0	%

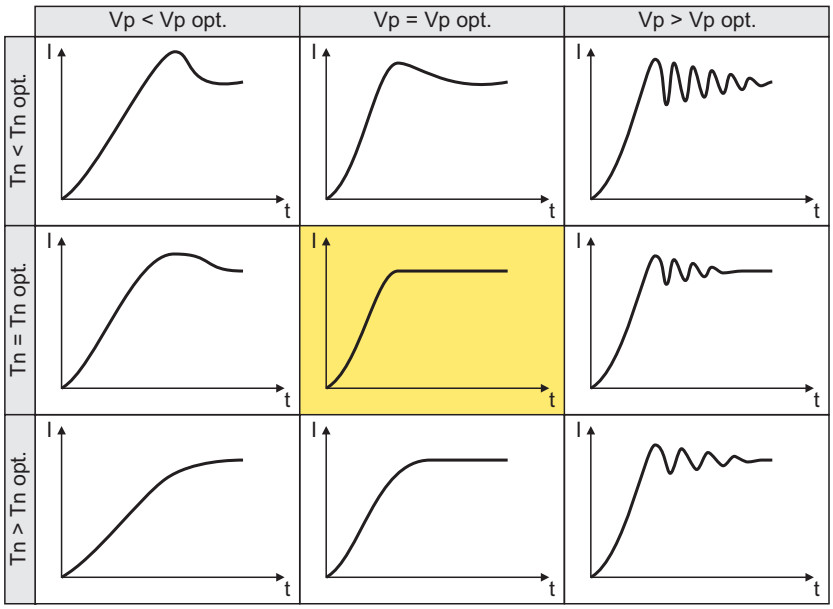
5.6.2.4 Optimise current controller

Note!

Only required if one of the following functions is used:
- Voltage vector control (📖 189)
- Flying restart function (📖 212)
- DC-injection braking (📖 215)

In a test mode you can select current setpoint step-changes and optimise the parameter settings of the current controller (gain and reset time) by evaluating the step responses.

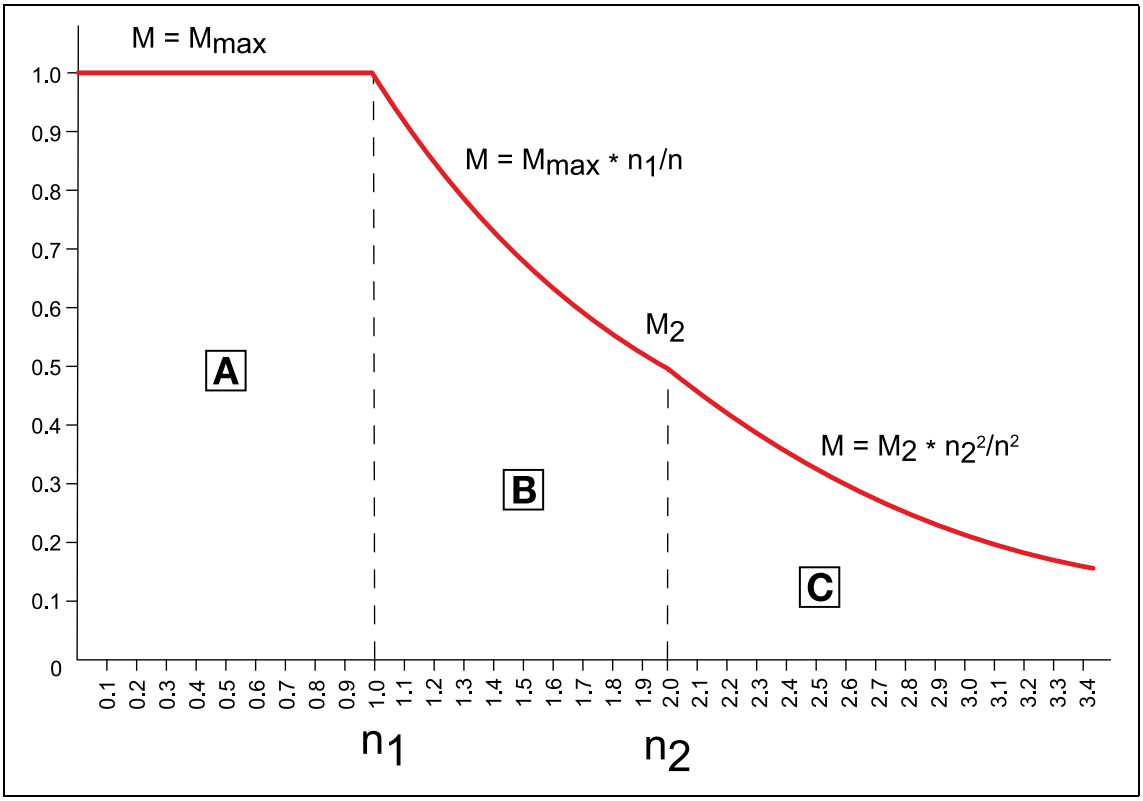
- The starting values for gain and reset time can be calculated with the following formula:



$$\text{Gain} = \frac{\text{Stator leakage inductance}}{340\ \mu\text{s}}$$

$$\text{Reset time} = \frac{\text{Stator leakage inductance}}{\text{Stator resistance}}$$

How to optimise the current controller in the test mode:



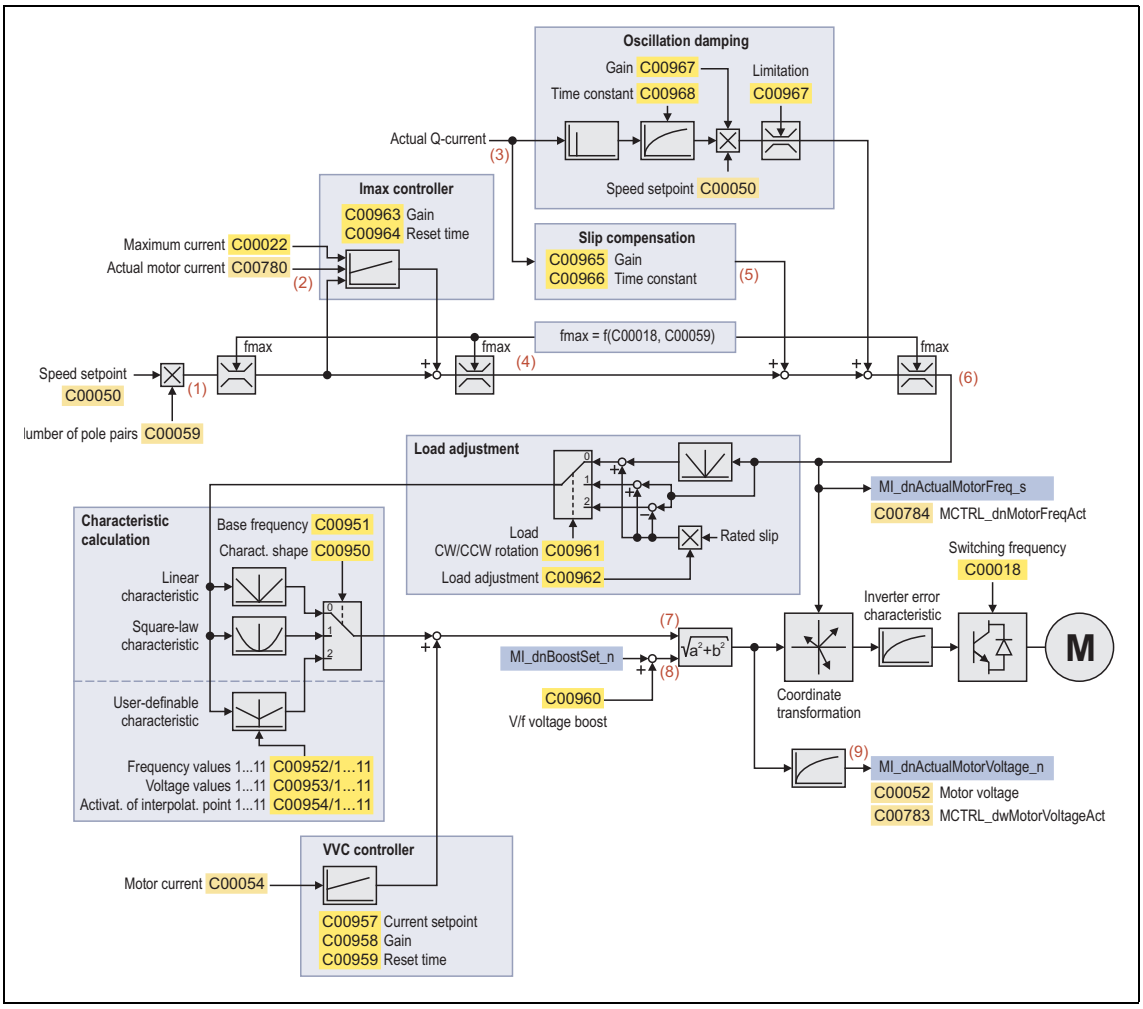
1. If the controller is enabled, inhibit the controller, e. g. with the device command C00002 = "41: Inhibit controller".
2. Activate one of the two following optimisation modes for the current controller:
   - C00398 = "3: Current controller optimisation mode":
     After controller enable, the motor is supplied with current as long as the controller is enabled.
   - From software version V7.0:
     C00398 = "4: Current controller optimisation mode pulse":
     The motor is supplied with voltage for 50 ms after controller enable. Due to this time limit, the load of the machine is reduced. Afterwards, the controller is inhibited automatically.
3. Select the effective value of the current setpoint step change under C00022.
   - The peak value of the measurable motor current will be 1.41 times higher.
4. Enable the controller for a short time and measure the step response of the motor current in the motor phases using the oscilloscope and clamp-on ammeters or record the field-oriented direct-axis current using the Oscilloscope function in »Engineer«. (📖 585)
   - Variable of the motor control to be recorded:
     Current.dnActualDirectCurrent (field-oriented direct-axis current)

5. Evaluate the step response:

6. Change the gain Vp under C00075 and the reset time Tn under C00076.
7. Repeat steps 4 ... 6 until the optimum step response of the motor current is reached.
   - In the optimised state the current rise time typically is 0.5 ... 1 ms.
8. After the optimisation has been completed, deactivate the test mode again (C00398 = "0: Test mode deactivated").
9. If the Imin control is used, both calculated controller parameters can also be used for the Imin controller:
   - C00075 → C00958 (Imin controller: gain)
   - C00076 → C00959 (Imin controller: reset time)
10. Save parameter set (C00002 = "11: Save start parameters").

5.6.2.5 Optimising pull-out slip limitation

[5-19] Speed/torque curve of the asynchronous motor with two field weakening ranges B and C



The operating range of an asynchronous motor consists of the voltage control range A and the field weakening range. The field weakening range again is divided into two ranges:

- In the first range B, the power can be kept constant without causing motor stalling.
- The second field weakening range C is characterised by the fact that the maximum permissible stator current (defined via C00022 "Maximum current") is reduced to prevent motor stalling.

The override point (n_2, M_2) can be influenced via C00980 ("VFC: Override point of field weakening"). If the motor stalls in the field weakening range, the override point (n_2, M_2) can be adjusted by decreasing C00980 so that motor stalling is avoided.

If the motor does not provide sufficient torque in the field weakening range, C00980 must be increased.

5.6.3 Signal flow

[5-20] Signal flow - V/f control

Internal variables of the motor control (oscilloscope signals)

- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(1)	Speed.dnSpeedSetpoint	Speed setpoint
(2)	Current.Current.dnActualMotorCurrent	Actual motor current
(3)	Current.dnActualQuadratureCurrent	Actual Q current

(7)	Voltage.dnOutputQuadratureVoltage	Q voltage
(8)	Voltage.dnOutputDirectCurrentCtrl	D voltage
(9)	Voltage.dnActualMotorVoltage	Current motor voltage

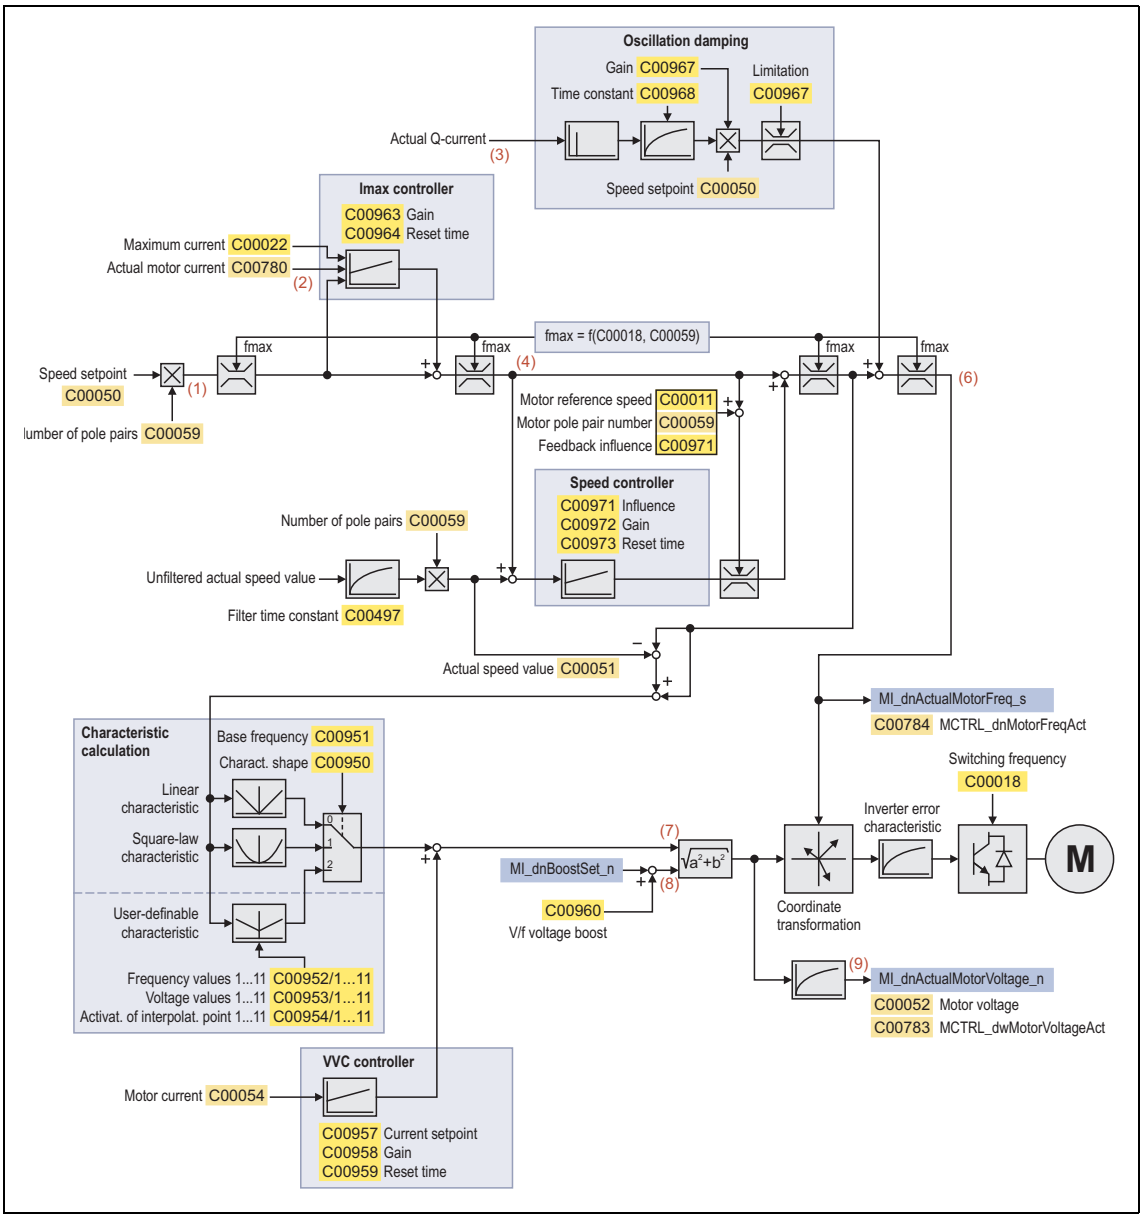
5.7 V/f control (VFCplus)

This function extension is available from software version V3.0!

Note!

The descriptions in chapter "V/f control (VFCplus)" also apply to the V/f control. (📖 184)

When this motor control mode is used, the operation can be continued if the encoder fails. For this, the encoder monitoring must be parameterised to "Warning". If the encoder fails, the speed controller is "frozen" so that the slip correction via the speed controller is maintained.



For the closed loop V/f control, the speed controller (also called "slip regulator") also has to be parameterised for the speed feedback.

- C00971 serves to define the influence of the speed controller in [%] with regard to the reference speed of the motor (C00011). If the influence is adjusted to the slip expected under normal operating conditions, the motor cannot accelerate in an uncontrolled way when the encoder fails.
- To activate the speed controller, parameterise the gain (C00972) and the reset time (C00973).

Short overview: Parameters for speed controller

Parameters	Info	Lenze setting	
		Value	Unit
C00971	VFC: Influence - speed controller	10.00	%
C00972	VFC: Gain - speed controller	0.000	Hz/rpm
C00973	VFC: Reset time - speed controller	6000.0	ms

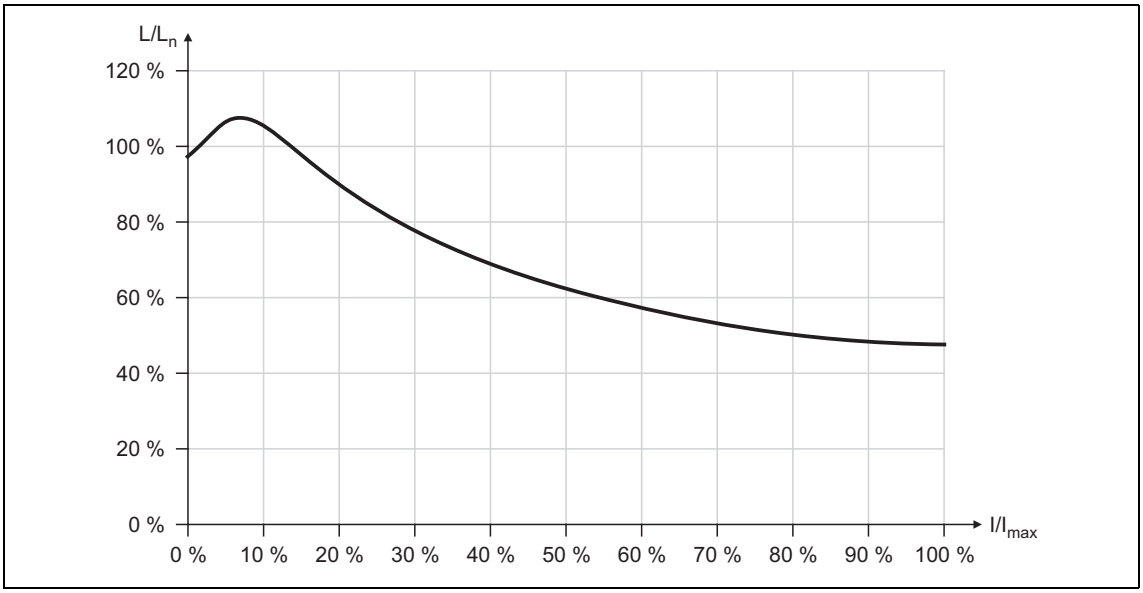
DC-injection braking (📖 215)	V3.0		●	●

* SC = servo control SLVC = sensorless vector control VFCplus = V/f control

5.8.1 Correction of the stator leakage inductance...

...and the current controller parameters by means of the saturation characteristic



Note!

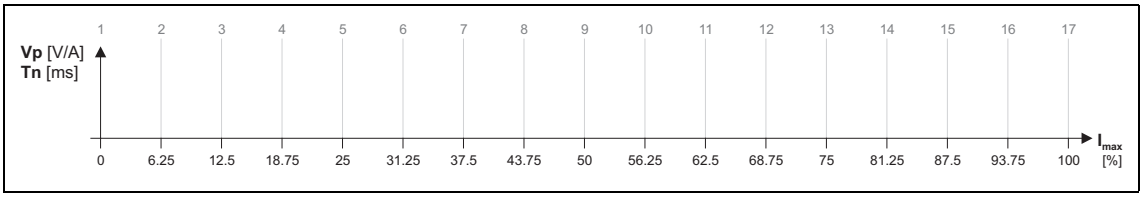
Function only possible for servo control!

The current controller must be adjusted to the electrical characteristics of the motor stator resistance (C00084) and stator leakage inductance (C00085). In case of modern motors, the stator leakage inductance changes with the height of the current so that a new current controller setting is required for each current height.

When the motor is operated with very low and very high currents (e.g. in *Pick and place* applications), it is not always possible to achieve a satisfactory current controller setting for all operating points. For this purpose, the correction of the stator leakage inductance and current controller parameters is now possible via an adjustable saturation characteristic that can be set in C02853 (17 interpolation points).

The following picture shows a typical saturation characteristic of an MCS motor:

[5-22] Saturation characteristic: Inductance referring to the inductance for rated current



- By optimising the current controller with different current setpoints such a characteristic can be determined "by trial" and set in C02853.
- The correction by means of this saturation characteristic can be switched on/off via C02859.

Note!

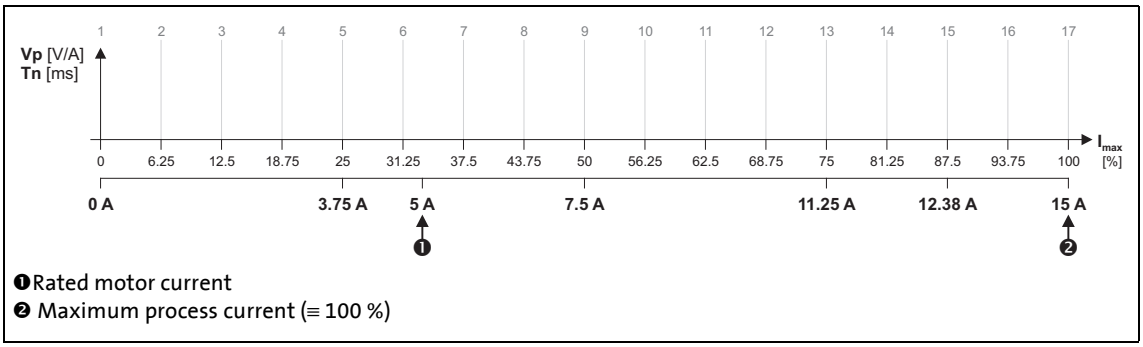
The saturation characteristic is not only used for the correction of the current controller but also influences the current controller feedforward control (C00074).

Distribution of the grid points

- The saturation characteristic is defined by 17 interpolation points which are distributed linearly on the x axis.
- Interpolation point 17 represents 100 % of the maximum motor current in the process (C02855).

[5-23] Saturation characteristic: Distribution of the grid points

Example for determining the saturation characteristic



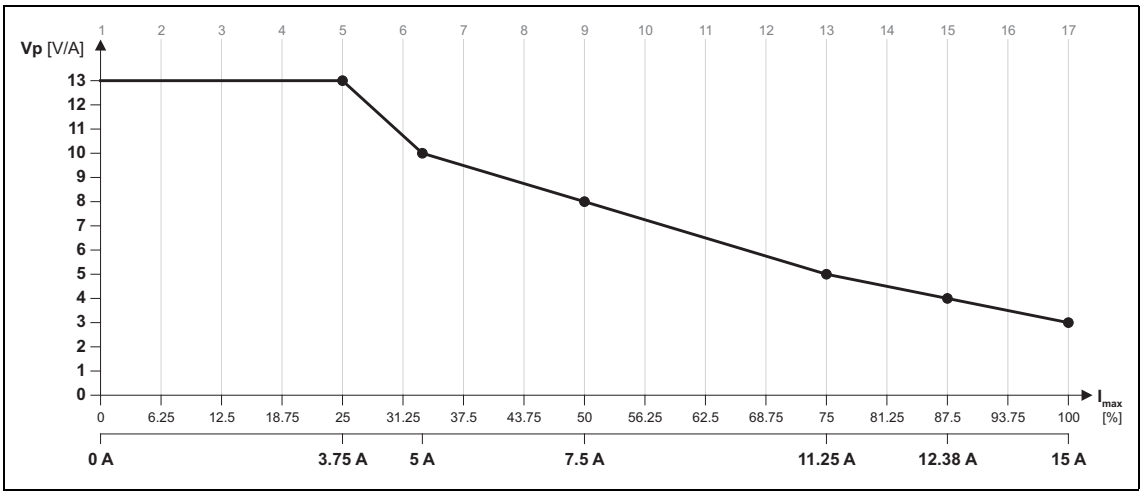
Given values:

- Rated motor current: 5 A
- Maximum motor current: 20 A
- Maximum process current: 15 A (must be set later in C00022)

Procedure:

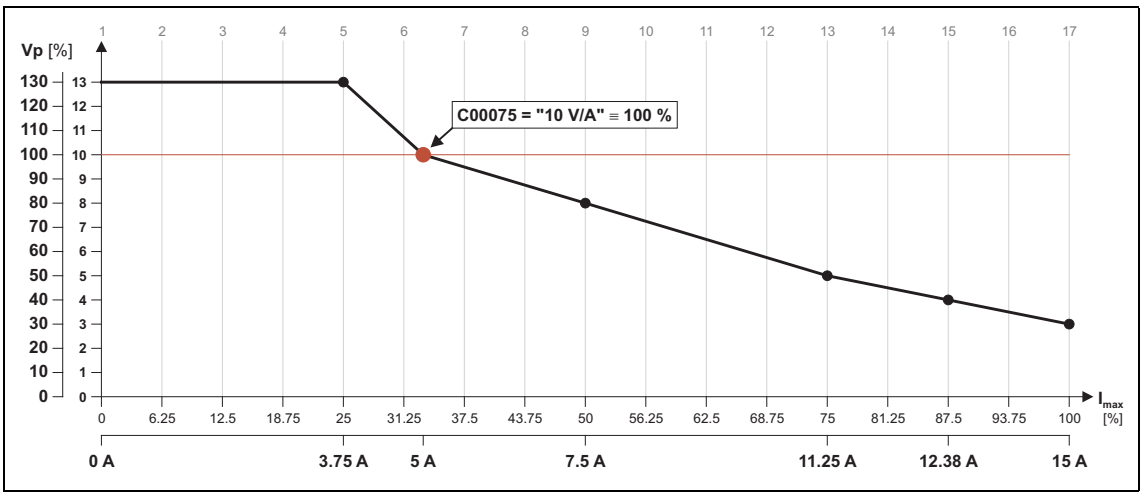
1. Deactivate correction (C02859 = "OFF").
2. Set the maximum current up to which the motor is to be operated in the process in C02855 (in this example "15 A").
   - The value set in C02855 has to be greater or the same as C00022.
3. Adjust the current controller with different current setpoints and take down the corresponding settings for Vp and Tn.
   - The procedure for the adjustment is described in the chapter "Optimise current controller".
   - The current setpoints that are to be set for the respective adjustment in C00022 result from the scaling of the maximum process current to the x axis of the saturation characteristic.
   - The grid points which are required to define the saturation characteristic with a sufficient quality varies from motor to motor and thus has to be determined individually.

- For this example currents were selected that are part of the interpolation points 5, 9, 13, and 15, and a measurement at rated motor current was carried out:



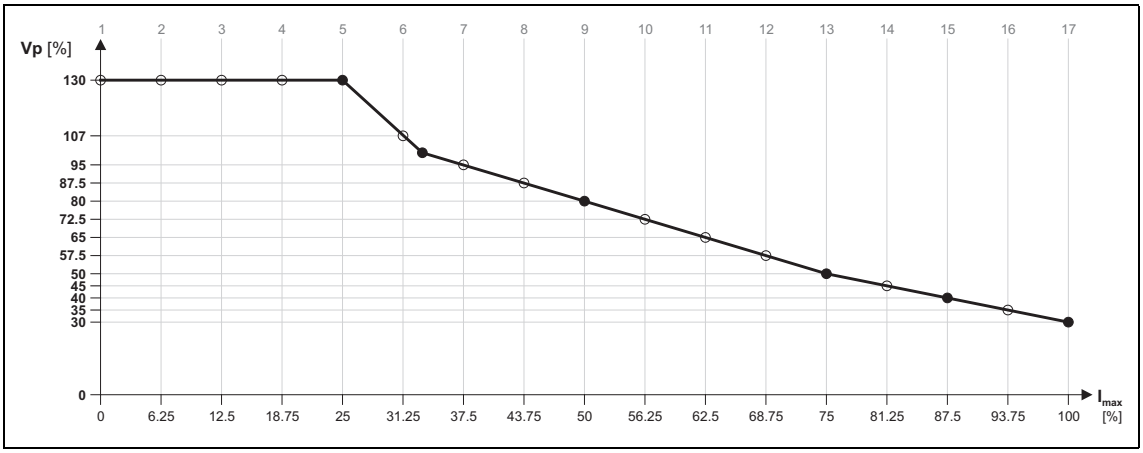
❶ Rated motor current
❷ Maximum process current (≡ 100 %)

[5-24] Saturation characteristic: Distribution of the grid points



Specifications for adjustment			Measured values	
Grid point	Standardisation	Setting in C00022	Vp [V/A]	Tn [ms]
5	0.25 * 15 A =	3.75 A	13	6.5
9	0.5 * 15 A =	7.5 A	8	4
13	0.75 * 15 A =	11.25 A	5	2.5
15	0.875 * 15 A =	12.38 A	4	2
17	1.0 * 15 A =	15 A	3	1.7
	Rated motor current =	5 A	10	5

4. Create a characteristic based on the values calculated for Vp.
   - Here, the values of the grid points which have not been adjusted must be determined by interpolation between two values.
   - **Note:** In this example it was assumed that the inductance does not change considerably below 3.75 A. For this reason the same Vp value resulting from a measurement with a motor current of 3.75 A was used for all grid points below 3.75 A.



[5-25] Determined saturation characteristic

5. Set the gain Vp in C00075 and the reset time Tn in C00076, which have been determined during the adjustment with rated motor current (in this example "5 A"):
   - Set C00075 = "10 V/A".
   - Set C00076 = "5 ms".
6. Scale the Vp values on the Y axis of the characteristic to the 100 % Vp setting in C00075:

[5-26] Scaling of the determined saturation characteristic to the "100 %" setting in C00075

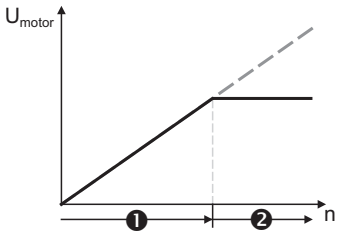
7. Enter the Vp values in percent, which are placed on the interpolation point, in C02853/1...17:

[5-27] Grid point values of the saturation characteristic determined

Grid point	setting	Grid point	setting
1	C02853/1 = 130 %	10	C02853/10 = 72.5 %
2	C02853/2 = 130 %	11	C02853/11 = 65 %
3	C02853/3 = 130 %	12	C02853/12 = 57.5 %
4	C02853/4 = 130 %	13	C02853/13 = 50 %
5	C02853/5 = 130 %	14	C02853/14 = 45 %
6	C02853/6 = 107 %	15	C02853/15 = 40 %
7	C02853/7 = 95 %	16	C02853/16 = 35 %
8	C02853/8 = 87.5 %	17	C02853/17 = 30 %
9	C02853/9 = 80 %		

8. Enter the maximum process current ("15 A") in C00022.

9. Switch on the correction (C02859 = "ON").
   - When the correction of the stator leakage inductance is switched on, the same current characteristic should occur, irrespective of the current magnitude.
   - Since the current controller gain is corrected actively, the step responses may differ slightly compared to the previous measurements. In this case C00075 and C00076 must be optimised one last time.
10. Save parameter set (C00002 = "11: Save start parameters").



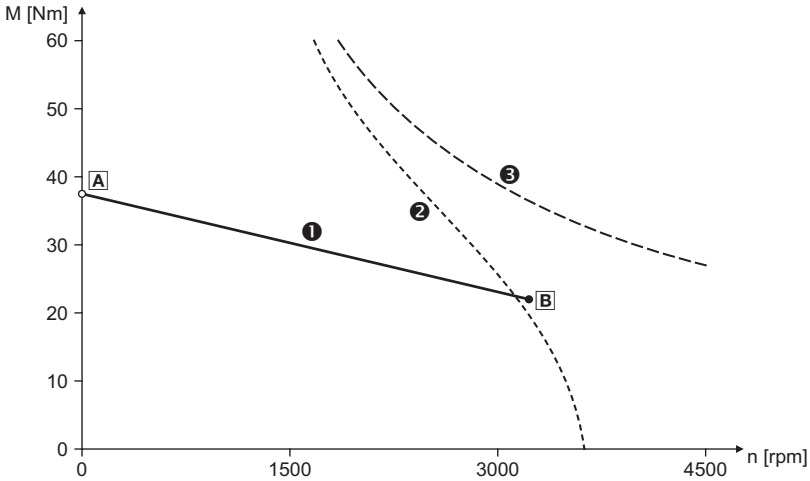
5.8.2 Field weakening for synchronous machines

This function is available from software version V2.0!

Note!

Function only possible for servo control!

If required, the field weakening mode can be switched on in C00093 for synchronous machines.



❶ Armature control range
❷ Field weakening range

- When field weakening is switched on, the motor magnetising current is increased from 0 A to the maximally effective magnetising current via an internal control loop when the voltage limit is reached.
- As a result, a higher speed can be reached at the same motor voltage or DC-bus voltage.

[5-28] Voltage/speed characteristic with switched-on field weakening

$$n_{max} = n_{nenn_mot} \cdot \frac{800V}{\sqrt{2} \cdot U_{nenn_mot}}$$

[5-29] Calculation of the maximally reachable speed with switched-on field weakening

A Standstill torque
B Rated torque
❶ Characteristic for continuous operation
❷ Limit characteristic at a mains voltage of 400 V without field weakening
❸ Limit characteristic with field weakening

[5-30] Speed/torque characteristics of a synchronous servo motor with field weakening

- The maximally effective motor magnetising current is calculated based on the motor data set in C00084 to C00091.Then the calculated value is internally limited to 98 % of the maximum current set in C00022.
- When field weakening is switched on, the actually used maximum effective motor magnetising current is shown in C00092, if field weakening is switched off, "0 A" are displayed, as before.

Note!

If a Lenze motor is used:

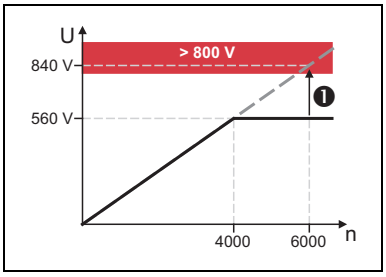
The controller is parameterised automatically so that the field weakening works optimally and there is no danger to the devices.

Stop!

If an OEM motor is used:

If pulse inhibit is set in the controller, the DC bus is loaded with the voltage that corresponds to the current speed of the machine.

Since with switched-on field weakening higher speeds can be achieved at a correspondingly higher rotor voltage of the motor, the DC bus can be loaded to a voltage higher than the set DC-bus voltage in case of pulse inhibit and a currently high motor speed and even exceed the maximally permissible voltage of 800 V!



In order to protect the device, either use a brake chopper, or parameterise the speed monitoring via C00596 and C00607, so that only a maximum motor speed is possible that could also be reached with Vdc-bus = 800 V without field weakening.

▸ Maximum motor speed (📖 127)

Example: Voltage increase in the DC bus when field weakening is switched off

(For instance by an active setting of the controller inhibit or by tripping a fault or error at high motor speed.)

Field weakening	Speed n	Motor voltage peak value
Switched off	4000 rpm	560 V
	5700 rpm	800 V
	6000 rpm	840 V
Switched on	6000 rpm	560 V

- If pulse inhibit occurs at 6000 rpm and switched-on field weakening, the DC bus is loaded to more than 800 V (❶).
- A speed limitation to 5700 rpm is required since this speed causes a DC-bus voltage of 800 V if field weakening is switched off.

[5-31] Example: Possible DC-bus voltage > 800 V if field weakening gets lost

5.8.3 Flying restart function

This function is available from software version V3.0!

Note!

Function only possible for V/f control or sensorless vector control!

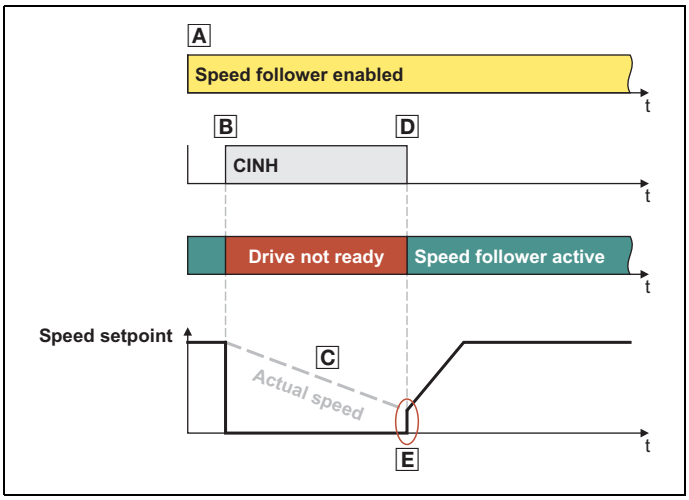
In the case of V/f control or sensorless vector control, the current motor speed is only provided to the controller if the motor control is active. However, if the controller is enabled, one cannot always assume that the drive is at standstill. The drive for example may still coast down, or be further operated by a load. It cannot always be assumed that fans are at standstill if the controller is enabled, e. g. if the fan impeller is further driven by an air flow in an undefined direction.

If the flying restart mode is activated in C00990, after controller inhibit is deactivated (or DC-injection braking is cancelled), a flying restart process is automatically started to determine the current motor speed if the following conditions are met:

- V/f control or sensorless vector control are selected as motor control in C00006.
- The position control structure is set to "Phase controller is active" in C02570.
- The *MI_bFlyingSyncBlocked* control input of the motor interface is not assigned or set to FALSE.
- The holding brake, if available, is not applied.

Stop!

If the flying restart function is deactivated and the controller is not enabled at standstill, the output voltage and output frequency does not match the current motor speed. High compensation currents may flow!



- The drive is first braked towards 0 Hz and is then accelerated again!
- This may cause the following error messages:
  - Controller: Overload during acceleration phases (fault)
  - Device utilisation Ixt > C00123 (warning)
  - Device utilisation Ixt > 100 % (fault)
  - Motor load I^2xt > C00127 (warning)
  - Motor load I^2xt > C00120 (error)
  - Overcurrent detected (fault)
  - Overvoltage in DC bus (trouble)

Note!

The flying restart algorithm requires the motor voltage as exact as possible. Therefore it is absolutely necessary to predetermine the inverter error characteristic. ▸ Optimising the switching performance of the inverter (📖 138)

In addition to the exact motor voltage, the stator resistance must also be known exactly. If the flying restart function should not work as required, slightly adjust the setting of the stator resistance in C00084.

Procedure

A. Initial situation: basic function "Speed follower" is enabled and active.

B. The controller is inhibited while the drive is not at standstill.

C. The motor coasts down (torqueless).

D. The controller inhibit is deactivated again.

E. The flying restart process starts.

[5-32] Process example: Speed follower is active → Controller inhibit → Controller enable

Flying restart process

The controller calculates the output frequency required for the momentary speed of the coasting motor, then connects to the system, and accelerates the motor to the defined setpoint again.

- The flying restart process serves to prevent the motor from decelerating to zero speed with subsequent acceleration.
- The currently detected flying restart speed is provided to the application via the current motor speed *MI_dnActualMotorSpeed_s*.

Parameter setting

- The flying restart algorithm injects a current into the motor to identify the current speed. This flying restart current can be parameterised in C00991 in [%] relating to the rated motor current.
  - The higher the current, the higher the torque acting on the motor.
  - In case of a too low current, a wrong speed can be detected.
- The starting frequency of the flying restart algorithm can be set in C00992.
  - If it is predictable at which frequency the motor can be restarted on the fly , set this frequency here.
- The integration time of the phase controller is set in C00993.
  - The Lenze setting "60 ms" is adapted for machines with a medium power (45 kW).
  - A guide value for the integration time can be calculated with the following equation as a function of the motor power (C00081):

$$T_i = 1.1\frac{\mu s}{W} \cdot \text{Motor power (C00081)} + 9.4\ \text{ms}$$

  - For accelerating the flying restart process, this guide value can be reduced.
  - If the flying restart frequency (*Frequency.dnActualRotatingFieldFrequency*) oscillates too much, the integration time has to be increased again.
  - A longer integration time increases the time for "catching" the drive.
- To avoid starting a flying restart process at short-time controller inhibit, a time can be set in C00995 for the minimum active controller inhibit time.
  - Since a pulse inhibit > 500 ms causes a controller inhibit, this also applies to the pulse inhibit.

Short overview: Parameters for flying restart process

Parameters	Info	Lenze setting	
		Value	Unit
C00990	Flying restart: Activation	Off	
C00991	Flying restart: Current	15	%
C00992	Flying restart circuit: start frequency	20.0	Hz
C00993	Flying restart: Integration time	60	ms
C00994	Flying restart: Min. deviation	5.00	°
C00995	Flying restart: Delay time	0	ms

5.8.4 DC-injection braking

This function is available from software version V3.0!

Note!

Function only possible for V/f control or sensorless vector control!

DC-injection braking can be divided into three functionalities:

Manual DC-injection braking

Braking can be activated and deactivated via the internal interface *QSP_bActivateDCBrake* of the basic function "Quick stop".

Tip!

A detailed description of this functionality can be found in the main chapter "Basic drive functions", subchapter "Quick stop":

- DC-injection braking". (📖 397)

DC-injection braking instead of quick stop

If DC-injection braking is activated in C00976 instead of quick stop, DC-injection braking is executed automatically when quick stop is activated.

Tip!

A detailed description of this functionality can be found in the main chapter "Basic drive functions", subchapter "Quick stop":

- DC-injection braking when quick stop is activated". (📖 399)

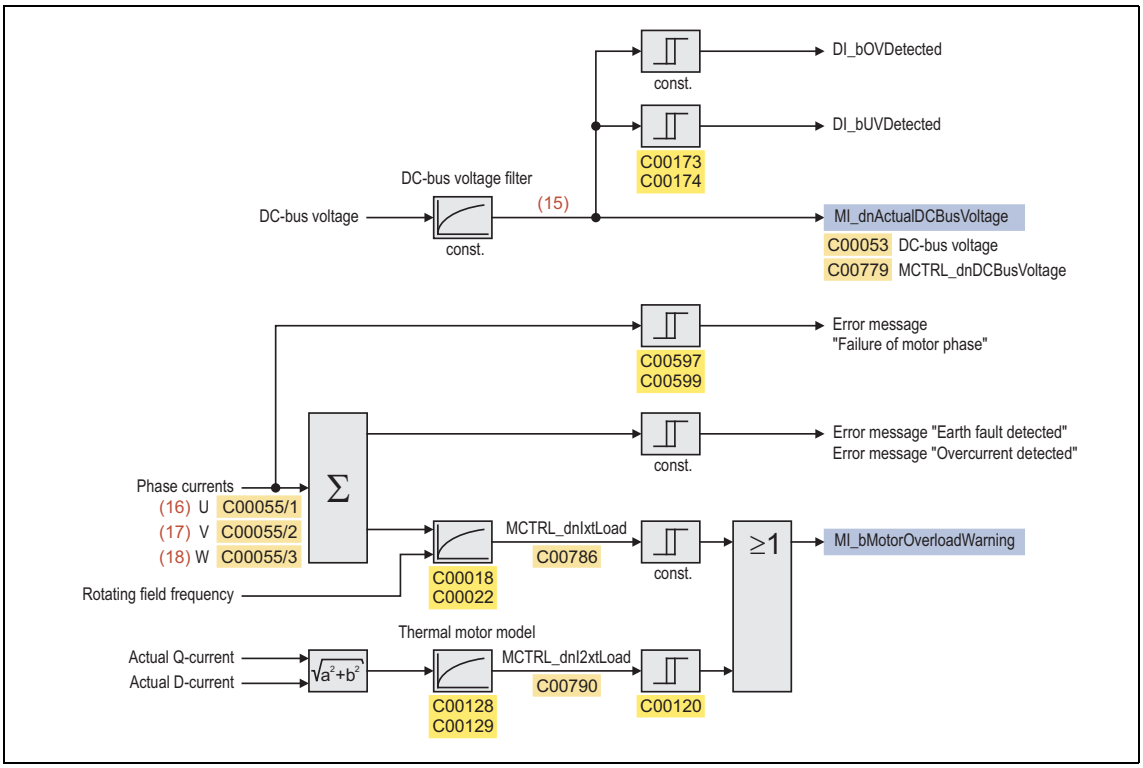
Automatic DC-injection braking

This functionality is part of the basic function "Brake control".

If mode 22 has been selected for the brake control in C02580, DC-injection braking is executed automatically if the current speed setpoint falls below the speed threshold set in C02581.

Tip!

A detailed description of this functionality can be found in the main chapter "Basic drive functions", subchapter "Brake control":



- Mode 22: Automatic DC-injection braking". (📖 397)

Short overview: Parameters for DC-injection braking

Parameters	Info	Lenze setting	
		Value	Unit
C00974	DC brakes: Current	0.00	A
C00975	DC brakes Current for quick stop	0.00	A
C00976	DC brake: Activat. by quick stop	Off	

5.9 Monitoring

5.9.1 Signal flow

[5-33] Signal flow of motor interface (monitoring)

Internal variables of the motor control (oscilloscope signals)

- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(15)	Voltage.dnActualDCBusVoltage	Current DC-bus voltage
(16)	Current.dnActualCurrentPhaseU	Actual motor current (phase U)
(17)	Current.dnActualCurrentPhaseV	Actual motor current (phase V)
(18)	Current.dnActualCurrentPhaseW	Actual motor current (phase W)

5.9.2 Motor monitoring (I^2xt)

The "Servo Drives 9400" are provided with an extended, sensorless thermal I^2xt motor monitoring function which is based on a mathematical model that calculates a thermal motor utilisation from the detected motor currents.

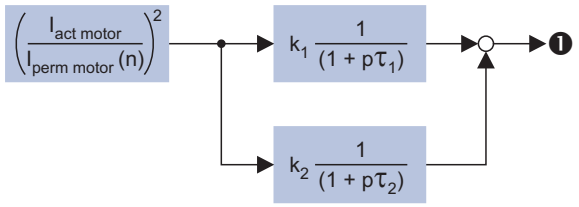
- The calculation considers the speed dependency of the torque (difference between standstill torque and rated torque).
- C00066 indicates the calculated motor utilisation in [%].
- If the motor utilisation exceeds the advance warning threshold set n C00127, the error message "I2t motor overload OC8" is output and the response (default setting: "Warning") set in C00606 is activated..
- If the switch-off threshold set in C00120 is exceeded, the error message "I2t motor overload OC6" is output and the "Fault" response is activated.
- From software version V11.0:
  After mains switching, the thermal model of the I²xt motor monitoring is initialised with the starting value initialised in C01197.

Stop!

The I^2xt motor monitoring function is no full motor protection!

Since the motor utilisation calculated in the thermal model gets lost after mains switching, the following operating states cannot be determined correctly:

- Restarting (after mains switching) of a motor that is already very hot.
- Change of the cooling conditions (e.g. cooling air flow interrupted or too warm).



Full motor protection requires additional measures such as the evaluation of temperature sensors that are located directly in the winding or the use of thermal contacts.

Note!

The result of the calculated thermal motor utilisation may be too low for quick traversing cycles (so-called pick-and-place applications) which include acceleration and deceleration times of less than 100 ms during overload operation of the motor (often used: linear motor).

Structure of the I^2xt monitoring

The introduction of a two-component model with two time constants (one for the winding and the other for the housing/laminated core) serves to display the thermal behaviour of the motor up to 500% of the rated current:

❶ Thermal utilisation of the motor in [%]

[5-34] Structure of the motor monitoring

Parameters		setting
$I_{act\ motor}$	Actual motor current	C00054
$I_{perm\ motor}$ (n)	Permissible motor current (speed-dependent)	-
τ_1	Therm. time constant coil	C00128/1
k_1	Percentage of the winding in the final temperature	C01195
τ_2	Therm. time constant plates	C00128/2
k_2	Percentage of the steel plates in the final temperature	100 % - C01195

Calculation with only one time constant

With C01195 = "0 %" the time constant for the winding is not considered and the thermal model is only calculated with the time constant set for the housing/laminated core.

- The setting C01195 = "0 %" is reasonable if for example the two time constants are not known.
- The calculation simplified due to this setting corresponds to the calculation in the previous Lenze devices (e.g. 9300 servo inverter or ECS).

Speed-dependent evaluation of the motor current

By selecting a characteristic in C01196/1...8 the permissible motor current is evaluated depending on speed for calculating the thermal motor utilisation.

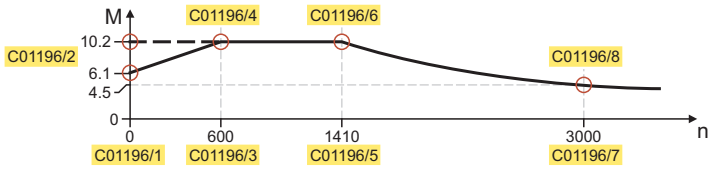
Parameters	Characteristic point	
C01196/1	n_1/n_n	Speed = "0" (standstill)
C01196/2	I_1/I_n	Permissible motor current at standstill
C01196/3	n_2/n_n	Speed from which the torque must be reduced for self-ventilated motors. • Below this speed the cooling air flow of the integral fan is not sufficient anymore.
C01196/4	I_2/I_n	Permissible motor current at speed n_2 (torque reduction)
C01196/5	n_3/n_n	Rated speed
C01196/6	I_3/I_n	Permissible motor current at rated speed
C01196/7	n_4/n_n	Speed above the rated speed (in the field weakening range for asynchronous motors)
C01196/8	I_4/I_n	Permissible motor current at speed n_4 (field weakening)

- The speed-dependent evaluation can be more or less switched off by setting C01196/1...8 to "100 %" each. The calculation simplified due to this setting corresponds to the calculation in previous Lenze devices (e.g. 9300 servo inverter or ECS).

Note!

Self-ventilated standard motors are protected insufficiently at low speeds by setting C01196/1...8 to "100 %" each.

Servo motors, however, do not have a point from which the torque must be reduced due to a too low speed.



- When setting the characteristic in C01196/1...8 this point must not be ignored. Hence, point 2 is to be set ideally to point 1 or point 3.

5.9.2.1 Example for entry of the characteristic for asynchronous servo motor

Motor type: MDFMARS 090-32

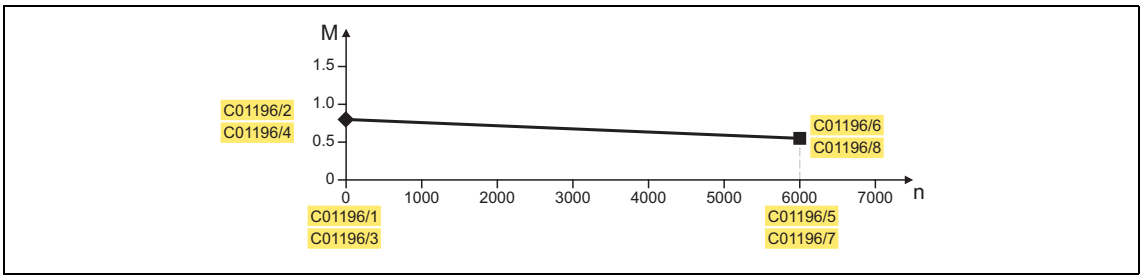
Data from the catalogue:

- Rated speed n_{rated}: 1410 rpm ➞ Setting in C00087
- Rated current I: 6.1 A ➞ Setting in C00088
- Rated torque M_{rated}: 10.2 Nm
- Characteristic of maximum torques (50 Hz, star connection):

[5-35] Torque/speed characteristic for motor type MDFMARS 090-32 from catalogue

Note!

At present, relative current values are still expected for the specification of the interpolation points in subcodes 2, 4, 6, 8 of C01196. This example, however, already uses relative torque values, the entry of which shall be possible at a later date.



Parameters	setting	Info
C00128/1	1.0 min	Thermal time constant - winding • Is unknown and is therefore deactivated by setting C01195 = "0 %".
C00128/2	5.0 min	Thermal time constant - laminated core/housing
C01195	0 %	Percentage of the winding in the final temperature.
C01196/1	0 %	Speed = "0" (standstill)
C01196/2	Permissible motor torque at standstill	
Self-ventilated:	60 %	= 6.1 Nm / 10.2 Nm * 100 %
Forced-ventilated:	100 %	= 10.2 Nm / 10.2 Nm * 100 %
C01196/3	Speed n_2 from which the torque must be reduced for self-ventilated motors.	
Self-ventilated:	43 %	= 600 rpm / 1410 rpm * 100 %
Forced-ventilated:	0 %	No torque reduction required.
C01196/4	100 %	Permissible motor torque at speed n_2 (torque reduction)
C01196/5	100 %	Rated speed (≡ 1410 rpm)
C01196/6	100 %	Permissible motor torque at rated speed (≡ 10.2 Nm)
C01196/7	213 %	Speed above the rated speed (in the field weakening range for asynchronous motors) = 3000 rpm / 1410 rpm * 100 %
C01196/8	44 %	Permissible motor torque at speed n_4 (field weakening) = 4.5 Nm / 10.2 Nm * 100 %

5.9.2.2 Example for entry of the characteristic for synchronous servo motor

Motor type: MCS 06C60

Data from the catalogue:

- Rated speed n_{rated}: 6000 rpm ➞ Setting in C00087
- Rated current I: 2.4 A ➞ Setting in C00088
- Rated torque M_N: 0.5 Nm (in S1 operation: 0.55 Nm)
- Characteristic - maximum torques:

[5-36] Torque/speed characteristic for motor type MCS 06C60 from the catalogue

Note!

At present, relative current values are still expected for the specification of the interpolation points in subcodes 2, 4, 6, 8 of C01196. This example, however, already uses relative torque values, the entry of which shall be possible at a later date.

Parameters	setting	Info
C00128/1	1.0 min	Thermal time constant - winding
C00128/2	14.2 min	Thermal time constant - laminated core/housing
C01195	27 %	Percentage of the winding in the final temperature. (Only the laminated core percentage is known.)
C01196/1	0 %	Speed = "0" (standstill)
C01196/2	160 %	Permissible motor torque at standstill = 0.8 Nm / 0.5 Nm * 100 %
C01196/3	0 %	Speed n_2 from which the torque must be reduced for self-ventilated motors.
C01196/4	160 %	Permissible motor torque at speed n_2 (torque reduction)
C01196/5	100 %	Rated speed (≡ 6000 rpm)
C01196/6	100 %	Permissible motor torque at rated speed (≡ 0.5 Nm)
C01196/7	100 %	Speed above rated speed
C01196/8	100 %	Permissible motor torque at speed n_4 (field weakening)

5.9.2.3 UL 508-compliant I²xt motor temperature monitoring

The following test steps 1 ... 3 are part of the UL 508C-compliant device acceptance.

They have to be executed successfully during the I²xt motor monitoring.

Test step 1

- Motor overload: 6 x $I_{rated,mot}$($I_{rated,mot}$: Rated motor current (C00088))
- Trigger time: Max. 20 s after the overload has occurred

Code	setting	Info
C00128/2	≤ 11.8 min	Thermal time constant - laminated core/housing
C01195	0 %	Percentage of the winding in the final temperature
C00120	100 %	Switch-off threshold of motor overload protection (I²xt)

Test step 2

- Motor overload: 1,1 x $I_{rated,mot}$($I_{rated,mot}$: Rated motor current (C00088))
- In case of a motor field frequency of 10 Hz, the I²xt motor monitoring has to be tripped faster than with a motor field frequency of 20 Hz.

Code	setting	Info
C01196/1	0 %	Speed = 0 (standstill)
C01196/2	< 100 %	Permissible motor torque at standstill
C01196/3	(20 Hz / C00089) * 100 %	Speed n_2 from which on the torque must be reduced
C01196/4	100 %	Permissible motor torque at speed n_2 (torque reduction)

Test step 3

- After mains switching and a motor load > 100 % of the (motor current (C00054) > rated motor current (C00088), I²xt motor monitoring must be tripped faster than before mains switching with the same overload.
- From software version V11.0:
  Initial value of the thermal model of the I²xt motor monitoring: C01197 > 0 %.

Example for a UL 508C-compliant total parameterisation of the I²xt motor monitoring of the device:

Code	setting	Info
C00120	100 %	Switch-off threshold of motor overload protection (I²xt)
C00128/2	≤ 11.8 min	Thermal time constant - laminated core/housing
C01195	0 %	Percentage of the winding in the final temperature
C01196/1	0 %	Speed = 0 (standstill)
C01196/2	< 100 %	Permissible motor torque at standstill
C01196/3	(20 Hz / C00089) * 100 %	Speed n_2 from which on the torque must be reduced
C01196/4	100 %	Permissible motor torque at speed n_2 (torque reduction)
C01196/5	100 %	Rated speed
C01196/6	100 %	Permissible motor torque at rated speed
C01196/7	100 %	Rated speed
C01196/8	100 %	Speed above rated speed
C01197	> 0 %	Initial value of the thermal model of the I²xt motor monitoring

5.9.3 Motor temperature monitoring

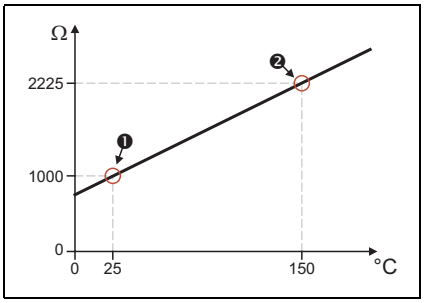
If the winding temperature detected by the motor temperature sensor exceeds the limit value set in C00121, the response set in C00584 is activated as advance warning.

- In the Lenze setting the "Warning" response occurs if the winding temperature exceeds 120 °C.
- As soon as the fixed limit value of 150 °C is exceeded, the response set in C00583 is activated (default setting: "Fault").
- If an open circuit is detected in the motor temperature sensor, the response set in C00594 (default setting: "Fault") is activated.

Note!

By setting C00583 = "0" the monitoring response and the temperature correction is switched off within the motor control (identification and parameter correction)

This setting for example is reasonable if no usable winding temperature signal is available.



Tip!

The winding temperature currently detected by the motor temperature sensor is displayed in C00063.

5.9.3.1 Specific characteristic for the motor temperature sensor

If required, you can define and activate a special characteristic for the motor temperature sensor.

- The specific characteristic is defined on the basis of two grid points which must be set in C01191 and C01192. Those two points define a line which is extrapolated to the right and to the left.
- The special characteristic is activated by setting C01190 = "1".
- In the Lenze setting, the specific characteristic is defined as follows:

[5-37] Lenze setting of the special characteristic

- Interpolation point❶
  - C01191/1 = 25 °C
  - C01192/1 = 1000 Ω
- Interpolation point❷
  - C01191/2 = 150 °C
  - C01192/2 = 2225 Ω

Note!

- If a motor is selected from the motor catalogue, parameters C01190, C01191, and C01192 are overwritten!
- If the controller measures a resistance below 122 Ω, this is interpreted as a sensor error and a temperature of 255 °C is output.

The following applies from software version V4.0:

- Sometimes a short circuit is a desired state (e.g. temperature contact closed below 140 °C). For this purpose, the interpolation point 1 (C01191/1) must be below 122 Ω to prevent the triggering of sensor errors. In this case the temperature continues to be calculated.

5.9.3.2 Motor temperature monitoring (PTC)

For detecting and monitoring of the motor temperature, a PTC thermistor (DIN 44081/DIN 44082) or a thermal contact (NC contact) can be connected to the terminals X106/T1 and X106/T2.

Stop!

- This monitoring is only active if the controller is supplied via the line side, i.e. if the DC-bus voltage (U_z) > undervoltage threshold (LU).
- The controller can only evaluate one PTC thermistor!
  Do not connect several PTC thermistors in series or parallel.
- If several motors are operated on one controller, use thermal contacts (NC contacts) connected in series.
- To achieve full motor protection, an additional temperature monitoring with separate evaluation must be installed.

Note!

- In the Lenze setting (C00585 = "0: No response"), motor temperature monitoring is deactivated!
- Lenze three-phase AC motors are provided with a thermal contact on delivery.

- The monitoring responds from a resistance value of 1.6 kΩ at connections X106/T1 and X106/T2, see functional test below.
- If the monitoring responds:
  - The error response set in C00585 is activated (Lenze setting: "No response").
  - the error message "PTC has triggered" (0x0077000f) is entered into the logbook of the controller.
  - the status output *MI_bMotorOverloadWarning* is set to TRUE.

Tip!

We recommend to always activate the PTC input when using motors which are equipped with PTC thermistors or thermostats. This prevents the motor from being destroyed by overheating.

Functional test

Connect a fixed resistor to the PTC input:

- R > 4 kΩ : Fault message must be activated.
- R < 1 kΩ : Fault message must not be activated.

5.9.3.3 Temperature monitoring of a second motor

This function is available from software version V7.0!

From software version V7.0 onwards, two motor temperature sensors can be evaluated simultaneously via the two encoder inputs X7 and X8 when two motor are used (e.g. double motor for a storage and retrieval unit). For this purpose, the selection "X7 and X8 in parallel" must be set as feedback system for the motor temperature in C01193.

- In this case, always the higher temperature of the two detected temperatures is displayed as the current motor temperature on the **Diagnostics** tab and in C00063.
- Moreover, the following display parameters are available from software version V6.0 onwards:
  - C01200/1: Motor temperature via X7
  - C01200/2: Motor temperature via X8
- If one of the two detected temperatures exceeds the limit value set in C00121, the response set in C00584 is activated as advance warning.
  - In the Lenze setting the "Warning" response occurs if one of the two winding temperature exceeds 120 °C.
- As soon as one of the two detected temperatures exceeds the fixed limit value of 150 °C, the response set in C00583 is activated (default setting: "Fault").
- If an open circuit is detected in one of the two motor temperature sensors, the response set in C00594 (default setting: "Fault") is activated.
- It is not possible to set different responses for the two temperature monitoring modes.
- For the motor model in the controller, the mean value of both detected temperatures is used.

Related topics:

▸ Brake control ▸ Control of two motor holding brakes (📖 556)

5.9.4 Motor phase failure monitoring

5.9.4.1 Monitoring of the individual motor phases during operation

Failure of one motor phase during operation

If a current-carrying motor phase (U, V, W) fails during operation, the response set in C00597 is executed (Lenze setting: "No response") if two conditions are fulfilled:

- Condition 1: Monitoring is activated

To safely detect a motor phase failure, a certain motor current must flow for the current sensor system.

- Monitoring will therefore only be activated if, in the case of servo control the setpoint of the motor current, and in the case of sensorless vector control or V/f control the actual value motor current (display in C00054) has exceeded a certain current value.
- The current value for the activation can be set in C00599 in [%] with regard to the maximum device current (display in C00789).

- Condition 2: A specific commutation angle was covered without the detection of a current flow.

In this case monitoring works according to the principle of checking for each motor phase that a current flows depending on the commutation angle.

- Monitoring responds if a rotating field is output and hence a specific commutation angle (approx. 150°, electric) is covered without the current having exceeded a (non-parameterisable) threshold that depends on the device power.

Note!

- In case of sensorless vector control or V/f control, the safe detection of a motor phase failure is only carried out if the actual current has exceeded the 3.5-fold value of the threshold parameterised in C00599.
- The dependence on the commutation angle also causes a dependence on the motor type used:
  - The commutation angle and the angle at the shaft (number of pole pairs) of a synchronous machine are proportional. This makes it possible to predict which shaft angle is maximally covered in case of error.
  - An asynchronous machine has an additional slip between the commutation angle and the angle on the shaft. This results in a load dependency due to which it is impossible to predict the maximally covered shaft angle in the event of a fault. In certain applications (e.g. hoists during lowering operation at non-zero speeds) it may be possible that a rotating field is no longer applied. Instead, a DC current flows. In this case, condition 2 is no longer met.

Failure of multiple motor phases during operation

This function is available from software version V10.0!

The following operating modes enable the detection of multiple motor phases during operation:

- VFCplus: V/f control closed loop
- SLVC: sensorless vector control

The monitoring for failure of multiple motor phases is *active* if

1. C00597 is set to a response other than "No response" (Lenze setting) and
2. the motor voltage exceeds the threshold value parameterised in C02867.

The "Motor disconnected" fault message is issued if the motor current is lower than the device-dependent threshold value for > 20 ms.

The monitoring for failure of multiple motor phases can be *deactivated* if a value of 1000.0 V is parameterised in C02867.

5.9.4.2 Checking the individual motor phases before operation is started

This function is available from software version V5.0!

From software version V5.0 a check via test signal application has been added. It injects a current into the machine before the actual operation is started, by means of which both a motor phase failure and the existence of the motor are checked. Only after the check has been carried out successfully, the actual operation is continued.

- The setpoint current amplitude corresponds to the lower of the two following values:

$$50\,\% \cdot \sqrt{2} \cdot \text{Rated device current}$$

or

$$50\,\% \cdot \sqrt{2} \cdot \text{Rated motor current}$$

- The test signal application is activated directly after controller enable if the following conditions are fulfilled:
  - In C00597 a response other than "No response" is set.
  - No test mode is activated (C00398 = 0).
  - No identification procedure is active (by device command C00002 = "51", "52", "71" or "72").
- The check actuates the response set in C00597 if one or more motor phase currents have not reached a certain threshold value within 5 ms after controller enable.
  - The threshold value depends on the device power and cannot be parameterised.
  - If only one motor phase current does not reach the threshold value, "Motor phase U/V/W not available" is entered in the logbook.
  - If several motor phases do not reach the threshold value, the motor is considered as not connected, and "Motor not connected" is entered in the logbook.
- The check is completed successfully if all three motor phase currents have exceeded the threshold value. Then the actual operation is continued immediately.

Note!

- As the check is cancelled immediately if all three motor phase currents have exceeded the threshold value, the setpoint current usually is not achieved.
- In order to be able to achieve the threshold value used for the check, the rated motor current must at least be 10 % of the maximum device current (display in C00789).
- This monitoring is independent of the further rotation of the commutation angle.

5.9.4.3 Limits of motor phase failure monitoring

Motor phase failure monitoring can be activated for both synchronous and asynchronous motors. However, it is possible that a current flow cannot be detected for sure in the case of certain operating statuses of correctly connected synchronous motors. Hence, a fault is triggered.

The following table provides an overview:

Operating status		Synchronous motor	Asynchronous motor
Check of the motor phases prior to operation		ž	ž
Check of the motor phases during operation			
• I_q < C00599	at standstill	☐	☑
	when motor is rotating	☐	☑
• I_q ≥ C00599	at standstill	☐	☑
	when motor is rotating	☑	☑

Explanation	
☑	Phase failure is detected for sure.
☐	Phase failure detection may trip without a fault pending.
I_q	Torque-forming current component

Special case: Hoist

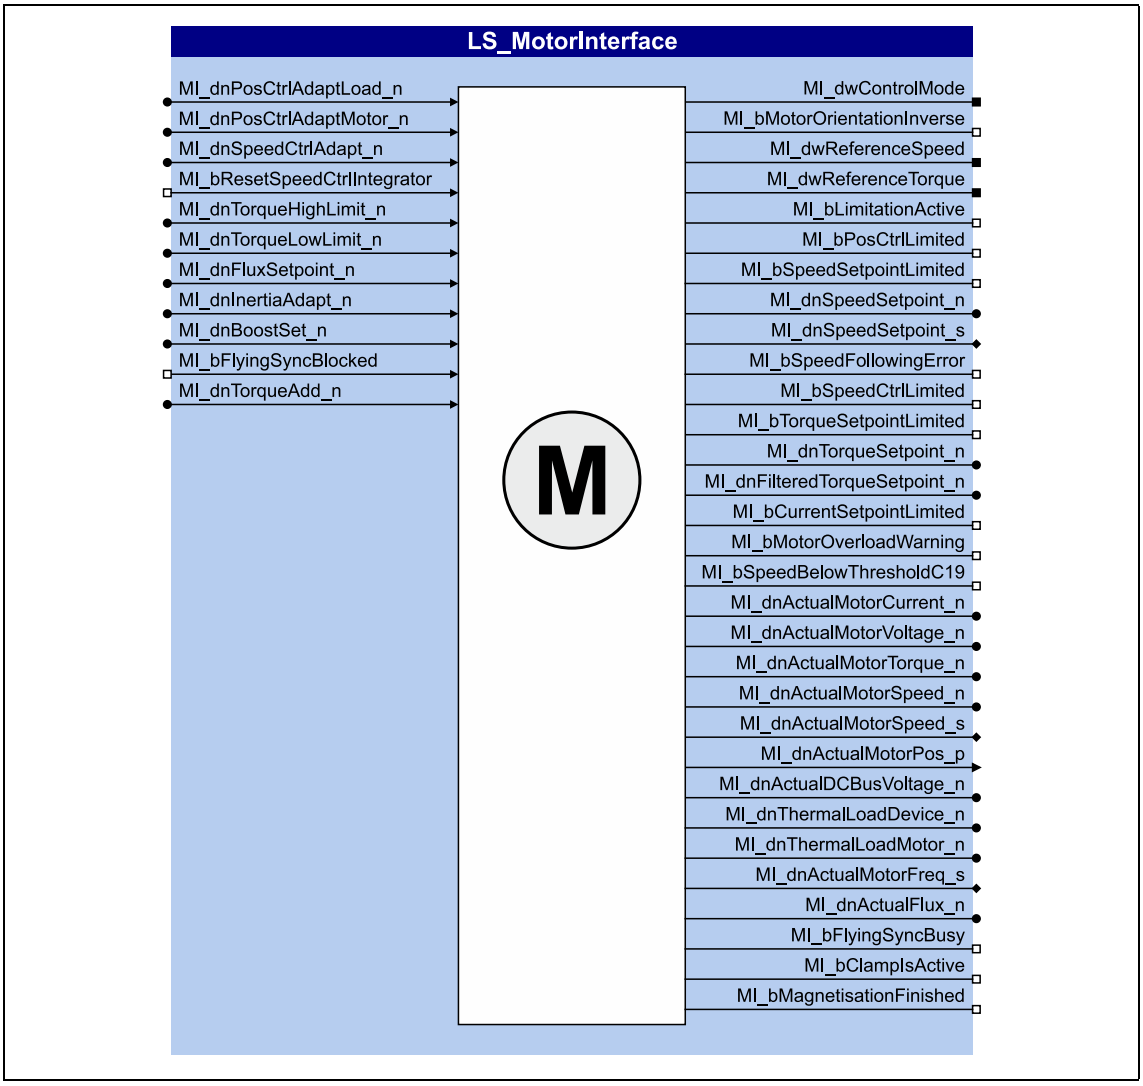
The special case "Hoist" is already referred to in the chapter
▸ Monitoring of the individual motor phases during operation (📖 229)

Motor phase failure monitoring may trigger a fault message in a hoist if the applied asynchronous motor reaches the following working point:

- The hoist moves downwards, i.e. the motor is in generator mode.
- The slip frequency equals the field frequency in terms of amount. Both frequencies mutually neutralise themselves due to their opposite effective directions.

5.9.5 Maximum current monitoring

The ultimate motor current I_{ULT} to be parameterised in C00620 is a limit value to protect the motor from destruction or influence of the rated data.



- This limit value must not be travelled cyclically in the drive process.
- The maximum current parameterisable in C00022 should have a sufficient distance from this limit value.
- If the instantaneous value of the motor current exceeds the limit value set in C00620 the response set in C00619 is executed for motor protection (Lenze setting: Fault).

Note!

When you select a Lenze motor from the catalogue and transfer the plant parameters of the motor to the controller, the setting in C00620 is automatically adjusted to the selected motor.

5.10 Internal interfaces | "LS_MotorInterface" system block

The **LS_MotorInterface** system block provides the internal interfaces to the driving machine, consisting of the phase controller, speed controller, and motor control in the function block editor.

Note!

All input and output signals of the motor interface directly refer to the motor!

Inputs

Identifier DIS code | data type	Information/possible settings
MI_dnPosCtrlAdaptLoad_n C02568/1 | DINT	Dynamic change of the proportional gain Vp of the position controller during operation • For software versions lower than V5.0 the following applies: Internal limitation to 10 ... 200 % • From software version V5.0 the following applies: Internal limitation to 0 ... 200 %
MI_dnPosCtrlAdaptMotor_n C02568/2 | DINT	Dynamic change of the proportional gain Vp of the phase controller during operation • For software versions lower than V5.0 the following applies: Internal limitation to 10 ... 200 % • From software version V5.0 the following applies: Internal limitation to 0 ... 200 %
MI_dnSpeedCtrlAdapt_n C02568/3 | DINT	Dynamic change of the proportional gain Vp of the speed controller during operation • If the input is assigned, the following applies: V_P = *MI_dnSpeedCtrlAdapt_n* [%] * C00070 • If the input is not assigned, the following applies: V_P = 100 % * C00070 = C00070 • Internal limitation to 10 ... 200 % ▸ Optimising the speed controller (📖 150)
MI_bResetSpeedCtrlIntegrator C02569/2 | BOOL	Reset integral action component in the speed controller TRUE: Integral action component is reset to "0".
MI_dnTorqueHighLimit_n C02568/4 | DINT MI_dnTorqueLowLimit_n C02568/5 | DINT	Upper/lower limit value for correcting variable of the speed controller and total torque setpoint • These two inputs serve to select an external torque limitation. • If the motor torque reaches the selected limits, the drive can no longer follow the speed setpoint! • If the torque limitation is active, the output *MI_bTorqueSetpointLimited* is set to TRUE. • 100 % ≡ C00057/2 • Only a positive torque is permissible as upper limit value. • Only a negative torque is permissible as lower limit value. • The motor mounting position (C02527) defines the assignment to the limitation inputs of the motor control. • The internally effective torque limit values are displayed in C02559/1...2.
MI_dnFluxSetpoint_n C02568/7 | DINT	Setpoint for the field controller
MI_dnInertiaAdapt_n C02568/8 | DINT	Adaptation of the moment of inertia in [%] • If input is not assigned = 100 % • Internal limitation to 0 ... 200 %
MI_dnBoostSet_n C02568/9 | DINT From V3.0	Boost voltage • 100 % ≡ 1000 V
MI_bFlyingSyncBlocked C02569/16 | BOOL From V3.0	Block flying restart ▸ Flying restart function (📖 212) FALSE: Flying restart function is active TRUE: Flying restart process is blocked.

Identifier DIS code | data type	Information/possible settings	
MI_dnTorqueAdd_n C02568/10 | DINT From V8.0	Additional torque feedforward control value in [%] This input serves to provide an additional torque setpoint. In this way, you can provide an additional torque for the basic functions manual jog, positioning and homing besides the acceleration feedforward control. • 100 % = motor reference torque If the controller is enabled, the torque setpoints at this input have a direct effect on the drive! The user has to • apply the appropriate setpoint for every state of the drive. • avoid setpoint step-changes.	
	- 200 %	
	+ 200 %	

Outputs

Identifier DIS code | data type	Value/meaning	
MI_dwControlMode DWORD	Active control structure of the motor control • Displayed value is bit-coded:	
	Bit 0	Encoderless motor control
	Bit 1	Position control (Setpoint from setpoint position)
	Bit 2	Position control (Setpoint from integrated setpoint speed)
	Bit 3	closed-loop speed control
	Bit 4	Closed-loop torque control
MI_bMotorOrientationInverse BOOL	Parameterised motor mounting position	
	FALSE	Motor mounting position in the same direction, setpoints are not defined.
	TRUE	Motor mounting position in the opposite direction, setpoints are reversed.
MI_dwReferenceSpeed DWORD	Parameterised motor reference speed (C00011) in [rpm]	
MI_dwReferenceTorque DWORD	Reachable motor torque with I_{max_device} (C00022) in [mNm] • 1000 mNm ≡ 1 Nm • Display in C00057/2 in [Nm]	
MI_bLimitationActive C02569/3 | BOOL	Status signal "Internal limitation active" • Group signal for all limitation messages.	
	TRUE	One of the internal limitations is active.
MI_bPosCtrlLimited C02569/4 | BOOL	Status signal "Phase/position controller at the limit"	
	TRUE	The limitation of the phase and/or position controller is active.
MI_bSpeedSetPointLimited C02569/5 | BOOL	Status signal "Resulting speed setpoint at the limit"	
	TRUE	The resulting speed setpoint is limited to the limit values parameterised in C00909/1 and C00909/2.
MI_dnSpeedSetpoint_n DINT	Current speed setpoint from position control and speed feedforward control or direct setpoint selection in [%] • After limitation by the upper speed limit value (C00909/1) and lower speed limit value (C00909/2). • 100 % ≡ Motor reference speed (C00011)	
MI_dnSpeedSetpoint_s DINT	Current speed setpoint from position control and speed feedforward control or direct setpoint selection in [rpm] • After limitation by the upper speed limit value (C00909/1) and lower speed limit value (C00909/2).	

Identifier DIS code | data type	Value/meaning	
MI_bSpeedFollowingError C02569/10 | BOOL	Status signal "Impermissible speed control deviation"	
	TRUE	Speed control deviation is higher than the window set in C00576.
MI_bSpeedCtrlLimited C02569/6 | BOOL	Status signal "Speed controller at the limit"	
	TRUE	The speed controller limitation is active.
MI_bTorqueSetpointLimited C02569/7 | BOOL	Status signal "Total torque setpoint at the limit"	
	TRUE	The total torque setpoint is limited.
MI_dnTorqueSetpoint_n DINT	Current torque setpoint from speed control and torque feedforward control or direct setpoint selection • After limitation by *MI_dnTorqueLimit_n*. • 100 % ≡ C00057/2	
MI_dnFilteredTorqueSetpoint_n DINT	Filtered torque setpoint (after jerk limitation and band-stop filters) • 100 % ≡ C00057/2	
MI_bCurrentSetpointLimited C02569/8 | BOOL	Status signal "Setpoint for current controller at the limit"	
	TRUE	The setpoint for the current controller is limited to I_{max_device} (C00022).
MI_bMotorOverloadWarning C02569/11 | BOOL	Status signal "Motor overload" • Group signal for warning signals from temperature monitoring (KTY, PTC, thermal switch) or I^2xt monitoring.	
	TRUE	One of the monitoring modes for motor overload protection is active.
MI_bSpeedBelowThresholdC19 C02569/9 | BOOL	Status signal "Standstill reached"	
	TRUE	The current speed is below the threshold set in C00019.
MI_dnActualMotorCurrent_n DINT	Actual motor current • 100 % ≡ I_{max_device} (C00789) • Display in C00780 in [A]	
MI_dnActualMotorVoltage_n DINT	Current motor voltage • 100 % ≡ 1000 V • Display in C00783 in [V]	
MI_dnActualMotorTorque_n DINT	Current motor torque • 100 % ≡ C00057/2 • Display in C00774 in [Nm]	
MI_dnActualMotorSpeed_n DINT	Current speed of the motor shaft in [%] • 100 % ≡ Motor reference speed (C00011)	
MI_dnActualMotorSpeed_s DINT	Current speed of the motor shaft in [rpm] • Display in C00772	
MI_dnActualMotorPos_p DINT	Current position of the motor shaft in [increments] • Display in C00770	
MI_dnActualDCBusVoltage_n DINT	Current DC-bus voltage • 100 % ≡ 1000 V	
MI_dnThermalLoadDevice_n DINT	Thermal device utilisation in [%] • Current result of the Ixt calculation. • Display in C00064 ▸ Monitoring of the device utilisation (📖 111)	
MI_dnThermalLoadMotor_n DINT	Thermal motor utilisation in [%] • Current result of the I^2xt calculation. • Display in C00066 ▸ Motor monitoring (I^2xt) (📖 218)	
MI_dnActualMotorFreq_s DINT From V3.0	Current motor frequency in [Hz] The motor frequency corresponds to the field frequency [Hz]. Field frequency [Hz] = motor speed × number of motor pole pairs	

Identifier DIS code | data type	Value/meaning	
MI_dnActualFlux_n DINT From V3.0	Actual flux value	
MI_bFlyingSyncBusy C02569/13 | BOOL From V3.0	"Flying restart function active" status signal ▸ Flying restart function (📖 212)	
	TRUE	Flying restart function is active
MI_bClampIsActive C02569/14 | BOOL From V3.0	Status signal "Clamping is active"	
	TRUE	Clamping is active.
MI_bMagnetisationFinished C02569/15 | BOOL From V3.0	Status signal "Motor magnetisation is completed" Note: This bit is only supported in the SLVC control mode (sensorless vector control).	
	TRUE	Motor magnetisation is completed.

6 Encoder evaluation

This chapter contains information on how to use feedback systems for the motor control.

Danger!

If the encoder/resolver is used as motor encoder:
In case of error, safe operation of the motor is no longer guaranteed!

When servo control is used:

- For the (open circuit) monitoring of the encoder/resolver for reasons of safety always the "Fault" response (Lenze setting) should be set!

When V/f control is used:

- For this type of motor control, the drive basically is to coast down after an encoder failure and may not stop, therefore the "Warning" response is to be set for the (open circuit) monitoring in this case!

Parameters for the (open circuit) monitoring:

- C00580: Response to open circuit of encoder
- C00586: Response to open circuit of resolver
- C00601: Response to communication error of encoder

Note!

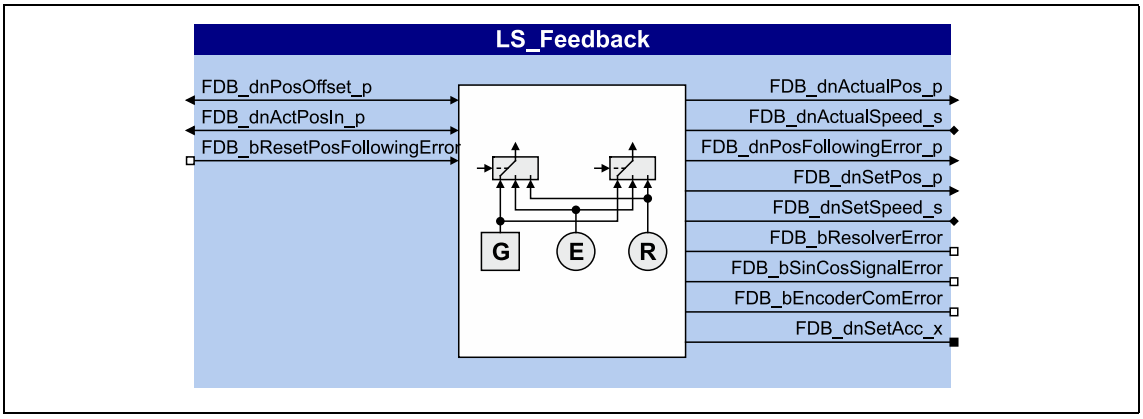
The encoder position is stored safe against mains failure in the memory module and is therefore known to the drive control even after the mains has been switched.

With regard to their position resolution, higher-level applications are based on the resolution of the encoder which is activated for position control.

Behaviour of the home position after mains switching

If the home position/information is also to be available after mains switching, the setting C02652 = "1: Received" is required.

- Another condition for keeping the home position/information after mains switching is the compliance with the maximum permissible angle of rotation of the encoder, which can be set in C02653.
- When resolvers or single-turn absolute value encoders are used and the mains is switched off (24 V supply off), the encoder may only be moved by ½ revolution since otherwise the home position will get lost due to the ambiguity of the encoder information.



Note!

A digital position encoder connected to the "LS_Feedback" system block must have a position resolution of exactly 16 bits if a safety module SM301 is used together with the safe speed detection.

See also: ▸ Parameterising motor encoder (📖 129)

6.1 Internal interfaces | "LS_Feedback" system block

The **LS_Feedback** system block provides the internal interfaces for the basic function "Encoder evaluation" in the function block editor.

Inputs

Identifier Data type	Information/possible settings	
FDB_dnPosOffset_p DINT	Offset for position setpoint and actual position in [increments]	
FDB_dnActPosIn_p DINT	External actual position in [increments] • For the selection of an external actual position with a corresponding position control. ▸ Use of an external position encoder (📖 242)	
FDB_bResetPosFollowingError BOOL	Input for deleting the following error	
	True	The position setpoint is equated with the actual position value.

Outputs

Identifier DIS code | data type	Value/meaning	
FDB_dnActualPos_p DINT	Current position of the position encoder in [increments]	
FDB_dnActualSpeed_s DINT	Current speed of the position encoder in [rpm]	
FDB_dnPosFollowingError_p DINT	Current following error in [increments]	
FDB_dnSetPos_p DINT	Set position calculated by active basic drive function in [increments] • Considering the motor mounting position. • In the case of an active speed or torque control (instead of position control) the actual position (*FDB_dnActualPos_p*) is shown at this output.	
FDB_dnSetSpeed_s DINT	Setpoint speed calculated by active basic drive function in [rpm] • Considering the motor mounting position.	
FDB_bResolverError C02579/1 | BOOL	Status signal "Resolver error"	
	TRUE	A resolver error (e.g. open circuit) has occurred.
FDB_bSinCosSignalError C02579/2 | BOOL	Status signal "sine/cosine encoder error"	
	TRUE	A sine/cosine encoder error has occurred.

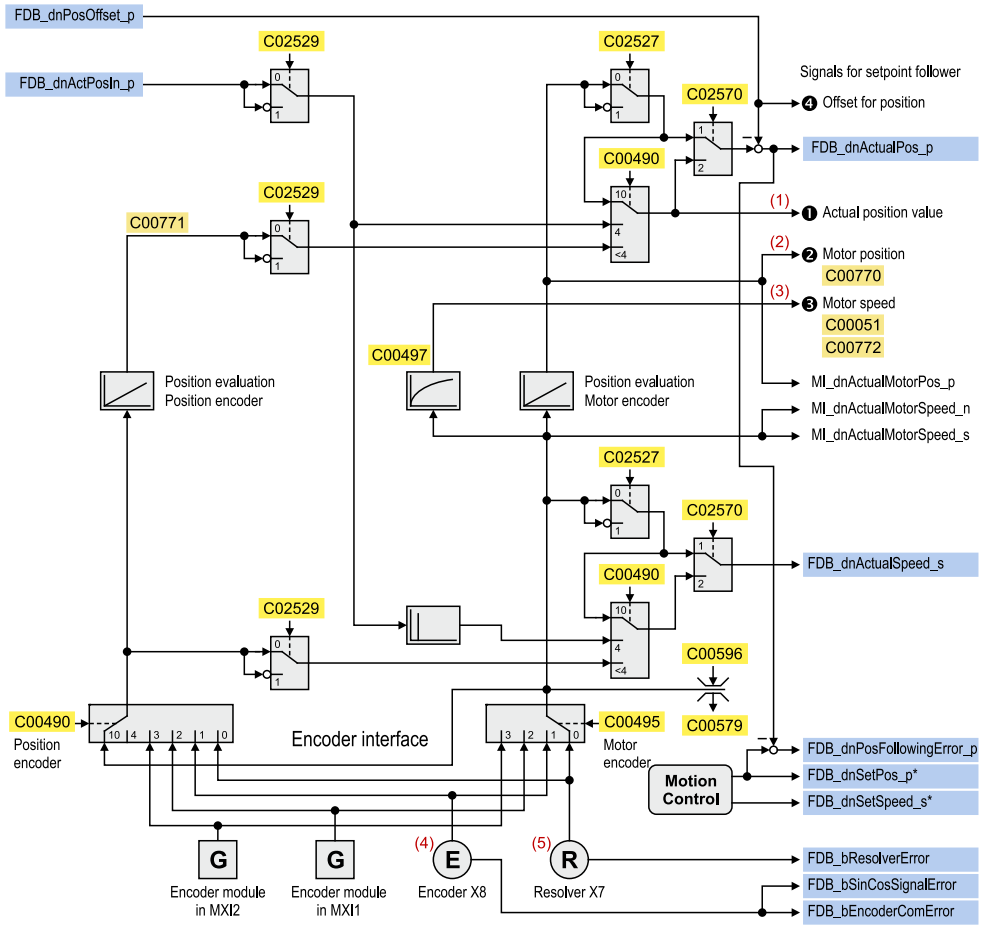
Identifier DIS code | data type	Value/meaning
FDB_bEncoderComError C02579/3 | BOOL	Status signal "Encoder communication error" TRUE: An encoder communication error has occurred.
FDB_dnSetAcc_x DINT From V7.0	Setpoint acceleration calculated by active basic function • Considering the motor mounting position. • For the basic functions Stop, Manual jog, Homing and Positioning, the internal acceleration resulting from the profile generation is output. • For the basic functions Quick stop, Position follower and Speed follower, the acceleration from the differentiated setpoint speed is determined. C02562 serves to filter the determined acceleration. • With an active torque control or in a non-controlled operation (function states "Controller not ready" and "Error"), the value "0" is output.

6.1.1 Use of an external position encoder

The *FDB_dnActPosIn_p* input serves to evaluate an external encoder (CAN, SSI, Profibus) for the position control.

- Via this input, a current actual position of an external encoder in [increments] can be directly transferred to the encoder evaluation.

How to activate the use of the external actual position:



On the **Application parameters** tab in the dialog level *Overview* → *Drive interface* → *Machine parameters:*

1. Select the "Position controller active" setting in the **Position control structure** list field (C02570), so that the position encoder is evaluated.
2. Set "From application" in the **Position encoder selection** list field (C00490).

Note!

- Encoder inversion and offset selection *FDB_dnPositionOffset_p* also affect the external actual position.
- If the use of the external actual position preset via *FDB_dnActPosIn_p* is activated, the "Home position known" status (*HM_bHomePosAvailable* = TRUE) is automatically set and homing with the basic function "Homing" cannot be activated anymore.
- If the traversing range (C02528) is set to "Modulo", the external actual position also has to be defined as modulo (0 ... cycle-1).

6.2 Signal flow

MI_... = output signals of the motor interface. ▸ Internal interfaces | "LS_MotorInterface" system block (📖 234)
* Set position and setpoint speed are calculated from the basic function that is currently active.

[6-1] Signal flow - encoder evaluation

Internal variables of the motor control (oscilloscope signals)

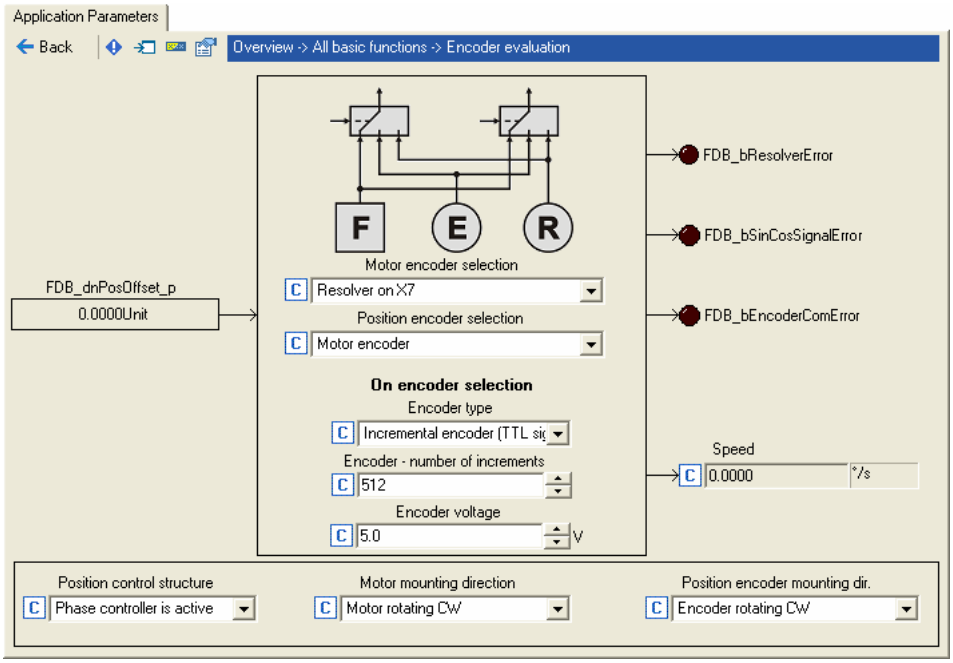
- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(1)	Position.dnActualLoadPos	Actual position
(2)	Position.dnActualMotorPos	Current motor position
(3)	Speed.dnActualMotorSpeed	Current motor speed
(4)	Speed.dnActualEncoderSpeed	Current encoder speed
(5)	Speed.dnActualResolverSpeed	Current resolver speed

6.3 Parameter setting

Short overview of parameters for the encoder evaluation:

Parameters	Info	Lenze setting	
		Value	Unit
C00058/1	Resolver pole position	-90.0	°
C00058/2	Rotor displ. angle encoder	0.0	°
C00058/3	Module pole position	0.0	°
C00080	Number of resolver pole pairs	1	
C00416	Resolver error correction	0	
C00417	Dynamics of the resolver evaluation	100	%
C00418	Activate resolver error compensation	Deactivated	
C00420	Number of encoder increments	512	
C00421	Encoder voltage	5.0	V
C00422	Encoder type	Incremental encoder (TTL signal)	
C00423	SSI encoder: Bit rate	400	kbps
C00424	SSI encoder: Data word length	25	Bit
C00427	TTL encoder signal evaluation	4x evaluation (A, B)	
C00435/1...8	SSI encoder: Partword starting position	0	
C00436/1	SSI encoder: partword length (partword 1)	31	
C00436/2...8	SSI encoder: partword length (partwords 2...8)	0	
C00437/1...8	SSI encoder: partword coding	Binary coded	
C00490	Position encoder selection	Motor encoder	
C00495	Motor encoder selection	Resolver X7	
C00497	Speed act. val. time const.	2.0	ms
C00579	Resp. to speed monitoring	Off	
C00580	Resp. to encoder open circuit	Error	
C00586	Resp. to resolver open circuit	Error	
C00601	Resp. to encoder fault	Error	
C00621	Resp. to angular drift of encoder	No response	
C02527	Motor mounting direction	Motor rotating CW	
C02529	Position encoder mounting direction	Encoder rotating CW	
C02570	Position control structure	Phase controller is active	
C02572	Speed setpoint (enc. eval.)	-	Unit/s
C02573	Position setpoint (enc. eval.)	-	Unit
C02574	Actual speed (encoder eval.)	-	Unit/s
C02575	Actual position (enc. eval.)	-	Unit
C02576	Following error	-	Unit
C02577	External actual position	-	Unit
C02578	Offset actual pos. value/setp.	-	Unit
C02760	Activate Encoder	Deactivated	
C02761	Resolution Multiturn	-	Rev.
C02762	Encoder position	-	Steps.
C02763	Encoder position	-	Rev.
C02764	Encoder speed	-	rpm
C02765	ENC_bError	-	
C02862/1	Resolver: cos gain	100	%



Greyed out = display parameter

Parameters	Info	Lenze setting	
		Value	Unit
C02862/1	Resolver: sine gain	100	%
C02863	Resolver: Angle correction	0	
Greyed out = display parameter			

How to get to the dialog for setting the encoder evaluation parameters:

1. Go to the *Project view* of the »Engineer« and select the 9400 HighLine controller.
2. Select the **Application parameters** tab from the *Workspace*.
3. Click the button **All basic functions** in the *Overview* dialog level.
4. Click the button **Encoder evaluation** in the dialog level *Overview* → *All basic functions*.

Parameterisation dialog in the »Engineer«

See also: ▸ Parameterising motor encoder (📖 129)

6.3.1 Controller configuration

The device interfaces for the encoder on the motor side and, if available, on the load side are directly assigned to the corresponding control according to the structure of the position control selected (C02570):

	Phase control (Lenze setting)	position control
Cycle time:	250 µs	Application-dependent
Dead time:	Smaller dead time in the actual value channel	Same dead time for position setpoint and actual position
Use:	In positioning technology and single-axis applications or if only one encoder is used.	In multi-axis applications or if a position encoder is used in addition to the motor encoder.

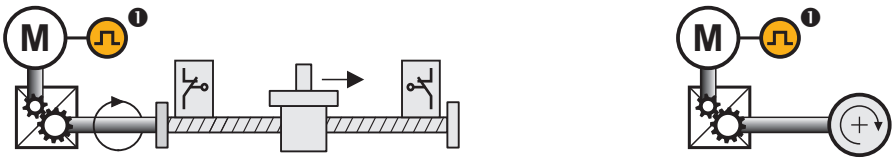
- If only an encoder on the motor side is available, this "motor encoder" provides the actual value signals for the phase/position control and the speed control.
  - In this case both the angle control and the position control can be selected.
  - When selecting the position control, make sure that the position encoder selection "10: Motor encoder (C00495)" is set in C00490. With this selection, the mounting position and the resulting gearbox factor are already considered.
  - The motor encoder supports the secondary servo control irrespective of the use for position and speed control (commutation).
- If an additional encoder is available on the load side, this "position encoder" only supports the position control and C02570 accordingly has to be set to "Position controller active", so that the position encoder is evaluated.
  - The used position encoder must be set in C00490.
  - The position encoder mounting direction must be set in C02529.
  - The starting position of the position encoder can be set via the basic function "Homing".

Note!

When the basic function "Quick stop" is activated, the controller configuration is always switched over to angle control internally, irrespective of the setting in C02570.

- If the basic function "Quick stop" is to be used, the gain of the phase controller (C00254) must also be set correctly for the "Position control" controller configuration.

For the technology applications for the interconnection via the "Electrical shaft", the controller configuration is set to position control in the default setting.



From software version V7.0 onwards, the selection "3: Position controller active" is available in C02570.

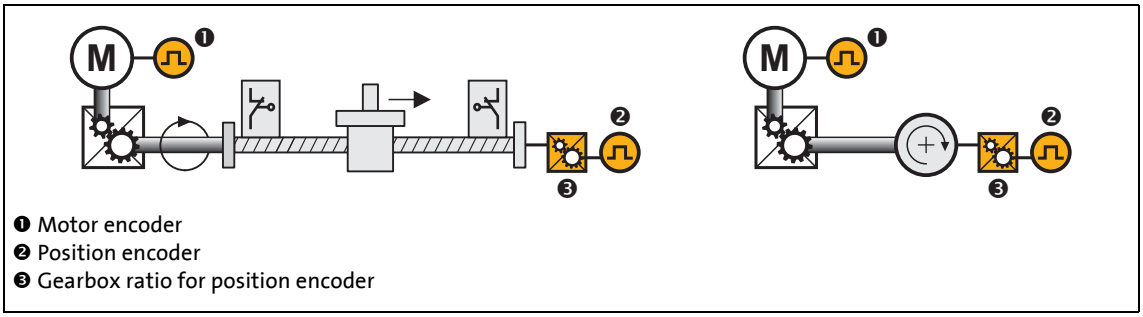
- In contrast to the already existing selection "2: Position controller active (<= FW V5.xx)", this selection considers the gearbox factor.
- Further explanations on this can be obtained from the following table:

C02570 = 2: Position controller active (<= FW V5.xx)	C02570 = 3: Position controller active
When the separate position encoder at the output end is used, the reference speed to the tool is assumed. This causes the acceleration and deceleration times not to refer to the motor but to the encoder. In order to re-establish the motor reference, the desired acceleration time of the corresponding function must be multiplied by the resulting gearbox factor.	When the separate position encoder at the output end is used, the reference speed is referred to the motor. Thus, all acceleration and deceleration times are calculated with regard to the reference speed at the motor.
Example: • Motor reference speed (C00011) = 3000 rpm • Resulting gearbox factor = 10 • Acceleration time = 1 s With 10 % setpoint selection:	
• Motor speed = 100 % (3000 rpm) • Tool speed = 300 rpm • Acceleration time up to 10 % setpoint selection (100 % motor speed) = 0.1 s	• Motor speed = 10 % (300 rpm) • Tool speed = 30 rpm • Acceleration time up to 10 % setpoint selection (10 % motor speed) = 0.1 s

6.3.2 System with motor encoder

No encoder is installed on the load side. The motor position (angle of rotation) and motor speed are detected via the motor encoder selected in C00495 and are converted with regard to the load side.

❶ Motor encoder



[6-2] Schematic diagram - feedback with position encoder = motor encoder

The actual position and actual speed values on the machine side result from the conversion via the gearbox factor on the motor side (C02520/C02521) and the feed constant (C02524).

See also:
- Gearbox ratio (📖 34)
- Feed constant (📖 39)

6.3.3 System with motor encoder and position encoder

The optional position encoder is used as a feedback for the position control and transmits the position of slide or drive roll to the controller.

❶ Motor encoder
❷ Position encoder
❸ Gearbox ratio for position encoder

[6-3] Schematic diagram - feedback with separate position encoder

In this case, the actual position and actual speed values on the machine side result from the conversion of the position encoder position via the resulting gearbox factor (ratio of the motor speed to the position encoder speed; display in C02531/3) and the feed constant (C02524).

How to activate the use of a separate position encoder:

On the **Application parameters** tab in the dialog level *Overview* → *Drive interface* → *Machine parameters:*

1. Select the "Position controller active" setting in the **Position control structure** list field (C02570), so that the position encoder is evaluated.
2. Select the position encoder available in the **Position encoder selection** list field (C00490).
3. Select the gearbox ratio of the position encoder (ratio of load speed to encoder speed) as a quotient (numerator/denominator) which results from the resulting teeth number:
   - Enter numerator in the input field **Gearbox fact. num.: Pos. enc.** (C02522).
   - Enter denominator in the input field **Gearbox fact. denom.: Pos. enc.** (C02523).
4. If required, adapt the position encoder mounting direction via the **Position encoder mounting direction** list field (C02529). The position encoder mounting direction is preset to "Encoder rotating CW".

Tip!

In C02531/2 the gearbox factor is displayed in decimal format.

Important reference variables converted to the load side:
- Motor reference speed (C00011) → Load reference speed (C02542)
- Reference torque (C00057/2) → Load reference torque (C02543)

If a position encoder is used as well as the motor encoder, it is essential that position control is used instead of angle control (C02570 = 2 or 3).

Rotative encoders as well as linear distance measuring devices can be used as position encoders.

The feedback from position encoders (SSI-, EnDat-, TTL-, Sin/Cos-, Hiperface encoder) is transferred via encoder input X8, with the exception of fieldbus encoders.

If a fieldbus encoder is used, the fieldbus interface is used for position feedback.
The actual position value is passed on to the position controller via the system block available for

encoder evaluation **LS_Feedback**. For this purpose, the actual position value must be connected to the input *FDB_dnActPosIn_p*.

Note!

The use of an SSI encoder is a special case:

- Position feedback takes place via encoder input X8 as is the case with most position encoders.
- Processing of the actual position value is carried out in the same way as in the case of a fieldbus encoder. The actual position is passed on to the position controller via the system block available for encoder evaluation **LS_Feedback**. For this purpose, the actual position value must be connected to the input *FDB_dnActPosIn_p*.

6.3.4 Position feedback with a linear distance measuring device

This function extension is available from software version V4.0!

Linear distance measuring devices (e.g. with Hiperface® or EnDat interface) are only used for additional position feedback in the case of servo-controlled drives. For speed and current control, a motor encoder is always necessary.

For applications with low requirements regarding dynamic response and speed accuracy, the use of sensorless V/F control (VFCplus) and position feedback for position control is possible.

6.3.4.1 Conversion from linear to rotative encoder variables

Like the signals of rotative position encoders, the signals of linear distance measuring devices are read in at encoder input X8. The actual position value of these usually optical encoders is thus directly available for position control. Additional block interconnection is not necessary.

Evaluation at encoder input X8 is designed for rotary encoders. In order to adapt the linear system, conversion to (notional) rotative values, which have to be entered in the code, is necessary.

Conversion for the number of encoder increments in C00420:

In the case of linear distance measurement devices, the encoder resolution is usually indicated in the form of graduations in [μm] or as a number of increments per millimetre [*inc/mm*].

The following rule of thumb can be used to determined the number of encoder increments C00420:

$$\text{Number of encoder increments} = \frac{\text{Feed constant [units/rev]}}{\text{Encoder graduation [units]}}$$

$$\text{C00420 = INT number of encoder increments} = \frac{\text{C02524}}{\text{Encoder graduation}}$$

[6-4] Determination of the number of encoder increments of linear distance measuring devices

The integer value (INT = integer part of the calculation) must be entered in C00420. The resulting rounding-off error is corrected by means of the position encoder gearbox factor (C02522 / C02523) in the machine parameters.
See ▸ Determination of the position encoder gearbox factor of linear distance measuring devices

The resulting maximum position which can be shown can be checked inC02539.

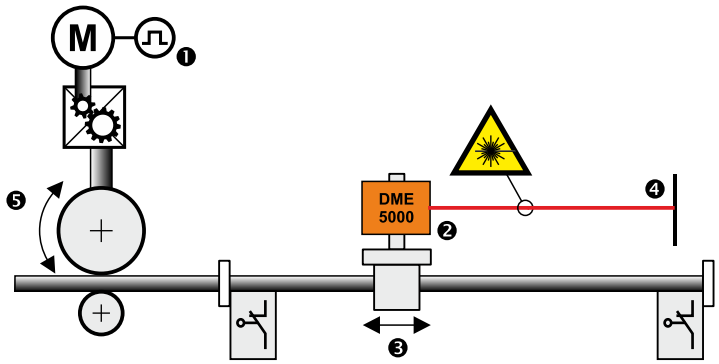
The maximum speed that can be shown is indicated in C02540.

If the necessary speeds and positions for the application can no longer be shown, C00420 can be enlarged. The internal resolution is thus decreased.

Calculation of the position encoder gearbox factor C02522 and C02523

Please note that, when the number of encoder increments in the numerator of the following formula is indicated, the value with decimal places must be given whereas, in the numerator, the integer (INT = integer) is used for purposes of calculation:

$$\text{n encoder - gearbox factor} = \frac{\text{Number of encoder increments (incl. decimal}}{\text{Number of encoder increments (integer}}$$



$$\frac{\text{:522}}{\text{:523}} = \frac{\text{Number of encoder increments (incl. decimal plac}}{\text{C00420}}$$

[6-5] Determination of the position encoder gearbox factor of linear distance measuring devices

Example: Position encoder feedback with a laser distance measuring device

The current position of a positioning unit is detected with a laser distance measuring device (e.g. »DME5000«) with a Hiperface® interface. A graduation of 0.1 mm has been parameterised in the distance measuring device.

The positioning unit is moved by 848.23 mm in an axial direction for each revolution of the slip-free drive roll. The current motor speed is detected by a resolver.

❶ Motor encoder
❷ Laser distance measuring device
❸ Feed
❹ Laser beam hits reflective surface
❺ Circumference of the drive roll = 848,23 mm

[6-6] Schematic diagram of feedback with a laser distance measuring device

Short overview of the parameters:

Parameters	Info	Lenze setting	
		Value	Unit
C00420	Number of encoder increments	8482	
C00422	Encoder type	Absolute value encoder (Hiperface)	
C00490	Position encoder selection	Encoder on X8	
C00495	Motor encoder selection	Resolver on X7	
C02522	Gearbox factor numerator: position encoder	84823	-
C02523	Gearbox factor denominator: position encoder	84820	
C02524	Feed constant	848.23	mm
C02570	Position control structure	Position controller is active	

See also: ▸ Feed constant (📖 39)

6.3.5 Adaptation of the resolver evaluation dynamics

This function extension is available from software version V5.0 onwards!

The resolver evaluation of the controller is adapted to the resolver types mounted in Lenze motors and offers a good compromise between the dynamic performance and interference suppression. If the resolver is used as a speed feedback system, the dynamic performance of the resolver evaluation determines, among other things, the maximum speed controller gain by means of which stable operation is possible.

In a system with an EMC-compliant structure (low interference), you can increase the dynamic performance of the resolver evaluation in C00417 without a loss in quality in the speed signal. By increasing C00417, the evaluation is rendered more dynamic, and thus the speed controller gain Vp (C00070) is also increased without leaving the stable operating range.

The acceleration of the evaluation depends on the cable length, the resolver, and the quality of the electrical shielding. In many cases, a setting of C00417 = 300 % is possible which can double the speed controller gain. The higher gain in the speed controller may reduce following errors.

When a resolver with a number of pole pairs > 1 (C00080 > 1) is used, it may be necessary to increase the dynamics of the resolver evaluation C00417. The following rule of thumb applies for the parameterisation:

$$\text{C00417} = 100\,\% \times \text{Value in C00080}$$

If an SM301 safety module is used to monitor the equipment, a parameterised value in C00417 of > 500 % can cause incorrect triggering of the safety module. A value which is too high must be decreased in order to eliminate incorrect triggering.

6.3.6 Parameterisation of an unknown Hiperface® encoder

This function extension is available from software version V11.0!

Application: A Hiperface® encoder is to be used with the controller, the current firmware of which has not (yet) been stored permanently.

How to parameterise a Hiperface® encoder unknown to the controller:

1. Determine the type code of the encoder.
   - If the encoder has already been connected and read out, the type code is indicated in C00413.
   - Alternatively, the type code can be obtained from the manufacturer or gathered from the documentation for the encoder.
2. Set the type code of the encoder in C00414.
   - Please observe that the decimal format has to be used for the setting. The type codes provided by the manufacturer, however, are in the hexadecimal format.
3. If a multi-turn encoder is used, set the number of displayable resolutions in C00415.
   - This value can also be gathered from the documentation for the encoder.
4. Set the number of encoder increments in C00420.
   - This point must be executed last since it initiates a renewed readout of the encoder.

6.3.7 Parameterisation of a Hiperface® encoder with increased initialisation time

This function extension is available from software version V11.0!

Application: A Hiperface® encoder is to be used at the controller which has an initialisation time that differs from the Hiperface specification. This applies to e.g. the absolute value encoders of the types SEK37, SEL37, SEK52 and SEL52 of the Sick company.

In case of Hiperface® encoders with increased initialisation time, an error message occurs after switching on the controller 0x007b001a ("absolute value encoder: communication error"). This error can be acknowledged but occurs again after every switch-on.

In order to avoid the error message, it is possible to consider the increased initialisation time of the encoder in C00412.

For the absolute value encoders of the types SEK37, SEL37, SEK52 and SEL52 of the Sick company, the required initialisation time in C00412 is = 1200 ms.

The initialisation time required for each case can be obtained from the respective absolute value encoder data sheet.

6.3.8 Use of an SSI encoder at X8

This function extension is available from software version V5.0 onwards!

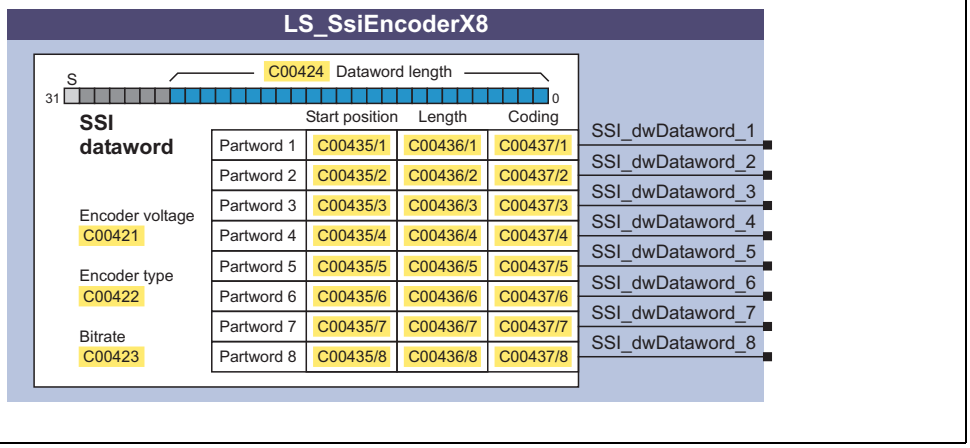
From software version V5.0 all encoders at X8 using the Stegmann SSI protocol are supported.

- Supported bit rates for the SSI communication: 150 ... 1000 kbits
- Supported data word widths: 1 ... 31 bits (effective)
- Supported output code of the SSI encoder: Gray or binary
- The SSI encoder can be used as position encoder or master encoder with a minimum cycle time of 1 ms.
- The SSI encoder can be supplied via X8 up to a maximum voltage of 12 V and a maximum current of 0.25 A.
- The SSI data words received are provided to the application via the LS_SsiEncoderX8 system block for further processing within the function block editor.

Note!

The LS_SsiEncoderX8 SB is only provided within controllers with a MM3xx or MM4xx memory module.

How to parameterise the SSI encoder at X8:



1. Set the supply voltage of the SSI encoder used in C00421.
2. Set the selection "4: SSI encoder" as encoder type in C00422.
3. Set the bit rate for SSI communication in C00423.
   - For SSI protocols, the permissible baud rate is reduced if the cable length is increased. A safe bit rate must be set, depending on the length of the used encoder cable and the electromagnetic interference level.
   - Lenze setting: 400 kbits (for encoder cables with a length of up to ≈ 50 meters)
4. Set the data word width in C00424, i. e. the number of data bits that is used for the transmission of a complete SSI data packet.
   - Lenze setting: 25 bits (Stegmann multiturn SSI encoder)
5. Optionally: Split the SSI data word received into partwords and connect a data conversion from Gray into binary code, which may be required (see the following subchapters).

6.3.8.1 "LS_SsiEncoderX8" system block

The **LS_SsiEncoderX8** system block provides the SSI data words received to the application for further processing in the function block editor.

Note!

- The **LS_SsiEncoderX8** SB is only provided within controllers with a MM3xx or MM4xx memory module.
- If a position is transmitted in the SSI data word, it is output in an unchanged manner with regard to the position format by the **LS_SsiEncoderX8** SB. For a use of the SSI encoder as position encoder the position has to be converted into the 9400 format afterwards by means of the **L_EsEncoderConv** FB.

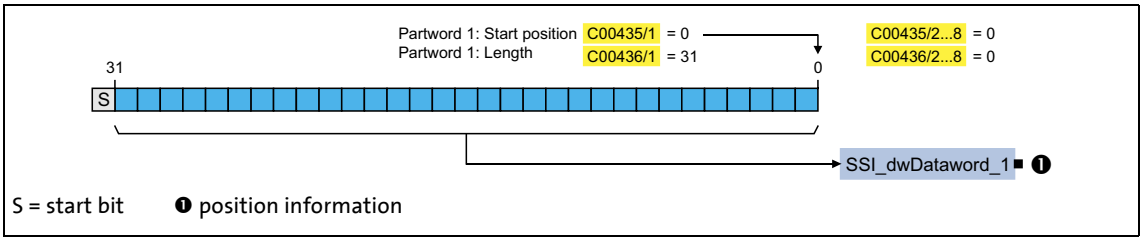
Outputs

Identifier Data type	Value/meaning
SSI_dwDataword_1 DWORD	SSI partword 1 • In the Lenze setting the complete SSI data word received is shown at this output without a conversion of the data format.
SSI_dwDataword_2 ... SSI_dwDataword_8 DWORD	SSI partwords 2 ... 8 • In the Lenze setting these outputs are deactivated. ▸ Dividing the SSI data word into partwords (📖 257)

Gray-binary conversion

If an SSI encoder with Gray coding is used, a data conversion of Gray-to-binary code can be connected in C00437/1...8 individually for each output of the **LS_SsiEncoderX8** SB, and thus for each partword.

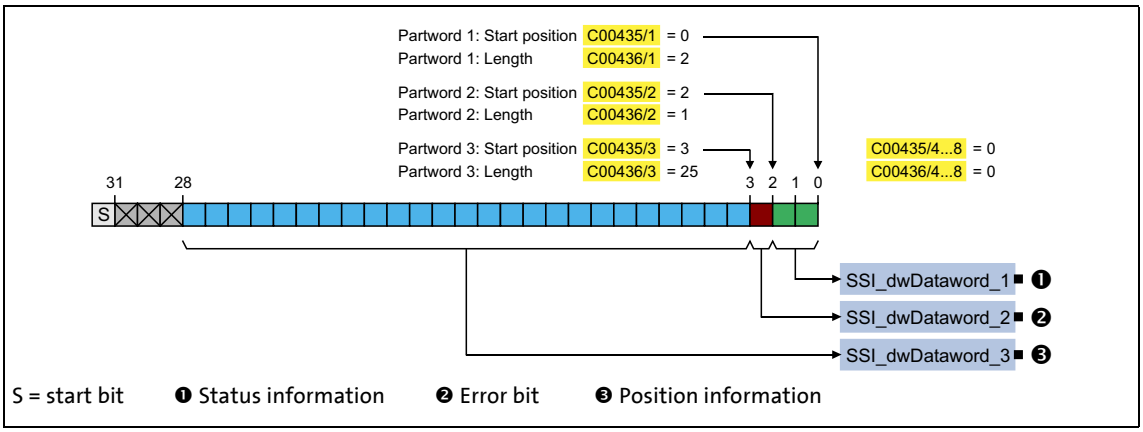
- In the Lenze setting "Binary coded" there is no conversion, i. e. an SSI encoder with binary coding is expected.



6.3.8.2 Dividing the SSI data word into partwords

The LS_SsiEncoderX8 SB can be configured so that it splits up the SSI data word received by the encoder interface into several partwords.

- A separation into partwords is reasonable if the SSI data word also contains other data (like for instance fault or status information) in addition to the position.
- The max. 8 possible partwords are fixedly assigned to the outputs *SSI_dwDataword_1* ... *SSI_dwDataword_8*.
- The partwords are configured via the following parameters:



Parameters	Info
C00435/1...8	**Starting position for partwords 1 ... 8** In order to be able to display the individual components of the SSI data word received at different outputs, this code serves to specify the bit position with which the partword for the respective output starts for the eight possible outputs of the LS_SsiEncoderX8 SB . Subcode 1 is fixedly assigned to the first output, subcode 2 to the second output, etc.
C00436/1...8	**Length of the partwords 1 ... 8** Apart from the position of the first bit, also the bit length of each partword is important for the separation. A length of zero means that no partword is to be shown at the corresponding output (output = 0). Here also subcode 1 is fixedly assigned to the first output, subcode 2 to the second output, etc.

- In the Lenze setting the complete SSI data word received is shown at the output *SSI_dwDataword_1*:

[6-7] Example 1: Lenze setting

- The following example shows the parameterisation required to split up the SSI data word received into three partwords (here status information, error bit, and position information):

[6-8] Example 2: Splitting up the SSI data word received into three partwords

6.3.8.3 Linear distance measuring devices with SSI protocol

Linear distance measuring devices provide the position directly in a physical unit of length (e.g. [mm]). An incremental position must be sent to the position controller via the system block

LS_Feedback. The reference of this incremental position corresponds to a value of 65536 (Lenze setting: C00100 = 16) in the case of a revolution at the output end.

The necessary conversion of the position value can be carried out by means of the block **L_EsEncoderConv**. The block **L_EsEncoderConv** is designed for rotary encoders. Conversion to (notional) rotative values is therefore necessary for the adaptation of linear distance measuring devices. The results of the conversion must be entered in the code.

Conversion for the number of encoder increments in C05273:

In the case of linear distance measurement devices, the encoder resolution is usually indicated in the form of graduations in [μm] or as a number of increments per millimetre [*inc/mm*].

The following rule of thumb can be used to determined the number of encoder increments C05273:

$$\text{Number of encoder increments} = \frac{\text{Feed constant [units/rev]}}{\text{Encoder graduation [units]}}$$

$$\text{C05273 = INT number of encoder increments} = \frac{\text{C02524}}{\text{Encoder graduation}}$$

[6-9] Determinatino of the number or encoder increments of linear distance measuring devices with SSI protocol

The integer (INT = integer part of the calculation) must be entered in C05273. The resulting rounding-off error is corrected by means of the position encoder gearbox factor (C02522 / C02523) in the machine parameters.
▸ Determination of the position encoder gearbox factor of linear distance measuring devices with SSI protocol

The resulting maximum position which can be shown can be checked inC02539.

The maximum speed that can be shown is indicated in C02540.

If the necessary speeds and positions for the application can no longer be shown, C05273 can be enlarged. The internal resolution is thus decreased.

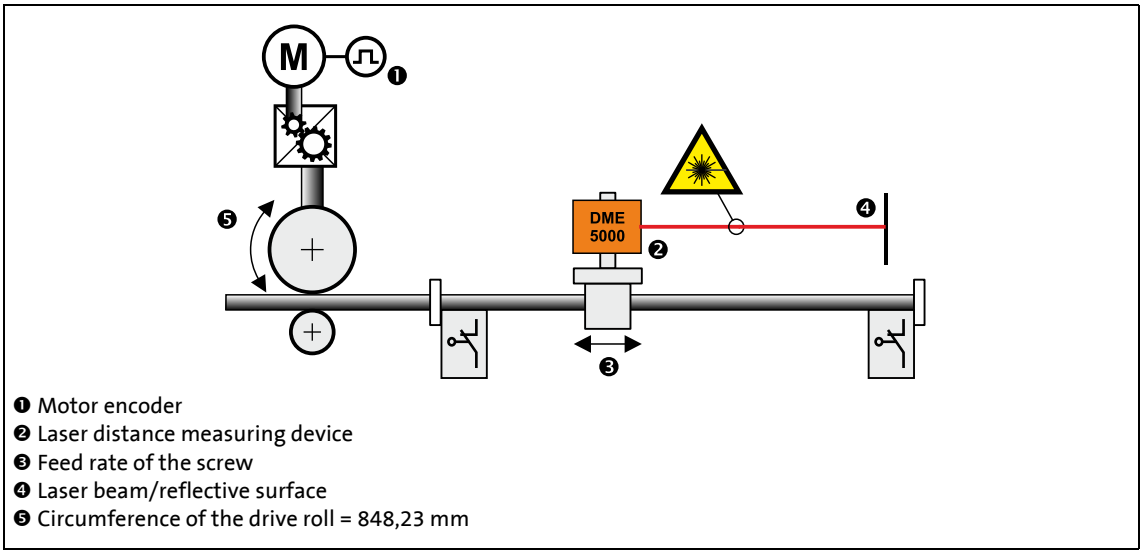
Calculation of the position encoder gearbox factor C02522 and C02523

Please note that, when the number of encoder increments in the numerator of the following formula is indicated, the value with decimal places must be given whereas, in the numerator, the integer (INT = integer) is used for purposes of calculation:

$$\text{n encoder - gearbox factor} = \frac{\text{Number of encoder increments (incl. decimal}}{\text{Number of encoder increments (integer}}$$

$$\frac{\text{:522}}{\text{:523}} = \frac{\text{Number of encoder increments (incl. decimal plac}}{\text{C05273}}$$

[6-10] Determination of the position encoder gearbox factor of linear distance measuring devices with SSI protocol



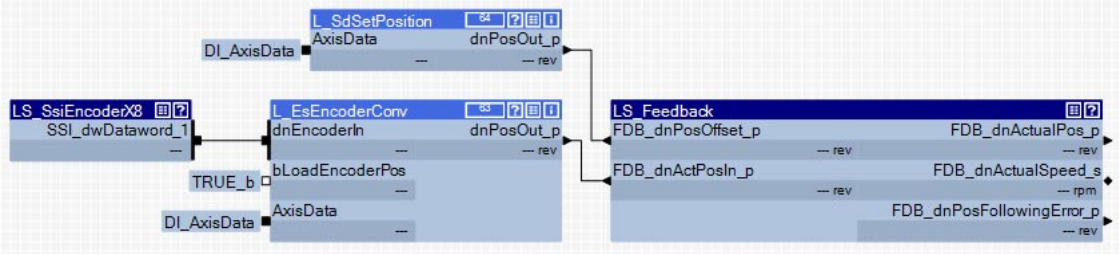
Example: Position encoder feedback with an SSI linear distance measuring device

The current position of a positioning unit is detected with a laser distance measuring device (e.g. »DME5000«) with an SSI interface. A graduation of 0.1 mm has been parameterised in the linear distance measuring device.

The positioning unit is moved by 848.23 mm in an axial direction for each revolution of the slip-free drive roll. The current motor speed is detected by a resolver.

A position offset of 100 mm must be taken into account due to installation of the distance measuring device and the reflector.

The lower 24 bits of the SSI data word contain information coded in Gray.



❶ Motor encoder
❷ Laser distance measuring device
❸ Feed rate of the screw
❹ Laser beam/reflective surface
❺ Circumference of the drive roll = 848,23 mm

[6-11] Schematic diagram of feedback with laser distance measuring device DME5000

The Multiturn resolution (C05274) that is set must allow the entire traversing range of the application to be represented and must also ensure that the display limit in the 9400 device is not exceeded.

- Minimum Multiturn resolution.
  C05274 = Maximum traversing range / feed constant = 59
- Maximum Multiturn resolution
  C05274 = 2^{31}-1 / resolution of Singleturn = 253181

Required FB interconnection

Short overview of the parameters:

Parameters	Info	Lenze setting	
		Value	Unit
C00422	Encoder type	SSI encoder	
C00423	SSI encoder: Bit rate	400	kbps
C00424	SSI encoder: Data word length	24	Bit

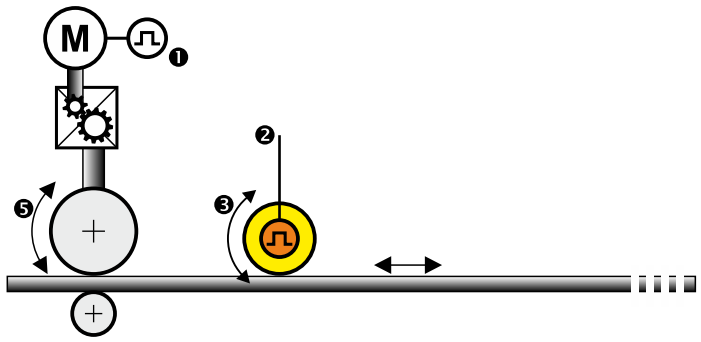
C005273	Single turn resolution	8482	Steps/rev
C05274	Resolution Multiturn	60	Rev

6.3.9 Rotative encoder with SSI protocol

In accordance with the parameterisation of the system block **LS_SsiEncoderX8**, the position information of the encoder is available in a partword and only has to be sent to the position controller via the SB **LS_Feedback**.

In accordance with the Lenze setting of the position encoder gearbox factor (C02522 = 1, C02523 1 = 1), it is expected that one encoder revolution corresponds to one rotation at the output end, i.e. to a feed rate in accordance with the feed constant C02524.

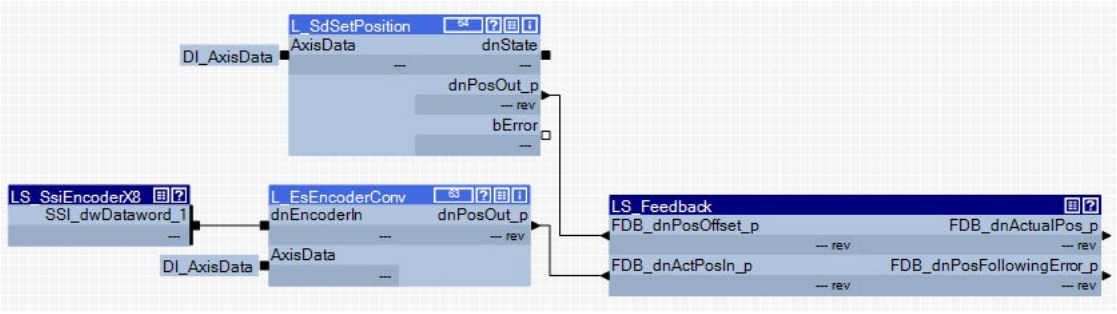


The position information from the SSI data word is converted to the internal scale with the function block **L_EsEnconderConv**, with which a certain machine position can be set as the reference/starting position. The parameterisation of the block makes it possible for the position to be reconstructed after mains switching. This is necessary if the absolute encoder display range of e.g. 4096 revolutions has been left.

Example: Material feed with length measurement by means of measuring wheel and SSI encoder

The current position of the material of a feed unit is detected with a rotative SSI encoder. One encoder revolution corresponds to one revolution of the measuring wheel (400 mm).

Every time the slip-free drive roll revolves, the material is moved 1200 mm in an axial direction. The current motor speed is detected by a resolver.



The lower 24 bits of the SSI data word contain the position information coded in Gray. The SSI encoder supplies 4096 gradations per revolution and has an absolute display range of 4096 revolutions.

❶ Motor encoder
❷ SSI encoder
❸ Circumference of the measuring wheel = 400 mm
❹ Circumference of the drive roll = 848,23 mm

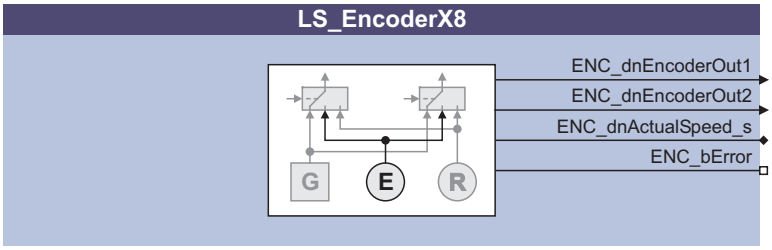
6.3.10 Provision of the encoder signal of input X8

This function extension is available from software version V7.0!

The **LS_EncoderX8** system block serves to provide the encoder signal of input X8 to the application, independent of the selected feedback system for the motor encoder and position encoder.

Application cases:



- High-resolution speed encoder as master encoder /value, correcting signal, ...
- Absolute value encoder for length measurements
- Display of the absolute encoder value without considering an offset

Note!

For SSL encoders, the LS_SsiEncoderX8 system block must be used. ▸ Use of an SSI encoder at X8 (📖 255)

6.3.10.1 System block "LS_EncoderX8"

The **LS_EncoderX8** system block provides the input X8 to the application in the function block editor.

Outputs

Identifier DIS code | data type	Value/meaning
ENC_dnEncoderOut1 C02762 |DINT	Display of the current encoder position (steps) within one revolution • 1 revolution ≡ 2^{32} bits **Note:** In order to convert the encoder information/position into a position_p in the internal measuring system, connect both outputs *ENC_dnEncoderOut1* and *ENC_dnEncoderOut2* with the inputs *dnEncoderIn* and *dnEncoderIn2* of the FB **L_EsEncoderConv**. A storage with mains failure protection of the position signal is also processed via this FB.
ENC_dnEncoderOut2 C02763 |DINT	Display of all revolutions of the encoder (only with Multiturn) • After the max. presentable revolutions have been reached, the value jumps back to "0". • C02761 shows the max. presentable revolutions of the MultiTurn encoder (encoder-dependent). • In case of SingleTurn, the value "0" is always output.
ENC_dnActualSpeed_s C02764 | DINT	Current encoder speed in [rpm]
ENC_bError C02765 | BOOL	Status signal "Encoder error" TRUE: An encoder error has occurred.

6.3.10.2 Activate evaluation

C02760 serves to activate the evaluation of the encoder signal of input X8.

- When the evaluation is activated, the encoder parameterised in C00422 is read in.
  - At the same time, the monitoring functions are active. If no encoder is available, the corresponding monitoring functions are triggered.
- When the evaluation is deactivated, the outputs of the system block are reset.
  - Monitoring is deactivated depending on the position encoder selection (C00490) and the motor encoder selection (C00495).

Monitoring

The monitoring functions depend on the encoder type selected inC00422 and do not differ from the existing monitoring functions:

- Open circuit of encoder (response: C00580)
- Encoder angular drift monitoring (📖 267)
- Encoder communication error (*FDB_bEncoderComError*; response: C00601)
- Sine/cosine encoder error (*FDB_bSinCosSignalError*)
- Group signal for errors as process date (*ENC_bError*)

Conditioning of the encoder signal

- The encoder signal is conditioned to a position (including a storage with mains failure protection) within the application using the FB **L_EsEncoderConv**:
  - Interconnection of the *ENC_dnEncoderOut1* output signal with the *dnEncoderIn* input of the FB **L_EsEncoderConv**.
  - Interconnection of the *ENC_dnEncoderOut2* output signal with the *dnEncoderIn2* input of the FB **L_EsEncoderConv**.
  - Additional parameter setting of the FB **L_EsEncoderConv**:
    Mode selection: Cxxxxx = 1
    Number of revolutions transmitted from C02761
  - The (optional) reconstruction of the position after mains switching is also made by the FB **L_EsEncoderConv**.
- In contrast, the conditioning of the encoder signal to a speed is directly made in the LS_EncoderX8 system block.
  - The current encoder speed is provided at the *ENC_dnActualSpeed_s* output in [rpm] (display parameter: C02764).
- TouchProbe function is not supported (continues to be only available for motor and position encoders).
- If the encoder at X8 is simultaneously used as motor or position encoder, the "raw value" of the encoder is continued to be output.

Display parameter

Parameters	Info	Lenze setting	
		Value	Unit
C02761	Resolution Multiturn	-	Rev.
C02762	Encoder position: Steps within one revolution	-	Steps
C02763	Encoder rev: Number of revolutions	-	Rev.
Greyed out = display parameter			

Parameters	Info	Lenze setting	
		Value	Unit
C02764	Encoder speed	-	rpm
C02765	Encoder error	-	
Greyed out = display parameter			

6.3.11 Resolver error compensation

This function extension is available from software version V7.0!

Resolver errors typically occur in form of the 1st and 2nd harmonic. They have two different causes:

1. The inductances of the sine and cosine track of the resolver have slightly different values.
2. Sine and cosine track do not magnetise orthogonally to each other.

Resolver errors due to cause 1 can be corrected by adjusting the gains of the digital/analog converters which feed the resolver tracks. In the Lenze setting, the gains of both resolver tracks are preset with identical values.

Resolver errors due to cause 2 can be compensated for by a slight correction of the angle via which both resolver tracks are fed relative to one another.

By executing the device command C00002 = "59: Resolver error identification", the gain of the digital/analog converter for feeding the resolver and the angle which serves to feed the two resolver tracks relatively to each other are corrected so that the resolver error is minimised.

- A precondition for the execution of the device command is that the machine is in speed-controlled operation (servo control). The speed amount during the identification must be constant and higher than 500 rpm.
- After the resolver error identification has been executed successfully, the resolver error compensation is activated automatically (C00418 = "1: Activated"). Now the resolver operates with the following resolver error parameters which have been identified during the procedure:

Parameters	Info	Lenze setting	
		Value	Unit
C02862/1	Resolver: cos gain	100	%
C02862/1	Resolver: sine gain	100	%
C02863	Resolver: Angle correction	0	

- The detected gain can take values between 0 ...100 %.
  - With a setting of 0 %, the gain of the corresponding resolver track is only 95 % of the default setting.
  - With a sensible resolver error compensation only one of the two gains is adapted. The other remains at 100 %.
- For a permanent acceptance of the identified resolver error parameters, the parameter set must be saved (C00002 = "11: Save start parameters").
- When the resolver error compensation is deactivated (C00418 = "0: Deactivated"), the resolver operates with the Lenze setting again. The identified resolver error parameters remain stored.

The resolver error identification can fail due to the following:

- Wrong control mode is active (no servo control)
- Error or fault is active
- Another identification is active
- The speed is too low (< 500 rpm)
- Time-out while the algorithm is processed

6.3.12 Encoder angular drift monitoring

The optional encoder angular drift monitoring monitors a potential deviation between the actual encoder angle and the angle calculated by the counting of increments in the encoder evaluation.

The encoder angular drift monitoring is activated by parameterising an error response that is not "0: No response" in C00621.

If a deviation higher than 45° (electrical) is recognised when monitoring is activated:

- The error message "Encoder monitoring: pulse deviation detected" is entered in the logbook of the controller.
- The error response parameterised in C00621 is triggered.
- The "Reference known" status of the "Homing" basic drive function is reset (if this status was set before)

Tip!

A deviation may occur, for instance, by incorrect parameter setting of the encoder increments, by lines in the form of interferences caused by EMC or loss of lines caused by EMC.

The encoder angular drift monitoring for encoders with and without absolute information is implemented by two different principles which are explained in detail in the following subchapters.

6.3.12.1 Angular drift monitoring for encoders without absolute information

When an encoder without absolute information is used, the number of increments between two zero pulses (one revolution) is monitored. This value must equal the encoder increments set in C00420.

Note!

After mains switching, monitoring is only active after second incoming zero pulse since the first line difference to be used can only be calculated with the second and first zero pulse.

When the motor (and thus the encoder) is replaced, it is very likely that a angular drift error occurs within the first revolution after acknowledging the encoder error since the monitoring function cannot recognise that the encoder has been replaced.

6.3.12.2 Angular drift monitoring for encoders with absolute information

For an encoder with absolute information, cyclical communication with the encoder takes place and the angle is read out digitally. This angle is compared to the angle from the encoder evaluation.

Note!

If monitoring is deactivated (C00621 ="0: No response"), there is no cyclic communication with the encoder, and therefore no communication errors with the encoder can occur.

If monitoring is activated, it is only executed for speeds lower than 100 rpm due to runtimes for communication.

- If increments get lost at higher speeds, this deviation can only be recognised when the speed falls below 100 rpm for at least 80 ms.

After each detected encoder angular drift error, a renewed read-out of the position is tripped automatically and this angle is written into the encoder evaluation. This makes it possible to acknowledge the error. In case of synchronous machines, the pole position is corrected simultaneously.

7 Braking operation

The 9400 HighLine controller as single-axis controller (single drive) is provided with an integrated brake transistor.

- The required brake resistor must be connected externally (see Mounting Instructions/Hardware Manual).
- The rated values for the internal brake transistor are given in the Hardware Manual in the chapter "Rated data".

Stop!

If the brake resistor actually connected is smaller than the brake transistor parameterised, the brake chopper can be destroyed!

The brake resistor can be thermally overloaded. Carry out protective measures suitable for the installation, e.g.:

- Parameterisation of an error response in C00574 and evaluation of the parameterised error message within the application or within the machine control. ▸ I2t utilisation - brake resistor (📖 273)
- External interconnection using the thermal contact on the brake resistor (e.g. supply interruption via the mains contactor and activation of the mechanical brakes).

Note!

The brake chopper control is also guaranteed if, for example, the application stands still or the 24-V supply is not connected and the controller is only fed by the DC bus.

7.1 Parameter setting

Short overview: Parameters for braking operation

Parameters	Info	Lenze setting	
		Value	Unit
C00129	Brake resistance value	180.0	Ohm
C00130	Rated brake resistor power	5600	W
C00131	Thermal capacity - brake resistor	485	kWs
C00133	Ref.: Brake chopper utilisation	Minimum resistance (C00134)	
C00134	Min. brake resistance	-	Ohm
C00137	Brake transistor utilisation	-	%
C00138	Brake resistor utilisation	-	%
C00173	Mains voltage	400/415 V	
C00181	Reduced brake chopper threshold	0	V
C00569	Resp. brake trans. ixt > C00570	Warning	
C00570	Warning thres. brake transistor	90	%
C00571	Resp. brake res. i2t > C00572	Warning	
C00572	Warning thres. brake resistor	90	%
C00573	Resp. to brake transistor overload	No response	
C00574	Resp. to brake resist. overtemp.	No response	
C00600	Resp. to DC bus overvoltage	Fault	
Greyed out = display parameter			

7.1.1 Setting the voltage threshold for braking operation

The voltage threshold for braking operation is set via C00173 (mains voltage) and C00181 (reduced brake chopper threshold). If the brake chopper threshold in the DC bus is exceeded, the brake transistor is switched on.

Mains voltage selected in C00173	Effective brake chopper threshold
230 V	390 V - value in C00181 (0 ... 100 V)
400/415 V	725 V - value in C00181 (0 ... 100 V)
460/480 V	765 V - value in C00181 (0 ... 100 V)
500 V	790 V - value in C00181 (0 ... 100 V)

7.2 Monitoring

7.2.1 Overcurrent protection

The brake chopper hardware is monitored with regard to overcurrent (short circuit or earth fault).

Note!

The monitoring with regard to overcurrent can only be triggered if a braking current is actually available. It is not possible to carry out a test in idle state (without connected brake resistor).

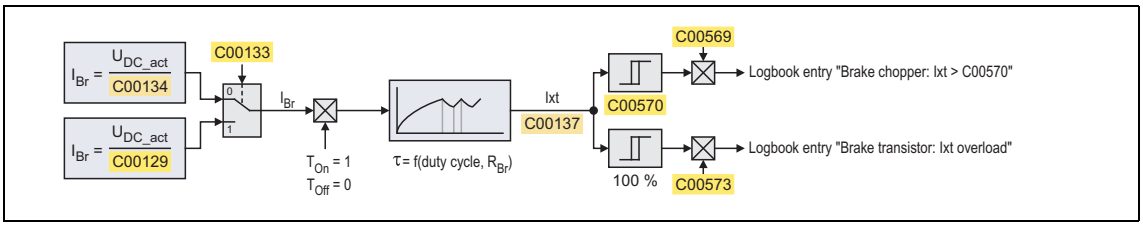
- If monitoring responds:
  - The brake chopper is switched off immediately.
  - The "Fault" response is activated.
  - The "Brake transistor: overcurrent" error message is entered into the logbook of the controller.

Note!

The error can only be acknowledged after 2 seconds at the earliest to resume the braking operation.

Tip!

In addition to the overcurrent protection the controller is provided with two further monitoring functions for the braking operation, which are also activated if no brake resistor is connected at all (testing mode for checking the parameterisation):



▸ Ixt utilisation - brake transistor (📖 272)
▸ I2t utilisation - brake resistor (📖 273)

7.2.2 Ixt utilisation - brake transistor

The controller is provided with a monitoring function for the Ixt utilisation of the internal brake transistor.

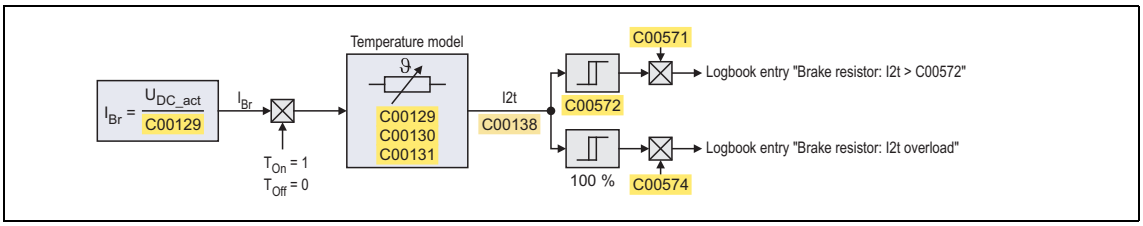
Note!

The braking operation will never be switched off by this monitoring function.

[7-1] Signal flow of Ixt utilisation - brake chopper

- Monitoring is based on a mathematical model which calculates the braking current from the current DC-bus voltage and the brake resistance parameterised.
  - Hence, monitoring can be activated although no brake resistor is connected and can therefore also be used for a testing mode to check the parameterisation.
- During the calculation the thermal utilisation of the brake transistor is taken into consideration by the use of an accordingly adapted time constant.
- In C00133 it can be selected whether the minimum brake resistance (display inC00134) which depends on the network setting in C00173) or the brake resistor value parameterised in C00129 is to be used as a reference for calculating the utilisation.
- C00137 displays the calculated utilisation of the brake transistor in [%].
  - A 100 % utilisation corresponds to the continuous braking power which is provided by the integrated brake chopper at a DC-bus voltage of 790 V (or 390 V at a mains voltage of 230 V).
  - The maximum braking power (assuming that the utilisation starts at 0 %) can be provided for a time period depending on the device.
  - The calculated utilisation is provided as oscilloscope signal *Common.dnIxtBrakeChopper* to check the braking operation while the system is running
    (scaling: $2^{30} \equiv 100$ %).
- If the utilisation exceeds the advance warning threshold set in C00570, "Brake chopper: Ixt > C00570" is entered in the logbook and the response set in C00569 (default setting: "Warning") is activated.
- When the utilisation reaches the limit value (100 %):
  - The activation of the brake chopper is reset to the permanently permissible mark-to space ratio (taking the parameterised brake resistance into consideration). (The brake chopper is activated with 4 kHz, which means that it can be switched on/off at minimum intervals of 250 µs.)
  - The response set in C00573 (default setting: "No response") is activated with the corresponding effects on the state machine and the inverter.

Note!



If the DC-bus voltage exceeds the overvoltage threshold due to a too high braking energy, the monitoring function for overvoltage in the DC bus responds. ▸ Overvoltage in the DC bus (📖 275)

7.2.3 I2t utilisation - brake resistor

The controller is provided with a monitoring function of the I^2t utilisation of the brake resistor which is proportional to the converted braking power.

Note!

The braking operation will never be switched off by this monitoring function.

[7-2] Signal flow - I2t utilisation - brake resistor

- The monitoring function is based on the mathematical model which calculates the braking current from the current DC-bus voltage and the brake resistance parameterised in C00129.
  - Hence, monitoring can be activated although no brake resistor is connected and can therefore also be used for a testing mode to check the parameterisation.
- The calculation considers the thermal utilisation of the brake resistor based on the following parameters:
  - Resistance value (C00129)
  - Continuous power (C00130)
  - Thermal capacity (C00131)
- C00138 displays the calculated utilisation of the brake resistor in [%].
  - A 100 % utilisation corresponds to the continuous power of the brake resistor which results at the maximum permissible temperature limit of the brake resistor.
  - The calculated utilisation is provided as oscilloscope signal *Common.dnI2tBrakeResistor* to check the braking operation while the system is running
    (scaling: $2^{30} \equiv 100$ %).
- If the utilisation exceeds the advance warning threshold set in C00572, "Brake resistor: I2t > C00572" is entered in the logbook and the response set in C00571 (default setting: "Warning") is activated.

- When the utilisation reaches the limit value (100 %):
  - The response set in C00574 (default setting: "No response") is activated with the corresponding effects on the state machine and the inverter.
  - Only applies to software versions lower than V3.0:

    The activation of the brake chopper is reset to the permanently permissible mark-to space ratio (taking the parameterised brake resistance into consideration). (The brake chopper is activated with 4 kHz, which means that it can be switched on/off at minimum intervals of 250 µs.)

Stop!

The brake resistor can be thermally overloaded. Carry out protective measures suitable for the installation, e.g.:

- Parameterisation of an error response in C00574 and evaluation of the parameterised error message within the application or within the machine control system.
- External interconnection using the thermal contact on the brake resistor (e.g. supply interruption via the mains contactor and activation of the mechanical brakes).

Note!

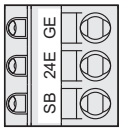
If the system is dimensioned correctly, this monitoring function should not respond. If individual rated data of the actually connected brake resistor are not known, they have to be determined "empirically".

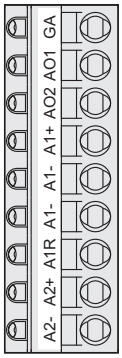
7.2.4 Overvoltage in the DC bus

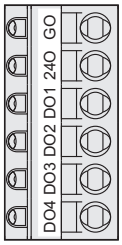
If, due to a too high braking energy, the DC-bus voltage exceeds the overvoltage threshold which results from the mains voltage setting in C00173, the "Overvoltage in the DC bus" error message is output and the response set in C00600 is activated (default setting: "Trouble").

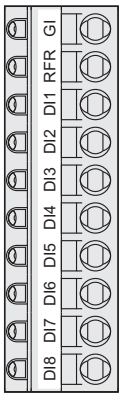
Note!

For hoist applications, the "Fault" response should be selected in C00600 (in combination with an emergency stop via mechanical brakes).









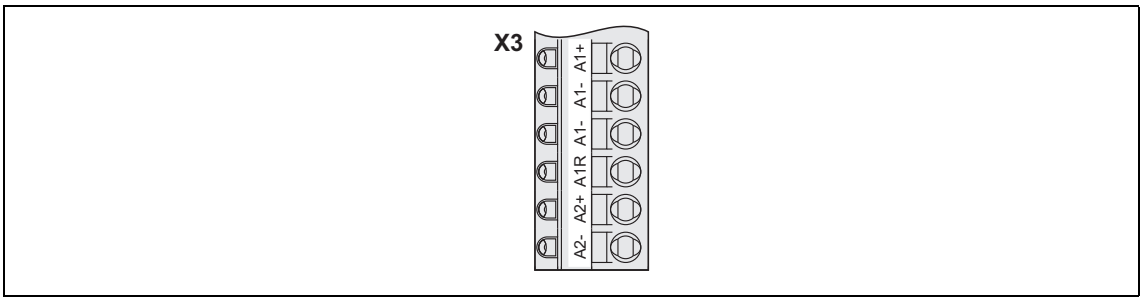
8 I/O terminals

This chapter provides information about options for parameter setting and configuration of the controller input and output terminals.

Tip!

Information on wiring the terminals can be found in the Mounting Instructions for the controller!

8.1 Overview



Front view	Terminal assignment	Info
	X2 	▸ "State bus" monitoring function (📖 286)
	X3 	▸ Analog inputs (📖 277) ▸ Analog outputs (📖 280)
	X4 	▸ Digital outputs (📖 284)
	X5 	▸ Digital inputs (📖 282) ▸ Touch probe detection (📖 288)

8.2 Analog inputs

The controller has two analog inputs that can be used to detect differential voltage signals in the range of ±10 V, e.g. analog speed setpoint selections or the voltage signals of an external sensor (temperature, pressure, etc.).

- Optionally, analog input 1 can also be used to detect current setpoints.

8.2.1 Terminal assignment/electrical data

Terminal	Use	Electrical data	
X3/A1- X3/A1+	Differential voltage input 1 (no jumper between A1R and A1-	Level:	-10 V ... +10 V
		Resolution:	11 bits + sign
		Scaling:	If C00034 = "0": ±10 V ≡ $\pm 2^{30}$
		Conversion rate:	1 kHz
	Current input (jumper between A1R and A1-)	Level:	-20 mA ... +20 mA
		Resolution:	10 bits + sign
		Scaling:	When C00034 = "1": -20 mA ... -4 mA = -2^{30} ... 0 +4 mA ... +20 mA = 0 ... 2^{30}
			If C00034 = "2": ±20 mA ≡ $\pm 2^{30}$
		Conversion rate:	1 kHz
X3/A2- X3/A2+	Differential voltage input 2	Level:	-10 V ... +10 V
		Resolution:	11 bits + sign
		Scaling:	±10 V ≡ $\pm 2^{30}$
		Conversion rate:	1 kHz

8.2.2 Parameter setting

Short overview of parameters for the analog inputs:

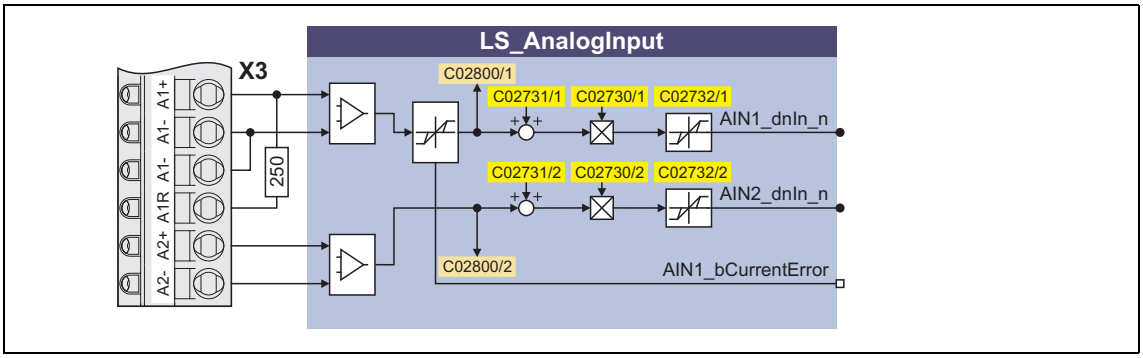
Parameters	Info
C00034	Config. analog input 1
C00598	Resp. to open circuit AIN1
C02730/1	Analog input 1: Gain
C02730/2	Analog input 2: Gain
C02731/1	Analog input 1: Offset
C02731/2	Analog input 2: Offset
C02732/1	Analog input 1: Dead band
C02732/2	Analog input 2: Dead band
C02800/1	Analog input 1: Input signal (-16384 ≡ -100 %, 16383 ≡ 100 %)
C02800/2	Analog input 2: Input signal (-16384 ≡ -100 %, 16383 ≡ 100 %)
Greyed out = display parameter	

8.2.3 Reconfiguring analog input 1 into current input

By means of the following two steps, analog input 1 can be reconfigured into a current input:

1. Bridge the terminals A1R and A1- at terminal strip X3 by means of wiring.
2. Select the corresponding current loop under C00034.

Tip!



Like this you can implement a 4 ...20 mA current loop, e.g. for speed setpoint selection.

Open-circuit monitoring

Under C00598 you can set an error response to open circuit for the 4 ...20 mA current loop.

8.2.4 "LS_AnalogInput" system block

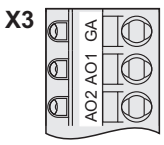
The **LS_AnalogInput** system block displays the analog inputs in the function block editor.

Output Data type	Value/meaning
AIN1_dnIn_n DINT	Analog input 1 • Scaling: $\pm 2^{30} \equiv \pm 10$ V for use as a voltage input $\pm 2^{30} \equiv \pm 20$ mA for use as a current input
AIN2_dnIn_n DINT	Analog input 2 • Scaling: $\pm 2^{30} \equiv \pm 10$ V
AIN1_bCurrentError BOOL	Status signal "Current input error" • Only when analog input 1 is used as current input. • Application: Cable-breakage monitoring of the 4 ...20 mA circuit.
	TRUE | $\lvert I_{AIN1} \rvert < 2$ mA

8.3 Analog outputs

The controller has two analog outputs that can be used to output internal analog signals as voltage signals, e.g. for the control of analog indicating instruments or as a setpoint for slave drives.

Note!



Initialisation behaviour:

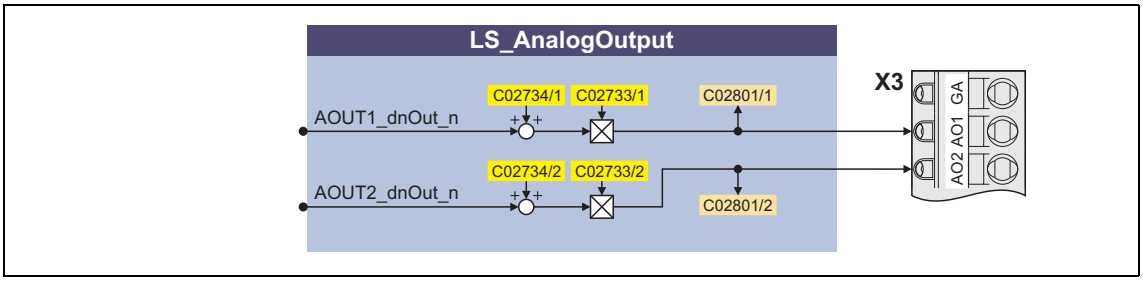
- After mains switching until the application is started, the analog outputs remain on 0 V.

Exception handling:

- In the case of a critical exception within the application (e. g. reset), the analog outputs are set to 0 V.

8.3.1 Terminal assignment/electrical data

Terminal	Use	Electrical data	
X3/AO1	Voltage output 1	Level:	-10 V ... +10 V (max. 2 mA)
		Resolution:	11 bits + sign
		Scaling:	$\pm 2^{30} \equiv \pm 10$ V
		Conversion rate:	1 kHz
X3/AO2	Voltage output 2	Level:	-10 V ... +10 V (max. 2 mA)
		Resolution:	11 bits + sign
		Scaling:	$\pm 2^{30} \equiv \pm 10$ V
		Conversion rate:	1 kHz
X3/GA	Reference potential (analog ground)		



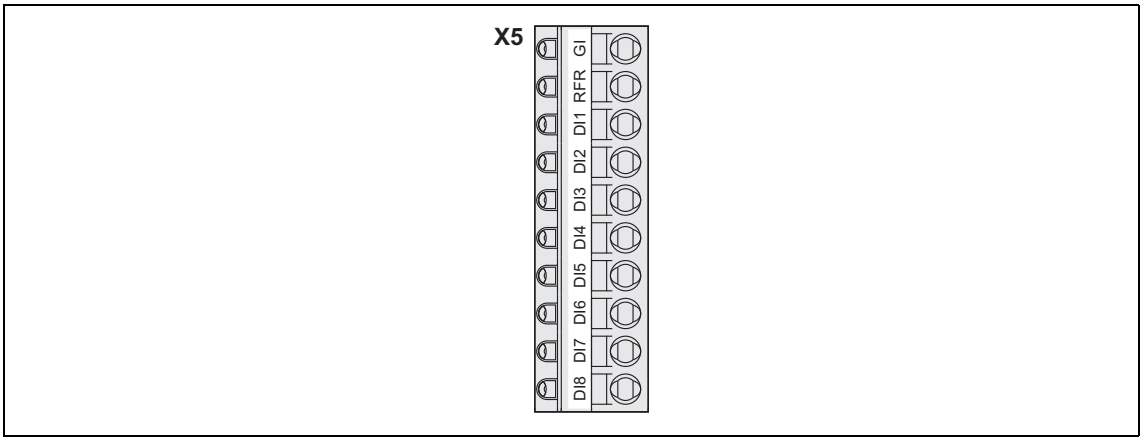
8.3.2 Parameter setting

Short overview of parameters for the analog outputs:

Parameters	Info
C02733/1	Analog output 1: Gain
C02733/2	Analog output 2: Gain
C02734/1	Analog output 1: Offset
C02734/2	Analog output 2: Offset
C02801/1	Analog output 1: Output signal
C02801/2	Analog output 2: Output signal
Greyed out = display parameter	

8.3.3 "LS_AnalogOutput" system block

In the function block editor the **LS_AnalogOutput** system block provides the interface to the analog outputs.



Input Data type	Information/possible settings
AOUT1_dnOut_n DINT	Analog output 1 • Scaling: $\pm 2^{30} \equiv \pm 10$ V
AOUT2_dnOut_n DINT	Analog output 2 • Scaling: $\pm 2^{30} \equiv \pm 10$ V

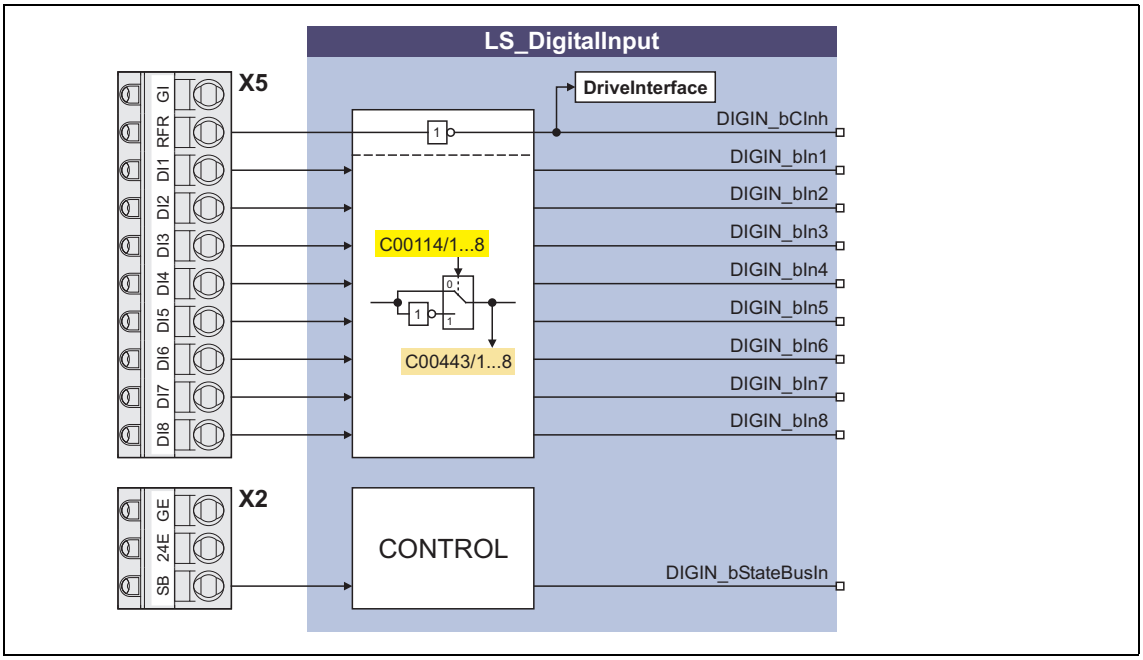
8.4 Digital inputs

The controller is provided with eight freely configurable digital inputs.

- All digital inputs can be used for touch probe. ▸ Touch probe detection (📖 288)
- The control input RFR of terminal strip X5 for controller enable is fixedly connected to the device control.

8.4.1 Terminal assignment/electrical data

Terminal	Use	Electrical data	
X5/DI1 X5/DI8	Digital input 1 ... 8	LOW level:	0 ... +5 V
		HIGH level:	+15 ... +30 V
		Input current:	8 mA per input (at 24 V)
		Electric strength of external voltage	Max. ±30 V
		Conversion rate:	1 kHz
X5/RFR	Controller enable	See digital inputs	
X5/GI	Reference potential (digital ground)		



8.4.2 Parameter setting

Short overview of parameters for the digital inputs:

Parameters	Info
C00114	Digital input x - terminal pol.
C00443	Status: Digital inputs
C02803	Status word: Digital inputs
C02830	Digital inputs: Delay time
Greyed out = display parameter	

8.4.3 "LS_DigitalInput" system block

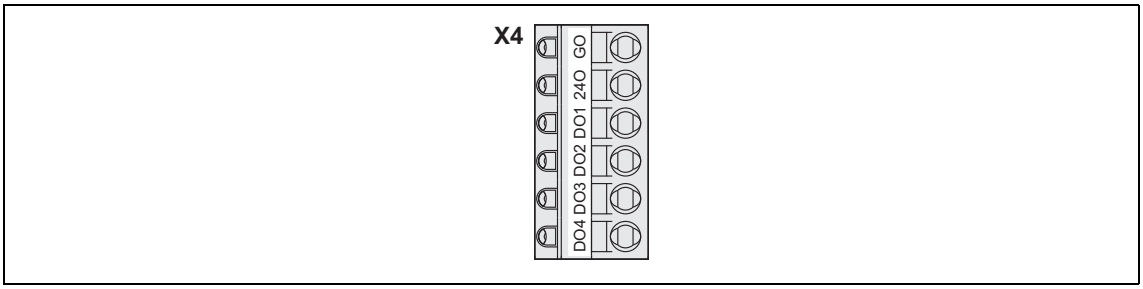
The **LS_DigitalInput** system block displays the digital inputs and the status of the state bus in the function block editor.

Output DIS code | data type	Value/meaning	
DIGIN_bCInh C00443/9 | BOOL	Status signal "Controller inhibit" • The control input RFR (X5/pin 9) for setting/deactivating controller inhibit is fixedly connected to the device control (DCTRL) via an inverter.	
	TRUE	Controller inhibit active
DIGIN_bIn1 C00443/1 | BOOL ... DIGIN_bIn8 C00443/8 | BOOL	Digital input 1 ... 8	
DIGIN_bStateBusIn C00443/12 | BOOL	State bus status ▸ "State bus" monitoring function (📖 286)	
	TRUE	A node connected to the state bus has set the state bus to LOW level and the "Error" state has been set. • The "Error" state is also set if a node connected to the state bus is not supplied with voltage.

8.5 Digital outputs

The controller is provided with four freely configurable digital outputs.

Note!



Initialisation behaviour:

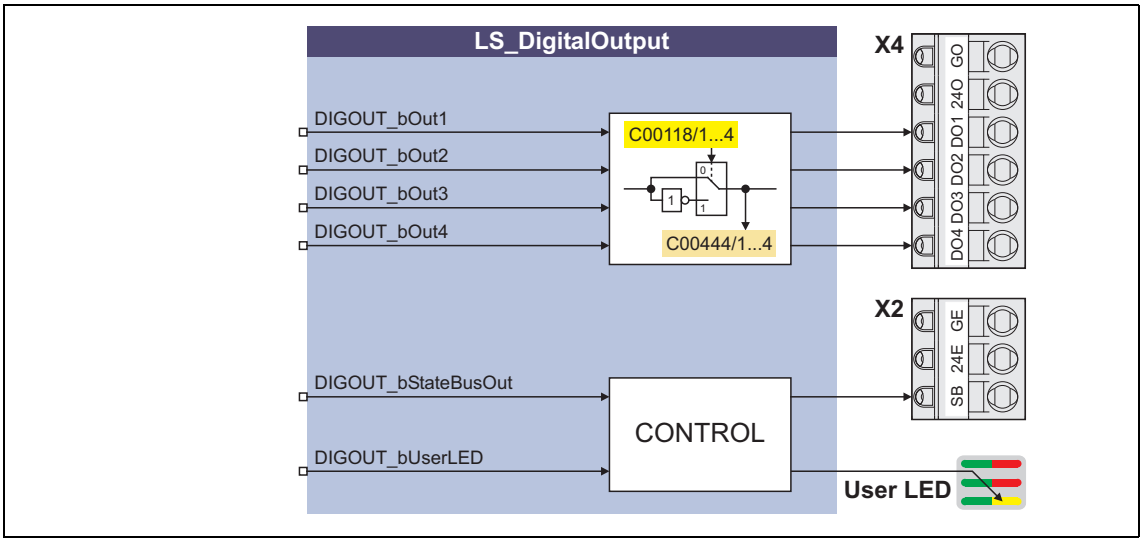
- After mains switching until the application is started, the digital outputs remain on FALSE.

Exception handling:

- In the case of a critical exception within the application (e. g. reset), the digital outputs are set to FALSE, taking the terminal polarity parameterised in C00118 into consideration.

8.5.1 Terminal assignment/electrical data

Terminal	Use	Electrical data	
X4/DO1 ... X4/DO4	Digital output 1 ... 4	LOW level:	0 ... +5 V
		HIGH level:	+15 ... +30 V
		Output current:	max. 50 mA per output (external resistance > 480 Ω at 24 V)
		Conversion rate:	1 kHz
X4/24O	External 24 V voltage supply for the digital outputs		
X4/GO	Reference potential (digital ground)		

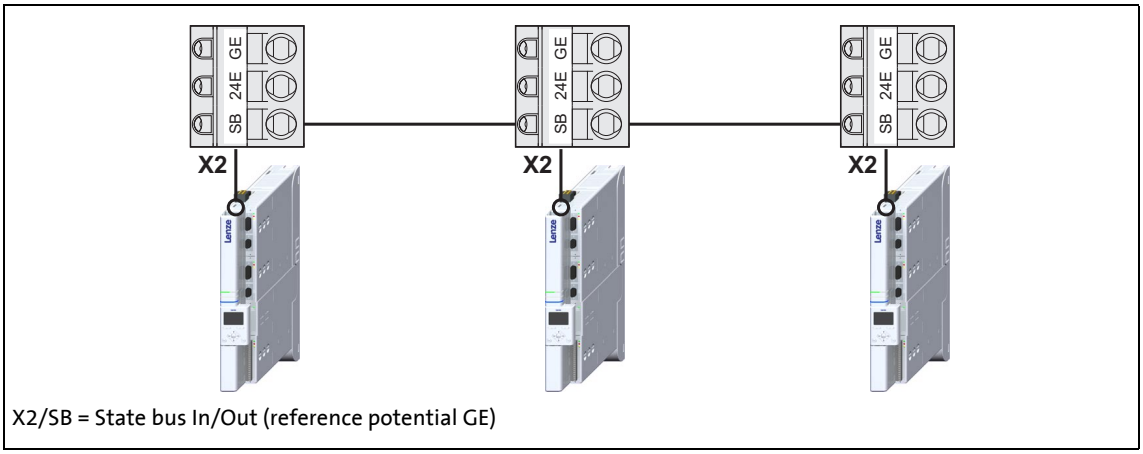


8.5.2 Parameter setting

Short overview of parameters for the digital outputs:

Parameters	Info
C00118	Digital output x - terminal pol.
C00444	Status: Digital outputs
C02802	Status word: Digital outputs
Greyed out = display parameter	

8.5.3 "LS_DigitalOutput" system block



In the function block editor the **LS_DigitalOutput** system block provides the interface to the digital outputs, the state bus, and the yellow user LED at the front of the controller.

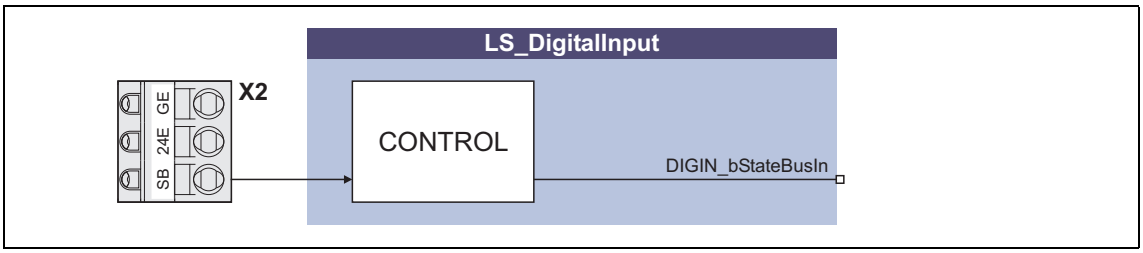
Input DIS code | data type	Information/possible settings	
DIGOUT_bOut1 C00444/1 | BOOL ... DIGOUT_bOut4 C00444/4 | BOOL	Digital output 1 ... 4	
DIGOUT_bStateBusOut C00444/18 | BOOL	Setting the state bus to the "Error" state ▸ "State bus" monitoring function (📖 286)	
	TRUE	The state bus is set to LOW level, all nodes connected to the state bus start their pre-programmed response.
DIGOUT_bUserLED C00444/9 | BOOL	Control of yellow user LED on the front of the controller	
	TRUE	LED on

8.6 "State bus" monitoring function

The state bus is a bus system that is solely designed for Lenze controllers, via which up to 20 controllers can be connected to each other, and by means of which the function of a "release cord" can be simulated:

[8-1] Schematic diagram: Networking via state bus

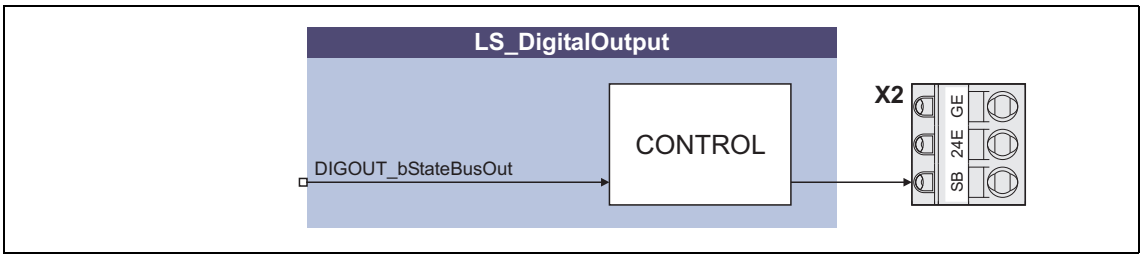
- The state bus only knows the states "OK" and "Error".
- The state bus is a bus with multi-master capability, i.e. each node connected to the state bus can set the state bus to the "Error" state by setting it to LOW level.
- In the "Error" status, all nodes start their adjustable response, e.g. synchronised braking of the drive system.
- The "Error" state is also set if a node connected to the state bus is not supplied with voltage.



Note!

Exception handling:

- In the case of a critical exception within the application (e. g. reset), the "release cord" is not triggered, the state bus remains in the "OK" status.



8.6.1 Detecting the current state

Via the output *DIGIN_bStateBusIn* of the LS_DigitalInput system block, the current status of the state bus can be queried. In case of error the output *DIGIN_bStateBusIn* is set to TRUE.

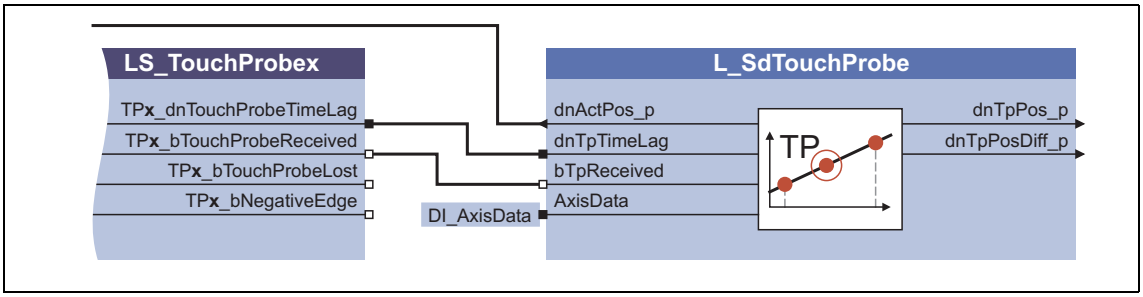
8.6.2 Setting the state bus to the "Error" state

If the input *DIGOUT_bStateBusOut* of the LS_DigitalOutput system block is set to TRUE, the state bus is set to "Error" and all connected nodes start their pre-programmed response.

8.7 Touch probe detection

A "touch probe" is an event that, for instance, can be triggered edge-controlled via a digital input in order to detect a (quickly changing) actual value at the time of triggering and process it in the program.

Overview of the touch probe channels



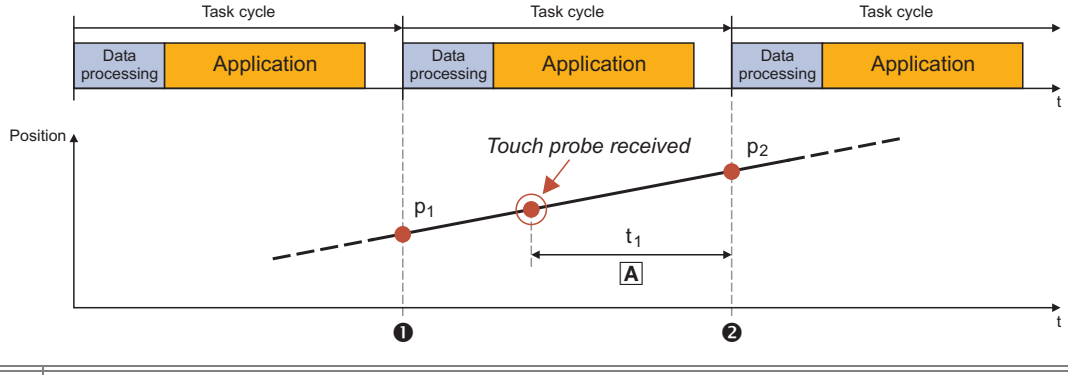
For the touch probe detection 12 touch probe channels are provided, which can be configured independently of each other:

Touch probe channel	Activating event	System block
1	Edge change at digital input 1	LS_TouchProbe1...8 (📖 291)
2	Edge change at digital input 2	
3	Edge change at digital input 3	
4	Edge change at digital input 4	
5	Edge change at digital input 5	
6	Edge change at digital input 6	
7	Edge change at digital input 7	
8	Edge change at digital input 8	
9	Motor encoder zero pulse	LS_TouchProbeMotor (📖 292)
10	Position encoder zero pulse	LS_TouchProbeLoad (📖 292)
11	DFIN zero pulse	LS_TouchProbeDFIN
12	DFOUT zero pulse	LS_TouchProbeDFOUT

- Each touch probe channel is assigned to a system block which provides the application with a scaled time stamp.
- The time stamp refers to the sampling time of the encoder signals and outputs the difference with regard to the touch probe event.

Further processing of the touch probe

For further processing of the touch probe event the time stamp is to be transmitted to an instance of the **L_SdTouchProbe** FB:



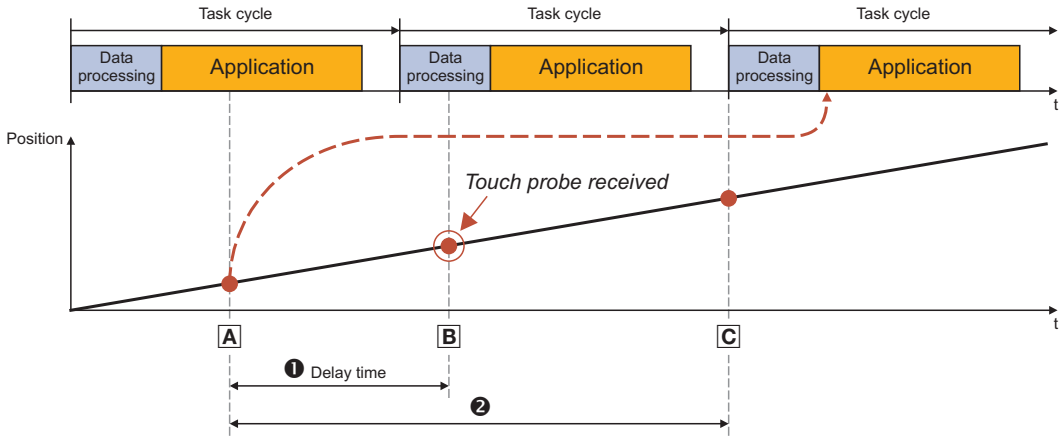
[8-2] Transfer of the time stamp to the L_SdTouchProbe FB

- The **L_SdTouchProbe** FB takes over the interpolation of the input signal on the basis of the time stamp and outputs the interpolated value and the difference to the last input signal.

8.7.1 Actual value interpolation (principle)

If a touch probe is detected, the (remaining) time until the following task cycle is determined and from this a time stamp is generated. On the basis of this time stamp, the **L_SdTouchProbe** FB can

then carry out a linear interpolation between the two actual position interpolation points; the result is the precise actual position at the time of the physical touch probe event.

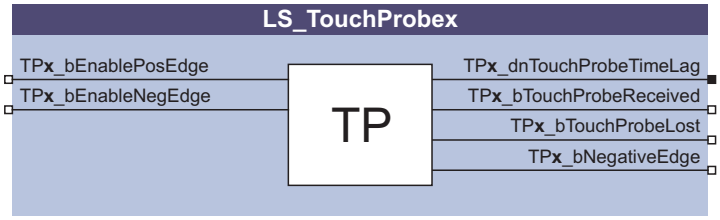


❶	Actual position point 1
❷	Actual position point 2
A	Residual time (*dnTouchProbeTimeLag*)

[8-3] Actual value determination through linear interpolation (principle)

8.7.2 Dead time compensation

For dead time compensation during the detection of the touch probe event, it is possible to select a delay time (*Touch probe delay*) in C02810 for each touch probe channel, which will be considered in the touch probe calculation.



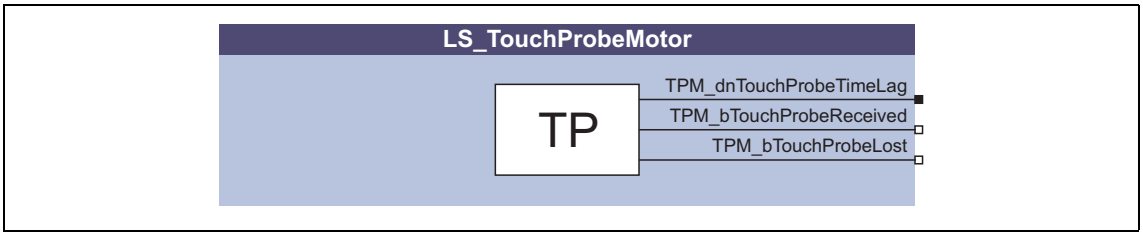
A	Mechanical event: Switch is closed
B	Electrical event: Closed switch contact is registered • Can for example be delayed by flying times of the mechanical contact or filter.
C	Value and position determination for the real (mechanical) event, the determined values are transferred to the application
❶	Delay time (dead time) between mechanical and electrical event • This dead time can be compensated by a corresponding setting in C02810.
❷	Time considered by touch probe calculation • If more than one task cycle has elapsed, the two actual position values are searched within a history buffer, between which the physical event has taken place.

[8-4] Dead time compensation (principle)

- The filtering of the digital inputs has an impact on the electrical detection of the touch probe, i. e. the delay time for the digital inputs set in C02830 has to be taken into consideration within the delay time C02810.
- For the optional digital frequency input/output the setting of the delay times is effected via separate parameters:
  - C13021 or C14021: TP delay time - digital frequency input.
  - C13061 or C14061: TP delay time - digital frequency output.

8.7.3 "LS_TouchProbe1...8" system block

In the function block editor the **LS_TouchProbe1** ... **LS_TouchProbe8** system blocks display the touch probe channels 1 ... 8 which are assigned to the digital inputs **DI1** ... **DI8**.

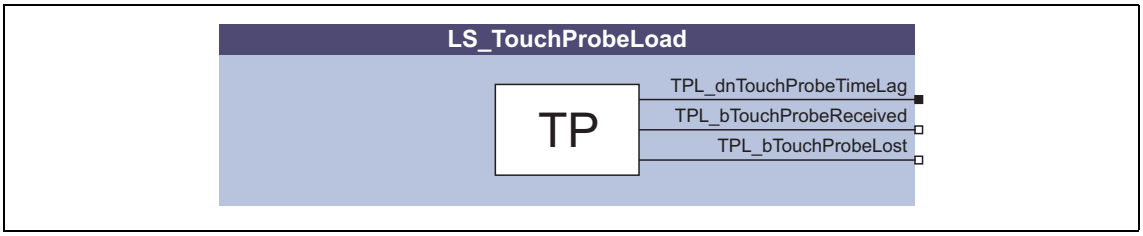


x = 1 ... 8

Input Data type	Value/meaning	
TPx_bEnablePosEdge BOOL	Enable response to positive edge **Note:** • If several positive edges occur within the basic cycle time (HighLine: 1 ms), only the first positive edge initiates the touch probe event and no status signal "touch probe(s) lost" is generated.	
	TRUE	A touch probe event is activated by a positive edge at the digital input DIx.
TPx_bEnableNegEdge BOOL	Enable response to negative edge **Note:** • If several negative edges occur within the basic cycle time (HighLine: 1 ms), only the first negative edge initiates the touch probe event. • If a positive and negative edge occur within the basic cycle time (1 ms), and if the response to both edges is enabled, only the positive edge initiates the touch probe event. • In both cases no status signal "touch probe(s) lost" is generated.	
	TRUE	A touch probe event is activated by a negative edge at the digital input DIx.

Output Data type	Value/meaning	
TPx_dnTouchProbeTimeLag DINT	Scaled time stamp for further processing of the touch probe event with the **L_SdTouchProbe** FB. • 1 ms ≡ 20 bits	
TPx_bTouchProbeReceived BOOL	Status signal "Touch probe detected" • State is only set for one task cycle.	
	TRUE	Touch probe event has been activated.
TPx_bTouchProbeLost BOOL	Status signal "Touch probe(s) lost" • State is only set for one task cycle.	
	TRUE	More than one touch probe event was actuated within the task runtime. The time stamp that is output only refers to the first touch probe event.
TPx_bNegativeEdge BOOL	Status signal "Negative edge detected" • State is only set for one task cycle.	
	TRUE	A negative edge has been detected at the digital input DIx.

8.7.4 "LS_TouchProbeMotor" system block

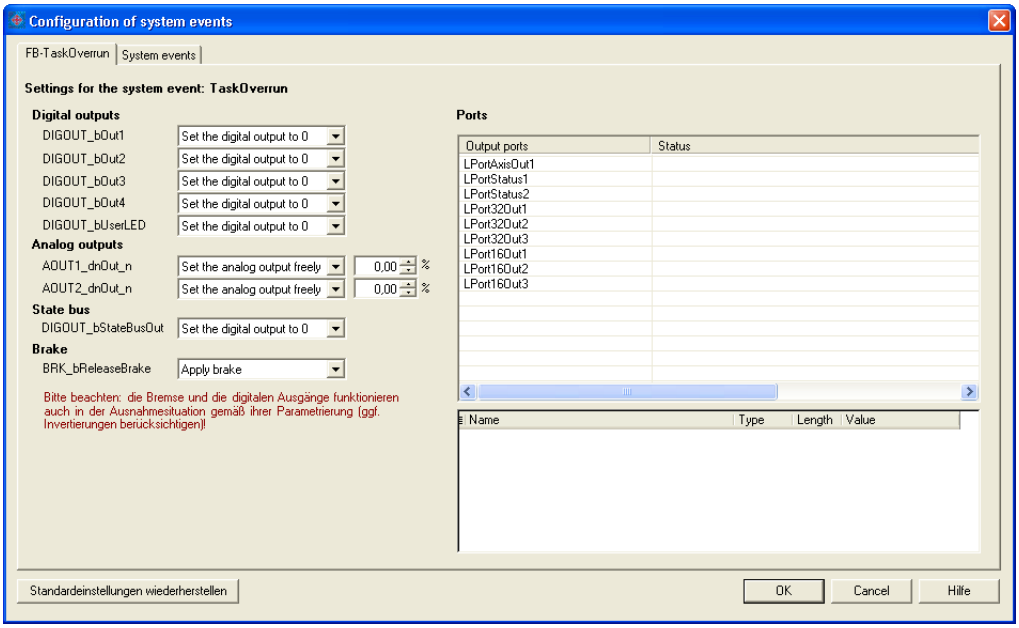


In the function block editor the **LS_TouchProbeMotor** system block represents the touch probe channel that is assigned to the motor encoder zero pulse.

Output Data type	Value/meaning	
TPM_dnTouchProbeTimeLag DINT	Scaled time stamp for further processing of the touch probe event with the **L_SdTouchProbe** FB.	
TPM_bTouchProbeReceived BOOL	Status signal "Touch probe detected" • State is only set for one task cycle.	
	TRUE	Touch probe event has been activated.
TPM_bTouchProbeLost BOOL	Status signal "Touch probe(s) lost" • State is only set for one task cycle.	
	TRUE	More than one touch probe event was actuated within the task runtime and therefore could not be detected anymore.

8.7.5 "LS_TouchProbeLoad" system block

In the function block editor the **LS_TouchProbeLoad** system block represents the touch probe channel that is assigned to the position encoder zero pulse.



Output Data type	Value/meaning	
TPL_dnTouchProbeTimeLag DINT	Scaled time stamp for further processing of the touch probe event with the **L_SdTouchProbe** FB.	
TPL_bTouchProbeReceived BOOL	Status signal "Touch probe detected" • State is only set for one task cycle.	
	TRUE	Touch probe event has been activated.
TPL_bTouchProbeLost BOOL	Status signal "Touch probe(s) lost" • State is only set for one task cycle.	
	TRUE	More than one touch probe event was actuated within the task runtime and therefore could not be detected anymore.

8.8 Configure exception handling of the outputs

From »Engineer« version 2.10 onwards, the function block editor for the controller can also be used to configure the behaviour of the analog and digital outputs and that of the brake control and the output ports after a task overflow in order to adapt it to the respective application.

How to configure the exception handling:

1. Go to the *Project view* of the »Engineer« and select the 9400 HighLine controller.
2. Change to the **FB-Editor** tab in the *Workspace*.
3. Click on the icon in the *FB editor toolbar* to open the *Configure exception handling* dialog box:

- On the **FB TaskOverrun** tab the behaviour of the controller outputs and that of the output ports defined in the application in the case of a task overflow can be configured.
- On the **FB System Events** tab, the behaviour of the outputs of the drive controller and the application is only displayed and cannot be configured.

4. Carry out the desired configuration.
   - Each output can be configured individually. A free value can be set for the analog outputs (-200.00 ... 200.00 %).
   - If you select an output port in the "Ports" area on the right, all application variables for this output port are shown in the table below. In the "Value" column a value can be set for each application variable to which it is to be set if an event occurs can be specified.
   - If a value has been set for at least one application variable, the status "Exceptional behaviour parameterised" is shown for the corresponding output port.
   - If the **Restore standard settings** button is clicked, the default setting for task overflow is restored. In this case, all output terminals would be set to LOW level or 0 V in the event of a task overflow and the output ports would retain their last value.
5. Click **OK** to accept the configuration and close the dialog box.

Danger!

In case a task overflow occurs, the brake can be configured to "open". This setting should be used with caution as the brake is then forcibly opened and does not close even if the drive controller is inhibited!

Note!

- To render the changes effective within the controller, the project has to be updated, and the changed application has to be transferred to the controller.
- During the reset or download of an application, all output signals are set to LOW level or 0 V for a short time (the state bus, in contrast, is set to HIGH level due to hardware inversion).

See also: ▸ Behaviour after task overflow (📖 109)

9 "CAN on board" system bus

The controller has an integrated CANopen system bus interface ("CAN on board") which is used to exchange i.a. process data and parameter values between the nodes. Furthermore, other modules can be connected via this interface such as decentralised terminals, operator and input devices (HMIs), as well as external controls and host systems.

The interface transfers CAN objects following the CANopen communication profile (CiA DS301, version 4.02) developed by the umbrella organisation of CiA (CAN in Automation) in conformity with the CAL (CAN Application Layer).

Tip!

- The parameters relevant for the CANopen system bus interface are assigned to different subcategories in the parameter list in »Engineer« and in the keypad in the **CAN** category.
- Information on CAN communication modules and CANopen system bus interfaces of other Lenze devices is provided in the "CAN" communication manual in the Lenze library.

9.1 General information

For many years the system bus (CAN) based on the CANopen communication profile has been integrated in Lenze controllers. Due to the lower number of data objects available, the functionality and compatibility of the old system bus are lower as compared with CANopen. For parameter setting, two parameter data channels are always available to the user while CANopen provides only one active parameter data channel (along with the possibility to establish further channels).

The system bus (CANopen) of the Servo Drives 9400 has been developed from the system bus (CAN) of the controller of the 9300 series with the following properties:

- Full compatibility according to CANopen DS301 V4.02.
- Support of the NMT master/slave function "Node Guarding" (DS301 V4.02).
- Support of the "Heartbeat" NMT slave function (DS301, V4.02).
- There are no restrictions regarding the selection of the node addresses.
- Number of parameterisable server and client SDO channels:
  - max. 10 channels with 1 ... 8 bytes
- Number of parameterisable PDO channels:
  - max. 4 Transmit-PDOs (TPDOs) with 1 ... 8 bytes
  - max. 4 Receive-PDOs (RPDOs) with 1 ... 8 bytes
- All PDO channels are functionally equivalent.
- Monitoring of the RPDOs for data reception
- Telegram counters for SDOs and PDOs
- Bus status diagnostics
- Boot-up telegram generation
- Emergency telegram generation
- Reset node telegram generation (in case of master configuration)
- Sync telegram generation and response to sync telegrams:
  - Data transmission/reception
  - Device-internal time base synchronisation
- Abort codes
- All CAN on board functions can be parameterised via codes
- Object directory (all mandatory functions, optional functions, indexes)

9.1.1 General data and application conditions

Department	Values
Communication profile	CANopen (DS301 V4.02)
Communication medium	DIN ISO 11898
Network topology	Line closed on both sides (e.g. termination by Sub-D plug, type EWZ0046)
Node addresses that can be set	1 ... 127 • Adjustable via DIP switch on the memory module (exception: memory module MM1xx) or via code C00350.
Max. number of nodes	127
Baud rate	10, 20, 50, 125, 250, 500, 800, 1000 kbit/s or automatic recognition • Adjustable via DIP switch on the memory module (exception: memory module MM1xx) or via code C00351.
Process data	• max. 4 TPDOs with 1 ... 8 bytes • max. 4 RPDOs with 1 ... 8 bytes
Parameter data	Max. 10 client and server SDO channels with 1 ... 8 bytes
Transfer mode for TPDOs	• With change of data • Time-controlled, 1 to x ms • After the reception of 1 to 240 sync telegrams

9.1.2 Supported protocols

Category	Protocol
Standard PDO protocols	PDO write PDO read
SDO protocols	SDO download SDO download initiate SDO download segment
	SDO upload SDO upload initiate SDO upload segment
	SDO abort transfer
	SDO block download SDO block download initiate SDO block download end
	SDO block upload SDO block upload initiate SDO block upload end
NMT protocols	Start remote node (master and slave)
	Stop remote node (slave)
	Enter pre-operational (slave)
	Reset node (slave and local device)
	Reset communication (slave)
Monitoring protocols	Node guarding (master and slave)
	Heartbeat (heartbeat producer and heartbeat consumer)

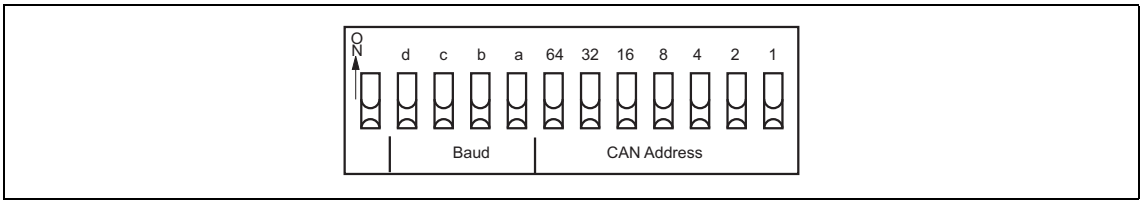
9.1.3 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

Tip!

The communication times in the CAN network depend on the

- processing time in the device
- telegram run time (baud rate / telegram length)
- bus load (especially if the bus is loaded with PDOs and SDOs at a low baud rate.)



Servo Drives 9400 processing time

There are no interdependencies between parameter data and process data.

- Parameter data:
  - For controller-internal parameters: approx. 30 ms ± 20 ms tolerance (typically)
  - For some codes the processing time can be longer.
- Process data are transported in real time.

9.2 Possible settings by DIP switch

The DIP switches on the front of the memory serve to set the baud rate and the node address.

[9-1] DIP switch

9.2.1 Setting the node address

The node address can be set via code C00350 or with the DIP switches 1 to 64.

- The labelling on the housing corresponds to the values of the individual DIP switches for determining the node address.
- Valid address range: 1 ... 127

Note!

- The addresses of the nodes must differ from each other.
- All twelve DIP switches = OFF (Lenze setting):
  - At switching on, the settings under code C00350 (node address) and C00351 (baud rate) will become active.
- Switch the voltage supply of the standard device off and then on again to activate altered settings.

Example: Setting of the node address 23

DIP switch	64	32	16	8	4	2	1
Switch position	OFF	OFF	ON	OFF	ON	ON	ON
Value	0	0	16	0	4	2	1
Node address	**= Sum of the values = 16 + 4 + 2 + 1 = 23**						

Tip!

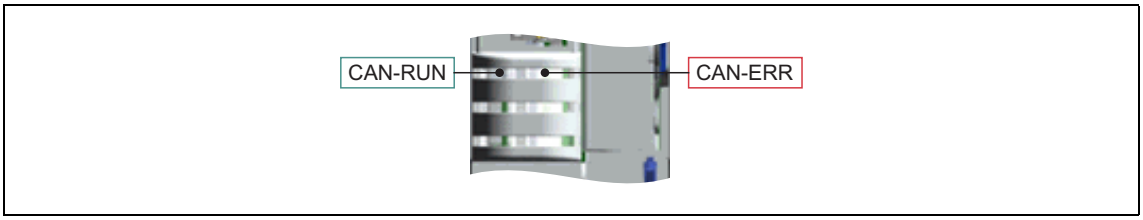
The node address resulting from the setting of the DIP switches at the last mains switching is displayed in C00349/1.

9.2.2 Setting the baud rate

The baud rate can be set via code C00351 or with the DIP switches a to d:

Switch positions				Baud rate
d	c	b	a	
OFF	ON	ON	OFF	10 kbps
OFF	ON	OFF	ON	20 kbps
OFF	OFF	ON	ON	50 kbps
OFF	OFF	ON	OFF	125 kbps
OFF	OFF	OFF	ON	250 kbps
OFF	OFF	OFF	OFF	500 kbps
ON	ON	ON	OFF	800 kbps
OFF	ON	OFF	OFF	1 Mbps
OFF	ON	ON	ON	Automatic recognition

Note!



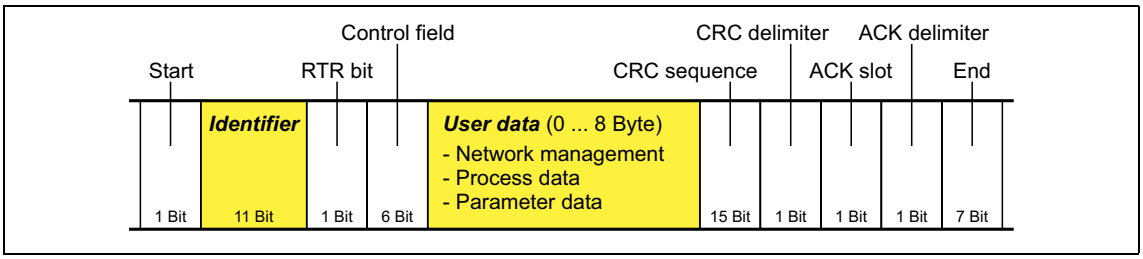
Switch the voltage supply of the standard device off and then on again to activate altered settings.

Tip!

The baud rate resulting from the setting of the DIP switches at the last mains switching is displayed in C00349/2.

9.3 LED status displays for the system bus

Both upper LEDs LEDs "CAN-RUN" and "CAN-ERR" on the front of the controller inform about the CANopen state and report CANopen errors.



[9-2] LED status displays CAN-RUN and CAN-ERR

The meaning can be seen from the table below:

LED status display		Meaning	
CAN-RUN	**CAN-ERR**	**CANopen state**	**CANopen error**
Only CAN-ERR is on		-	**Bus off**
CAN-RUN and CAN-ERR jitter		Automatic detection of the baud rate is active.	
CAN-RUN is blinking every 0.2 seconds | CAN-ERR is off		**Pre-Operational**	-
CAN-RUN is blinking every 0.2 seconds | CAN-ERR 1 x blinking, 1 s off			**Warning Limit reached**
CAN-RUN is blinking every 0.2 seconds | CAN-ERR 2 x blinking, 1 s off			**Node Guard Event**
Only CAN-RUN is on		**Operational**	-
CAN-RUN on | CAN-ERR 1 x blinking, 1 s off			**Warning Limit reached**
CAN-RUN on | CAN-ERR 2 x blinking, 1 s off			**Node Guard Event**
CAN-RUN on | CAN-ERR 3 x blinking, 1 s off			**Sync Message Error**
CAN-RUN is blinking every 1 second | CAN-ERR is off		**Stopped**	-
CAN-RUN is blinking every 1 second | CAN-ERR 1 x blinking, 1 s off			**Warning Limit reached**
CAN-RUN is blinking every 1 second | CAN-ERR 2 x blinking, 1 s off			**Node Guard Event**

9.4 Structure of the CAN data telegram

[9-3] Basic structure of the CAN telegram

The following subchapters provide a detailed description of the identifier and the user data. The other signals refer to the transfer characteristics of the CAN telegram whose description is not included in the scope of this documentation.

Tip!

Please visit the homepage of the CAN user organisation CiA (CAN in automation) for further information:
http://www.can-cia.org

9.4.1 Identifier

The principle of the CAN communication is based on a message-oriented data exchange between a transmitter and many receivers. All nodes can transmit and receive quasi-simultaneously.

The identifier, also called COB-ID (abbr. for communication object identifier), is used to control which node is to receive a transmitted message. In addition to the addressing, the identifier contains information on the priority of the message and the type of user data.

The identifier consists of a basic identifier and the node address of the node to be addressed:

Identifier (COB-ID) = basic identifier + node address (node ID)

Exception: The identifier for process data/heartbeat/emergency objects as well as network management and sync telegrams is freely assigned by the user (either manually or automatically by the network configurator), or is permanently assigned.

Node address (node ID)

Every node of the system bus network must be assigned to a node address (also called node ID) within the valid address range (1 ... 127) for unambiguous identification.

- Assigning a node address more than once within a network is impermissible.
- The own node address can be configured via the DIP switch of the memory module (exception: MM1xx memory module) or via code C00350. ▸ Setting the node address (📖 299)

Identifier assignment

The system bus is message-oriented instead of node-oriented. Every message has an unambiguous identification, the identifier. For CANopen, node-oriented transfer is achieved by the fact that every message has only one transmitter.

- The basic identifiers for network management (NMT) and sync as well as the basic SDO channel (SDO1) are defined in the CANopen protocol and cannot be changed.
- The basic identifiers of the PDOs are preset in the Lenze setting according to the "Predefined Connection Set" of DS301 V4.02 and can be changed via parameters/indexes, if required.
  ▸ Identifiers of the process data objects (📖 310)

Object		Direction		Basic identifier	
		from device	to device	dec	hex
Network management (NMT)				0	0
Sync				128	80
Emergency		●		128	80
PDO1 (process data channel 1)	TPDO1	●		384	180
	RPDO1		●	512	200
PDO2 (Process data channel 2)	TPDO2	●		640	280
	RPDO2		●	768	300
PDO3 (Process data channel 3)	TPDO3	●		896	380
	RPDO3		●	1024	400
PDO4 (Process data channel 4)	TPDO4	●		1152	480
	RPDO4		●	1280	500
SDO1 (Basic SDO channel)		●		1408	580
			●	1536	600
SDO2 ... SDO10 (parameter data channel 2 ... 10)		●		1472	5C0
			●	1600	640
Node guarding, heartbeat		●		1792	700

9.4.2 User data

All nodes communicate by exchanging data telegrams via the system bus. The user data area of the CAN telegram either contains network management data or parameter data or process data:

Network management data

(NMT data)

- Control information on start, stop, reset, etc. of communication to specific nodes or to all nodes of the CAN network.

Process data

(PDOs – process data objects)

- Process data are transferred via the process data channel.
- Process data can be used to control the controller.
- Process data are not saved to the controller.
- Process data are transmitted between host system and nodes to ensure continuous exchange of current input and output data.
- Process data usually are unscaled/scalable raw data.
- Process data are, for instance, setpoints and actual values.

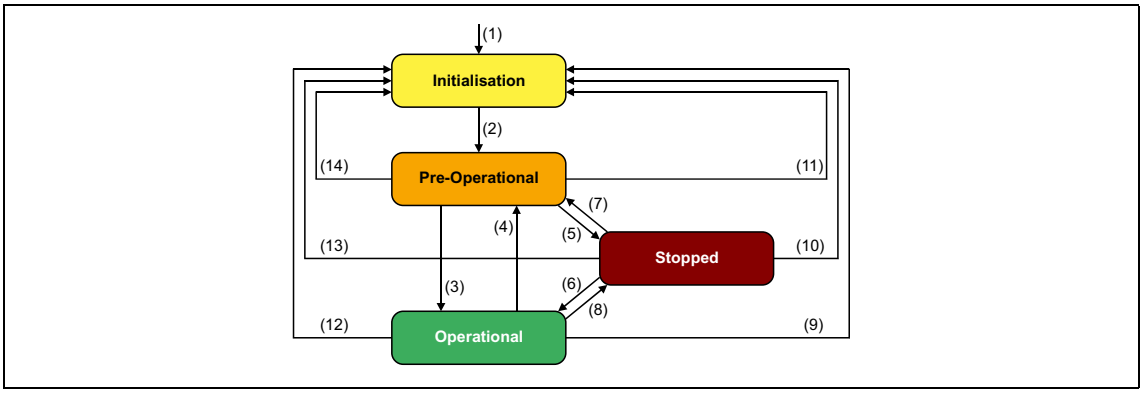
Parameter data

(SDOs – service data objects)

- Parameter data are the CANopen indexes or, in case of Lenze devices, the codes.
- Parameters are set, for instance, when the system is initially adjusted during commissioning or when the material of the production machine is changed.
- Parameter data are transmitted as SDOs via the parameter data channel. They are acknowledged by the receiver, i.e. the transmitter gets a feedback about the transmission being successful or not.
- The parameter data channel enables access to all Lenze codes and CANopen indexes.
- Parameter changes are automatically saved to the controller until mains switching.
- In general, the parameter transfer is not time-critical.
- Parameter data are, for instance, operating parameters, diagnostic information, and motor data.

9.5 Communication phases/network management

Regarding communication via the system bus, the controller distinguishes between the following statuses:



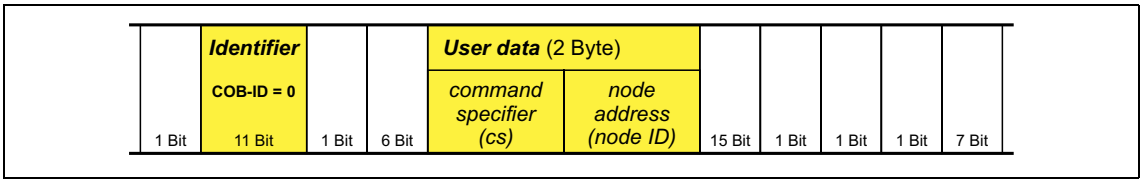
State	Explanation
"Initialisation" (Initialisation)	After switch-on, an initialisation run is carried out. • During this phase, the controller is not involved in the data exchange via the bus. • The standard values are re-written to all CAN-relevant parameters. • After initialisation is completed, the controller is automatically set to the "Pre-Operational" status.
"Pre-Operational" (before being ready for operation)	Parameter data can be received, process data are ignored.
"Operational" (ready for operation)	Parameter data and process data can be received!
"Stopped" (stopped)	Only network management telegrams can be received.

Communication object	Initialisation	Pre-Operational	Operational	Stopped
PDO			●	
SDO		●	●	
Sync		●	●	
Emergency		●	●	
Boot-up	●			
Network management (NMT)		●	●	●

Tip!

Part of the initialisation or the entire initialisation can be carried out anew in every status by transferring the corresponding network management telegrams.

9.5.1 State transitions



[9-4] NMT status transitions in the CAN network

Transition	NMT command	Status after change	Effects on process/parameter data after status change
(1)	-	Initialisation	Initialisation starts automatically when the mains is switched on. • During initialisation, the controller is not involved in the data exchange. • After the initialisation is completed, the node sends a boot-up message with an individual identifier and automatically changes to the "pre-operational" status.
(2)	-	Pre-Operational	In this phase, the master determines the way in which the node(s) takes/take part in communication.
	From here, the master changes the statuses for the entire network. • A target address included in the NMT command defines the receiver(s). • If the 9400 controller has been configured as CAN master, the state automatically changes to "Operational" after the waiting time has expired (C00378) and the NMT command 0x0100 ("Start Remote Node") is sent to all nodes. • Data can only be exchanged via process data objects if the status is "Operational"!		
(3), (6)	0x01 xx Start remote node	Operational	Network management/sync/emergency telegrams as well as process data (PDO) and parameter data (SDO) are active. Optional: When the status is changed, event and time-controlled process data (PDOs) are transmitted once.
(4), (7)	0x80 xx Enter Pre-Operational	Pre-Operational	Network management/sync/emergency telegrams and parameter data (SDO) are active.
(5), (8)	0x02 xx Stop remote node	Stopped	Only network management telegrams can be received.
(9), (10), (11)	0x81 xx Reset node	Initialisation	All CAN-relevant parameters (CiA DS 301) are initialised with the saved values.
(12), (13), (14)	0x82 xx Reset communication		All CAN-relevant parameters (CiA DS 301) are initialised with the saved values.
	Meaning of the node address in the NMT command: • xx = 0x00: If this assignment is selected, the telegram addresses all nodes (broadcast telegram). The status of all nodes can be changed at the same time. • xx = Node ID: If a node address is specified, only the status of the node with the corresponding address changes.		

9.5.2 Network management telegram (NMT)

The telegram for the network management contains identifier "0" and the command included in the user data which consists of the command byte and the node address:

[9-5] Network management telegram for changing over the communication phases

Command specifier (cs)		NMT command
dec	hex	
1	0x01	Start remote node
2	0x02	Stop remote node
128	0x80	Enter Pre-Operational
129	0x81	Reset node
130	0x82	Reset communication

The communication phases are changed over by a node, the CAN master, for the entire network. The CAN master can also be a controller. ▸ Parameterising the controller as CAN master (📖 308)

Example:

Data can only be exchanged via process data objects if the status is "Operational".If the CAN master is supposed to switch all nodes connected to the bus from the "Pre-Operational" communication status to the "Operational" communication status, the identifier and user data in the transmission telegram must be set as follows:

- Identifier: 0x00 (network management)
- User data: 0x0100 ("Start remote node" NMT command to all nodes)

9.5.3 Parameterising the controller as CAN master

If the initialisation of the system bus and the associated status change from "Pre-Operational" to "Operational" is not effected by a superimposed host system, the controller can instead be defined to be a "quasi" master to execute this task.

The controller is configured as CAN master in C00352.

- Being the CAN master, the controller sets all nodes connected to the bus (broadcast telegram) to the "Operational" communication status with the "Start remote node" NMT telegram. Only in this communication status, data can be exchanged via process data objects.
- In C00378, you can set a delay time which must elapse after power-up before the controller applies the "Start Remote Node" NMT telegram to the bus.

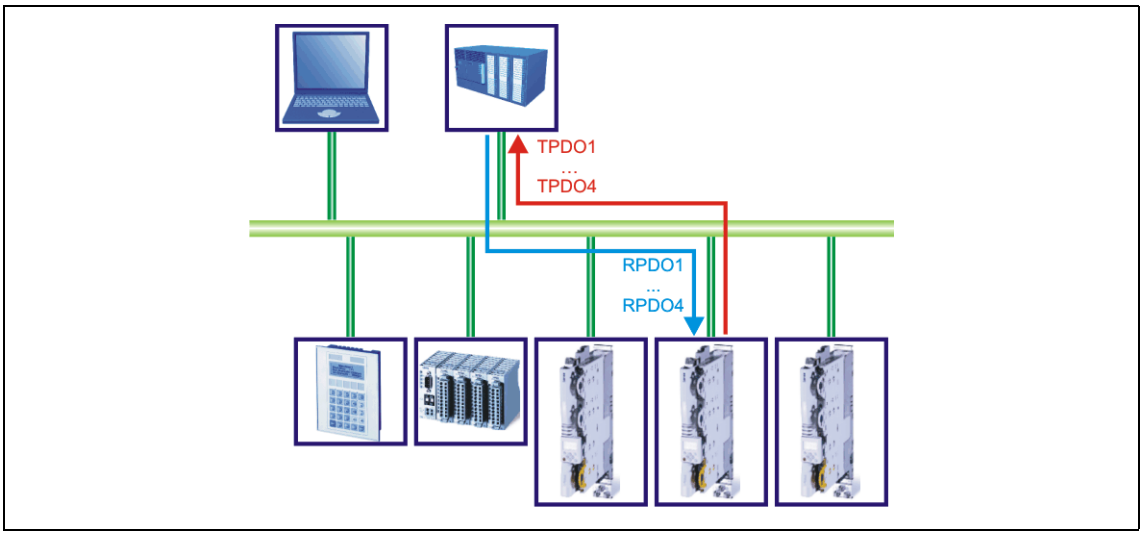
Parameters	Info	Lenze setting	
		Value	Unit
C00352	CAN slave/master	slave	
C00378	CAN delay boot-up - Operational	3000	ms

Note!

The changes of the master/slave operation in C00352 will not be activated until

- another mains switching of the controller

or



- the "Reset node" or "Reset communication" NMT telegram has been transmitted to the controller.

As an alternative to the "Reset Node" NMT telegram, the device command C00002 = "91: CAN on board: Reset Node" can be used to reinitialise the CAN-specific device parameters.

Tip!

Master functionality is only required during the initialisation phase of the drive system.

9.6 Process data transfer

[9-6] PDO data transfer from / to the higher-level host system

For the transfer of process data, four separated process data channels (PDO1 ... PDO4) are available.

Definitions

- Process data telegrams between the host system and the devices are distinguished in terms of direction as follows:
  - Process data telegrams to the device (RPDO)
  - Process data telegrams from the device (TPDO)
- The CANopen process data objects are designated as seen from the node's view:
  - Receive PDOs (RPDOx): Process data object received by a node
  - Transmit PDOs (TPDOx): Process data object sent by a node

Note!

Data can only be exchanged via process data objects if the status is "Operational"!

▸ Communication phases/network management (📖 305)

9.6.1 Identifiers of the process data objects

The identifiers for the process data objects PDO1 ... PDO4 in the Lenze setting result from the basic identifier and the node address set in C00350.

Identifier (COB-ID) = basic identifier + node address (node ID)

- The basic identifiers of the PDOs are preset in the Lenze setting according to the "Predefined Connection Set" of DS301 V4.02.
- The identifiers for the PDOs can be set individually via the Lenze codes and CANopen indexes listed in the following table. Thus, you can also set an identifier independent of the node address for certain PDOs.

Process data object	Basic identifier		Individual setting	
	dec	hex	Lenze code	CANopen index
PDO1				
RPDO1	512	0x200	C00321/1	I-1400/1
TPDO1	384	0x180	C00320/1	I-1800/1
PDO2				
RPDO2	768	0x300	C00321/2	I-1401/1
TPDO2	640	0x280	C00320/2	I-1801/1
PDO3				
RPDO3	1024	0x400	C00321/3	I-1402/1
TPDO3	896	0x380	C00320/3	I-1802/1
PDO4				
RPDO4	1280	0x500	C00321/4	I-1403/1
TPDO4	1152	0x480	C00320/4	I-1803/1

Note!

After the node address (C00350) has changed and a subsequent CAN reset node, the identifiers which result from the corresponding basic identifiers and the set node address are automatically set again in the subcodes of C00320 and C00321.

Tip!

The "Predefined Connection Set" can be re-established anytime using the following device commands (C00002):

- "93: CAN on board: Pred.Connect.Set" for CAN on board
- "94: CAN module: Pred.Connect.Set" for E94AYCCA communication module

9.6.2 Transmission type

The process data objects are transmitted in an event-controlled or time-controlled way.

- **Event-controlled:** The PDO is sent if a special device-internal event has occurred, for instance, when the data contents of the TPDO have changed or when a transmission cycle time has elapsed.
- **Synchronous:** A TPDO (or RPDO) is transmitted (or received) after the device has received a sync telegram (with identifier 0x80).
- **Cyclically:** The PDOs are transmitted in fixed time intervals after the transmission cycle time has elapsed.

The table shows that combinations of logic operations (AND, OR) are also possible between the different transmission modes:

Transmission type	PDO transmission			Logic operation
	cyclic	synchronous	event-controlled	
0		●	●	AND
1 ... 240		●		-
254, 255	●		●	OR

Transmission type	Description
0	The PDO is transmitted on an event-controlled basis with every sync (e.g. when a bit change occurs in the PDO).
1 ... 240	**SYNC (with response)** • Selection n = 1: The PDO is transmitted with every sync. • Selection 1 < n ≤ 240: The PDO is transmitted with every n-th sync.
254, 255	**Event-controlled (with mask) with cyclic overlay** If this value is entered, the PDO transmission is event-controlled or cyclic. (Note: The values "254" and "255" have the same meaning). For cyclic overlay, a cycle time must be set for the respective PDO. In this case, cyclic transmission takes place in addition to event-controlled transmission (e.g. through a bit change in the PDO).

The communication parameters such as the transmission mode and cycle time can be set freely for every PDO and independently of the settings of other PDOs:

Parameters	Info	Lenze setting	
		Value	Unit
C00322/1...4	CAN TPDOx Tx mode	254	
C00323/1...4	CAN RPDOx Rx mode	254	
C00324/1...4	CAN TPDOx delay time	0	1/10 ms
C00356/1...4	CAN TPDOx cycle time	0	ms

Tip!

The setting can also be carried out via the following CANopen objects:

- I-1400 ... I-1403: Communication parameters for RPDO1 ... RPDO4
- I-1800 ... I-1803: Communication parameters for TPDO1 ... TPDO4

9.6.3 Masking of the TPDOs for event control

For TPDO1 ... TPDO4, a mask can be parameterised for every byte. In case of the event-controlled transmission of a PDO, only the masked bits are used for the event control.

- Mask "0x0" means that no bit of the corresponding byte actuates the transmission.
- Mask "0xff" means that every bit of the corresponding byte can actuate the transmission.

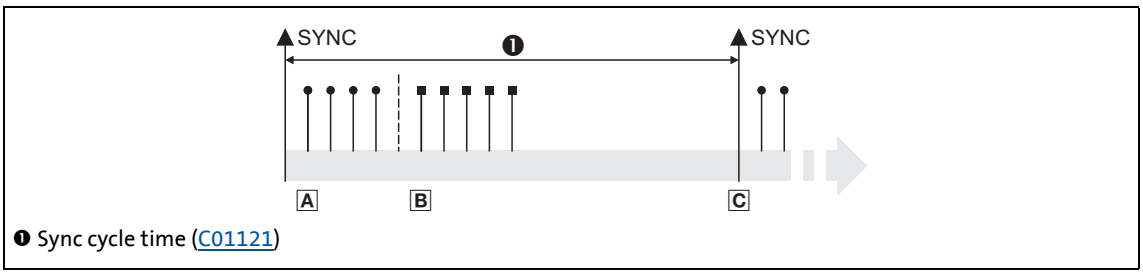
Short overview: Parameters for masking the TPDOs

Parameters	Info	Lenze setting
C00311/1...8	CAN TPDO1 mask byte x	0x00
C00312/1...8	CAN TPDO2 mask byte x	0x00
C00313/1...8	CAN TPDO3 mask byte x	0x00
C00314/1...8	CAN TPDO4 mask byte x	0x00

9.6.4 Monitoring of the RPDOs for data reception

For RPDO1 ... RPDO4 each, a monitoring time can be parameterised within which the RPDO must arrive. If the RPDO is not received within the monitoring time or not with the configured sync, the response parameterised for each RPDO takes place.

Short overview: Parameters for RPDO monitoring



Parameters	Info	Lenze setting	
		Value	Unit
C00357/1...4	CAN RPDOx monitoring time	3000	ms
C00591/1...4	Resp. to CAN RPDOx error	No response	

9.6.5 Synchronisation of PDOs via sync telegram

During cyclic transmission, one or more PDOs are transmitted/received in fixed time intervals. An additional specific telegram, the so-called sync telegram, is used for synchronising cyclic process data.

- The sync telegram is the trigger point for the transmission of process data from the slaves to the master and for the acceptance of process data from the master in the slaves.
- For sync-controlled process data processing, the sync telegram must be generated accordingly.
- The response to a sync telegram is determined by the transmission type selected.
  ▸ Transmission type (📖 311)

Basic workflow

❶ Sync cycle time (C01121)

[9-7] Sync telegram

A. After the sync telegram has been received, the slaves transmit the synchronous process data to the master (TPDOs). The master reads them as process input data.
B. When the transmission process is completed, the slaves receive (RPDOs) the process output data (of the master).
   - All other telegrams (e.g. parameters or event-controlled process data) are accepted acyclically by the slaves after the transmission is completed.
   - Illustration [9-7] does not include acyclic data. However, they need to be considered when dimensioning the cycle time.
C. The data are accepted in the slave with the next sync telegram if the Rx mode is set to 1 ... 240. If the Rx mode is 254 or 255, the data are accepted in the next device cycle, irrespective of the sync telegram.

9.6.5.1 Parameter setting

Short overview: Parameters for the synchronisation via sync telegram

Parameters	Info	Lenze setting		Assignment	
		Value	Unit	Sync master	Sync slave
C00367	CAN SYNC Rx identifier	128			●
C00368	CAN SYNC Tx identifier	128		●	
C00369/1	CAN sync transmission cycle time	0	ms	●	
C01120	Sync source	Off			●
C01121	Sync cycle time For synchronisation via the system bus, only integer multiples of 1000 µs should be set.	1000	µs		●
C01122	Sync phase position	400	µs		●
C01123	Sync tolerance	0	µs		●
C01124	Sync PLL increment	109	ns		●
C01130	Sync application cycle	1000	µs		●

Note!

The following codes are ineffective if the servo inverter is synchronised via a communication module:

- C01121
- C01122
- C01123
- C01124

Sync source

C01120 is used to select the source of the synchronisation signals. Basically, only one source can synchronise the node.

Sync cycle time

Time interval at which the internal phase-locking loop (PLL) expects the synchronisation signals.

The sync cycle time must be set in C01121, matching the cycle of the synchronisation source selected in C01120.

- Example 1:
  For the system bus the interval between two synchronisation signals has been set with 2 ms. If the system bus is to be used as synchronisation source, a sync cycle time of 2000 µs must be set in C01121.
- Example 2:
  The cycle time of the application task running in the user application must also comply exactly with the sync cycle time.
  Therefore, the following constellation can not be implemented:
  - Cycle time of the application task: 2 ms
  - Sync cycle time: 4 ms

Sync phase position

The phase position defines the zero point of time for the application relating to the synchronisation signal (bus cycle). Since PDO processing is integrated in the system part of the application, the instant of the PDO acceptance also changes if the phase position is changed.

- If 0 is set, the application is started together with the synchronisation signal.
- If a value > 0 is set, the application starts by the set time interval before the synchronisation signal arrives (the phase position acts negatively).

Example: If the phase position is set to 400 µs, the system part of the application starts 400 µs before the synchronisation signal arrives.

Note!

From software version V3.0:

The effect of the sync phase position can be affected by the application cycle set in C01130. For the Lenze setting of C01130 the behaviour remains as before.

Sync tolerance

Time slot for monitoring the synchronisation signal via the system block **LS_SyncInput**. ▸ System block "LS_SyncInput" (📖 367)

- If the last synchronisation signal has been within this time slot around the expected value, the *SYNC_bSyncInsideWindow* output of the **LS_SyncInput** system block is set to TRUE.
- This setting does not affect the synchronisation process.

Sync PLL increment

If the cycle times of the synchronisation signal and the phase-locking loop (PLL) differ from each other, the setting in C01124 defines the increment with which the phase-locking loop can be readjusted.

- The recommended reset time for the system bus as synchronisation source with regard to occurring deviations is 109 ns (Lenze setting).

Sync application cycle

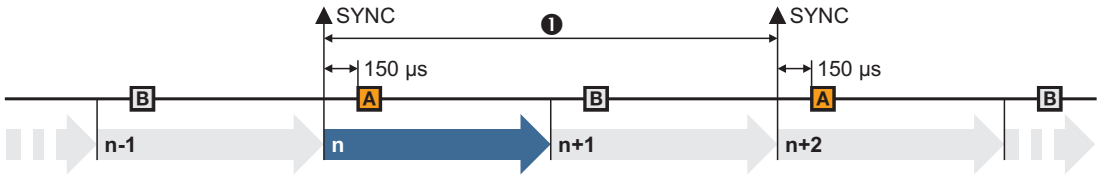
This parameter influences the effect of the sync phase position (C01122) with regard to the instant of acceptance of the synchronous PDOs by the application or the instant of transmission of the synchronous PDOs to the system bus.

The following applies to software versions lower than V3.0:

- The sync application cycle is fixedly set to 1000 µs.
- The resulting PDO delay can be calculated with the following formula taking into consideration an internal processing time of 150 s:
  PDO delay= (sync cycle time - sync phase position + 150 µs) modulo 1000

The following applies from software version V3.0:

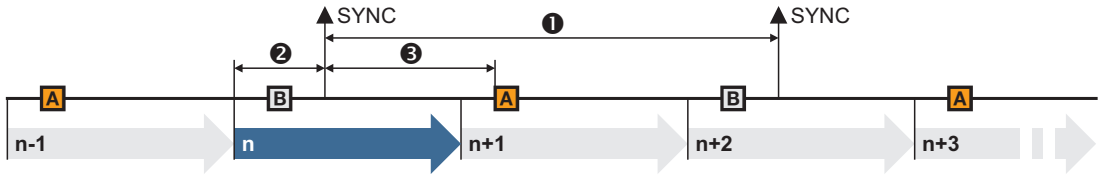
- The sync application cycle can be set in C01130. The value set is automatically rounded down to full 1000 µs.
- The resulting PDO delay can be calculated with the following formula, taking an internal processing time of 150 s into consideration:
  PDO delay= (sync cycle time - sync phase position + 150 µs) modulo C01130



Note!

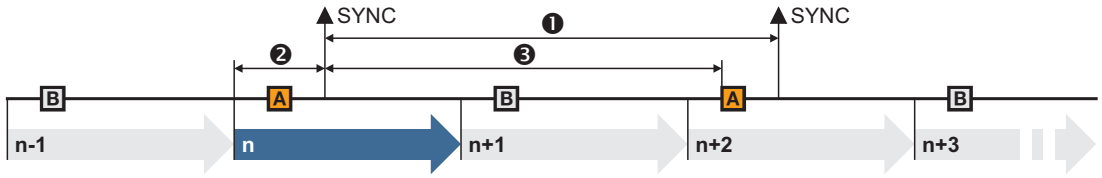
If the sync application cycle in C01130 is set higher than the sync cycle time (C01121), the response is undefined. The same applies if the sync phase position (C01122) is set higher than the sync cycle time (C01121).

Usually, no synchronous PDOs are then applied to the system bus anymore.



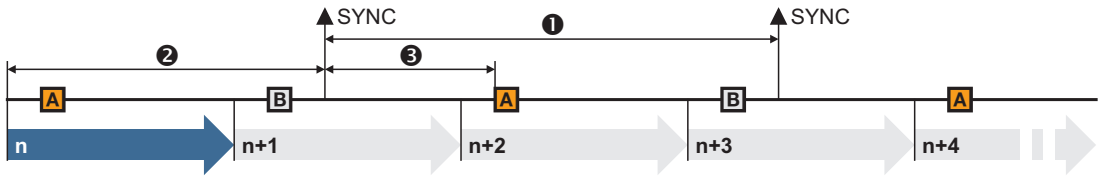
9.6.5.2 Effect of C01130 on the sync phase position

Example 1:



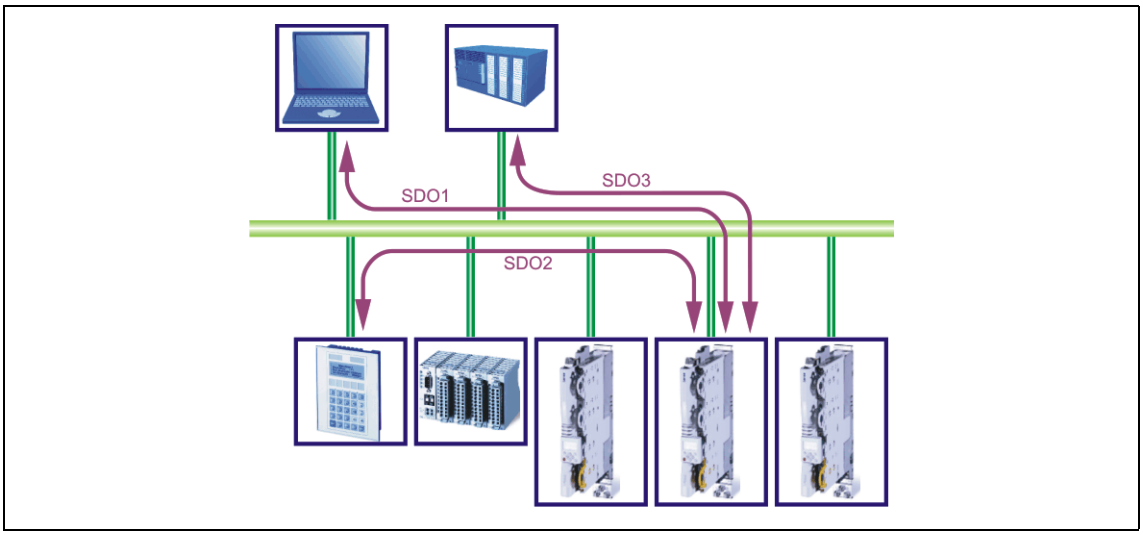
❶	Sync cycle time (C01121)	= 2000 µs
	Sync phase position (C01122)	= 0 µs
	Sync application cycle (C01130)	= 1000 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

Example 2:



❶	Sync cycle time (C01121)	= 2000 µs
❷	Sync phase position (C01122)	= 400 µs
	Sync application cycle (C01130)	= 1000 µs
❸	PDO delay	= (C01121 - C01122 + 150 µs) modulo C01130 = 750 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

Example 3:



❶	Sync cycle time (C01121)	= 2000 µs
❷	Sync phase position (C01122)	= 400 µs
	Sync application cycle (C01130)	= 2000 µs
❸	PDO delay	= (C01121 - C01122 + 150 µs) modulo C01130 = 1750 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

Example 4:

❶	Sync cycle time (C01121)	= 2000 µs
❷	Sync phase position (C01122)	= 1400 µs
	Sync application cycle (C01130)	= 1000 µs
❸	PDO delay	= (C01121 - C01122 + 150 µs) modulo C01130 = 750 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

9.7 Parameter data transfer

[9-8] Parameter data transfer via the available parameter data channels

Parameters are values stored in codes on Lenze controllers.

Ten separate parameter data channels are available for parameter setting, enabling the simultaneous connection of several devices for configuration.

Parameter data are transmitted via the system bus as SDOs ("Service Data Objects") and acknowledged by the receiver. The SDO enables read and write access to the object directory. Indexes (e.g. I-1000) ensure access to parameters and functions included in the object directory. To transfer SDOs, the information contained in the user data must comply with the CAN-SDO protocol.

9.7.1 Identifiers of the parameter data objects

The identifiers for the parameter data objects SDO1 ... SDO10 in the Lenze setting result from the basic identifier and the node address set in C00350.

Identifier (COB-ID) = basic identifier + node address (node ID)

- The basic identifiers of the SDOs are preset in the Lenze setting according to the "Predefined Connection Set" of DS301 V4.02.

Parameter data object	Direction		Basic identifier	
	from device	to device	dec	hex
SDO1 (Parameter data channel 1)	●		1408	580
		●	1536	600
SDO2 ... 10 (parameter data channel 2 ... 10)	●	●	deactivated	
Node guarding, heartbeat	●		1792	700
Boot-up	●		1792	700

Note!

Please observe that the parameter data channels 2 ... 10 are deactivated in the Lenze setting.

The procedure for activating these parameter data channels is explained in the description of parameters C00372 and C00373 and the description for the implemented CAN object I-1201. ▸ Example (📖 355)

9.7.2 User data

Structure of the user data of the parameter data telegram

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	LOW byte	HIGH byte		LOW word		HIGH word	
				LOW byte	HIGH byte	LOW byte	HIGH byte

Note!

For the user data, the Motorola format is used.

▸ Parameter data telegram examples (📖 325)

The following subchapters provide detailed information on user data.

9.7.2.1 Command

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	LOW byte	HIGH byte		LOW word		HIGH word	
				LOW byte	HIGH byte	LOW byte	HIGH byte

The following commands can be transmitted or received for writing and reading the parameters:

Command	1st byte		Data length	Info
	hex	dec		
Write request	0x23	35	4 bytes	Writing of a parameter to the controller.
	0x2B	43	2 bytes	
	0x2F	47	1 byte	
	0x21	33	Block	
Write response	0x60	96	4 bytes	Controller acknowledges a write request.
Read request	0x40	64	4 bytes	Reading of a parameter from the controller.
Read response	0x43	67	4 bytes	Controller's response to a read request with the current parameter value.
	0x4B	75	2 bytes	
	0x4F	79	1 byte	
	0x41	65	Block	
Error response	0x80	128	4 bytes	Response from the controller when the read/write request could not be executed correctly. ▸ Error messages (📖 322)

More precisely, the command byte comprises the following information:

Command	1st byte							
	Command specifier (cs)			Toggle (t)	Length*		E	s
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Write request	0	0	1	0	0/1	0/1	1	1
Write response	0	1	1	0	0	0	0	0
Read request	0	1	0	0	0	0	0	0
Read response	0	1	0	0	0/1	0/1	1	1
Error response	1	0	0	0	0	0	0	0

*Bit coding of the length: 00 = 4 bytes, 01 = 3 bytes, 10 = 2 bytes, 11 = 1 byte
e: expedited (shortened block service)
s: segmented (normal block service)

Tip!

More commands are defined in CANopen specification DS301, V4.02 (e.g. segmented transfer).

9.7.2.2 Addressing by means of index and subindex

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	LOW byte	HIGH byte		LOW word		HIGH word	
				LOW byte	HIGH byte	LOW byte	HIGH byte

A parameter (a Lenze code) is addressed as per the following formula:
Index = 24575 - (Lenze code number)

Example

The C00011 parameter (motor reference speed) is to be addressed.

Calculation:

- Index:
  - Decimal: 24575 - 11 = 24564
  - Hexadecimal: 0x5FFF - 0xB = 0x5FF4
- Subindex: 0x00 (subindex 0 since the parameter does not have any subcodes)

Entries:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	0xF4	0x5F	0x00				

9.7.2.3 Data 1 ... Data 4

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	LOW byte	HIGH byte		LOW word		HIGH word	
				LOW byte	HIGH byte	LOW byte	HIGH byte

Maximally 4 bytes are available for parameter value entries. Depending on the data format, they are assigned as follows:

5th byte	6. byte	7th byte	8th byte
Parameter value (1 byte)	0x00	0x00	0x00
Parameter value (2 bytes)		0x00	0x00
LOW byte	HIGH byte		
Parameter value (4 bytes)			
LOW word		HIGH word	
LOW byte	HIGH byte	LOW byte	HIGH byte

Note!

The "Factor" column of the Table of attributes contains a so-called scaling factor for all Lenze parameters. The scaling factor is relevant to the transfer of parameter values which have one or more decimal positions in the parameter list.

If the scaling factor is > 1, the value must be multiplied by the indicated scaling factor prior to transmission to be able to transfer the value as an integer. At the SDO client end, the integer must be divided by the scaling factor to obtain the original value including decimal positions again.

Example

For a code with the scaling factor "100" and the data format U32 the value "123.45" is to be transmitted.

Calculation:

- Value to be transmitted = scaling factor x value
- Data $_{(1 \ldots 4)}$ = 100 x 123.45 = 12345 (0x00 00 30 39)

Entries:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
				0x39	**0x30**	**0x00**	**0x00**

9.7.2.4 Error messages

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Error code			
0x80 (128)	LOW byte	HIGH byte		LOW word		HIGH word	
				LOW byte	HIGH byte	LOW byte	HIGH byte

In the event of an error, the addressed node generates a telegram with the "Error response" (0x80) command.

- The telegram includes the index and subindex of the code where the error occurred.
- The error code is entered in bytes 5 ... 8.
  - The error codes are standardised according to DS301, V4.02.
  - The representation of the error codes is provided in reverse read direction (see example below).

Example

Representation of error code "0x06 04 00 41" in bytes 5 ... 8:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Command	Index		Subindex	Error code			
				0x41	0x00	0x04	0x06

Meaning of the error codes

Error code	Explanation
0x0503 0000	Toggle bit not changed.
0x0504 0000	SDO protocol expired.
0x0504 0001	Invalid or unknown client/server command specifier.
0x0504 0002	Invalid block size (block mode only).
0x0504 0003	Invalid processing number (block mode only).
0x0504 0004	CRC error (block mode only).
0x0504 0005	Memory does not suffice.
0x0601 0000	Object access not supported.
0x0601 0001	Attempted read access to a writable only object.
0x0601 0002	Attempted write access to a readable only object.
0x0602 0000	Object not listed in object directory.
0x0604 0041	Object not mapped to PDO.
0x0604 0042	Number and length of objects to be transferred longer than PDO length.
0x0604 0043	General parameter incompatibility.
0x0604 0047	General internal device incompatibility.
0x0606 0000	Access denied because of hardware error.
0x0607 0010	Unsuitable data type (unsuitable service parameter length).
0x0607 0012	Unsuitable data type (service parameter length exceeded).
0x0607 0013	Unsuitable data type (service parameter length too short).
0x0609 0011	Subindex does not exist.
0x0609 0030	Parameter value range exceeded.
0x0609 0031	Parameter values too high.
0x0609 0032	Parameter values too low.
0x0609 0036	Maximum value falls below minimum value.
0x0800 0000	General error.
0x0800 0020	Data cannot be transferred or saved for application.
0x0800 0021	Data cannot be transferred or saved for application due to local control.
0x0800 0022	Data cannot be transferred or saved for application due to current device status.
0x0800 0023	Dynamic generation of object directory failed or no object directory available (e.g. object directory generated from file, generation not possible because of a file error).

9.7.3 Parameter data telegram examples

9.7.3.1 Read parameters

Task: The heatsink temperature of 43 °C (code C00061, data format INTEGER32, scaling factor 1) is to be read from the controller with node address 5.

Telegram to drive

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0605	0x40	0xC2	0x5F	0x00	0x00	0x00	0x00	0x00

Explanations on the telegram to the drive	
Identifier	= 1536 + node address = 1536 + 5 = 1541 = 0x0605 (1536 = SDO1 basic identifier to the controller)
Command	= 0x40 = "Read request" (read request of a parameter from the controller)
Index	= 24575 - code number = 24575 - 61 = 24514 = 0x5FC2
Subindex	= 0 (code C00061 does not have any subcodes)

Response telegram from drive (if data have been correctly transmitted)

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0585	0x43	0xC2	0x5F	0x00	0x2B	0x00	0x00	0x00

Explanations on the telegram from the drive	
Identifier	= 1408 + node address = 1408 + 5 = 1413 = 0x0585 (1408 = SDO1 basic identifier from the controller)
Command	= 0x43 = "Read Response" (response to read request with current value)
Index	as in telegram to the drive
Subindex	
Data 1 ... 4	= 0x0000002B = 43 [°C]

9.7.3.2 Write parameters

Task: The rated current of the connected motor with I_{rated} = 10.2 A (code C00088) is to be entered in the controller.

Telegram to drive

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4

Explanations on the telegram to the drive	
Identifier	= 1536 + node address = 1536 + 2 = 1538 = 0x0602 (1536 = SDO1 basic identifier to the controller)
Command	= 0x23 = "Write request" (write request of a parameter to the controller)
Index	= 24575 - code number = 24575 - 88 = 24487 = 0x5FA7
Subindex	= 0 (code C00088 does not have any subcodes)
Data 1 ... 4	= 10,2 x 10 = 102 = 0x00000066 (Value for motor current, data type U32; display factor 1/10)

Response telegram from drive (if data have been correctly transmitted)

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0582	0x60	0xA7	0x5F	0x00	0x00	0x00	0x00	0x00

Explanations on the telegram from the drive	
Identifier	= 1408 + node address = 1408 + 2 = 1410 = 0x0582 (1408 = SDO1 basic identifier from the controller)
Command	= 0x60 = "Write response" (Acknowledgement of the write access from the controller)
Index	as in telegram to the drive
Subindex	

9.7.3.3 Read block parameters

Task: The firmware version (code C00099) is to be read from the parameter set of the controller with node address "12". The firmware version has a length of 11 ASCII characters which are transmitted as a block parameter. Depending on the block, the data width from the 2nd to 8th byte is assigned within the user data.

Telegram 1 to the drive: Read request

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x060C	0x40	0x9C	0x5F	0x00	0x00	0x00	0x00	0x00

Explanations on the telegram to the drive	
Identifier	= 1536 + node address = 1536 + 12 = 1548 = 0x060C (1536 = SDO1 basic identifier to the controller)
Command	= 0x40 = "Read request" (read request of a parameter from the controller)
Index	= 24575 - code number = 24575 - 99 = 24476 = 0x5F9C
Subindex	= 0 (code C00099 does not have any subcodes)

Response telegram 1 from the drive: Indication of the block length (11 characters)

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x058C	0x41	0x9C	0x5F	0x00	0x0B	0x00	0x00	0x00

Explanations on the telegram from the drive	
Identifier	= 1408 + node address = 1408 + 12 = 1420 = 0x058C (1408 = SDO1 basic identifier from the controller)
Command	= 0x41 = "Read response" (response is block telegram)
Index	as in telegram to the drive
Subindex	
Data 1 ... 4	= 0x0000000B = data length of 11 characters in the ASCII format

Telegram 2 to the drive: Request of the 1st data block

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x060C	0x60	0x00	0x00	0x00	0x00	0x00	0x00	0x00

Explanations on the telegram to the drive	
Command	= 0x60 = "Read segment request" (request: read data block) • Bit 4 = 0 (toggle bit)
	Influence of the toggle bit on the request command The blocks are toggled one after another, i.e. the request is made with the "0x60" (= 011**0***0000_{bin}) command, then with the "0x70" (= 011**1***0000_{bin}) command, and then again with the "0x60" command, etc. * Toggle bit

Response telegram 2 from the drive: Transmission of the 1st data block

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x058C	0x00	0x30	0x31	0x2E	0x30	0x30	0x2E	0x30
		0_{asc}	1_{asc}	$._{asc}$	0_{asc}	0_{asc}	$._{asc}$	0_{asc}

Explanations on the telegram to the drive	
Command	= 0x00 = 00000000_{bin} • Bit 4 = 0 (toggle bit)
	Influence of the toggle bit on the transmission command • The 1st response of the controller in the command byte is "0x000**0***0000_{bin}" if bytes 2 ... 8 are completely filled with data and other telegrams are following. • The 2nd response of the controller in the command byte is "0x000**1***0000_{bin}" if bytes 2 ... 8 are completely filled with data and other telegrams are following, etc. * Toggle bit
Data 1 ... 7	= "01.00.0" (ASCII representation)

Telegram 3 to the drive: Request of the 2nd data block

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x060C	0x70	0x00	0x00	0x00	0x00	0x00	0x00	0x00

Explanations on telegram 3 to the drive	
Command	= 0x70 = "Read segment request" (request: read data block) • Bit 4 = 1 (toggle bit)

Response telegram 3 from the drive: Transmission of the 2nd data block including end identifier

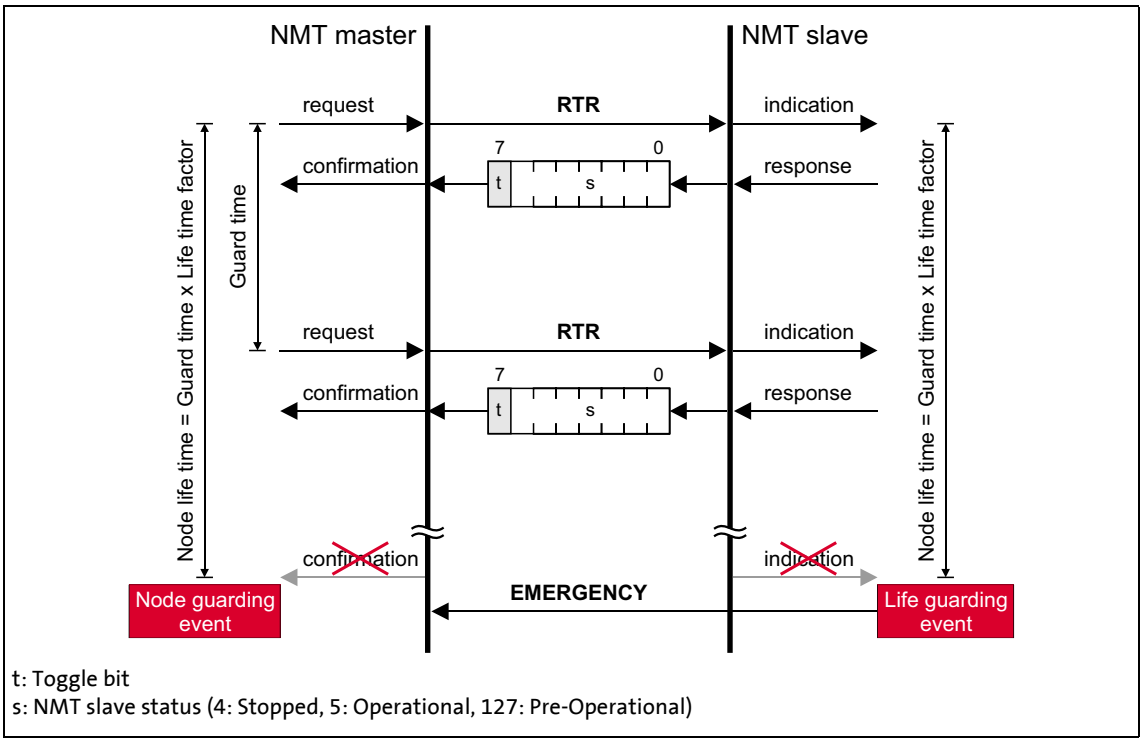
Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x058C	0x17	0x30	0x2E	0x30	0x30	0x00	0x00	0x00
		0_{asc}	$._{asc}$	0_{asc}	0_{asc}	-	-	-

Explanations on telegram 3 from the drive	
Command	= 0x17 = 00010111_{bin}: • Bit 0 = 1 (end of transmission) • Bit 1 ... bit 3 = 011_{bin} (3 bytes do not contain any data) • Bit 4 = 1 (toggle bit)
	Influence of the final bit and the residual data length on the transmission command • The end of transmission is signalled via the set final bit 0. • Bits 1 ... 3 reveal the number of bytes that do not contain any data anymore. * Toggle bit
Data 1 ... 7	= "0.00" (ASCII representation) The result of the data block transmission is: "01.00.00.00"

9.8 Diagnostics

The display parameters listed in the following table serve to request current information on the system bus for diagnostic purposes, e.g. using the keypad, via a bus system, or using »Engineer« (when an online connection has been established to the controller).

- The »Engineer« parameter list and the keypad contain these parameters in the category **CAN → CAN management**.
- A detailed description of these parameters can be found in the chapter "Parameter reference". (📖 724)



Parameters	Display
C00345	CAN error
C00359	CAN status
C00360/1	CAN stuffing bit error counter
C00360/2	CAN format error counter
C00360/3	CAN acknow. error counter
C00360/4	CAN bit 1 error counter
C00360/5	CAN bit 0 error counter
C00360/6	CAN CRC error counter
C00360/7	CAN Tx telegram counter
C00360/8	CAN Rx telegram counter
C00361/1	CAN bus load: Current node load in Tx direction
C00361/2	CAN bus load: Current node load in Rx direction
C00361/3	CAN bus load: Current node load of faulty telegrams
C00361/4	CAN bus load: Node peak load in Tx direction
C00361/5	CAN bus load: Node peak load in Rx direction
C00361/6	CAN bus load: Node peak load of faulty telegrams
C00390	CAN error register (DS301V402)

9.9 Monitoring

9.9.1 Node guarding protocol

In a CAN network, the node guarding protocol serves to monitor the connection between the NMT master and the NMT slave(s). If the controller was parameterised as NMT master, it can monitor up to 32 NMT slaves.

Basic workflow

t: Toggle bit
s: NMT slave status (4: Stopped, 5: Operational, 127: Pre-Operational)

[9-9] Node guarding protocol

1. The NMT master within cyclic time intervals sends a data telegram to the NMT slave, which is referred to as "Remote Transmission Request" (RTR).
2. The NMT slave then returns a response telegram ("Response") to the NMT master.

9.9.1.1 Telegram structure

RTR telegram

- The RTR telegram from the NMT master has the following identifiers:
  Identifier (COB-ID) = 1792 + node address of the NMT slave
- The RTR telegram does not contain any user data.
- The RTR bit in the arbitration field of the RTR telegram is set to the valency LOW (dominant level).

Response message

- The response telegram from the requested NMT slave has the same identifier as the RTR telegram received by the NMT master.
- The user data (1 byte) contains the NMT slave status and the toggle bit (see the following description).

NMT slave state (s)

NMT slave status		Data							
Communication status	Decimal value (s)	(t)	NMT slave state (s)						
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Stopped	4	0/1	0	0	0	0	1	0	0
Operational	5	0/1	0	0	0	0	1	0	1
Pre-Operational	127	0/1	1	1	1	1	1	1	1

Toggle bit (t)

- The toggle bit (t) in the response telegram has the value "0" when the node guarding protocol is activated for the first time.
- The toggle bit (t) must change its value with each response.

Note!

The toggle bit is monitored by the NMT master.

If a telegram is received with a toggle bit value that has not changed compared to the previously received telegram, it will be treated as if it were not received, i.e. the monitoring time is not reset and elapses further.

The toggle bit can only be reset to the value "0" by the "Reset Communication" telegram of the NMT master.

9.9.1.2 Parameter setting

Short overview of parameters for the "Node Guarding" monitoring function:

Parameters	Info	Lenze setting		Assignment	
		Value	Unit	master	slave
C00382	CAN guard time	0	ms		●
C00383	CAN life time factor	0			●
C00386/1...32	CAN node guarding	0x00000000		●	
C00387	CAN Node Guarding Activity	-		●	
C00388/1...32	CAN node guarding status	-		●	
C00612/1...32	Resp. to CAN node guarding error	No response		●	
C00614	Resp. to CAN life guarding error	No response			●
C00625	CAN behaviour in case of fault	Pre-operational state		●	●
Greyed out = display parameter					

Guard time

The time interval with which the NMT master transmits the RTR telegram is the guard time.

- For each NMT slave to be monitored an individual time interval can be set.
- The RTR telegram prompts the NMT slave to send its current status.

Node life time

The node life time is the product of the guard time and the life time factor:
node life time = guard time x life time factor

- "Life time factor" and "Guard time" have to be known to the NMT master. For this, the values from the NMT slave are read at each reboot, or defined values are sent to the NMT slave at each reboot.
- It is possible to select a different "node life time" for each NMT slave to be monitored.

OK status

The status of the connection is ok (OK status) if within the "Node life time"

- the NMT slave has received an RTR telegram from the NMT master and
- the NMT master has received a correct response from the requested NMT slave.

In the OK status the monitoring times for the NMT master and the NMT slave are reset and the node guarding protocol is continued.

Life guarding event

The "life guarding event" is triggered in the NMT slave if the slave has not received an RTR telegram from the NMT master within the node life time:

- In the Lenze setting, the NMT slave changes from the "Operational" communication status into the "Pre-Operational" communication status.
  - C00625 or the I-1029 object serve to set a status change.
- The NMT master receives an emergency telegram containing emergency error code 0x8130.
- The response parameterised in C00614 takes place (Lenze setting: "No response").

Note!

The "Life Guarding Event" can only be triggered in the NMT slave if at least one RTR telegram has been received successfully from the NMT master.

Node guarding event

The "node guarding event" is triggered in the NMT master if the master has not received any response to its RTR telegram from the requested NMT slave within the node life time or if the toggle bit in the response telegram has not changed within the node life time.

- In the Lenze setting, the NMT master changes from the "Operational" communication status into the "Pre-Operational" communication status.
  - C00625 or the I-1029 object serve to set a status change.
- The response parameterised in C00612/1...32 takes place (Lenze setting: "No response"). The response in the NMT master can be set individually for each monitored node.

Note!

The "Node Guarding Event" can only be triggered in the NMT master if at least one response has been received successfully from the requested NMT slave.

9.9.1.3 Commissioning example

Task

A 9400 controller configured as NMT master (node 1) is to monitor another 9400 controller (node 2).

- The node guarding telegram is to be transmitted from the NMT master to the NMT slave in intervals of 1 s:
  - Guard time = 1000 ms
- The node life time is to amount to 5 seconds:
  - Node life time = guard time (1000 ms) x life time factor (5)
- If an error occurs, an error response is to be activated both in the NMT master and the NMT slave.

Parameter setting of the NMT master (node 1)

1. Set heartbeat producer time (C00381) to 0 ms to deactivate the heartbeat monitoring (node guarding and heartbeat must not be used simultaneously in a CANopen device).
2. Configure controller as NMT master: Set C00352 = "1: Master".
3. Set guard time (C00382) to 0 ms (slave parameter).
4. Set life time factor (C00383) to 0 (slave parameter).
5. Configure monitoring for the node guarding in C00386.
   - The value to be entered into a free subcode (1 ... 32) is "0x050203E8". It consists of the following:

Bit 31 ... bit 24 **Life time factor**	Bit 23 ... Bit 16 **Node address of slave**	Bit 15 ... Bit 0 **Guard time**
0x05	**0x02**	**1000 [ms] = 0x03E8**

6. Go to C00612/1...32 and set the response required for the monitoring functions parameterised in C00386/1...32 which are to take place in case of a "Node Guarding Event" in the NMT master.

Tip!

- C00387 displays the activity of every monitoring function parameterised in C00386/1...32 in a bit-coded form.
- C00388/1...32 displays the node guarding status of the monitored NMT slaves.
- C00625 serves to set which status change is to occur in the NMT master in case of a "Node Guarding Event".

Parameterise NMT slave (node 2)

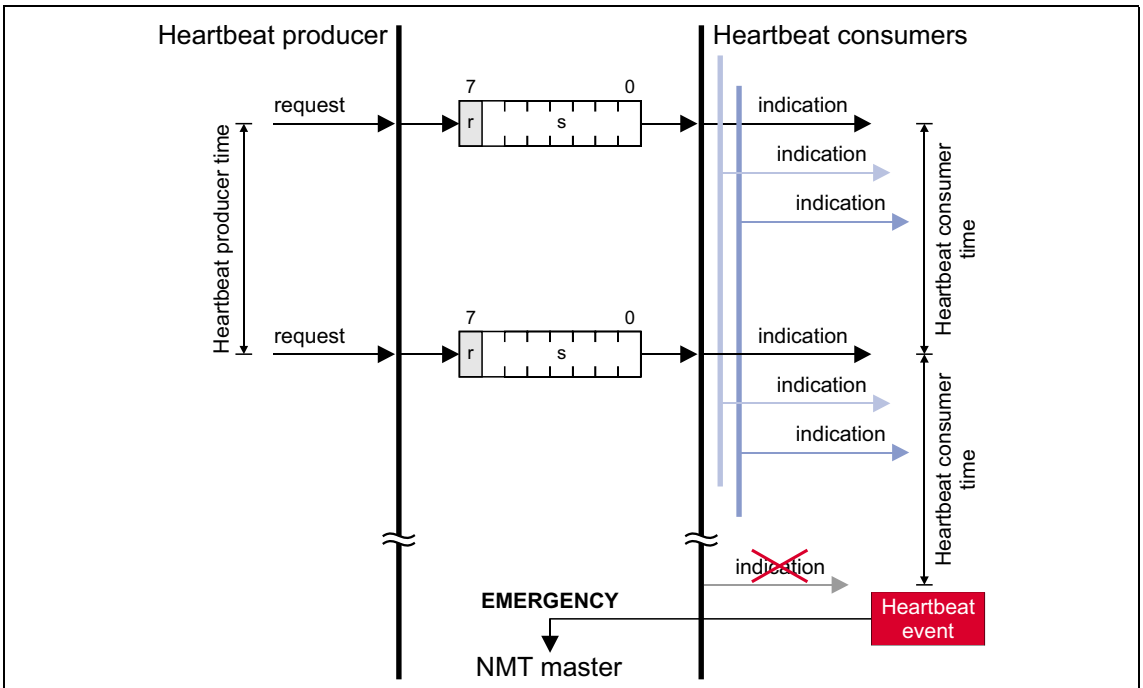
1. Accept the settings made in the NMT master in C00386 of the life time factor and the guard time for the NMTslave:
   - Set guard time (C00382) to 1000 ms.
   - Set life time factor (C00383) to 5.
2. Go to C00614 and set the response required in case of a "Life Guarding Event" in the NMT slave.

Tip!

C00625 serves to set which status change is to occur in case of a "Life Guarding Event" in the NMT slave.

Node guarding telegrams

- Remote Transmission Request:
  The RTR telegram from the NMT master has the following identifiers:
  Identifier (COB-ID) = 1792 + node address of slave = 1792 + 2 = 1794 = 0x702
- Remote Transmission Response:
  The response telegram from the NMT slave has the same identifier and the "Operational" NMT status in the user data (s = 5). ▸ Telegram structure (📖 332)



9.9.2 Heartbeat protocol

The heartbeat protocol can be used optionally to the node guarding protocol for monitoring nodes within a CAN network. Unlike the node guarding, this monitoring does not require a polling by means of an RTR telegram (Remote Transmission Request) from the NMT master.

Note!

Heartbeat and node guarding protocols must not be used simultaneously in a CANopen device. If the heartbeat producer time is set > 0 ms, the heartbeat protocol is used.

Basic workflow

r: Reserved (always 0)
s: Status of the producer (0: Boot-up, 4: Stopped, 5: Operational, 127: Pre-Operational)

[9-10] Heartbeat protocol

1. A heartbeat producer cyclically transmits a so-called heartbeat telegram to one or more consumers.
2. The consumer(s) monitor the heartbeat telegram for arrival on a regular basis.

9.9.2.1 Telegram structure

- The heartbeat telegram of the producer has the following identifier:
  Identifier (COB-ID) = 1792 + producer's node address
- The user data (1 byte) contain the status (s) of the producer:

Heartbeat producer status		Data							
Communication status	Decimal value (s)	(r)	Producer status (s)						
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Boot-up	0	0	0	0	0	0	0	0	0
Stopped	4	0	0	0	0	0	1	0	0
Operational	5	0	0	0	0	0	1	0	1
Pre-Operational	127	0	1	1	1	1	1	1	1

9.9.2.2 Parameter setting

Short overview of the parameters for the "Heartbeat" monitoring function:

Parameters	Info	Lenze setting		Assignment	
		Value	Unit	Consumer	Producer
C00346	CAN heartbeat activity	-		●	
C00347/1...32	CAN heartbeat status	-		●	
C00381	CAN Heartbeat producer time	0	ms		●
C00385/1...32	CAN heartbeat consumer time	0x00000000		●	
C00613/1...32	Resp. to CAN Heartbeat error	No response		●	
C00625	CAN behaviour in case of fault	Pre-operational state		●	●
Greyed out = display parameter					

Heartbeat producer time

Time interval for the transmission of the heartbeat telegram to the consumer(s).

- Parameterisable in C00381 or via object I-1017. The parameterised time is rounded down to an integer multiple of 5 ms.
- The heartbeat telegram is sent automatically as soon as a time > 0 ms is set.

Note!

Heartbeat and node guarding protocols must not be used simultaneously in a CANopen device. If the heartbeat producer time is set > 0 ms, the heartbeat protocol is used.

Heartbeat consumer time

Monitoring time for the nodes (producers) to be monitored.

- Can be parameterised in C00385/1...32 or via the object I-1016.
- The parameterised time is rounded down to an integer multiple of 5 ms and must have a greater value than the heartbeat producer time of the node to be monitored.
- A consumer can monitor up to 32 producers.

Heartbeat event

The "Heartbeat event" is activated in the consumer if it does not receive any heartbeat telegram from the producer within the heartbeat consumer time:

- In the Lenze setting, the consumer changes from the "Operational" communication status into the "Pre-Operational" communication status.
  - C00625 or the I-1029 object serve to set a status change.
- The NMT master receives an emergency telegram containing emergency error code 0x8130.
- The response parameterised in C00613/1...32 for the corresponding producer takes place (Lenze setting: "No response").

Note!

The heartbeat monitoring will not start until the first heartbeat telegram of a monitored producer has been received successfully and the "Pre-Operational" NMT status has been assumed.

The boot-up telegram counts as the first heartbeat telegram.

9.9.2.3 Commissioning example

Task

A 9400 controller (node 2) configured as a heartbeat consumer is to monitor another 9400 controller (Heartbeat Producer; node 1).

- The heartbeat producer is to transmit a heartbeat telegram to the heartbeat consumer every 10 ms.
- The heartbeat consumer monitors the heartbeat telegram for arrival. A response is to be activated in the event of an error.

Parameterising the heartbeat producer (node 1)

1. Set the heartbeat producer time (C00381) to 10 ms.

Parameterising the heartbeat consumer (node 2)

1. Configure monitoring for the heartbeat in C00385.
   - Note: The heartbeat consumer time must be greater than the heartbeat producer time of the node to be monitored set in C00381.
   - The value to be entered into a free subcode (1 ... 32) is "0x0001000F". It consists of the following:

Bit 31 ... bit 24 **Reserved**	Bit 23 ... Bit 16 **Node address of the producer**	Bit 15 ... Bit 0 **Heartbeat consumer time** (integer multiple of 5 ms)
0x00	**0x01**	**15 [ms] = 0x000F**

2. Go to C00613/1...32 and set the response required for the monitoring functions parameterised in C00385/1...32 which are to take place in case of a "Heartbeat Event" in the consumer.

Tip!

- C00346 displays the activity of every monitoring function parameterised in C00385/1...32 in a bit-coded form.
- C00347/1...32 displays the node guarding status of the monitored NMT slaves.
- C00625 serves to set which status change is to occur in case of a "Heartbeat Event".

Heartbeat telegram

- The heartbeat telegram of the producer has the following identifier:
  Identifier (COB-ID) = 1792 + producer's node address = 1792 + 1 = 1793 = 0x701

9.9.3 Emergency telegram

If the error status changes because an internal device error occurs or has been eliminated, the NMT master receives an emergency telegram once with the following structure:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Emergency error codes		Error register	Manufacturer-specific error message				
LOW byte	HIGH byte	I-1001	0x00 (Reserved)	LOW word		HIGH word	
				LOW byte	HIGH byte	LOW byte	HIGH byte
See table below			• With emergency error code 0x1000: Lenze error number (displayed value in C00168) • All other emergency error codes have a value of "0" here.				

Emergency error codes	Error register	Cause
0x0000	0xXX	One of several errors eliminated
	0x00	One error has been eliminated (error-free status afterwards)
0x1000	0x01	Generic error • In the standard device, an error has occurred with the error response "Fault", "Trouble", "Quick stop by trouble", "Warning", "Warning locked" or "System fault". • Error message is the Lenze error number (C00168). • For error cause see fault error description (C00166).
0x3100	0x01	Supply voltage of standard device faulty or failed
0x8100	0x11	Communication error (warning)
0x8130	0x11	Life guarding error or heartbeat error
0x8150	0x11	Collision of identifiers (COB-IDs): An identifier parameterised for reception is also used for transmission.
0x8210	0x11	PDO length shorter than expected
0x8220	0x11	PDO length greater than expected
0x8700	0x11	Monitoring of the sync telegram

Example

1st byte	2nd byte	3rd byte	4th byte	5th byte	6. byte	7th byte	8th byte
Emergency error codes		Error register	Manufacturer-specific error message				
0x00	0x10	0x01	0x00 (Reserved)	0x1B	0x00	0x7B	0x00
Generic error				Lenze error message 0x007b001b: Encoder wire breakage. ▸ Error messages of the operating system Corresponding error-free message: Value "0x00000000"			

Tip!

A detalied description can be found in CAN specification DS301, V4.02.

9.10 CANopen objects implemented

Lenze devices can be parameterised with both Lenze codes and manufacturer-independent "CANopen objects". Fully CANopen-compliant communication can only be achieved by exclusively using CANopen objects for the parameterisation. The CANopen objects described in this chapter are defined in the DS301 V4.02 CAN specification.

Many CANopen objects can be mapped on Lenze codes. The following table lists the related Lenze codes in the column "Relationship to Lenze codes".

Note!

Some of the terms used here derive from the CANopen protocol.

Overview of CANopen indices and their relationship to Lenze codes

CANopen object			Relationship to Lenze code
Index	Subindex	Name	
I-1000	0	Device type	-
I-1001	0	Error register	C00390
I-1003	Predefined error field		
	0	Number of errors	-

I-1000

Index **I-1000**	Name: **Device type**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: Device type	0	0		4294967295	ro	U32

The CANopen index I-1000 specifies the profile for this device. Furthermore, additional information defined in the device profile itself can be stored here.

8th byte	7th byte	6. byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
HIGH word		LOW word	
HIGH byte	LOW byte	HIGH byte	LOW byte
Additional information		**ECAT: Device Profile Number**	

[9-11] Data frame assignment

I-1001

Index: **I-1001**	Name: **Error register**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: Error register	-	0		255	ro	U8

Error register

- This object is related to the Lenze code C00390.
- The error status in the data byte (U8) is bit coded (see the following table). Currently only bit 0 and bit 4 in the data byte contain the corresponding information.

Bit	Meaning if bit is set:
Bit 0	Generic error
Bit 1	Current error (not used)
Bit 2	Voltage error (not used)
Bit 3	Temperature error (not used)
Bit 4	Communication error
Bit 5	Device profile spec. error (not used)
Bit 6	Reserved
Bit 7	Manufacturer-specific error (not used)

I-1003

Index: **I-1003**	Name: **Predefined error field**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Number of errors	0	0		255	rw	U8
1 ... 10: Standard error field	-	0		4294967295	ro	U32

Error history

This object indicates that an error has occurred in the module and in the standard device.

Subindex	Meaning
0	Number of saved error messages
1 ... 10	Display of the error list The error messages (U32) consist of a 16-bit error code and a manufacturer-specific information field comprising 16 bits.

Note!

The values in the "standard error field" under subindex 1 ... 10 will be deleted if the subindex "number of recorded errors" is overwritten with the value "0".

Emergency error codes	Cause	Entry in the error register (I-1001)
0x0000	One of several errors eliminated	0xXX
	Elimination of one single error (afterwards no more errors)	0x00
0x1000	Standard device is in error status (error response "fault", "message", "warning", "error", "quick stop by trouble", or "system error")	0x01
0x3100	Supply voltage of standard device faulty or failed	0x01
0x8100	Communication error (warning)	0x11
0x8130	Life guard error or heartbeat error	0x11
0x8150	Collision of COB-IDs: An ID parameterised for reception is also used for transmission.	0x11
0x8210	PDO length shorter than expected	0x11
0x8220	PDO length greater than expected	0x11
0x8700	Monitoring of the sync telegram	0x11

I-1005

Index: **I-1005**	Name: **COB-ID SYNC message**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: COB-ID SYNC message	0x0000 0080 or 0x8000 0080	0		4294967295	rw	U32

This object can be used to activate the generation of sync telegrams and to write the identifier value.

- This object is related to the Lenze codes C00367 and C00368.

Creating sync telegrams

To create sync telegrams, bit 30 (see below) must be set to "1". The interval of the sync telegrams can be set with the object I-1006.

Writing identifiers

To receive PDOs, the value 0x80 must be entered in the 11-bit identifier in the Lenze setting (and according to CANopen specification) . This means that all modules are by default set to the same sync telegram.

- If sync telegrams are only to be received by certain communication modules, their identifiers can be entered with values up to and including 0x07FF.
- The identifier can only be changed if the communication module does not send any sync telegrams (bit 30 = "0").
- How to change the identifier:
  - Deactivate identifier (set bit 30 to "0").
  - Change identifier.
  - Activate identifier (set bit 30 to "1").

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
x	**0/1**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported. Bit 11 ... bit 29 must be set to "0".				

[9-12] Data frame assignment

I-1006

Index: **I-1006**	Name: **Communication cycle period**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Communication cycle period	0 µs	0	µs	65535000	rw	U32

Setting the sync telegram cycle time.

- The cycle time can be selected as "1000" or as an integer multiple of it.
- If "0 µs" is set (Lenze setting), no sync telegrams are created.
- This object is related to the Lenze code C00369.

I-100C

Index: **I-100C**	Name: **Guard time**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Guard time	0 ms	0	ms	65535	rw	U16

Monitoring time for node guarding. ▸ Node guarding protocol (📖 331)

- Time within the NMT slave expects the RTRs from the NMTmaster.
- The node life time is the product of the guard time and the life time factor:
  Node Life Time = Guard Time (I-100C) **x Life Time Factor** (I-100D)
- The "life guarding event" occurs in the NMT slave if the slave has not been triggered by the NMT master through an RTR within the node life time.
- With "0 ms" (Lenze setting), monitoring is not supported by the slave.
- This object is related to the Lenze code C00382.

I-100D

Index: **I-100D**	Name: **Life time factor**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Life time factor	0	0		255	rw	U8

Life Time Factor for node guarding. ▸ Node guarding protocol (📖 331)

- The node life time is the product of the guard time and the life time factor:
  Node Life Time = Guard Time (I-100C) **x Life Time Factor** (I-100D)
- The "life guarding event" occurs in the NMT slave if the slave has not been triggered by the NMT master through an RTR within the node life time.
- With "0" (Lenze setting), monitoring is not supported by the slave.
- This object is related to the Lenze code C00383.

I-1010

Index: **I-1010**	Name: **Store parameters**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	1	- (read access only)			ro	U32
1: Save all parameters	-	0		4294967295	rw	U32

Save parameters with mains failure protection.

- Corresponds to device command C00002 = "11: Save start parameters".
- This command serves to save the current parameter settings of the active application with mains failure protection in the memory module of the controller.

Subindex	Meaning	
	Read	Write
0	Max. supported subindex: 1	- (A write attempt triggers the error message 0x06010002.)
1	Reading memory functions of all parameters.	Save parameters with mains failure protection.

Read subindex 1

8th byte	7th byte	6. byte	5th byte	
Data 4	Data 3	Data 2	Data 1	
Bit 31 ... bit 2			Bit 1	Bit 0
0			**0**/1	0/**1**

[9-13] Assignment of the data telegram (read access)

Bit	Meaning	
Bit 0	0	No saving of parameters on command.
	1	Saving of parameters on command (Lenze).
Bit 1	0	No automatic saving of parameters (Lenze).
	1	Automatic saving of parameters.

Write subindex 1

In addition to the index and subindex, the telegram data must also include the "save" signature (ASCII characters; ISO 8859) so that the parameters are stored.

- A response according to the DS301 V4.02 specification occurs while writing with a wrong identifier.

8th byte	7th byte	6. byte	5th byte
Data 4	Data 3	Data 2	Data 1
"e" = 0x65	**"v" = 0x76**	**"a" = 0x61**	**"s" = 0x73**

[9-14] Assignment of the data telegram (write access)

I-1011

Index: **I-1011**	Name: **Restore default parameters**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	1	- (read access only)			ro	U32
1: restore all default parameters	-	0		4294967295	rw	U32

Load Lenze setting.

- Corresponds to the device command C00002 = "0: Load Lenze setting".
- This command serves to reset the parameters of the active application to the Lenze setting which is stored in the firmware.

Subindex	Meaning	
	Read	Write
0	Max. supported subindex: 1	- (A write attempt triggers the error message 0x06010002.)
1	Loading of all parameters possible.	Load Lenze setting.

Read subindex 1

8th byte	7th byte	6. byte	5th byte	
Data 4	Data 3	Data 2	Data 1	
Bit 31 ... bit 1				Bit 0
0				0/**1**

[9-15] Assignment of the data telegram (read)

Bit	setting	
Bit 0	0	Parameters cannot be loaded.
	1	Parameters can be loaded (Lenze).

Write subindex 1

In addition to the index and subindex, the telegram data must include the "load" signature (ASCII characters; ISO 8859) so that the Lenze setting can be loaded.

- A response according to the DS301 V4.02 specification occurs while writing with a wrong identifier.

8th byte	7th byte	6. byte	5th byte
Data 4	Data 3	Data 2	Data 1
"d" = 0x64	**"a" = 0x61**	**"o" = 0x6F**	**"l" = 0x6C**

[9-16] Assignment of the data telegram (write)

I-1014

Index: I-1014	Name: COB-ID EMCY					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: COB-ID EMCY	0x80 + node ID	0		4294967295	rw	U32

If a communication error or an internal error of the communication module or the controller occurs or is acknowledged (e. g. "trouble"), an error message is sent via the system bus. For each error, the telegram is interrupted once. By means of bit 31 this function can be activated or deactivated.

- This object is related to the Lenze code C00391.

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported. Bit 11 ... bit 29 must be set to "0".				

[9-17] Data frame assignment

Bit	setting	
Bit 31	0	Emergency object is valid.
	1	Emergency object is invalid.

Note!

The identifier can only be changed in the "emergency object invalid" status (bit 31 = 1).

I-1015

Index: I-1015	Name: Inhibit time EMCY					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: inhibit time EMCY	0	0	0.1 ms	65535	rw	U32

Time which must elapse after an error message (I-1014) has been transmitted before further error messages can be sent via the bus.

- The entered value multiplied by "0.1" gives the delay time in [ms]. The values are automatically rounded up to whole values in [ms].
- This object is related to the Lenze code C00392.

I-1016

Index: **I-1016**	Name: **Consumer heartbeat time**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Highest subindex supported	32	- (read access only)			ro	U32
1 ... 32: consumer heartbeat time	0	0		4294967295	rw	U32

Monitoring time for the nodes 1 ... 32 to be monitored via heartbeat. ▸ Heartbeat protocol (📖 337)

- The parameterised time is rounded down to an integer multiple of 5 ms and must have a greater value than the heartbeat producer time of the node to be monitored.

Subindex	Meaning	Lenze code
0	Number of nodes to be monitored	
1 ... 32	Node-ID and heartbeat time of the node 1 ... 32 to be monitored	C00385/1...32

8th byte	7th byte	6. byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
Bit 31 ... bit 24	Bit 23 ... Bit 16	Bit 15 ... Bit 0	
0 (Reserved)	**Node ID**	**Heartbeat time** in [ms]	

[9-18] Data frame assignment

I-1017

Index: **I-1017**	Name: **Producer heartbeat time**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Producer heartbeat time	0	0	ms	65535	rw	U32

Time interval for the transmission of the heartbeat telegram to one or several consumers. ▸ Heartbeat protocol (📖 337)

- The parameterised time is rounded down to an integer multiple of 5 ms.
- The heartbeat telegram is automatically sent as soon as a time > 0 ms is entered. In this case, the "node guarding" monitoring function is deactivated.
- This object is related to the Lenze code C00381.

I-1018

Index: **I-1018**	Name: **Identity object**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: Highest subindex supported	see below	0		4294967295	ro	U32
1: Vendor ID						
2: Product code						
3: Revision number						
4: Serial number						

Subindex	Meaning	
1	Manufacturer's identification number • The identification number allocated to Lenze by the organisation "CAN in Automation e. V." is "0x0000003B".	
2	Product code	
	0x94001	9400 StateLine
	0x94002	9400 HighLine / ServoPLC
	0x94004	9400 regenerative power supply module
3	Main and subversion of firmware	
4	Serial number	

I-1029

Index: **I-1029**	Name: **Error behaviour**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Highest subindex supported	1	- (read access only)			ro	U8
1: Communication error	0	0		2	rw	U8

This object serves to set the communication status to which the controller is to change after a bus off, a node/life guarding event or a heartbeat event.

Subindex	Meaning		Lenze code
1	Status change after bus off, node/life guarding event or heartbeat event:		C00625
	0	State change from "Operational" to "Pre-operational"	
	1	No state change	
	2	State change to "Stopped"	

I-1200

Index: **I-1200**	Name: **SDO1 server parameter**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: Highest subindex supported	2	2		2	ro	U8
1: COB-ID client -> server (rx)	node ID + 0x600	0		4294967295	ro	U32
2: COB-ID server -> client (tx)	node ID + 0x580	0		4294967295	ro	U32

Identifiers for SDO server channel 1 (basic SDO channel).

- According to DS301 V4.02, the basic SDO channel can neither be changed nor deactivated.

Subindex	Meaning
1	Specification of receive identifier • For SDO server channel 1: node address (C00350) + 0x600
2	Specification of send identifier • For SDO server channel 1: node address (C00350) + 0x580

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0	**0**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported. Bit 11 ... bit 29 must be set to "0".				

[9-19] Data frame assignment

I-1201

Index: **I-1201**	Name: **SDO2 server parameter**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Highest subindex supported	3	- (read access only)			ro	U8
1: COB-ID client -> server (rx)	0x80000000	0		4294967295	rw	U32
2: COB-ID server -> client (tx)	0x80000000	0		4294967295	rw	U32
3: Node-ID of the SDO client	1 ... 127	- (read access only)			ro	U32

Identifiers for SDO server channel 2.

- The SDO server parameter is only valid, if bit 31 is set to "0" for both transmission directions (subindex 1 and 2).
- In the Lenze setting, the SDO server channels 2 ... 10 are deactivated (bit 31 = "1").
- The identifier can only be changed if the SDO is invalid (bit 31 = "1").

Subindex	Meaning
1	Specification of receive identifier
2	Specification of send identifier
3	Node address of the client

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported. Bit 11 ... bit 29 must be set to "0".				

[9-20] Data frame assignment

Bit	setting	
Bit 31	0	SDO is valid.
	1	SDO is invalid.

How to change the identifier:

1. Deactivate identifier (set bit 31 to "1").
2. Change identifier.
3. Activate identifier (set bit 31 to "0").

Example

Parameter data channel 2 of the controller with node address 4 shall be activated.

- For this purpose, bit 31 in the subindexes 1 and 2 of the I-1201 object must be set to the value "0" (≡ "SDO valid").
- The master must send the two "write request" commands to the nodes via the basic SDO channel.

Identifier calculation

- Identifier (COB-ID) = basic identifier + node address (node ID)
- Basic identifier SDO2 from master to drive: 1600 (0x640)
  → Identifier = 0x640 + 0x4 = 0x644
- Basic identifier SDO2 from drive to master: 1472 (0x5C0)
  → Identifier = 0x5C0 + 0x4 = 0x5C4

Resulting data (data 1 ... data 4)

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0	0	Extended identifier = 0		11-bit identifier = 0x644
0x00		0x00	0x06	0x44

[9-21] Data telegram assignment for subindex 1

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0	0	Extended identifier = 0		11-bit identifier = 0x5C4
0x00		0x00	0x05	0xC4

[9-22] Data telegram assignment for subindex 2

User data assignment

Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Highest subindex supported	5	- (read access only)			ro	U8
1: COB-ID used by RPDO	0x200 + node ID	0		4294967295	rw	U32
2: Transmission type	254	0		255	rw	U8
3: Inhibit time	-	- (not used for RPDOs)			rw	U16
4: Compatibility entry	-	- (reserved, read or write access leads to error message 0x06090011)			rw	U8
5: Event timer	-	- (not used for RPDOs)			rw	U16

Communication parameter for receiving process data via RPDO1

Subindex	Meaning	Lenze code
1	RPDO1 identifier • The basic setting is according to the "Predefined Connection Set": Identifier = 0x200 + node ID	C00321/1
2	RPDO Transmission type according to DS301 V4.02 ▸ Transmission type (📖 311)	C00323/1

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0/1**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported. Bit 11 ... bit 29 must be set to "0".				

[9-25] Data frame assignment

Bit	setting	
Bit 30	0	RTR to this PDO possible (cannot be set).
	1	RTR to this PDO not possible (Lenze).
Bit 31	0	PDO active
	1	PDO inactive

How to change the identifier:

1. Deactivate identifier (set bit 31 to "1").
2. Change identifier.
3. Activate identifier (set bit 31 to "0").

I-1401

Index: **I-1401**	Name: **RPDO2 communication parameter**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type

3: Inhibit time	-	- (not used for RPDOs)			rw	U16
4: Compatibility entry	-	- (reserved, read or write access leads to error message 0x06090011)			rw	U8
5: Event timer	-	- (not used for RPDOs)			rw	U16

Communication parameter for receiving process data via RPDO4

Subindex	Meaning	Lenze code
1	Identifier RPDO4 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x500 + node ID	C00321/4
2	RPDO Transmission type according to DS301 V4.02 ▸ Transmission type (📖 311)	C00323/4

- For assignment of the data telegram see object I-1400.

I-1600

Index: I-1600	Name: RPDO1 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

The object I-1600 serves to receive parameter data as RPDO1.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO1

8th byte	7th byte	6. byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
Bit 31 ... bit 16		Bit 15 ... bit 8	Bit 7 ... bit 0
Index		**Subindex**	**Length**

[9-26] Data frame assignment

IEC 61131 process data words are mapped. Only whole bytes can be mapped (the granularity of the mapping entries is one byte).

I-1601

Index: **I-1601**	Name: **RPDO2 mapping parameter**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

The object I-1601 serves to receive parameter data as RPDO2.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO2

- For data telegram assignment, see object I-1600.

I-1602

Index: **I-1602**	Name: **RPDO3 mapping parameter**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

The object I-1602 serves to receive parameter data as RPDO3.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO3

- For data telegram assignment, see object I-1600.

I-1603

Index: **I-1603**	Name: **RPDO4 mapping parameter**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

The object I-1603 serves to receive parameter data as RPDO4.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO4

- For data telegram assignment, see object I-1600.

I-1800

Index: **I-1800**	Name: **TPDO1 communication parameter**

3: Inhibit time	0 ms	0	0.1 ms	65535	rw	U16
4: Reserved	-	- (reserved, read or write access leads to error message 0x06090011)			rw	U8
5: Event timer	0 ms	0	ms	65535	rw	U16

Communication parameter for sending process data via TPDO1

Subindex	Meaning	Lenze code
1	TPDO1 identifier • The basic setting is according to the "Predefined Connection Set": Identifier = 0x180 + node ID	C00320/1
2	TPDO transmission type according to DS301 V4.02 ▸ Transmission type (📖 311)	C00322/1
3	Minimum time between sending two identical TPDOs (see DS301 V4.02).	C00324/1
5	Cycle time for PDO transmission with transmission type "254".	C00356/1

8th byte		7th byte	6. byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0/1**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported. Bit 11 ... bit 29 must be set to "0".				

[9-27] Data frame assignment

Bit	setting	
Bit 30	0	RTR to this PDO possible (Lenze).
	1	RTR to this PDO not possible (not adjustable)
Bit 31	0	PDO active
	1	PDO inactive

How to change the identifier:

1. Deactivate identifier (set bit 31 to "1").
2. Change identifier.
3. Activate identifier (set bit 31 to "0").

Subindex 3 - inhibit time

The delay time can only be changed if the PDO is inactive (subindex 1, bit 31 = 1). The entered value multiplied by 0.1 results in the delay time in [ms]. The calculated delay time is always rounded down to an inter value.

Example:

- Entered value: 26
- Calculated time = 26 * 0.1 [ms] = 2.6 [ms] → delay time = 2 [ms}

- For assignment of the data telegram see object I-1A00.

9.11 System block "LS_SyncInput"

The **LS_SyncInput** system block provides status information in the function block editor about the sync telegram received via the system block.

Outputs

Identifier Data type	Value/meaning	
SYNC_wSyncCycleTime WORD	Sync cycle time in [µs] • Time with which the internal phase-locking loop (PLL) expects the synchronisation signals. The time must be set in C01121 in accordance with the cycle of the synchronisation source selected in C01120.	
SYNC_wSource WORD	Synchronisation source selected in C01120:	
	0	Off
	1	CAN on board
	2	CAN module
	4	Module in MXI1
	5	Module in MXI2
	6	Digital input 1
	7	Digital input 2
	8	Digital input 3
	9	Digital input 4
	10	Digital input 5
	11	Digital input 6
	12	Digital input 7
	13	Digital input 8
SYNC_nSyncDeviation INT	Deviation of the synchronisation signal in [increments] • ±16000 increments ≡ ±1 ms	
SYNC_bSyncInsideWindow BOOL	Status signal "Synchronisation signal within time slot" **Note!** If you use this signal in the application, observe the change in behaviour from software version V7.= onwards described in the following subchapter! ▸ Behaviour of the status signal bSyncInsideWindow (📖 368)	
	TRUE	The last synchronisation signal has been around the expected value within the time slot parameterised in C01123.
SYNC_bSyncSignalReceived BOOL	Status signal "Receive synchronisation signal"	
	TRUE	Synchronisation signal has been received.
SYNC_ bProcessDataExpected BOOL	Status signal "Synchronous PDO expected"	
	TRUE	Synchronous PDO is expected

Identifier Data type	Value/meaning	
SYNC_bProcessDataInvalid BOOL	Status signal "Synchronous PDO invalid"	
	TRUE	Synchronous PDO is invalid.

▸ Synchronisation of PDOs via sync telegram (📖 313)

9.11.1 Behaviour of the status signal bSyncInsideWindow

C01123 serves to set a time slot for monitoring the synchronisation signal. If the synchronisation signal received via the bus is in this time slot (around the expected time of the synchronisation signal), the *bSyncInsideWindow* output is set to TRUE.

Up to and including software version V6.0 the following applies:

Due to an error in the implementation, the phase position set in C01122 is included in the calculation of the time slot. The time slot effective for monitoring around the expected time of the synchronisation signal is thus increased by the amount of the set phase position.

Example:

- Sync phase position (C01122) = 400 µs
- Sync tolerance (C01123) = 20 µs

→ The time slot for monitoring has a size of 420 µs!

The following applies from software version V7.0 onwards:

The faulty inclusion of the phase position set in C01122 into the calculation of the time slot has been removed. The time slot for monitoring the synchronisation signal only corresponds to the sync tolerance set in C01123.

Example:

- Sync phase position (C01122) = 400 µs
- Sync tolerance (C01123) = 20 µs

→ The time slot for monitoring has a size of 20 µs!

Feedbacks and their remedies

If the *bSyncInsideWindow* status signal is used in existing systems, this remedy reduces the monitoring window by the amount of the phase position if it is non-zero. This may cause an unwanted activation of the monitoring of the synchronisation signal programmed by the user.

Remedy: When the syn tolerance is increased (C01123) by the amount of the phase position set in C01122, the compatible state is restored.

10 Safety engineering

The controller can be equipped with a safety module. The individual safety module types have a different range of functions to optimally meet different requirements.

"Integrated safety" stands for application-oriented safety functions that can be used on machines for the protection of persons and machines.

The motion functions are furthermore executed by the controller. The safety modules monitor the reliable compliance with limit values and provide safe inputs and outputs. If limit values are exceeded, the safety modules start control functions for the fault scenario in accordance with EN 60204-1 directly in the controller.

The safety functions are suitable for applications according to IEC 61508 to SIL 3 and, depending on the module, achieve the requirements of the EN ISO 13849-1 up to control category 4 and performance level (PL) "e".

Note!

For detailed information about the integrated safety technology, please see the manual for the safety module.

10.1 Integration into the application

If a safety function is requested, the safety engineering activates a corresponding safe monitoring function. The standstill function, however, is only executed directly if the "Safe torque off" function (STO) is activated. For the other safety functions, an action of the controller is required, which is safely monitored. The implementation of the corresponding action (e.g. braking, braking to standstill, holding of the standstill position) must be carried out by the application.

"LS_SafetyModuleInterface" system block

For the transmission of the control and status information from the safety module to the application, the **LS_SafetyModuleInterface** system block is provided in the function block editor of the »Engineer«. (📖 371)

"LS_Limiter" system block/basic function "Limiter"

Furthermore the **LS_Limiter** system block which contains the basic function "Limiter" is provided in the function block editor for the connection of safety engineering to the application. (📖 506)

For one thing, the basic function "Limiter" provides a parameterisation interface in »Engineer« for a comfortable setting of limit positions, limited speeds, and limit values, and for another it enables the drive to be braked specifically **after request** through the safety module.

Basic workflow

1. Activation of the safety function on the safety module (e. g. SS1 - safe stop 1).
   ➞ Monitoring starts.
2. The safety module informs the controller via a control word that the safety function has been activated.
3. The application evaluates the control word and starts the required motion sequence (e.g. braking).

Note!

If communication to the controller is interrupted, e.g. by switching off the controller, the safety module responds as follows:

- Fault stop with STO is activated.
- "Warning" error message is transmitted.
- The LED "ME" is blinking.

The required error acknowledgement (AIE) is possible via terminal or safety bus.

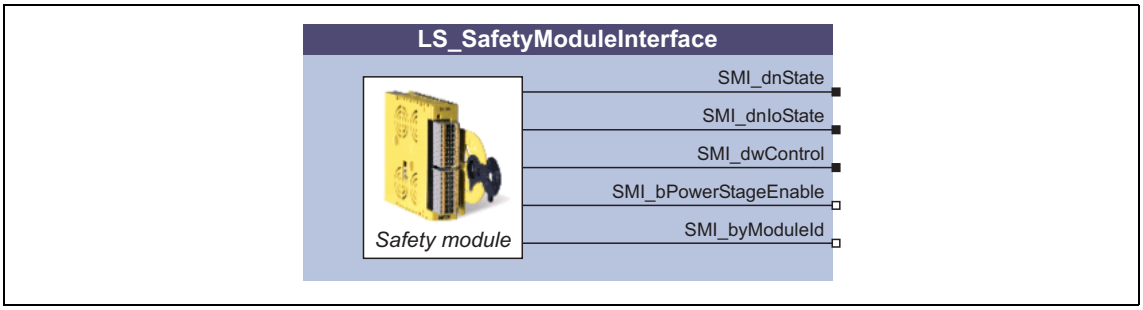
10.2 Selecting the required safety module

Note!

With online communication via a bus system, there is the possibility that several users access the same drive at the same time and edit the safe parameter set.

After transferring the safe parameters, it must be checked whether the check sums (CRC) of the parameter set, memory module, and the safety module comply with each other in the *Safe Transfer* dialog box.

Access to the safety parameters by several users is currently technically unavoidable; therefore, organisational measures are required to ensure the consistency of the safety parameters.



The safety module expected by the application and the controller is selected in C00214.

- In »Engineer« this setting is carried out automatically by assigning the device modules to the controller, i.e. »Engineer« automatically sets C00214 according to the safety module selected.
- If the safety module set in C00214 does not comply with the plugged-in safety module type, an error (fault) is triggered. The error can only be eliminated by mains switching.

Parameter | Name: **C00214 | Required safety module**		Data type: UNSIGNED_8 Index: $24361_d = 5F29_h$
Setting of the expected safety module		
Selection list		
1	SM0	
2	SM100	
4	SM300	
5	**SM301**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ COM ☐ MOT		

10.3 System block "LS_SafetyModuleInterface"

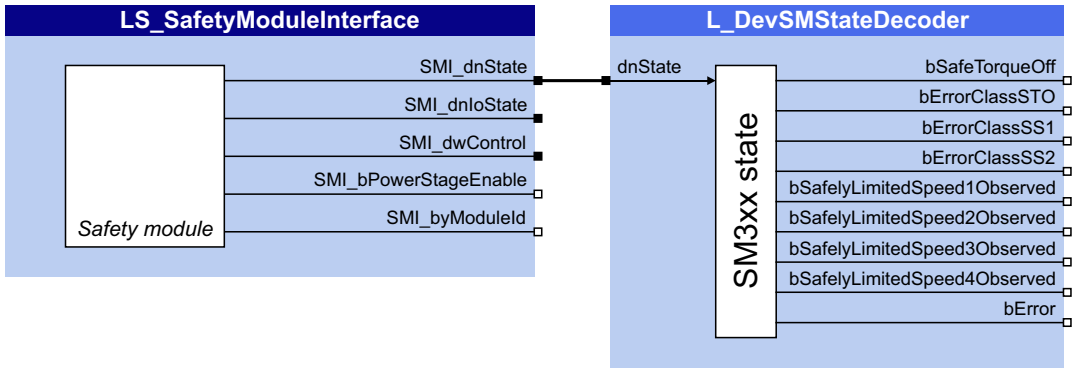
The **LS_SafetyModuleInterface** system block is the interface to the safety module in the function block editor.

Outputs

Identifier Data type	Value/meaning
SMI_dnState DINT	Bit coded status information from the safety module ▸ Status information (📖 373)
SMI_dnIoState DINT	Bit coded I/O status information from the safety module ▸ I/O status information (📖 374)
SMI_dwControl DWORD	Bit coded control information from the safety module ▸ Control information (📖 374)
SMI_bPowerStageEnable BOOL	Status signal "Inverter enable" TRUE: Inverter is enabled by the safety module.
SMI_byModuleId BYTE	ID of the safety module available in the controller

10.3.1 Status information

Via the bit-coded status signal *SMI_dnState* of the **LS_SafetyModuleInterface** SB, the SM3xx safety module transmits the status of safety functions to the application.



- Which bits are supported depends on the safety module used.

Bit coding of the status signal SMI_dnState		
Bit	**Name**	**Meaning**
0	STO	"Safe torque off (STO)" function is active. • The drive is safely switched to torqueless operation.
3	EC_STO	Error stop category 0: "Safe torque off (STO)" function is active.
4	EC_SS1	Error stop category 1: "Safe stop 1 (SS1)" function is active.
5	EC_SS2	Error stop category 2: "Safe stop 2 (SS2)" function is active.
8	SLS1 observed	Safely limited speed 1 is activated and complied with.
9	SLS2 observed	Safely limited speed 2 is activated and complied with.
10	SLS3 observed	Safely limited speed 3 is activated and complied with.
11	SLS4 observed	Safely limited speed 4 is activated and complied with.
12	SDIpos observed	Safe positive direction of rotation (SDIpos) is activated and complied with.
13	SDIneg observed	Safe negative direction of rotation (SDIneg) is activated and complied with.
14	Error active	SM3xx safety module has the error status (trouble or warning).
Bits not listed are reserved for future extensions!		

Tip!

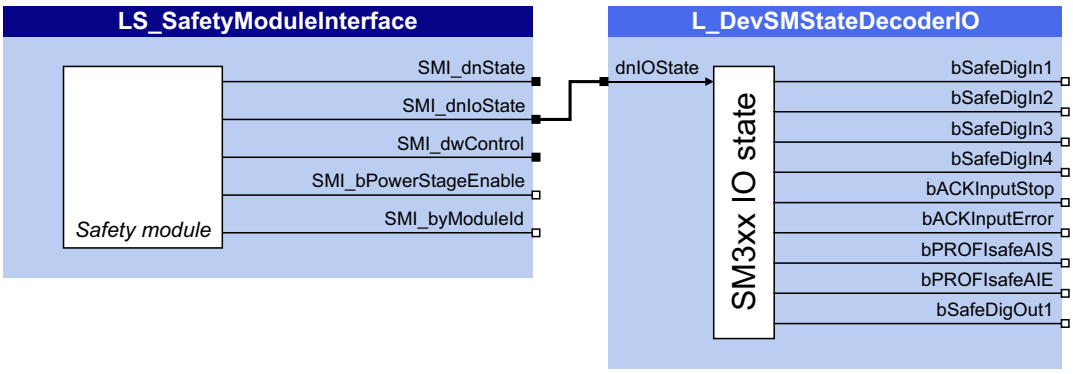
For decoding the status signal into individual boolean status signals, simply connect the *SMI_dnState* output to the **L_DevSMStateDecoder** FB which is available in the function library from V2.0.

Note:
This connection example only shows the status signals of the FB **L_DevSMStateDecoder** supported by SM301 V1.1.

[10-1] Example: Decoding of the SMI_dnState status signal into individual boolean status signals

10.3.2 I/O status information

Via the bit coded status signal *SMI_dnIoState* of the **LS_SafetyModuleInterface** SB, the SM3xx safety module transmits the status of the safe inputs and outputs to the application.



- Which bits are supported depends on the safety module used.

Bit coding of the SMI_dnIoState status signal		
Bit	**Name**	**Meaning**
0	SD-In1	Sensor input 1 in ON state.
1	SD-In2	Sensor input 2 in ON state.
2	SD-In3	Sensor input 3 in the ON state.
3	SD-In4	Sensor input 4 in the ON state.
5	AIS	Restart acknowledgement via terminal effected (negative edge: 1↘0).
6	AIE	Error acknowledgement via terminal effected (negative edge: 1↘0).
8	PS_AIS	Restart acknowledgement via safety bus effected (positive edge: 0↗1)
9	PS_AIE	Error acknowledgement via safety bus effected (positive edge: 0↗1)
12	SD-Out1	Safe output 1 (feedback output) in the ON state.
Bits not listed are reserved for future extensions!		

Tip!

For decoding the status signal into individual boolean status signals, simply connect the *SMI_dnIoState* output to the **L_DevSMStateDecoderIO** FB which is available in the function library from V2.0.

Note:
This connection example only shows the status signals of the FB **L_DevSMStateDecoderIO** supported by SM301 V1.1.

[10-2] Example: Decoding of the SMI_dnIoState status signal into individual boolean status signals

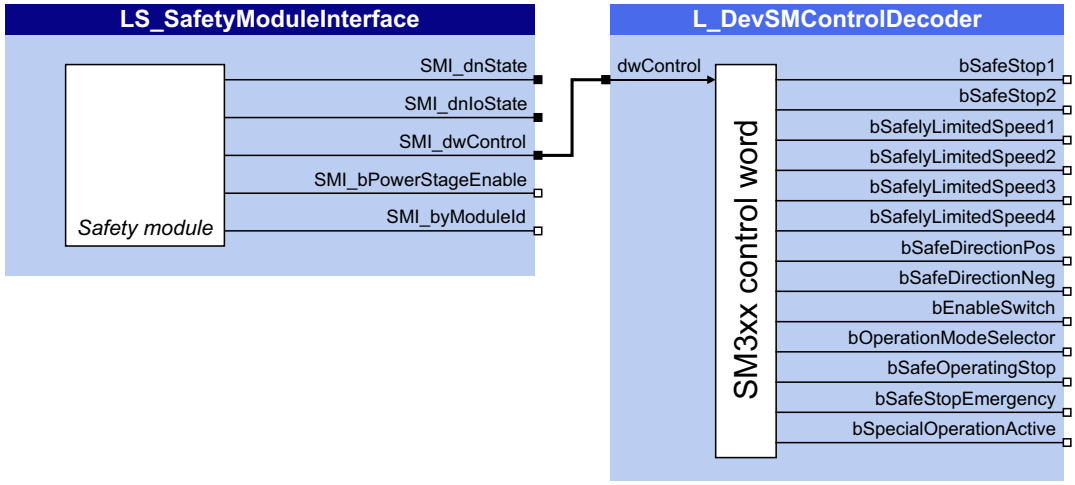
10.3.3 Control information

Via the bit coded control signal *SMI_dwControl* of the **LS_SafetyModuleInterface** SB, the SM3xx safety module transmits information on safety functions requested, or on active safety functions to the application.

- Several safety functions can be requested/active at the same time.
- Which bits are supported depends on the safety module used.

Bit coding of the control signal SMI_dwControl		
Bit	**Name**	**Meaning**
1	SS1 active	"Safe stop 1 (SS1)" function is active. • After the parameterised stopping time has elapsed, bit 0 of the status signal *SMI_dnState* (STO active) is set.
2	SS2 active	"Safe stop 2 (SS2)" function is active. • After the parameterised stopping time has elapsed, bit 16 (SOS monitored) is set.
3	SLS1 active	"Safely limited speed 1 (SLS1)" function is active. • After the parameterised braking time Nlim3 has elapsed, bit 8 of the status signal *SMI_dnState* (SLS1 monitored) is set additionally.
4	SLS2 active	"Safely limited speed 2 (SLS2)" function is active. • After the parameterised braking time Nlim2 has elapsed, bit 9 of the status signal *SMI_dnState* (SLS2 monitored) is set additionally.
5	SLS3 active	"Safely limited speed 3 (SLS3)" function is active. • After the parameterised braking time Nlim3 has elapsed, bit 10 of the status signal *SMI_dnState* (SLS3 monitored) is set additionally.
6	SLS4 active	"Safely limited speed 4 (SLS4)" function is active. • After the parameterised braking time has elapsed, bit 11 of the status signal *SMI_dnState* (SLS4 monitored) is additionally set.
7	SDIpos active	"Safe positive direction of rotation (SDIpos)" function is active. • After the parameterised SDI delay time has elapsed, bit 12 of the status signal *SMI_dnState* (SDIpos monitored) is set additionally.
8	SDIneg active	"Safe negative direction of rotation (SDIneg)" function is active. • After the parameterised SDI delay time has elapsed, bit 13 of the status signal *SMI_dnState* (SDIneg monitored) is set additionally.
9	ES active	"Confirm button (ES)" function for motion functions in special operation is active.
10	SLI active	"Safely limited increment (SLI)" function is active.
11	OMS	"Operation mode selector (OMS)" function for special operation has been requested.
16	SOS active	"Safe operating stop (SOS)" function is active. • The safe operating stop is monitored. • The function becomes active after the "Safe stop 2 (SS2)" function has been executed.
23	SSE active	Emergency stop function (SSE) is active. • At the end of the function, bit 1 (SS1 active) or bit 0 of the status signal *SMI_dnState* (STO active) is set according to the emergency stop function parameterised.
29	OMS active	Special operation is active.
Bits not listed are reserved for future extensions!		

Note!



To effect the corresponding action (e.g. braking to standstill, holding the standstill position), the application engineer has to provide an appropriate interconnection in the application.

- To integrate the basic function "Limiter", the output *SMI_dwControl* is to be connected to the input *LIM_dwControl* of the **LS_Limiter** system block.

Tip!

For decoding/coding the control signal, the function blocks **L_DevSMControlDecoder** and **L_DevSMControlEncoder** are available in the function library from V2.0.

Note:
This connection example only shows the control signals of the FB **L_DevSMControlDecoder** supported by SM301 V1.3.

[10-3] Example: Decoding of the SMI_dwControl control signal into individual boolean control signals

11 Basic drive functions

In this chapter the basic (drive) functions of the "Servo Drives 9400" are described, to which the active application can access via defined, internal interfaces, and which can be carried out in the following way, depending on the controller type (StateLine or HighLine) and the Motion Control licence available:

Parameter setting by means of »Engineer« or keypad

In each licence level the basic functions can be parameterised in »Engineer« via a corresponding dialog or alternatively via the keypad.

In the case of the 9400 StateLine (licence level Motion Control StateLevel), the interconnection of the internal interfaces is defined by the technology application selected.

Configuration in the »Engineer« function block editor

»Engineer« additionally provides the graphic function block editor for the 9400 HighLine which can be used to reconfigure and extend the application interconnection by individual functions using the function library.

Programming according to IEC 61131-3 in »PLC Designer«*

For the 9400 HighLine with the licence level Motion Control PLC the basic functions are also provided as separate system blocks in »PLC Designer«, which, if required, can be integrated in the control configuration, and which then can be accessed from the IEC 61131-3 program via the corresponding system variables.

* In preparation!

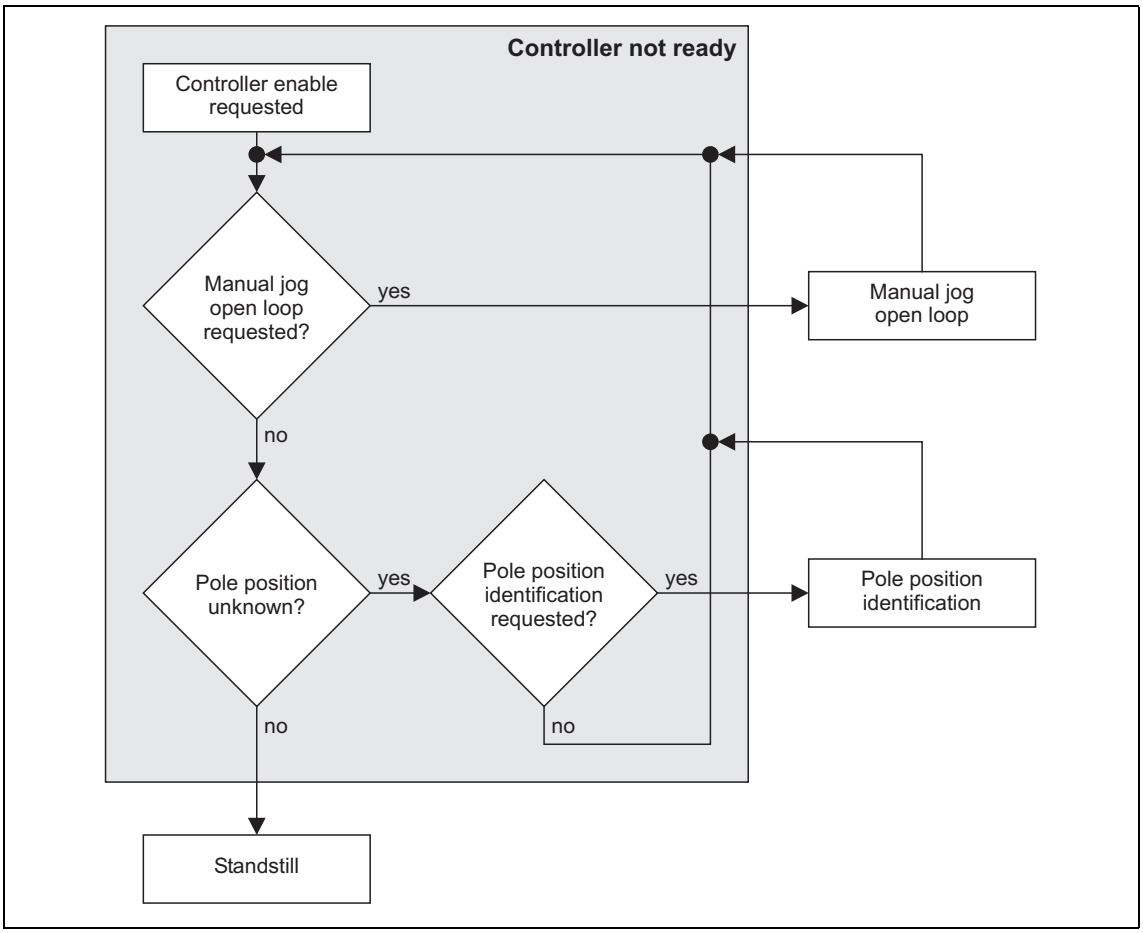
11.1 General information

11.1.1 Internal state machine

The execution of the different basic functions is internally controlled by a state machine which can adopt the following "function states":

[11-1] Function states of the state machine "Basic functions"

The state machine ensures that:



- one basic function at a time adopts the control of the drive.
- only the basic function with the highest priority (= smallest number) is executed if several basic functions are activated at the same time. ▸ Priorities (📖 383)
- the drive always has a defined state both in case of error and in normal operation.

Note!

The basic functions "Limiter" and "Brake control" run autonomously, but are able to control the state machine to a certain function state, if required.

The function states are not to be confused with the device states ("Operation", "Fault active", "Device is switched on", etc.) of the controller. ▸ Device states (📖 100)

From software version V7.0 onwards, the basic functions "Manual job, encoderless" and "Pole position identification" are additionally available for the setting-up operation. Both basic functions can only be requested when the controller is inhibited and with the "Controller not ready" function state:

[11-2] Sequence diagram for basic functions "Manual job, encoderless" and "Pole position identification"

11.1.2 Function states

Tip!

In C02530 the currently active function state is displayed.

"Initialisation" state

If the controller has completed the device initialisation, the function state "Initialisation" is passed through automatically.

- In the "Initialisation" function state, the process data required for processing the basic functions are initialised.
- The monitoring functions are not active yet.
- The basic functions are not yet processed (e.g. brake control) and cannot yet be parameterised or activated either.
- If the initialisation of the basic functions is completed and no fault is available, a change-over to the basic state "Drive at standstill" is automatically effected.

State "Controller not ready"

In this function state the pulse inhibit is set in the controller, which means that the power output stages are high-resistance and the drive cannot be controlled.

State "Manual jog, encoderless active"

From software version V7.0 onwards, the drive can be controlled without feedback (encoderless) in this function state, e.g. for a setting-up operation or in the event of service when the feedback system fails. ▸ Manual job, encoderless (📖 412)

State "Identification of pole position active"

From software version V7.0 onwards, an identification of pole position can be executed in this function state in order to detect the pole position for the motor encoder that is currently activated in C00495. ▸ Pole position identification (📖 575)

State "Drive at standstill"

This "basic state" is automatically adopted if no other state is active.

- The setpoints for speed and acceleration are set to "0".
- The drive is position-controlled.
- No error has occurred and quick stop is not active.
- Every basic function can be activated out of this state.

State "Drive is stopped"

This function state is automatically passed through when a basic function is deactivated.

- If the drive is not yet in the standstill state, it is decelerated to standstill via a parameterisable deceleration ramp.
- If a basic function is activated during the "stopping" process, this basic function takes over the control of the drive from the current speed on and the function state "Drive is stopped" is abandoned.
- If the drive is at standstill, a change-over to the basic state "Drive at standstill" is automatically effected.

State "Manual jog active"

In this function state, the drive can be operated manually clockwise or anti-clockwise ("Manual jog, encoderless"). ▸ Manual jog (📖 400)

- If the home position is known to the controller, the software limit positions set and a potentially connected travel range limit switch are monitored.
- "Retracting" from an activated travel range limit switch is also possible.

State "Homing active"

In this function state the home position and the machine measuring system for the drive can be determined. ▸ Homing (📖 421)

- The home position can be specified by an active homing or by reference setting.
- A redetermination of the home position is only required in case of recommissioning or in case of service (e.g. when drive components are exchanged) or after travel commands have been executed which reset the reference.

State "Positioning active"

In this function state all positioning types (absolute, relative, modulo, continuous, touch probe etc.) can be executed. ▸ Positioning (📖 479)

- In the position-controlled mode, the drive executes a time-controlled point-to-point setpoint generation based on the defined motion profile.

State "Setpoint follower active"

In this function state the drive directly follows the defined setpoint.

- The setpoint can be optionally defined as speed, torque, or position via three separate basic functions:
  - Speed follower (📖 496)
  - Torque follower (📖 501)
  - Position follower (📖 490)

State "Quick stop active"

This function state is active if quick stop has been activated by the user. ▸ Quick stop (📖 393)

- The drive is brought to standstill within the deceleration time parameterised, irrespective of the setpoint defined.
- If the quick stop is cancelled again by the user, a change-over to a setpoint-generating basic function (e. g. "Speed follower") is effected, if requested.

Note!

For the encoderless motor control types (from software version V3.0) **the following applies:**

The "Quick stop active" function state is also activated when DC-injection braking is executed.

Tip!

Quick stop can also be set as error response for many monitoring functions ("quick stop by trouble"). Detailed information can be found in the chapter "Diagnostics & fault analysis".

The source that activated quick stop is displayed bit-coded in C00159.

"Error" status

This function state is active if a fault has occurred and the controller is in the "Fault active" or "Quick stop by trouble active" device state.

- The function state can only be abandoned by acknowledging the error if the error is removed.

11.1.3 Interrupting/replacing states

An active function state cannot be interrupted or replaced by the activation of another function state. However, the following exceptions apply:

- The "Initialisation" state replaces all other states.
- The "Fault" state can replace all other states except "Initialisation".
- The "Controller not ready" state can replace all other states except "Error" and "Initialisation".
- The "Quick stop active" state can replace all other states except "Initialisation", "Error" and "Controller not ready".

11.1.4 Priorities

The function states are assigned to priorities so that, if several basic functions are activated at the same time, it is always changed to the function state with the highest priority:

Priority	Function state	Executable basic function
1	Initialisation	-
2	Error	-
3	Controller is not ready	-
4	Quick stop active	▸ Quick stop (📖 393)
5	Manual jog active	▸ Manual jog (📖 400)
6	Homing active	▸ Homing (📖 421)
7	Positioning active	▸ Positioning (📖 479)
8	Setpoint follower (position) active	▸ Position follower (📖 490)
9	Setpoint follower (speed) active	▸ Speed follower (📖 496)
10	Setpoint follower (torque) active	▸ Torque follower (📖 501)
10	Brake check	▸ Brake control (📖 521)
12	Drive is stopped	▸ Stop (📖 389)
13	Manual jog, encoderless active	▸ Manual job, encoderless (📖 412)
14	Pole position identification active	▸ Pole position identification (📖 575)
1 ≡ highest priority; 14≡ lowest priority		

Note!

The basic state "Drive at standstill" is automatically adopted if no other state is active.

11.1.5 Requesting control via a basic function

Enable input "bEnable"

The basic functions "Manual jog", "Homing" and "Positioning" and the three setpoint followers each possess an *bEnable* enable input, via which the control of the corresponding basic function can be requested.

- If no other basic function and no error status is active, a change-over to the corresponding function state is effected, and the basic function can be controlled now.
- If several enable inputs are set to TRUE at the same time, the change-over to the function state is effected with the highest priority.

Status outputs "bEnabled", "bActive" and "bDone"

If the basic function is enabled, the *bEnabled* status output of the basic function is set to TRUE and the corresponding drive motion can be started via the control inputs of the basic function.

- If the basic function is currently carrying out a drive movement, this is shown by a TRUE signal at the status output *bActive*.
- The basic functions "Speed follower", "Torque follower", and "Position follower" are only provided with the status output *bEnabled*, as the drive directly follows the setpoint selection after being enabled.
- The basic functions "Homing" and "Positioning" are furthermore provided with a status output *bDone* showing that the drive movement started (Homing or positioning) has been completed.

Priority	Basic function	Status outputs		
		bEnabled	*bActive*	*bDone*
1	Manual jog	☑	☑	
2	Homing	☑	☑	☑
3	Positioning	☑	☑	☑
4	Speed follower	☑		
5	Torque follower	☑		
6	Position follower	☑		

Re-deactivating the enable of a basic function

When the *bEnable* enable input of the active basic function is reset to FALSE, the control inputs of the basic function are inhibited and the status outputs *bEnabled*, *bActive* and *bDone* are reset to FALSE.

- If the drive is not at standstill, it is brought to standstill within the deceleration time for Stop if no other basic function takes over the control of the drive. Here a change-over from the active function state via the function state "Drive is stopped" back to the basic state "Drive at standstill" is effected.
- When the enable input of another basic function is set to TRUE, this basic function adopts the control of the drive immediately.

11.1.6 Start acceleration/acceleration reduction when the basic function changes

In order to make the transitions during the changeover between the single basic functions as jerk-free as possible, i.e. preventing acceleration steps, the current setpoint acceleration is used as starting value for the new basic function (see the following table).

from	to: Position, speed or torque follower	Manual jog	Homing	Positioning	Error/controller not ready	Stop	Quick stop*
Position follower	0	A	A	A	0	A	0
Speed follower	0	A	A	A	0	A	0
Torque follower	0	0	0	0	0	0	0
Manual jog	0	-	B	B	0	B	0
Homing	0	B	-	B	0	B	0
Positioning	0	B	B	-	0	B	0
Error/controller not ready	0	0	0	0	-	0	0
Stop	0	B	B	B	0	-	0
Quick stop*	0	A	A	A	0	A	-

Legend:

0	The start acceleration is defined with "0", thus no acceleration reduction is required.
A	• Acceleration value is generated from the differentiation and filtering (C02562) of the active setpoint speed. • Jerk = Maximum value from transition jerk (defined via C02545) and jerk of the "new" profile data.
B	• Acceleration value is taken from the setpoint generator (e.g. profile generator). • Jerk = maximum value from the jerk of the "old" and "new" profile data.

* Also quick stop by trouble

Reduction of the start acceleration

Depending on the acceleration and S-ramp time parameterised in the basic function, the start acceleration is reduced.

The following applies for software versions lower than V7.0:

- The start acceleration is reduced with the maximum jerk of the old or new basic function. ▸ Setting the S-ramp time (📖 387)

Note!

Very low jerks cause very high speeds!
See also the following chapter "Setting the S-ramp time". (📖 387)

Since this behaviour is mostly not wanted or expected, the acceleration is reduced from software version V7.0 as described in the following section.

The following applies from software version V7.0 onwards:

- The start acceleration is reduced with the maximum jerk of the old or new basic function.

Transition of a profile-generating to a profile-generating basic function

The corresponding jerk results from the profile data:

$$\text{Jerk} = \frac{\text{Profile acceleration/deceleration}}{\text{S-ramp time}}$$

Transition of a non-profile-generating to a profile-generating basic function

- The jerk of the profile-generating basic function results from the profile data:

$$\text{Jerk} = \frac{\text{Profile acceleration/deceleration}}{\text{S-ramp time}}$$

- Since a non-profile-generating basic function has no defined jerk, a "transition jerk" is used which results from the reference acceleration and the reference S-ramp time parameterised in C02545.

$$\text{Transition jerk} = \frac{\text{Reference acceleration}}{\text{Reference Jerktime}} = \frac{\text{C00011 / 1 ms}}{\text{C02545} \times 10}$$

- With a Lenze setting C02545 = 0.001 s, a maximum jerk occurs, i.e. the start acceleration is reduced in one cycle (1 ms).
- The setting C02545 = 0.000 s results in a compatible behaviour lower than V7.0.

Tip!

Profile-generating basic functions are:
"Stop", "Manual jog", "Homing", "Positioning"

Non-profile-generating basic functions are:
"Quick stop", "Position follower", "Speed follower", "Torque follower"

11.1.7 Setting the S-ramp time

For path planning, various basic functions serve to build up or reduce the acceleration linearly. The motion profile causes less structural vibrations and the gearboxes are protected.

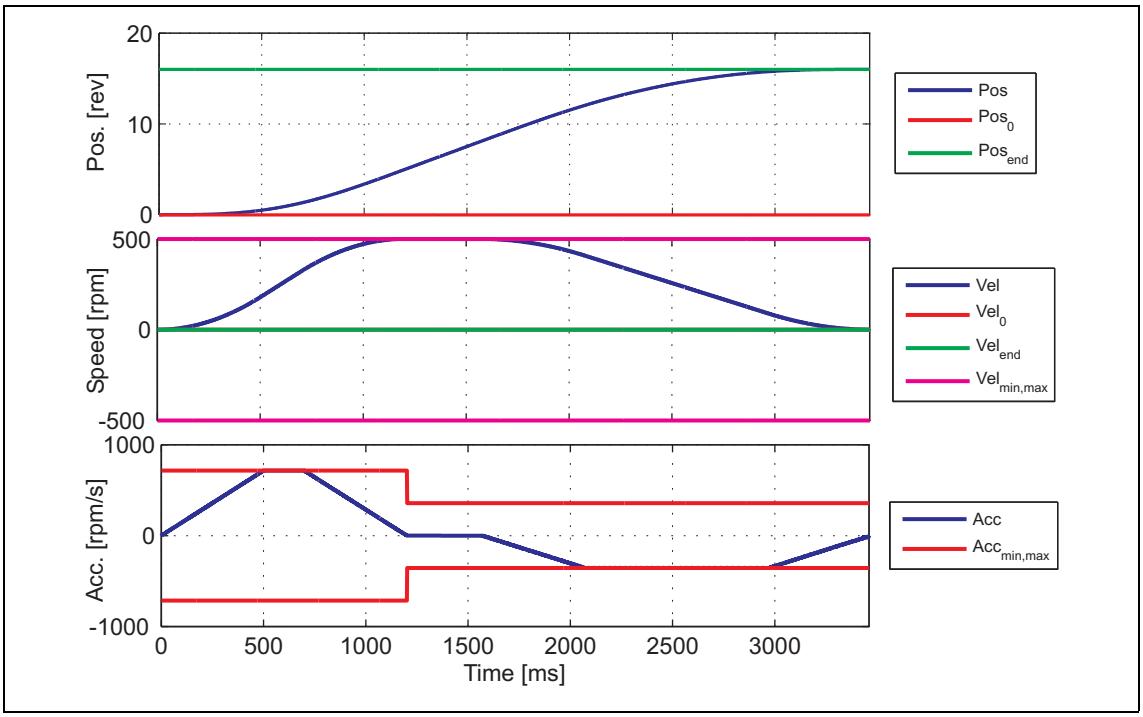
The smoothening (jerk) is calculated via the S-ramp time and the maximum acceleration permitted in the profile:

$$\text{Jerk} = \frac{\text{maximum acceleration}}{\text{S-ramp time}}$$

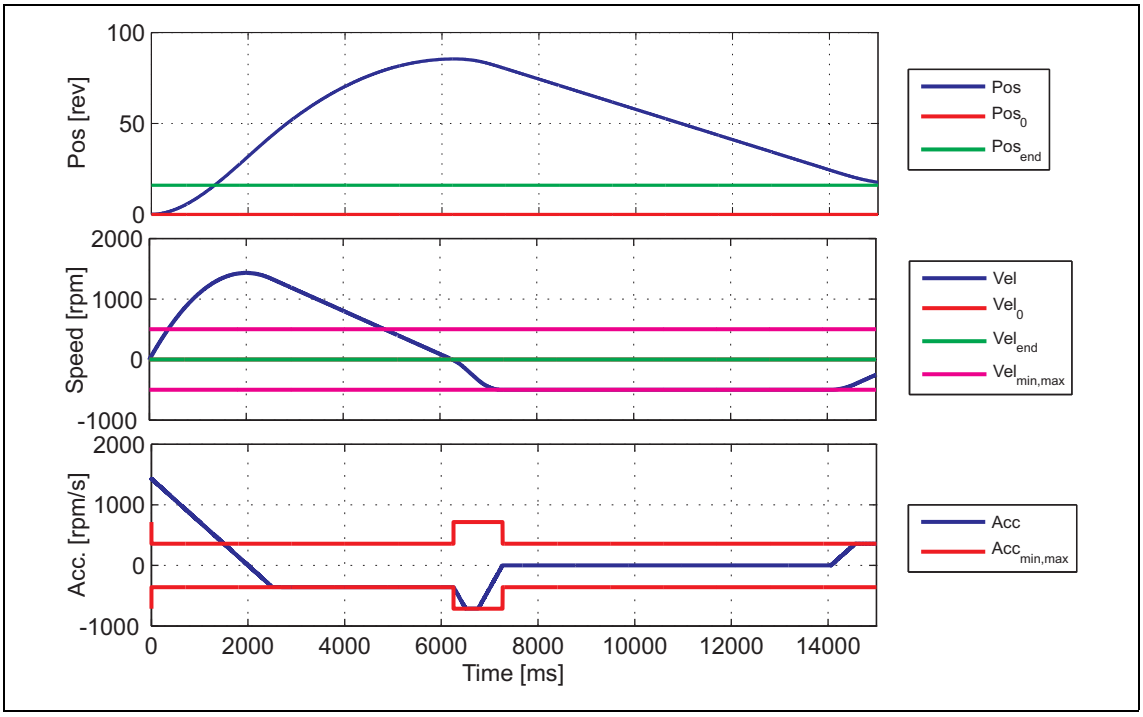
[11-3] Formula for calculating the jerk for acceleration and deceleration phases

S-ramp times can be set in the given parameters for the following basic functions:

Basic function	Parameter for S-ramp time
Stop	C02611
Quick stop	C00106
Manual jog	C02624
Homing	C02648
Positioning	The S-ramp time is defined via FB L_PosPositionerTable or FB L_PosProfileTable.



Stop!



When it is switched to another basic function, the start acceleration is reduced with the jerk of the new basic function. **A small jerk causes very high speeds!**

Remedy: Avoid unnecessarily long S-ramp times. Set the profile parameters of the different basic functions so that the jerk is roughly the same for all basic functions.

Examples

[11-4] Example 1: Point-to-point positioning from standstill without start acceleration

[11-5] Example 2: Point-to-point positioning from standstill with start acceleration

In the example 2, the slow reduction of the start acceleration results in very high speeds!

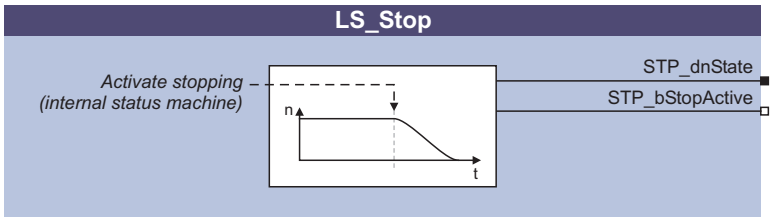
11.2 Stop

The standard stop (in the following called "stop") of the drive will be automatically activated by the internal state machine if a basic function is deactivated and the drive is not yet at standstill.

- The drive is decelerated to standstill along a parameterised deceleration ramp
  - While the drive is braked to standstill, the state machine is in the "Drive is stopped" function state.
  - If meanwhile another basic function is activated, this basic function takes over the control of the drive from the current speed on and the function state "Drive is stopped" is abandoned.
  - If the drive is at standstill, a change-over to the basic state "Drive at standstill" is automatically effected.
- An acceleration phase active at the time of activated stopping process is considered by the normal stop, i.e. the current acceleration is first lead to "0" with the parameterised S-ramp time before the real deceleration process starts.
- If the controller is enabled with the shaft coasting (controller inhibit and pulse inhibit are deactivated), the drive is lead to standstill from the current speed.

Stop!

The basic functions "Speed follower", "Torque follower", and "Position follower" do not take over the control of the from the current speed, but immediately with the setpoint defined, which may cause a jerk!



Note!

- As the stop function takes into account the acceleration active at the moment of activation, the deceleration of the stop function should always be set greater than the deceleration of the active process in order to avoid a possible overshoot.
- If the stop function is activated while the basic function "Torque follower" or the states "Controller inhibited" or "Error" are active, the drive is braked to standstill starting from the current speed and without taking into account the current acceleration.

▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

11.2.1 Internal interfaces | "LS_Stop" system block

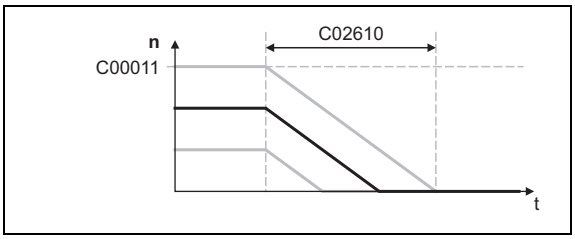
The **LS_Stop** system block provides the internal interfaces for the basic function "Stop" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

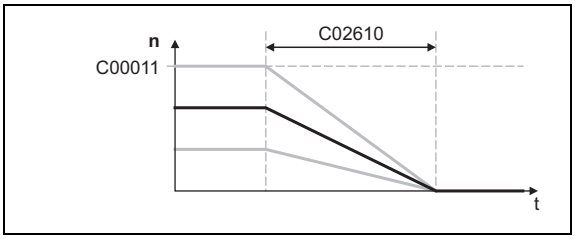
Outputs



Identifier DIS code | data type	Value/meaning	
STP_dnState C02616 | DINT	Status (bit coded) • When the basic function is not active, all bits are set to "0". • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Drive is braked to standstill. • The internal state machine is in the "Drive is stopped" function state.
	Bit 2	Drive is at standstill. • The internal state machine is in the "Drive at standstill" function state.
	Bit 3	Deceleration phase is active.
	Bit 5	CCW rotation is active.
STP_bStopActive C02617 | BOOL	Status signal "Stop is active"	
	TRUE	The drive is braked to standstill or is at standstill. • The internal state machine is in the "Drive is stopped" or "Drive at standstill" function state.

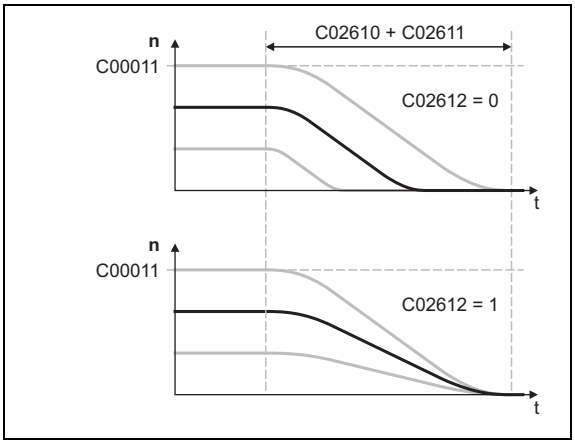
11.2.2 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameter** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Stop*
- Short overview of parameters for standard stop :



Parameters	Info
C02610	Deceleration time for stop
C02611	S-ramp time for stop
C02612	Ref. for decel. time of stop

Parameter setting of stop

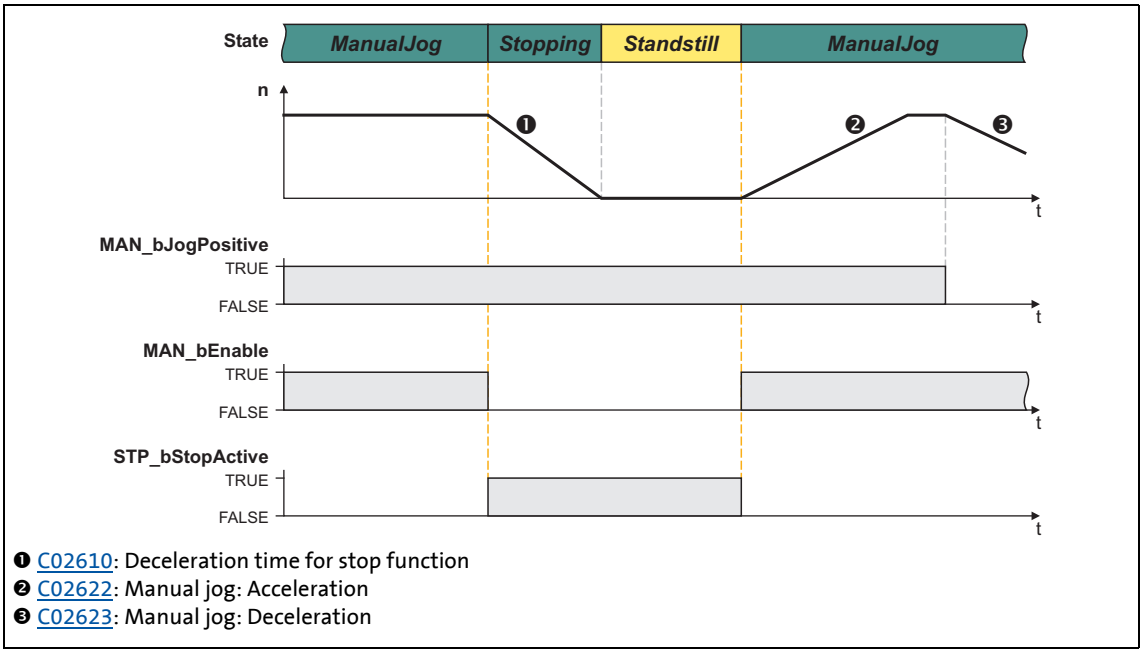


[11-6] Deceleration time referred to the motor reference speed

- The deceleration time for stop set in C02610 refers to a speed variation from the motor reference speed (C00011) to standstill, i. e. the deceleration is constant.

[11-7] Deceleration time referred to the current speed

- When C02612 is set = "1", the deceleration time refers to the current speed, i. e. the braking time is constant.

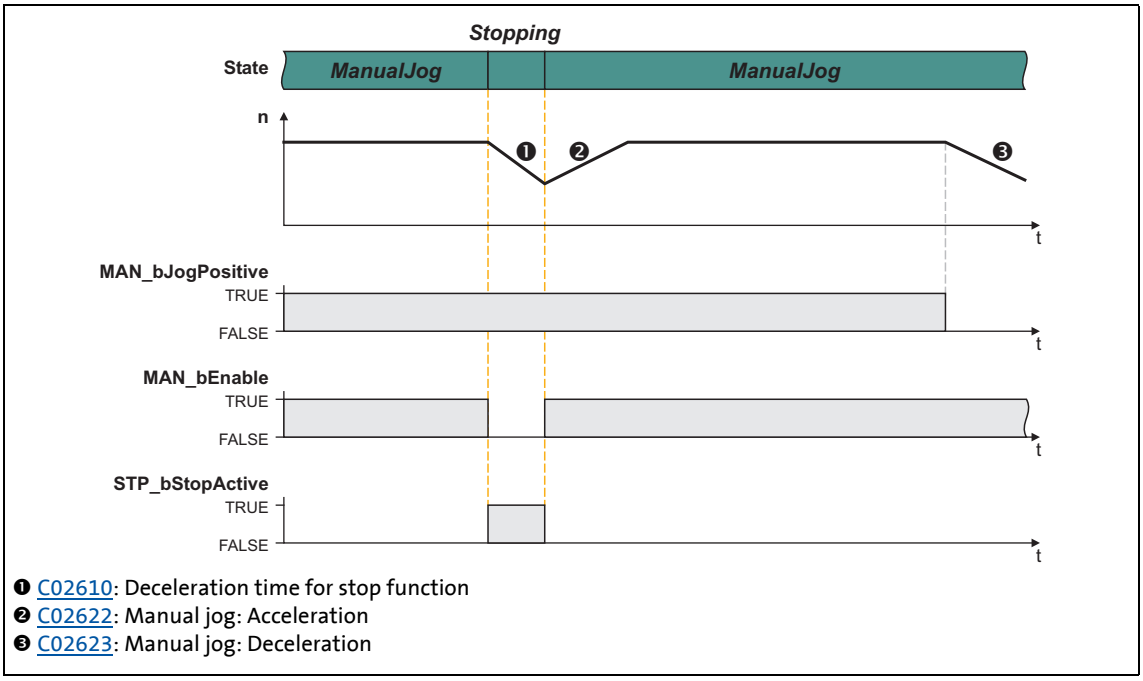


[11-8] S-shaped deceleration ramp through selection of a relative S-ramp time

- By entering an S-ramp time in C02611, the deceleration ramp can be set in an S-shaped manner for purposes of jerk limitation; the total time until standstill is then extended by the S-ramp time set. ▸ Setting the S-ramp time (📖 387)
- Braking time at motor reference speed or C02612 = "1":

$$C02610\ [s] + C02611\ [s]$$

11.2.3 Behaviour of the function (example)



In the following example the enable of manual jog is deactivated during an active manual jog. Then the drive is braked to standstill within the deceleration time ❶ set for stop.

❶ C02610: Deceleration time for stop function
❷ C02622: Manual jog: Acceleration
❸ C02623: Manual jog: Deceleration

[11-9] Example: Stop with reaching standstill

If the basic function "Manual Jog" is reactivated within the deceleration time ❶, this basic function takes over the control of the drive from the current speed and the function state "Drive is stopped" is abandoned immediately:

❶ C02610: Deceleration time for stop function
❷ C02622: Manual jog: Acceleration
❸ C02623: Manual jog: Deceleration

[11-10] Example: Stop without reaching standstill

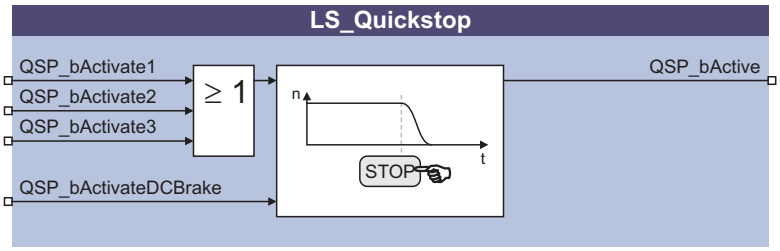
11.3 Quick stop

In contrast to Stop, the purpose of quick stop (QSP) is a stop in case of error. If quick stop is activated, the drive is brought to standstill within the deceleration time set irrespective of the setpoint that is preselected.

Note!

Through this, superimposed controls (e.g. synchronous or position control) may produce following errors. If several drives execute a coordinated motion, the quick stop function should only be used for the motion master (master drive) in order to maintain the coordination.

When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)



Tip!

Quick stop can also be set as error response for many monitoring functions ("quick stop by trouble"). Detailed information can be found in the chapter "Diagnostics & fault analysis". (📖 608)

The source that activated quick stop is displayed bit-coded in C00159.

11.3.1 Internal interfaces | "LS_Quickstop" system block"

The **LS_Quickstop** system block provides the internal interfaces for the basic function "Stop" in the function block editor.

Note!

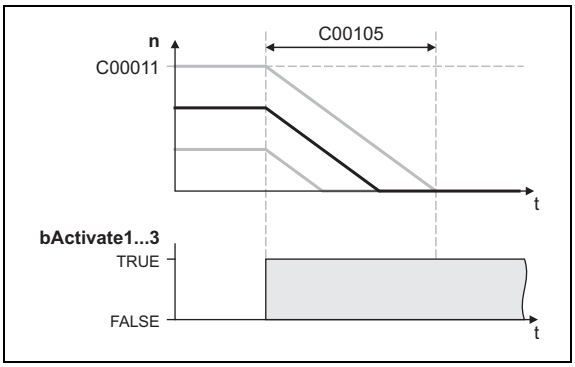
Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
QSP_bActivate1 C02619/1 | BOOL QSP_bActivate2 C02619/2 | BOOL QSP_bActivate3 C02619/3 | BOOL	Activate quick stop • The three inputs are linked via a logic OR gate.	
	TRUE	If one of the three inputs is set to TRUE, a change-over to the "Quick stop active" function state is effected and the drive is brought to standstill within the deceleration time set for quick stop.
	TRUE↘FALSE	If all three inputs are reset to FALSE, a change-over to a setpoint-generating basic function (e. g. "Speed follower") via the "Drive is stopped" function state is effected.
QSP_bActivateDCBrake C02619/5 | BOOL From V3.0	Activate DC-injection braking. (📖 397) • Only possible if V/f control or sensorless vector control is selected as motor control type in C00006! • This input has a higher priority than the three inputs *QSP_bActivate1 ... 3*.	
	TRUE	A change-over to the "Quick stop active" function state is effected and the drive is decelerated with the braking current set in C00974.
	TRUE↘FALSE	DC-injection braking is activated again. • If flying restart is activated in C00990, a flying restart process is automatically started to determine the current motor speed.

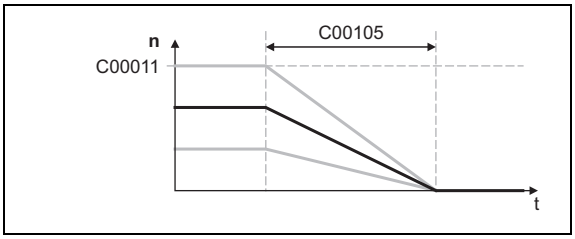
Outputs



Identifier DIS code | data type	Value/meaning	
QSP_bActive C02619/4 | BOOL	Status signal "Quick stop through application active" • *QSP_bActive* is not set to TRUE if quick stop has been activated by another source, e. g. via device command or as an error response ("Quick stop by trouble").	
	TRUE	Quick stop has been requested via one of the three inputs *QSP_bActivate1 ... 3* and is active. - or - DC-injection braking has been requested via *QSP_bActivateDCBrake* and is active (only for motor control mode without encoder).

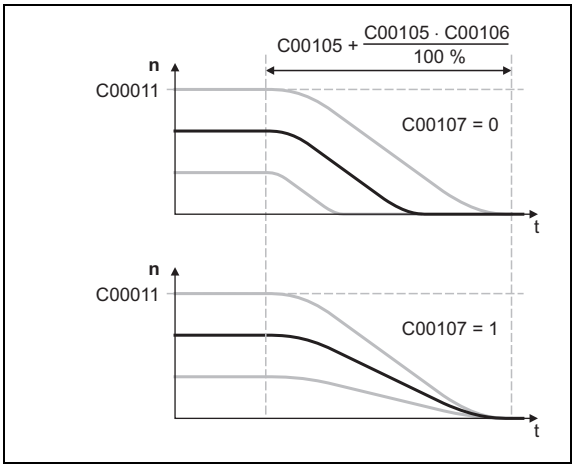
11.3.2 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameter** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Quick stop*
- Short overview of the parameters for quick stop:



Parameters	Info
C00105	Decel. time - quick stop
C00106	Quick stop S-ramp time
C00107	Reference for quick stop deceleration time

Parameter setting of quick stop



[11-11] Deceleration time referred to the motor reference speed

- The deceleration time for the quick stop function set in C00105 refers to a speed variation from the motor reference speed (C00011) to standstill.

[11-12] Deceleration time referred to the current speed

- When C00107 is set = "1", the deceleration time refers to the current speed.

[11-13] S-shaped deceleration ramp through selection of a relative S-ramp time

- By entering a relative S-ramp time in C00106, the deceleration ramp can be set in an S-shaped manner for purposes of jerk limitation; the total time until standstill is then extended by the S-ramp time set. ▸ Setting the S-ramp time (📖 387)
- Braking time at motor reference speed or C00107 = "1":

$$C00105 + \frac{C00105 \cdot C00106\ [\%]}{100\ \%}$$

Tip!

After reaching standstill, the standstill position can be maintained while a torque is applied.

- For this purpose, select the phase controller gain in C00254 > "0".
- With C00254 > "0" the phase control is automatically activated after the standstill is reached.

11.3.3 Activate/deactivate quick stop

For activation/deactivation of quick stop by the application, the three inputs *QSP_bActivate1...3* are provided. (📖 393)

- The three control inputs are linked via a logic OR gate, i.e. in order to activate quick stop, only one of the three inputs must be set to TRUE. To deactivate quick stop, though, all three inputs must be reset to FALSE.
- The control inputs can be linked with terminals (digital inputs) and/or process data in the function block editor.

Note!

In the standard technology applications the control input *QSP_bActivate1* is linked with the digital input DI1 in the Lenze setting.

Further options for activating quick stop

- Via device command "Activate quick stop" (C00002 = "45"), e.g. via a corresponding SDO of a higher-level control, an HMI or »Engineer«.
- Via the stop key at the keypad, unless the Lenze setting of C00469 (assignment of the key) has been changed.
- Through the response "quick stop by trouble" parameterised for monitoring.

11.3.4 DC-injection braking

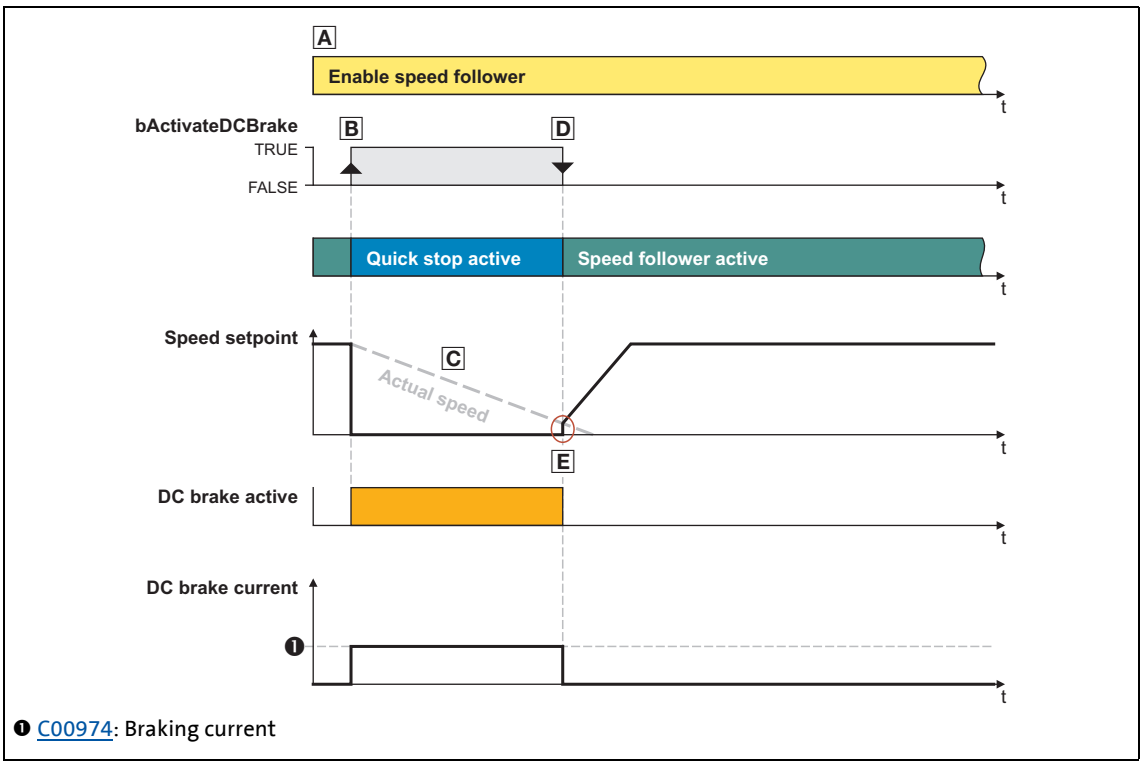
This function extension is available from software version V3.0!

Note!

DC-injection braking is only possible if V/f control or sensorless vector control is selected as motor control type in C00006!

Activate DC-injection braking

To activate DC-injection braking through the application, the *bActivateDCBrake* control input must be set to TRUE.



- A change-over to the "Quick stop active" function state is effected and DC-injection braking with the braking current set in C00974 is carried out.

Flying restart process after cancelling DC injection braking

If the flying restart mode is activated in C00990 and DC-injection braking is cancelled, a flying restart process is automatically started to determine the current motor speed if the following conditions are met:

- V/f control or sensorless vector control are selected as motor control in C00006.
- The position control structure is set to "Phase controller is active" in C02570.
- The *MI_bFlyingSyncBlocked* control input of the motor interface is not assigned or set to FALSE.
- The holding brake, if available, is not applied.

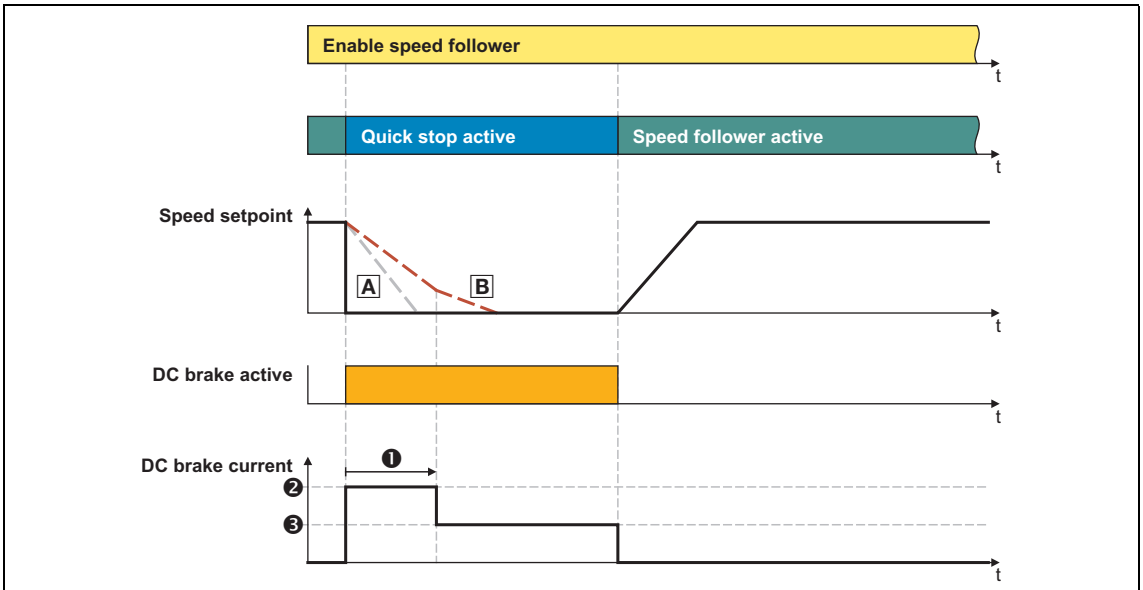
11.3.4.1 DC-injection braking and flying restart process

[11-14] Process example: speed follower is active ➞ QSP_bActivateDCBrake is active ➞ speed follower is active

A. Initial situation: basic function "Speed follower" is enabled and active.

B. *QSP_bActivateDCBrake* control input is set to TRUE through the application to activate DC-injection braking.

C. DC-injection braking is executed with the braking current set in C00974.



D. *QSP_bActivateDCBrake* control input is reset to FALSE through the application to deactivate DC-injection braking.

E. The flying restart process starts, i.e. the controller calculates the output frequency required for the momentary motor speed, then connects to the system, and accelerates the motor to the defined setpoint again.

11.3.4.2 DC-injection braking when quick stop is activated

If DC-injection braking is activated in C00976 instead of quick stop, DC-injection braking is executed automatically when quick stop is activated.

- After activating quick stop, a change-over to the "Quick stop active" function state is effected, and for the quick stop deceleration time set in C00105 a DC-injection braking process with the braking current set in C00975 is carried out.
- After this time has elapsed, a change-over to the braking current parameterised in C00974 is carried out and DC-injection braking is continued with this braking current.
- The DC-injection braking in this case is also carried out when the "Quick stop by trouble" error response is actuated; however, instead of the "Quick stop active" function state, the "Fault" function state is active, and the controller is in the "Quick stop by trouble active" device state.

Ⓐ Actual speed value
Ⓑ Actual speed value if the quick stop braking current is parameterised too low (C00975)
❶ C00105: Quick stop decel. time
❷ C00975: Quick stop braking current
❸ C00974: Braking current

[11-15] Process example: speed follower is active ➞ quick stop activation ➞ speed follower is active

Note!

The quick stop braking current in C00975 has to be set so that the drive can be decelerated from the maximum operating speed to standstill within the deceleration time for quick stop set in C00105!

11.4 Manual jog

The basic function "Manual jog" serves to traverse the drive manually, e.g. to clean or exchange the tool.

- As an option, it is possible to change over to a second speed during traversing.
- "Retraction" of operated (travel range) limit switches is also supported. Only traversing in the corresponding retracting direction is then possible.

Danger!

During manual jogging, specially assigned profile parameters are active. If they have not been set correctly, the drive can engage in uncontrolled movement!

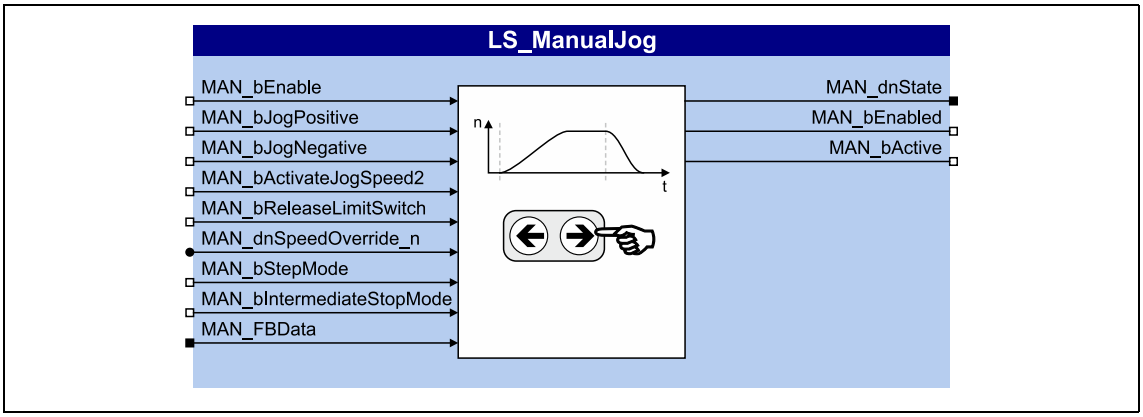
Stop!

In manual mode a travel range monitoring via limit switches and software limit positions is carried out via the basic function "Limiter". (📖 506)

If no limit switches are connected and no software limit positions are set, and the reference is not known, the drive can travel into a mechanical barrier during manual mode and machine parts can be destroyed or damaged!

Note!

For manual jog setpoint speeds greater than 30000 rpm are not possible. The speeds defined for these basic function are internally limited to 30000 rpm.



When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

For the encoderless motor control types (from software version V3.0) **the following applies:**

If no position controller has been selected for position control in case of V/f control or sensorless vector control (C02570 = "1: Phase controller is active"), the manual jog is only executed via the speed profile resulting from the manual jog parameters.

11.4.1 Internal interfaces | "LS_ManualJog" system block"

The **LS_ManualJog** system block provides the internal interfaces for the basic function "Manual jog" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

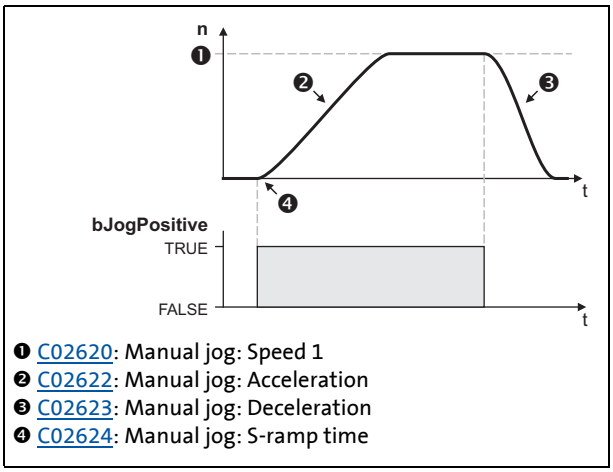
Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
MAN_bEnable C02639/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Manual jog active" function state is effected and manual jog can be carried out via the control inputs.
	TRUE↘FALSE	Active manual jog is stopped, i. e. a change-over from the active "Manual jog active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.
MAN_bJogPositive C02639/2 | BOOL	▸ Manual jog in positive/negative direction (📖 407)	
MAN_bJogNegative C02639/3 | BOOL		
MAN_bActivateJogSpeed2 C02639/4 | BOOL	Change over to speed 2 for manual jog	
	FALSE	Speed 1 (C02620) active.
	TRUE	Speed 2 (C02621) active.
MAN_bReleaseLimitSwitch C02639/5 | BOOL	Retracting of an activated limit switch	
	TRUE	Retracting of the accordingly operated limit switch in the corresponding retracting direction until the limit switch is cleared again (no longer operated) and the drive is within the software limit positions again. Afterwards the drive is braked to standstill with the deceleration set unless the control input *MAN_bJogPositive* or *MAN_bJogNegative* is activated for the corresponding retracting direction.

Identifier DIS code | data type	Information/possible settings
MAN_dnSpeedOverride_n C02637 | DINT From V5.0	Value for speed override • Percentage multiplier for the currently active speed (C02620 or C02621). • In the case of active manual jog, the speed override is always active and does not have to be activated separately. • Changes are accepted in each cycle. • $2^{30} \equiv 100$ % of the speed parameterised in C02620 or C02621. • For values ≤ 1 % the status bit 19 is set. • Values ≤ 0 % are set to 0 % internally and lead to the standstill of the drive.
MAN_bStepMode C02639/8 | BOOL From V5.0	▸ Manual jog with step limitation (📖 408) • Only possible if the "Manual jog with intermediate stop" mode is not active. TRUE: Manual jog with step limitation active.
MAN_ bIntermediateStopMode C02639/9 | BOOL From V5.0	▸ Manual jog with intermediate stop (📖 409) • This mode has a higher priority than the "Manual jog with step limitation" mode. TRUE: Manual jog with intermediate stop active.
MAN_FBData From V5.0	Interface for the transfer of the function block instance data for determining the positions for intermediate stop • Connect this input to the output *FBData* of the function block instance of type **L_PosPositionerTable** or **L_PosProfileTable**.

Outputs



Identifier DIS code | data type	Value/meaning	
MAN_dnState C02638 | DINT	Status (bit coded) • When the basic function is not enabled, all bits are set to "0". • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Manual jog active.
	Bit 2	Manual jog is completed.
	Bit 3	Acceleration/deceleration phase is active.
	Bit 5	CCW rotation is active.
	Bit 15	Fault in basic function active (group signal).
	Bit 16	Stop by simultaneous selection of negative direction and retraction of limit switch.
	Bit 17	Stop by simultaneous selection of positive and negative direction.
	Bit 18	Stop by simultaneous selection of positive direction and retraction of limit switch.
	Bit 19	Speed override ≤1 % • This status is only available from software version V5.0.
	Bit 20	Speed 2 (C02621) active.
	Bit 21	Speed 1 (C02620) active.
	Bit 22	Stop by selection of positive direction and simultaneous activation of the positive software limit position or the positive limit switch.
	Bit 23	Stop by selection of negative direction and simultaneous activation of the negative software limit position or the negative limit switch.
	Bit 24	General abort process (ramp down of the speed setpoint) • Takes place e.g. when a manual direction initiator is released or due to an impermissible state (see bit 16, 17, 18, 22, 23).
	Bit 25	Stopping is active. • Basic function enabled for the first time but no manual jog has been requested/is active yet or current speed is higher than the manual jog speed.
	Bit 26	Home position is not known. • This status is only available from software version V5.0.
	Bit 27	No intermediate stop position available. • This status is only available from software version V5.0.
	Bit 30	Profile generation error.
MAN_bEnabled C02639/6 | BOOL	Status signal "Basic function is enabled"	
	TRUE	Manual jog via the control inputs is possible. • The *MAN_bEnable* enable input is set to TRUE and the controller is in the "Manual jog active" function state.
MAN_bActive C02639/7 | BOOL	Status signal "Basic function is active"	
	TRUE	Manual jog is active (the drive axis is moving).

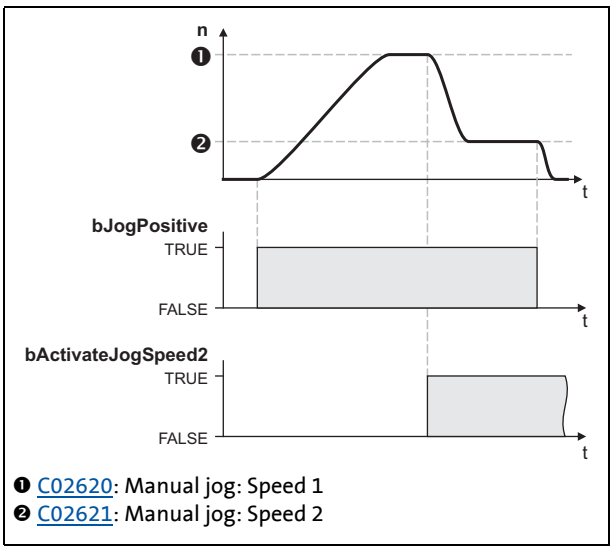
11.4.2 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** → Dialog level *Overview* → *All basic functions* → *Manual jog*
- Short overview of the parameters for manual jog:

Parameters	Info
C02620	Manual jog: Speed 1
C02621	Manual jog: Speed 2
C02622	Manual jog: Acceleration
C02623	Manual jog: Deceleration
C02624	Manual jog: S-ramp time
C02625	Manual jog: Step distance
C02626/1...16	Manual jog: Index stop position
C02627/1...16	Manual jog: Selected stop position
Greyed out = display parameter	

11.4.2.1 Smooth start and quick stop of the drive

❶ C02620: Manual jog: Speed 1
❷ C02622: Manual jog: Acceleration
❸ C02623: Manual jog: Deceleration
❹ C02624: Manual jog: S-ramp time



[11-16] Example: Smooth start and quick stop

- Different values for acceleration and deceleration can be set in C02622/ C02623 in order to implement a smooth start and a quick stop of the drive.
- By entering a relative S-ramp time in C02624 both ramps can be set in S-shape for jerk reduction. ▸ Setting the S-ramp time (📖 387)

Tip!

A quick deceleration (C02623) reduces the time from letting go of the "Jog key" to the actual stop of the drive, so that the drive can thus be better positioned "by eye" and the desired stop position is not overtravelled.

11.4.2.2 Second speed

❶ C02620: Manual jog: Speed 1
❷ C02621: Manual jog: Speed 2

[11-17] Example: Change-over to second speed

- By setting the input *MAN_bActivateJogSpeed2* to TRUE, a change-over to a second speed (C02621) can be carried out during the traversing process.

11.4.3 Executing manual jogging

Prerequisites

- The controller is in the "Operation" device state.
- The basic function "manual jog" is part of the active application.
- No other basic function is active.

Activation

To request the control via the basic function, the *MAN_bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Manual jog active" function state is effected and manual jog can be carried out via the control inputs.
- A successful change to the function state "Manual jog active" is displayed by a TRUE signal at the *MAN_bEnabled* status output.

Deactivation

If the *MAN_bEnable* enable input is reset to FALSE, an active manual jog is reset, i.e. the control inputs for manual jog are inhibited and the drive is braked to standstill within the deceleration time for Stop. (📖 389)

- The status output *MAN_bEnabled* is reset to FALSE and a change-over from the active "Manual jog active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.

11.4.3.1 Manual jog in positive/negative direction

In the "Manual jog active" function state the drive can be traversed manually according to the following truth table via the control inputs:

MAN_bJogNegative	MAN_bJogPositive	MAN_bActivateJogSpeed2	Job title
FALSE	FALSE	-	Stop • The drive is controlled to standstill at the set rate of deceleration.
FALSE	TRUE	FALSE	Manual jog • In positive direction • Using speed 1 (C02620)
		TRUE	Manual jog • In positive direction • Using speed 2 (C02621)
TRUE	FALSE	FALSE	Manual jog • In negative direction • Using speed 1 (C02620)
		TRUE	Manual jog • In negative direction • Using speed 2 (C02621)
TRUE	TRUE	-	When both inputs are set to TRUE at the same time: • The drive is controlled to standstill at the set rate of deceleration. If not both inputs are set to TRUE at the same time: • The drive continues to traverse in the direction that was selected first.

Note!

In the standard technology applications "Actuating drive – speed" and "Actuating drive – torque", in the Lenze setting the control inputs are linked to the following digital inputs:

- **DI6**: Activate manual mode
- **DI7**: Manual jog in positive direction
- **DI8**: Manual jog in negative direction

11.4.3.2 Manual jog with step limitation

This function extension is available from software version V5.0 onwards!

This mode can be activated via the control input *MAN_bStepMode*.

In the "Manual jog with step limitation" mode the drive traverses by the "step distance" parameterised in C02625 if a direction is requested via the control inputs *MAN_bJogPositive/ MAN_bJogNegative*. After traversing this distance, the drive stops.

- A new positive edge for the routing request causes a restart of the function or a reset of the distance counter, even if the drive is not at standstill yet.
- If the routing request is reset before the distance is reached, the drive stops immediately (with the deceleration set).

Note!

The two modes "Manual jog with step limitation" and "Manual jog with intermediate stop" cannot be active at the same time.

If there is a simultaneous request via the control inputs *MAN_bStepMode* and *MAN_bIntermediateStopMode*, only the "Manual jog with intermediate stop" mode is active. ▸ Manual jog with intermediate stop (📖 409)

11.4.3.3 Manual jog with intermediate stop

This function extension is available from software version V5.0 onwards!

This mode can be activated via the control input *MAN_bIntermediateStopMode*.

In the "Manual jog with intermediate stop" mode, in the case of a routing request via the control inputs *MAN_bJogPositive/MAN_bJogNegative* the drive traverses to the defined "Intermediate stop position" that is next in the corresponding direction.

MAN_bJogNegative	MAN_bJogPositive	Job title
FALSE	TRUE	Drive traverses from the current position to the next target in positive direction of the intermediate positions defined.
TRUE	FALSE	Drive traverses from the current position to the next target in negative direction of the intermediate positions defined.

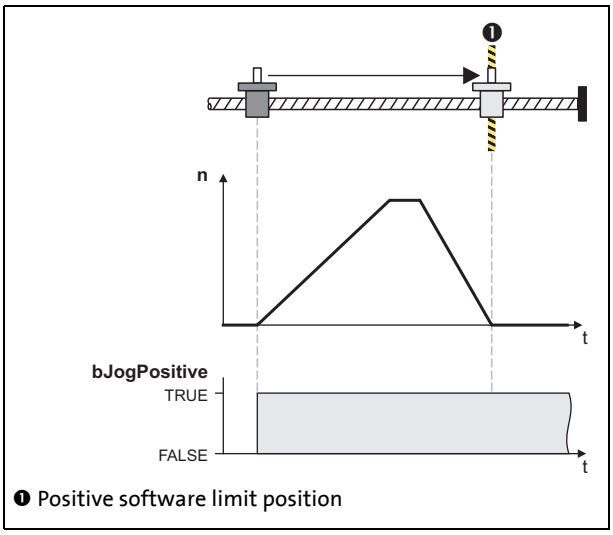
- The drive stops on the intermediate position that is approached.
- If the routing request is reset before the intermediate position is reached, the drive stops immediately (with the deceleration set).
- After the drive has stopped on the intermediate position, it can only continue after a new positive edge for the routing request.
- If the drive is in the outmost intermediate position defined and a new routing request is effected, the drive stops.

Note!

Requirements for manual jog with intermediate stop:
- The home position is known (otherwise status bit 26 is set).
- At least one intermediate stop position is defined (otherwise status bit 27 is set).

Selection of the intermediate stop positions

The max. 16 intermediate stop positions are selected/defined via a function block instance of type **L_PosPositionerTable** or **L_PosProfileTable**.



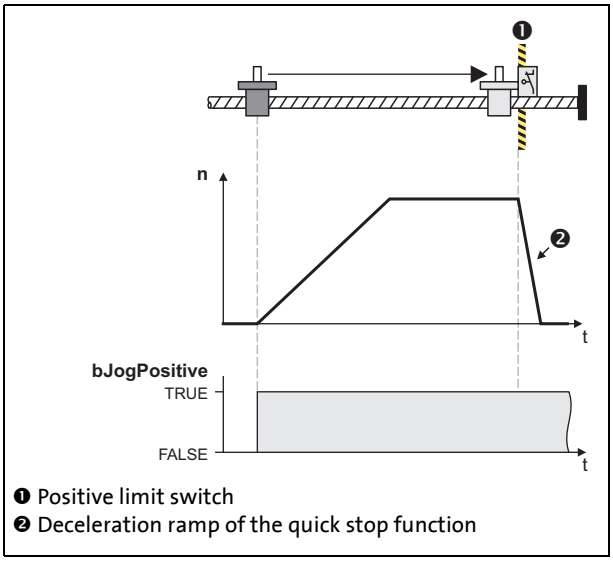
- For the transfer of the intermediate stop positions the output *FBData* of the respective function block instance is to be connected to the input *MAN_FBData* of the **LS_ManualJog** SB.
- The positions defined by the function block instance, which are to be used as intermediate stop positions are selected via C02626/1...16.
  - In connection with a function block instance of type **L_PosPositionerTable**:
    In C02626/x the index [1...75] of the table position in the VTPOS table has to be specified, which contains the intermediate stop position x that is to be used.
  - In connection with a function block instance of type **L_PosProfileTable**:
    In C02626/x the index [1...4] of the profile data set has to be specified, which contains the intermediate stop position x that is to be used.
- The positions selected are shown in C02627/1...16.

11.4.3.4 Manual jog to limit position

Note!

Detailed information on travel range monitoring via limit switches and software limit positions can be found in the description of the basic function "Limiter". (📖 506)

Manual jog to software limit position



❶ Positive software limit position

[11-18] Example: Manual jog to positive software limit position

- If the reference is known and the software limit positions are set, a positioning to the corresponding software limit position is carried out, if manual jog was not exited manually before by resetting *MAN_bJogNegative* or *MAN_bJogPositive*.
- The drive brakes with the deceleration set (C02623) to the position of the corresponding software limit position.

Manual jog to hardware limit position (limit switch)

❶ Positive limit switch
❷ Deceleration ramp of the quick stop function

[11-19] Example: Manual jog to positive limit switch

- When a limit switch is approached during manual jog, the drive is braked to standstill within the deceleration time set for the quick stop function.

See also:
- Software limit positions (📖 512)
- Hardware limit positions (limit switch) (📖 515)

11.4.3.5 Retracting of an activated limit switch

By setting *MAN_bReleaseLimitSwitch* to TRUE, retracting from an operated limit switch is possible. The traversing process in the corresponding retracting direction is carried out until the limit switch is no longer activated.

- If, while retracting, a direction is selected additionally via the control inputs *MAN_bJogPositive* or *MAN_bJogNegative* towards the retracting direction, the travel is continued even after the limit switch has been abandoned until *MAN_bJogPositive* or *MAN_bJogNegative* are reset to FALSE.
- If the direction opposite to the retracting direction is preselected instead, the drive stops, and a corresponding status is shown via the status output *MAN_dnState*.

Note!

Retracting from a limit switch is only possible if it is still activated, i. e. if the corresponding limit switch input of the limiter is still activated. Therefore ensure that if a limit switch is approached, its trigger mechanics is not "overtravelled", for instance by a too great mass or drive, so that by this the limit switch is no longer activated.

Tip!

An activated limit switch can also be exited again by manual jog in the retracting direction via the control input *MAN_bJogPositive* or *MAN_bJogNegative*.

See also: ▸ Hardware limit positions (limit switch) (📖 515)

11.5 Manual job, encoderless

This function extension is available from software version V7.0!

Danger!

In this basic function, the extent of the useable operating modes of the holding brake is restricted. Only the following operating modes function:

- Directly with brake module (C02580, selection 1) and
- Direct switching externally (C02580, selection 11)

The basic function "Manual jog (OL)", which is implemented in the motor control system of the drive controller, enables the user to operate the drive without control (i.e. "**o**pen **l**oop", encoderless) and independently of the selected operating mode:

- If the motor is asynchronous, the speed depends on the load.
- A synchronous motor turns with a prescribed field frequency.

Stop!

It is only permissible to activate controlled operation of synchronous machines if the following parameters have been set correctly, in addition to correct assignment of the encoder image and the motor's rotating field:

- Motor control *SC*, "Servo control of sync motor" (C00006, selection 1)
- Pole position of the motor encoder (C00058)
- Motor data (C00081 ... C00091)
- Active resolver feedback or encoder feedback as motor encoder (C00420 ... C00422)

The basic function "Manual jog (OL)"

- is based on the I-rotation test mode and is especially suitable for the operation of synchronous motors. There is a corresponding dialog box in »Engineer«
- is *not* identical with sensorless operation of synchronous machines. In the basic function "Manual jog (OL)", neither parameters relevant to the motor model nor parameters relevant to the motor type are used
- can be activated and controlled by means of process data (system block inputs) or by accessing codes (e.g. via keypad).

Uses of "Manual job, encoderless"

- Test of hardware (e.g. connection system, rotating field and motor cables) during initial commissioning and during servicing
- Movement of the drive or machine to a service position in the event of defective encoder feedback
- Functional test of the discretely structured feedback system of a torque or linear motor.

- Support for Pole position identification (📖 131) in the case of torque and linear motors by means of
  - movement to a machine position in which pole position identification can be carried out in a reproducible manner and
  - setting of the pole position angle with the "PL touch probe signal"

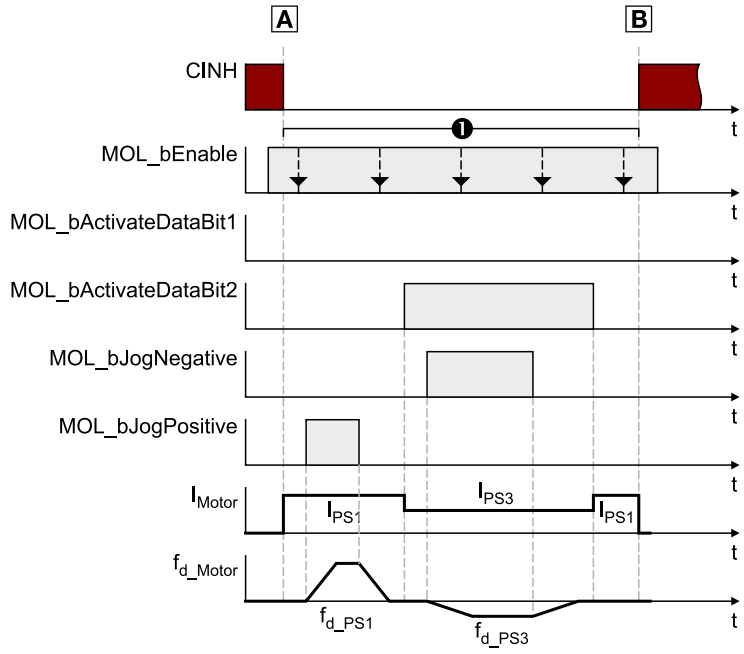
11.5.1 Parameter setting

- Parameterising dialog box in»Engineer«: Tab **Application parameters** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Manual jog (OL)*
- Short overview of the parameters for manual jog, encoderless:

Parameters	Info	Lenze setting	
		Value	Unit
C02770/1	EnableManualMode	0: Deactivate	
C02770/2	JogPositive	0: Deactivate	
C02770/3	JogNegative	0: Deactivate	
C02770/4	ActivateDataBit1	0: Deactivate	
C02770/5	ActivateDataBit2	0: Deactivate	
C02771/1...4	Frequency • Field frequency f_d with which the current vector rotates.	1.0	Hz
C02772/1...4	Start angle	0.0	°
C02773/1...4	Current • R.m.s. value of the current vector which is injected with the parameterised frequency/starting angle. • 100 % ≡ I_{max_device} (C00022)	10.00	%
C02774/1...4	Acceleration time	1.000	s
C02775/1...4	Deceleration time	1.000	s
C02776/1...4	Max. activation time	1.000	s
C02779	Mol_SetpointCurrent	-	A
C02780	Mol_dnState	-	
C02781	ManualJogOpenLoop: Dig. signals	-	
Greyed out = display parameter			

Stop!

At the frequency f_d = 0 Hz, the r.m.s. value increases to 141 % of the current parameterised in C02773/x. As a result, the connected motor can be destroyed!



Remedy: Activation of a derating curve in i2xt monitoring or limitation of the parameterised current in C02773/x to 71 % of the rated motor current. ▸ Motor monitoring (I^2xt) (📖 218)

11.5.2 Carrying out encoderless manual jogging

The procedure for using this basic function is described with reference to the signal characteristic shown below.

Please refer to the following chapters for more information

- Prerequisites
- Activation / Deactivation
- Selection and contents of the profile parameter set
- Encoderless manual jogging in a positive/negative direction

❶ Resetting of *MOL_bEnable* is not permissible here
A On activation:
1. *MOL_bEnable* = Low → High
2. CINH = High → Low
B On deactivation:
1. CINH = Low → High
2. *MOL_bEnable* = High → Low

[11-20] Signal characteristic: activation/deactivation of basic function "manual jog (OL)"

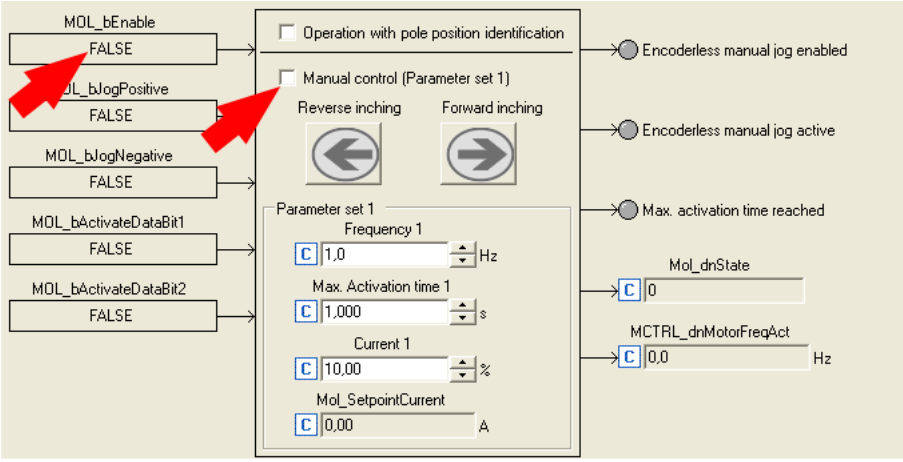
11.5.2.1 Prerequisites

- Check and, if necessary, adjust the basic parameterisation:
  - Optimisation of the current controller in the case of non-Lenze motors or motors that are not included in the »Engineer« motor catalogue. ▸ Optimise current controller (📖 181)
  - Parameterisation of motor monitoring corresponding to the existing motor with the monitoring response "Fault". ▸ Motor monitoring (I^2xt) (📖 218)
  - This function is especially important for monitoring the permissible r.m.s. current load on motors at f_d = 0 Hz.
  - Activation of maximum current monitoring with the monitoring response "Fault" in the case of non-Lenze motors or motor that are not included in the »Engineer« motor catalogue. ▸ Maximum current monitoring (📖 233)
  - Activation of motor temperature monitoring via PTC and/or KTY. ▸ Motor temperature monitoring (📖 225)
- The controller inhibit is active.
- The controller is in the "Controller not ready" state ▸ Device states (📖 100).
- The basic function "Manual jog (OL)" is part of the active application; see ▸ Internal interfaces | "LS_ManualJogOpenLoop" system block (📖 419).
- No other basic function is active.

11.5.2.2 Activation

In order to request the control via the basic function, the *MOL_bEnable* enable input in the application must be set to TRUE or C02770/1 to "1".

- If no other basic function is active, a changeover to the function state "Manual jog, encoderless active" takes place and controlled traversing can be carried out by means of the control inputs or by writing values into C02770/2...5.
- A successful changeover to the function state"Manual jog, encoderless active" is indicated by a TRUE signal at the status output *MOL_bEnabled*.



11.5.2.3 Deactivation

Stop!

Before the basic function is deactivated, the controller inhibit must be set. Otherwise, unsteady drive behaviour can occur when a changeover is made from the basic function "Manual jog, encoderless" to the basic function "Stop".

The basic function is deactivated by

- setting the input "*MOL_bEnable*" to FALSE or
- removing the checkmark (if there is one) in the »Engineer« dialog box entitled *Manual control (parameter set 1)*.

[11-21] Deactivation of the basic function "Manual jog, encoderless"

11.5.2.4 Selection and contents of the profile parameter set

For controlled traversing, four different profiles can be parameterised. The profile parameter set to be used is selected by means of the control inputs *MOL_bActivateDataBit1* C02781/4 and *MOL_bActivateDataBit2* C02781/5 or alternatively by means of the parameters C02770/4 (*ActivateDataBit1*) and C02770/5 (*ActivateDataBit2*):

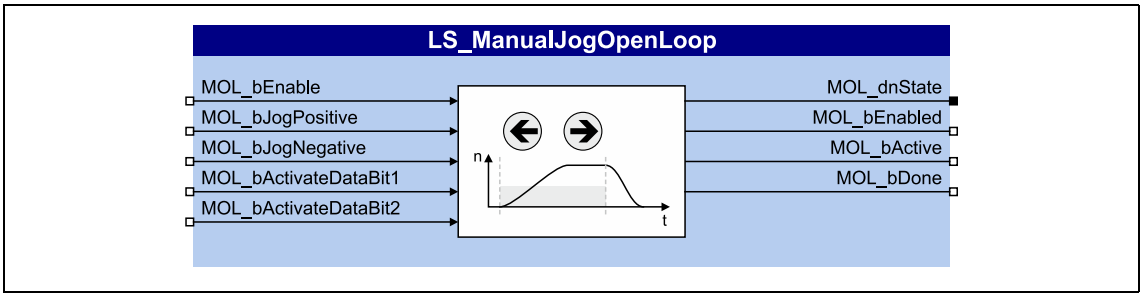
MOL_bActivateDataBit2 C02781/5	MOL_bActivateDataBit1 C02781/4	Selected profile parameter set
FALSE	FALSE	Profile parameter set **1**
FALSE	TRUE	Profile parameter set **2**
TRUE	FALSE	Profile parameter set **3**
TRUE	TRUE	Profile parameter set **4**

Setpoint	Profile parameter set 1	Profile parameter set 2	Profile parameter set 3	Profile parameter set 4
Frequency	C02771/1	C02771/2	C02771/3	C02771/4
Start angle	C02772/1	C02772/2	C02772/3	C02772/4
Current	C02773/1	C02773/2	C02773/3	C02773/4
Acceleration time	C02774/1	C02774/2	C02774/3	C02774/4
Deceleration time	C02775/1	C02775/2	C02775/3	C02775/4
Max. activation time	C02776/1	C02776/2	C02776/3	C02776/4

Note!

The four profile parameter sets must be dealt with sequentially, i.e. a selected profile parameter set must first be completed with f_d = 0 Hz before a further profile parameter set can be activated.

- The signal characteristic in Fig. [11-20] (📖 414) shows that the drive must ramp down completely in the case of each parameter set before the next parameter set can be started.
- Lenze recommends to control the basic function in accordance with this signal characteristic.



11.5.2.5 Encoderless manual jogging in a positive/negative direction

In the function state"Manual jog, encoderless active", the drive can be traversed manually in accordance with the following truth table by means of the indicated control inputs:

MOL_bJogNegative C02770/3	MOL_bJogPositive C02770/2	Job title
FALSE	FALSE	Stop • The drive is braked to standstill with the deceleration time in (C02775/x) set for the selected profile.
FALSE	TRUE	Controlled traversing in positive direction • The drive is led to the setpoint frequency with the acceleration time (C02774/x) set for the selected profile (C02771/x).
TRUE	FALSE	Controlled traversing in negative direction • The drive is led to the setpoint frequency with the acceleration time (C02774/x) set for the selected profile (C02771/x).
TRUE	TRUE	When both inputs are set to TRUE at the same time: • The drive is braked to standstill with the deceleration time in (C02775/x) set for the selected profile. If not both inputs are set to TRUE at the same time: • The drive continues to traverse in the direction that was selected first.
		x = number (1...4) of the selected profile parameter set

11.5.3 Internal interfaces | "LS_ManualJogOpenLoop" system block

In the function block editor, the system block **LS_ManualJogOpenLoop** makes the internal interfaces to the basic function "Manual jog, encoderless" available.

Note!

For the basic function "Manual jog, encoderless", the system block must be integrated into the application task. When the FB editor is activated, the basic dialog boxes of the corresponding technology application in »Engineer« change.

In the dialog box entitled "All basic functions", the "Manual jog, encoderless" button is not shown until the project has been updated.

Inputs

Identifier DIS code | data type	Information/possible settings	
MOL_bEnable C02781/1 | BOOL	Request control of basic function • Request is also possible via C02770/1.	
	TRUE	If no other basic function is active, a changeover to the function state "Manual jog, encoderless active" takes place and controlled traversing of the drive can be carried out by means of the control inputs
	TRUE↘FALSE	Actively controlled traversing is ended, i.e. a changeover from the active function state "Manual jog, encoderless active" back to the basic state "Controller not ready" takes place.
MOL_bJogPositive C02781/2 | BOOL	▸ Encoderless manual jogging in a positive/negative direction (📖 418) • Control is also possible via C02770/2 and C02770/3.	
MOL_bJogNegative C02781/3 | BOOL		
MOL_bActivateDataBit1 C02781/4 | BOOL	▸ Selection and contents of the profile parameter set (📖 417) • Selection is also possible via C02770/4 and C02770/5.	
MOL_bActivateDataBit2 C02781/5 | BOOL		

Outputs

Identifier DIS code | data type	Value/meaning	
Mol_dnState C02780 | DINT	Status (bit coded) • When the basic function is not enabled, all bits are set to "0". • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Manual jog, encoderless active.
	Bit 2	Profile executed.
	Bit 16	Request for "Quick stop" (QSP) active
MOL_bEnabled C02781/6 | BOOL	Status signal "Basic function is enabled"	
	TRUE	Controlled traversing via the control inputs is possible. • The enable input *MOL_bEnable* has been set to TRUE and the controller is in the function state "Manual job, encoderless active".
MOL_bActive C02781/7 | BOOL	Status signal "Basic function is active"	
	TRUE	Controlled traversing is active (the drive axis moves according to the defined profile).
MOL_bDone C02781/8 | BOOL	Status signal "Max. activation time reached" • The status signal indicates that the respective parameterised max. activation time has been reached. • The counter of the max. activation time is reset every time there is a TRUE-FALSE edge at *MOL_bJogPositive/MOL_bJogNegative*. • The setpoint frequency and therefore the rotating field at the motor terminals is generated within the acceleration time parameterised in C02774/1...4 for the selected profile and the drive movement starts accordingly. • At the instant of "Max. activation time reached", the drive is still moving and ramping down within the deceleration time parameterised in C02775/1...4 for the selected profile is initiated.	
	TRUE	Controlled manual jogging is active • The max. activation time parameterised for the selected profile in C02776/1...4 has expired. • *MOL_bJogPositive* or *MOL_bJogNegative* is TRUE • The setpoint frequency still corresponds to the setpoint frequency parameterised in C02771/1...4 for the selected profile.

11.6 Homing

With the basic function "Homing" the measuring system of the machine is transmitted to the controller within the travel range that is physically possible.

- The reference (e.g. zero position of the drive axis in the machine measuring system) can be defined by reference search or reference setting.
- In case of reference search, the drive travels according to the defined homing mode to detect the reference in the measuring system independently.
  - In the reference point, the home position parameterised in C02642 is set as the current position. Afterwards, an absolute positioning to the target position parameterised in C02643 takes place (if C02641 = "0").
- If the reference is set in the homing mode "100: Set reference directly" or via the control input *HM_bLoadHomePos*, the drive can also be referenced manually if the motor is at standstill. The measuring system is set by means of the home position parameterised in C02642 or applied at the input *HM_dnHomePos_p*.

Danger!

During homing, specially assigned profile parameters are active. If they have not been set correctly, the drive can engage in uncontrolled movement!

Note!

Normally homing is only required once during commissioning of systems for which the machine cycle can be represented in the display area of the encoder, e. g. if multiturn absolute value encoders or singleturn absolute value encoders/resolvers are used during the machine cycle on one motor revolution.

- The encoder position is stored safe against mains failure in the memory module and is therefore known to the drive control even after the mains has been switched. ▸ Behaviour of the home position after mains switching (📖 426)
- A renewed reference setting is only required in case of a renewed commissioning or in case of service (e.g. when drive components are exchanged).
- When multipole resolvers (C00080 > 1) are used, a renewed homing is required after mains switching due to the ambiguity of the evaluated position.

Note!

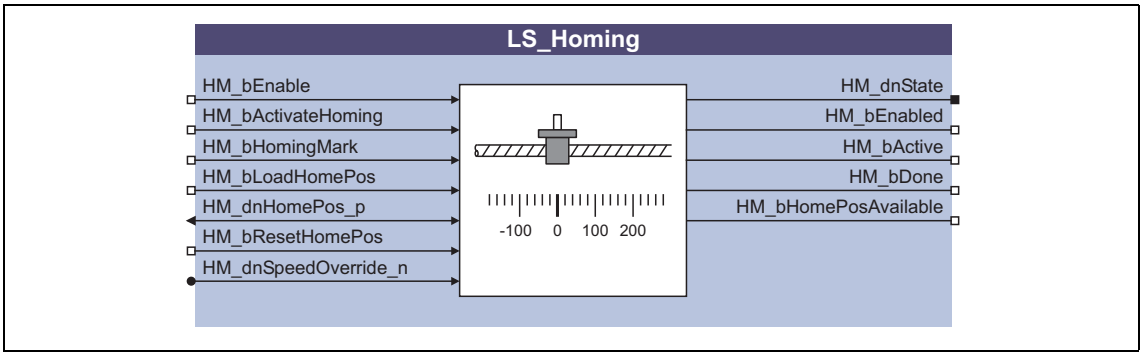
For homing, setpoint speeds greater than 30000 rpm are not possible. The speeds defined for these basic function are internally limited to 30000 rpm.

When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

For the encoderless motor control types (from software version V3.0) **the following applies:**

The basic function "Homing" can only be activated for V/f control or sensorless vector control if the position controller has been selected for the position control (C02570 = "2: position controller active").

- The homing modes 14 & 15 are not permissible for the V/f control. If the selection is impermissible, the error message "Homing mode not allowed" is output.



For the encoderless motor control types (from software version V5.0) **the following applies:**

If the V/f control or sensorless vector control is selected, the basic function "Homing" can be activated, irrespective of the use of the position controller.

- If no position controller has been selected for the position control in case of V/f control or sensorless vector control (C02570 = "1: Phase controller is active"), homing is only carried out via the speed profile resulting from the homing parameters. Because of this, the target positions set will only "roughly" be reached.

11.6.1 Internal interfaces | "LS_Homing" system block

The **LS_Homing** system block provides the internal interfaces for the basic function "Homing" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
HM_bEnable C02659/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Homing active" function state is effected and homing can be carried out via the control inputs.
	TRUE↘FALSE	An active reference search is stopped, i. e. a change-over from the active "Homing active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.
HM_bActivateHoming C02659/2 | BOOL	Start homing/set home position directly	
	TRUE	Reference search is started in the homing mode selected (C02640). In the homing mode "100: Set reference directly" no reference search is started, but the home position set in C02642 is directly accepted.
	TRUE↘FALSE	Active reference search is completed/cancelled.
HM_bHomingMark C02659/3 | BOOL	Input for reference switch	
	TRUE	Reference switch is activated.
HM_bLoadHomePos C02659/4 | BOOL	Load home position	
	FALSE↗TRUE	The position applied to input *HM_dnHomePos_p* is accepted as home position.
HM_dnHomePos_p C02658 | DINT	Home position in [increments] for acceptance with *HM_bLoadHomePos*	

Identifier DIS code | data type	Information/possible settings	
HM_bResetHomePos C02659/5 | BOOL	Reset the "Reference known" status	
	FALSE↗TRUE	The internal "Home position known" status is reset. • The status outputs *HM_bDone* and *HM_bHomePosAvailable* are reset to FALSE.
HM_dnSpeedOverride_n C02655 | DINT From V5.0	Value for speed override • Percentage multiplier for the currently active speed (C02644 or C02646). • In the case of active homing, the speed override is always active and does not have to be activated separately. • Changes are accepted in each cycle. • $2^{30} \equiv 100$ % of the speed parameterised in C02644 or C02646. • For values ≤ 1 % the status bit 19 is set. • Values ≤ 0 % are set to 0 % internally and lead to the standstill of the drive.	

Outputs

Identifier DIS code | data type	Value/meaning	
HM_dnState C02657 | DINT	Status (bit coded) • When the basic function is not enabled, all bits are set to "0". • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Reference search is active.
	Bit 2	Reference search is completed.
	Bit 3	Acceleration/deceleration phase is active.
	Bit 5	CCW rotation is active.
	Bit 7	Reference known.
	Bit 15	Fault in basic function active (group signal).
	Bit 16	Pre-switch-off (reference switch) has been detected.
	Bit 17	Touch probe/zero pulse has been detected.
	Bit 19	Speed override ≤1 % • This status is only available from software version V5.0.
	Bit 21	Profile data are limited by basic function "Limiter".
	Bit 22	Traversing direction is inhibited by basic function "Limiter".
	Bit 23	Abort by basic function "Limiter".
	Bit 25	Stopping is active. • Basic function is enabled for the first time but no referencing has been requested / is active yet or speed ≠ 0.
	Bit 30	Profile generation error.
HM_bEnabled C02659/6 | BOOL	Status signal "Basic function is enabled"	
	TRUE	Homing via the control inputs is possible. • The *HM_bEnable* enable input is set to TRUE and the controller is in the "Homing active" function state.
HM_bActive C02659/7 | BOOL	Status signal "Basic function is active"	
	TRUE	Reference search is active (the drive axis is moving).
HM_bDone C02659/8 | BOOL	Status signal "Basic function is ready"	
	TRUE	Reference search is completed. • Output is reset to FALSE when input *HM_bActivateHoming* is reset to FALSE.
HM_bHomePosAvailable C02659/9 | BOOL	Status signal "Home position is known"	
	TRUE	The drive knows the home position.

11.6.2 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Homing*
- Short overview of the parameters for homing:

Parameters	Info
C02528	Traversing range
C02640	Homing mode
C02641	Action after detect Home position
C02642	Home position
C02643	Homing: target position
C02644	Homing: Speed 1
C02645	Homing: Acceleration 1
C02646	Homing: veloc. 2
C02647	Homing: acceleration 2
C02648	Homing: S-ramp time
C02649	Homing: Torque limit
C02650	Homing: Blocking time
C02651	Homing: TP configuration
C02652	Home pos. following mains switching
C02653	Max. rot. ang. aft. mns. swtch.
C02656	Actual position (homing)

11.6.2.1 Behaviour of the home position after mains switching

If the home position/information is also to be available after mains switching, the setting C02652 = "1: Received" is required.

Another condition for keeping the home position/information after mains switching is the compliance with the maximum permissible angle of rotation of the encoder.

- The maximally permissible angle of rotation can be set in C02653 in angular degree [°] with regard to the encoder shaft (360° ≡ one encoder shaft rotation).

Note!

Due to the internal numerical format and the resolution of one encoder revolution according to C00100, the position may not be reconstructed over the complete encoder range!

- The possible number of revolutions can be calculated as follows:
  Number of revolutions = $2^{(31 - C00100)}$
- Example: For a standard multiturn absolute value encoder with an absolute display area of 4096 revolutions (±2048), a maximum position resolution of 20 bits per revolution can be used!

When resolvers or single-turn absolute value encoders are used and the mains is switched off (24 V supply off), the encoder may only be moved by ½ revolution since otherwise the home position will get lost due to the ambiguity of the encoder information.

When multipole resolvers (C00080 > 1) are used, a renewed homing is required after mains switching due to the ambiguity of the evaluated position.

11.6.2.2 Homing mode

The zero position, also called reference, can be defined by a reference search or reference setting:

- In case of a reference search the drive travels according to a defined mode to detect the reference independently.
- In case of reference setting the reference is manually set when the drive has stopped.

Tip!

A reference search is mainly used in the case of continuously running systems, or if the traversing range or machine cycle of the drive cannot be represented in the display area of the encoder, e. g. if incremental encoders are used at the motor, or singleturn absolute value encoders or resolvers are used at the gearbox.

A reference is mainly set in systems/machines that bear the risk of collisions, or every time no homing can be executed (e.g. in case of a cross cutter having material in the machine).

- For reference setting, select the homing mode "100" in C02640.
- For a reference search the homing modes 0"..."15" are provided in C02640.
  - For process descriptions see the chapter "Overview of the Lenze homing modes". (📖 432)
  - From software version V3.0 according to the DS402 device profile, additionally the homing modes 1001"..."1035" are provided in C02640. Process descriptions for these homing modes can be found in the chapter "Overview of DS402 homing modes". (📖 432)

Note!

Profile data switch-over

For the reference search, two profile data sets with different velocities and accelerations can be parameterised. Like this, the homing time can be reduced, and at the same time accuracy can be increased.

▸ Profile data switch-over (📖 429)

The process descriptions in the following chapters provide information on the time the change-over to the profile data set 2 takes place in the corresponding homing mode.

▸ Overview of the Lenze homing modes (📖 432)
▸ Overview of DS402 homing modes (📖 445)

If the speed 2 (C02646) is set to "0" (Lenze setting), no change-over to the profile data set 2 takes place and the reference search and positioning to the target position is only executed with the profile parameters of the profile data set 1.

Note!

Drive behaviour after setting the reference

From software version V4.0 onwards, C02641 serves to parameterise the drive behaviour after setting the home position.

▸ Drive behaviour after setting the home position (📖 428)

In the Lenze setting (C02641 = "0"), the drive traverses to the absolute target position set in C02643 similarly to the behaviour known from the previous versions.

Note!

Conditions for new homing

A new homing must not be started if

- the drive is between a software and hardware limit position at the starting time and
- is to move towards the hardware limit position.

For the described case, the old homing must be reset first.

11.6.2.3 Home position & target position

When the home position is set during the reference search, the position detected in the machine measuring system corresponds to the value set in C02642.

For software versions lower than V4.0 the following applies:

- Afterwards the drive travels to the target position set in C02643.

The following applies from software version V4.0:

- The subsequent drive behaviour is determined by the mode parameterised in C02641. See the below chapter "Drive behaviour after setting the home position".

11.6.2.4 Drive behaviour after setting the home position

This function extension is available from software version V4.0!

C02641 can be used to select the drive behaviour after setting the home position.

Selection "0: Move absolute on Target position"

After setting the home position (C02642), the drive moves to the absolute target position set in C02643.

This selection is the Lenze setting and corresponds to the behaviour known from the previous versions.

Selection "1: Move relative by Target position"

After setting the home position (C02642), the drive moves relatively by the target position set in C02643.

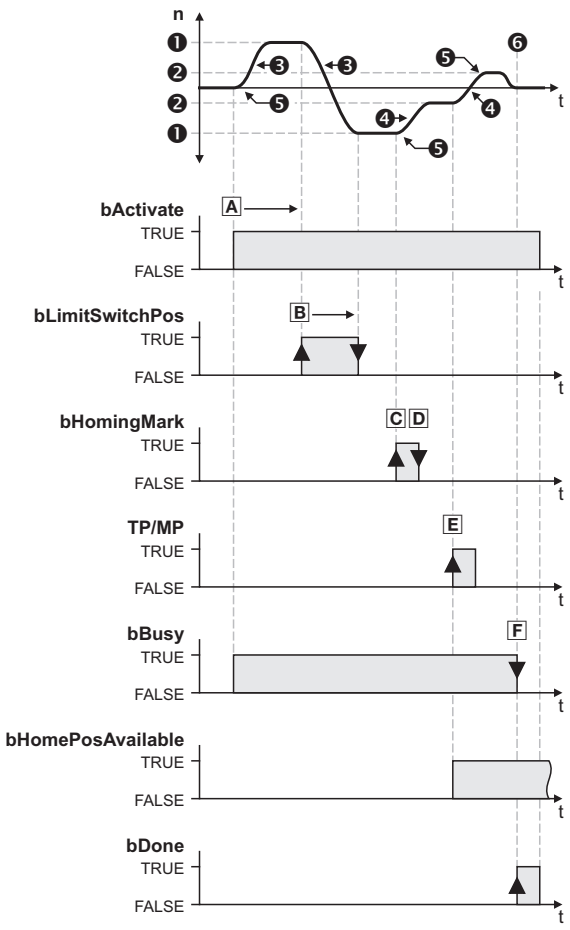
Selection "2: Stop immediately"

After setting the home position (C02642), the drive stops immediately.

11.6.2.5 Profile data switch-over

For the reference search two profile data sets can be parameterised to reduce the homing time and increase the accuracy:

Profile data set 1		Profile data set 2	
C02644	Speed 1	C02646	Speed 2
C02645	Acceleration 1 (and deceleration 1)	C02647	Acceleration 2 (and deceleration 2)
C02648	S-ramp time (identical in the two profile data sets) ▸ Setting the S-ramp time (📖 387)	C02648	S-ramp time (identical in the two profile data sets) ▸ Setting the S-ramp time (📖 387)



- With the profile data set 1 first the limit switch/reference switch (depending on the mode selected) is quickly approached.
- After reversing on the limit switch/reference switch, the slower – but more accurate – approach of the encoder zero pulse/touch probe sensor and the positioning to the target position (C02643) are effected with profile data set 2.

Note!

The change-over to profile data set 2 is only effected if speed 2 (C02646) is set > "0"!

In the Lenze setting (C02646 = "0") no change-over to the profile data set 2 takes place and the reference search and positioning to the target position is only executed with the profile parameters of the profile data set 1.

The process descriptions of the homing modes provide information about when the change-over to profile data set 2 takes place in the respective homing mode. ▸ Overview of the Lenze homing modes (📖 432)

❶ C02644: Speed 1
❷ C02646: Speed 2
❸ C02645: Acceleration 1 (and deceleration 1)
❹ C02647: Acceleration 2 (and deceleration 2)
❺ C02648: S-ramp time
❻ C02643: Target position

Example: Procedure of mode 2:

A. Movement in positive direction with profile data set 1.
B. Reversing to positive travel range limit switch.
C. Positive edge at *HM_bHomingMark* activates profile data set 2 for the further reference search.
D. Negative edge at *HM_bHomingMark* enables home position detection.
E. The following positive edge of the encoder zero pulse (MP) sets the reference.
F. Drive has reached defined target position.

11.6.2.6 Homing to end stop

By selecting the homing modes 14 & 15, homing to end stop can be executed as follows:

1. The drive travels with reduced torque in positive direction (mode 14) or negative direction (mode 15).
2. When the drive hits an end stop so that the torque limit set in C02649 is exceeded for the blocking time defined in C02650, the reference is set.
   - If a reference offset is set, traversing takes place around this offset in a correctly signed manner.

▸ Mode 14: positive direction to torque limit (📖 443)

▸ Mode 15: negative direction to torque limit (📖 443)

11.6.2.7 Reference switch connection

For the homing modes with reference switch, the *HM_bHomingMark* control input must be connected to the digital input which is connected to the reference switch.

11.6.2.8 Touch probe interface configuration

The touch probe channel to be used for homing with touch probe detection in »Engineer« is selected on the **Application parameters** tab in the dialog level *Overview* ➞ *All basic functions* ➞ *Homing* ➞ *TP interface*.

- The setting carried out in this parameterisation dialog directly affects the setting of C02651 ("Homing: TP configuration") and vice versa.
- For directly setting C02651 (e. g. by means of the keypad) the corresponding decimal values are listed for all configuration options in the following table:

Selection Touch probe channel	Touch probe response		
	Positive edge	Negative edge	Both edges
Digital input 1	1	2	3
Digital input 2	4	8	12
Digital input 3	16	32	48
Digital input 4	64	128	192
Digital input 5	256	512	768
Digital input 6	1024	2048	3072
Digital input 7	4096	8192	12288
Digital input 8	16384	32768	49152
Motor encoder zero pulse	65536		
Position encoder zero pulse	262144		

- Example: For selecting the touch probe channel "Digital input 1" and a response only to a negative edge, the decimal value "2" has to be set in C02651.

11.6.3 Overview of the Lenze homing modes

In the following subchapters the procedures of homing modes 0 ... 15 are described, which can be selected in C02640.

Homing mode C02640	Evaluated signals/sensors			
	Touch probe sensor/ encoder zero pulse	Travel range limit switch		Reference switch at *HM_bHomingMark*
		Negative limit switch	Positive limit switch	
0	☑			☑
1	☑			☑
2	☑		☑	☑
3	☑	☑		☑
4	☑			☑
5	☑			☑
8	☑			
9	☑			
10	☑		☑	
11	☑	☑		
12			☑	
13		☑		
14	Positive direction of rotation to torque limit.			
15	Negative direction of rotation to torque limit.			
100	Set reference directly.			

The switches/sensors are evaluated via the following internal interfaces:

Switch/sensor	Internal interface for digital input signal
Touch probe sensor	*DIGIN_bIn1 ... DIGIN_bIn8* • Alternatively the motor encoder or position encoder zero pulse can be evaluated. ▸ Touch probe interface configuration (📖 431)
Positive travel range limit switch	*LIM_bLimitSwitchPositive* (basic function "Limiter")
Negative travel range limit switch	*LIM_bLimitSwitchNegative* (basic function "Limiter")
Reference switch	*HM_bHomingMark* (basic function "Homing")

Note!

Profile data switch-over

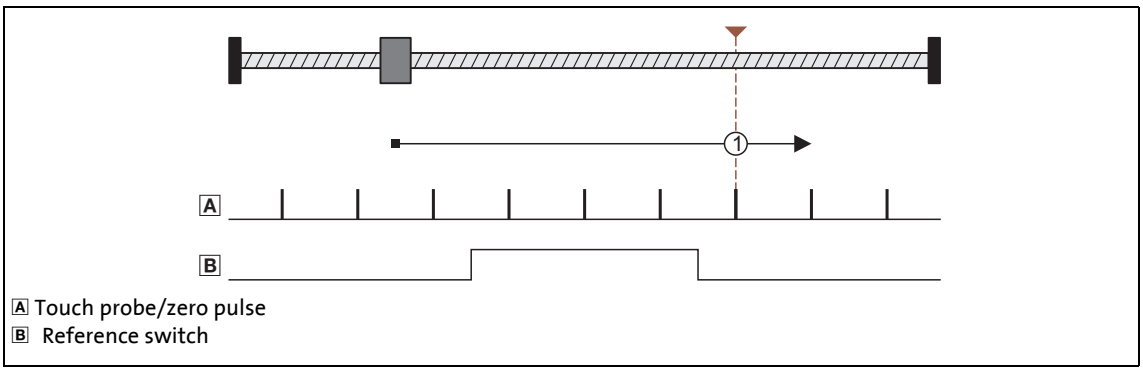
For the reference search, two profile data sets with different velocities and accelerations can be parameterised. Like this, the homing time can be reduced, and at the same time accuracy can be increased.

▸ Profile data switch-over (📖 429)

The following process descriptions give information about the time the change-over to the profile data set 2 takes place in the corresponding homing mode.

If the speed 2 (C02646) is set to "0" (Lenze setting), no change-over to the profile data set 2 takes place and the reference search and positioning to the target position is only executed with the profile parameters of the profile data set 1.

Note!



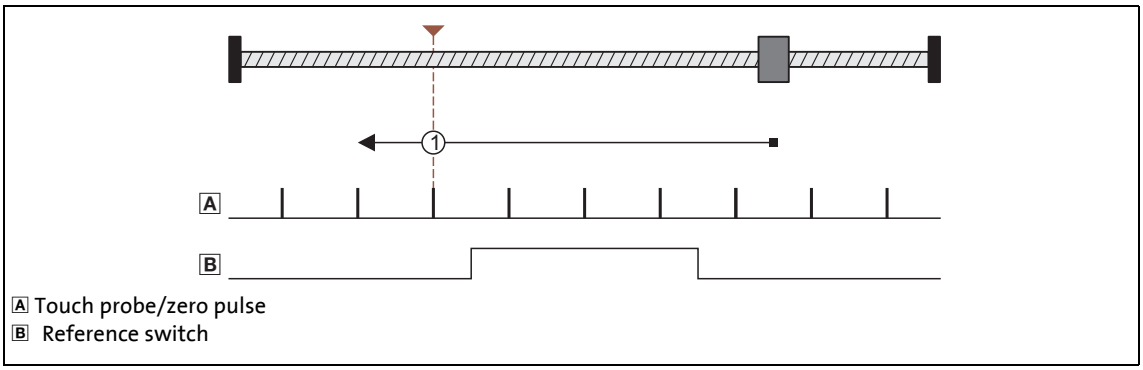
Drive behaviour after setting the reference

From software version V4.0 onwards, C02641 serves to parameterise the drive behaviour after setting the home position.

▸ Drive behaviour after setting the home position (📖 428)

In the Lenze setting (C02641 = "0"), the drive traverses to the absolute target position set in C02643 similarly to the behaviour known from the previous versions.

Mode 0: pos. direction - via home mark - to TP

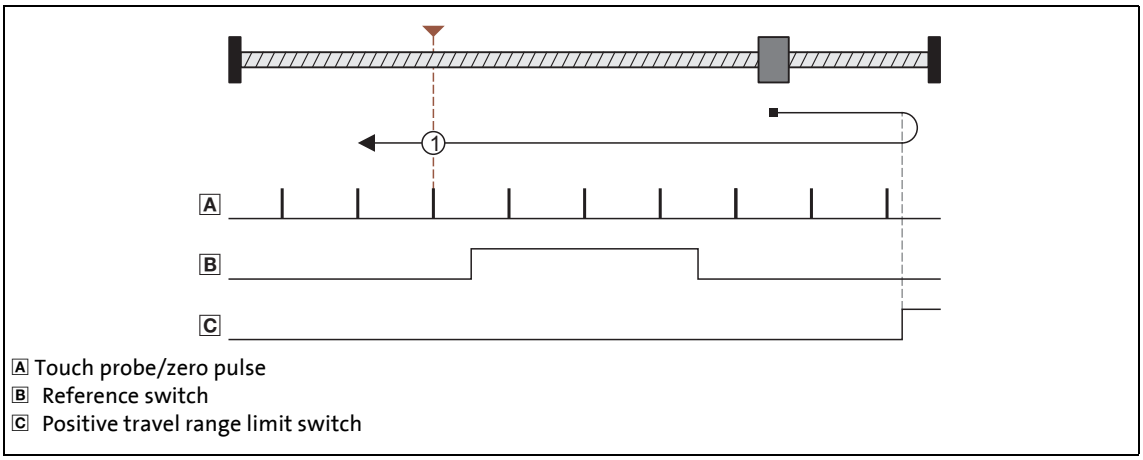


A Touch probe/zero pulse
B Reference switch

Procedure:

1. Movement in positive direction with profile data set 1.
2. Positive edge at *HM_bHomingMark* activates profile data set 2 for the further reference search.
3. Negative edge at *HM_bHomingMark* enables home position detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1: neg. direction - via home mark - to TP

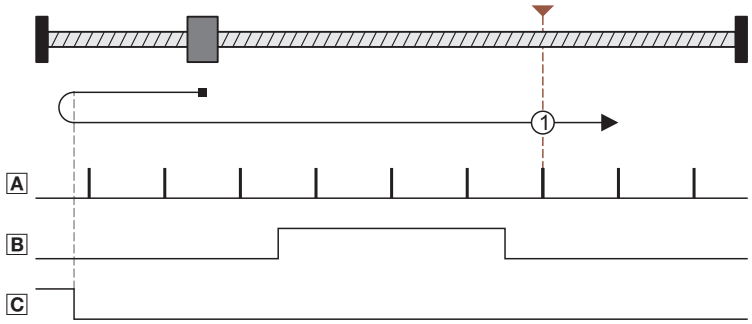


A Touch probe/zero pulse
B Reference switch

Procedure:

1. Movement in negative direction with profile data set 1.
2. Positive edge at *HM_bHomingMark* activates profile data set 2 for the further reference search.
3. Negative edge at *HM_bHomingMark* enables home position detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 2: pos. direction - reversing to limit switch - via home mark - to TP

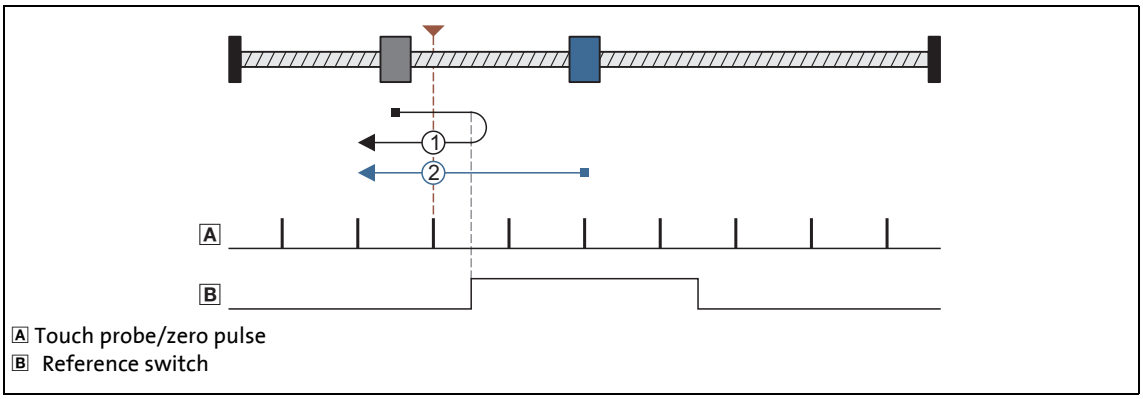


A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Procedure:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge at *HM_bHomingMark* activates profile data set 2 for the further reference search.
4. Negative edge at *HM_bHomingMark* enables home position detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 3: neg. direction - reversing to limit switch - via home mark - to TP



A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

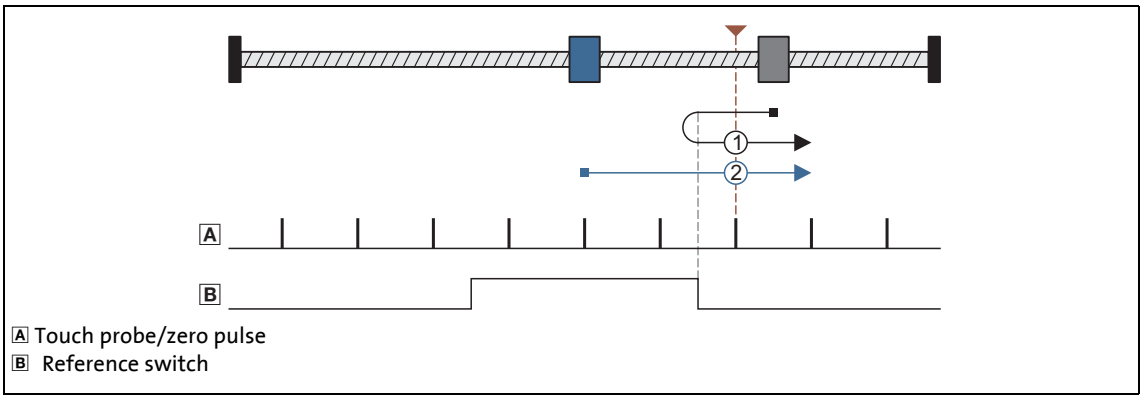
Procedure:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge at *HM_bHomingMark* activates profile data set 2 for the further reference search.
4. Negative edge at *HM_bHomingMark* enables home position detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 4: pos. direction - reversing to home mark - to TP

A Touch probe/zero pulse
B Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge at *HM_bHomingMark* and simultaneous activation of the profile data set 2 for further reference search.
3. Negative edge at *HM_bHomingMark* enables home position detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

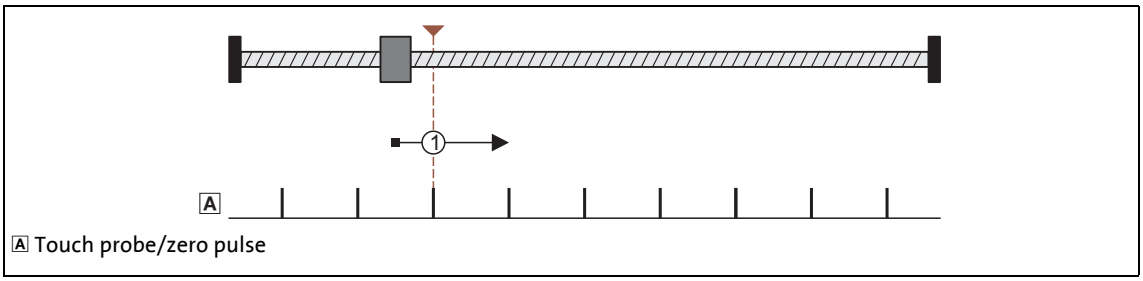
Case 2: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Negative edge at *HM_bHomingMark* enables home position detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 5: neg. direction - reversing to home mark - to TP

A Touch probe/zero pulse
B Reference switch

Procedures:



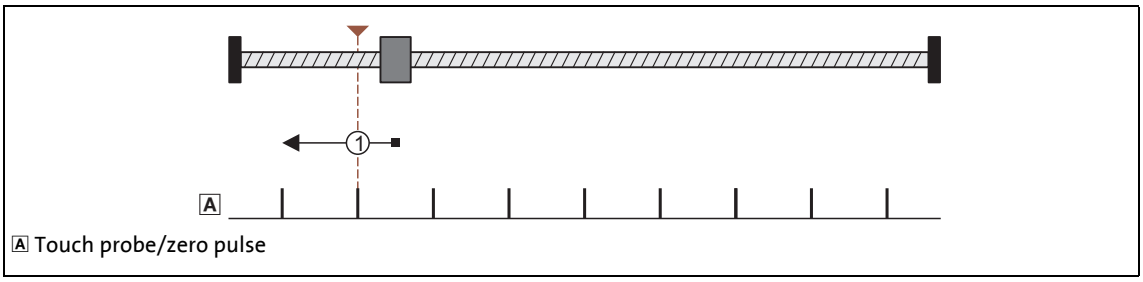
Case 1: Axis has not activated reference switch yet:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge at *HM_bHomingMark* and simultaneous activation of the profile data set 2 for further reference search.
3. Negative edge at *HM_bHomingMark* enables home position detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 2: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge at *HM_bHomingMark* enables home position detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 8: positive direction to touch probe

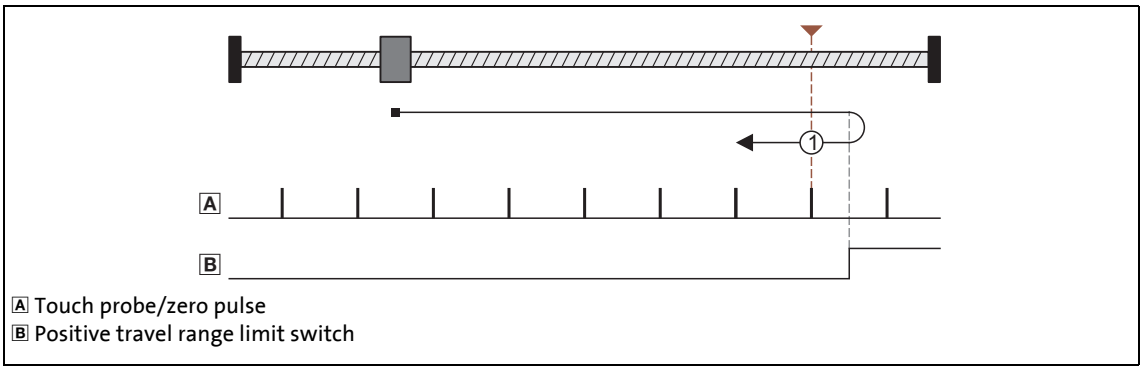


A Touch probe/zero pulse

Procedure:

1. Movement in positive direction with profile data set 1.
2. The following positive edge of the touch probe sensor sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 9: negative direction to touch probe



A Touch probe/zero pulse

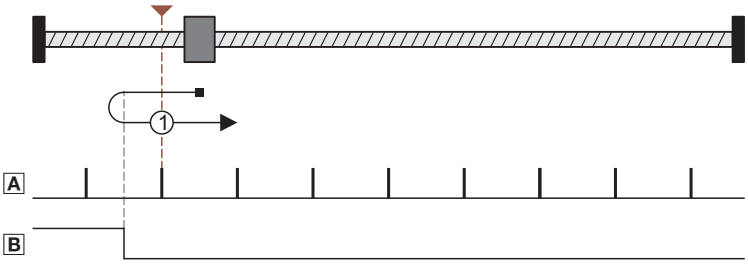
Procedure:

1. Movement in negative direction with profile data set 1.
2. The following positive edge of the touch probe sensor sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 10: pos. direction - reversing to limit switch - to TP

A Touch probe/zero pulse
B Positive travel range limit switch

Procedure:



1. Movement in positive direction with profile data set 1.
2. Reversing when the edge of the positive travel range limit switch is positive and, at the same time, activation of profile data set 2 for continued reference searching.
3. The touch probe signal is evaluated while reserving the limit switch.
4. The following positive edge of the touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Note!

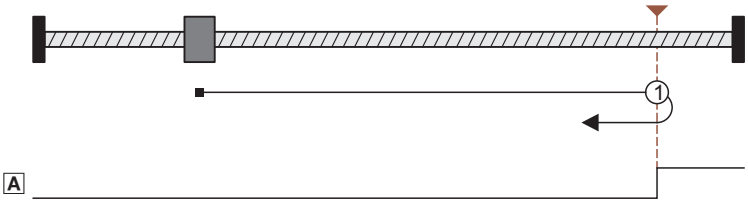
The touch probe detection is already activated after reversing to the travel range limit switch, i.e. the home position may be set to the travel range limit switch.

- We therefore recommend to set a target position (C02643) unequal to the home position (C02642), in order to reenable the activated limit switch. Otherwise, the positioning process to the target position may be aborted by the basic function "Limiter" (see status signal *HM_dnState*).
- We recommend the use of the DS402 homing methods 1 and 2 if the touch probe detection (especially the one of the motor zero pulse) is to be activated after the travel range switch has been left. ▸ Overview of DS402 homing modes (📖 445)

Mode 11: neg. direction - reversing to limit switch - to TP

A Touch probe/zero pulse
B Negative travel range limit switch

Procedure:



1. Movement in negative direction with profile data set 1.
2. Reversing when the edge of the negative travel range limit switch is positive and, at the same time, activation of profile data set 2 for continued reference searching.
3. The touch probe signal is evaluated while reserving the limit switch.
4. The following positive edge of the touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Note!

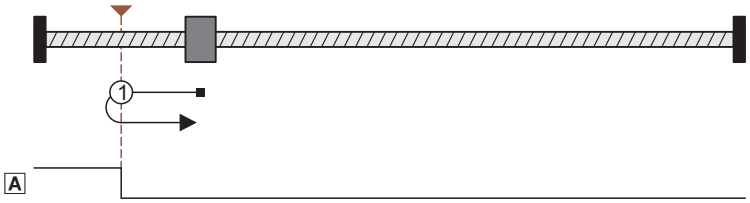
The touch probe detection is already activated after reversing to the travel range limit switch, i.e. the home position may be set to the travel range limit switch.

- We therefore recommend to set a target position (C02643) unequal to the home position (C02642), in order to reenable the activated limit switch. Otherwise, the positioning process to the target position may be aborted by the basic function "Limiter" (see status signal *HM_dnState*).
- We recommend the use of the DS402 homing methods 1 and 2 if the touch probe detection (especially the one of the motor zero pulse) is to be activated after the travel range switch has been left. ▸ Overview of DS402 homing modes (📖 445)

Mode 12: positive direction to limit switch

A Positive travel range limit switch

Procedure:



1. Movement in positive direction with profile data set 1.
2. Positive edge of the travel range limit switch sets reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Note!

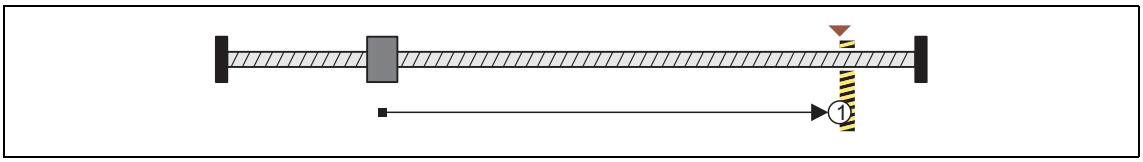
The load machine can also leave the travel range limit switch. There follows a return to the home position that was set with the positive edge of the travel range limit switch.

- It is possible that, as a result, the machine will remain on an operated limit switch.
- Therefore it is recommended to set a target position (C02643) that is unequal to the home position (C02642) to release the activated limit switch again.

Mode 13: negative direction to limit switch

A Negative travel range limit switch

Procedure:

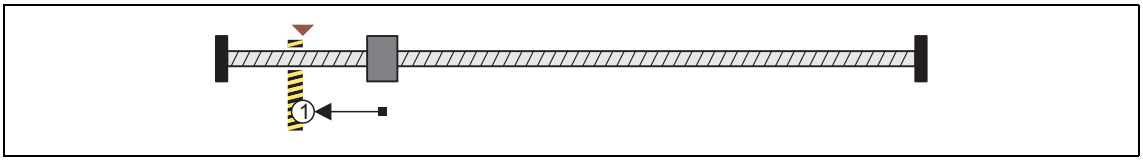


1. Movement in negative direction with profile data set 1.
2. Positive edge of the travel range limit switch sets reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Note!

The load machine can also leave the travel range limit switch. There follows a return to the home position that was set with the positive edge of the travel range limit switch.

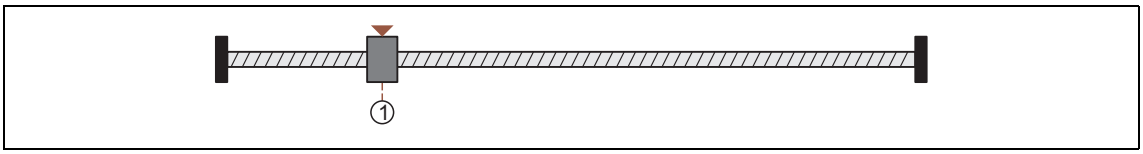
- It is possible that, as a result, the machine will remain on an operated limit switch.
- Therefore it is recommended to set a target position (C02643) that is unequal to the home position (C02642) to release the activated limit switch again.



Mode 14: positive direction to torque limit

Procedure:

1. Movement in positive direction with reduced torque and profile data set 1.
2. The reference is set if the two following conditions for the time set in C02650 are fulfilled at the same time:
   - The current speed is lower than the threshold for standstill detection set in C00019.
   - Current torque is greater than the torque limit set in C02649 ("Homing to end stop").
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Mode 15: negative direction to torque limit

Procedure:

1. Movement in negative direction with reduced torque and profile data set 1.
2. The reference is set if the two following conditions for the time set in C02650 are fulfilled at the same time:
   - The current speed is lower than the threshold for standstill detection set in C00019.
   - Current torque is greater than the torque limit set in C02649 ("Homing to end stop").
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 100: Set reference directly

During the drive is at standstill, the measuring system is set by means of the home position parameterised in C02642.

11.6.4 Overview of DS402 homing modes

This function extension is available from software version V3.0!

In addition to the homing modes described in the previous subchapter "Overview of the Lenze homing modes", from software version V3.0 also the homing modes described in the following can be selected for a homing in C02640, according to the DS402 device profile.

DS402 homing method	Evaluated signals/sensors			
	Touch probe sensor/ encoder zero pulse	Travel range limit switch		Reference switch at *HM_bHomingMark*
		Negative limit switch	Positive limit switch

The switches/sensors are evaluated via the following internal interfaces:

Switch/sensor	Internal interface for digital input signal
Touch probe sensor	*DIGIN_bIn1 ... DIGIN_bIn8* • Alternatively the motor encoder or position encoder zero pulse can be evaluated. ▸ Touch probe interface configuration (📖 431)
Positive travel range limit switch	*LIM_bLimitSwitchPositive* (basic function "Limiter")
Negative travel range limit switch	*LIM_bLimitSwitchNegative* (basic function "Limiter")
Reference switch	*HM_bHomingMark* (basic function "Homing")

Note!

Profile data switch-over

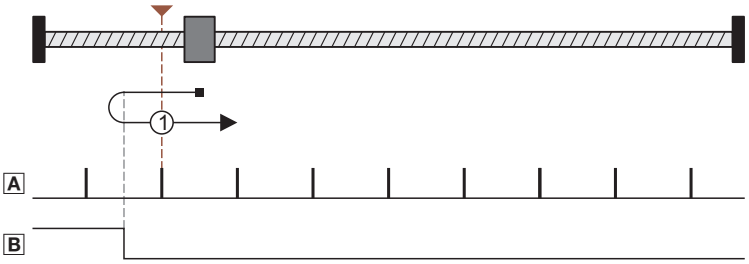
For the reference search, two profile data sets with different velocities and accelerations can be parameterised. Like this, the homing time can be reduced, and at the same time accuracy can be increased.

▸ Profile data switch-over (📖 429)

The following process descriptions give information about the time the change-over to the profile data set 2 takes place in the corresponding homing mode.

If the speed 2 (C02646) is set to "0" (Lenze setting), no change-over to the profile data set 2 takes place and the reference search and positioning to the target position is only executed with the profile parameters of the profile data set 1.

Note!



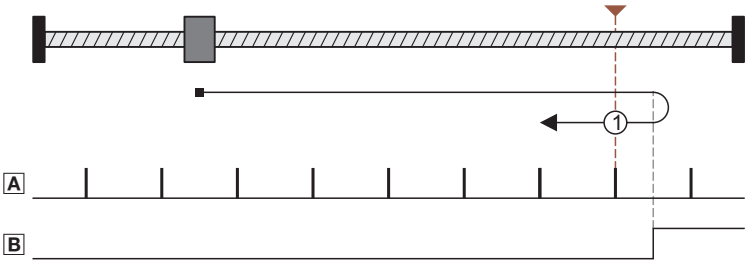
Drive behaviour after setting the reference

From software version V4.0 onwards, C02641 serves to parameterise the drive behaviour after setting the home position.

▸ Drive behaviour after setting the home position (📖 428)

In the Lenze setting (C02641 = "0"), the drive traverses to the absolute target position set in C02643 similarly to the behaviour known from the previous versions.

Mode 1001: DS402 homing method 01

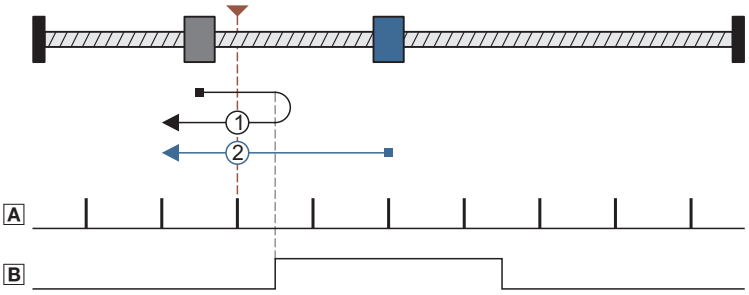


A Touch probe/zero pulse
B Negative travel range limit switch

Procedure:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch and change-over to profile data set 2.
3. Negative edge of the travel range limit switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1002: DS402 homing method 02



A Touch probe/zero pulse
B Positive travel range limit switch

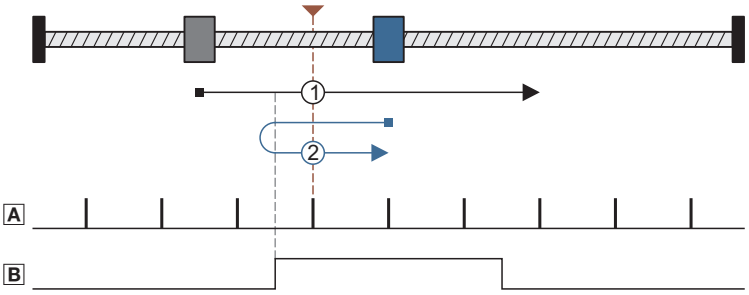
Procedure:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch and change-over to profile data set 2.
3. Negative edge of the travel range limit switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1003: DS402 homing method 03

A Touch probe/zero pulse
B Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. Negative edge of the reference switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

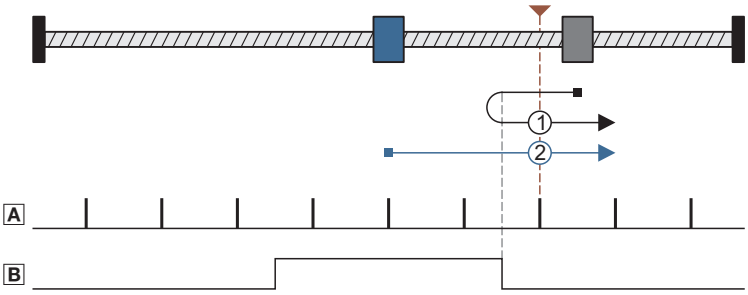
Case 2: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1004: DS402 homing method 04

A Touch probe/zero pulse
B Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

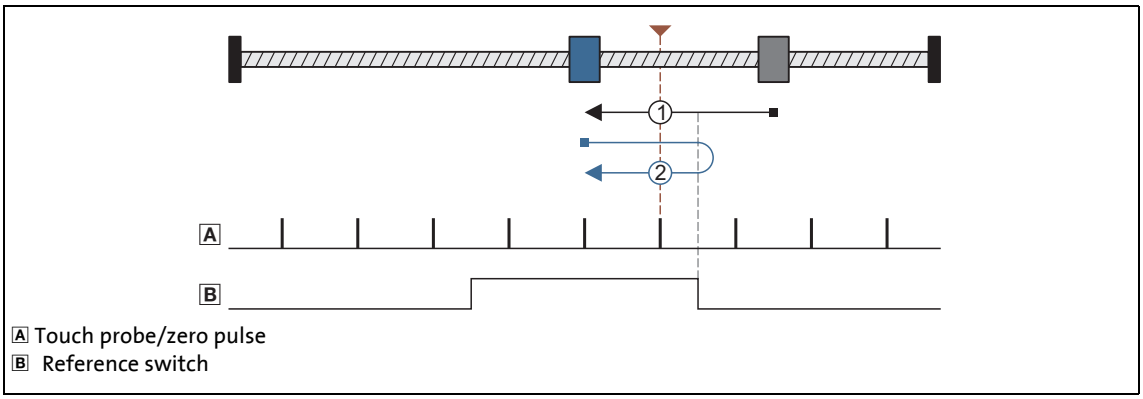
Case 2: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1005: DS402 homing method 05

A Touch probe/zero pulse
B Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. Negative edge of the reference switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

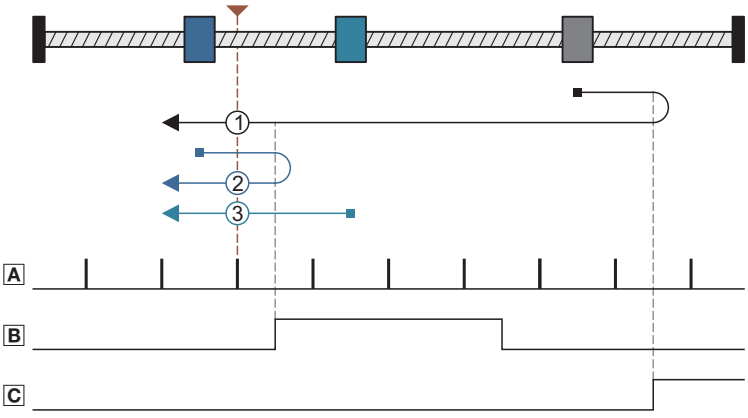
Case 2: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1006: DS402 homing method 06

A Touch probe/zero pulse
B Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 2: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

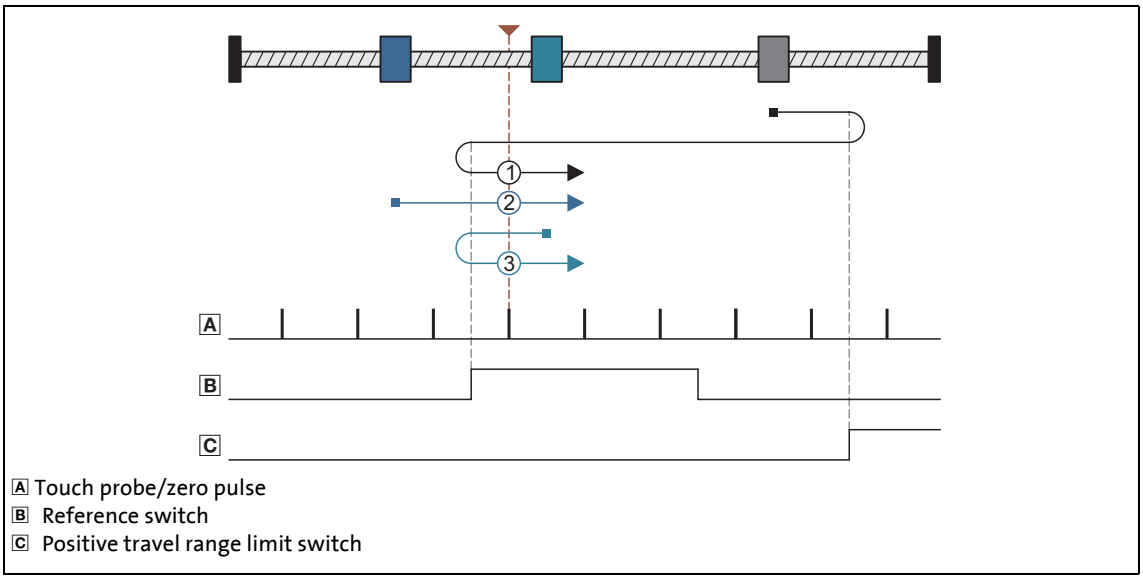
Mode 1007: DS402 homing method 07

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Negative edge of the reference switch activates touch probe recognition.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. Negative edge of the reference switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

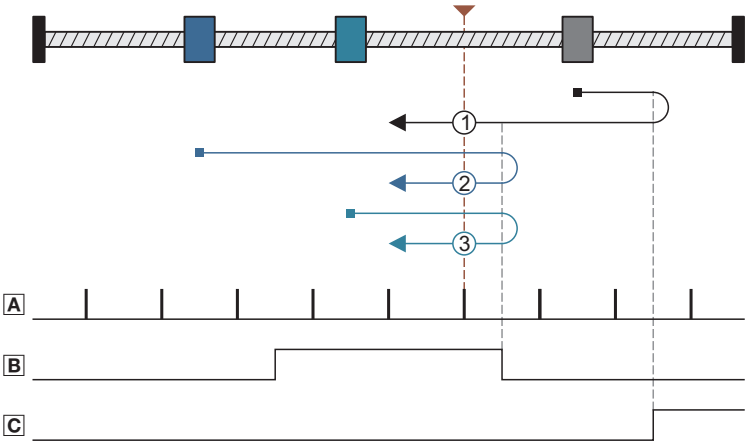
Mode 1008: DS402 homing method 08

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of the reference switch.
5. Positive edge of the reference switch activates touch probe detection.
6. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
7. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

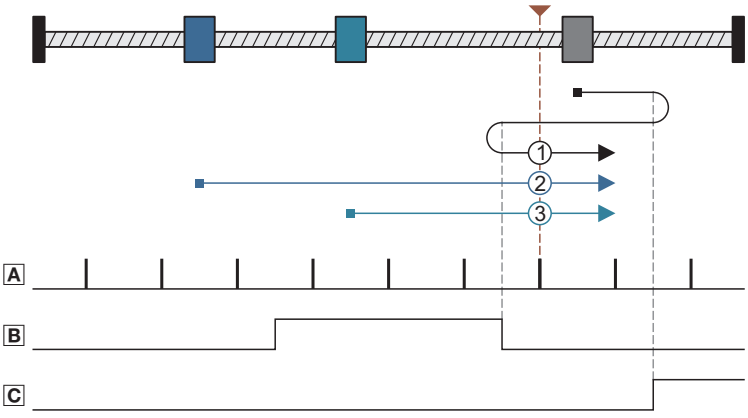
Mode 1009: DS402 homing method 09

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. Reversing with negative edge of the reference switch.
4. Positive edge of the reference switch activates touch probe detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

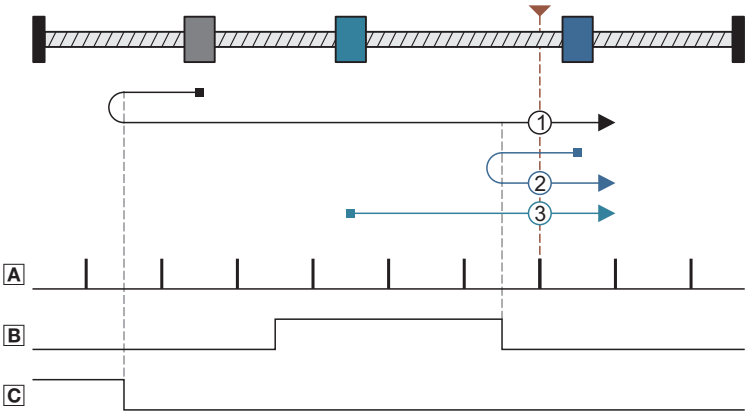
Mode 1010: DS402 homing method 10

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Reversing with positive edge of the reference switch and change-over to profile data set 2.
4. Negative edge of the reference switch activates touch probe recognition.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

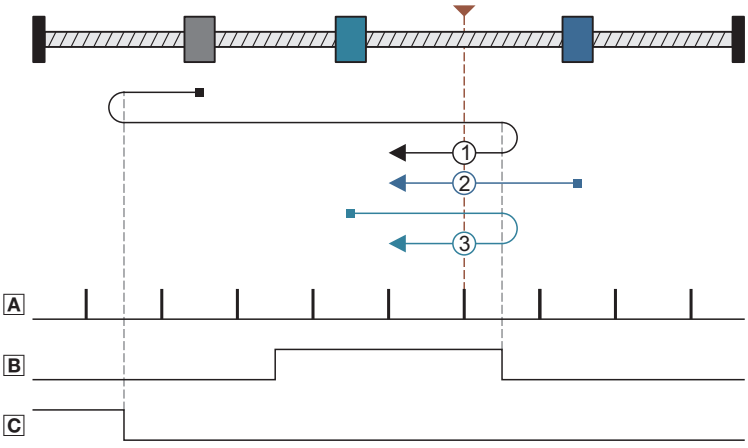
Mode 1011: DS402 homing method 11

A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Negative edge of the reference switch activates touch probe recognition.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. Negative edge of the reference switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

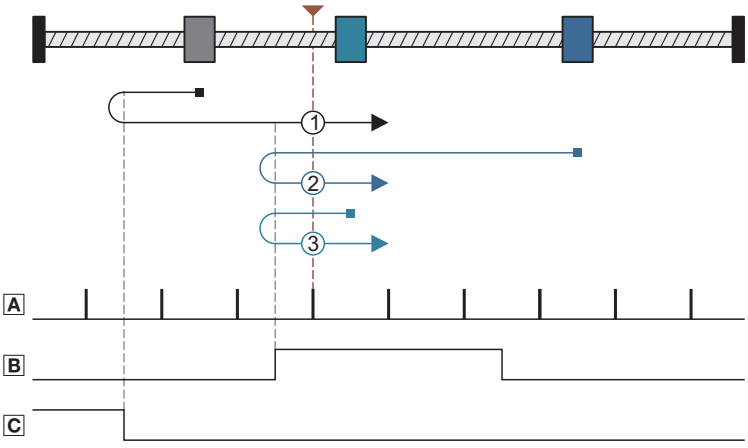
Mode 1012: DS402 homing method 12

A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of the reference switch.
5. Positive edge of the reference switch activates touch probe detection.
6. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
7. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

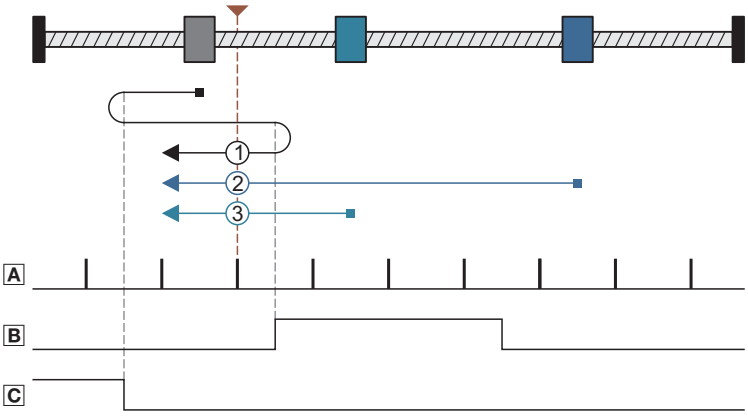
Mode 1013: DS402 homing method 13

A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. Reversing with negative edge of the reference switch.
4. Positive edge of the reference switch activates touch probe detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1014: DS402 homing method 14

A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

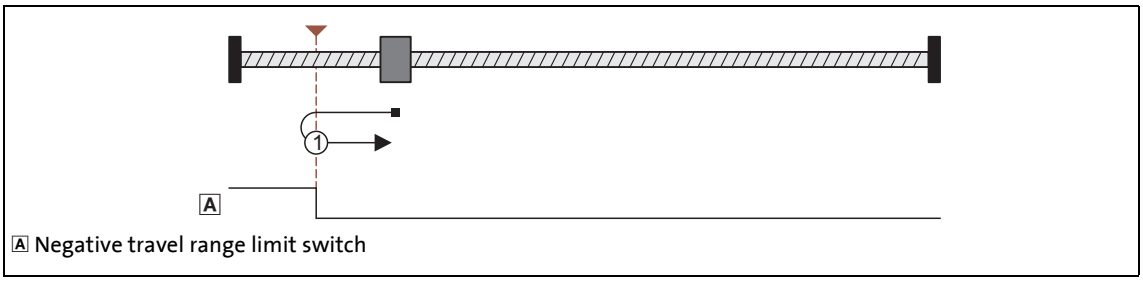
1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Reversing with positive edge of the reference switch and change-over to profile data set 2.
4. Negative edge of the reference switch activates touch probe recognition.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. Negative edge of the reference switch activates touch probe recognition.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe recognition.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



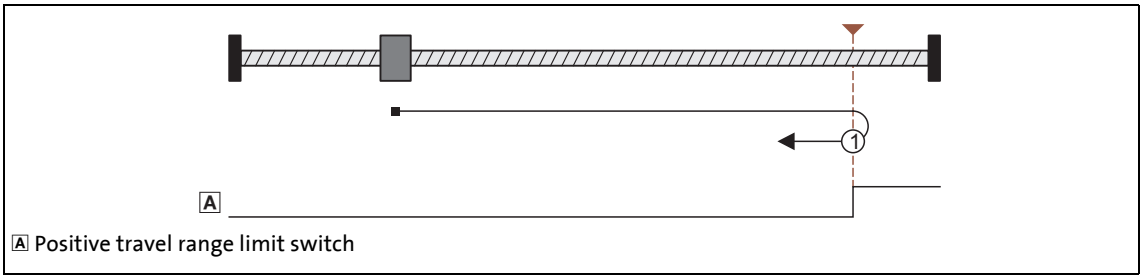
Mode 1015: DS402 homing method 15

Reserved: no homing is executed.

Mode 1016: DS402 homing method 16

Reserved: no homing is executed.

Mode 1017: DS402 homing method 17

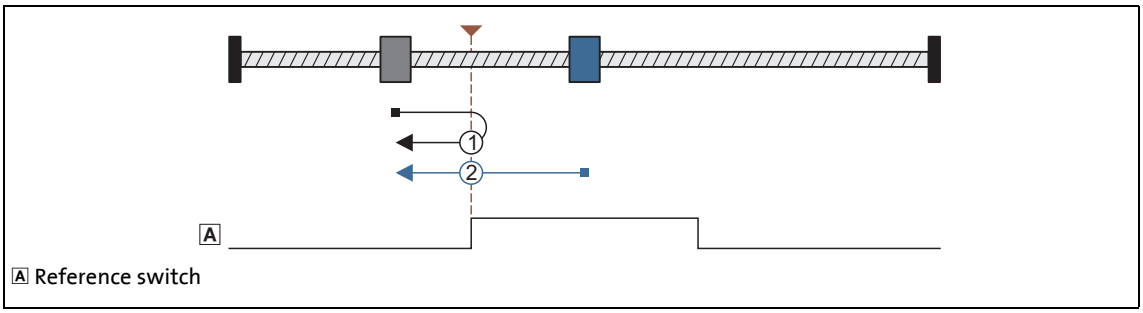


A Negative travel range limit switch

Procedure:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch and change-over to profile data set 2.
3. The following negative edge of the travel range limit switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1018: DS402 homing method 18



A Positive travel range limit switch

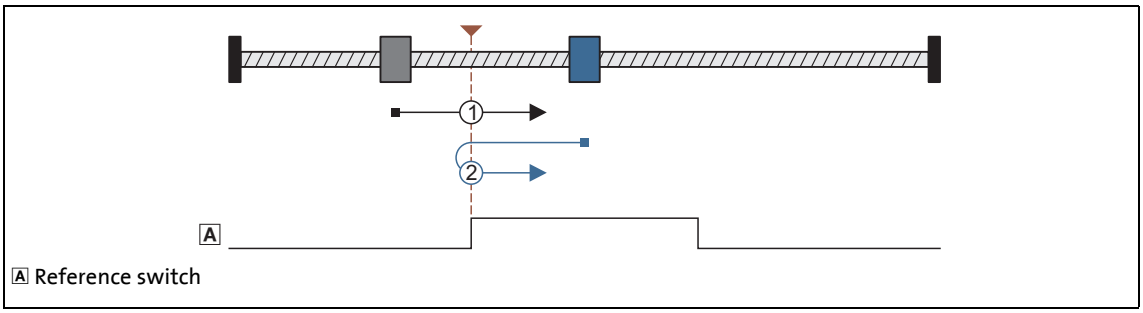
Procedure:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch and change-over to profile data set 2.
3. The following negative edge of the travel range limit switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1019: DS402 homing method 19

A Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. The following negative edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

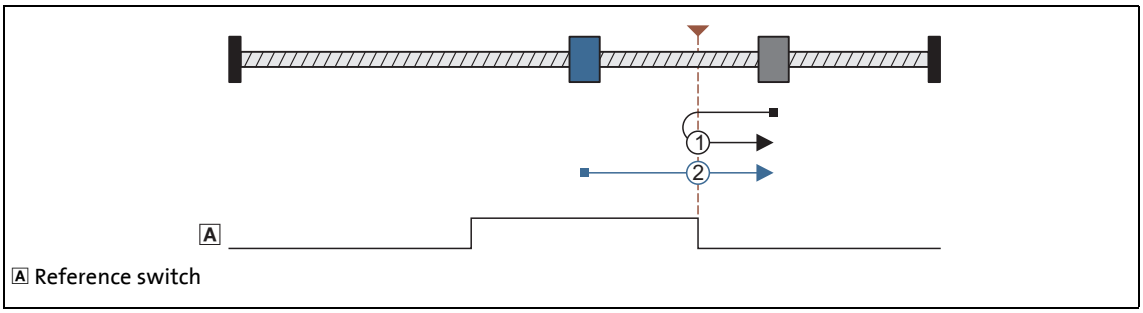
Case 2: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. The following negative edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1020: DS402 homing method 20

A Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in positive direction with profile data set 1.
2. The following positive edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

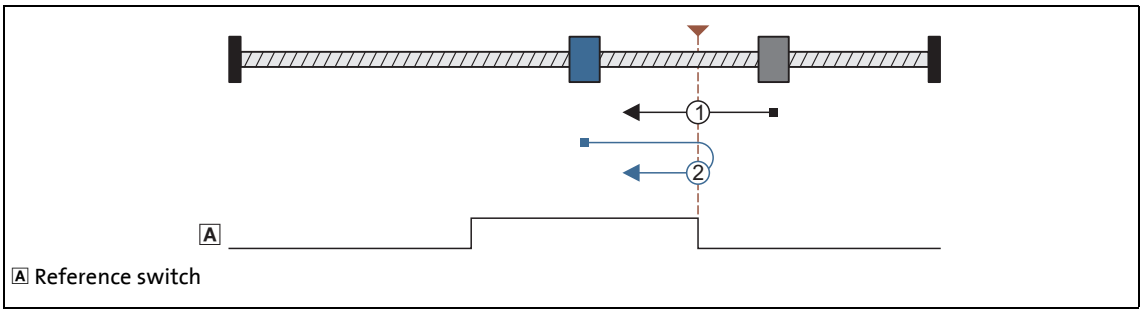
Case 2: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1021: DS402 homing method 21

A Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. The following negative edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

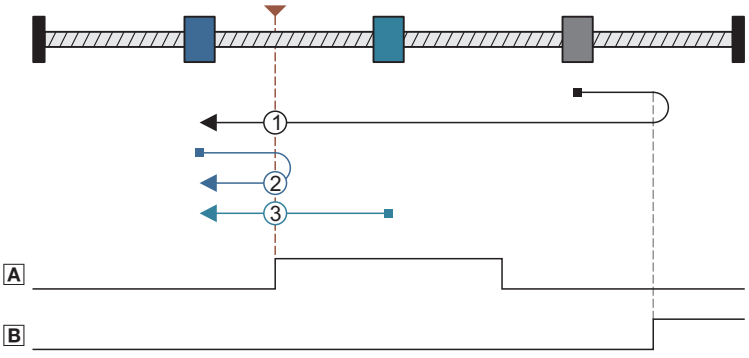
Case 2: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. The following negative edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1022: DS402 homing method 22

A Reference switch

Procedures:



Case 1: Axis has not activated reference switch yet:

1. Movement in negative direction with profile data set 1.
2. The following positive edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 2: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

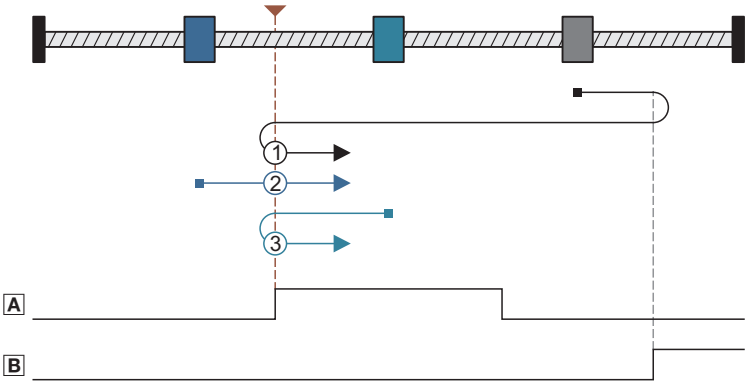
Mode 1023: DS402 homing method 23

A Reference switch
B Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. The following negative edge of the reference switch sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. The following negative edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. The following negative edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

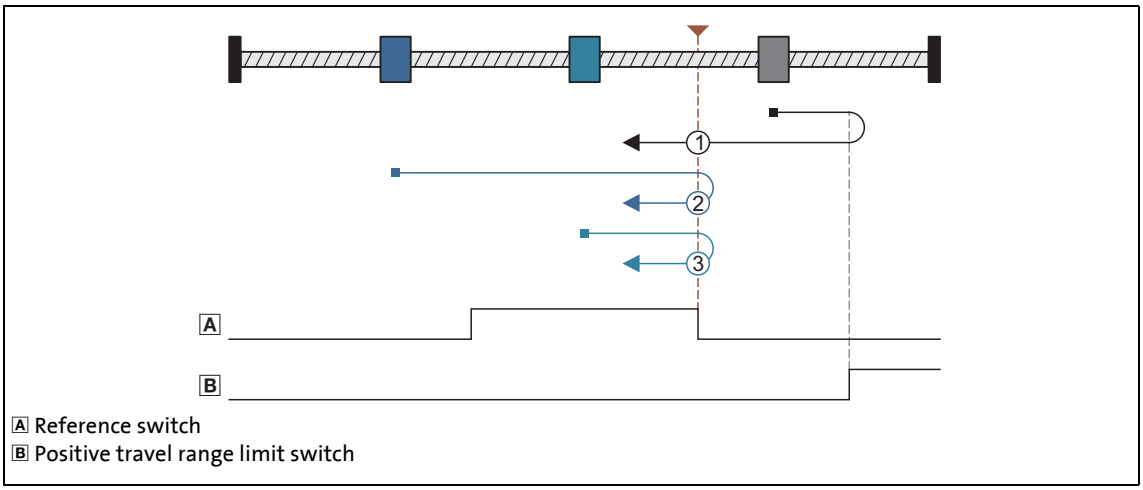
Mode 1024: DS402 homing method 24

A Reference switch
B Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of the reference switch.
5. The following positive edge of the reference switch sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. The following positive edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

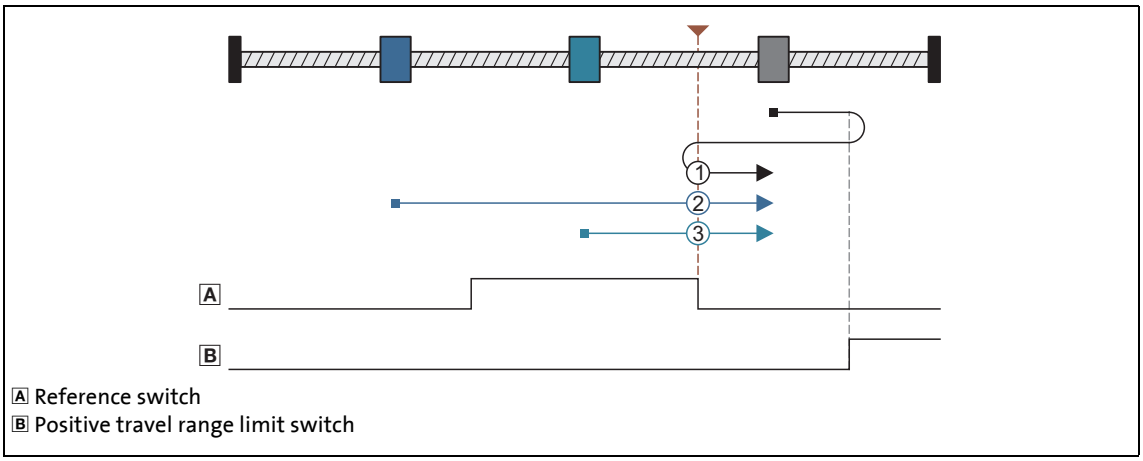
Mode 1025: DS402 homing method 25

A Reference switch
B Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. The following positive edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis already stands on the reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

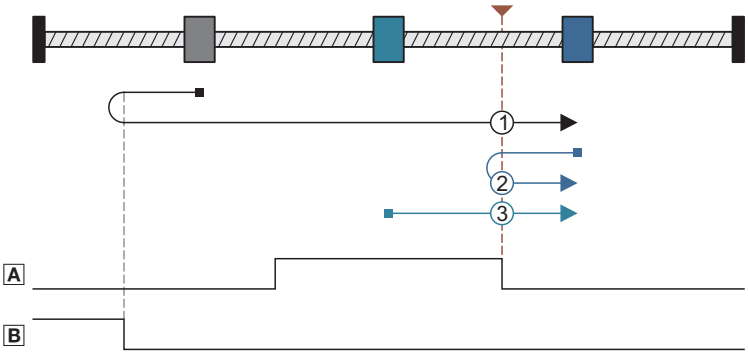
Mode 1026: DS402 homing method 26

A Reference switch
B Positive travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Reversing with positive edge of the reference switch and change-over to profile data set 2.
4. The following negative edge of the reference switch sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. The following negative edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. The following negative edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

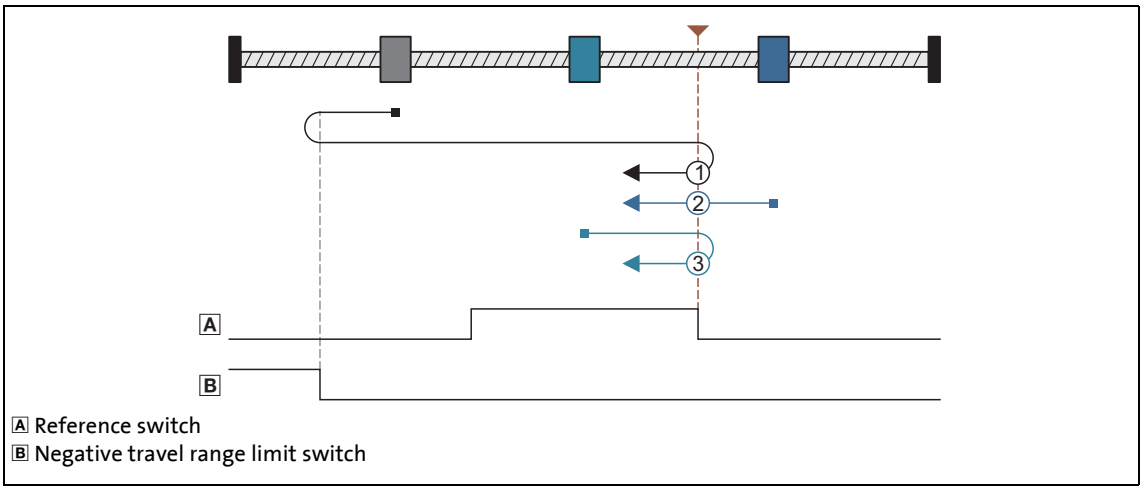
Mode 1027: DS402 homing method 27

A Reference switch
B Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. The following negative edge of the reference switch sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change-over to profile data set 2.
3. The following negative edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. The following negative edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

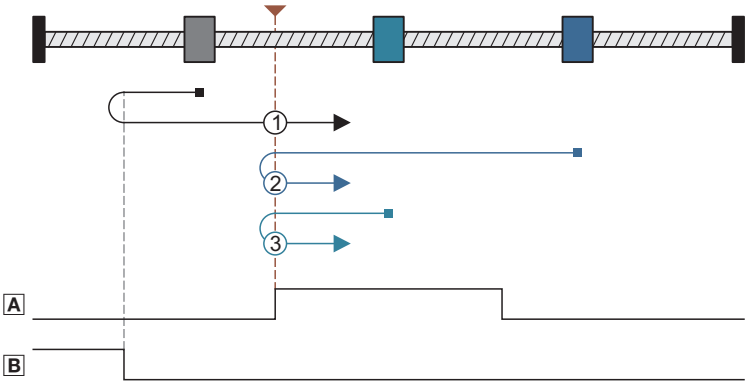
Mode 1028: DS402 homing method 28

A Reference switch
B Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of the reference switch.
5. The following positive edge of the reference switch sets the reference.
6. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. The following positive edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

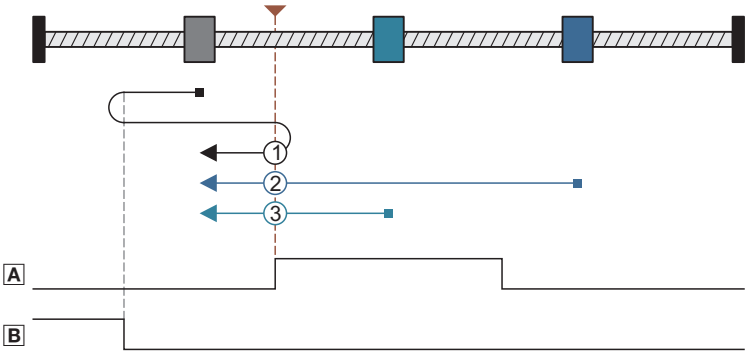
Mode 1029: DS402 homing method 29

A Reference switch
B Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. Reversing with negative edge of the reference switch.
4. The following positive edge of the reference switch sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of the reference switch.
3. The following positive edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1030: DS402 homing method 30

A Reference switch
B Negative travel range limit switch

Procedures:

Case 1: Axis does not activate the reference switch while moving towards the limit switch:

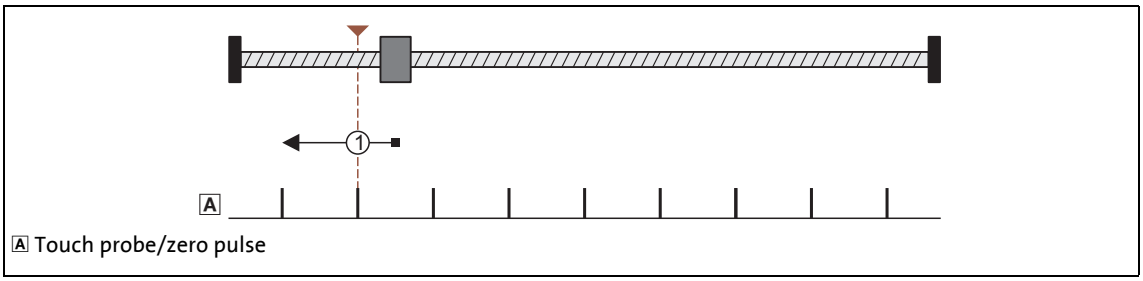
1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Reversing with positive edge of the reference switch and change-over to profile data set 2.
4. The following negative edge of the reference switch sets the reference.
5. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 2: Axis first activates the reference switch while moving towards the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. The following negative edge of the reference switch sets the reference.
4. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Case 3: Axis is already positioned on reference switch:

1. Movement in negative direction with profile data set 2.
2. The following negative edge of the reference switch sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").



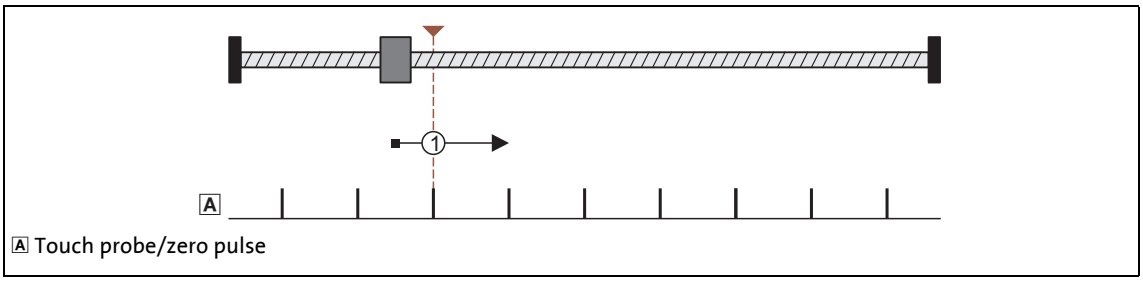
Mode 1031: DS402 homing method 31

Reserved: no homing is executed.

Mode 1032: DS402 homing method 32

Reserved: no homing is executed.

Mode 1033: DS402 homing method 33

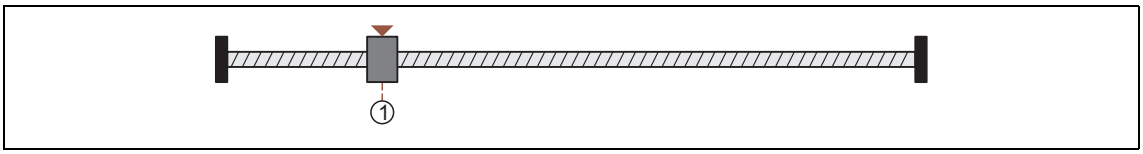


A Touch probe/zero pulse

Procedure:

1. Movement in negative direction with profile data set 1 and activation of the touch probe recognition.
2. The following positive edge of the touch probe sensor sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1034: DS402 homing method 34



A Touch probe/zero pulse

Procedure:

1. Movement in positive direction with profile data set 1 and activation of the touch probe recognition.
2. The following positive edge of the touch probe sensor sets the reference.
3. Absolute positioning to target position (C02643) with profile data set 2 (if C02641 = "0").

Mode 1035: DS402 homing method 35

Direct reference setting.

11.6.5 Execute homing

Prerequisites

- The controller is in the "Operation" device state.
- The basic function "Homing" is part of the active application.
- No other basic function is active.

Activation

To request the control via the basic function, the HM_*bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Homing active" function state is effected and homing can be carried out via the control inputs.
- A successful change to the "Homing active" function state is displayed by a TRUE signal at the *HM_bEnabled* status output.

Deactivation

When the *HM_bEnable* enable input is reset to FALSE, an active homing is stopped, i.e. the control inputs for homing are inhibited and the drive is braked to standstill within the deceleration time for stop.

- The status output *HM_bEnabled* is reset to FALSE and a change-over from the active "Homing active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.

11.6.5.1 Starting reference search/setting the reference directly

By setting the *HM_bActivateHoming* control input to TRUE, the reference search in the selected homing mode is started.

- During reference search, the *HM_bActive* status output is set to TRUE.
- By setting the status output *HM_bHomePosAvailable* to TRUE, it is already signalised during the reference search that the home position has been found. Depending on the homing mode selected, the drive traverses further on to the target position set in C02643.
- When the reference search is completed, the *HM_bActive* status output is reset to FALSE and the *HM_bDone* status output is set to TRUE.

Note!

In the homing mode "100: Set reference directly" no reference search is started, but the home position set in C02642 is directly accepted.

11.6.5.2 Loading home position via input

By setting the control input *HM_bLoadHomePos* to TRUE, the "Tool position" that is pending at input *HM_dnHomePos_p* is manually accepted as home position during the drive is at standstill. This is also possible if the controller is inhibited.

- The *HM_bDone* status output is set to TRUE for one cycle.
- The *HM_bHomePosAvailable* status output is set to TRUE.

Note!

For the encoderless motor control types (from software version V3.0) **the following applies:**

If V/f control or sensorless vector control has been selected, this function is only effective if the position controller has also been selected for the position control (C02570 = "2: position controller active").

For the encoderless motor control types (from software version V5.0) **the following applies:**

If the V/f control or sensorless vector control is selected, this function can be activated irrespective of the use of the position controller.

11.6.5.3 Reset home position

By setting the control input *HM_bResetHomePos* to TRUE, the "Home position known" status can be reset.

- The status outputs *HM_bDone* and *HM_bHomePosAvailable* are reset to FALSE.

Note!

For the encoderless motor control types (from software version V3.0) **the following applies:**

If V/f control or sensorless vector control has been selected, this function is only effective if the position controller has also been selected for the position control (C02570 = "2: position controller active").

For the encoderless motor control types (from software version V5.0) **the following applies:**

If the V/f control or sensorless vector control is selected, this function can be activated irrespective of the use of the position controller.

11.7 Positioning

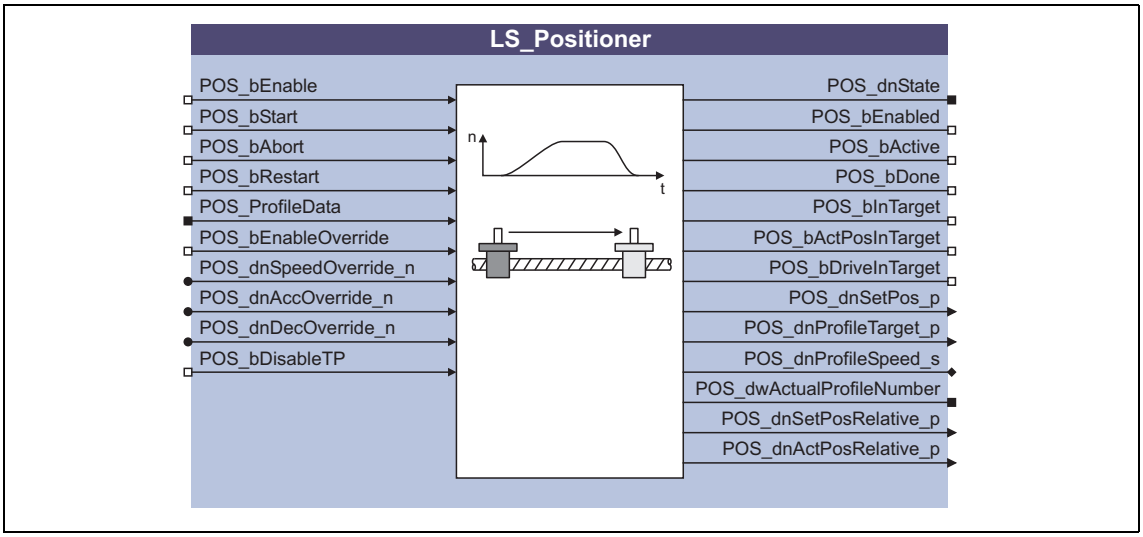
The basic function "Positioning" provides the functions for executing the (travel) profiles and supports an "override" of speed and acceleration.

- A profile describes a motion request which can be implemented by this basic function into a rotary motion.
- A profile is described via the following profile parameters: Mode (type of positioning), position, speed, acceleration, deceleration, S-ramp time, final speed, standard sequence profile, TP sequence profile, TP window starting and end position and touch probe signal source(s).

Note!

For positioning, setpoint speeds greater than 30000 rpm are not possible. The speeds defined for these basic function are internally limited to 30000 rpm.

If the basic function is activated for a speed greater than 30000 rpm (e. g. if the basic function "Speed follower" is replaced), the internal limitation of the speed setpoint causes a speed step.



When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

For the encoderless motor control types (from software version V3.0) **the following applies:**

If no position controller has been selected for the position control in case of V/f control or sensorless vector control (C02570 = "1: Phase controller is active"), positioning is only executed via the speed profile resulting from the profile parameters. Because of this, the target positions set will only "roughly" be reached.

11.7.1 Internal interfaces | "LS_Positioner" system block

The **LS_Positioner** system block provides the internal interfaces for the basic function "Positioning" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
POS_bEnable C02679/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Positioning active" function state is effected and positioning can be carried out via the control inputs.
	TRUE↘FALSE	Active positioning is stopped, i. e. a change-over from the active "Positioning active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.
POS_bStart C02679/2 | BOOL	Start positioning	
	FALSE↗TRUE	The profile *POS_ProfileData* is executed.
	FALSE↗TRUE (once again)	"Restart" • During an active positioning process, another profile can be specified via the input *POS_ProfileData* which is executed after restart. • Distances of a relative positioning that have already been covered are not taken into consideration.

Identifier DIS code | data type	Information/possible settings	
POS_bAbort C02679/3 | BOOL	Abort or interrupt positioning	
	FALSE↗TRUE	The current profile is not completed but braked to standstill with the deceleration defined in the profile data.
	TRUE	A restart via *POS_bStart* or the continuation of an interrupted positioning via *POS_bRestart* is inhibited.
	FALSE	A restart via *POS_bStart* or the continuation of an interrupted positioning via *POS_bRestart* is possible again. • If the restart signal *POS_bRestart* is already effected during the deceleration phase, positioning is continued immediately.
POS_bRestart C02679/4 | BOOL	Continue interrupted positioning • Only possible if *POS_bAbort* has been reset from TRUE to FALSE.	
	TRUE	The positioning interrupted before via *POS_bAbort* is completed. • Distances of a relative positioning already covered are taken into account.
	FALSE↗TRUE (once again)	"Restart" • During an active positioning process, another profile can be specified via the input *POS_ProfileData* which is executed after restart. • Distances of a relative positioning already covered are taken into account.
POS_ProfileData	Pointer to the profile to be executed in internal units (increments) • A profile linkage results from the fact that a pointer to the sequence profile is contained within the profile.	
POS_bEnableOverride C02679/5 | BOOL	Activate override	
	TRUE	Override of the speed, acceleration, and deceleration is active. • If the *POS_dnDecOverride_n* input is triggered with a very low value after the override function is activated, the drive decelerates correspondingly slow. The target position may be overtravelled.
POS_dnSpeedOverride_n C02677/1 | DINT	Value for speed override • Percentage multiplier for the current profile parameter "Speed". • Changes are accepted in each cycle. • $2^{30} \equiv 100$ % of the speed defined in the profile. • For values ≤ 1 % the status bit 18 is set. • Values ≤ 0 % are set to 0 % internally and lead to the standstill of the drive.	
POS_dnAccOverride_n C02677/2 | DINT	Value for acceleration override • Percentage multiplier for the current profile parameter "Acceleration". • Changes are accepted in each cycle. • $2^{30} \equiv 100$ % of the acceleration defined in the profile. • For values ≤ 1 % the status bit 19 is set. • Values ≤ 0 % are internally set to 0 % ("no acceleration").	
POS_dnDecOverride_n C02677/3 | DINT From V5.0	Value for deceleration override • Percentage multiplier for the current profile parameter "Deceleration". • Changes are accepted in each cycle. • $2^{30} \equiv 100$ % of the acceleration defined in the profile. • For values ≤ 1 % the status bit 19 is set. • Values ≤ 0 % are internally set to 0 % ("no deceleration").	
POS_bDisableTP C02679/6 | BOOL	Deactivating touch probe positioning	
	TRUE	Detected touch probes are ignored. There is no automatic change-over to the TP sequence profile defined in the profile data.

Outputs

Identifier DIS code | data type	Value/meaning	
POS_dnState C02675 | DINT	Status (bit coded) • When the basic function is not enabled, all bits are set to "0". • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Positioning active.
	Bit 2	Positioning is completed (all profiles have been executed).
	Bit 3	Acceleration/deceleration phase is active.
	Bit 4	Actual position in the target • The actual position value of the drive has reached the target of the last profile to be traversed within the tolerance window set in C02670.
	Bit 5	CCW rotation is active.
	Bit 6	Set position reached (in case of sequence profiles the drive continues to travel).
	Bit 10	Zero crossing in the positioning mode "modulo".
	Bit 11	Positioning cannot be continued.
	Bit 12	Drive in the target (actual position and set position in the target). • This status is available from software version V5.0.
	Bit 15	Fault in basic function active (group signal).
	Bit 16	Positioning is aborted.
	Bit 17	Reversing phase is active.
	Bit 18	Speed override ≤1 %
	Bit 19	Acceleration or deceleration override ≤ 1 %
	Bit 20	Position is limited by basic function "Limiter".
	Bit 21	Profile data are limited by basic function "Limiter".
	Bit 22	Direction is inhibited by basic function "Limiter".
	Bit 23	Abort by basic function "Limiter".
	Bit 24	Home position is not known.
	Bit 25	Stopping is active. • Basic function is enabled for the first time but no positioning has been requested / is active yet.
	Bit 26	Cycle is not known.
	Bit 27	Invalid positioning mode.
	Bit 28	Invalid change of the positioning mode.
	Bit 29	Profile data are not plausible or incorrect.
	Bit 30	Profile generation error.
POS_bEnabled C02679/7 | BOOL	Status signal "Basic function is enabled"	
	TRUE	Positioning via the control inputs is possible. • The *POS_bEnable* enable input is set to TRUE and the controller is in the "Positioning active" function state.
POS_bActive C02679/8 | BOOL	Status signal "Basic function is active"	
	TRUE	Positioning is active (the drive axis is moving).
POS_bDone C02679/9 | BOOL	Status signal "Basic function is ready"	
	TRUE	Positioning is completed. • The profile is executed and no sequence profile is defined.

Identifier DIS code | data type	Value/meaning	
POS_bInTarget C02679/10 | BOOL	Status signal "Setpoint has reached target position"	
	FALSE	Positioning is still active or has been aborted.
	TRUE	The current position setpoint has reached the target position.
POS_bActPosInTarget C02679/11 | BOOL	Status signal "Actual position in the target" • In the case of sequence profiles, the target position of the last profile to be processed. ▸ Actual value-based evaluation "Target position reached" (📖 485)	
	FALSE	Positioning is still active or has been aborted.
	TRUE	The current actual position value of the drive has reached the target of the last profile to be traversed within the tolerance window set in C02670.
POS_bDriveInTarget C02679/12 | BOOL From V5.0	Status signal "Drive in target" • In the case of sequence profiles, the target position of the last profile to be processed. • The status is also output when the basic function "Positioning" is deactivated. ▸ Actual value- and setpoint-based evaluation "Drive in the target" (📖 486)	
	FALSE	Positioning is still active or has been aborted.
	FALSE↗TRUE	The current actual position value of the drive has reached the target position within the profile to be traversed last within the tolerance window set in C02671. At this time, the current position setpoint has already reached the target position. • In positioning processes with sequence profiles, the output will only be set to TRUE when the last profile has been processed.
	TRUE↘FALSE	The current actual position value of the drive has exited the tolerance and hysteresis window set in C02671 and C02672 again after a positioning process has been completed.
	FALSE↗TRUE (once again)	If C02673 = "1", a modulo evaluation is carried out in all cycles (Lenze setting): • The output is set to TRUE again if the current actual position value of the drive enters the tolerance and hysteresis window in an optional modulo cycle again.
		If C02673 = "0", a modulo evaluation is only carried out in the modulo cycle of the target setpoint: • The output is set to TRUE again if the current actual position value of the drive enters the tolerance and hysteresis window in the same modulo cycle again.
POS_dnSetPos_p C02678/1 | DINT	Current position setpoint in [increments] • Reference point is the home position.	
POS_dnProfileTarget_p C02678/2 | DINT	Target position of the current profile in [increments] • Reference point is the home position.	
POS_dnProfileSpeed_s C02676 | DINT	Current setpoint speed of the current profile as speed in [rpm] • Taking a speed override into consideration.	
POS_dwActualProfileNumber C02674 | DWORD	Profile number (1 .... 100) of the current profile	

Identifier DIS code | data type	Value/meaning
POS_dnSetPosRelative_p C02678/3 | DINT From V5.0	Current relative position setpoint of the current positioning in [increments] • The value is also output if the basic function "Positioning" is deactivated. • Reference point is the starting position of the current profile. • After a positioning process has been completed, the output keeps the last relative value of the setpoint profile. • The output is reset when a new positioning is started, or when the home position is set.
POS_dnActPosRelative_p C02678/4 | DINT From V5.0	Current relative actual position value of the current positioning in [increments] • The value is also output if the basic function "Positioning" is deactivated. • Reference point is the starting position of the current profile. • The output follows the current position even if the basic function "Positioning" is no longer active. • The output is reset when a new positioning is started, or when the home position is set.

11.7.1.1 Possibilities for the selection of the profile

For specifying as well as storing and managing (travel) profiles, the following function blocks are available:

Function block	Job title
L_PosPositionerTable	...serves to store and manage up to 100 (travel) profiles and to "Teach" positions, speeds, accelerations/decelerations and S-ramp times. • A further important task of this FB is the conversion of the table values according to the preselected scaling in the **LS_DriveInterface** SB.
L_PosProfileTable	...serves to store and manage up to four (travel) profiles and allows the "teaching" of target positions. • In contrast to the FB **L_PosPositionerTable** this FB does not use any variable tables but the data of the profile parameters are entered directly into the assigned codes. • The position at the input *dnExtPos_p* is used as target position as a further specific feature for the selection of profile no. 1.
L_PosProfileInterface	...provides a profile data set for the **LS_Positioner** SB.

Related topics:

▸ Setting the S-ramp time (📖 387)

11.7.2 Parameter setting

Setting parameters is not required for the basic function "Positioning".

- After activating the function, the profile is executed which has been transferred from the application to the basic function via the input *POS_ProfileData*.
- For profiles with touch probe positioning mode (residual path positioning) touch probe is detected implicitly.

Related topics:

▸ Setting the S-ramp time (📖 387)

11.7.2.1 Actual value-based evaluation "Target position reached"

An actual value-based evaluation on whether the drive has reached the target position can be carried out by means of the output *POS_bActPosInTarget* and parameterisation of C02670.

- The output *POS_bActPosInTarget* is set to TRUE if the current actual position value of the drive has reached the target position of the profile to be traversed last within the tolerance window set in C02670.
  - Hence, for sequence profiles the evaluation is only valid for the target position of the last profile.
- If C02670 is set to "0" (Lenze setting), the evaluation is setpoint-based and the signal at the *POS_bActPosInTarget* output corresponds to the *POS_bDone* signal.

Tip!

In many cases the signal *POS_bActPosInTarget* only has to be evaluated if the setpoint has also reached the target position. This can for instance be implemented in the function block editor by a logic "AND" operation with the signal *POS_bDone*.

From software version V5.0 it is displayed whether the set position and the actual position are in the target via the output *POS_bDriveInTarget*. ▸ Actual value- and setpoint-based evaluation "Drive in the target" (📖 486)

11.7.2.2 Actual value- and setpoint-based evaluation "Drive in the target"

This function extension is available from software version V5.0 onwards!

An actual value- and setpoint-based evaluation on whether the drive is in the target can be carried out by means of the output *POS_bDriveInTarget* and parameterisation of C02671, C02672, and C02673.

- The output *POS_bDriveInTarget* is set to TRUE if the current actual position value of the drive has reached the target position of the profile to be traversed last within the tolerance window set in C02671.
  - At this time, the current setpoint value has already reached the target position, i. e. the actual position and set position are in the target.
  - In positioning processes with sequence profiles, the output will only be set to TRUE when the last profile has been processed.
- The output *POS_bDriveInTarget* is reset to FALSE if the current actual position value of the drive has exited the tolerance and hysteresis window set in C02671 and C02672 again after a positioning process has been completed.
- How the modulo evaluation is to be carried out if the actual position value enters the tolerance and hysteresis window again can be set in C02673:
  - Modulo evaluation in all cycles (Lenze setting):
    The output *POS_bDriveInTarget* is set to TRUE again if the current actual position value of the drive enters the tolerance window again in an optional modulo cycle.
  - Modulo evaluation only in the modulo cycle of the target setpoint:
    The output *POS_bDriveInTarget* is set to TRUE again if the current actual position value of the drive enters the tolerance window again in the same modulo cycle.
- A new FALSE↗TRUE edge at the output *POS_bDriveInTarget* after a positioning process has been completed can for instance occur when the basic function is deactivated afterwards, and if the drive axis is skewed so that the tolerance and hysteresis window is exited and then the tolerance range is entered again.

Short overview of the parameters for the actual value- and setpoint-based evaluation:

Parameters	Info	Lenze setting	
		Value	Unit
C02671	Tolerance for target position	2.0000	Unit
C02672	Hysteresis for target position	1.0000	Unit
C02673	Activate DriveInTarget Modulo	All cycles	

11.7.3 Carrying out positioning

Prerequisites

- The controller is in the "Operation" device state.
- The basic function "Positioning" is part of the active application.
- No other basic function is active.

Activation

To request the control via the basic function, the POS_*bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Positioning active" function state is effected and positioning can be carried out via the control inputs.
- A successful change to the function state "Positioning active" is displayed by a TRUE signal at the *POS_bEnabled* status output.

Deactivation

When the *POS_bEnable* enable input is reset to FALSE, an active positioning is stopped, i.e. the control inputs for positioning are inhibited and the drive is braked to standstill within the deceleration time for stop.

- The status output POS_*bEnabled* is reset to FALSE and a change-over from the active "Positioning active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.

11.7.3.1 Start positioning

By setting the control input *POS_bStart* to TRUE, the positioning process is started.

- The (travel) profile that has been transferred to the basic function via the input *POS_ProfileData* is traversed.

11.7.3.2 Aborting/interrupting positioning

By setting the control input *POS_bAbort* to TRUE, the active positioning can be aborted or interrupted.

- The current profile is not completed but braked to standstill with the deceleration defined in the profile data.
- If the control input *POS_bAbort* remains on TRUE, a restart or the continuation of an interrupted positioning is inhibited.
- After resetting the control input *POS_bAbort* to FALSE, a restart or the continuation of an interrupted positioning process is possible again.

11.7.3.3 Continue interrupted positioning

By setting the control input *POS_bRestart* to TRUE, an interrupted positioning process can be continued if the control input *POS_bAbort* has been reset to FALSE before.

- Distances of a relative positioning already covered are taken into account.
- If the continuation of a positioning process via the input *POS_bRestart* is not possible, this is displayed via bit 11 of the status output *POS_dnState*.

The following applies to software versions lower than V3.0:

- If during an active or cancelled positioning process a change-over to the states "Quick stop active", "Drive is stopped", or "Drive at standstill" is effected, it is also possible to continue a positioning process via *POS_bRestart*, taking the distance that has already been covered into consideration.

The following applies from software version V3.0:

- If during an active or cancelled positioning process a change-over is effected (e. g. by activating a quick stop or inhibiting the controller), it is also possible to continue a positioning process via *POS_bRestart*, taking the distance that has already been covered into consideration.
- However, after a homing has been carried out again, or after the following machine parameters have been changed, a continuation of an interrupted positioning process via the control input *POS_bRestart* is no longer possible:
  - Encoder resolution (C00100)
  - Position encoder selection (C00490), motor encoder selection (C00495)
  - Gearbox factors (C02520, C02521, C02522, C02523)
  - Feed constant (C02524)
  - Motor mounting direction (C02527), position encoder mounting direction (C02529)
  - Traversing range (C02528)
  - Cycle (C02536) for modulo traversing range
  - Position control structure (C02570)

11.7.3.4 Activate override

An "Override" is the change of profile parameters and their acceptance during the positioning process.

- When the input *POS_bEnableOverride* is set to TRUE, a speed and acceleration override occurs according to the override values applied to the inputs *POS_dnSpeedOverride_n* and *POS_dnAccOverride_n*.
  - The override values represent percentage multipliers with regard to the current profile parameters for speed and acceleration.
  - For override values ≤ 1 % a status bit is set.
  - Override values ≤ 0 % are internally set to 0 %.
  - Changes of the override values are accepted in each cycle.

Note!

The online change of speed and acceleration is in effect from the start of the profile until the deceleration phase begins. Changing the deceleration phase by means of an override is therefore not possible!

- In the case of an override value of 0 % for the speed, the drive is brought to a standstill.
- In the case of an override value of 0 % for the acceleration, acceleration does not take place any longer.

- From software version V5.0 also a deceleration override via the input *POS_dnDecOverride_n* can be carried out if the input *POS_bEnableOverride* is set to TRUE.
  The deceleration override is effective:
  - During the deceleration phase of a profile
  - During an abort process
  - In the case of a speed change-over from a high to a low speed within a profile (e. g. if the speed override is used)

Note!

If the override value for deceleration is 0 %, there is no deceleration, i. e. the drive does not come to a standstill!

- If the input *POS_bEnableOverride* is reset to FALSE again, the speeds, accelerations, and decelerations are run again, which have been defined via the profile parameters. There is an immediate acceleration from the override speed to the speed set in the profile.

11.8 Position follower

This basic function is used as setpoint interface for position-controlled drives.

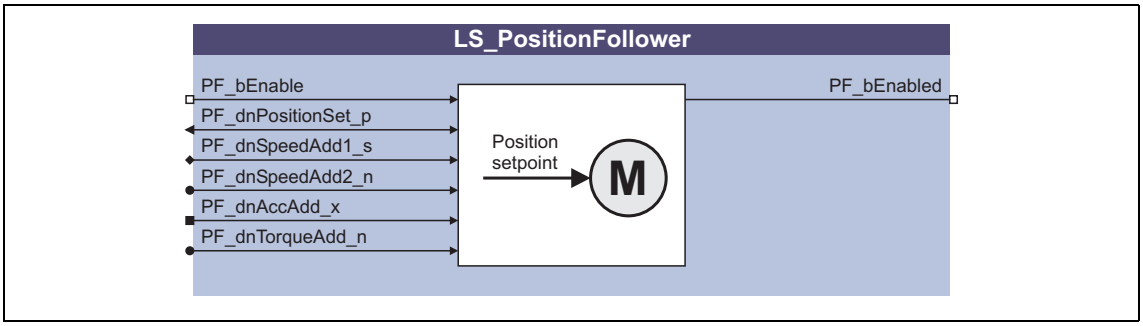
- The specified position setpoint can either refer to the encoder on the motor side or to the (position) encoder used additionally to detect the machine position. The selection of the encoder configuration serves to adapt the internal control structure accordingly.
- Instead of a position setpoint alternatively also a speed setpoint can be specified by an according selection in C02680; the set position is then calculated by the integration of the speed setpoint on the basis of the current actual position (relative positioning).
- If the direction of rotation of the motor has to be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.
- The speed feedforward control can also be executed with the position setpoint by a corresponding selection in C02681. Then, the speed is calculated by differentiation of the position setpoint.

Stop!

If a limit switch is approached by means of the basic function "Position follower" and by this a fault with the "Quick stop by trouble" response is activated, always a set/actual adjustment of the position has to be carried out before the fault is acknowledged, as otherwise an uncontrolled motor movement may result after the fault is acknowledged!

▸ Hardware limit positions (limit switch) (📖 515)

Note!



When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

For the encoderless motor control types (from software version V3.0) **the following applies:**

The basic function "Position follower" can only be activated for V/f control or sensorless vector control if the position controller has been selected for the position control (C02570 = "2: position controller active").

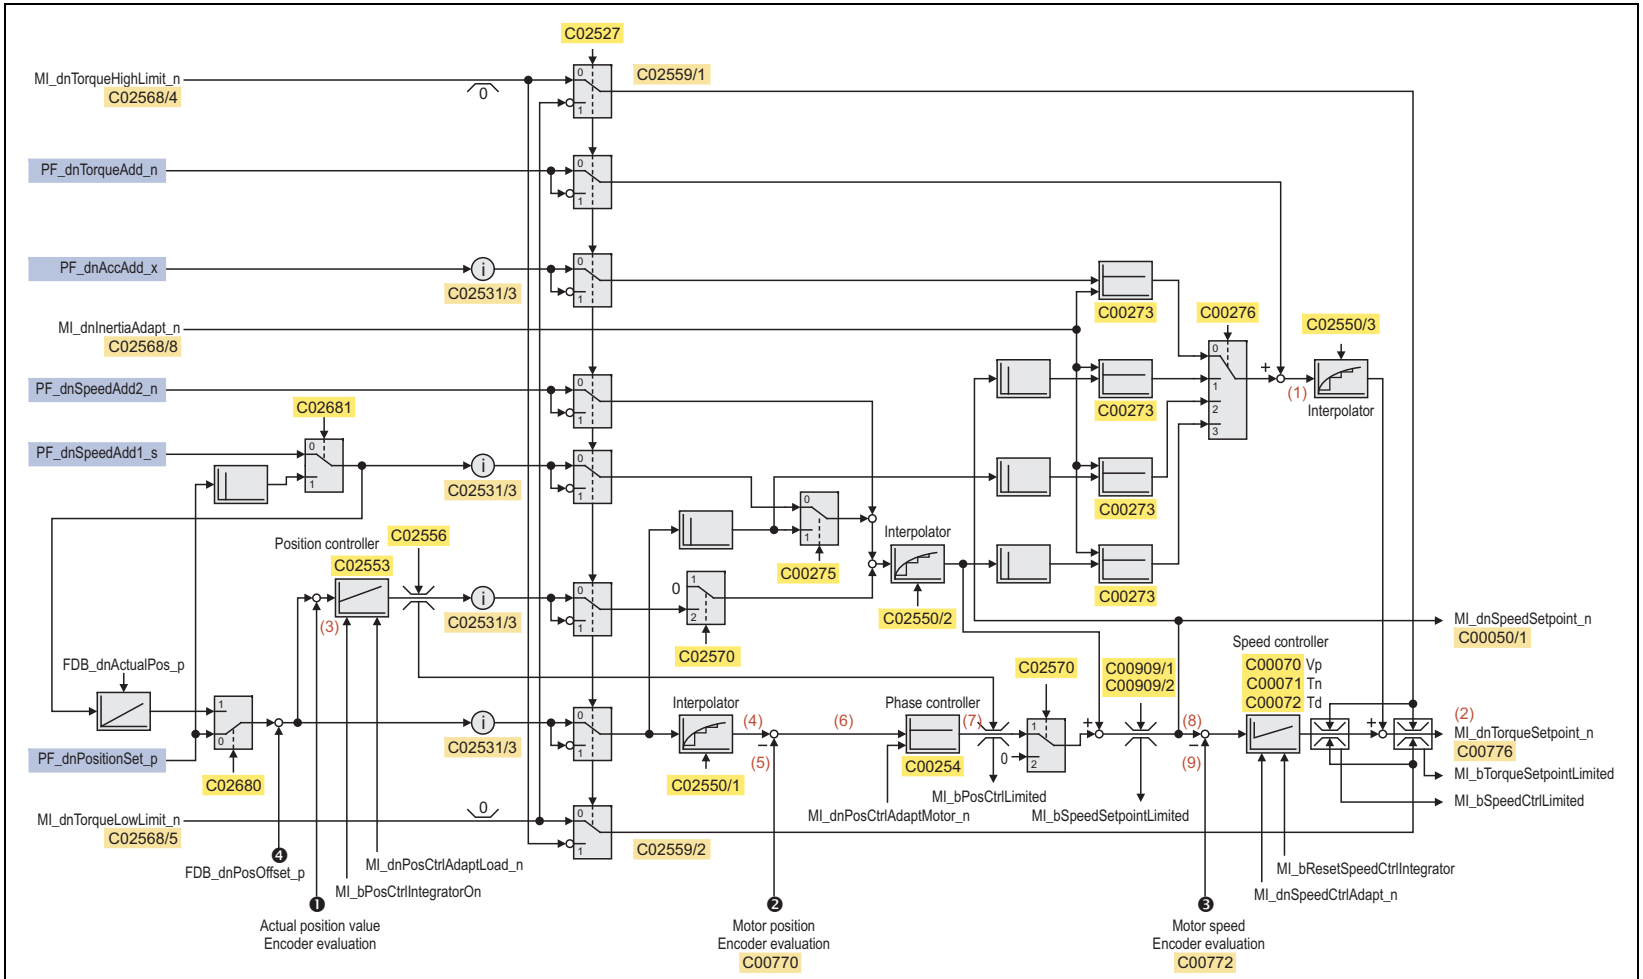
11.8.1 Internal interfaces | "LS_PositionFollower" system block

The **LS_PositionFollower** system block provides the internal interfaces for the basic function "Position follower" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!



Inputs

Identifier DIS code | data type	Information/possible settings	
PF_bEnable C02689/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Position follower active" function state is carried out, and the setpoints defined are accepted.
	TRUE↘FALSE	If no other basic function takes over the control of the drive, the drive is brought to standstill, i. e. a change-over from the active function state "Position follower active" via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.
PF_dnPositionSet_p C02688/1 | DINT	Position setpoint in [increments]	
PF_dnSpeedAdd1_s C02686 | DINT	Speed feedforward control value in [rpm]	
PF_dnSpeedAdd2_n C02687/1 | DINT	Additional speed setpoint in [%] • 100 % ≡ Motor reference speed (C00011)	
PF_dnAccAdd_x C02685 | DINT	Motor acceleration • For calculating the acceleration torque (for setting C00276 = "0"). • Selection as speed variation/time in [rpm/s]	
PF_dnTorqueAdd_n C02687/2 | DINT	Additive torque feedforward control value in [%] • 100 % ≡ motor reference torque (display in C00057/2).	

Outputs

Identifier DIS code | data type	Value/meaning	
PF_bEnabled C02689/2 | BOOL	Status signal "Basic function is enabled"	
	TRUE	The defined setpoints are accepted.

11.8.2 Signal flow

❶...❹ Signals from Signal flow - encoder evaluation (📖 243)	FDB_... = input/output signals of the Encoder evaluation (📖 239) MI_... = input/output signals of the Motor interface (📖 118)

[11-22] Signal flow - position follower

Internal variables of the motor control (oscilloscope signals)

- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(1)	Torque.dnTotalTorqueAdd	Additive torque feedforward control value
(2)	Torque.dnTorqueSetpoint	Torque setpoint
(3)	Position.dnActualLoadPos	Actual position
(4)	Position.dnPositionSetpoint	Position setpoint
(5)	Position.dnActualMotorPos	Current motor position
(6)	Position.dnContouringError	Following error
(7)	Speed.dnOutputPosCtrl	Output signal - phase controller
(8)	Speed.dnSpeedSetpoint	Speed setpoint
(9)	Speed.dnActualMotorSpeed	Current motor speed

11.8.3 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Position follower*
- Short overview of the parameters for the position follower:

Parameters	Info
C00050/1	Speed setpoint 1 [rpm]
C00070	Speed controller gain
C00071	Speed controller reset time
C00072	Speed controller rate time
C00273/1	Motor moment of inertia
C00273/2	Load moment of inertia
C00275	Signal source - speed setpoint
C00276	Signal source - torque setpoint
C00909/1	Upper speed limit value
C00909/2	Lower speed limit value
C02520	Gearbox factor numerator: Motor
C02521	Gearbox factor denom.: Motor
C02522	Gearbox factor num.: Pos. enc.
C02523	Gearbox fac. denom.: Pos. enc.
C02527	Motor mounting direction
C02550/1	Position setpoint interpolat.
C02550/2	Speed setpoint interpolation
C02550/3	Torque setpoint interpolation
C02553	Position controller gain
C02554	Position controller reset time
C02555	D component position controller
C02559	Internal torque limit
C02680	Source position setpoint
C02681	Source add. speed
Greyed out = display parameter	

11.8.3.1 Setpoint interpolation

When the setpoint interpolation is activated, the motor control creates intermediate values to "smoothly" follow the setpoints which may be transferred from a slower task.

- C02550/1 = "1": The motor control follows the position setpoint in interpolated steps.
- C02550/2 = "1": The motor control follows the speed setpoint in interpolated steps.
- C02550/3 = "1": The motor control follows the torque setpoint in interpolated steps.

11.8.3.2 Inversion of the direction of rotation

Depending on the motor mounting position, if required, the direction of rotation can be inverted:

- C02527 = "0": Clockwise rotating motor ≡ positive machine direction.
- C02527 = "1": Counter-clockwise rotating motor ≡ positive machine direction.

11.8.4 Activating setpoint interface

Prerequisites

- The controller is in the "Operation" device state.
- The basic function "Position follower" is part of the active application.
- No other basic function is active.

Activation

To request the control via the basic function, the *PF_bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Position follower active" function state is carried out. Setpoints can now be defined via the corresponding inputs. ▸ Signal flow
- A successful change to the "Position follower active" function state is displayed by a TRUE signal at the status output *PF_bEnabled*.

Stop!

The basic function does not take over the control of the drive from the current speed, but immediately with the setpoint defined, which may cause a jerk!

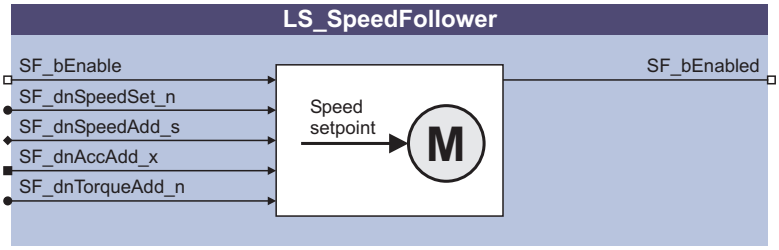
Deactivation

When the *PF_bEnable* enable input is reset to FALSE, the setpoint inputs are inhibited. If the drive is not at standstill, it is braked to standstill within the deceleration time set for stop unless another basic function takes over the control of the drive.

- The status output *PF_bEnabled* is reset to FALSE and a change-over from the active "Position follower active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.

11.9 Speed follower

This basic function is used as setpoint interface for speed-controlled drives.



- The motor control is switched over automatically to speed control with torque limitation.
- If the direction of rotation of the motor has to be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.

Note!

When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

11.9.1 Internal interfaces | "LS_SpeedFollower" system block

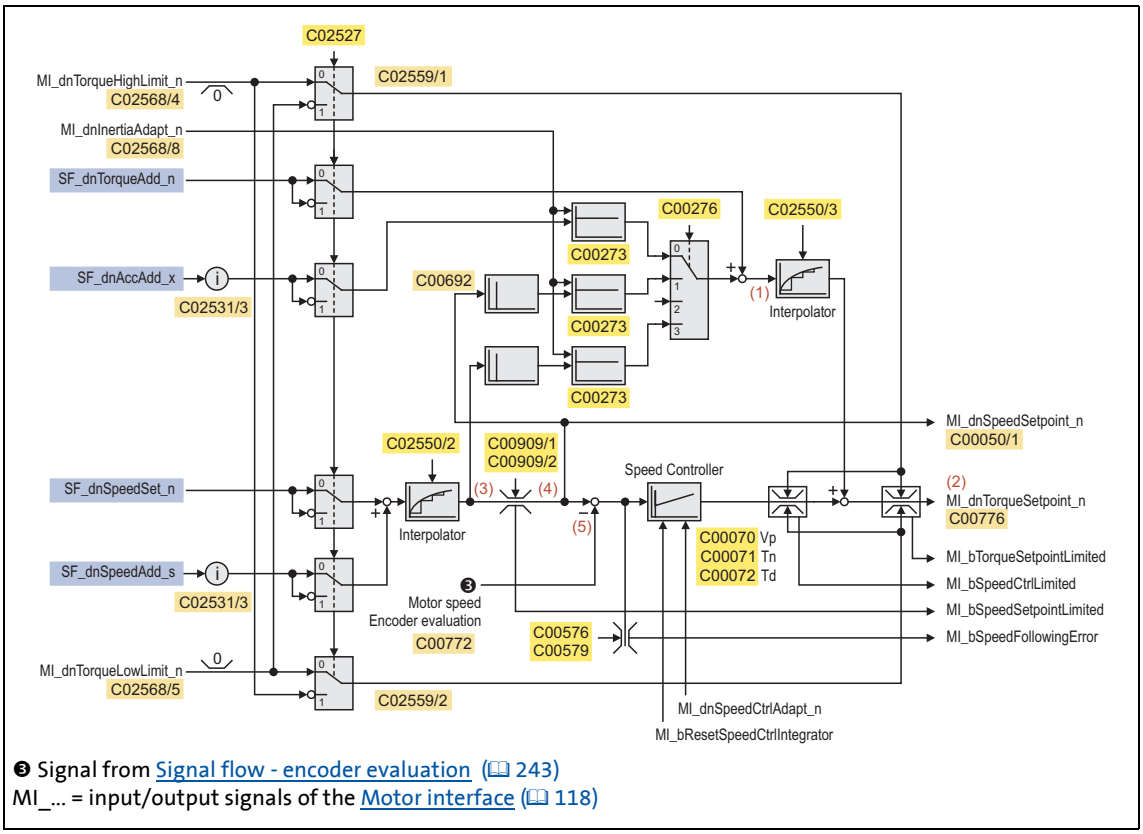
The **LS_SpeedFollower** system block provides the internal interfaces for the basic function "Speed follower" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs



Identifier DIS code | data type	Information/possible settings	
SF_bEnable C02695/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Speed follower active" function state is carried out, and the setpoints defined are accepted.
	TRUE↘FALSE	If no other basic function takes over the control of the drive, the drive is brought to standstill, i. e. a change-over from the active function state "Speed follower active" via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.
SF_dnSpeedSet_n C02694/1 | DINT	Speed setpoint in [%] • 100 % ≡ Motor reference speed (C00011)	
SF_dnSpeedAdd_s C02693 | DINT	Additive speed setpoint in [rpm] • Without position control function.	

Identifier DIS code | data type	Information/possible settings
SF_dnAccAdd_x C02692 | DINT	Motor acceleration • For calculating the acceleration torque (for setting C00276 = "0"). • Selection as speed variation/time in [rpm/s]
SF_dnTorqueAdd_n C02694/2 | DINT	Additive torque feedforward control value in [%] • 100 % ≡ motor reference torque (display in C00057/2).

Outputs

Identifier DIS code | data type	Value/meaning	
SF_bEnabled C02695/2 | BOOL	Status signal "Basic function is enabled"	
	TRUE	The defined setpoints are accepted.

11.9.2 Signal flow

❸ Signal from Signal flow - encoder evaluation (📖 243)
MI_... = input/output signals of the Motor interface (📖 118)

[11-23] Signal flow - speed follower

Internal variables of the motor control (oscilloscope signals)

- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(1)	Torque.dnTotalTorqueAdd	Additive torque feedforward control value
(2)	Torque.dnTorqueSetpoint	Torque setpoint
(3)	Speed.dnTotalSpeedAdd	Additive speed setpoint
(4)	Speed.dnSpeedSetpoint	Speed setpoint
(5)	Speed.dnActualMotorSpeed	Current motor speed

11.9.3 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** → Dialog level *Overview* → *All basic functions* → *Speed follower*
- Short overview of the parameters for the speed follower:

Parameters	Info
C00050/1	Speed setpoint 1
C00070	Speed controller gain
C00071	Speed controller reset time
C00072	Speed controller rate time
C00273/1	Motor moment of inertia
C00273/2	Load moment of inertia
C00276	Signal source - torque setpoint
C00576	Speed monitoring window
C00579	Resp. to speed monitoring
C00909/1	Upper speed limit value
C00909/2	Lower speed limit value
C02520	Gearbox factor numerator: Motor
C02521	Gearbox factor denom.: Motor
C02522	Gearbox factor num.: Pos. enc.
C02523	Gearbox fac. denom.: Pos. enc.
C02527	Motor mounting direction
C02531/3	Effective gearbox factor (dec.)
C02550/2	Speed setpoint interpolation
C02550/3	Torque setpoint interpolation
C02570	Position control structure
C02559	Internal torque limit
Greyed out = display parameter	

11.9.3.1 Setpoint interpolation

When the setpoint interpolation is activated, the motor control creates intermediate values to "smoothly" follow the speed and/or torque setpoints which may be transferred from a slower task.

- C02550/2 = "1": The motor control follows the speed setpoint in interpolated steps.
- C02550/3 = "1": The motor control follows the torque setpoint in interpolated steps.

11.9.3.2 Inversion of the direction of rotation

Depending on the motor mounting position, if required, the direction of rotation can be inverted:

- C02527 = "0": Clockwise rotating motor ≡ positive machine direction.
- C02527 = "1": Counter-clockwise rotating motor ≡ positive machine direction.

11.9.4 Activating setpoint interface

Prerequisites

- The controller is in the "Operation" device state.
- The basic function "Speed follower" is part of the active application.
- No other basic function is active.

Activation

To request the control via the basic function, the *SF_bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Speed follower active" function state is carried out, and the motor control is automatically switched over to speed control with torque limitation. Setpoints can now be defined via the corresponding inputs. ▸ Signal flow
- A successful change to the function state "Speed follower active" is displayed by a TRUE signal at the *SF_bEnabled* status output.

Stop!

The basic function does not take over the control of the drive from the current speed, but immediately with the setpoint defined, which may cause a jerk!

Deactivation

When the *SF_bEnable* enable input is reset to FALSE, the setpoint inputs are inhibited. If the drive is not at standstill, it is braked to standstill within the deceleration time set for stop unless another basic function takes over the control of the drive.

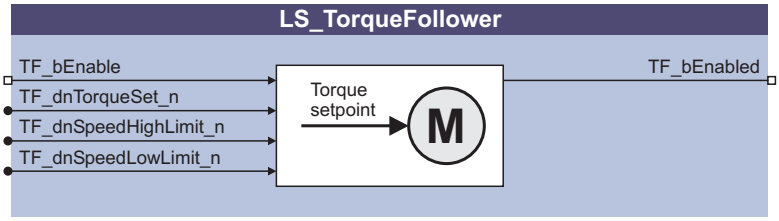
- The status output *SF_bEnabled* is reset to FALSE and a change-over from the active "Speed follower active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.

11.10 Torque follower

This basic function is used as setpoint interface for torque-controlled drives.

- The motor control is switched over automatically to torque control with speed limitation.
- If the direction of rotation of the motor has to be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.
- A stable speed limitation requires a minimum difference of the speed limit values of 50 rpm. If the defined speed limit values fall below this minimum difference, the internal lower speed limit value is lowered accordingly. The upper speed limit value remains unchanged. ▸ Signal flow - torque follower (📖 503)

Note!



When the basic function is activated, a start acceleration is considered. ▸ Start acceleration/acceleration reduction when the basic function changes (📖 385)

For the encoderless motor control types (from software version V3.0) **the following applies:**

The basic function "Torque follower" cannot be activated when the V/f control has been selected.

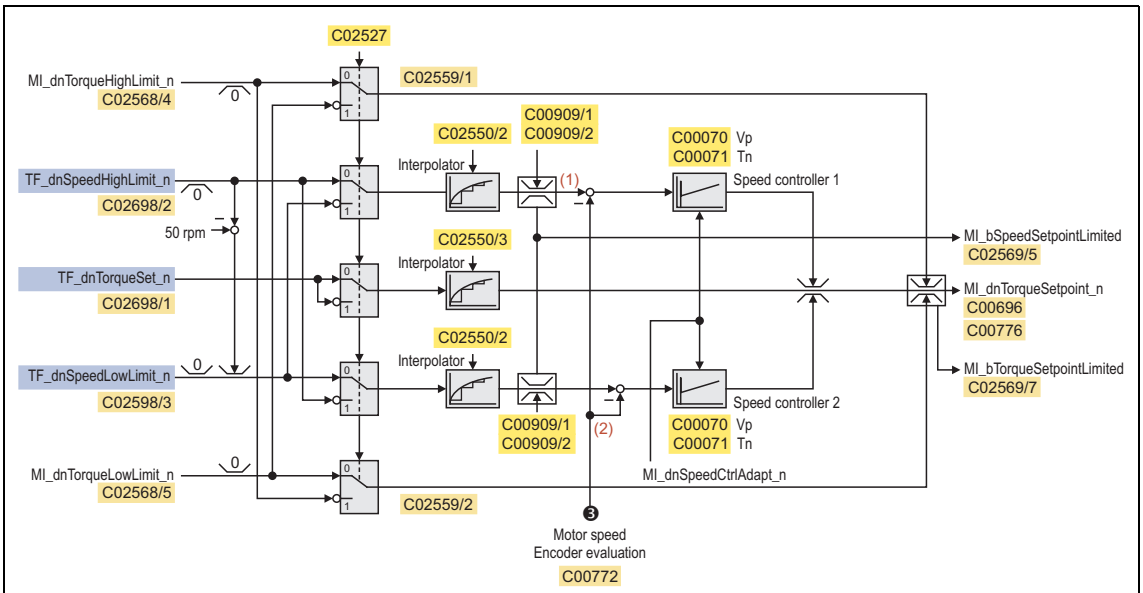
11.10.1 Internal interfaces | "LS_TorqueFollower" system block

The **LS_TorqueFollower** system block provides the internal interfaces for the basic function "Torque follower" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!



Inputs

Identifier DIS code | data type	Information/possible settings	
TF_bEnable C02699/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Torque follower active" function state is carried out, and the setpoints defined are accepted.
	TRUE↘FALSE	If no other basic function takes over the control of the drive, the drive is brought to standstill, i. e. a change-over from the active function state "Torque follower active" via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.
TF_dnTorqueSet_n C02698/1 | DINT	Torque setpoint in [%] • 100 % ≡ motor reference torque (display in C00057/2).	
TF_dnSpeedHighLimit_n C02698/2 | DINT	Upper speed limit value in [%] for speed limitation • For positive direction of motion. • 100 % ≡ Motor reference speed (C00011). • Negative values are limited internally to the value "0".	
TF_dnSpeedLowLimit_n C02698/3 | DINT	Lower speed limit value in [%] for speed limitation • For negative direction of motion. • 100 % ≡ Motor reference speed (C00011). • Positive values are limited internally to the value "0".	

Outputs

Identifier DIS code | data type	Value/meaning	
TF_bEnabled C02699/2 | BOOL	Status signal "Basic function is enabled"	
	TRUE	The defined setpoints are accepted.

11.10.2 Signal flow

❸ Signal from Signal flow - encoder evaluation (📖 243)
MI_... = input/output signals of the Motor interface (📖 118)

[11-24] Signal flow - torque follower

Internal variables of the motor control (oscilloscope signals)

- The red numbers in brackets listed in the signal flow stand for internal variables of the motor control, which you can record by means of the Oscilloscope for purposes of diagnostics and documentation. (📖 585)

No.	Variable of the motor control	Meaning
(1)	Speed.dnSpeedSetpoint	Speed setpoint
(2)	Speed.dnActualMotorSpeed	Current motor speed

11.10.3 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** → Dialog level *Overview* → *All basic functions* → *Torque follower*
- Short overview of the parameters for the torque follower:

Parameters	Info
C00050/1	Speed setpoint 1
C00050/2	Speed setpoint 2
C00070	Speed controller gain
C00071	Speed controller reset time
C00909/1	Upper speed limit value
C00909/2	Lower speed limit value
C02527	Motor mounting direction
C02550/2	Speed setpoint interpolation
C02550/3	Torque setpoint interpolation
C02559	Internal torque limit
Greyed out = display parameter	

11.10.3.1 Setpoint interpolation

When the setpoint interpolation is activated, the motor control creates intermediate values to "smoothly" follow the speed and/or torque setpoints which may be transferred from a slower task.

- C02550/2 = "1": The motor control follows the speed setpoint in interpolated steps.
- C02550/3 = "1": The motor control follows the torque setpoint in interpolated steps.

11.10.3.2 Inversion of the direction of rotation

Depending on the motor mounting position, if required, the direction of rotation can be inverted:

- C02527 = "0": Clockwise rotating motor ≡ positive machine direction.
- C02527 = "1": Counter-clockwise rotating motor ≡ positive machine direction.

11.10.4 Activating setpoint interface

Prerequisites

- The controller is in the "Operation" device state.
- The basic function "Torque follower" is part of the active application.
- No other basic function is active.

Activation

To request the control via the basic function, the *TF_bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Torque follower active" function state is carried out, and the motor control is automatically switched over to torque control with speed limitation. Setpoints can now be defined via the corresponding inputs. ▸ Signal flow
- A successful change to the function state "Torque follower active" is displayed by a TRUE signal at the *TF_bEnabled* status output.

Stop!

The basic function does not take over the control of the drive from the current speed, but immediately with the setpoint defined, which may cause a jerk!

Deactivation

When the *TF_bEnable* enable input is reset to FALSE, the setpoint inputs are inhibited. If the drive is not at standstill, it is braked to standstill within the deceleration time set for stop unless another basic function takes over the control of the drive.

- The status output *TF_bEnabled* is reset to FALSE and a change-over from the active "Torque follower active" function state via the "Drive is stopped" function state back to the basic state "Drive at standstill" is carried out.

11.11 Limiter

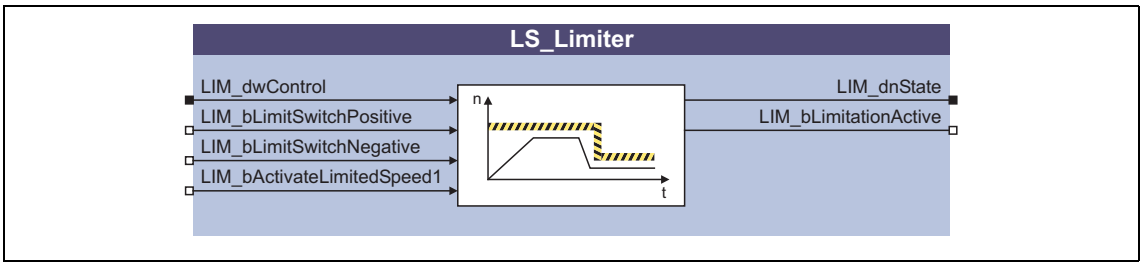
The basic function "Limiter" monitors the travel range limits via limit switches and parameterised software limit positions and can lead the drive to defined limit ranges when being requested accordingly by the safety module.

Danger!

The safety is exclusively ensured by the safety module!

When the request for the safety function is cancelled, the drive can restarts automatically.

Ensure by external measures that the drive only starts after a confirmation (EN 60204).



Note!

In order to make it possible for the basic function "Limiter" to lead the drive to the limit ranges defined **after a corresponding request by the safety module**, before the limits set for the safety module have been reached and it shuts down the drive, the limits for the basic function "Limiter" have to be set lower than the limits of the safety module!

See also: ▸ Safety engineering (📖 369)

11.11.1 Internal interfaces | "LS_Limiter" system block

The **LS_Limiter** system block provides the internal interfaces for the basic function "Limiter" in the function block editor.

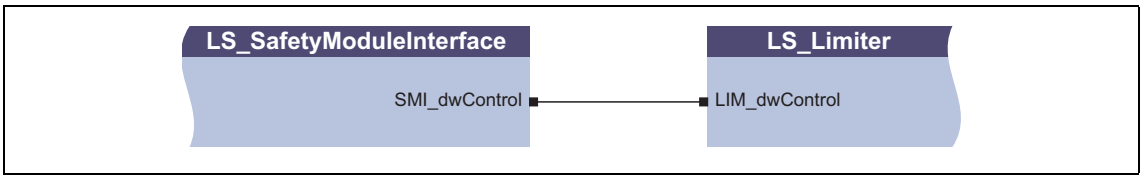
Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
LIM_dwControl C02717 | DWORD	Interface to the safety module (bit coded) • For a simple connection of the safety module to the application, the transmission of the currently valid safety requirement(s) is effected via this bit coded control signal. • It is also possible to make several requirements at the same time via the control signal, e.g. manual jog with limited increment and limited speed 2. • Bits not listed are reserved for future extensions!	
	Bit 0	Switched-off torque: request controller inhibit. • This bit is no longer supported by the control signal of the **LS_SafetyModuleInterface** system block.
	Bit 1	Stop 1: request quick stop with subsequent controller inhibit.
	Bit 2	Stop 2: request quick stop. • If the automatic brake operation is activated, the brake remains open at standstill.
	Bit 3	Request limited speed 1. • Change of the traversing profile according to the parameters set for the limited speed 1 (C02708/1, C02710/1, C02711/1). • Only effective for the basic functions "Manual jog", "Homing" and "Positioning".
	Bit 4	Request limited speed 2. • Change of the traversing profile according to the parameters set for the limited speed 2 (C02708/2, C02710/2, C02711/2). • Only effective for the basic functions "Manual jog", "Homing" and "Positioning".
	Bit 5	Request limited speed 3. • Change of the traversing profile according to the parameters set for the limited speed 3 (C02708/3, C02710/3, C02711/3). • Only effective for the basic functions "Manual jog", "Homing" and "Positioning".
	Bit 6	Request limited speed 4. • Change of the traversing profile according to the parameters set for the limited speed 4 (C02708/4, C02710/4, C02711/4). • Only effective for the basic functions "Manual jog", "Homing" and "Positioning".
	Bit 7	Only permit positive direction of rotation. • Only effective for the basic functions "Manual jog", "Homing" and "Positioning".
	Bit 8	Only permit negative direction of rotation. • Only effective for the basic functions "Manual jog", "Homing" and "Positioning".
	Bit 10	Limited increment • Activate maximum distance set in C02713 as limited increment for the basic function "Manual jog".
	Bit 12	Defined limit positions • Activate software limit positions set in C02701/1 and C02701/2.



Identifier DIS code | data type	Information/possible settings	
LIM_bLimitSwitchPositive C02719/1 | BOOL	Input for positive travel range limit switch	
	TRUE	Limit switch is activated.
LIM_bLimitSwitchNegative C02719/2 | BOOL	Input for negative travel range limit switch	
	TRUE	Limit switch is activated.
LIM_bActivateLimitedSpeed 1 C02719/3 | BOOL	Request limited speed 1 • If a setpoint follower is active, no limitation takes place, but an exceeding of the limit values is displayed via the output *LIM_dnState*.	
	TRUE	Request limited speed 1.

Outputs

Identifier DIS code | data type	Value/meaning	
LIM_dnState C02718 | DINT	Status word (bit coded) • Bits which are not listed are not assigned with a status (always "0").	
	Bit 0	Controller inhibit is initiated. (Safe torque off is requested; bit 0 of the *LIM_dwControl* control signal is set to "1".)
	Bit 1	Quick stop is initiated. (Safe stop 1 is requested; bit 1 of the *LIM_dwControl* control signal is set to "1".)
	Bit 2	Quick stop is initiated. (Safe stop 2 is requested; bit 2 of the *LIM_dwControl* control signal is set to "1".)
	Bit 3	Profile change due to speed limitation. (Limited speed 1 is requested; bit 3 of the *LIM_dwControl* control signal is set to "1".)
	Bit 4	Profile change due to speed limitation. (Limited speed 2 is requested; bit 4 of the *LIM_dwControl* control signal is set to "1".)
	Bit 5	Profile change due to speed limitation. (Limited speed 3 is requested; bit 5 of the *LIM_dwControl* control signal is set to "1".)
	Bit 6	Profile change due to speed limitation. (Limited speed 4 is requested; bit 6 of the *LIM_dwControl* control signal is set to "1".)
	Bit 7	Only positive direction of rotation is permissible. • When the direction of rotation is negative while requesting "Only positive direction of rotation", the drive is braked to standstill.
	Bit 8	Only negative direction of rotation is permissible. • When the direction of rotation is positive while requesting "Only negative direction of rotation", the drive is braked to standstill.
	Bit 10	Increment in manual jog mode is limited.
	Bit 12	Limitation of the set position is active.
	Bit 16	Positive limit switch inhibits travel in positive direction.
	Bit 17	Negative limit switch inhibits travel in negative direction.
	Bit 18	Positive software limit position inhibits travel in positive direction.
	Bit 19	Negative software limit position inhibits travel in negative direction.
	Bit 20	Limitation of speed is active.
	Bit 21	Limitation of acceleration is active.
	Bit 22	Limitation of deceleration is active.
	Bit 23	Limitation of jerk is active (S-ramp time is increased).
LIM_bLimitationActive C02715 | BOOL	Status signal "Limitation is active" (group signal)	
	TRUE	A limitation is active.

11.11.1.1 Interface to the safety module

For the simple connection of the safety module to the application, the transmission of the currently valid safety requirement(s) is effected in the form of a bit coded control signal via the following interface:

[11-25] Interface to connect the safety module to the basic function "Limiter"

- It is also possible to make several requirements at the same time via the control signal, e.g. manual jog with limited increment and limited speed 2.
- If no safety module is connected, the control signal can also be generated by means of a converter block (FB **L_DevSMControlEncoder**).

11.11.2 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Limiter*
- Short overview of the parameters for the limiter:

Parameters	Info
C02700	Software limit positions active
C02701/1	Positive software limit position
C02701/2	Negative software limit position
C02702	Limitations effective
C02703	Max. speed
C02704	Max. speed [rpm]
C02705	Max. acceleration
C02706	Min. S-ramp time
C02707	Permissible direction of rotation
C02708/1...4	Limited speed 1 4
C02709/1...4	Limited speed 1 .... 4 (display in [rpm])
C02710/1...4	Dec. limited speed 1 4
C02711/1...4	S-ramp time limited speed 1 4
C02712/1...4	Dec. time limited speed 1 4
C02713	Max. distance manual control
C02714	Max. dist. manual control (display in [increments])
C02715	Limitation active (status display)
C02716/1	Resp. to rotation limitation
C02716/2	Resp. to SW lim. pos. exceeded
C02716/3	Resp. to max. value exceeded
C02720	Observation software limit positions
Greyed out = display parameter	

Note!

The safety module has its own parameters.

Relevant to the basic function "Limiter" are the parameters of the safety modules for setting "Limited direction of rotation", "Speed with time limit" and "Limited increment (position)".

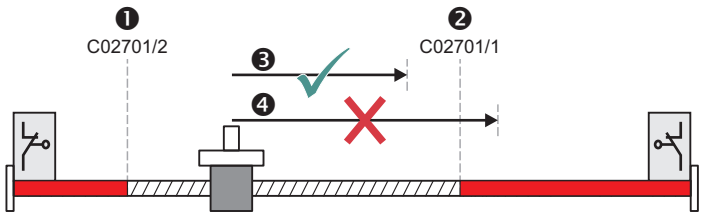
However, several other parameters of the safety module have no significance for the basic function "Limiter", e. g. the parameters for the configuration of the inputs of the safety module.

11.11.2.1 Software limit positions

The parameterisable limit positions serve to limit the traversing range by the software.

Note!

Software limit positions are only evaluated and monitored if the drive knows the home position and the software limit positions are active (C02700 = "1").

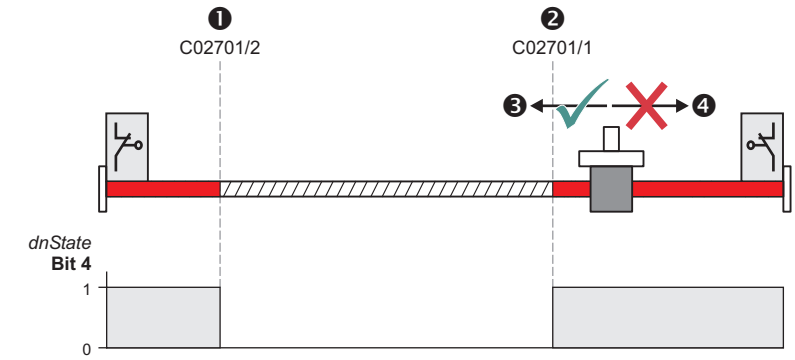


- When the traversing range is limited (C02528 = "1") and the software limit positions are not active, the range is limited by the software to the internal value range that can be maximally displayed ($\pm 2^{31}$ increments).
- For the "Modulo" traversing range (C02528 = "2") the software limit positions are generally not effective.
- If the error response that can be set in C02716/2 is deactivated or is only set to "Warning" or "Information", the software limit positions are not effective in an active manner for the basic functions "Speed follower", "Torque follower", and "Position follower"!
- After the software limit positions have been exceeded, it must be ensured before acknowledging a pending error that the setpoint applied to the SB **LS_PositionFollower** is not beyond the software limit positions.

From software version V4.0 onwards, the triggering behaviour of the software limit position monitoring can be parameterised in C02720.

- If you want to maintain the device behaviour known from the previous versions, select "1: Based on set and actual value" in C02720.

▸ Triggering behaviour of software limit position monitoring (📖 514)



- The positive software limit position is set in C02701/1, and the negative software limit position is set in C02701/2.
- If the software limit positions are active, travelling commands that would result in exiting from the permissible travel range can no longer be executed:

❶ C02701/2: Negative software limit position
❷ C02701/1: Positive software limit position
❸ Travel command possible
❹ Travel command not possible since the target position is outside the permissible traversing range.

[11-26] Example: Traversing range limitation by means of software limit positions

- If the drive is already outside the permissible travel range and the software limit positions have been activated, only travel commands that result in the drive moving back into the permissible travel range can be executed:

❶ C02701/2: Negative software limit position
❷ C02701/1: Positive software limit position
❸ Traversing in "retracting direction" possible
❹ Traversing opposite to "retracting direction" not possible

[11-27] Example: Permissible traversing direction if software limit positions active

- If the software limit positions are active and a software limit position is passed ("overtravel"):
  - The error response "quick stop by trouble" is carried out in the Lenze setting, i.e. the drive is braked to standstill within the deceleration time set for the quick stop function irrespective of the setpoint selection. The error response can be parameterised in C02716/2.
  - The fault message "Pos. SW limit switch overtravelled" or "Neg. SW limit overtravelled" is entered in the logbook of the controller.
  - A corresponding status is output via the *LIM_dnState* output.
  - Depending on the parameterised fault response, the drive cannot traverse until the error has been acknowledged.

See also: ▸ Manual jog to limit position (📖 410)

11.11.2.2 Triggering behaviour of software limit position monitoring

This function extension is available from software version V4.0!

C02720 can be used to select the triggering behaviour of the software limit position monitoring of non-positon-controlled basic functions:

Selection "0: Based on set value"

From software version V4.0 onwards, this is the Lenze setting:

- If the basic functions "Speed follower" and "Torque follower" are used, the monitoring responds if the drive is outside the software limit positions and a command to travel in the "forbidden" direction is given (depending on the speed setpoint of the application).
- For all other non-position-controlled basic functions, the monitoring does not respond if a software limit position is exceeded.

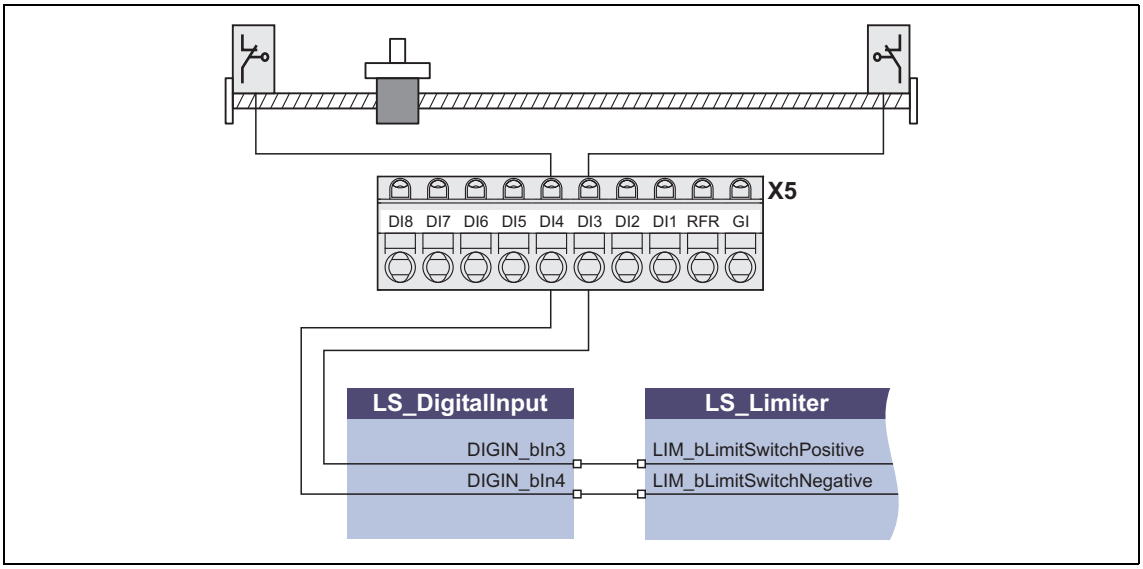
Selection "1: Based on set and actual value"

This selection corresponds to the behaviour known from the previous versions (software versions < V4.0):

- For all non-position-controlled basic functions, the monitoring responds if the actual position exceeds a software limit position.
  - The monitoring also responds in the function states "Controller not ready" and "Error". This may cause the monitoring to trigger permanently if the drive traverses to a software limit position and controller inhibit is set subsequently because the actual position slightly changes around the software limit position.
- If the basic functions "Speed follower" and "Torque follower" are used, the monitoring also responds if the drive is outside the software limit positions and a command to travel in the "forbidden" direction is given (depending on the speed setpoint of the application).

Note!

If the position-controlled basic functions "Manual jog", "Positioning" and "Position follower" are used, the monitoring responds independently of the triggering behaviour parameterised in C02720 if one of the following cases occurs:



- The setpoint position exceeds a software limit position.
- A travel command is given which would cause the drive to leave the permissible travel range.
- The drive is outside the software limit positions and a command to travel in the "forbidden" direction is given.

If the software limit position monitoring is triggered, the error response parameterised in C02716/2 is carried out.

11.11.2.3 Hardware limit positions (limit switch)

Monitoring of the travel range limit by means of limit switches is effected via the inputs *LIM_bLimitSwitchPositive* and *LIM_bLimitSwitchNegative* of the **LS_Limiter** SB.

- The two inputs respond to the TRUE state and are to be connected to the corresponding digital inputs to which the limit switches are connected:

[11-28] Example: Connection of the travel range limit switches to the digital inputs DI3 & DI4

- If the limit switches are connected to decentralised terminals, the two inputs *LIM_bLimitSwitchPositive* and *LIM_bLimitSwitchNegative* can be connected to the decentralised terminal via a bus system (e. g. system bus).

Note!

If the digital inputs used for the connection of the limit switches are to be designed in a fail-safe manner (activation at LOW level), you simply change the terminal polarity of the corresponding digital inputs in C00114.

- If one of the two monitoring inputs is set to TRUE:
  - The error response "quick stop by trouble" is carried out, i.e. the drive is braked to standstill within the deceleration time set for the quick stop function irrespective of the setpoint selection.
  - The fault message "Pos. SW limit switch has tripped" or "Neg. SW limit has tripped" is entered in the logbook of the controller.
  - A corresponding status is output via the *LIM_dnState* output.
  - The drive can only be traversed again after the error has been acknowledged.

Stop!

If a limit switch is approached by means of the basic function Position follower and by this a fault with the "Quick stop by trouble" response is activated, always a set/actual adjustment of the position has to be carried out before the fault is acknowledged, as otherwise an uncontrolled motor movement may result after the fault is acknowledged!

Tip!

An activated limit switch can be retracted using the function "Retracting the limit switch". ▸ Retracting of an activated limit switch (📖 411)

See also: ▸ Manual jog to limit position (📖 410)

11.11.2.4 Limitations

Limit values for the basic functions "Manual jog", "Homing" and "Positioning" can be set via the following parameters:

Parameters	Info
C02703	Max. speed • Max. permissible speed that can be driven by the system. • This parameter depends, among other things, on the max. motor speed.
C02705	Max. acceleration • Max. permissible acceleration or deceleration for positioning processes. • This parameter depends, among other things, on the motor torque and moment of inertia of the entire mechanics which is driven during the positioning process.
C02706	Min. S-ramp time

- The parameters depend on the mechanics (e.g. the tool used).
- Usually the parameters must be changed when a tool is exchanged, e.g. by means of a recipe management of a superimposed control or via an HMI ("*Human Machine Interface*").

Note!

In order that the set limit values are effective, "1" must be selected in C02702.
- Irrespective of this setting, basically, the speed setpoint is limited to the motor reference speed (C00011)!

The limitations are not effective for the basic functions "Speed follower", "Torque follower" and "Position follower"!
- In case of these basic functions only speed and acceleration are monitored.
- If the limit values for speed and acceleration are exceeded, the response parameterised in C02716/3 is activated (Lenze setting: no response).
- **Background:** In the case of technology applications which are synchronised via an electrical shaft, the setpoint followers may not be limited, since synchronism would be lost by this. A possible consequence would be a collision of tools.

- If the limit values are switched effectively and a limit value that is set is exceeded:
  - The setpoints of the active basic function ("Manual jog", "Homing" or "Positioning") are changed (limited).
  - The response parameterised in C02716/3 (Lenze setting: "No response") is activated.
  - A corresponding error message is entered into the logbook of the controller.
  - A corresponding status is output via the *LIM_dnState* output.
  - The display parameter "Limitation active" (C02715) is set to "1: Activated".

11.11.2.5 Permissible direction of rotation

Via C02707, or alternatively via the input *LIM_dwControl* (generally by the control word of the safety module) the permissible direction of rotation for the basic functions "Manual jog", "Homing", and "Positioning" can be restricted.

Note!

The restriction of the permissible direction of rotation is not actively effective for the basic functions "Speed follower", "Torque follower" and "Position follower"!

- Only the response parameterised in C02716/1 is executed.
  (Lenze setting: "No response")

- If the permissible direction of rotation is restricted and a travel command in the inhibited direction of rotation is requested:
  - The movement of the active basic function ("Manual jog", "Homing" or "Positioning") is cancelled.
  - The response parameterised in C02716/1 (Lenze setting: "No response") is activated.
  - The fault message "Pos. direction of rotation was limited" or "Neg. direction of rotation was limited" is entered in the logbook of the controller.
  - A corresponding status is output via the *LIM_dnState* output.

11.11.2.6 Limited speed

"Limited speeds" for the basic functions "Manual jog", "Homing" and "Positioning" can be set via the following parameters:

Parameters	Info
C02708/1...4	Limited speed 1 4
C02710/1...4	Dec. limited speed 1 4
C02711/1...4	S-ramp time limited speed 1 4
C02712/1...4	Dec. time limited speed 1 4

Note!

The limited speeds are not effective for the basic functions "Speed follower", "Torque follower" and Position follower"!

- The request "Limited speed 1 ... 4" is effected via the input *LIM_dwControl*, generally by the control word of the safety module. If no safety module is available, the control word for the input *LIM_dwControl* can also be generated by means of an inverter.
- By means of the input *LIM_bActivateLimitedSpeed1* additionally the request of "Limited speed 1" can be effected, e. g. via a digital input that is connected to this input.
- If a limited speed is requested and the current speed exceeds the limited speed:
  - The setpoints of the active basic function ("Manual jog", "Homing" or "Positioning") are changed (limited).
  - The response parameterised in C02716/3 (Lenze setting: "No response") is activated.
  - The error message "Speed has been limited" is entered into the logbook of the controller.
  - A corresponding status is output via the *LIM_dnState* output.
  - The display parameter "Limitation active" (C02715) is set to "1: Activated".

Process example: "Manual jog"

1. Manual jog in positive direction is active and the manual speed is greater than the "Limited speed 1" set.
2. Via the control word of the safety module the "Limited speed 1" is requested.
3. The drive is decelerated to the "Limited speed 1" with the deceleration and S-ramp time set for the "Limited speed 1".
4. At the same time, a corresponding status is output via the *LIM_dnState* output.

Priorisation of the limited speeds

The following applies to software versions lower than V3.0:

If several limited speeds are requested at the same time, the parameters of the limited speed with the lowest number are used, i.e. the "Limited speed 1" has the highest priority.

The following applies from software version V3.0:

If several limited speeds are requested at the same time, the lowest speed with the greatest deceleration and the lowest S-ramp time is approached from the parameters of the requested limited speeds.

When activating the profile parameter limitations (C2702 = TRUE), observe the following:

- The SLS deceleration is limited to maximally C2705.
- The SLS jerk time can minimally correspond to the value of the minimum S-ramp (C2706).

11.11.2.7 Limited increment for manual jog

Via C02713 the maximum permissible distance (limited increment) for the basic function "Manual jog" can be set.

- The request "Limited increment" is effected via the input *LIM_dwControl*, generally by the control word of the safety module. If no safety module is available, the control word for the input *LIM_dwControl* can also be generated by means of an inverter.
- In C02714 the maximum permissible distance in [increments] is displayed.

11.12 Brake control

This basic function is used for a wear-free control and monitoring of a motor holding brake which in the simplest case is connected to the optionally available motor brake control module (accessories).

Alternatively, the motor holding brake can be controlled via a digital output and monitored via a digital input.

Intended use

Motor holding brakes are used to hold axes in the case of controller inhibit or pulse inhibit and in the "Mains OFF" system state. This is not only important for vertical axes, but for instance also for horizontal axes for which an uncontrolled movement can bring about diverse problems.

Examples:

- Loss of the reference information after mains OFF and further spinning of the drive.
- Collision with other moving machine parts.

Danger!

Please bear in mind that the motor holding brake is an important element of the safety concept of the entire machine. Thus maintain this system component with special care!

Stop!

Motor holding brakes at Lenze motors are not designed for braking during operation. The increased wear resulting from braking during operation may lead to an early destruction of the motor holding brake!

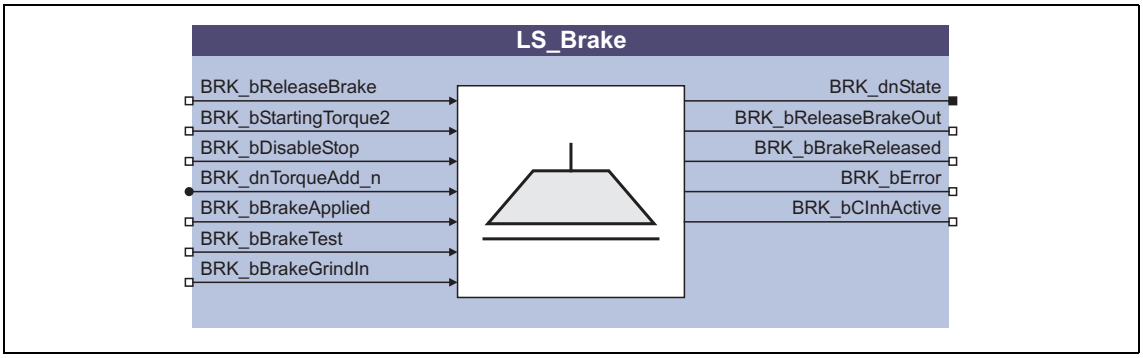
Please observe the notes in the hardware manual for mounting and electrical installation of the motor holding brake!

Note!

For the operation with the motor brake control module:

- For single-axis controllers (Single Drive) the control (release) of the motor holding brake is only possible if both the DC-bus voltage and a 24-V supply voltage are available for the motor brake control!
- For multi-axis controllers (Multi Drive) the motor holding brake can also be released without a DC-bus voltage.

For the encoderless motor control types (from software version V3.0) **the following applies:**



The operation of vertical drives/hoists is

- only supported up to 55 kW by the V/f control!
- not supported by the sensorless vector control!

When the V/f control or sensorless vector control are selected, standstill monitoring is always switched off.

11.12.1 Internal interfaces | "LS_Brake" system block

The **LS_Brake** system block provides the internal interfaces for the basic function "Brake control" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
BRK_bReleaseBrake C02609/1 | BOOL	Releasing/applying the brake in connection with the selected operating mode	
	FALSE	Apply brake. • During automatic operation, the internal brake logic controls the brake.
	TRUE	Release brake. • During automatic operation, the internal brake logic is deactivated and the brake is released. If the brake control has inhibited the controller, this inhibit is deactivated again.
BRK_bStartingTorque2 C02609/2 | BOOL	Selection of the torque feedforward control value • For the general use of the parameterisable starting torque as a feedforward control value, the setting C02588 = 0 is required. ▸ Torque feedforward control (📖 537)	
	FALSE	Starting torque 1 (C02586) is active.
	TRUE	Starting torque 2 (C02587) is active.
BRK_bDisableStop C02609/10 | BOOL	Prevent the brake from being applied in automatic operation • By this the drive remains position-controlled in the function states "Quick stop active", "Drive is stopped", and "Drive at standstill". • The input has no effect when the controller is inhibited.	
	TRUE	The application of the brake in automatic operation is prevented.
BRK_dnTorqueAdd_n C02608 | DINT	Additive torque value in [%] for torque feedforward control during start • 100 % ≡ C00057/2 ▸ Torque feedforward control (📖 537) Note: The input is read out if the brake receives a release signal, e.g. when *BRK_bReleaseBrake* = TRUE.	
BRK_bBrakeApplied C02609/3 | BOOL	Input for status detection via switching contacts at the brake • Activation of the input by setting C02583 = 1. ▸ Signal configuration (📖 528)	
	FALSE	Status "Brake is released".
	TRUE	Status "Brake is applied".
BRK_bBrakeTest C02609/4 | BOOL	Start/abort of the brake test ▸ Carrying out brake test (📖 554)	
	TRUE	Carry out brake test
	TRUE↘FALSE	Abort brake test (deactivate mode).
BRK_bBrakeGrindIn C02609/5 | BOOL	Start/abort of the brake grinding process ▸ Grinding the brake (📖 552)	
	TRUE	Brake grinding.
	TRUE↘FALSE	Abort grinding process (deactivate mode).

Outputs

Identifier DIS code | data type	Value/meaning	
BRK_dnState C02607 | DINT	Status (bit coded) • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Brake control is active.
	Bit 4	Motor brake control module is used.
	Bit 8	Brake status (internal status signal).
	Bit 9	Torque feedforward control is active.
	Bit 10	Controller inhibit by brake is active or set.
	Bit 15	Fault is active (collective message).
	Bit 16	State "Grinding the brake".
	Bit 17	State "Brake test".
	Bit 18	State "Direct control".
	Bit 19	State "Automatic control".
	Bit 20	Fault: External feedback.
	Bit 21	Fault: Position drift when brake is applied/checked.
	Bit 22	Error: Monitoring of motor brake control module
	Bit 23	Information: Brake activation via waiting time.
	Bit 24	Information: Brake grinding process completed.
	Bit 25	Information: Brake test completed.
	Bit 26	Fault: Feedforward control torque could not be established within one second.
	Bit 27	Information: Current speed has fallen below the threshold for brake activation set in C02581.
BRK_bReleaseBrakeOut C02609/6 | BOOL	Control signal for triggering an external brake/status signal for control state	
	FALSE	Apply brake.
	TRUE	Release brake.
BRK_bBrakeReleased C02609/7 | BOOL	Status signal of the brake control considering the closing and opening time of the brake	
	FALSE	Brake applied (after the brake application time has expired).
	TRUE	Brake released (after the brake release time has expired).
BRK_bError C02609/8 | BOOL	Status signal "Brake error"	
	TRUE	An error has been detected.
BRK_bCInhActive C02609/9 | BOOL	Status signal "Controller inhibit"	
	TRUE	Controller inhibit has been set by brake control.

11.12.2 Parameter setting

Danger!

A faultless brake control function requires a correct setting of the different deceleration times in the following parameters!

If the delay times are set incorrectly, a faulty control of the motor holding brake may be caused!

In the case of the basic functions Manual job, encoderless (📖 412) and Pole position identification (📖 575), the number of available operating modes of the holding brake is limited. Please refer to the danger notes in the chapters indicated.

- Parameterisation dialog in »Engineer«: Tab **Application parameters** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Brake control*
- Short overview of parameters for brake control:

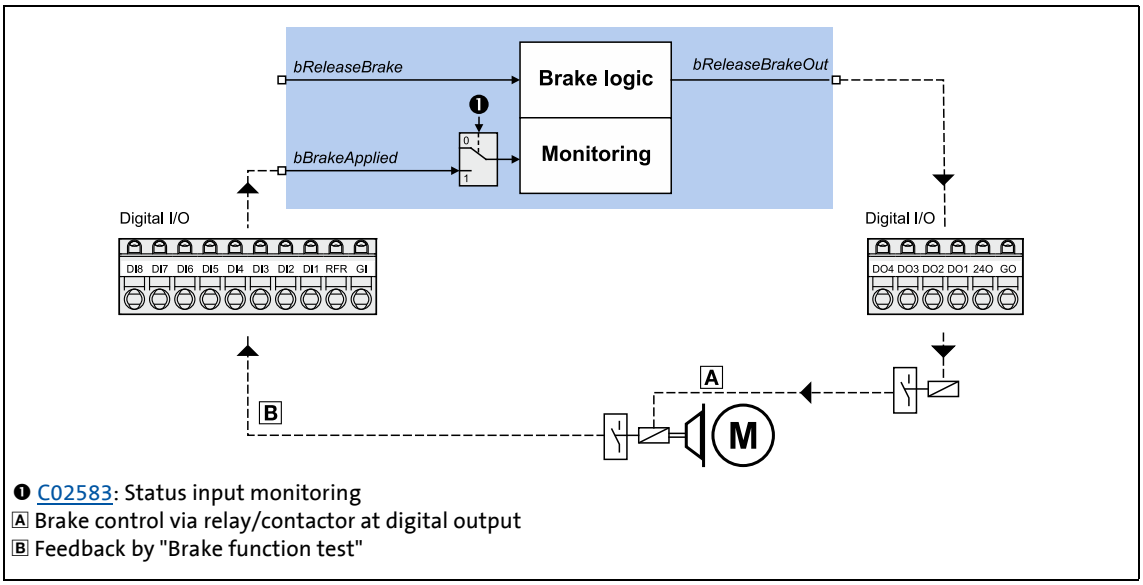
Parameters	Info
C02580	Brake operating mode
C02581	Threshold - brake activation
C02582	Brake resp. to pulse inhibit
C02583	Status input monitoring
C02585	Brake control polarity
C02586	Starting torque 1
C02587	Starting torque 2
C02588	Source of starting torque
C02589	Brake closing time
C02590	Brake opening time
C02591	Waiting time - status monitoring
C02593	Waiting time - brake activation
C02594	Test torque
C02595	Permissible angle of rotation
C02596	Grinding speed
C02597	Accel./decel. time - grinding
C02598	Grinding ON time
C02599	Grinding OFF time
C02600	Acceleration time feedf. control
C02601	Reference for acceleration time of brake
C02602	Source for feedf. control brake
C02603	Threshold 1 for opening brake
C02604	Threshold 2 for opening brake
C02605/1	Acceleration time - brake test
C02605/2	Duration of constant torque - brake test
C02605/3	Deceleration time - brake test
C02606	Minimum starting torque

11.12.2.1 Operating mode

Various operating modes are available in C02580 for different applications and tasks:

- Mode 0: Brake control is switched off (📖 542)
- Mode 1/11: Direct control of the brake (📖 543)
  - Without a specific logic or automatic system, can for instance be used to carry out a simple check on whether the brake switches correctly.
- Mode 2/12: Automatic control of the brake (📖 544)
  - The normal mode for the control of mech. holding brakes with and without holding torque precontrol.

Function extension from software version V3.0:



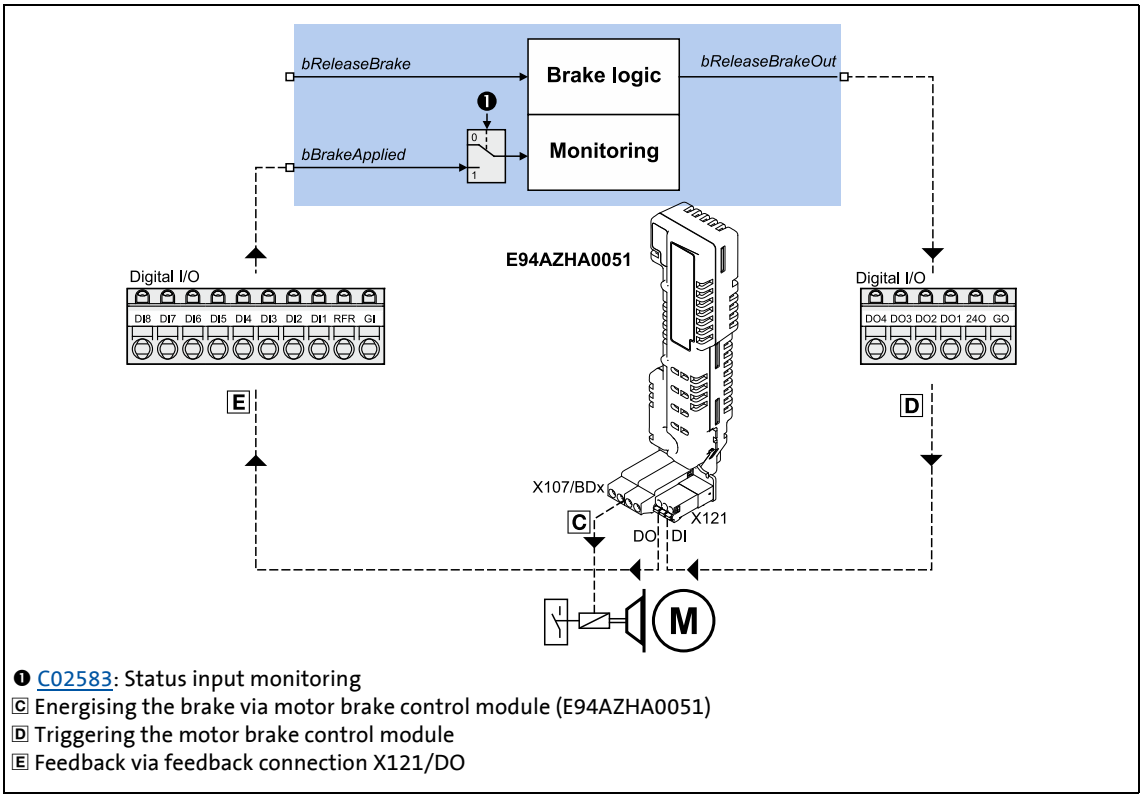
- Mode 22: Automatic DC-injection braking (📖 549)
  - DC-injection braking for V/f control and sensorless vector control.

11.12.2.2 Signal configuration

The signal configuration of the control and status signals for the brake logic and monitoring function is executed via the parameters shown in the following signal flows.

Direct brake control

This triggering of the holding brake does not need the motor brake control module:

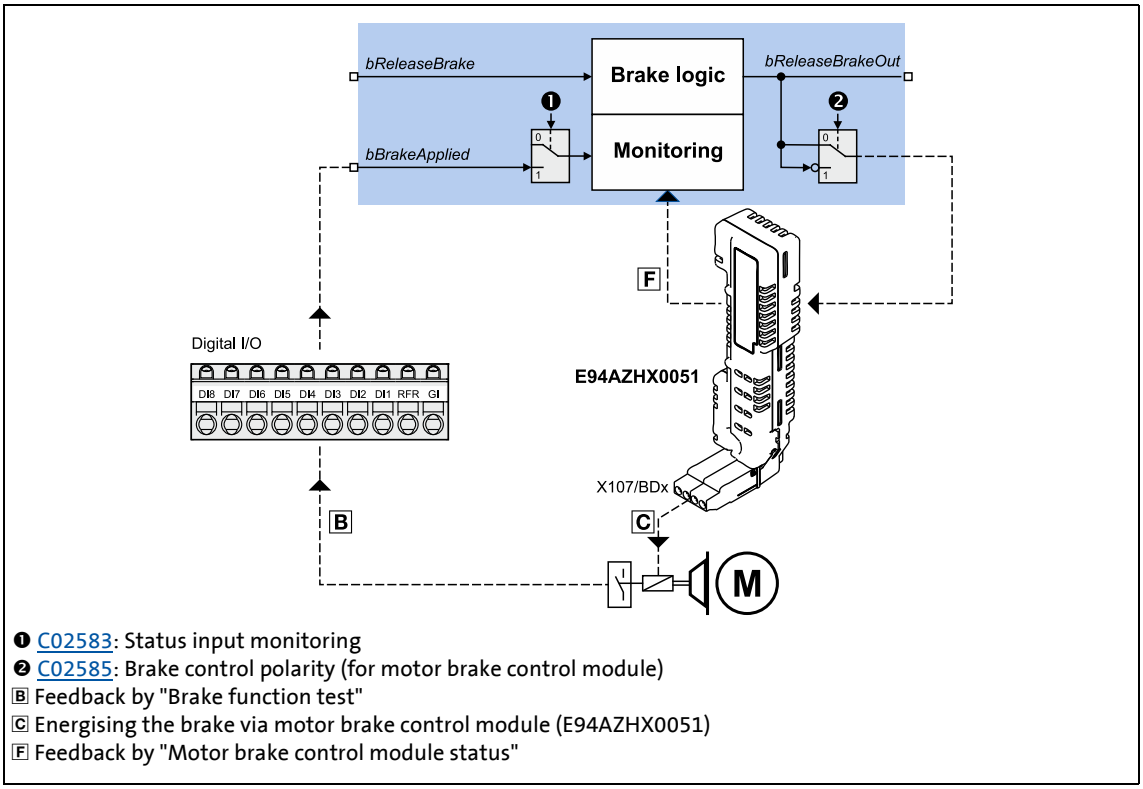


❶ C02583: Status input monitoring
A Brake control via relay/contactor at digital output
B Feedback by "Brake function test"

[11-29] Direct control of the motor holding brake

Triggering the brake via the motor brake control module E94AZHA0051

The design of the motor brake control module E94AZHA0051 enables the external control of the holding brake via an additional 3-pole terminal (X121).



❶ C02583: Status input monitoring
C Energising the brake via motor brake control module (E94AZHA0051)
D Triggering the motor brake control module
E Feedback via feedback connection X121/DO

[11-30] Signal configuration of the control and status signal with the motor brake control module E94AZHA0051

Triggering the brake via the motor brake control module E94AZHX0051

The motor brake control module E94AZHX0051 does **not** include an additional 3-pole terminal for the external control of the holding brake.

❶ C02583: Status input monitoring
❷ C02585: Brake control polarity (for motor brake control module)
B Feedback by "Brake function test"
C Energising the brake via motor brake control module (E94AZHX0051)
F Feedback by "Motor brake control module status"

[11-31] Signal configuration of the control and status signal with the motor brake control module E84AZHX0051

Note!

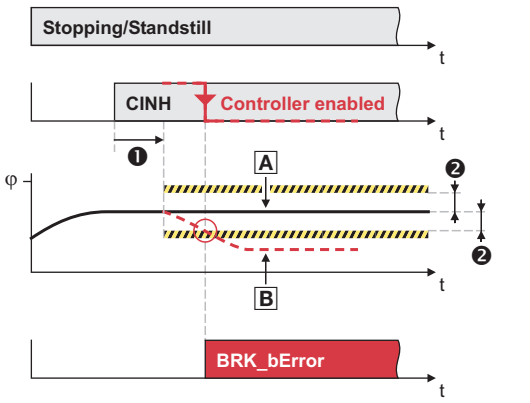
If an electrically holding (self-releasing) motor holding brake is to be controlled instead of an electrically releasing (self-holding) motor holding brake, the corresponding control and status signals must be inverted!

Please observe the notes in the hardware manual for mounting and electrical installation of the motor holding brake!

Status monitoring by "Motor brake control module status"

(See signal path E in fig. [11-30])

- Indirect status detection of the brake function.
- Monitoring of the motor brake control module and the electrical brake circuit.



Status monitoring by "Brake function test"

(See signal path B in fig. [11-29] or [11-31]

- Direct function test of the complete brake circuit by microswitches at the brake.
- Wear control of the brake rotor.

11.12.2.3 Standstill monitoring

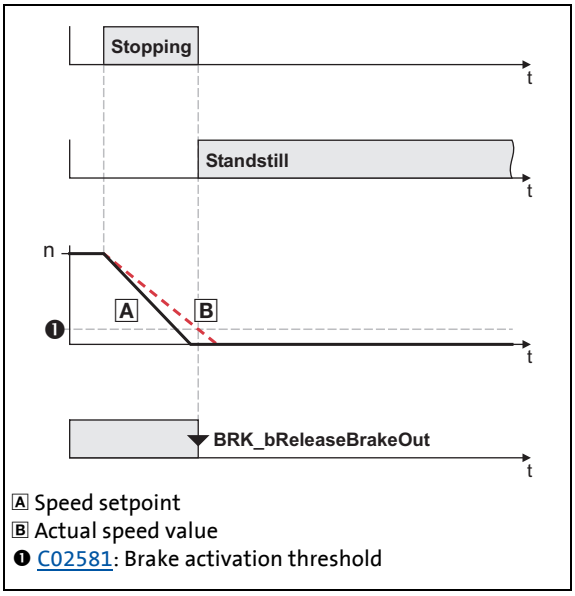
After the brake closing time and the waiting time for the status monitoring have elapsed, the standstill monitoring becomes active, i. e. the holding position is noted and compared to the permissible angle of rotation set in C02595 (Lenze setting: 5°) when the brake is applied.

A Normal behaviour
B Error behaviour
❶ C02591: Waiting time - status monit.
❷ C02595: Permissible angle of rotation
CINH = controller inhibit

[11-32] Automatic monitoring of the holding position

- If the stop position of the motor axis has changed by more than the permissible angle of rotation set in C02595, although the brake is engaged:
  - The error message "Motor brake: Angular drift with closed brake too high" is entered into the logbook.
  - "Quick stop by trouble" is activated as error response to avoid a further rotation/acceleration of the drive.
  - The error output *BRK_bError* is set to TRUE for one task cycle.
  - The status "position drift when brake is applied" is displayed at the *BRK_dnState* status output via bit 21 for one task cycle.

Note!



The standstill monitoring can be switched off by the setting C02595 = "0°".

For the encoderless motor control types (from software version V3.0) **the following applies:**

If the V/f control or the sensorless vector control is selected, the standstill monitoring is generally switched off, irrespective of the setting in C02595.

11.12.2.4 Speed watchdog

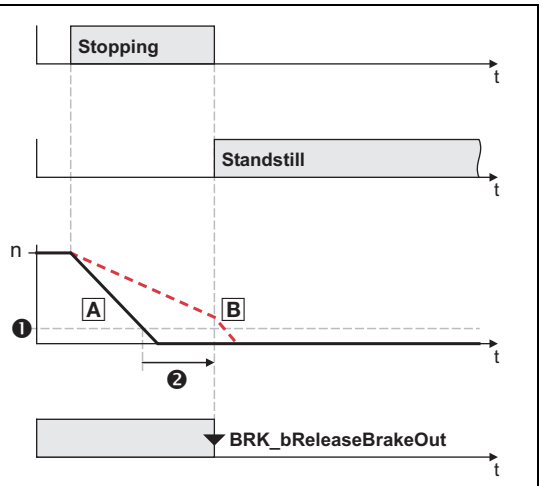
Brake activation through N < N_{min}

A Speed setpoint
B Actual speed value
❶ C02581: Brake activation threshold

[11-33] Process of brake activation through N < Nmin

- If the motor speed falls below the threshold for brake activation set in C02581, the function "Close brake" is activated in the automatic operation (mode 2/12).
- Here only the absolute value of the motor speed is considered, the direction of rotation remains unconsidered.
- In manual operation (mode 1/11) C02581 has no function.

Tip!



The value in C02581 should be set to approx. 5 ... 20 % of the maximum speed to minimise the wear of the brake and also provide for an optimum braking behaviour by a low grinding of the brake.

Brake activation through time-out

If a waiting time for the brake activation > 0 s is set in C02593, the time monitoring is active, i. e. the brake at the latest is activated for application after the waiting time has elapsed, even if the actual speed value is still above the threshold for the brake activation set in C02581.

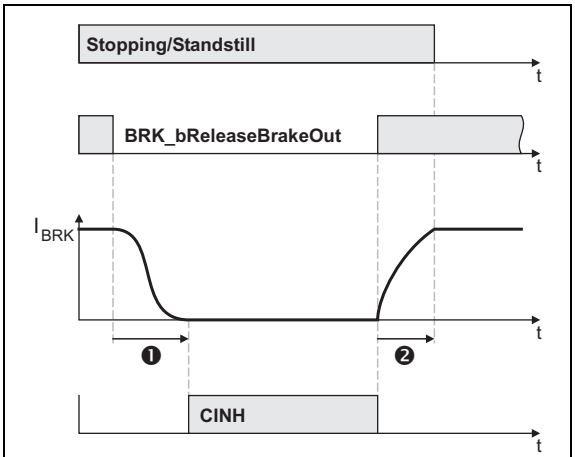
Note!

In the Lenze setting the time monitoring is not active (C02593 = "0 s").

Ⓐ Speed setpoint
Ⓑ Actual speed value
❶ C02581: Brake activation threshold
❷ C02593: Waiting time for brake activation

[11-34] Process of brake activation through time-out

- The waiting time starts to elapse if the speed setpoint has reached the threshold for the brake activation.
- If the speed setpoint is still above the threshold after the waiting time has elapsed:
  - The brake is automatically triggered to close in automatic operation (mode 2/12).
  - The "brake activation via waiting time" status is displayed at the *BRK_dnState* status output via bit 23.
  - The information "Motor brake: Automatically activated after waiting time has elapsed" is entered in the logbook.



11.12.2.5 Braking time characteristics

Application and release time

Danger!

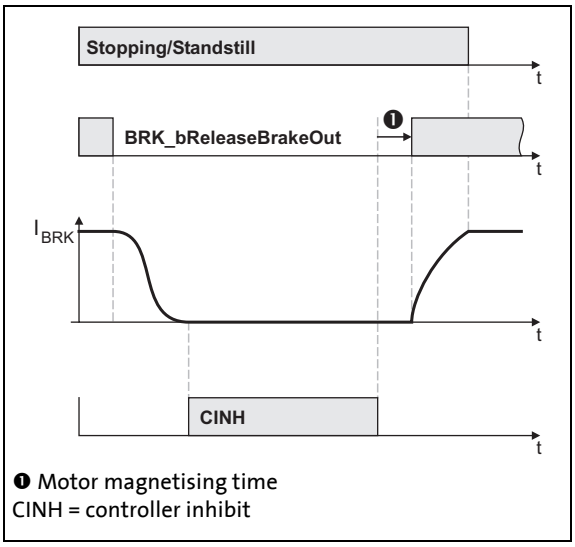
A wrong setting of the closing and opening time can cause a wrong activation of the motor holding brake!

- When the closing time is set too low, the controller is inhibited and the drive gets torqueless before the motor holding brake is closed completely.

❶ C02589: Brake closing time
❷ C02590: Brake opening time
CINH = controller inhibit

[11-35] Definition of the application and release time with the example of the PM brake

- Every mechanical motor holding brake has a construction-conditioned application and opening time which has to be taken into consideration by the brake control and which for this purpose has to be set in C02589 and in C02590.
- The information on the application and opening time of a Lenze-motor holding brake can be found in the corresponding Operating Instructions in the chapter "Technical data".
- If the application and release times are too long, this is uncritical in respect of safety but leads to unnecessarily long delays during cyclical braking processes.



Tip!

The application and release times do not only vary between the brake types but also depend on the basic conditions in the plant:

- Parameters of the hardware (cable length, temperature, level of supply voltage etc.)
- Contact elements used (motor brake control module or contactor at the digital output)
- Type of overvoltage limitation/suppressor circuit

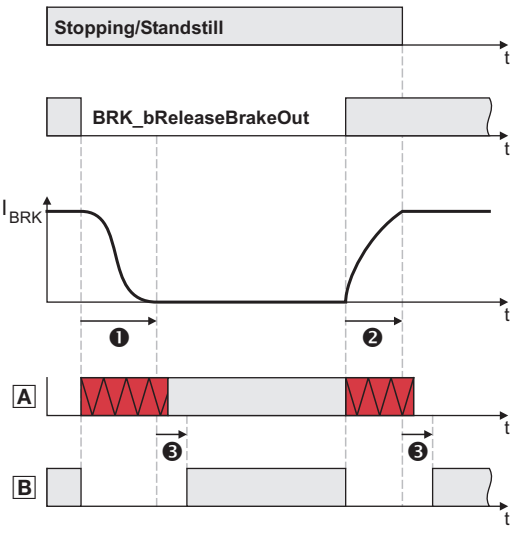
For optimisation purposes, detect in individual cases the response times by measurement.

Motor magnetising time (only with asynchronous motor)

❶ Motor magnetising time
CINH = controller inhibit

[11-36] Considering the motor magnetising time taking the PM brake as an example

- When an asynchronous motor is used, first the magnetic field required for the holding torque is created (which is already available when a synchronous motor is used) after the controller inhibit is deactivated.
- The brake is only released if the actual torque has reached 90 % of the feedforward control torque.



Waiting time for status monitoring

Every time the brake status changes, the waiting time set in C02591 is awaited after the brake opening or brake closing time has elapsed, before the monitoring of the motor brake control module and the status input *BRK_bBrakeApplied* (if activated via C02583) and the standstill monitoring function are switched active again.

- During the "Closing the brake" process, a mechanical contact must signal the "brake closed" state after the waiting time has elapsed.
- During the "Releasing the brake" process, a mechanical contact must signal the "brake released" state after the waiting time has elapsed.

Tip!

The additional waiting time is based on the fact that during the state change of the brake also state changes with regard to the monitored signals within the brake logic can occur, e. g. by bouncing the microswitch on the brake, or activation of the short circuit threshold within the motor brake control module due to discharge current peaks when the brake voltage is switched on. These state changes result in the activation of the monitoring function, although no stationary fault is pending.

A Brake status (with bouncing or transient response)
B Active status monitoring
❶ C02589: Brake closing time
❷ C02590: Brake opening time
❸ C02591: Waiting time - status monit.

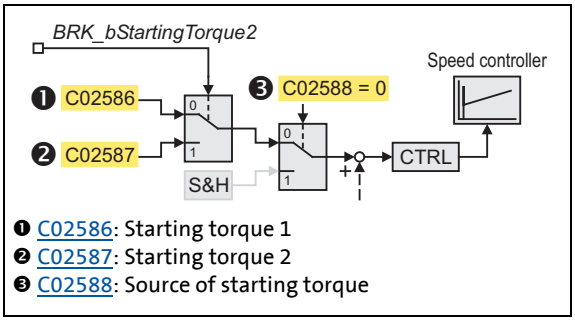
[11-37] Definition of the waiting time for status monitoring

- The waiting time in C02591 must be set so that bouncing of a feedback contact and the transient response of the brake current monitoring will be suppressed completely.
- If no corresponding feedback takes place after the waiting time has elapsed:
  - The error output *BRK_bError* is set to TRUE until the next trigger attempt starts.
  - The error response "Quick stop by trouble" is activated.
  - The error message "Brake status error" is entered into the logbook.

11.12.2.6 Torque feedforward control

In automatic operation (mode 2/12) the brake control offers the possibility of precontrolling the required torque of the drive when the brake is released.

Note!



The torque is precontrolled for one second. During this time, the actual torque must have reached 90 % of the set torque, otherwise a fault is tripped!

The torque feedforward control is also supported for the V/f control (from software version V3.0) .

Via C02588 first the basic selection on whether a parameterised starting torque or the torque memorised during the last application process is to be used for the feedforward control.

With this setting, C02606 serves to define an additional torque which is to be used for feedforward control. This is for instance reasonable for hoist drives, in order to avoid, for example, that, due to stalling, a counteracting standstill torque is saved.

Feedforward control with parameterised starting torque

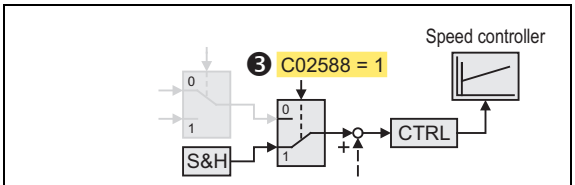
[11-38] Feedforward control with parameterised starting torque

- When C02588 = 0, a change-over between two starting torques is possible via input *BRK_bStartingTorque2*:
  - *BRK_bStartingTorque2* = FALSE: Starting torque 1 (C02586) is used.
  - *BRK_bStartingTorque2* = TRUE: Starting torque 2 (C02587) is used.

Application example:

A hoist drive is to be operated with different loads. Unfortunately we do not know when the load is available, but the starting direction (lifting or lowering) is known.

- In a no-load condition, the hoist drive needs a torque of 10 Nm. For holding the maximum load it needs a torque of 50 Nm.
- The change-over between lifting and lowering at start-up is done via the input *BRK_bStartingTorque2*.



- To ensure the correct direction at start-up, the speed controller is loaded with the following starting torques:

	Lifting	Lowering
Starting torque:	C02586 = 50 Nm	C02587 = 10 Nm

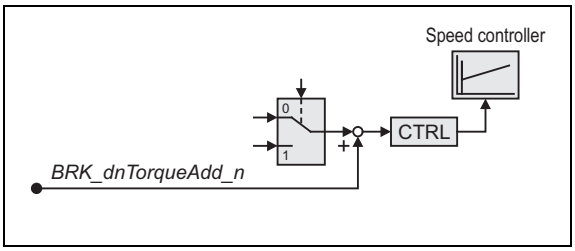
- This results in the following behaviour depending on load and direction:

	Lifting	Lowering
Behaviour at max. load:	Optimum behaviour	Start-up a bit fast, but correct direction (non-critical).
Behaviour without load:	Start-up a bit fast, but correct direction (non-critical).	Optimum behaviour

Feedforward control with memorised torque

❸ C02588: Source of starting torque

[11-39] Feedforward control with parameterised starting torque



- When C02588 = 1, the starting torque is the setpoint which has been automatically memorised during the last closing process (falling below the speed threshold set in C02581).

Note!

The greater the threshold for the brake activation set in C02581, the greater the dynamic portion (e. g. the speed-dependent friction torque) in the memorised torque.

For the specific case that the load is altered while the motor holding brake is closed, a correction value for the torque feedforward control can be defined via the input *BRK_dnTorqueAdd_n* that is added to the memorised torque.

Further torque feedforward control options

[11-40] Feedforward control with parameterised starting torque

- Via the input *BRK_dnTorqueAdd_n* an additional feedforward control value can be defined.

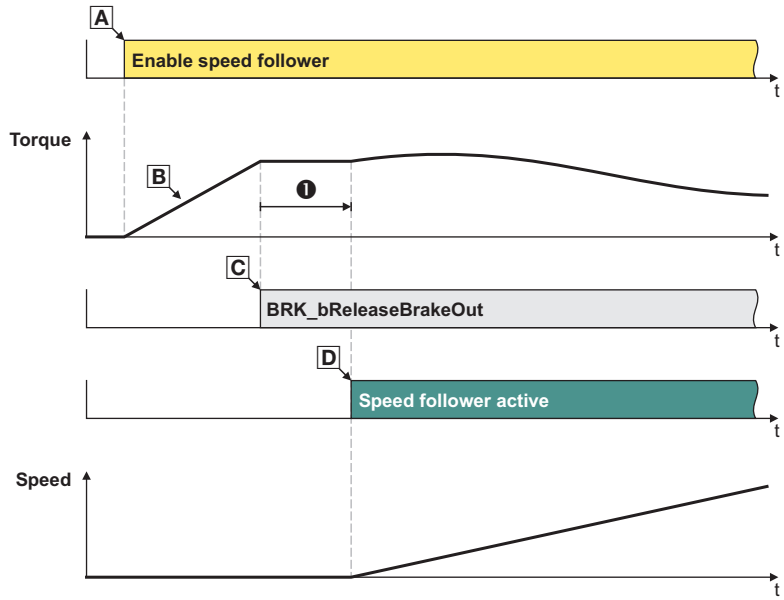
  Note:
  The input is read out if the brake receives a release signal, e.g. when *BRK_bReleaseBrake* = TRUE.

Application example:

In the case of a hoist drive, the load is always known. For an optimum behaviour a torque proportional to the load and additionally 10 Nm as a constant feedforward control value should be loaded into the speed controller.

- As a constant feedforward control value the starting torque 1 is used (C02586 ="10 Nm", C02588 = "0", and *BRK_bStartingTorque2* = FALSE).
- Via the input *BRK_dnTorqueAdd_n* the torque is specified proportional to the load.

11.12.2.7 Torque feedforward control via ramp function



This function extension is available from software version V3.0!

The brake control additionally offers the possibility of establishing the required torque of the drive when the brake is released via a parameterisable ramp function.

Recruitments

1. Go to C02600 and set the acceleration time for the feedforward control.
2. Go to C02601 and select the reference for the acceleration time:
   - Selection "0: Motor reference value":
     The acceleration time refers to the generation of the motor reference torque (C00057/2), i.e. the acceleration is constant.
   - Selection "1: Starting current value":
     The acceleration time refers to the torque requested, i. e. the acceleration time is constant.

Procedure

Ⓐ Request of basic function "Speed follower" ➞ open brake
Ⓑ Torque is generated up to the setpoint via ramp function
Ⓒ Brake is triggered for being opened
Ⓓ After brake opening time has elapsed, the basic function "Speed follower" is activated
❶ C02590: Brake opening time

[11-41] Sequence of torque feedforward control via ramp function

11.12.2.8 Speed feedforward control via ramp function for V/f control

This function extension is available from software version V3.0!

For the V/f control there is the possibility of carrying out a feedforward control by means of a speed which is generated via a parameterisable ramp.

Note!

The operation of vertical drives/hoists is only supported up to 55 kW by the V/f control!

Settings:

1. Go to C02602 and set the selection "1: Speed" as source for the feedforward control.
2. Go to C02603 to set the speed threshold from which on the brake is to be opened.
   - C02604 can be used to parameterise a second speed threshold which can be activated by setting *BRK_bStartingTorque2* to TRUE.
3. Go to C02600 and set the acceleration time for the feedforward control.
4. Go to C02601 and set the reference for the acceleration time (0: Motor reference value, 1: Starting current value).

11.12.3 Mode 0: Brake control is switched off

If the mode 0 is selected in C02580, the brake control is switched off.

- If a motor brake control module is available, it will not be triggered.
- The brake monitoring function is not active.
- A potential fault reported by the brake control is reset automatically.
- The output signals of the system block LS_Brake are reset:
  - *BRK_dnState* = 0
  - *BRK_bReleaseBrakeOut* = FALSE
  - *BRK_bBrakeReleased* = FALSE
  - *BRK_bError* = FALSE

Note!

In the Lenze setting, the mode 0 is preset to get into a safe state after the mains is switched on.

11.12.4 Mode 1/11: Direct control of the brake

If the mode 1 or 11 has been selected in C02580, the brake is directly controlled via the input *BRK_bReleaseBrake*.

Tip!

Mode 1/11 can be used to easily check if the brake switches correctly.

- By the selection of the mode it is also defined in which way the brake is to be controlled:
  - Mode 1: Direct brake control via a motor brake control module.
  - Mode 11: Direct brake control via a digital output.

Note!

The digital outputs are not suitable for the "direct" control of a motor holding brake!

- The digital output used must be connected to a relay or power contactor which switches the brake supply.
- If a power contactor is used, the response and release time of the contactor contact is also added to the response and release time of the brake.

For the operation with the motor brake control module:

- For single-axis controllers (Single Drive) the control (release) of the motor holding brake is only possible if both the DC-bus voltage and a 24-V supply voltage are available for the motor brake control!
- For multi-axis controllers (Multi Drive) the motor holding brake can also be released without a DC-bus voltage.

- Setting the pulse inhibit or controller inhibit does not influence the output signal.
- After the brake has been activated and the brake closing time has elapsed, the controller inhibit is set automatically by the basic function "brake control".
- For the operation with a motor brake control module (mode 1) the desired polarity for controlling the brake can be set in C02585.

11.12.5 Mode 2/12: Automatic control of the brake

If mode 2 or mode 12 is selected in C02580, the brake is controlled automatically, i. e. if another basic function is activated, which results in a traversing of the drive, the brake is automatically opened and operation is enabled. If the corresponding basic function is deactivated again, the drive is stopped via the basic function "Stop" and the brake is automatically closed again if the speed setpoint and the actual speed value are below the speed threshold set in C02581.

Tip!

The 2/12 mode is the usual mode to control the brake.

In this mode, the *BRK_bReleaseBrake* input should be set permanently to FALSE unless a manual release is required.

If *BRK_bReleaseBrake* = TRUE, the brake is released permanently and the automatic control cannot close the brake.

- By the selection of the mode it is also defined in which way the brake is to be controlled:
  - Mode 2: Current monitoring active, brake is automatically controlled via motor brake control module.
  - Mode 12: Current monitoring deactivated, brake is controlled via digital output. If a motor brake control module is installed, this will also be controlled.

Note!

The digital outputs are not suitable for the "direct" control of a motor holding brake!

- The digital output used must be connected to a relay or power contactor which switches the brake supply.
- If a power contactor is used, the response and release time of the contactor contact is also added to the response and release time of the brake.

For the operation with the motor brake control module:

- For single-axis controllers (Single Drive) the control (release) of the motor holding brake is only possible if both the DC-bus voltage and a 24-V supply voltage are available for the motor brake control!
- For multi-axis controllers (Multi Drive) the motor holding brake can also be released without a DC-bus voltage.

- The brake is also activated automatically if a quick stop is activated in the drive, e.g. via the basic function "Quick stop" or as a response to a fault and also in case of a controller inhibit and pulse inhibit. ▸ Behaviour in case of pulse inhibit (📖 545)
- By setting the input *BRK_bDisableStop* to TRUE, an application of the brake at standstill or during quick stop can be avoided; by this the drive remains position-controlled.
- After the brake has been activated automatically and the brake closing time has elapsed, the controller inhibit is set automatically by the basic function "brake control".
- For the operation with a motor brake control module (mode 2) the desired polarity for controlling the brake can be set in C02585.

11.12.5.1 Behaviour in case of pulse inhibit

In case of pulse inhibit the brake is applied. This occurs according to the parameter setting in C02582 either immediately (default setting) or delayed when the threshold set for brake activation is fallen below, which can be selected to protect the brake if high centrifugal masses occur.

Note!

Setting the pulse inhibit results causes the motor to coast down in a load-controlled manner until pulse enable is carried out again.

Pulse inhibit can be set in the enabled controller, e.g. due to a DC overvoltage, DC undervoltage or the "Safe torque off" request.

Stop!

Before setting the parameters of C02582 it is important to assess the energy conditions of the machine.

The amount of energy stored in the machine can exceed the permissible switching energy of a motor holding brake at the time of pulse inhibit and can thus destroy the brake when being applied!

Activate the brake in any case

When C02582 = "0", the brake is immediately triggered to close to prevent the mechanics from being damaged.

Only activate brake below threshold for brake activation

When C02582 = "1", the brake remains released until the threshold set in C02581 for brake activation has been reached to protect the brake from excessive wear.

- The braking action only takes places due to the friction in the load mechanics.
- Only when the motor speed has reached the threshold for brake activation, the brake will be closed.

Stop!

Do not set the threshold for brake activation in C02581 too high to protect the motor holding brake from wear!

Note!

For the encoderless motor control types (from software version V3.0) **the following applies:**

If V/f control without encoder or sensorless vector control is selected, there is no speed information for the controller in the case of pulse inhibit, therefore the threshold set in C02581 for the brake activation is not effective in this case.

In order to avoid that the motor holding brake is closed in case of pulse inhibit, a waiting time for the brake activation can be parameterised in C02593. In case of pulse inhibit, the motor holding brake is then only triggered to close after this application time has elapsed. ▸ Speed watchdog (📖 532)

11.12.5.2 Process when brake is released

The following process occurs when a basic function is requested which causes the drive to traverse:

1. The controller inhibit is deactivated.
2. The magnetic field required for the holding torque is created in the motor (is already available when a synchronous machine is used).
3. The feedforward control torque is loaded into the speed controller.
4. If the actual torque has reached 90 % of the feedforward control torque:
   - The output *BRK_bReleaseBrakeOut* is set to TRUE for releasing the brake.
   - Monitoring of the motor brake control module is deactivated temporarily.
   - Monitoring of the status input is deactivated temporarily (if switched active via C02583).
   - The brake opening time starts to elapse.
5. After the brake opening time has elapsed:
   - The output *BRK_bBrakeReleased* is set to TRUE.
   - The requested basic function is enabled.
6. After the additional waiting time set for the status monitoring in C02591 has elapsed:
   - Monitoring of the motor brake control module is active again.
   - Monitoring of the status input is active again (if switched active via C02583).

11.12.5.3 Process when brake is closed

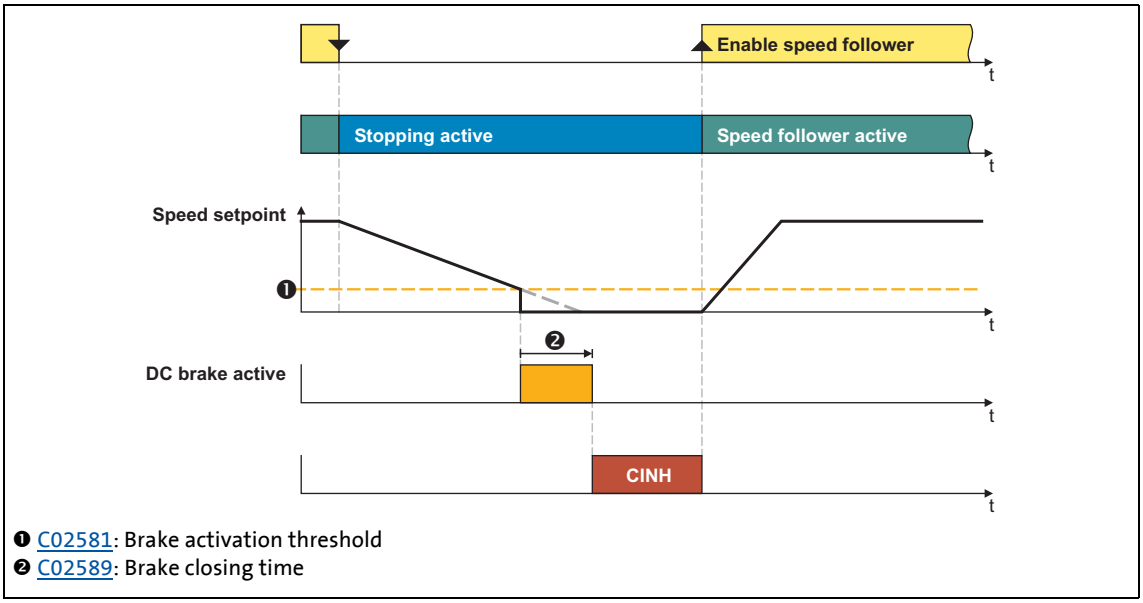
The following process occurs if the enable of the requested basic function for traversing the drive is deactivated again:

1. The drive is brought to standstill via the basic function "Stop", or, where required, also via the basic function "Quick stop".
2. When speed setpoint and actual speed value have fallen below the speed threshold set in C02581:
   - The output *BRK_bReleaseBrakeOut* is set to FALSE for closing the brake.
   - The current torque is saved, so that, if necessary, it can be used for feedforward control during the next start.
   - Monitoring of the motor brake control module is deactivated temporarily.
   - Monitoring of the status input is deactivated temporarily (if switched active via C02583).
   - The brake application time starts to expire.
3. After the brake closing time has elapsed and the corresponding state change of the status signal:
   - The output *BRK_bBrakeReleased* is reset to FALSE.
   - Controller inhibit set.
4. After the additional waiting time set for the status monitoring in C02591 has elapsed:
   - Monitoring of the motor brake control module is active again.
   - Monitoring of the status input is active again (if switched active via C02583).
   - Standstill monitoring is activated. ▸ Standstill monitoring (📖 531)

11.12.6 Mode 22: Automatic DC-injection braking

This function extension is available from software version V3.0!

Note!

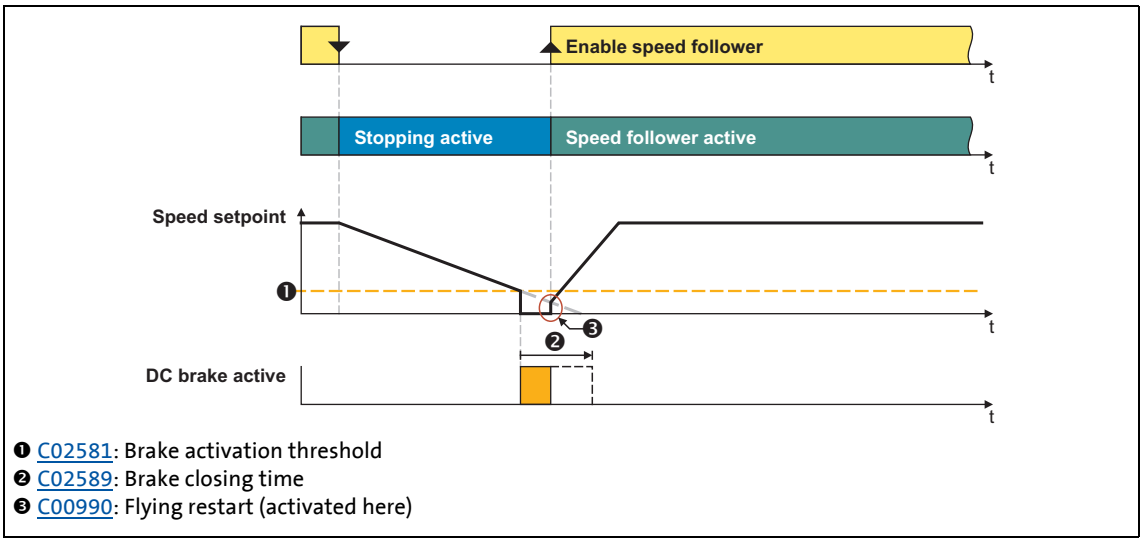


Automatic DC-injection braking is only possible if V/f control or sensorless vector control is selected as motor control type in C00006!

If mode 22 has been selected in C02580, DC-injection braking is executed automatically if the current speed setpoint falls below the speed threshold set in C02581.

- The automatic is only effective in the function states "Drive is stopped", "Drive at standstill", "Quick stop active", and "Fault".
- DC-injection braking is executed for the brake closing time set in C02589 with the braking current set in C00974.
- After the brake closing time has elapsed, the controller inhibit is set automatically by the basic function "brake control".

Danger!

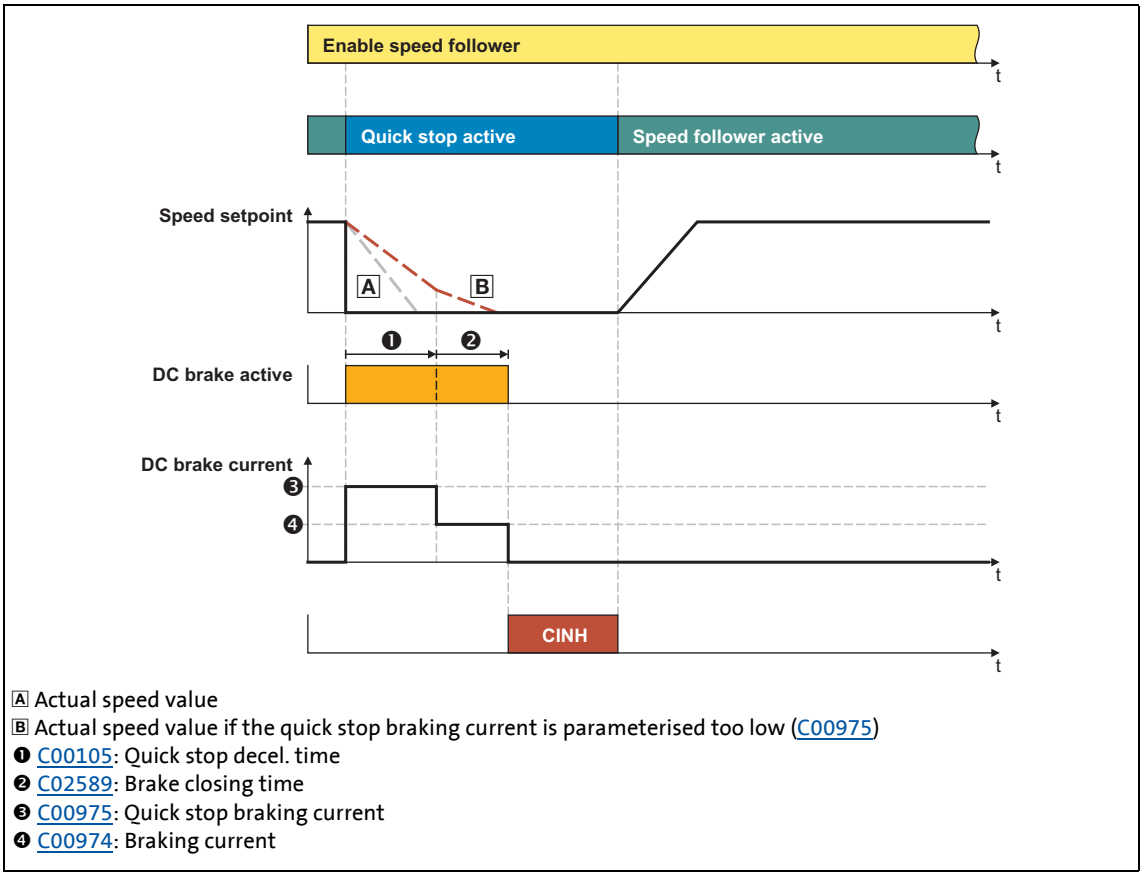


If the braking current is set too low, or the application time is too short, controller inhibit is set and the drive becomes torqueless before being completely braked to standstill by means of DC-injection braking!

❶ C02581: Brake activation threshold
❷ C02589: Brake closing time

[11-42] Example 1: Speed follower active → stopping active (stopping time > brake closing time) → speed follower active

- If a basic function is requested again before the brake closing time has elapsed, DC-injection braking is interrupted and - if activated in C00990 – the flying restart process is started and the basic function is activated:



[11-43] Example 2: Speed follower active ➞ stopping active (stopping time > brake closing time) ➞ speed follower active

Automatic DC-injection braking when quick stop is activated

DC-injection braking is activated automatically if a quick stop is triggered in the drive, e.g. via the basic function "Quick stop" or as a response to an error.

- A change-over to the "Quick stop active" function state is effected, and for the quick stop deceleration time set in C00105 a DC-injection braking process with the braking current set in C00975 is carried out.
- After this time has elapsed, a change-over to the braking current parameterised in C00974 is carried out and DC-injection braking is continued with this braking current.
- After the brake closing time set in C02589 has also elapsed, the basic function "Brake control" automatically sets controller inhibit.
- The DC-injection braking in this case is also carried out when the "Quick stop by trouble" error response is actuated; however, instead of the "Quick stop active" function state, the "Fault" function state is active, and the controller is in the "Quick stop by trouble active" device state.

A Actual speed value
B Actual speed value if the quick stop braking current is parameterised too low (C00975)
❶ C00105: Quick stop decel. time
❷ C02589: Brake closing time
❸ C00975: Quick stop braking current
❹ C00974: Braking current

[11-44] Process example: speed follower is active → quick stop activation → speed follower is active

Note!

The quick stop braking current in C00975 has to be set so that the drive can be decelerated from the maximum operating speed to standstill within the deceleration time for quick stop set in C00105!

11.12.7 Grinding the brake

This function may be required after the brake has been replaced. The holding torque specified in the data sheet is only reached if the friction partners are ground in after mounting.

Stop!

If this function is activated, the drive is automatically accelerated to the grinding speed parameterised in C02596.

- The axis must move freely without driving against the travel range limitations.
- The maximally permissible friction energy of the brake must not be exceeded (observe the specifications of the manufacturer)!

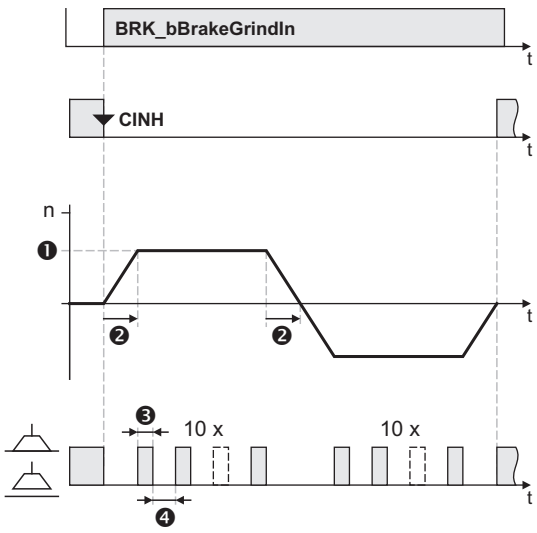
$$W_{total}[J] \sim M_K[Nm] \cdot \frac{2\pi}{60} \cdot N[min^{-1}] \cdot t_{total}[s]$$

[11-45] Formula for estimating the friction energy during grinding process

Prerequisites

In order to be able to activate the grinding of the brake, the following conditions must be fulfilled:

- The grinding speed in C02596 is set higher than 0 rpm.
- The brake is activated, i.e. the "brake closing time" (C02589) and the "waiting time for status monitoring" (C02591) are elapsed.
- No other source for controller inhibit is active so that the controller inhibit can be deactivated by the brake control.



Note!

When grinding the brake, ensure that the motor shaft can be kept at speed against the closed holding brake.

- For this purpose, make sure that the maximum torque of the motor control (C00057/2) is higher than the holding torque of the brake.

Procedure

If all requirements mentioned before have been met, the grinding process can be started by setting the input *BRK_bBrakeGrindIn* to TRUE.

❶ C02596: Grinding speed
❷ C02597: Acc./dec. time - grinding
❸ C02598: Grinding ON time
❹ C02599: Grinding OFF time
CINH = controller inhibit

[11-46] Sequence of the grinding operation

- After the grinding speed has been reached, the friction partners in the brake are ground by a pulse-type control.
- After the brake has been closed and opened ten times, the direction of rotation changes and grinding in the opposite direction is carried out.
- By resetting the input *BRK_bBrakeGrindIn* to FALSE the grinding process can be aborted.

11.12.8 Carrying out brake test

This function can be used to check the holding torque of the brake.

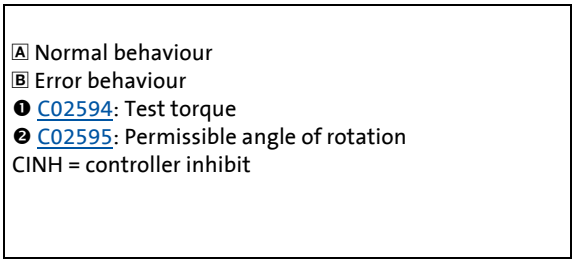
Tip!

You can carry out this test in regular intervals, e. g. to detect a defect or wear of the brake at an early stage.

Note!

Due to possible deviations in the torque generation, the test of the holding torque cannot determine the holding torque exactly!

- The generated motor torque can deviate up to ±15 % from the default value depending on temperature.
- The test torque is internally limited to the value of the motor reference torque (C00057/2). A higher parameterisation of C02594 is automatically limited to this value.



Prerequisites

In order to be able to activate the brake test, the following requirements have to be met:

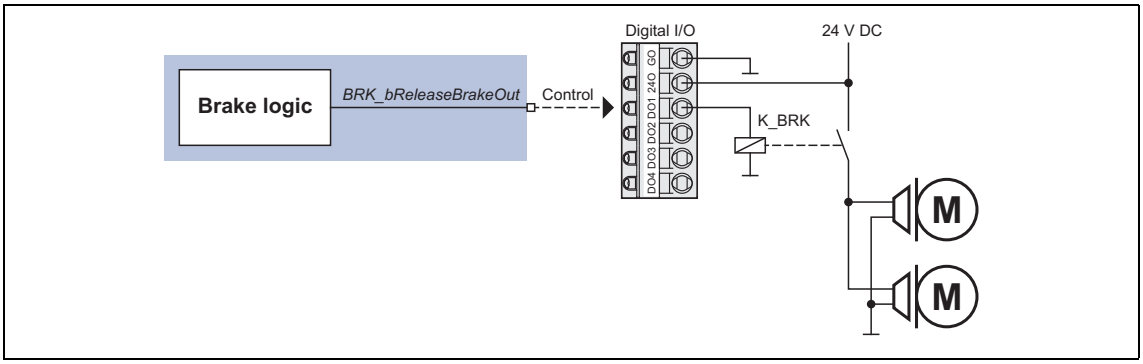
- The test torque in C02594 is set higher than 0 Nm.
- The permissible angle of rotation is set greater 0° in C02595, thus standstill monitoring is active. ▸ Standstill monitoring (📖 531)
- The brake is activated, i.e. the "brake closing time" (C02589) and the "waiting time for status monitoring" (C02591) are elapsed.
- No other source for controller inhibit is active so that the controller inhibit can be deactivated by the brake control.

Procedure

If all requirements mentioned before have been met, the brake test can be started by setting the input *BRK_bBrakeTest* to TRUE.

[11-47] Sequence of the brake test

- The specified test torque is created via a ramp generator with an acceleration time of 1 s and held max. 4 s.
  - By this the motor shaft tries to rotate while the brake is applied.
- By resetting the input *BRK_bBrakeTest* to FALSE the brake test can be aborted.



Error behaviour

If during the brake test the stop position of the motor axis has changed by more than the permissible angle of rotation set in C02595, although the brake is engaged:

- The brake test is cancelled immediately and "Quick stop by trouble" is activated as error response to avoid a further rotation/acceleration of the drive.
- The error message "Motor brake: Angular drift with closed brake too high" is entered into the logbook.
- The status "position drift when brake is applied" is displayed for one cycle at the *BRK_dnState* status output via bit 21 and the status "brake error" is displayed via bit 15.
- The *BRK_bError* output is set to TRUE for one task cycle.

11.12.9 Control of two motor holding brakes

The technical implementation is based on the control of an external relay by a digital output. The relay contact then switches an external 24-V supply for both motor holding brakes:

[11-48] Interconnection example for controlling two motor holding brakes

Tip!

From software version V7.0 onwards, two motor temperature sensors can be evaluated simultaneously via the two encoder inputs X7 and X8 when two motor are used (e.g. double motor for a storage and retrieval unit).

▸ Temperature monitoring of a second motor (📖 228)

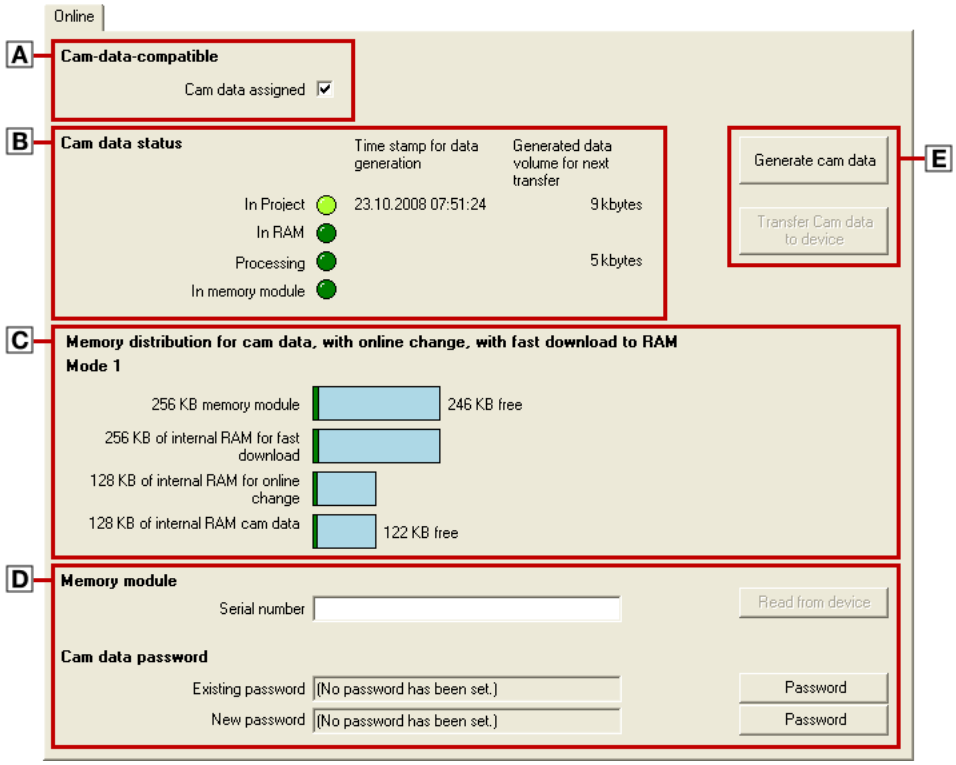
11.13 Cam data management

This function extension is available from software version V3.0!

The basic function "Cam data management" provides different functions for the systemwide management of the cam data available in the memory module for a cam application.

- Cam data are motion profiles/characteristics, cam tracks, and position marks.
- The cam data required can either be created using the »Cam Editor« and transmitted to the controller by means of »Engineer«, or they can be directly entered via the parameters of this basic drive function if cam data have already been downloaded.

Note!



For the use of cam data in the controller, the licence level Motion Control TopLevel is required!

11.13.1 "Online" tab for cam data management

After an interconnection has been created via the electrical shaft, it is shown in the *Project view* with the axes assigned:

If you select the axis representing the 9400 HighLine controller under the electrical shaft, the **Online** tab for cam data management is provided in the *Workspace*:

Info	
A	Cam-data-compatible • This property is set automatically for the controller if the controller supports cam data (licence level Motion Control TopLevel required). • **Note: The checkmark must not be removed, as otherwise the assignment to the cam data is lost!**
B	Cam data status • The first green LED for instance is lit if the cam data file in the project is active. • When an online connection to the controller has been established, also the status of the cam data available in the controller is shown.
C	Display of the current memory distribution for the cam data. ▸ Memory distribution (📖 559)
D	Configuration of the access protection for the cam data. ▸ Access protection (📖 560)
E	Possibility for quickly updating the cam data in the controller (without having to transfer the complete application). ▸ Regenerating the cam data file and transferring it to the controller (📖 562)

11.13.1.1 Memory distribution

From software version V5.0 there are three different storage modes for the distribution of the cam data memory in the controller. The specification of the storage mode is effected automatically by the »Engineer« when the cam data file is generated.

Note!

For controllers with a software version lower than V5.0 the memory distribution always corresponds to storage mode 1 (see following table), i. e. the max. size of the cam data file is limited to 256 kBytes.

Storage modes 2 and 3 automatically provide a greater memory for an extensive amount of cam data, however, in return certain functions are no longer supported (e. g. changing cam data via parameterisation).

Memory distribution of the cam data	Display in [bytes]	Storage mode		
		1	2*	3*
Memory module	-	262144 bytes (256 kBytes)	524288 bytes (512 kBytes)	1048576 bytes (1024 kBytes)
Internal RAM for quick download	C02901/1	262144 bytes (256 kBytes)	0 bytes	0 bytes
Internal RAM for online change	C02901/2	131072 bytes (128 kBytes)	262144 bytes (256 kBytes)	0 bytes
Internal RAM for cam data	C02901/3	131072 bytes (128 kBytes)	262144 bytes (256 kBytes)	524288 bytes (512 kBytes)

* Only from software version V5.0

Functions supported	Storage mode		
	1	2*	3*
Changing cam data via parameterisation	●		
Quick download to the RAM	●		
Online change	●	●	
Device command "Load cam data"	●	●	●
Device command "Save cam data"	●		
Device command "Calculate cam data"	●	●	●
Device command "Calculate cam data checksum"	●		

* Only from software version V5.0

11.13.1.2 Access protection

If required, the cam data can be protected against unauthorised or unintentional change by means of a three-stage access protection concept:

Step 1: Access protection deactivated

- There is no access protection for the upload/download of new cam data and the change of cam data via parameters.

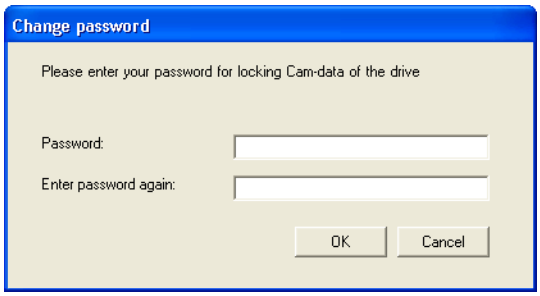
Step 2: Access protection via user password

- The user password must be entered for the upload/download of new cam data and the change of password-protected cam data via parameters.

Step 3: Linking the cam data to the serial number of the memory module

- The user password must be entered for the upload/download of new cam data and the change of password-protected cam data via parameters.
- In addition, the serial number of the memory module must comply with the serial number given in »Engineer« for the cam data.

Note!



The settings for the access protection are firmly defined for the existing cam data and cannot be changed.

For a change of the settings the cam data have to be updated in »Engineer« and then transferred to the controller. These two actions can be carried out on the **Online** tab via the buttons **Generate cam data file** and **Transfer cam data to the device**.

▸ Regenerating the cam data file and transferring it to the controller (📖 562)

How to define a password for the cam data:

1. Click the lower **Password** button (for new password).
   - The *Change password* dialog box appears:

2. Enter desired user password.
3. Click **OK** to accept the entry and close the dialog box.

How to change an existing password:

1. Click upper **Password** button (for existing password).
2. Enter the existing user password in the *Change password* dialog box.
3. Click **OK** to accept the entry and close the dialog box.
4. Click the lower **Password** button (for new password).
5. Enter the new user password in the *Change password* dialog box.
6. Click **OK** to accept the entry and close the dialog box.

Tip!

An existing access protection via user password can be cancelled again by carrying out the steps described before for changing the password and simply leaving blank the input field for the new password.

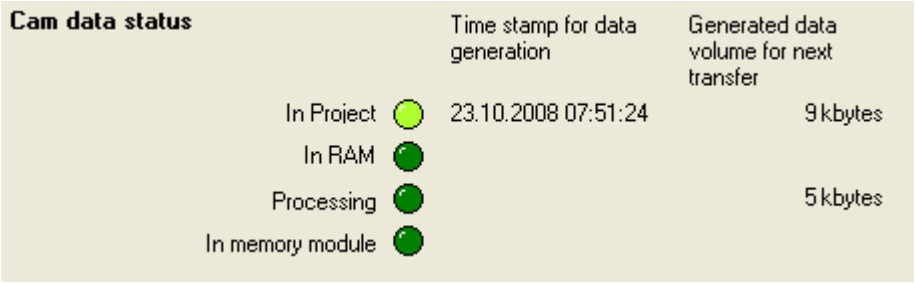
How to link the cam data to the serial number of the memory module:

Go to the **Serial number** input field and enter the serial number of the memory module.

- When an online connection to the controller has been established, you can read out the serial number of the memory module in the controller by clicking the **Read from device** button.

Tip!

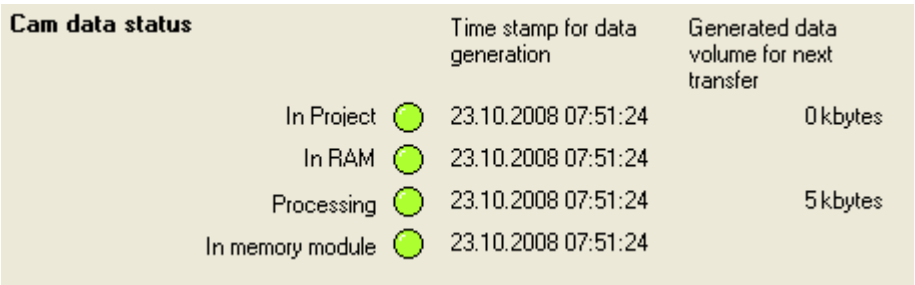
The linkage of the cam data to the serial number of the memory module can be cancelled again by carrying out the steps described before and simply leaving blank the **Serial number** input field.



11.13.1.3 Regenerating the cam data file and transferring it to the controller

If you transfer the parameter set or the application from »Engineer« to the controller, the cam data are also transferred automatically to the controller.

To only regenerate the cam data file and transferring it to the controller, after the cam data have been changed in the »Cam Manager« or the settings have been changed for access protection, carry out the following steps:



How to update the cam data:

1. Click on the **Generate cam data file** button on the **Online** tab to regenerate the cam data file for the controller.
   - The cam data status shown and the information with regard to the memory distribution on the **Online** tab are updated. The green LED behind "In the project" is lit now, which means that the cam data file in the project is active:

   When an online connection has been established to the controller:

2. To transmit the cam data to the controller, click the **Download cam data** button.
   - The new/altered cam data are accepted in the controller according to the online change mode set. ▸ Online change mode (📖 567)
   - The green LED behind "In the memory module" is now lit as well, which means that the cam data file in the memory module is also active:

11.13.2 Internal interfaces | "LS_CamInterface" system block

The **LS_CamInterface** system block provides the internal interfaces for cam data management in the function block editor.

Inputs

Identifier DIS code | data type	Information/possible settings
CAM_dnProductNumber DINT	Product number • The basic function manages the product number for all cam FBs within the application. • The product number is displayed in the »Cam Manager« in squared brackets after the product name. • If the product number is to be defined via parameter instead, a corresponding user code must be created in the application and connected with this input. • The highest product number to be created is shown in C02908.
CAM_bActivateProduct BOOL	Activate product • The change-over to another product is caused by an event which is generated from the application.
	TRUE: The product with the product number at input *CAM_dnProductNumber* is activated.
CAM_bActivateNewData BOOL	Reload cam data from the backup memory (controlled acceptance) • Only possible if the online change mode "10: Manual Activation" is set in C02905. • If the online change mode "16: Automatic activation with CINH" (Lenze setting) or "15: Automatic activation" is set in C02905, the new cam data are accepted immediately after a download and this input has no function. • The current status of the data acceptance is shown in C02906.
	TRUE: Reload cam data from the backup memory.

Outputs

Identifier DIS code | data type	Value/meaning	
CAM_dnActiveProduct C02909 | DINT	Product number of the currently active product	
CAM_bDownloadBusy BOOL	Status signal "Download/data change active" • The current status of the data acceptance is shown in C02906.	
	TRUE	Currently the cam data in the RAM of the controller are changed. • For instance, due to parameter set transfer, device command C00002 = "501: Load cam data" or change of the cam data via parameters.
	TRUE↘FALSE	Download/data change completed. • In order to detect if the download/ the data change has been completed correctly, the *CAM_bError* error output should also be evaluated.
CAM_bNewDataAvailable BOOL	Status signal "New cam data available"	
	TRUE	The internal recalculation of the new/changed cam data is completed and the cam data are ready for acceptance. • The time when the new/altered cam data are accepted depends on the online change mode set in C02905. ▸ Online change mode (📖 567) • In the Lenze setting the new/altered cam data are accepted automatically as soon as the controller inhibit is set within the controller. • If the online change mode "15: Automatic activation" is set in C02905, the new/changed cam data are accepted immediately after the internal recalculation and the TRUE signal is only pending for one task cycle.
	TRUE↘FALSE	The new/changed cam data have been accepted.
CAM_bError BOOL	"Fault" status signal	
	TRUE	An error has occurred (group signal).

11.13.3 Parameter setting

Short overview of the parameters for cam data management:

Parameters	Info	Effective in storage mode		
		1	2*	3*
C00198	Axis number	●	●	●
C02900	User Password	●	●	●
C02901	Cam storage capacity	●	●	●
C02902	Time stamp of cam data	●	●	●
C02903	GUID cam data	●	●	●
C02905	Online change mode	●	●	
C02906	Online change status	●	●	●
C02908	Number of products	●	●	●
C02909	Active Product	●	●	●
C02910	Product designation	●	●	●
C02911	Product Choice	●	●	●
C02912	Number of products	●		
C02919	Number of curve tracks	●		
C02920	Cam Track Choice	●	●	●
C02921	Cam Track Type	●		
C02922	Number of Cam Data Points	●		
C02923	Cam Data Point Choice	●	●	●

Greyed out = display parameter
* Storage modes 2 and 3 are only available from software version V5.0. Parameters that are not effective are set to zero.

11.13.3.1 Password entry

If a password has been defined for the cam data in »Engineer«, the defined user password must be entered once to execute the following actions:

- Download of new cam data during operation
  → Entry of the existing password in »Engineer«.
- Change of the cam data via parameter setting
  → Entry of the existing password in C02900.
- Loading/saving of the cam data
  → entry of the existing password in C02900.

Note!

From software version V4.0 onwards, you do not need to enter a possibly existing user password (C02900) if you want to save the cam data.

Tip!

The access protection for the cam data can be configured on the **Online** tab. ▸ "Online" tab for cam data management (📖 558)

Validity

The user password entered in C02900 is maintained until the next download, mains switching, or until reset by the user (logout).

- You can "log out" deliberately by entering an invalid password into C02900.

Behaviour in case of invalid entry

If the user password is entered incorrectly three times, the cam data are blocked. A correct entry resets the number of the failed attempts.

To remove the blocking of the cam data, there are two possibilities:

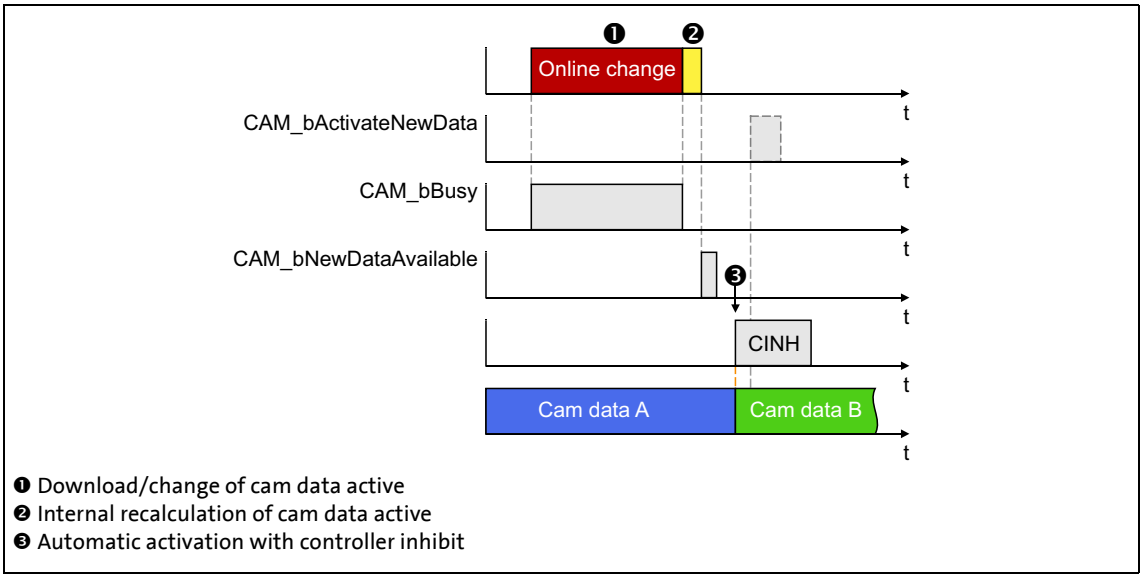
A. Resetting the parameters to the Lenze setting via device command C00002 = "0: Load Lenze setting".
   - When the Lenze setting is loaded, the cam data are deleted.
   - Afterwards the cam data can be transferred to the device again.

B. Transfer complete application to the device again.
   - The application available and the cam data are deleted and all data are transferred to the device again.

11.13.3.2 Online change mode

During running operation, new cam data can be downloaded from »Engineer« to the controller if the controller is in storage mode 1 or 2.

- If the cam data are provided with an access protection, the user password has to be entered first.
  ▸ Access protection (📖 560)
- The time when the new/altered cam data are accepted depends on the online change mode set in C02905.



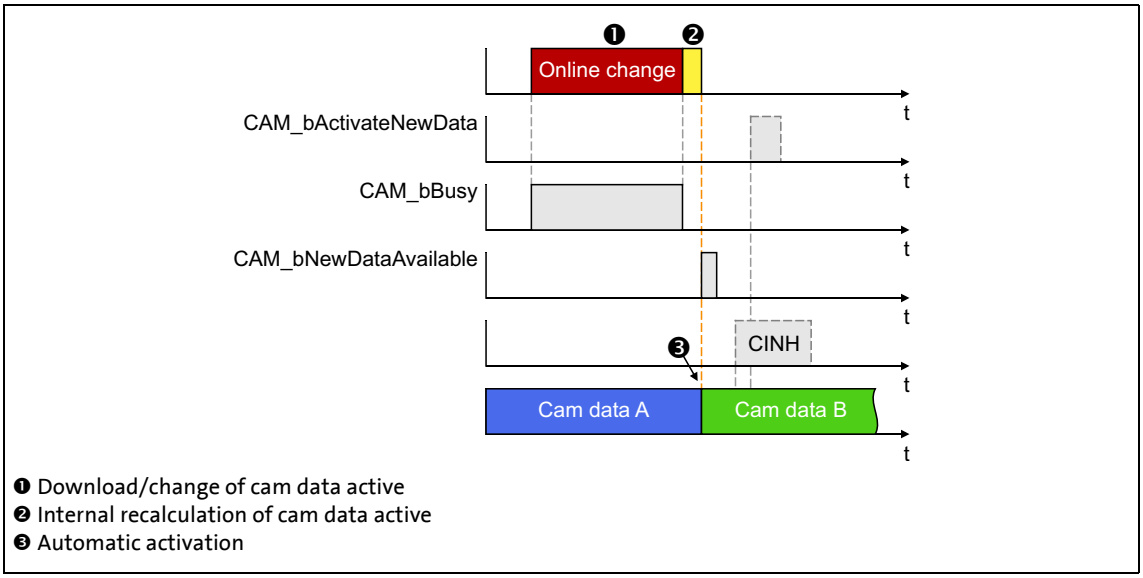
Note!

If the controller is in storage mode 3, the "Online change" function is deactivated:
- The online change mode set in C02905 is ineffective.
- In C02906 the status "999: Online change deactivated" is displayed.
- For the download of new cam data, controller inhibit is required.
- The cam data are accepted immediately after download.

▸ Memory distribution (📖 559)

Mode 16: Automatic activation with CINH

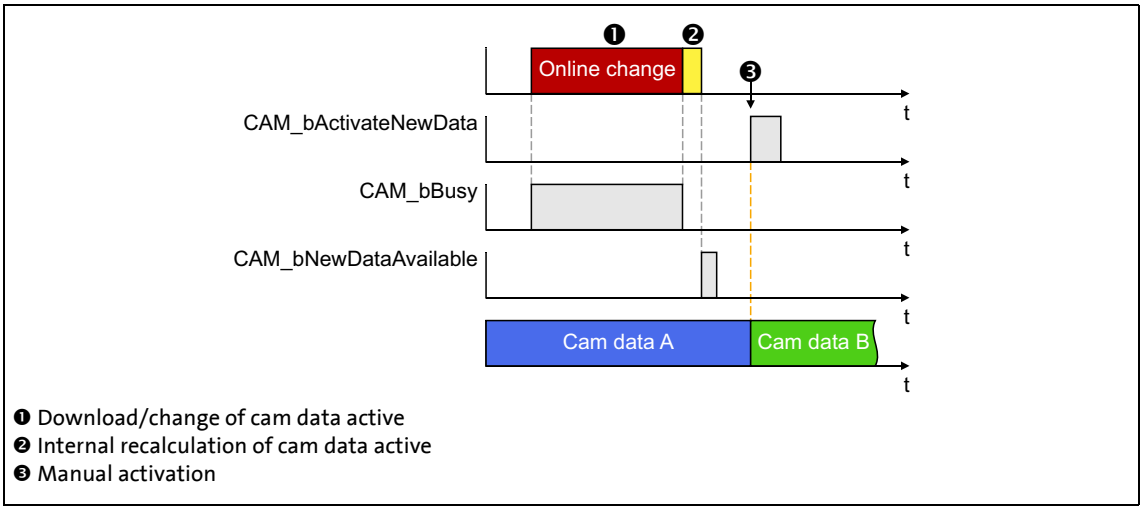
In the Lenze setting, the online change mode "Automatic activation with CINH" is set in C02905, i.e. the new cam data are accepted automatically as soon as the controller is inhibited.



[11-49] Online change mode "Automatic activation with CINH"

Mode 15: Automatic activation

In the online change mode "Automatic activation", the new cam data are accepted directly after the internal recalculation of the data from the application unit [unit] into the internal unit [increments] has been completed.



- The controller does not need to be inhibited for acceptance.

[11-50] Online change mode "Automatic activation"

Mode 10: Manual activation

In the online change mode "Manual activation", the new cam data are accepted when the *CAM_bActivateNewData* control input is set to TRUE.

[11-51] Online change mode "Manual activation"

11.13.3.3 Changing cam data via parameterisation

If required, the cam data (motion profiles/characteristics, cams, and position markers) can be changed via corresponding parameters if the controller is in storage mode 1. Except for the last interpolation point, all interpolation points of an electronic cam can be changed via the parameter access.

- If the cam data are provided with an access protection, the user password has to be entered in C02900 first. ▸ Access protection (📖 560)
- From software version V4.0 onwards, the time stamp of the cam data is updated if the cam data are changed by parameter setting. This enables, for instance, the »Engineer» to recognise that the cam data of the »Engineer« project and those of the controller differ.

Note!

If the controller is in storage mode 2 or 3, the cam data cannot be changed via parameterisation. All parameters for change are ineffective and set to zero. ▸ Memory distribution (📖 559)

If the cam data of the controller have been changed by parameter setting, the C00002 = "504: Calculate Cam Checksum" device command has to be executed afterwards. ▸ Calculate cam data checksum (📖 95)

Then the cam data can be converted into the internal format with the "503: Calculate Cam Data" device command or saved on the memory module in a powerfail-proof manner with the "502: Save Cam Data" device command. ▸ Calculate cam data (📖 94) / ▸ Save cam data (📖 92)

From software version V4.0 onwards, the changed cam data and the parameters can be saved together on the memory module in a powerfail-proof manner with the C00002 = "11: Save start parameters" device command. ▸ Save start parameters (📖 52)

How to change an interpolation point in a curve (motion profile or characteristic):

1. Go to C02911 and set the product number of the product to be edited.
2. Go to C02920 and set the track number of the curve track to be edited.

   Tip!

   In C02921 the curve type, and in C02922 the number of interpolation points of the curve selected is shown.
3. Set the interpolation point to be edited in C02923.
4. Change the desired parameters of the selected grid point:
   - C02924: x position
   - C02925: y position
   - C02926: Torque feedforward control value
     (only in case of a motion profile with feedforward control.)

Tip!

C02927 serves to activate a grid point auto increment if several successive grid points are to be changed.

- When the grid point auto increment is activated, it is automatically incremented to the next grid point every time the y position is written into C02925 so that the specification of the grid point to be changed in C02923 is only required once.

How to change several successive grid points (auto increment):

1. Go to C02911 and set the product number of the product to be edited.
2. Go to C02920 and set the track number of the curve track to be edited.

   Tip!

   In C02921 the curve type, and in C02922 the number of interpolation points of the curve selected is shown.
3. Set selection "1: Activate" in C02927 to activate the grid point auto increment.
4. Set the grid point from which on the grid point auto increment is to be started in C02923.
5. Set the following parameters for the grid point set in C02923 in the given order:
   - C02924: x position
   - C02926: Torque feedforward control value
     (only in case of a motion profile with feedforward control.)
   - C02925: y position

   After the y position is written into C02925 it is automatically incremented to the next grid point.
6. Set the parameters for the next grid point in the same order:
   - C02924: x position
   - C02926: Torque feedforward control value
     (only in case of a motion profile with feedforward control.)
   - C02925: y position
7. Repeat step 4 until all grid points are changed.

   Note: Do not change more grid points then available (depending on the start grid point). Changing a non-available grid point causes an error message!

How to change a cam:

1. Go to C02911 and set the product number of the product to be edited.
2. Go to C02940 and set the track number of the cam track to be edited.

   Tip!

   The cam type is displayed in C02941 and the number of cams of the selected cam data is displayed in C02942.
3. Go to C02943 and set the cam to be edited.
4. Change the desired parameters of the selected cam:
   - C02944: Cam position X0
   - C02945: Cam position X1
   - C02946: Cont Time (for position/time cams)

How to change a position mark:

1. Go to C02911 and set the product number of the product to be edited.
2. Go to C02960 and set the track number of the position track to be edited.

   Tip!

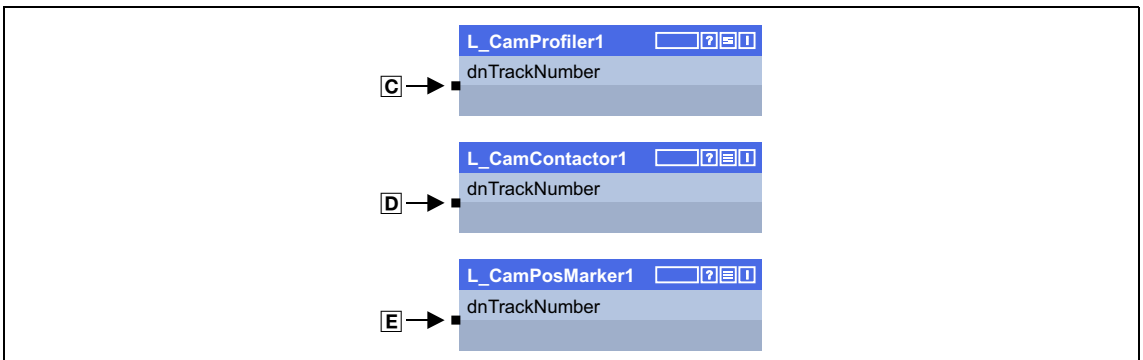
   In C02962 the number of the position marks of the position data selected is shown.
3. Set the position mark to be edited in C02963.
4. Change the desired parameters of the selected position mark:
   - C02964: x position
   - C02965: y position

11.13.4 Product/track change-over

Product change-over

The change-over to another product number is effected for all cam FBs within the application via the basic function "Cam data management".

- The change-over is effected via the input *CAM_bActivateProduct* on the basis of an event that is generated from the application.
- By setting the input *CAM_bActivateProduct* to TRUE, the product is activated with the product number at input *CAM_dnProductNumber*.



A Product number
B Activate product change-over

[11-52] Principle: Product change-over

Track switch-over

The change-over to another curve track, cam track, or position track, however, is individually effected via the input *dnTrackNumber* at the respective cam function block.

- For the two FBs **L_CamProfiler** and **L_CamContactor** it can be parameterised whether the track change-over is to be effected in the next zero crossing of the x axis or immediately (Lenze setting: in the next zero crossing).

C Track number of the curve track
D Track number of the cam track
E Track number of the position track

[11-53] Principle: Track change-over

11.13.5 Invalid cam data due to changed machine parameters

This function extension is available from software version V4.0!

If one or more machine parameters affecting the internal scaling of the cam data are changed, the message "Cam Data: Invalidated due to change of mechanical data" (error number 0x00b80034) is entered into the logbook and the error response "Warning" occurs.

- The cam data are no longer valid and have to be recalculated.
- The warning is automatically reset if the C00002 = "503: Calculate Cam Data" device command is executed. ▸ Calculate cam data (📖 94)

Machine parameters affecting the internal scaling of the cam data:

Parameters	Info
C00006	Selection of the motor control
C00100	Resolution of an encoder revolution
C02520 / C02521	Gearbox factor - motor (if motor = reference source)
C02522 / C02523	Gearbox factor - position encoder (if position encoder = reference source)
C02524	Feed constant
C02570	Position control structure

11.13.6 Behaviour after mains switching

After mains switching, the cam data are loaded from the memory module into the controller between loading and start of the application.

Note!

During the initialisation no check of the user password takes place, but a check of the serial number of the memory module is carried out, if this access protection has been activated by the user in »Cam Designer«. If the serial number specified and the serial number of the memory module do not match, the cam data are not loaded.

- The "Cam data: serial number" error message is entered in the logbook.
- The "Warning locked" error response occurs.

If a download of cam data that was carried out before mains switching was not completed correctly, the previous cam data – if available – are loaded by the memory module.

- The "Cam data restored" error message is entered into the logbook.
- The "Fault" error response occurs.
- After the error is reset (acknowledged), operation with the previous cam data is possible.

11.14 Pole position identification

This function extension is available from software version V7.0!

Danger!

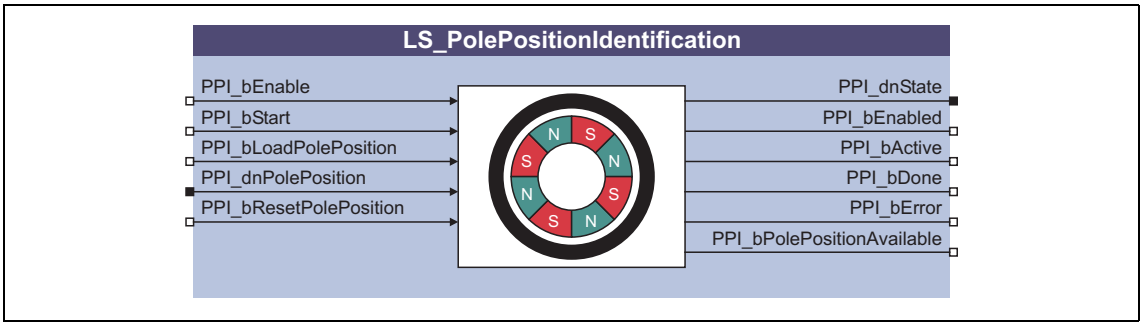
In this basic function, the extent of the useable operating modes of the holding brake is restricted. Only the following operating modes function:

- Directly with brake module (C02580, selection 1) and
- Direct switching externally (C02580, selection 11)

The device commands "Identify pole position (360°)" and "Identify pole position (min. motion)" serve to execute an identification of pole position to detect the pole position to the motor encoder currently activated in C00495.

From software version V7.0 onwards, the identification of pole position is additionally available as a basic function in the form of the LS_PolePositionIdentification system block.

Note!



An identification of pole position is only required:

- For servo control with synchronous motor of a third-party manufacturer.
- For servo control with synchronous motor and use of incremental encoders (TTL or sin/cos encoders as well as multi-pole pair resolvers).
- After changes of the motor feedback system, e.g. encoder exchange.

Detailed information on the identification of pole position can be found in the subchapter "Pole position identification" for the motor interface. (📖 131)

11.14.1 Internal interfaces | System block "LS_PolePositionIdentification"

The **LS_PolePositionIdentification** system block provides the internal interfaces for the basic function "Pole position identification" in the function block editor.

Note!

Ensure that the system block is called in a cyclic application task.

Basically, projects which only contain an unsolicited task and no cyclic task are not permissible!

Inputs

Identifier DIS code | data type	Information/possible settings	
PPI_bEnable C02789/1 | BOOL	Request control of basic function	
	TRUE	If no other basic function is active, a change-over to the "Identification of pole position active" function state is effected and an identification of pole position can be carried out via the control inputs.
	TRUE↘FALSE	An active identification of pole position is stopped, i.e. a change-over from the active "Identification of pole position active" function state back to the "Controller not ready" basic state is effected.
PPI_bStart C02789/2 | BOOL	For starting pole position identification	
	FALSE↗TRUE	Pole position identification is started in the mode selected in C02786.
PPI_bLoadPolePosition C02789/3 | BOOL	For starting pole position identification	
	FALSE↗TRUE	The pole position angle applied at *PPI_dnPolePosition* is accepted in C00058/x. • The subcode to be described of C00058 depends on the motor encoder selected in C00495.
PPI_dnPolePosition C02788 | DINT	Pole position angle in [°] with one decimal position • Value range: -179.9 ... +179.9 °	
PPI_bResetPolePosition C02789/4 | BOOL	For resetting status "Pole position known"	
	FALSE↗TRUE	The status outputs *PPI_bDone* and *PPI_bPolePositionAvailable* are reset to FALSE.

Outputs

Identifier DIS code | data type	Value/meaning	
Ppi_dnState C02787 | DINT	Status (bit coded) • When the basic function is not enabled, all bits are set to "0". • Bits which are not listed are not assigned with a status (always "0").	
	Bit 1	Pole position identification active.
	Bit 2	Pole position identification completed.
	Bit 14	Pole position known.
	Bit 15	An error has occurred (group signal).
PPI_bEnabled C02789/5 | BOOL	Status signal "Basic function is enabled"	
	TRUE	Pole position identification vie the control inputs is possible. • The *PPI_bEnable* enable input is set to TRUE and the controller is in the "Pole position identification active" function state.
PPI_bActive C02789/6 | BOOL	Status signal "Basic function is active"	
	TRUE	Pole position identification is active. • Output is reset to FALSE if the *PPI_bStart* input is reset to FALSE, controller enable is deactivated, or an error has occurred.
PPI_bDone C02789/7 | BOOL	Status signal "Basic function is ready"	
	TRUE	Pole position identification is completed. • Output is reset to FALSE when input *PPI_bStart* is reset to FALSE.
PPI_bError C02789/8 | BOOL	"Fault" status signal	
	TRUE	An error has occurred (group signal).
PPI_bPolePositionAvailable BOOL	Status signal "Pole position is known"	
	TRUE	The drive knows the pole position. • The value written into C00058/x corresponds to the pole position (x depends on the motor encoder selected in C00422).

11.14.2 Parameter setting

- Parameterisation dialog in »Engineer«: Tab **Application parameters** ➞ Dialog level *Overview* ➞ *All basic functions* ➞ *Pole position identification*
- Short overview of parameters for pole position identification:

Parameters	Info
C02785	Activation of PPI
C02786	Mode of PPI
C02787	Ppi_dnState
C02788	PolePosition Setpoint
C02789	PolePositionIdentification: Dig. signals
Greyed out = display parameter	

11.14.3 Execution of the pole position identification

Prerequisites

- The controller inhibit is active.
- The controller has the "Controller not ready" function state.
- The basic function "Pole position identification" is part of the active application.
- No other basic function is active.

Activate basic function

To request the control via the basic function, the *PPI_bEnable* enable input in the application must be set to TRUE.

- If no other basic function is active, a change-over to the "Identification of pole position active" function state is effected and an identification of pole position can be carried out via the control inputs.
- A successful change to the function state "Pole position identification active" is displayed by a TRUE signal at the *PPI_bEnabled* status output.

For starting pole position identification

Danger!

The machine must not be braked or blocked during the pole position identification! For this reason, the pole position identification is not permitted for hanging loads!

During the pole position identification the rotor aligns itself. The motor shaft moves by max. one electrical revolution which causes the corresponding movement of the connected mechanical components!

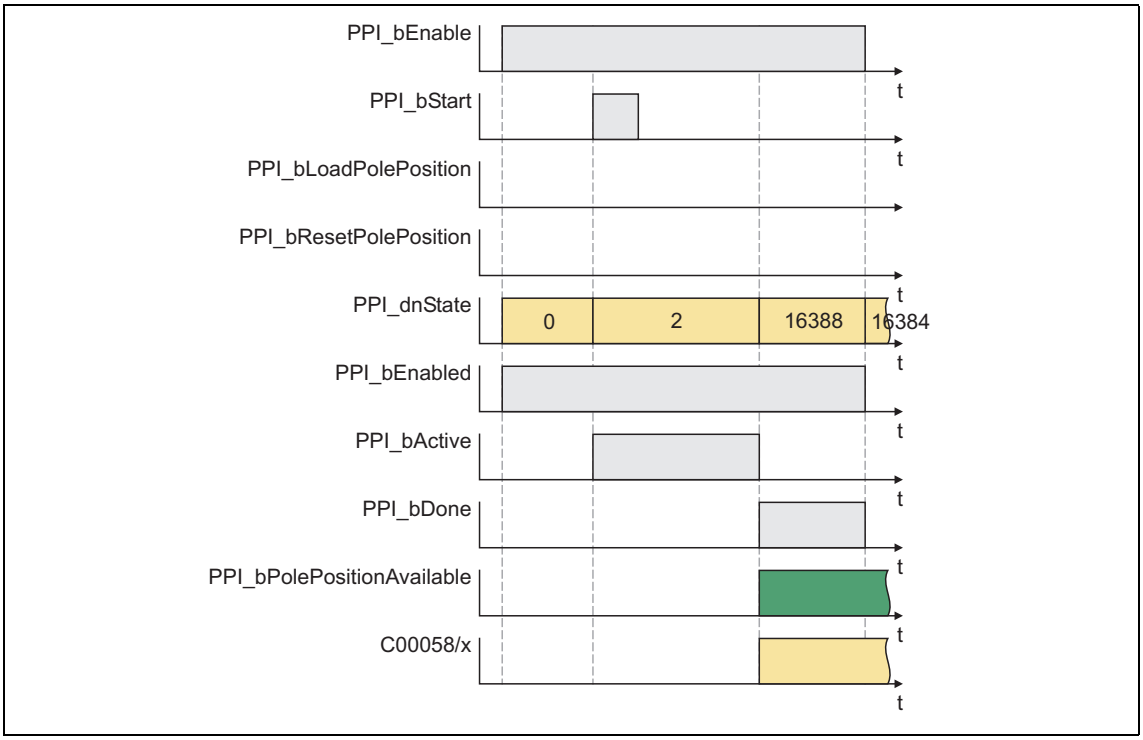
Stop!

Check the correct parameterisation of the max. motor current monitoring (C00619 and C00620) before carrying out the pole position identification to prevent the motor from being permanently damaged.

By setting the *PPI_bStart* control input to TRUE, the pole position identification is started in the mode selected in C02786.

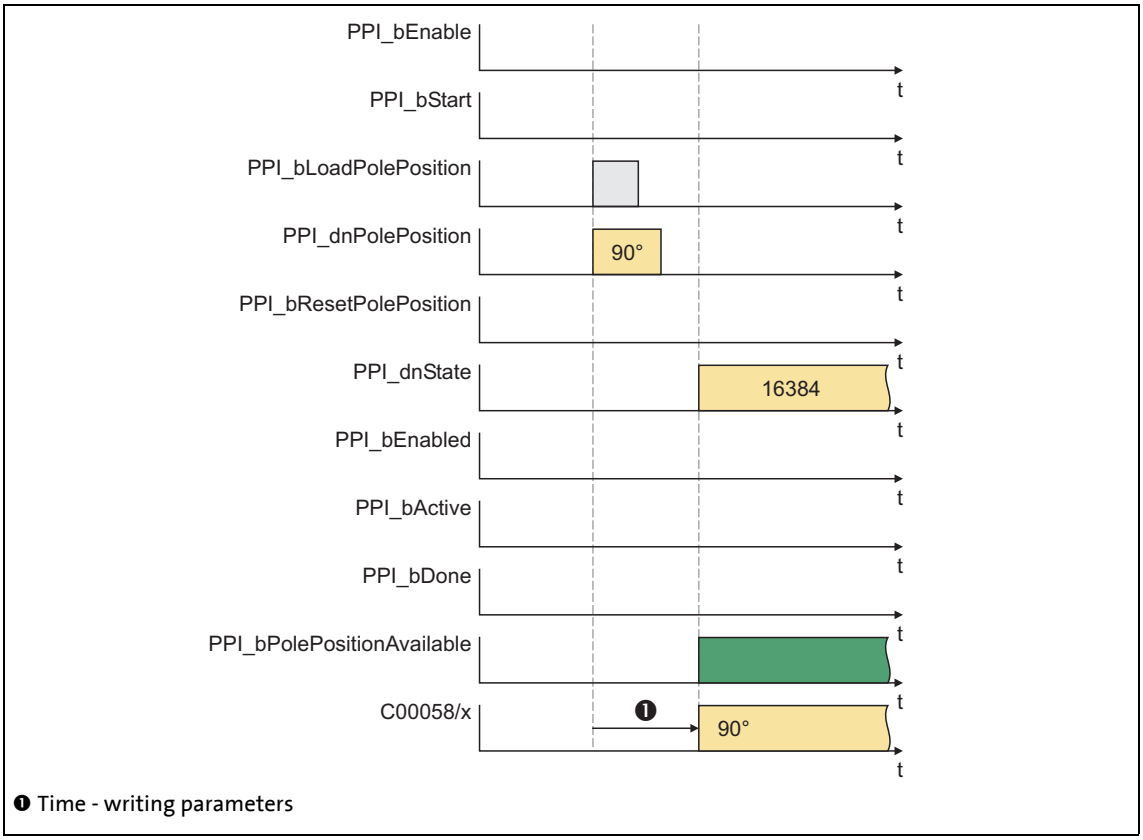
- The procedure starts with controller enable, if
  - a synchronous machine is selected,
  - no other identification is active,
  - no error has occurred, and
  - no test mode is activated.
- If one of the above conditions is not met, the procedure is cancelled and the corresponding device command status is indicated via *PPI_dnState*.

Note!



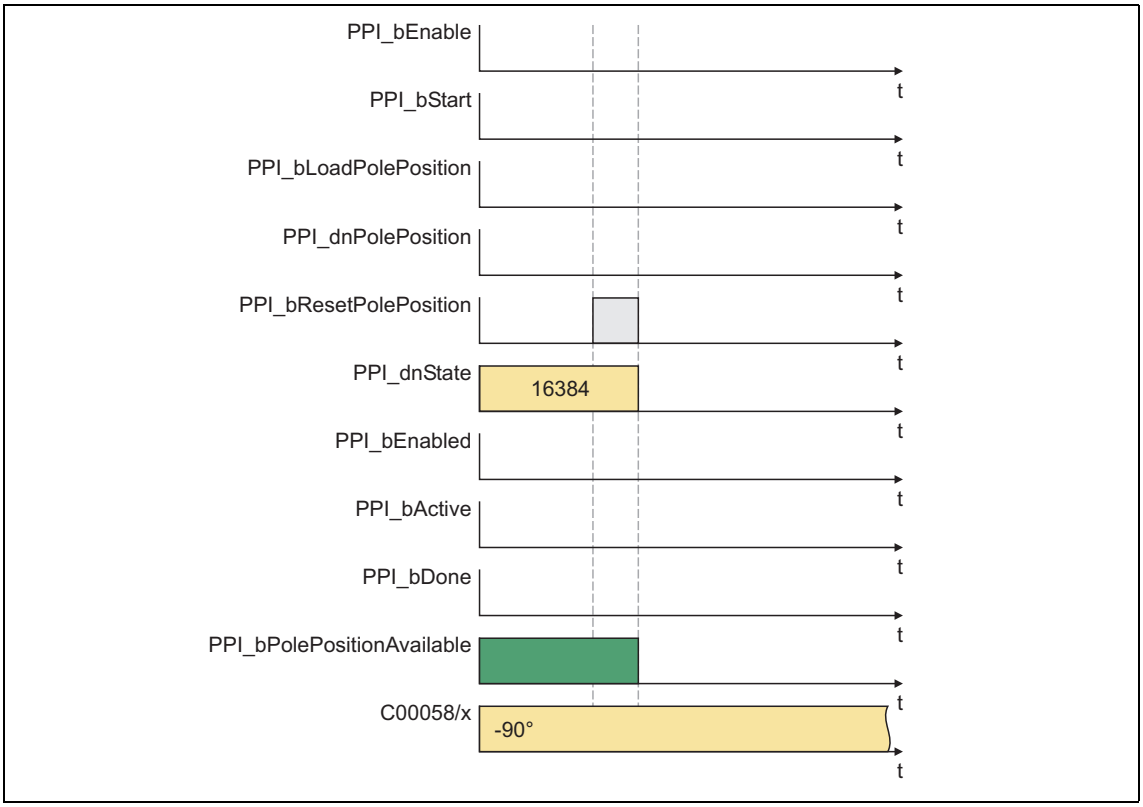
Detailed information on the identification of pole position can be found in the subchapter "Pole position identification" for the motor interface. (📖 131)

Deactivation



When the *PPI_bEnable* enable input is reset to FALSE, an active pole position identification is stopped.

- If the pole position identification is aborted, no change is made in C00058/x.
- The *PPI_bEnabled* status output is reset to FALSE and a change-over from the active "Pole position identification active" function state back to the basic "Controller not ready" state is carried out".



11.14.4 Signal characteristics

[11-54] Signal characteristic 1: Normal procedure of the pole position identification

[11-55] Signal characteristic 2: Load pole position

[11-56] Signal characteristic 3: Reset pole position

11.14.5 Deactivating a known pole position

The following describes the circumstances that cause a deactivation of an already known pole position by changing certain parameter settings. The pole position status *PPI_bPolePositionAvailable* changes from TRUE to FALSE due to the change.

Changing the type of motor control (C00006)

Initial situation	Parameter change
• *PPI_bPolePositionAvailable* = TRUE • Motor control (C00006) = • "2: SC: Servo control async. motor" or • "4: SLVC: Sensorless vector control" or • "6: VFCplus: V/f control" or • "7: VFCplus: V/f control"	In C00006, the motor control "1: SC: Servo control sync. motor" is set.

Changing relevant motor data

Initial situation	Parameter change
PPI_bPolePositionAvailable = TRUE	One of the following parameters is changed: • Rated motor speed (C00087) • Rated motor frequency (C00089) • Rated motor voltage (C00090)

Changing relevant encoder data

Initial situation	Parameter change
PPI_bPolePositionAvailable = TRUE	One of the following parameters is changed: • Resolver - number of pole pairs (C00080) • Encoder - number of increments (C00420) • Encoder type (C00422) • TTL encoder signal evaluation (C00427) • Motor encoder selection (C00495)

Behaviour after mains ON

Initial situation 1	Behaviour after mains ON
• *PPI_bPolePositionAvailable* = TRUE • Motor control (C00006) = "1: SC: Servo control sync. motor" • Resolver - number of pole pairs (C00080) > 1	*PPI_bPolePositionAvailable* is only reset to FALSE if: • Motor encoder selection (C00495) = "0: Resolver to X7" **AND** • The number of motor pole pairs are (C00059no integer multiple of the number of resolver pole pairs (C00080).

Initial situation 2	Behaviour after mains ON
• *PPI_bPolePositionAvailable* = TRUE • Motor control (C00006) = "1: SC: Servo control sync. motor" • Encoder type (C00422) = • "0: Incremental encoder (TTL signal)" or • "1: Sine/Cosine encoder" • Motor encoder selection (C00495) = "1: Encoder to X8"	*PPI_bPolePositionAvailable* is reset to FALSE.

Behaviour after encoder error

Initial situation	Behaviour after encoder error
• *PPI_bPolePositionAvailable* = TRUE • Motor control (C00006) = "1: SC: Servo control sync. motor" • Encoder type (C00422) = • "0: Incremental encoder (TTL signal)" or • "1: Sine/Cosine encoder" or • "2: Absolute value encoder (Hiperface)" or • "3: Absolute value encoder (EnDat)" or • Motor encoder selection (C00495) = "1: Encoder to X8"	*PPI_bPolePositionAvailable* is reset to FALSE.

Behaviour after resolver error

Initial situation	Behaviour after resolver error
• *PPI_bPolePositionAvailable* = TRUE • Motor control (C00006) = "1: SC: Servo control sync. motor" • The number of motor pole pairs are (C00059no integer multiple of the number of resolver pole pairs (C00080). • Motor encoder selection (C00495) = "0: Resolver to X7"	*PPI_bPolePositionAvailable* is reset to FALSE.

12 Oscilloscope

The oscilloscope function integrated in the Servo Drives 9400 HighLine can be used as support for commissioning, maintenance and troubleshooting. The oscilloscope function is operated via a user interface in the engineering tool.

Typical applications

- Graphic display of measured variable (e.g. speed setpoint, actual speed value and torque)
- Detection of process values without additional measuring instruments (e.g. oscilloscope, voltmeter and ammeter)
- Convenient documentation for fine tuning of control circuits or parameter changes of the Servo Drives 9400 HighLine

Special features

- Recording and saving measured values in the Servo Drives 9400 HighLine
- Simultaneous measuring on eight independent channels
- Measuring fast and slow signals by means of adjustable sample rate
- Triggering on channel, variable or system event
- Detecting measured values before and after the trigger event
- Transferring measured values to the Engineering PC for the purpose of graphic display and evaluation in the engineering tool
- The measured values represented in the form of curves can be optionally shown and hidden, represented in any colour or overlaid with the signal characteristic of other variables recorded.
- Cursor and zoom function for the measurement analysis
- Saving & loading oscilloscope configurations on the Engineering PC
- Export of measured values via the clipboard for further processing
- Linking channel values with arithmetic operations (addition, subtraction and multiplication)
- Simple signal analysis by frequency transformation of time signals with FFT ("Fast Fourier Transformation").

12.1 Functional description

When an online connection to the Servo Drives 9400 HighLine has been established, use the oscilloscope user interface of the engineering tool to set the trigger condition and the sample rate and select the signal sources to be recorded. Here, "signal sources" are the internal output signals of the function, system, application and port blocks.

The values are validated after each input acknowledgement by the "Return" key. If the check shows invalid settings, the oscilloscope triggers an error.

With an online connection, the measured values contained in the Servo Drives 9400 HighLine are transferred to the engineering tool and graphically presented on the oscilloscope user interface as soon as the measurement has been completed.

12.2 Technical data

Oscilloscope function of Servo Drives 9400 HighLine	
Number of channels	1 ... 8
Depth of the measured value memory	Max. 16384 measured values, depending on the number of channels and the size of the variables to be recorded.
Data width of a channel	1 ... 4 bytes, corresponding to the size of the variables to be recorded
Sampling rate	1 ms or a multiple of it. Increased sampling rates of 62.5 µs or 250 µs are possible.
Max. time base	8 channels 32 bits each ≡ 26 hours
Max. recording time	8 channels 32 bits each ≡ 10 days
Memory capacity	32768 bytes
Trigger level	Corresponding to the value range of the signal sources to be triggered
Trigger selection	Immediate triggering, rising/falling edge, signal change
Trigger delay	-100 % ... +400 %
Trigger source	Channel 1 ... 8: • Any application variable • Motor control variables • System events • Internal variables

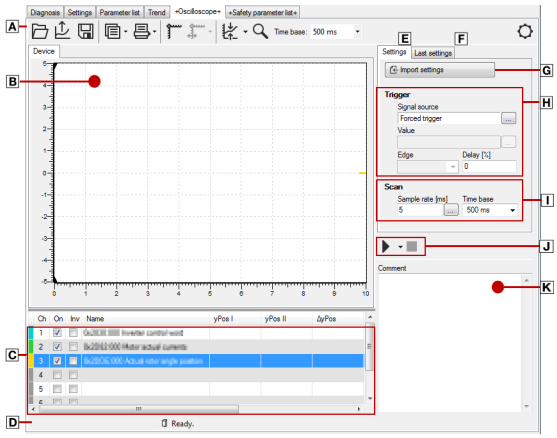
12.3 Operation

This chapter informs you step by step on how to record signal characteristics of variables in the Servo Drives 9400 HighLine using the oscilloscope and then present, analyse, document and process them in the oscilloscope.

Note!

The configuration of the oscilloscope and the start of recording are only possible when an online connection has been established to the Servo Drives 9400 HighLine.

12.3.1 User interface



The oscilloscope user interface is available in the following Lenze engineering tools:

☑ »Engineer« from version 2.16	☐ »PLC Designer«	☑ »EASY Starter« from version 1.9

How to go to the oscilloscope user interface:

1. Go to the *Project view* and select the Servo Drives 9400 HighLine.
2. Select the **Oscilloscope** tab from the *Workspace*.

The oscilloscope user interface contains the following control and function elements:

A Oscilloscope toolbar

B Oscillogram selection

C Channel list
▸ Selecting the signal sources to be recorded

D Status bar

E Recruitments

F Last settings

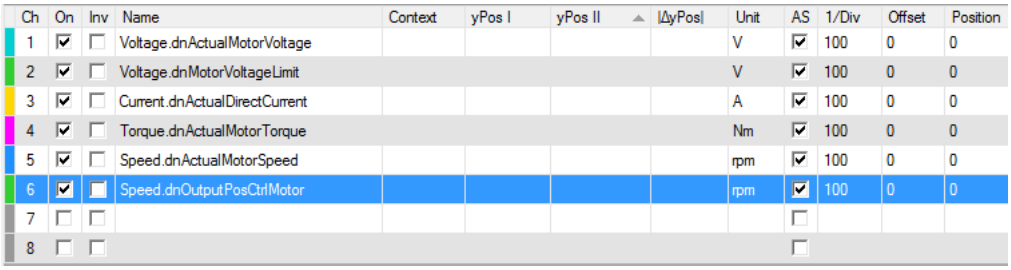
G Import settings from a loaded oscillogram or an oscillogram file

H Trigger settings

I Input fields for
▸ Selecting the recording time/sample rate

J Start recording / stop

: Input field for comments



Oscilloscope toolbar

Symbol	Job title
	Loading the oscillogram file (📖 601)
	Upload recorded oscillogram from device • Transmit values from the measured value memory of the Servo Drives 9400 HighLine to the Engineering PC. • Only possible when an online connection has been established to the Servo Drives 9400 HighLine.
	Saving the oscillogram in a file (📖 600)
	Copy to clipboard: Copy as text | Copy as picture | Copy as table | Copy as raw value • For documentation purposes, it is possible to copy the measured value of an oscilloscope as a table or, alternatively, the oscilloscope user interface as a picture, to the clipboard for use in other programs.
	Printer settings | Print view | Print
	Activate zoom function ▸ Adjusting the representation (📖 596)
	Show cursor
	Automatically scale vertically • Set all Y positions to zero • Arrange all curves above one another: The Y positions are evenly distributed over the entire vertical range.
	Activate zoom function ▸ Adjusting the representation (📖 596)
	Start recording (📖 595) • Transfer settings to the device • Activate trigger
	Stop recording
	Oscilloscope settings • Cyclic recording of oscillograms • Always load oscillograms after recording is completed without a query

12.3.2 Selecting the signal sources to be recorded

The oscilloscope supports up to eight channels. Thus, the **channel list** can record maximally eight signal sources.

Use the **channel list** to configure the signal sources to be recorded:

Ch	On	Inv	Name	Context	yPos I	yPos II	|ΔyPos|	Unit	AS	1/Div	Offset	Position
1	☑	☐	Voltage.dnActualMotorVoltage					V	☑	100	0	0
2	☑	☐	Voltage.dnMotorVoltageLimit					V	☑	100	0	0
3	☑	☐	Current.dnActualDirectCurrent					A	☑	100	0	0
4	☑	☐	Torque.dnActualMotorTorque					Nm	☑	100	0	0
5	☑	☐	Speed.dnActualMotorSpeed					rpm	☑	100	0	0
6	☑	☐	Speed.dnOutputPosCtrlMotor					rpm	☑	100	0	0
7	☐	☐							☐			
8	☐	☐							☐			

Designation	Meaning
-	Curve colour for representation in the oscillogram • A double-click on the colour area of the channel serves to set a user-defined colour.
Ch	Channel number
To	Cam visible / invisible
Inv	Inversion yes / no
Name	Name of the signal source
Context	Channel representation with task reference • Channel representation with task selection: • If the selected task is active at the time of recording, the value is taken from the input image of the selected task. • If the selected task is not active at the time of recording, an invalid value is recorded. There will be a gap in the graph. • Channel representation without task selection: • The current value of the variables is used without task reference at the time of recording.
yPos I	y position of cursor I
yPos II	y position of cursor II
ΔyPos	Difference of the y positions of both cursors • Difference = yPos II - yPos I
Unit	Unit of the signal source
AS	Select/deselect channel for automatic scaling
1/Div	Vertical scaling factor
Offset	Offset value • The offset value is subtracted from the recorded raw value before scaling is executed. This serves, for instance, to make very slight value fluctuations visible within one constantly very high recording value (e.g. harmonics with low amplitude).
Position	Position value • The position value determines the vertical position of the zero point of the y axis of a curve with regard to the vertical curve scale (- 5 ... + 5).

How to select a signal source for recording:

1. Double-click a non-assigned line in the **channel list** to open the *Select signal source* dialog box.
   - Double-clicking an already pre-assigned selection enables you to assign it with another signal source.
2. Select a new variable in the *Select signal source* dialog box.
3. Click the **OK** button.
   - The dialog box is closed and the selection is accepted.

How to delete a selection:

1. Go to the **channel list** and click the signal source to be removed.
2. Right-click the *context menu* to open it.
3. Select the **Delete signal source** command in the *context menu*.

You can add so many signal sources for the recording until all eight channels are assigned.

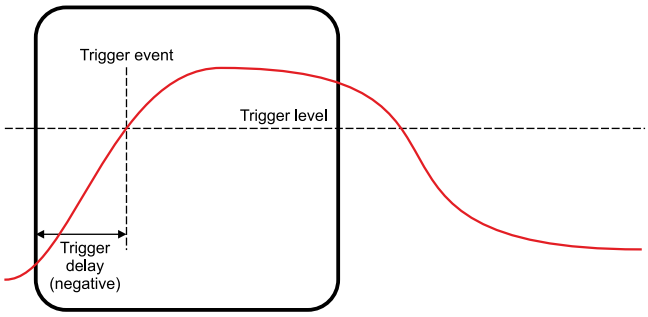
12.3.3 Selecting the recording time/sample rate

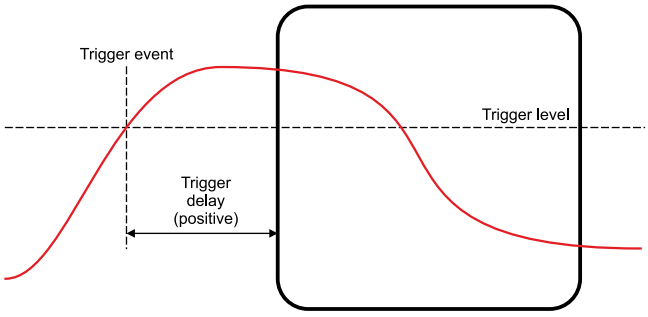
How to select the recording time and the sample rate:

1. Select the desired time base from the **time base** list field.
   - The current time base setting multiplied by ten results in the recording time.
   - Since the measured data memory of the Servo Drives 9400 HighLine has a limited capacity, usually a compromise is made between sample rate and recording time.
2. Enter the desired sampling rate in [ms] in the **sampling rate** input field.

   Pressing the " **...** " button next to the **Sampling rate** input field opens the *Sampling rate* dialog box. Here, you can also select the option **Increased sampling rate**:

Note!





When the option **Increased sampling rate** is selected, only integer multiples of 1/(sampling rate in ms) are detected by the system.

- Since a complete representation in the oscillogram (10 * 1/(sampling rate in ms) * (horizontal resolution in ms/Div)) requires + 1 measured values, but due to system-dependent reasons only integer multiples of (1 / (sampling rate in ms)) can be recorded, 1 ... 3 measured values may be missing at the left or right edges of the oscillogram. The displayed curve then ends before the end or starts after the start of the oscillogram.
- The curve that is recorded is not extended or compressed.

12.3.4 Selecting the trigger condition

Use the trigger condition to define when recording should start in the Servo Drives 9400 HighLine. The oscilloscope offers various trigger conditions for controlling how the measured values are recorded.

If the **Last settings** tab is in the foreground, click the **Settings** tab to show the input fields for configuring the trigger condition. The **Settings** tab contains the **Import settings** button for importing settings from a loaded oscillogram.

setting	Job title
Signal source	Selection of the trigger source
Variable	Selection of an application variable or a motor control variable as signal source
Channel	The oscilloscope triggers on a channel configured in the **channel list**.
System event	The following system events serve as trigger source: • Fault • Warning • Error • Quick stop by trouble • Any system event
Direct trigger	No trigger condition. Recording commences as soon as you press the **Start recording** button, if **Activate trigger** has been activated in the dropdown menu.
Value	Value from which on triggering is activated.
Deceleration	Time delay between recording and trigger event. Unit: [%]
Trigger delay	To detect signals that occur **before** the trigger event (e.g. values responsible for causing the event), enter a negative delay time.  In the oscillograph, the trigger time is marked by a dotted line. If you set a negative trigger delay, make sure that the recording memory contains the required values at the time of the trigger event. To ensure this, the settings must be transferred to the device far enough in advance of the trigger event.
	To detect signals that occur a certain time **after** the trigger event, enter a positive delay time. 

setting	Job title
Edge	Three trigger types are available:
Positive edge	First, the selected trigger value must be fallen below and then exceeded in order that the trigger is activated.
Negative edge	First, the selected trigger value must be exceeded and then fallen below in order that the trigger is activated.
Change	For triggering on a Boolean signal source: • Trigger activation requires a state change. For triggering on a different signal source: • The current value must be different than the last value in order that the trigger is activated.

12.3.5 Start recording

The following options are available in the dropdown menu:

- **Transfer settings to the device**
  - All oscilloscope settings are written to the device.
- **Activate trigger**
  - Actual recording from the device is only enabled if this option is activated.
  - The **Oscilloscope** tab displays the recording.

When you press the **Start recording** button, only the actions that have been activated in the dropdown menu (signalled by a checkmark) will be executed.

- With the engineering tool default setting, both options are active. When you press the **Start recording** button, both actions will be executed one after the other.
- There is always at least one active option.

Start recording after the trigger or scan settings are changed

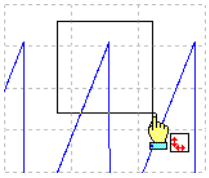
If the trigger or scan settings have been changed on the **Oscilloscope** tab, an exclamation mark will appear on the **Start recording** button:

After the configuration has been changed, it is transferred to the device by opening the dropdown menu and activating **Transfer settings to the device**.

12.3.6 Cyclic recording

How to record oscillogram cyclically:

1. Click the icon in the *oscilloscope toolbar* to open the **Oscilloscope settings** dialog box ▶ Oscilloscope toolbar (📖 589).
2. In order that the recording process is restarted automatically after the upload of an oscillogram, set the checkmark accordingly.
   - Cyclic recording is only possible for time base values ≥ 500 ms.



For monitoring certain situations, this serves, for instance, to obtain the increased view of the interesting part of a characteristic even after the cyclic update, as originally zoomed.

12.3.7 Adjusting the representation

After the variable values have been recorded and the oscillogram has been transferred to the PC, it is visualised. If required, the representation can now be adjusted by using the zoom or the automatic scaling function.

Zoom function

Go to the *oscilloscope toolbar* and click the icon to activate the zoom function
▸ Oscilloscope toolbar (📖 589)

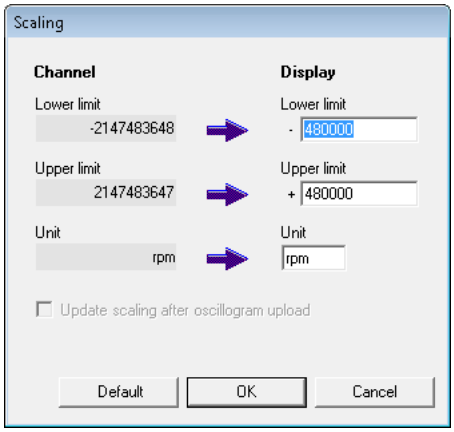
Zoom function	Procedure	
Zoom selection		Hold down the left mouse button and draw the oscillogram section to be zoomed:  • While being drawn, the selection is shown with a frame. • When the left mouse button is released, the selection is zoomed in the oscillogram.
Horizontal stretching		Hold down the left mouse button and move the mouse pointer on the horizontal scale to the left to stretch the shown selection from the right edge.
		Hold down the right mouse button and move the mouse pointer on the horizontal scale to the right to stretch the shown selection from the left edge.
	Moving the mouse pointer in opposite direction continuously reduces the stretching.	
Vertical stretching		Hold down the left mouse button and move the mouse pointer on the vertical scale to the bottom to stretch the shown selection from the top.
		Hold down the right mouse button and move the mouse pointer on the vertical scale to the top to stretch the shown selection from the bottom.
	Moving the mouse pointer in opposite direction continuously reduces the stretching.	
Return to original representation		Click the right mouse button in the oscillogram to return step by step to the original representation.

Automatic scaling function

Use the automatic scaling function to automatically scale and reposition the representation of selectable signal characteristics in the oscillogram and reset the offset to "0".

How to carry out automatic scaling:

1. Activate the automatic scaling for each channel in the **channel list** by a checkmark in the "AS" column.
2. Go to the *oscilloscope toolbar* and click the icon to activate the automatic scaling function for the activated channels.



3. Click the **OK** button.
   - The dialog box is closed and the selected channels/signal sources are scaled automatically.

4. Go to the *oscilloscope toolbar* and click the arrow next to the  symbol to set all the displayed curves to the Y position "0". This way, the curves are displayed "above one another".

How to carry out scaling manually per channel:

1. Go to the **Channel list** and click the entry to be changed in the "Unit" column (double-clicking an empty line has no effect.)
   - The dialog for entering the scaling opens which, as can be seen here in the example, allows for the entry of the lower and upper limit and the unit:

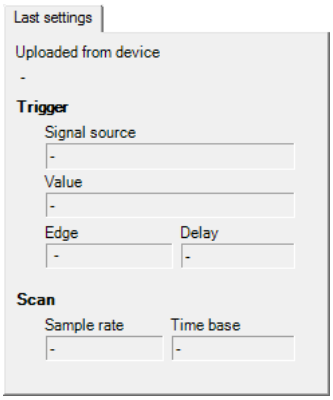
2. Enter the lower limit, the upper limit and the unit.
   - On the right side, any scaling values can be entered as upper and lower limit.
   - On the left side of the dialog, the limits of the data type of the recorded value are displayed.
3. Click the **OK** button.
   - The dialog box is closed.

There are variables the scaling of which depends on a parameter setting at the recording time (e.g. C00100). For these variables, the "Update scaling after oscillogram upload" option can be selected in the "Scaling" dialog.

If this option is active (box checked), the scaling settings "lower limit" and "upper limit" are automatically reset in the device according to the respective parameter value (e.g. C00100) each time an oscillogram is uploaded.

The option is automatically deactivated as soon as a value has been entered manually into the "lower limit" or "upper limit" field - the box is unchecked in the option.

12.3.8 Cursor function: Reading individual measured values



In addition to the zoom and scaling function, the oscilloscope offers a "cursor function" that can be used to display individual measured values of a selectable channel or the difference between two measured values.

How to use the cursor function:

1. Go to the *oscilloscope toolbar* and click the icon to activate the cursor function.
   - Another button is then shown which enables the centering of two independent and movable measuring lines.
   - The status bar displays the position of both measuring lines and the difference between them.
2. Select the channel for which individual measured values are to be indicated from the **Channel** list field.
3. Hold down the left mouse button and drag the red vertical measuring line to the desired position.
   - The active measuring line is represented by a continuous line, the inactive measuring line is represented by a dashed line.
   - If you click the inactive measuring line, it automatically becomes active.
   - The value measured at the position of the active measuring line is indicated in the value group box.
   - The difference between the values measured at the two measuring lines is indicated in the Differential value group field.
   - Comparing peak values: Several values displayed in the oscillogram can be compared by means of a horizontal measuring line. This measuring line is automatically generated based on the current cursor position and thus cannot be moved separately.

12.3.9 Last settings

All information included in the **Last settings** tab refer to the oscillogram loaded into the device:

The contents cannot be changed.

12.4 Managing oscillograms (measured data records)

If several oscillograms are loaded in the oscilloscope at the same time, the oscillogram to be displayed is selected via the corresponding tab below the toolbar. In general, the following oscillograms are to be distinguished:

Device oscillogram

The device oscillogram is the only oscillogram which can be used to establish a connection to the target system to carry out an oscilloscope measurement.

MERGE oscillogram

If two or more oscillograms are loaded in the oscilloscope, a "MERGE" tab is available.

- In the merge tab, several characteristics from the currently loaded data records can be overlaid, e.g. to compare signal characteristics from different recordings. ▸ Overlay function (📖 603)

Loaded oscillogram

An oscillogram loaded from a file.

12.4.1 Commenting the oscillogram

The **Comments** text field serves to enter a comment on the selected oscillogram.

- If you execute the Saving the oscillogram in a file command, the comment is saved together with the oscillogram in the file.

12.4.2 Saving the oscillogram in a file

After the signal sources to be recorded have been selected and the required settings have been entered, you can save the configuration and recording, if already executed, for future use in the project or export them to a file.

Note!

The reuse of a saved configuration is only reasonable for devices of the same type, as otherwise due to a scaling of the oscilloscope channels that is not adapted, incorrect values are displayed!

How to save an oscillogram in the project:

1. Click the icon in the *oscilloscope toolbar*.
   - The *Open oscillogram file* dialog box is displayed.
2. Specify a file name in the **File name** input field.
3. Click the **Filing in the project** button.
   - The dialog box is closed and the current oscillogram is filed in the project.

Note!

The oscillogram is only saved if the entire project is saved!

How to save an oscillogram as external file:

1. Click the icon in the *oscilloscope toolbar*.
   - The *Open oscillogram file* dialog box is displayed.
2. Press the **Save as external file ...** button.
   - A new window opens in which the directory and the file name for the oscillogram to be saved have to the specified.
3. Click the **Save** button.
   - The dialog box is closed and the current oscillogram is saved.

12.4.3 Loading the oscillogram file

Configurations/oscillograms already saved can be reloaded into the oscilloscope any time, e.g. for the overlay function.

Note!

The reuse of a saved configuration is only possible for devices of the same type, as otherwise due to a scaling of the oscilloscope channels that is not adapted, incorrect values are displayed!

How to load an oscillogram file from the project:

1. Click the icon in the *oscilloscope toolbar*.
   - The *Load oscillogram file* dialog box appears.
2. Select the file to be loaded from the upper list field.
3. Click the **OK** button.
   - The dialog box is closed and the oscillogram file is accepted.

How to load an oscillogram file from an external file:

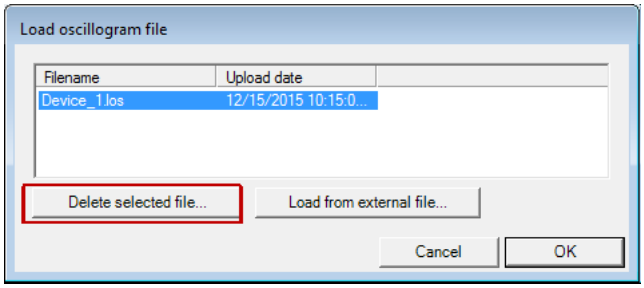
1. Click the icon in the *oscilloscope toolbar*.
   - The *Load oscillogram file* dialog box appears.
2. Press the **Load from external file...** button.
   - A new window opens in which the directory and the file name for the oscillogram file to be loaded have to be selected.
3. Click **Open**.
   - The dialog box is closed and the oscillogram file is loaded.
   - The oscillogram is displayed on an additionally appearing tab.
   - If the configuration to be loaded contains signal sources that are no longer available in the device, these variables are automatically removed from the configuration.

12.4.4 Importing settings from another loaded oscillogram

Pressing the **Import settings** button opens a dialog box containing the following possible settings:

- Select an oscillogram for importing the settings
  - By default, the settings from the oscillograms currently loaded in the oscilloscope are provided.
- Select the oscillogram file of the project to import the settings
  This setting is only available for the »Engineer« from version 2.16 onwards!
  - One or several oscillogram files saved in the project (*.los) are provided. Their file name and the time of upload from the device are given.
- Import oscillogram settings from oscillogram file
  - You can navigate to the respective oscillogram file on the file level of the PC by pressing the "**...**" button under this menu item.

12.4.5 Overlay function



The overlay function serves to lay several characteristics from the currently loaded oscillogram files on top of each other, e.g. to compare signal characteristics from different recordings.

- If two or more oscillograms are loaded in the oscilloscope, e.g. the device oscillogram and an oscillogram previously saved in the project, a "MERGE" tab is available.
- If the MERGE tab is selected, the desired characteristics to be overload or compared can be selected from the loaded files in the **channel list**.
- If a device oscillogram is used in the merge tab, an update is carried out in the MERGE oscillogram in case of a renewed recording.
- Removing signal sources from the device oscillogram causes the characteristics in the MERGE oscillogram to be deleted.

12.4.6 Deleting an oscillogram file saved in the project

How to delete an oscillogram file saved in the project:

1. Click the icon in the *oscilloscope toolbar*.
   - The *Load oscillogram file* dialog box appears.

2. Select one or several oscillogram files from the upper list field.
3. Press the **Delete selected file...** button.
   - The selected file(s) is/are deleted and the dialog box is closed.

12.5 Variables of the motor control (oscilloscope signals)

The system variables of the internal motor control listed in the following table can be recorded with the oscilloscope for diagnostic and documentation purposes.

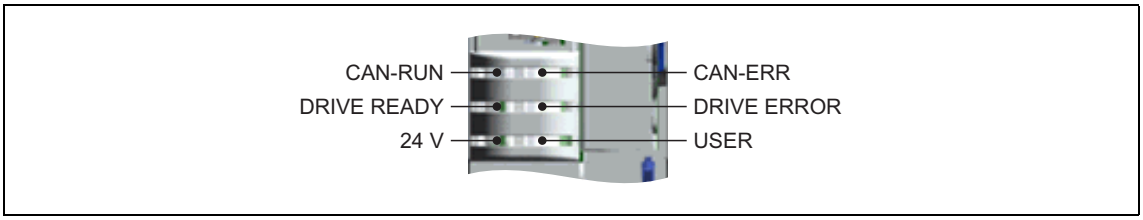
Note!

In comparison to all other variable values, the system variables of the internal motor control have a cycle offset of 2 ... 3 ms!

Tip!

The exact position of a variable in the motor control can be obtained from the corresponding signal flow.

Variable of the motor control		Meaning
▸ Signal flow - servo control for synchronous motor (📖 162) ▸ Signal flow - servo control for asynchronous motor (📖 164)		
	Common.dnActualFlux	Actual flux value
	Common.dnFluxSet	Flux setpoint
	Current.dnActualCurrentPhaseU	Actual motor current (phase U)
	Current.dnActualCurrentPhaseV	Actual motor current (phase V)
	Current.dnActualCurrentPhaseW	Actual motor current (phase W)
	Current.dnActualDirectCurrent	Actual D current
	Current.dnActualQuadratureCurrent	Actual Q current
	Current.dnDirectCurrentSet	D current setpoint
	Current.dnQuadratureCurrentSet	Q current setpoint
	Torque.dnActualMotorTorque	Actual torque
	Torque.dnFilteredTorqueSetpoint	Filtered torque setpoint
	Torque.dnInputNotchFilter1	Torque setpoint at the band-stop filter input 1
	Torque.dnInputNotchFilter2	Torque setpoint at the band-stop filter 2 input
	Voltage.dnActualDCBusVoltage	Current DC-bus voltage
	Voltage.dnActualMotorVoltage	Current motor voltage
	Voltage.dnOutputQuadratureCurrentCtrl	Q-output voltage of the current controller
	Voltage.dnOutputDirectCurrentCtrl	D-output voltage of the current controller
	Voltage.dnDirectVoltage	D voltage
	Voltage.dnQuadratureVoltage	Q voltage



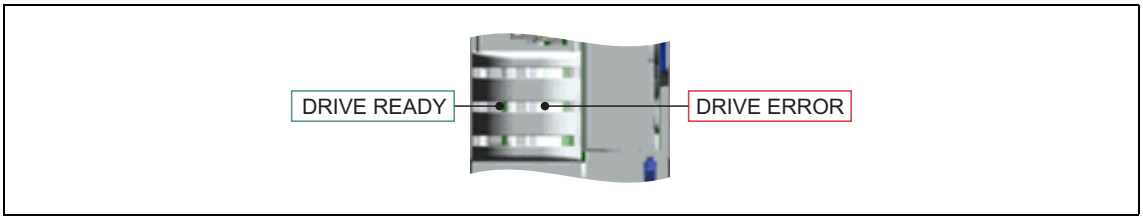
Variable of the motor control		Meaning
▸ Signal flow - sensorless vector control (📖 183)		
	Common.dnActualFlux	Actual flux value
	Current.dnActualDirectCurrent	Actual D current
	Current.dnActualQuadratureCurrent	Actual Q current
	Current.dnDirectCurrentSet	D current setpoint
	Current.dnQuadratureCurrentSet	Q current setpoint
	Frequency.dnActualRotatingFieldFrequency	Current field frequency
	Frequency.dnActualSlipFrequency	Actual slip frequency
	Speed.dnActualMotorSpeed	Actual speed value
	Torque.dnTorqueSetpoint	Torque setpoint
	Voltage.dnActualMotorVoltage	Current motor voltage
	Voltage.dnDirectVoltage	D voltage
	Voltage.dnQuadratureVoltage	Q voltage
▸ Signal flow - V/f control (📖 199) ▸ Signal flow for closed loop V/f control (📖 201)		
	Current.Current.dnActualMotorCurrent	Actual motor current
	Current.dnActualQuadratureCurrent	Actual Q current
	Frequency.dnActualRotatingFieldFrequency	Current field frequency
	Frequency.dnActualSlipFrequency	Actual slip frequency
	Speed.dnActualMotorSpeed	Current motor speed
	Speed.dnSpeedSetpoint	Speed setpoint
	Voltage.dnActualMotorVoltage	Current motor voltage
	Voltage.dnOutputDirectCurrentCtrl	D voltage
	Voltage.dnOutputQuadratureVoltage	Q voltage
▸ Signal flow - encoder evaluation (📖 243)		
	Position.dnActualLoadPos	Actual position
	Position.dnActualMotorPos	Current motor position
	Speed.dnActualEncoderSpeed	Current encoder speed
	Speed.dnActualMotorSpeed	Current motor speed
	Speed.dnActualResolverSpeed	Current resolver speed
▸ Signal flow - position follower (📖 492)		
	Position.dnActualLoadPos	Actual position
	Position.dnActualMotorPos	Current motor position
	Position.dnContouringError	Following error
	Position.dnPositionSetpoint	Position setpoint
	Speed.dnActualMotorSpeed	Current motor speed
	Speed.dnOutputPosCtrl	Output signal - phase controller
	Speed.dnSpeedSetpoint	Speed setpoint
	Torque.dnTorqueSetpoint	Torque setpoint
	Torque.dnTotalTorqueAdd	Additive torque feedforward control value

Variable of the motor control		Meaning
▸ Signal flow - speed follower (📖 498)		
	Speed.dnActualMotorSpeed	Current motor speed
	Speed.dnSpeedSetpoint	Speed setpoint
	Speed.dnTotalSpeedAdd	Additive speed setpoint
	Torque.dnTorqueSetpoint	Torque setpoint
	Torque.dnTotalTorqueAdd	Additive torque feedforward control value
▸ Signal flow - torque follower (📖 503)		
	Speed.dnActualMotorSpeed	Current motor speed
	Speed.dnSpeedSetpoint	Speed setpoint

13 Diagnostics & fault analysis

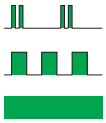
13.1 LED status display

Information on some operating states can be quickly obtained via LED displays:



[13-1] LED display on the controller front panel

Labelling	Colour	Description	
CAN-RUN	green	CAN bus ok	▸ LED status displays for the system bus (📖 301)
CAN-ERR	red	CAN bus error	
DRIVE READY	green	Standard device ready for operation	▸ LED status displays for the device state (📖 609)
DRIVE ERROR	red	Warning/trouble/fault	
24 V	green	24-V supply voltage ok	
USER	yellow	Message parameterised by the application	



13.1.1 LED status displays for the device state

The control of the two LEDs "DRIVE READY" and "DRIVE ERROR" in the middle of the controller's front panel depends on the device state. ▸ Device states (📖 100)

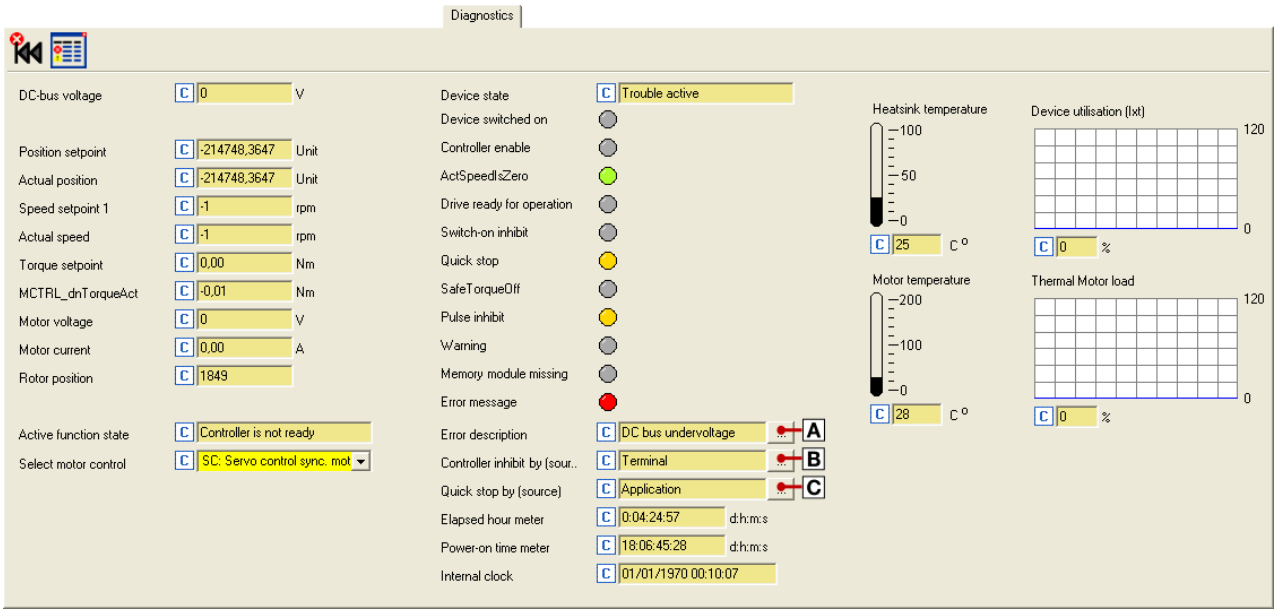
[13-2] DRIVE READY and DRIVE ERROR LED status displays

The meaning can be seen from the table below:

DRIVE READY	DRIVE ERROR	Meaning
OFF	OFF	"Initialisation active" state
	OFF	"Safe torque off active" state Observe LED on the safety module!
	OFF	"Device is ready to switch on" state
	OFF	"Device is switched on" state
	OFF	"Operation" state
		"Warning active" or "Warning locked active" The controller is ready to switch on, switched on or the operation is enabled and a warning is indicated.
		"Quick stop by trouble active" state
OFF		"Trouble active" state
OFF		"Fault active" state
OFF		"System fault active" state

Legend
Meaning of the symbols used to describe the LED states:

	LED is flashing once approx. every 3 seconds (*slow flash*)
	LED is flashing once approx. every 1.25 seconds (*flash*)
	LED is flashing twice approx. every 1.25 seconds (*double flash*)
	LED is blinking every second
	LED is permanently on

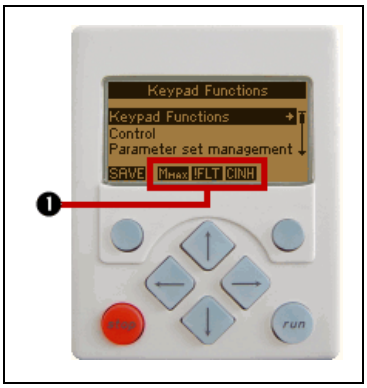


13.2 Drive diagnostics with the »Engineer«

When an online connection to the controller has been established, the connected controller can be diagnosed and relevant actual controller states can be displayed in a clearly arranged visualisation using the »Engineer«.

How to diagnose a drive with the »Engineer«:

1. Select the 9400 HighLine controller to be diagnosed in the *Project view*.
2. Click the icon or select the **Online→Go online** command to build up an online connection with the controller.
3. Select the **Diagnostics** tab.



With an online connection, the **Diagnostics** tab displays current status information about the controller:

Button		Job title
		Acknowledge error message (if the error cause has been eliminated).
		Reading out logbook entries (📖 615)
...	A	Display details of the current error.
	B	Display all active sources of a controller inhibit.
	C	Display all active sources of a quick stop.

13.3 Drive diagnostics via keypad/bus system

Keypad display of the controller status

- If the keypad on the front of the controller is connected to the diagnostic interface X6, the status of the controller is shown via different icons on the LCD display in the area ❶.

Symbol	Meaning	Note
RDY	Controller is ready for operation.	
RUN	Controller is enabled.	
STP	Application in the controller is stopped.	
QSP	Quick stop active	
CINH	Controller is inhibited.	The power outputs are inhibited.
OFF	Controller is ready to start.	
Mmax	Speed controller 1 at the limit.	The drive is torque-controlled.
Imax	Set current limit has been exceeded in motor or generator mode.	
IMP	Pulse inhibit active	The power outputs are inhibited.
!SFLT	System fault active	
!FLT	Fault active	
!TRB	Trouble active	
!TQSP	Quick stop by trouble active	
WRN	Warning is active	

Display parameters

The parameters listed in the following tables serve to query current states and actual values of the controller for diagnostic purposes, e.g. by using the keypad, a bus system or the »Engineer« (with an online connection to the controller).

- These parameters are listed in the »Engineer« parameter list and the keypad in the **Diagnostics** category.
- A detailed description of these parameters can be found in the chapter "Parameter reference". (📖 724)

Parameters	Display
C00183	Device status
C00166	Error description
C00168	Error number
C00051	Actual speed value [min-1]
C00052	Motor voltage
C00054	Motor current

Parameters	Display
C00057/1	Maximum torque
C00057/2	Motor reference torque
C00059	Motor - number of pole pairs
C00060	Motor pole angle
C00061	Heatsink temperature
C00062	Interior temperature
C00063	Motor temperature
C00064	Device utilisation (Ixt) during the last 180 seconds
C00065	Ext. 24-V voltage
C00066	Thermal motor load (I^2xt)
C00068	Capacitor temperature
C00069	CPU temperature
C00178	Time the controller was enabled (elapsed-hour meter)
C00179	Power-up time (power-on time meter)
C00186	ENP: Identified motor type

Identification data

The parameters listed in the following table, which in the »Engineer« parameter list and in the keypad are classified in the category **Identification → Controller**, serve to display the identification data of the controller:

Parameters	Display
C00099	Firmware version
C00200	Firmware product type
C00201	Firmware compilation date
C00203/1...9	HW product types
C00204/1...9	HW serial numbers
C00205/1...6	HW descriptions
C00206/1...6	HW manufacturing data
C00208/1...6	HW manufacturer
C00209/1...6	HW countries of origin
C00210/1...6	HW versions
C02113	Program name

13.4 Logbook

The integrated logbook function of the controller chronologically logs important events within the system and plays an important role for troubleshooting and controller diagnostics.

Events that can be logged

The following events can be logged in the logbook:

- Error messages of the operating system (📖 620)
- Error messages generated by the application
- Controller enable
- Starting / stopping the application
- Loading/saving of parameter sets, loading of the Lenze setting
- Transmitting an application or firmware to the controller
- Switching the controller on/off
- Formatting the file system

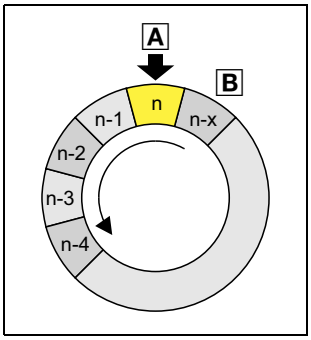
Tip!

Use a parameterisable filter to exclude certain events from logbook entry. ▸ Filtering logbook entries (📖 614)

Information saved

For each event, the following information is saved in the logbook:

- Type of response to the event (e.g. fault, warning or information)
- Event
- Value of power-on time meter
- Date/time (for memory module with real-time clock)
- Module that activated the event (A = application; S = system).



Memory depth

The number of possible logbook entries depends on the memory module used:

- MM1xx, MM2xx: 7 entries
- MM3xx, MM4xx: 439 entries

13.4.1 Functional description

The structure of the logbook corresponds to a ring buffer:

[13-3] Ring buffer structure

- As long as free logbook memory is available, the entry is placed in the next free position within the memory (A).
- If all memory units are assigned, the oldest entry (B) is deleted for a new entry.
- The newest entries will always remain available.

13.4.2 Filtering logbook entries

The logbook enters new entries in the ring buffer after they have passed through a parameterisable filter. By means of this filter you can exclude events with a specific error response (trouble, warning, information, etc.) from being entered in the logbook.

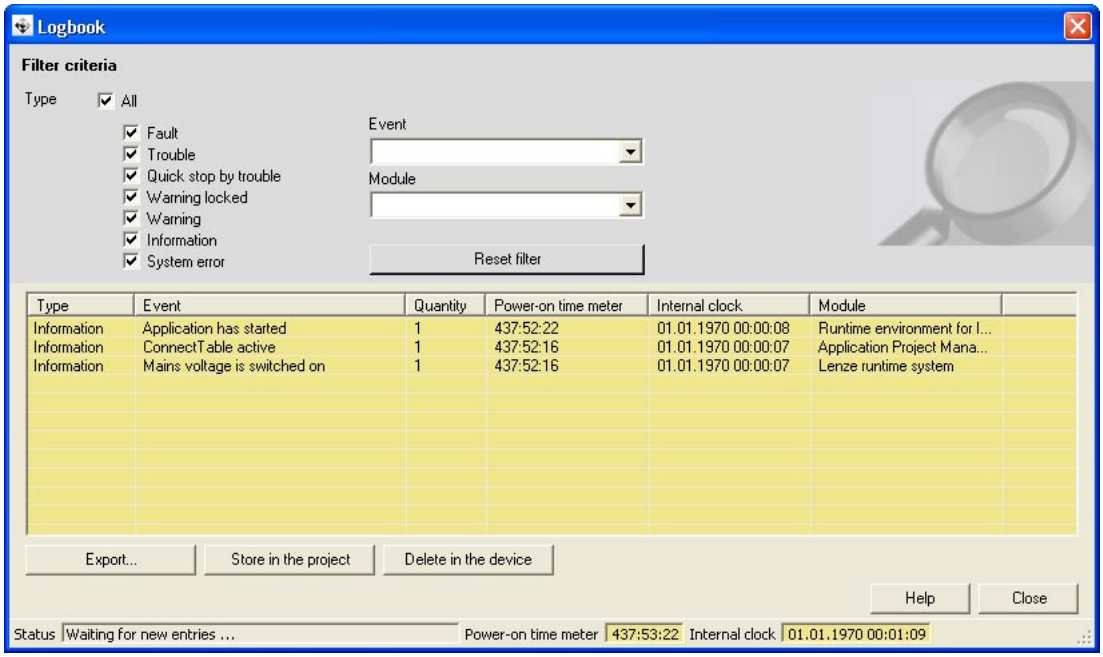
Note!

Events with the "No response" setting are not entered into the logbook.

The filter is parameterised in C00169 by means of a bit mask. A set bit inhibits the entry of the corresponding event in the logbook.

- From software version V5.0 the option that identical consecutive entries ("Multiple entries") into the logbook are suppressed can be additionally activated via bit 0. Then only the time stamp of the last (latest) entry and the number of times the same event has occurred successively are saved.

Bit	Filter	Lenze setting
0	No multiple entries	0 ≡ filter inactive
1	Error	0 ≡ filter inactive
2	Fault	0 ≡ filter inactive
3	Quick stop by trouble	0 ≡ filter inactive
4	Warning locked	0 ≡ filter inactive
5	Warning	0 ≡ filter inactive
6	Information	0 ≡ filter inactive



13.4.3 Reading out logbook entries

With an online connection, the existing logbook entries can easily be displayed in the »Engineer«.

How to display logbook entries in the »Engineer«:

1. Go to the *Project view* and select the 9400 HighLine controller the logbook entries of which are to be read out.
2. Click the icon or select the **Online→Go online** command to build up an online connection with the controller.
3. Select the **Diagnostics** tab from the *Workspace*.
4. Click the symbol in the *diagnostics toolbar* to open the *Logbook* dialog box.

The *Logbook* dialog box displays all logbook entries available in the device. You can filter the entries displayed systematically by selecting or defining filter criteria.

Button	Job title
Export...	Exporting logbook entries to a file (📖 616)
Storing in the project	Storing logbook entries in the project. Logbook entries stored in the project are also displayed if there is no online connection to the controller (e.g. for service and documentation purposes).
Deleting in the device	Delete all logbook entries available in the device.

13.4.4 Exporting logbook entries to a file

How to export the logbook entries to a file:

1. Click **Export...** in the *Logbook* dialog box.
   - The *Export logbook* dialog box is displayed.
2. Specify the folder, file name, and file type for the file.
3. Click the **Save** button to export the logbook entries into the given file.
   - Hidden logbook entries are not exported, i.e. the filter criteria specified are accounted for during the export.
   - The logbook entries are written to the file in the form of a semicolon separated list.

Example

```
Type;event;error number;number;power-on time meter;internal clock;module
Fault;motor:overtemperature;611778563;1;16243:36:56;01.01.1970 00:00;temperature monitoring
Fault;motor:thermal detector is defective;611778572;1;16243:36:56;01.01.1970 00:00;temperature

13.5 Monitoring

The controller is provided with various monitoring functions which protect the drive against impermissible operating conditions.

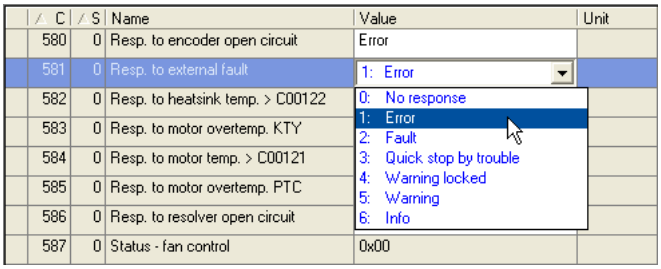
- If a monitoring function responds,
  - an entry will be made into the Logbook of the controller,
  - the response (quick stop by trouble, warning, fault, etc.) selected for this monitoring function is activated,
  - the status of the internal device control changes according to the selected response, controller inhibit is set, and the "DRIVE ERROR" LED on the front of the controller goes on:

Response	Logbook entry	Display in C00168	Pulse inhibit	Inverter disable	Acknowledgement required	LED "DRIVE ERROR"
None						OFF
Information	☑					OFF
Warning	☑	☑				
Warning locked	☑	☑			☑	
Quick stop by trouble	☑	☑			☑	
Fault	☑	☑	☑	☑ (after 0.5 s)		
Error	☑	☑	☑	☑	☑	
System fault	☑	☑	☑	☑	Mains switching is required!	

Danger!

If automatic restart is enabled (C00142 = "1: Enabled"), the drive can restart automatically from the "Trouble" and "Safe torque off" device states when the trouble or request for "Safe torque off active" has been eliminated!

▸ Automatic restart after mains connection/trouble... (📖 107)



See also:

▸ Device states (📖 100)
▸ LED status displays for the device state (📖 609)

13.5.1 Setting the error response

If a monitoring function responds, the response set for this monitoring function (quick stop by trouble, warning, fault, etc.) is triggered.

- For many monitoring functions the response can be individually parameterised via parameters.

Tip!

The table in the chapter "Short overview (A-Z)" contains the error messages for which the response can be set. (📖 626)

Warning thresholds

Some of the monitoring functions are activated if a defined warning threshold (e.g. temperature) has been exceeded.

- The corresponding preset threshold values can be changed via the following parameters:

Parameters	Info
C00120	Motor overload protection (I²xt)
C00121	Motor temp. warning threshold
C00122	Heatsink temp. warn. threshold
C00123	Device utilisation warning threshold
C00126	CPU temp. warning threshold
C00127	Mot. overload warning threshold
C00128	Thermal time constant of motor
C00174	Undervoltage (LU) threshold
C00570	Warning thres. brake transistor
C00572	Warning thres. brake resistor
C00576	Speed monitoring tolerance
C00596	Threshold max. speed reached
C00599	Motor phase failure threshold
C00620	Max. motor current threshold

13.6 Maloperation of the drive

The motor does not rotate.

Cause	Remedy
DC-bus voltage is too low.	Check mains voltage.
Controller is inhibited.	Deactivate controller inhibit (can be set by several sources).
Motor holding brake is not released.	Release motor holding brake.
Quick stop is active	Deactivate quick stop
Setpoint = 0	Select setpoint.

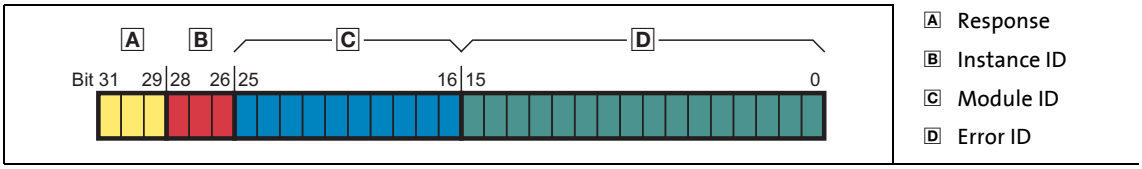
With a positive speed setpoint selection, the motor rotates counter-clockwise instead of clockwise (when looking at the motor shaft).

Cause	Remedy
Feedback system is not connected in correct phase relation.	Connect feedback system in correct phase relation.

The maximum current (C00022) flows and the motor does not rotate according to the defined speed setpoint.

Cause	Remedy
Two motor phases are interchanged, i.e. an anti-clockwise rotating field is applied to the motor.	Carry out the following steps for verification: 1. Ensure that the motor shaft is not blocked and can rotate freely without damaging the system. 2. Activate the "U-rotation test mode" for the motor control (C00398 = "1"). • In this test mode a voltage phasor with the frequency set in C00399/1 and the amplitude from the linear characteristic of rated voltage and rated frequency is applied to the machine, which corresponds to a clockwise rotating field. • ⚠ **Danger!** **When the test mode is active, the parameterisable error response "Quick stop by trouble" has no effect!** If the test mode is active and a monitoring function responds with this error response, no quick stop is executed but the motor continues to rotate with the frequency set for the test mode! 3. Increase the frequency step by step for the test mode in C00399/1 until the motor shaft starts to rotate. • If the motor shaft does not rotate, check the electrical connection. 4. While the motor shaft is rotating, check whether it rotates clockwise when looking at the A end shield. If not, two motor phases are interchanged. 5. Additionally check whether the actual speed value shown in C00051 is positive and whether it corresponds to the defined frequency, taking the number of pole pairs of the machine into consideration (C00059). If this is not the case, the connection and the parameter setting of the feedback system are to be checked. 6. Deactivate the test mode for the motor control again (C00398 = "0").

13.7 Error messages of the operating system

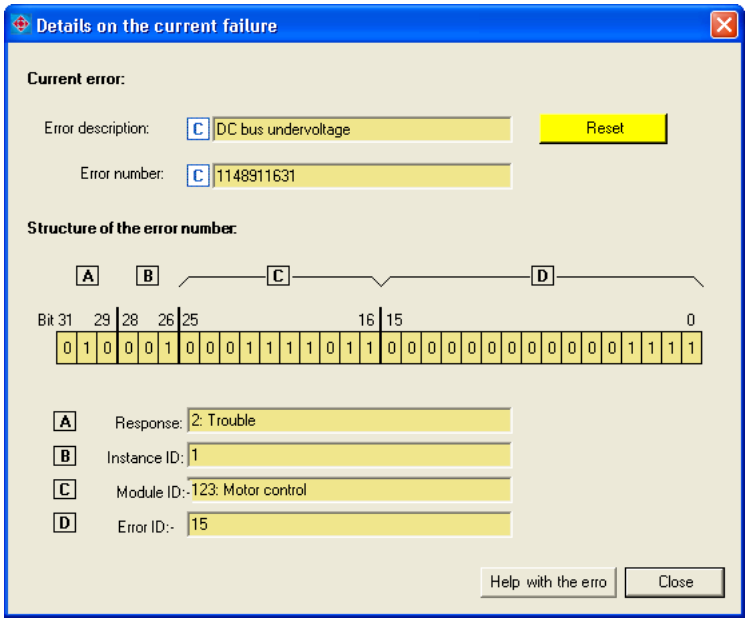


This chapter describes all error messages of the controller operating system and possible causes & remedies.

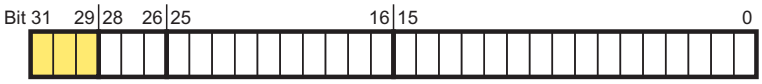
Tip!

Each error message is also saved to the logbook in chronological order. ▸ Logbook (📖 613)

13.7.1 Structure of the error number (bit coding)



If an error occurs in the controller, a 32-bit value will be saved in decimal format in the internal history buffer (C00168), which contains the following information:

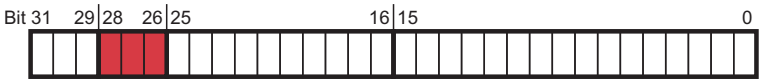


[13-4] Structure of the error number

Tip!

If you go to the **Diagnostics** tab and click the button ... to the right of the **Error description** display parameter, you will be shown all details on the current error in a separate dialog box.

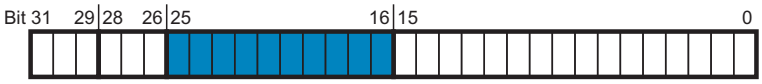
13.7.1.1 Response



Bit 31	Bit 30	Bit 29	Response
0	0	0	0: No Response
0	0	1	1: Error
0	1	0	2: Trouble
0	1	1	3: Quick stop by trouble
1	0	0	4: Warning locked
1	0	1	5: Warning
1	1	0	6: Information
1	1	1	7: System fault

The state of the internal device control changes according to the selected response to an error, controller inhibit is set, and the "DRIVE ERROR" LED on the front of the controller goes on:

Response	Logbook entry	Display in C00168	Pulse inhibit	Inverter disable	Acknowledgement required	LED "DRIVE ERROR"
None						OFF
Information	☑					OFF
Warning	☑	☑				
Warning locked	☑	☑			☑	
Quick stop by trouble	☑	☑			☑	
Fault	☑	☑	☑	☑ (after 0.5 s)		
Error	☑	☑	☑	☑	☑	
System fault	☑	☑	☑	☑	Mains switching is required!	

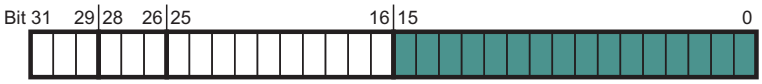


13.7.1.2 Instance ID

The instance ID is dynamically assigned by the operating system.

Bit 28	Bit 27	Bit 26	Meaning
0	0	0	Instance ID 0
0	0	1	Instance ID 1
0	1	0	Instance ID 2
0	1	1	Instance ID 3
1	0	0	Instance ID 4
1	0	1	Instance ID 5
1	1	0	Instance ID 6
1	1	1	Instance ID 7

13.7.1.3 Module ID



Use the module ID to identify the module in which the error has occurred.

Module ID		Module
hex	decimal	
0x0065	**101**	Logbook module
0x0068	**104**	Module recognition

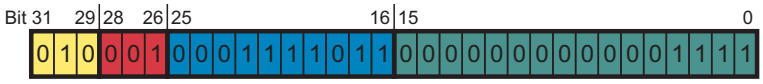
0x3b3	**947**	Electricalshaft function library
0x3b4	**948**	CIA402 function library

13.7.1.4 Error ID



16-bit value (0 ... 65535_{dec}) for error identification.

13.7.1.5 Example for bit coding of the error number

C00168 displays the error number "1148911631".

- This decimal value corresponds to the following bit sequence:

Assignment	Information	Meaning in the example
0 1 0	Response	2: Trouble
0 0 1	Instance ID	1: Instance ID 1
0 0 0 1 1 1 1 0 1 1	Module ID	Module ID 123 (0x007b): Motor control
0 0 0 0 0 0 0 0 0 0 0 1 1 1 1	Error ID	Error ID 15 (0x000f) for motor control: Undervoltage in the DC bus

- Error number "1148911631" thus means:
  The "DC-bus undervoltage" error with the response "Trouble" occurred in the "motor control" module with the instance ID 1.

13.7.2 Reset error message

An error message with the response "Fault", "Quick stop by trouble", or "Warning locked" must be reset (acknowledged) explicitly after the cause of error has been eliminated.

To reset (acknowledge) a pending error message, execute the device command C00002 = "43: Reset error".

Tip!

When an online connection to the controller has been established, use the **Diagnostics** tab of »Engineer« and click **Reset error** to reset a pending error message.

13.7.3 Short overview (A-Z)

The following table contains all error messages of the controller operating system in alphabetical order with the preset error response and - if available – the parameter for setting the error response.

Tip!

If you click on the cross-reference in the first column, you get to the detailed description of the corresponding error response in the following chapter "Cause & possible remedies". (📖 634)

Note!

Error message "Unknown error"

If the "Unknown error xxxx" error message is indicated in the logbook or in C00166, the reason for the missing plain text is that the error texts required have not been downloaded to the controller during the application download.

- This, for instance, is the case if a device module plugged into the controller has not been included in the Engineer project.
- Remedy: Include the device module, recompile and download the project.

hex	dec	Error message	Response (Lenze setting)	Adjustable in

13.7.4 Cause & possible remedies

This chapter contains all error messages of the controller operating system in numerical order of the error numbers. The list provides detailed information on the response to the error message as well as information on the cause & possible remedies.

Tip!

A list of all error messages of the controller operating system in alphabetical order can be found in the previous chapter "Short overview (A-Z)". (📖 626)

Note!

Error message "Unknown error"

If the "Unknown error xxxx" error message is indicated in the logbook or in C00166, the reason for the missing plain text is that the error texts required have not been downloaded to the controller during the application download.

- This, for instance, is the case if a device module plugged into the controller has not been included in the Engineer project.
- Remedy: Include the device module, recompile and download the project.

Logbook: Overflow [0x00650000]

Module ID (decimal)	**Error ID** (decimal)
101: Logbook module	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Too many events/faults have occurred in a very short time. It was therefore not possible to list all of them in the logbook.	Check whether application generates too many error messages.

Logbook: Reset (read error) [0x00650001]

Module ID (decimal)	**Error ID** (decimal)
101: Logbook module	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The logbook has been reset due to a read error..	- (is irreversible)

Logbook: Reset (version error) [0x00650002]

Module ID (decimal)	**Error ID** (decimal)
101: Logbook module	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The logbook has been reset due to a version conflict.	- (is irreversible)

Memory module is missing [0x00650003]

Module ID (decimal)	**Error ID** (decimal)
101: Logbook module	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Memory module is defective or not available.	Use a different memory module.

Control card is defect [0x00680000]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	0

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the control card.	Mains switching • Please contact Lenze if the error occurs again.

Power section is defect [0x00680001]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	1

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the power section.	Mains switching • Please contact Lenze if the error occurs again.

Memory module is defect or missing [0x00680002]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the memory module.	Mains switching • If the error occurs again: Switch off the controller, remove memory module and plug in again, switch on the controller again. • If the error still occurs: Switch off controller and use a different memory module.

Safety module is defect or missing [0x00680003]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	3

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the safety module.	Mains switching • If the error occurs again: Switch off the controller, remove safety module and plug in again, switch on the controller again. • If the error still occurs: Switch off controller and use a different safety module.

MXI1: Module changed during operation [0x00680004]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	4

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
It was tried to plug an extension module into module slot MXI1, which is not "Hot-plug"-able.	Plug in valid module and switch on mains. • Through mains switching, the system accepts modules without "hot plug" capability in the following switch-on phase.

MXI2: Module changed during operation [0x00680005]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	5

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
It was tried to plug an extension module into module slot MXI2, which is not "Hot-plug"-able.	Plug in valid module and switch on mains. • Through mains switching, the system accepts modules without "hot plug" capability in the following switch-on phase.

Memory module has been removed [0x00680006]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	6

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
You have tried to remove or change the memory module during operation.	Switch off the controller, plug in memory module and switch on the controller again. • If the error occurs again, the memory module is defective and must be replaced.

Safety module has been removed [0x00680007]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	7

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
You have tried to remove or change the safety module during operation.	Switch off the controller, plug in safety module and switch on the controller again. • If the error occurs again, the safety module is defective and must be replaced.

Control card is defect [0x00680008]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	8

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the control card.	Please contact Lenze.

Power section is defect [0x00680009]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	9

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the power section.	Please contact Lenze.

MXI1: Module is defect or missing [0x0068000a]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	10

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the extension module in module slot MXI1.	• Use a different extension module. • Please contact Lenze.

MXI2: Module is defect or missing [0x0068000b]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	11

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the extension module in module slot MXI2.	• Use a different extension module. • Please contact Lenze.

Memory module is defect or missing [0x0068000c]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	12

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the memory module.	• Use a different memory module. • Please contact Lenze.

Safety module is defect or missing [0x0068000d]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	13

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Operating system could not identify the safety module.	• Use a different safety module. • Please contact Lenze.

Control card incompatible [0x0068000e]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	14

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The control card is not supported by the operating system.	Please contact Lenze.

Power section incompatible [0x0068000f]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	15

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The power section is not supported by the operating system.	Please contact Lenze.

MXI1: Wrong module [0x00680010]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	16

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The extension module in module slot MXI1 is not supported by the operating system.	• Use a different module. • Please contact Lenze.

MXI2: Wrong module [0x00680011]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	17

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The extension module in module slot MXI2 is not supported by the operating system.	• Use a different module. • Please contact Lenze.

Incorrect memory module [0x00680012]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	18

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The memory module is not supported by the operating system.	• Use a different module. • Please contact Lenze.

Incorrect safety module [0x00680013]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	19

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The safety module is not supported by the operating system.	• Use a different module. • Please contact Lenze.

Power section was changed [0x00680014]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	20

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☒ **Information**

Cause	**Remedy**
The power section has been changed since the last mains switching.	(Only information or warning locked if the hardware type has also changed.)

MXI1: Module has been changed [0x00680015]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	21

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☒ **Information**

Cause	**Remedy**
The extension module in module slot MXI1 has been changed since the last mains switching.	(Only information or warning locked if the hardware type has also changed.)

MXI2: Module has been changed [0x00680016]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	22

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☒ **Information**

Cause	**Remedy**
The extension module in module slot MXI2 has been changed since the last mains switching.	(Only information or warning locked if the hardware type has also changed.)

Memory module has been changed [0x00680017]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	23

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☒ **Information**

Cause	**Remedy**
The memory module has been changed since the last mains switching.	(Only information or warning locked if the hardware type has also changed.)

Safety module has been changed [0x00680018]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	24

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety module has been changed since the last mains switching.	(Only information or warning locked if the hardware type has also changed.)

Combination MXI1/MXI2 not possible [0x00680019]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	25

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Extension modules which are not supported in this combination are plugged into module slots MXI1 & MXI2.	Create permitted module combination.

Firmware has been changed [0x0068001a]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	26

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The firmware of the operating system has been updated.	- (Information only)

Electronic nameplate: Communication error [0x0068001b]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	27

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Communication with the electronic nameplate is interrupted, the data could not be read.	Check correct connection of the encoder cable.

Memory module: Faulty file system [0x0068001c]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	28

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Memory module is plugged in incorrectly or is defective.	• Plug in the memory module correctly. • Exchange defective memory module.

Electronic nameplate: Checksum error [0x0068001d]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	29

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The checksum of the electronic nameplate is defective.	Please contact Lenze.

Firmware is incompatible with control card [0x0068001e]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	30

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Firmware is not compatible with the hardware.	Import the compatible firmware.

Combination memory module/device not possible [0x0068001f]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	31

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The memory module used is not supported by the controller according to the license model.	Plug in supported module and switch the mains. • The 9400 HighLine supports the MM220 (licence: Motion Control HighLevel) and MM330 memory modules (licence: Motion Control TopLevel).

Combination of module in MXI1/device not possible [0x00680020]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	32

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The extension module in module slot MXI1 is not supported by the controller.	• Remove the extension module and switch the mains. • Plug in supported extension module and switch the mains.

Combination of module in MXI2/device not possible [0x00680021]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	33

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The extension module in module slot MXI2 is not supported by the controller.	• Remove the extension module and switch the mains. • Plug in supported extension module and switch the mains.

Real-time clock is defective [0x00680022]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	34

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
Device error: The clock integrated in the MM440 memory module is defective.	• Replacing the memory module. • Please contact Lenze.

Real-time clock: Change battery [0x00680023]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	35

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
The battery in the clock integrated in the MM440 memory module is low. The clock is expected to fail soon.	Replacing the memory module.

Real-time clock: Battery empty, time lost [0x00680024]

Module ID (decimal)	**Error ID** (decimal)
104: Module identification	36

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
The battery integrated in the clock in the MM440 memory module is empty. The clock has been reset to its initial value (01.01.1970 - 00:00:00 o'clock).	• If the memory module is used for the first time, restart the controller to initialise the memory module. • If the problem occurs again, replace the memory module.

Code refresh [0x00690000]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	0

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (memory area - logbook) [0x00690001]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	1

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (LDS instance data) [0x00690002]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	2

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (LDS tasks) [0x00690003]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	3

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (storage blocks) [0x00690004]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	4

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (task queue) [0x00690005]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	5

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (message memory) [0x00690006]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	6

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (message queue) [0x00690007]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	7

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (name data base) [0x00690008]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	8

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (event mechanism) [0x00690009]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	9

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (event mechanism) [0x0069000a]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	10

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (semaphores) [0x0069000b]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	11

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (semaphores) [0x0069000c]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	12

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Serious device error or component failure.	Switch the controller off and then on again. • Please contact Lenze if the problem occurs again.

Internal error (file system lifetime) [0x0069000d]

Module ID (decimal)	**Error ID** (decimal)
105: Error check of the program memory during runtime	13

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The maximum number of permissible writing cycles has been reached for the memory module.	Replace memory module, otherwise data may get lost.

General error in the application [0x006a0000]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
General application error.	Mains switching. Transmit the application to the controller again. • Please contact Lenze if the problem occurs again.

Faulty program download [0x006a0001]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Faulty transmission of the application to the controller (checksum error).	Repeat transmission.

Fault during the update of the inputs and outputs [0x006a0002]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Mains switching. Transmit the application to the controller again. • Please contact Lenze if the problem occurs again.

New application loaded [0x006a0003]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Application has been changed by transmission from Engineer or loading from the memory module.	- (Information only)

ApplicationTask: Overflow [0x006a0004]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	4

Reaction (Lenze setting in bold)	**Setting:** C02111 (☑ Adjustable response)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	**Remedy**
Program runtime in Application task is too high.	Reduce program runtime by means of: • Omitting functions (e.g. by reducing the number of active FBs). • Optimisation of functions to the calculating time.

UserTask: Overflow [0x006a0005]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	5

Reaction (Lenze setting in bold)	**Setting:** C02111 (☑ Adjustable response)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	**Remedy**
Program runtime in user task is too high.	Reduce program runtime by means of: • Omitting functions (e.g. by reducing the number of active FBs). • Optimisation of functions to the calculating time.

IdleTask: Overflow [0x006a0006]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	6

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Program runtime in idle task is too high.	Reduce program runtime by means of: • Omitting functions (e.g. by reducing the number of active FBs). • Optimisation of functions to the calculating time.

Runtime error [0x006a000d]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	13

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
A runtime error has occurred in the application. The application processing has been interrupted.	Remove runtime error in the application and retransfer application to controller.

Application has stopped [0x006a000e]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	14

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The application has been stopped using the device command C00002="32". All user tasks are stopped.	Restart application with device command C00002="31".

Breakpoint reached [0x006a000f]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	15

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The application has reached a set breakpoint and the user task with the breakpoint has stopped.	Delete breakpoint and restart application.

Faulty application parameter [0x006a0010]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	16

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An invalid parameter description is available.	Transmit application and parameter set to the controller again.

Division by zero [0x006a0011]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	17

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An impermissible division by zero occurred in the application. The division has been intercepted and the divisor was replaced by the value "1".	Replace application.

Pointer access in impermissible memory area [0x006a0012]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	18

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An invalid pointer access to a protected area occurred in the application.	Replace application.

Application has started [0x006a0013]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	19

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The application in the controller has been started.	- (Information only)

Application has stopped [0x006a0014]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	20

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The application in the controller has been stopped.	- (Information only)

PDO mapping (MXI1): Faulty configuration [0x006a0015]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	21

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI1: Incorrectly configured process data mapping. • The corresponding PDO channel is not installed, e. g. because no communication module was selected for module slot MXI1 in the Engineer project. • The communication module selected for module slot MXI1 in the Engineer project does not support PDO mapping. • The mapping information downloaded to the controller is faulty.	• Integrate suitable communication module for module slot MXI1 in the Engineer project. • Check the configuration of the network. Then recompile the project and transmit it to the controller.

PDO mapping (MXI2): Faulty configuration [0x006a0016]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	22

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: Incorrectly configured process data mapping. • The corresponding PDO channel is not installed, e. g. because no communication module was selected for module slot MXI2 in the Engineer project. • The communication module selected for module slot MXI2 in the Engineer project does not support PDO mapping. • The mapping information downloaded to the controller is faulty.	• Integrate suitable communication module for module slot MXI2 in the Engineer project. • Check the configuration of the network. Then recompile the project and transmit it to the controller.

Fault in the control configuration [0x006a0017]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	23

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An invalid control configuration has occurred.	Load a different application.

Retain memory of the application faulty [0x006a001a]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	26

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
During reading or saving the retain memory of the application a fault has occurred.	Check whether the memory module suitable for the application is plugged in. Mains switching. (C00002) = 33 (reset program). Carry out project download again. • Please contact Lenze if the problem occurs again.

Watchdog cycle is greater than task cycle [0x006a001b]

Module ID (decimal)	**Error ID** (decimal)
106: Runtime environment for IEC 61131-3 programs	27

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
An application has been downloaded • with the highest priority task having a smaller cycle than the parameterised watchdog cycle or • with the watchdog of the highest priority task being deactivated.	You can acknowledge the error if you follow the below procedure: 1. Activate watchdog 2. Set a watchdog cycle that is smaller than or equal to the task cycle 3. Recreate the application and download it again • From software version V11.0: If the device boots with an application without an activated watchdog or with a watchdog set incorrectly, only an information is entered in the logbook.

Control card: Supply voltage (24 V DC) too low [0x006f0000]

Module ID (decimal)	**Error ID** (decimal)
111: Monitoring of the 24V supply voltage	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☒ **Trouble** ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
External 24 V supply voltage of the control card is lower than 18 V.	Check external supply voltage. • If the external supply voltage is available and the error message does not disappear, please contact Lenze.

Read error service register [0x00720000]

Module ID (decimal)	**Error ID** (decimal)
114: Service register	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
During reading or writing the service register a fault has occurred.	Mains switching • Please contact Lenze if the problem occurs again.

External error [0x00750000]

Module ID (decimal)	**Error ID** (decimal)
117: Device control	0

Reaction (Lenze setting in bold)	**Setting:** C00581 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
The drive interface has activated the error message "External error". • The input *DI_bSetExternError* of the system block **LS_DriveInterface** has been set to TRUE.	• Check external device to be monitored. • Check assignment of the input *DI_bSetExternError* in the application.

Controller enabled [0x00750001]

Module ID (decimal)	**Error ID** (decimal)
117: Device control	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The controller is enabled and has the "Operation" state.	- (Information only)

Controller in STO state [0x00750003]

Module ID (decimal)	**Error ID** (decimal)
117: Device control	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The controller has received the "Safe torque off (STO)" request by the safety module and is now in the "Safe torque off active" device state.	- (Information only)

Controller: Pulse inhibit is active [0x00750005]

Module ID (decimal)	**Error ID** (decimal)
117: Device control	5

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The pulse inhibit is active in the controller.	- (Information only)

PLC configuration invalid [0x00750006]

Module ID (decimal)	**Error ID** (decimal)
117: Device control	6

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An invalid control configuration has occurred.	Load a different application.

Heatsink: Temperature > C00122 [0x00770000]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	0

Reaction (Lenze setting in bold)	**Setting:** C00582 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	**Remedy**
Heatsink temperature higher than variable temperature limit (C00122). • Ambient controller temperature too high. • Dirty fan or ventilation slots. • Value set under C00122 is too low.	• Check control cabinet temperature. • Clean filter. • Clean inverter. • Set a higher value in C00122.

Heatsink: Overtemperature [0x00770001]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Heatsink temperature greater than fixed temperature limit. • Ambient controller temperature too high. • Dirty fan or ventilation slots. **Note:** The fixed temperature limit is dependent on the device size (DS). • Temperature limit 90 °C: DS1 - DS7, i.e. for devices with a rated current up to 104 A • Temperature limit 100 °C: DS81 - DS91, i.e. for devices with a rated current from 145 A	• Check control cabinet temperature. • Clean filter. • Clean inverter.

Motor: Temperature > C00121 [0x00770002]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	2

Reaction (Lenze setting in bold)	**Setting:** C00584 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	**Remedy**
Motor temperature higher than variable temperature limit (C00121). • Motor too hot due to impermissibly high currents or frequent and too long acceleration processes. • No PTC connected. • Value set under C00121 is too low.	• Check drive dimensioning. • Connect PTC or switch off monitoring (C00584="0"). • Set a higher value in C00121.

Motor: Overtemperature [0x00770003]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	3

Reaction (Lenze setting in bold)	**Setting:** C00583 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Motor temperature higher than fixed temperature limit (150 °C). • Motor too hot due to impermissibly high currents or frequent and too long acceleration processes. • No PTC connected.	• Check drive dimensioning. • Connect PTC or switch off monitoring (C00583="0").

CPU: Temperature > C00126 [0x00770008]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	8

Reaction (Lenze setting in bold)	**Setting:** C00589 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
CPU temperature higher than variable temperature limit (C00126). • Ambient controller temperature too high. • Dirty fan or ventilation slots. • Value set under C00126 is too low.	• Check control cabinet temperature. • Clean filter. • Clean inverter. • Set a higher value in C00126.

CPU: Overtemperature [0x00770009]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	9

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
CPU temperature higher than fixed limit temperature (85 °C). • Ambient controller temperature too high. • Dirty fan or ventilation slots.	• Check control cabinet temperature. • Clean filter. • Clean inverter.

Heatsink: Thermal detector is defect [0x0077000a]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	10

Reaction (Lenze setting in bold)	**Setting:** C00588 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Encoder for heatsink temperature supplies undefined values.	Check control cabinet temperature, maybe it is too low.

Inside the device: Thermal detector is defective [0x0077000b]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	11

Reaction (Lenze setting in bold)	**Setting:** C00588 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Encoder for interior temperature supplies undefined values.	Check control cabinet temperature, maybe it is too low.

Motor: Thermal detector is defect [0x0077000c]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	12

Reaction (Lenze setting in bold)	**Setting:** C00594 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
The signals of the connected encoder for the motor temperature detection (resolver at X7 or encoder at X8) are outside the defined operating range of the detection.	• Check contacts of the encoder cable at the motor and controller. • Check selection of the motor temperature sensor in C01190 and make sure that it complies with the assembly in the motor. • Possibly switch off temperature sensor monitoring (C00594="0"). • If a PTC is in the motor, activate the monitoring of the PTC temperature in C00585 instead.

DC-bus capacitor: Thermal detector is defect [0x0077000d]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	13

Reaction (Lenze setting in bold)	**Setting:** C00588 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Encoder for capacitor temperature supplies undefined values.	Check control cabinet temperature, maybe it is too low.

CPU: Thermal detector is defect [0x0077000e]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	14

Reaction (Lenze setting in bold)	**Setting:** C00588 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Encoder for CPU temperature supplies undefined values.	Check control cabinet temperature, maybe it is too low.

Motor: PTC has triggered [0x0077000f]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	15

Reaction (Lenze setting in bold)	**Setting:** C00585 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
The motor temperature detected via the terminals T1/T2 is too high. • Motor is too hot due to an increased effective current that results from operation with too high/too frequent acceleration processes. • Motor too hot due to increased ambient conditions. • Motor too hot due to lacking cooling in the case of self-ventilation and continuous operation with speeds lower than the rated speed. • Terminals T1/T2 are not assigned. • Open circuit of the supply cables for terminals T1/T2.	• Check drive dimensioning. • Connect PTC or thermal contact to terminals T1/T2. • If a motor without integrated temperature monitoring is used, switch off the monitoring function (C00585="0").

Heatsink: Fan is defect [0x00770010]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	16

Reaction (Lenze setting in bold)	**Setting:** C00610 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Speed of heatsink fan too low, e.g. due to dirt.	Check/clean fan.

Inside the device: Fan is defective [0x00770011]

Module ID (decimal)	**Error ID** (decimal)
119: Temperature monitoring	17

Reaction (Lenze setting in bold)	**Setting:** C00611 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Speed of internal fan is too low, e.g. due to dirt.	Check/clean fan.

Device utilisation Ixt > C00123 [0x00780000]

Module ID (decimal)	**Error ID** (decimal)
120: Analog signal monitoring	0

Reaction (Lenze setting in bold)	**Setting:** C00604 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	**Remedy**
Frequent and too long acceleration processes with overcurrent > C00123.	Check drive dimensioning.

Device utilisation Ixt > 100 % [0x00780001]

Module ID (decimal)	**Error ID** (decimal)
120: Analog signal monitoring	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Frequent and too long acceleration processes with overcurrent.	Check drive dimensioning.

Motor load I²xt > C00127 [0x00780002]

Module ID (decimal)	**Error ID** (decimal)
120: Analog signal monitoring	2

Reaction (Lenze setting in bold)	**Setting:** C00606 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	**Remedy**
Motor is thermally overloaded, e.g. due to: • impermissible continuous current • frequent or too long acceleration processes	• Check drive dimensioning. • Check setting in C00127.

Motor load I²xt > C00120 [0x00780003]

Module ID (decimal)	**Error ID** (decimal)
120: Analog signal monitoring	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Motor is thermally overloaded, e.g. due to: • impermissible continuous current • frequent or too long acceleration processes	• Check drive dimensioning. • Check setting in C00120.

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Calculated mutual inductance unrealistic [0x007b0002]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor data are inconsistent [0x007b0003]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Phase resistance too high [0x007b0004]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	4

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Device current too low for rated magnetisation [0x007b0006]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	6

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Controller current is too low for rated magnetisation, i.e. the controller cannot energise the motor sufficiently.	Check drive dimensioning.

Motor: Rated current < rated magnetising current [0x007b0007]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	7

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters and setting of C00022.

Motor: Calculated rotor resistance unrealistic [0x007b0009]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	9

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Calculated mutual inductance unrealistic [0x007b000a]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	10

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Calculated e. m. f. factor unrealistic [0x007b000b]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	11

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Calculated rotor time constant unrealistic [0x007b000c]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	12

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Motor: Calculated flux factor unrealistic [0x007b000d]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	13

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

DC bus overvoltage [0x007b000e]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	14

Reaction (Lenze setting in bold)	**Setting:** C00600 (☑ Adjustable response)
☐ None ☐ System fault ☑ Fault ☒ **Trouble** ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	**Remedy**
Due to a too high braking energy, the DC-bus voltage exceeds the overvoltage threshold which results from the mains voltage setting in C00173.	• Use brake resistor or regenerative module. • Check setting in C00173.

DC bus undervoltage [0x007b000f]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	15

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☒ **Trouble** ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
DC bus voltage is lower than the undervoltage threshold resulting from the mains setting under C00173.	• Check mains voltage. • Check setting in C00173.

Overcurrent detected [0x007b0010]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	16

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
• Short circuit/earth fault in motor cable. • Excessive capacitive charging current in the motor cable.	• Check motor cable. • Use shorter or lower-capacitance motor cable.

Earth fault detected [0x007b0011]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	17

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
• Earth fault in motor cable. • Excessive capacitive charging current in the motor cable.	• Check motor cable. • Use shorter or lower-capacitance motor cable.

Actual speed value outside the tolerance (C00576) [0x007b0012]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	18

Reaction (Lenze setting in bold)	**Setting:** C00579 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Difference between actual and setpoint speed is too big.	• Increase speed tolerance margin under C00576. • Check drive dimensioning.

Motor control: Task overflow [0x007b0013]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	19

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error (motor control).	Please contact Lenze.

Internal communication error (host MCTRL) [0x007b0014]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	20

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error (motor control).	Please contact Lenze.

Motor data are inconsistent [0x007b0017]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	23

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Resolver: Open circuit [0x007b0018]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	24

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information

Cause	**Remedy**
• Resolver cable interrupted. • Resolver defective.	• Check resolver cable. • Check resolver. • Switch off the monitoring function (C00586="0") if no resolver is used.

Motor: Calculated leakage inductance unrealistic [0x007b0019]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	25

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty motor parameterisation.	Check motor parameters.

Absolute value encoder: Communication error [0x007b001a]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	26

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Absolute value encoder does not send any data or a digital readout has been activated while the machine is coasting down.	• Check supply cable. • Check encoder. • Check voltage supply (C00421). • For Hiperface absolute value encoders: Check the initialisation time (C00412).

Encoder: Open circuit [0x007b001b]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	27

Reaction (Lenze setting in bold)	**Setting:** C00580 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
• Encoder cable interrupted. • Encoder defective. • Faulty parameter setting of the encoder. • Interruption of the light path of laser measuring systems. • Insufficient reflection of the light of laser measuring systems. **Note:** The encoder open-circuit monitoring for incremental encoders (C00422 = "0: Incremental encoder (TTL signal)") requires a signal amplitude > 3.5 V! If the signal amplitude is lower than 3.0 V, the error response parameterised in C00580 is triggered.	• Check encoder cable. • Check encoder. • Check parameter setting (C00422). • Switch off the monitoring function (C00580="0") if no encoder is used. • Correct the light path (for laser measuring systems). • Improve the reflection (for laser measuring systems).

Brake transistor: Ixt overload [0x007b001c]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	28

Reaction (Lenze setting in bold)	**Setting:** C00573 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Too frequent and too long braking processes.	Check drive dimensioning.

Brake resistor: I²xt overload [0x007b001d]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	29

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Too frequent and too long braking processes.	• Check drive dimensioning. • Check parameter setting (C00129, C00130, C00131).

Motor: Actual current value > C00620 [0x007b001e]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	30

Reaction (Lenze setting in bold)	**Setting:** C00619 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
The instantaneous value of the motor current has exceeded the value set in C00620.	• Set a higher value in C00620. • Reduce maximum current (C00022). • Change response (C00619).

Resolver: Calculated acceleration unrealistic [0x007b001f]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	31

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Resolver evaluation faulty (implausible acceleration at the resolver).	Check structure.

Motor: Actual speed value > C00596 [0x007b0020]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	32

Reaction (Lenze setting in bold)	**Setting:** C00607 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
Threshold for speed monitoring set in C00596 has been exceeded.	Check drive dimensioning.

Brake transistor: Overcurrent [0x007b0021]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	33

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Brake chopper short circuit/earth fault detected.	Check brake chopper cable and brake resistor.

Position encoder: Module selected in C00490 not available [0x007b0023]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	35

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The position encode selected under C00490 has not been recognised.	• Check position encoder. • Check parameter setting (C00490).

Motor encoder: Module selected in C00495 not available [0x007b0024]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	36

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The motor encoder selected under C00495 has not been recognised.	• Check motor encoder. • Check parameter setting (C00495).

Motor temperature: Module selected in C01193 not available [0x007b0025]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	37

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The module for temperature feedback selected in C01193 has not been recognised.	• Check feedback module. • Check parameter setting (C01193).

EnDat encoder: Lamp error [0x007b0026]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	38

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

EnDat encoder: Signal error [0x007b0027]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	39

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

EnDat encoder: Position error [0x007b0028]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	40

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

EnDat encoder: Overvoltage [0x007b0029]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	41

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

EnDat encoder: Undervoltage [0x007b002a]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	42

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

EnDat encoder: Overcurrent [0x007b002b]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	43

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

EnDat encoder: Battery empty [0x007b002c]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	44

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
EnDat encoder defective.	Check EnDat encoder.

Failure of motor phase U [0x007b002d]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	45

Reaction (Lenze setting in bold)	**Setting:** C00597 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
U phase interruption of motor cable.	• Check cabling between the controller and motor. • Check parameter setting (C00599).

Failure of motor phase V [0x007b002e]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	46

Reaction (Lenze setting in bold)	**Setting:** C00597 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
V phase interruption of the motor cable.	• Check cabling between the controller and motor. • Check parameter setting (C00599).

Failure of motor phase W [0x007b002f]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	47

Reaction (Lenze setting in bold)	**Setting:** C00597 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
W phase interruption of the motor cable.	• Check cabling between the controller and motor. • Check parameter setting (C00599).

Electronic nameplate: Data loaded [0x007b0030]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	48

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
New electronic nameplate (ENP) has been found.	- (Information only)

Electronic nameplate: Not found [0x007b0031]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	49

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Electronic nameplate (ENP) is not available.	- (Information only)

Electronic nameplate: Encoder protocol unknown [0x007b0032]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	50

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The connected motor with feedback is not supported by the controller firmware.	Check drive dimensioning.

Electronic nameplate: Encoder signal unknown [0x007b0033]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	51

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The connected motor with feedback is not supported by the controller firmware.	Check drive dimensioning.

Internal communication error (DMA) [0x007b0034]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	52

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error.	Please contact Lenze.

Controller: Overload during acceleration phases [0x007b0035]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	53

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Frequent or too long acceleration processes.	• Check drive dimensioning. • Reduce steepness of acceleration ramps.

Internal communication error (MCTRL host) [0x007b0036]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	54

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error.	Please contact Lenze.

PLC configuration invalid [0x007b0037]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	55

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An invalid control configuration has occurred.	Load a different application.

Motor parameter identification was cancelled [0x007b0038]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	56

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The motor current during identification was too high.	• The motor must not move during identification. • Check motor parameters.

Electronic nameplate: Data outside the parameter limits [0x007b0039]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	57

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The motor parameters of the electronic nameplate are outside of the limit values of the controller and therefore cannot be accepted.	Please contact Lenze.

Hiperface encoder: Transmission error [0x007b003a]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	58

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
• Encoder signal interferences (EMC). • Encoder cable interrupted. • Encoder defective. • Faulty parameter setting of the encoder. **Note:** This information is always supplied together with the "I/O error - encoder communication" error message and is entered in the logbook even if the encoder monitoring is deactivated (C00580).	• Check encoder cable, use shorter encoder cable if required. • Check encoder. • Check parameter setting (C00420, C00421, C00422).

Hiperface encoder: Command error [0x007b003b]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	59

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
• Encoder signal interferences (EMC). • Encoder cable interrupted. • Encoder defective. • Faulty parameter setting of the encoder. **Note:** This information is always supplied together with the "I/O error - encoder communication" error message and is entered in the logbook even if the encoder monitoring is deactivated (C00580).	• Check encoder cable, use shorter encoder cable if required. • Check encoder. • Check parameter setting (C00420, C00421, C00422).

Hiperface encoder: Unknown encoder [0x007b003c]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	60

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Encoder is not supported by the controller firmware.	• Exchange encoder for known type. • From software version V4.0: Parameterise the unknown encoder with the codes C00414 (type code) and C00415 (number of revolutions).

Hiperface encoder: Position initialisation error [0x007b003d]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	61

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A digital readout of the absolute encoder is only possible at standstill. The readout is activated by the following actions: • Mains switching • Change of C00420, C00422 and C00427 • To "Absolute value encoder: Communication error" • To "Encoder: Open circuit" **Note:** This information is always supplied together with the "I/O error - encoder communication" error message and is entered in the logbook even if the encoder monitoring is deactivated (C00580).	Prevent coasting of the machine while the absolute encoder is read out.

Encoder monitoring: Pulse deviation detected [0x007b003e]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	62

Reaction (Lenze setting in bold)	**Setting:** C00621 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
• Encoder signal interferences (EMC). • Encoder cable interrupted. • Encoder defective. • Faulty parameter setting of the encoder.	• Check encoder cable, use shorter encoder cable if required. • Check encoder. • Check parameter setting (C00422). • Possibly switch off monitoring (C00621).

Failure of a mains phase [0x007b003f]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	63

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Missing mains phase. **Note:** This monitoring is only available for devices ≥ 75 kW (type 8S and bigger).	Check mains connection.

Brake chopper: Ixt > C00570 [0x007b0040]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	64

Reaction (Lenze setting in bold)	**Setting:** C00569 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☐ Information	

Cause	**Remedy**
Frequent and too long braking.	• Check drive dimensioning. • Check setting in C00570.

Brake resistor: I2t > C00572 [0x007b0041]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	65

Reaction (Lenze setting in bold)	**Setting:** C00571 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☐ Information	

Cause	**Remedy**
Frequent and too long braking.	• Check drive dimensioning. • Check setting in C00572. • Check settings for brake resistor (C00129, C00130, C00131).

Power section is defect [0x007b0042]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	66

Reaction (Lenze setting in bold)
☐ None ☒ **System fault** ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Device error	Mains switching • Please contact Lenze if the problem occurs again.

Controller: Clamp operation [0x007b0047]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	71

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Actual motor current is higher than the maximum device current (C00789).	• Increase speed setpoint ramps. • Optimise Imax controller.

Pole position recognition cancelled [0x007b004a]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	74

Reaction (Lenze setting in bold)	**Setting:** C00640 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☑ Warning locked ☐ Warning ☐ Information	

Cause	**Remedy**
From software version V4.0 An error occurred during the pole position identification. The pole position identification could not be completed successfully.	• Check whether all requirements for an identification of the pole position are fulfilled. • Ensure that the machine is not braked or blocked during the pole position identification. • Repeat the pole position identification.

Motor switched off [0x007b004c]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	76

Reaction (Lenze setting in bold)	**Setting:** C00597 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	**Remedy**
From software version V5.0 Interruption of several motor cable phases.	Check cabling between the controller and motor.

EnDat encoder: Transmission error [0x007b004e]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	78

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
• Encoder signal interferences (EMC). • Encoder cable interrupted. • Encoder defective. • Faulty parameter setting of the encoder. **Note:** This information is always supplied together with the "I/O error - encoder communication" error message and is entered in the logbook even if the encoder monitoring is deactivated (C00580).	• Check encoder cable, use shorter encoder cable if required. • Check encoder. • Check parameter setting (C00420, C00421, C00422).

EnDat encoder: Command error [0x007b004f]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	79

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
• Encoder signal interferences (EMC). • Encoder cable interrupted. • Encoder defective. • Faulty parameter setting of the encoder. **Note:** This information is always supplied together with the "I/O error - encoder communication" error message and is entered in the logbook even if the encoder monitoring is deactivated (C00580).	• Check encoder cable, use shorter encoder cable if required. • Check encoder. • Check parameter setting (C00420, C00421, C00422).

EnDat encoder: Position initialisation error [0x007b0050]

Module ID (decimal)	**Error ID** (decimal)
123: Motor control	80

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A digital readout of the absolute encoder is only possible at standstill. The readout is activated by the following actions: • Mains switching • Change of C00420, C00422 and C00427 • To "Absolute value encoder: Communication error" • To "Encoder: Open circuit" **Note:** This information is always supplied together with the "I/O error - encoder communication" error message and is entered in the logbook even if the encoder monitoring is deactivated (C00580).	Prevent coasting of the machine while the absolute encoder is read out.

Memory module: File system has been formatted [0x007c0000]

Module ID (decimal)	**Error ID** (decimal)
124: Device command module (C00002)	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
File system of the memory module has been formatted.	- (Information only)

Memory module: File system has been restored [0x007c0001]

Module ID (decimal)	**Error ID** (decimal)
124: Device command module (C00002)	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
File system of the memory module has been restored.	- (Information only)

Analog input 1: Master current < 4 mA [0x007d0000]

Module ID (decimal)	**Error ID** (decimal)
125: Processing of analog inputs/outputs	0

Reaction (Lenze setting in bold)	**Setting:** C00598 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
Master current is in the impermissible range -4 ... +4 mA, e. g. due to a cable break or a defective master current value encoder. • Only for parameterisation as master current input (see C00034).	Remove cable break.

PLC configuration invalid [0x007d0001]

Module ID (decimal)	**Error ID** (decimal)
125: Processing of analog inputs/outputs	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	Remedy
An invalid control configuration has occurred.	Load a different application.

Communication error between device and device module [0x007f0002]

Module ID (decimal)	**Error ID** (decimal)
127: Interface to the intelligent communication module	2

Reaction (Lenze setting in bold)	**Setting:** C01501 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☐ Information	

Cause	Remedy
Communication between the controller and extension module is interrupted, e.g. due to disturbances in the ambience (EMC), defective hardware, or loose contact. • This monitoring is designed for safe process data communication.	• Eliminate EMC interference. • Switch off inverter, correctly plug in the module, switch on the inverter again. • Switch mains or restart inverter. • Replace module/inverter. • Please contact Lenze if the problem occurs again.

Communication with module in MXI1 interrupted [0x007f0003]

Module ID (decimal)	**Error ID** (decimal)
127: Interface to the intelligent communication module	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	Remedy
Communication between the controller and the extension module in module slot MXI1 cannot be established.	• Switch off controller, plug module correctly in module slot MXI1, switch on controller again. • If the problem occurs again, replace the module.

Communication with module in MXI2 interrupted [0x007f0004]

Module ID (decimal)	**Error ID** (decimal)
127: Interface to the intelligent communication module	4

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Communication between the controller and the extension module in module slot MXI2 cannot be established.	• Switch off controller, plug module correctly in module slot MXI2, switch on controller again. • If the problem occurs again, replace the module.

CAN on board: Bus off [0x00830000]

Module ID (decimal)	**Error ID** (decimal)
131: "CAN on board": CAN dispatcher	0

Reaction (Lenze setting in bold)	**Setting:** C00595 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: "Bus-Off" state • Received too many faulty telegrams. • Defective cable (e.g. loose contact). • Two nodes with the same ID.	• Remove fault (e.g. EMC). • Remove loose contact, screw down adapter. • Assign different IDs to nodes.

CAN on board: Invalid node address 0 [0x00830001]

Module ID (decimal)	**Error ID** (decimal)
131: "CAN on board": CAN dispatcher	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
CAN on board: initialisation error • The hardware allocation of the node address was selected via DIP switches, and the DIP switches of the node address are all on zero. **Note:** Instead of the impermissible node address 0, node address 1 is used.	• Set a non-zero node address by means of the DIP switches and then switch mains. • Activation of the software allocation of the node number by switching over DIP switch 2, then switch mains.

CAN on board: Basic configuration invalid [0x00830002]

Module ID (decimal)	**Error ID** (decimal)
131: "CAN on board": CAN dispatcher	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: configuration error • Faulty download of an Engineer or PLC Designer project • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN on board: Heartbeat error index 1 ... 32 [0x00840000 ... 0x0084001f]

Module ID (decimal)	**Error ID** (decimal)
132: "CAN on board": CAN-NMT handler	0 ... 31

Reaction (Lenze setting in bold)	**Setting:** C00613/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: Cyclic node monitoring • Node station has not received a heartbeat telegram from node 1 ... 32 within the defined time.	• Reactivate CAN node by mains switching, restart of the controller (C00002="11000") or CAN reset node. • Select a different heartbeat producer monitoring time or switch off monitoring and reset locked error status, if necessary. Tip: Save the current parameter set before mains switching and restart of the controller (C00002="11").

CAN on board: Lifeguarding error [0x00840020]

Module ID (decimal)	**Error ID** (decimal)
132: "CAN on board": CAN-NMT handler	32

Reaction (Lenze setting in bold)	**Setting:** C00614 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: Cyclic node monitoring • Slave response: Maximum time between two node guarding telegrams (remote transmission request telegram) from the master has been exceeded.	Select a different Lifeguarding monitoring time or switch off monitoring.

CAN on board: Faulty NMT slave configuration [0x00840021]

Module ID (decimal)	**Error ID** (decimal)
132: "CAN on board": CAN-NMT handler	33

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: A configuration error has occurred in the network management of the CAN slave. • Faulty download of an Engineer or PLC Designer project • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer. • Incorrect parameterisation of node guarding or heartbeat.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN on board: Faulty emergency configuration [0x00850000]

Module ID (decimal)	**Error ID** (decimal)
133: "CAN on board": CAN emergency handler	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: CAN emergency configuration is faulty. • Faulty download of an Engineer or PLC Designer project • Invalid CAN emergency settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN on board: Node guarding error 1 ... 32 [0x00860000 ... 0x0086001f]

Module ID (decimal)	**Error ID** (decimal)
134: "CAN on board": CAN-NMT master	0 ... 31

Reaction (Lenze setting in bold)	**Setting:** C00612/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: Cyclic node monitoring • CAN master has not received a response to a node guarding telegram (remote transmission request telegram) from node 1 ... 32 within the defined time.	• Reactivate CAN node by mains switching, restart of the controller (C00002="11000") or CAN reset node. • Select a different node guarding monitoring time or switch off monitoring. • Reset potentially caught error status. Tip: Save the current parameter set before mains switching and restart of the controller (C00002="11").

CAN on board: Faulty NMT master configuration [0x00860020]

Module ID (decimal)	**Error ID** (decimal)
134: "CAN on board": CAN-NMT master	32

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: A configuration error has occurred in the network management of the CAN master. • Faulty download of an Engineer or PLC Designer project. • Invalid CAN master settings according to DS301V402 and DS405 in the Engineer or PLC Designer. • Incorrect parameterisation of node guarding or heartbeat.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN on board RPDO1: Telegram not received or faulty [0x00870000]

Module ID (decimal)	**Error ID** (decimal)
135: "CAN on board": CAN-PDO handler	0

Reaction (Lenze setting in bold)	**Setting:** C00591/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: CAN-IN 1 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN on board RPDO2: Telegram not received or faulty [0x00870001]

Module ID (decimal)	**Error ID** (decimal)
135: "CAN on board": CAN-PDO handler	1

Reaction (Lenze setting in bold)	**Setting:** C00591/2 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: CAN-IN 2 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN on board RPDO3: Telegram not received or faulty [0x00870002]

Module ID (decimal)	**Error ID** (decimal)
135: "CAN on board": CAN-PDO handler	2

Reaction (Lenze setting in bold)	**Setting:** C00591/3 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: CAN-IN 3 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN on board RPDO4: Telegram not received or faulty [0x00870003]

Module ID (decimal)	**Error ID** (decimal)
135: "CAN on board": CAN-PDO handler	3

Reaction (Lenze setting in bold)	**Setting:** C00591/4 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CAN on board: CAN-IN 4 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN on board PDO manager: Faulty configuration [0x00870008]

Module ID (decimal)	**Error ID** (decimal)
135: "CAN on board": CAN-PDO handler	8

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: CAN-PDO configuration error • Faulty project download. • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer. • Mapping variables have incorrect CANopen indices according to DS405.	• Repeat download. • Correct CAN settings in the project and regenerate project.

CAN on board SDO server: Faulty configuration [0x00880000]

Module ID (decimal)	**Error ID** (decimal)
136: "CAN on board": CAN-SDO server	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: A configuration error has occurred in the CAN SDO server. • Faulty project download. • Invalid SDO server settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download. • Correct CAN settings in the project and regenerate project.

CAN on board SDO client: Faulty configuration [0x00890000]

Module ID (decimal)	**Error ID** (decimal)
137: "CAN on board": CAN-SDO client	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CAN on board: A configuration error has occurred in the CAN SDO client. • Faulty project download. • Invalid SDO client settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

File ProjectSelection.dat defect [0x008c0000]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File ProjectList.dat defect [0x008c0001]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File DeviceCFG.dat defect [0x008c0002]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File ProjectSelection.dat is missing [0x008c0003]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File ProjectList.dat is missing [0x008c0004]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	4

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File DeviceCFG.dat is missing [0x008c0005]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	5

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File ProjectSelection.dat invalid [0x008c0006]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	6

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File ProjectList.dat invalid [0x008c0007]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	7

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

File DeviceCFG.dat invalid [0x008c0008]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	8

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Internal error	Reformat memory module (C00002="1030") and repeat project download.

Project is not loaded [0x008c0009]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	9

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Application could not be loaded because of a file error.	Load new or different application.

Project is not available [0x008c000a]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	10

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Application not available.	• Download application with Engineer • Switch off controller and use a different memory module with an existing application.

Required licence missing [0x008c000b]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	11

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Memory module could not be initialised.	Two possibilities: • Use Engineer to download and activate an application suitable for the memory module. • Switch off controller and use memory module suitable for the application.

Application and device are incompatible [0x008c000c]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	12

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Application is incompatible with the controller.	• Download of an application suitable for the controller using Engineer. • Switch off controller and use a different memory module with suitable application.

MXI1: Module is missing or incompatible [0x008c000d]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	13

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Extension module in module slot MXI1 is incompatible with the application.	Use extension module supported by the application.

MXI2: Module is missing or incompatible [0x008c000e]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	14

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Extension module in module slot MXI2 is incompatible with the application.	Use extension module supported by the application.

MXI1: PROFIBUS module is missing or incompatible [0x008c000f]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	15

Reaction (Lenze setting in bold)	**Setting:** C00615/2 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
E94AYCPM communication module (PROFIBUS) in module slot MXI1 is incompatible with the application.	Use communication module supported by the application.

MXI2: PROFIBUS module is missing or incompatible [0x008c0010]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	16

Reaction (Lenze setting in bold)	**Setting:** C00615/3 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
E94AYCPM communication module (PROFIBUS) in module slot MXI2 is incompatible with the application.	Use communication module supported by the application.

MXI1: Ethernet module is missing or incompatible [0x008c0011]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	17

Reaction (Lenze setting in bold)	**Setting:** C00615/2 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
E94AYCEN communication module (Ethernet) in module slot MXI1 is incompatible with the application.	Use communication module supported by the application.

MXI2: Ethernet module is missing or incompatible [0x008c0012]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	18

Reaction (Lenze setting in bold)	**Setting:** C00615/3 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
E94AYCEN communication module (Ethernet) in module slot MXI2 is incompatible with the application.	Use communication module supported by the application.

MXI1: Digital frequency module is missing or incompatible [0x008c0013]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	19

Reaction (Lenze setting in bold)	**Setting:** C00615/2 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
Digital frequency extension module in module slot MXI1 is incompatible with the application.	Use extension module supported by the application.

MXI2: Digital frequency module is missing or incompatible [0x008c0014]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	20

Reaction (Lenze setting in bold)	**Setting:** C00615/3 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
Digital frequency extension module in module slot MXI2 is incompatible with the application.	Use extension module supported by the application.

MXI1: ICM module is missing or incompatible [0x008c0015]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	21

Reaction (Lenze setting in bold)	**Setting:** C00615/2 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
ICM extension module in module slot MXI1 is incompatible with the application.	Use extension module supported by the application.

MXI2: ICM module is missing or incompatible [0x008c0016]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	22

Reaction (Lenze setting in bold)	**Setting:** C00615/3 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
ICM extension module in module slot MXI2 is incompatible with the application.	Use extension module supported by the application.

MXI1: CAN module is missing or incompatible [0x008c0017]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	23

Reaction (Lenze setting in bold)	**Setting:** C00615/2 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in module slot MXI1 is incompatible with the application.	Use communication module supported by the application.

MXI2: CAN module is missing or incompatible [0x008c0018]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	24

Reaction (Lenze setting in bold)	**Setting:** C00615/3 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in module slot MXI2 is incompatible with the application.	Use communication module supported by the application.

ConnectTable active [0x008c001a]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	26

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The application is provided with a so-called connection table, i. e. connections can be altered "online" in the function block editor without having to carry out a new complete download.	- (Information only)

Internal error (CRC application) [0x008c001d]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	29

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
• The checksum of the application is faulty. • Files required to run the application are missing. • The supply voltage failed before the entire parameter set could be saved.	Transmit the application to the controller again.

Storage capacity for user parameters exceeded [0x008c001e]

Module ID (decimal)	**Error ID** (decimal)
140: Application project manager	30

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Due to the creation of too many user parameters within the application, the storage capacity available on the memory module has been exceeded. User parameters are produced directly by manual creation or indirectly by the insertion of function blocks.	• Use an MM4xx memory module instead of the MM3xx type (approx. twice the storage capacity). • Remove unnecessary, manually created user parameters from the application. • Remove unnecessary function blocks from the application. • Recompile the application and download it again. • Acknowledge the error. Then the current utilisation of the memory can be assessed using code C02112. If 100 % is displayed, this corresponds to the maximum utilisation for an executable application.

Parameter set faulty [0x00900000]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Parameter set is invalid.	Transfer parameter set from Engineer to the controller and save with C00002="11".

Lenze setting loaded [0x00900001]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Lenze setting has been loaded.	- (Information only)

Parameter set saved [0x00900002]

144: Parameter manager	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Parameter set has been saved.	- (Information only)

Parameter set loaded [0x00900003]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Parameter set has been loaded.	- (Information only)

Loading of Lenze setting failed [0x00900004]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	4

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Lenze setting of a parameter is not within the valid limits.	Eliminate error in the application and retransfer application to controller.

Parameter set restored [0x00900005]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	5

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An error has occurred while loading the selected parameter set.	Transfer parameter set from Engineer to the controller and save with C00002="11".

Saving of parameters failed [0x00900006]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	6

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An error has occurred while saving the current parameter set.	Use a different memory module.

Parameter set: Version conflict [0x00900007]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	7

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The parameter set version on the memory module is not compatible with the firmware of the controller.	Transfer parameter set from Engineer to the controller and save with C00002="11".

Code number duplicated [0x00900008]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	8

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
Code number of the operating system has been assigned to the application.	Eliminate error in the application and retransfer application to controller.

Parameter set: Type of standard device has been changed [0x00900009]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	9

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The firmware has loaded a parameter set the type code of which does not correspond to the type code of the controller.	Load a suitable parameter set.

No parameters for module in MXI1 [0x0090000a]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	10

Reaction (Lenze setting in bold)	**Setting:** C00615/2 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
The parameter set contains no parameters for the module inserted in MXI1.	Integrate the module inserted in MXI1 into the Engineer project and then retransmit the parameter set to the controller.

No parameters for module in MXI2 [0x0090000b]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	11

Reaction (Lenze setting in bold)	**Setting:** C00615/3 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	**Remedy**
The parameter set contains no parameters for the module inserted in MXI2.	Integrate the module inserted in MXI2 into the Engineer project and then retransmit the parameter set to the controller.

Disconnection in the case of par. storage [0x0090000c]

Module ID (decimal)	**Error ID** (decimal)
144: Parameter manager	12

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The supply voltage has failed before the saving of the parameter set could be completed. In the case of a device replacement/firmware update, the parameter set can no longer be established automatically.	Save the start parameters again, and in doing this, ensure that the supply voltage is applied until the saving process has been completed. Afterwards acknowledge the error message with "Reset error".

Mains voltage is switched on [0x00910000]

145: Lenze runtime system	13

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
System overload.	Please contact Lenze.

Communication task: Standstill > 3 s [0x0091000e]

Module ID (decimal)	**Error ID** (decimal)
145: Lenze runtime system	14

Reaction (Lenze setting in bold)	**Setting:** C01230 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
Service data communication within the system (SDO communication of all bus systems connected) has caused an overload of service data processing. Due to this, the monitoring interval of the processing task has been violated. PDO communication is not affected by this overload.	Reduce system load. • Reduce the data and communication volume on the buses. Processing will restart automatically when the overload has been eliminated. For systems frequently affected by this type of overload, the error response can be changed to warning via code C01230 in order to increase the drive availability.

Cyclic task: Standstill > 60 s [0x0091000f]

Module ID (decimal)	**Error ID** (decimal)
145: Lenze runtime system	15

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
System overload or CRC check task crash.	Reduce system load. • This is possible in the application or data transfer of the communication interfaces.

Position value faulty [0x00910010]

Module ID (decimal)	**Error ID** (decimal)
145: Lenze runtime system	16

Reaction (Lenze setting in bold)

Reaction (Lenze setting in bold)	**Setting:** C13041 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI1: Interruption (open circuit) of the signal cable for the "Enable" signal or no "Enable" signal available.	• Check signal cable for "Enable" signal. • Check encoder.

DFIN (MXI1): Supply cannot be corrected anymore [0x00990004]

Module ID (decimal)	**Error ID** (decimal)
153: Extension module - digital frequency in MXI1	4

Reaction (Lenze setting in bold)	**Setting:** C13042 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI1: The encoder voltage controlled by the digital frequency input has reached the voltage limit.	Check encoder.

DFOUT (MXI1): Maximum frequency reached [0x00990005]

Module ID (decimal)	**Error ID** (decimal)
153: Extension module - digital frequency in MXI1	5

Reaction (Lenze setting in bold)	**Setting:** C13080 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI1: Limit frequency at the digital frequency output reached. • The digital frequency has reached the limit value set in C013053.	Check limit value set.

CAN module (MXI1): Bus off [0x009d0000]

Module ID (decimal)	**Error ID** (decimal)
157: CAN module in MXI1: CAN dispatcher	0

Reaction (Lenze setting in bold)	**Setting:** C13595 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
CANopen communication module in MXI1: "Bus-off" state • Received too many faulty telegrams. • Defective cable (e.g. loose contact). • Two nodes with the same ID.	• Remove fault (e.g. EMC). • Remove loose contact, screw down adapter. • Assign different IDs to nodes.

CAN module (MXI1): Invalid node address 0 [0x009d0001]

Module ID (decimal)	**Error ID** (decimal)
157: CAN module in MXI1: CAN dispatcher	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
CANopen communication module in MXI1: Initialisation error • The hardware allocation of the node address was selected via DIP switches, and the DIP switches of the node address are all on zero. **Note:** Instead of the impermissible node address 0, node address 1 is used.	• Set a non-zero node address by means of the DIP switches and then switch mains. • Activation of the software allocation of the node number by switching over DIP switch 2, then switch mains.

CAN module (MXI1): Basic configuration invalid [0x009d0002]

Module ID (decimal)	**Error ID** (decimal)
157: CAN module in MXI1: CAN dispatcher	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI1: Configuration error • Faulty download of an Engineer or PLC Designer project • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI1): Heartbeat error index 1 ... 32 [0x009e0000 ... 0x009e001f]

Module ID (decimal)	**Error ID** (decimal)
158: CAN module in MXI1: CAN-NMT handler	0 ... 31

Reaction (Lenze setting in bold)	**Setting:** C13613/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI1: Cyclic node monitoring • Node station has not received a heartbeat telegram from node 1 ... 32 within the defined time.	• Reactivate CAN node by mains switching, restart of the controller (C00002="11000") or CAN reset node. • Select a different heartbeat producer monitoring time or switch off monitoring and reset locked error status, if necessary. Tip: Save the current parameter set before mains switching and restart of the controller (C00002="11").

CAN module (MXI1): Lifeguarding error [0x009e0020]

Module ID (decimal)	**Error ID** (decimal)
158: CAN module in MXI1: CAN-NMT handler	32

Reaction (Lenze setting in bold)	**Setting:** C13614 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI1: Cyclic node monitoring • Slave response: Maximum time between two node guarding telegrams (remote transmission request telegram) from the master has been exceeded.	Select a different Lifeguarding monitoring time or switch off monitoring.

CAN module (MXI1): Faulty NMT slave configuration [0x009e0021]

Module ID (decimal)	**Error ID** (decimal)
158: CAN module in MXI1: CAN-NMT handler	33

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	Remedy
CANopen communication module in MXI1: A configuration error has occurred in the network management of the CAN slave. • Faulty download of an Engineer or PLC Designer project • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer. • Incorrect parameterisation of node guarding or heartbeat.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI1): Faulty emergency configuration [0x009f0000]

Module ID (decimal)	**Error ID** (decimal)
159: CAN module in MXI1: CAN emergency handler	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	Remedy
CANopen communication module in MXI1: CAN emergency configuration is faulty. • Faulty download of an Engineer or PLC Designer project • Invalid CAN emergency settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI1): Node guarding error 1 ... 32 [0x00a00000 ... 0x00a0001f]

Module ID (decimal)	**Error ID** (decimal)
160: CAN module in MXI1: CAN-NMT master	0 ... 31

Reaction (Lenze setting in bold)	**Setting:** C13612/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: Cyclic node monitoring • CAN master has not received a response to a node guarding telegram (remote transmission request telegram) from node 1 ... 32 within the defined time.	• Reactivate CAN node by mains switching, restart of the controller (C00002="11000") or CAN reset node. • Select a different node guarding monitoring time or switch off monitoring. • Reset potentially caught error status. Tip: Save the current parameter set before mains switching and restart of the controller (C00002="11").

CAN module (MXI1): Faulty NMT master configuration [0x00a00020]

Module ID (decimal)	**Error ID** (decimal)
160: CAN module in MXI1: CAN-NMT master	32

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	Remedy
CANopen communication module in MXI1: A configuration error has occurred in the network management of the CAN master. • Faulty download of an Engineer or PLC Designer project. • Invalid CAN master settings according to DS301V402 and DS405 in the Engineer or PLC Designer. • Incorrect parameterisation of node guarding or heartbeat.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI1) RPDO1: Telegram not received or faulty [0x00a10000]

Module ID (decimal)	**Error ID** (decimal)
161: CAN module in MXI1: CAN-PDO handler	0

Reaction (Lenze setting in bold)	**Setting:** C13591/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: CAN-IN 1 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO2: Telegram not received or faulty [0x00a10001]

Module ID (decimal)	**Error ID** (decimal)
161: CAN module in MXI1: CAN-PDO handler	1

Reaction (Lenze setting in bold)	**Setting:** C13591/2 (☑ Adjustable response)

Cause	**Remedy**
CANopen communication module in MXI1: CAN-IN 5 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO6: Telegram not received or faulty [0x00a10005]

Module ID (decimal)	**Error ID** (decimal)
161: CAN module in MXI1: CAN-PDO handler	5

Reaction (Lenze setting in bold)	**Setting:** C13591/6 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI1: CAN-IN 6 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO7: Telegram not received or faulty [0x00a10006]

Module ID (decimal)	**Error ID** (decimal)
161: CAN module in MXI1: CAN-PDO handler	6

Reaction (Lenze setting in bold)	**Setting:** C13591/7 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI1: CAN-IN 7 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO8: Telegram not received or faulty [0x00a10007]

Module ID (decimal)	**Error ID** (decimal)
161: CAN module in MXI1: CAN-PDO handler	7

Reaction (Lenze setting in bold)	**Setting:** C13591/8 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI1: CAN-IN 8 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI1) PDO manager: Faulty configuration [0x00a10008]

Module ID (decimal)	**Error ID** (decimal)
161: CAN module in MXI1: CAN-PDO handler	8

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI1: CAN-PDO configuration error • Faulty project download. • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer. • Mapping variables have incorrect CANopen indices according to DS405.	• Repeat download. • Correct CAN settings in the project and regenerate project.

CAN module (MXI1) SDO server: Faulty configuration [0x00a20000]

Module ID (decimal)	**Error ID** (decimal)
162: CAN module in MXI1: CAN-SDO server	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI1: In the CAN SDO server a configuration error has occurred. • Faulty project download. • Invalid SDO server settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download. • Correct CAN settings in the project and regenerate project.

CAN module (MXI1) SDO client: Faulty configuration [0x00a30000]

Module ID (decimal)	**Error ID** (decimal)
163: CAN module in MXI1: CAN-SDO client	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI1: In the CAN SDO client a configuration error has occurred. • Faulty project download. • Invalid SDO client settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

DFIN (MXI2): Track error A-/A [0x00aa0000]

Module ID (decimal)	**Error ID** (decimal)
170: Extension module - digital frequency in MXI2	0

Reaction (Lenze setting in bold)	**Setting:** C14040 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI2: Interruption (open circuit) of the signal cable for track A.	• Check signal cable for track A. • Check encoder.

DFIN (MXI2): Track error B-/B [0x00aa0001]

Module ID (decimal)	**Error ID** (decimal)
170: Extension module - digital frequency in MXI2	1

Reaction (Lenze setting in bold)	**Setting:** C14040 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI2: Interruption (open circuit) of the signal cable for track B.	• Check signal cable for track B. • Check encoder.

DFIN (MXI2): Track error Z-/Z [0x00aa0002]

Module ID (decimal)	**Error ID** (decimal)
170: Extension module - digital frequency in MXI2	2

Reaction (Lenze setting in bold)	**Setting:** C14040 (☑ Adjustable response)
☑ None ☐ System fault ☒ **Fault** ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI2: Interruption (open circuit) of the signal cable for track Z.	• Check signal cable for track Z. • Check encoder.

DFIN (MXI2): Signal error enable/lamp control [0x00aa0003]

Module ID (decimal)	**Error ID** (decimal)
170: Extension module - digital frequency in MXI2	3

Reaction (Lenze setting in bold)	**Setting:** C14041 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI2: Interruption (open circuit) of the signal cable for the "Enable" signal or no "Enable" signal available.	• Check signal cable for "Enable" signal. • Check encoder.

DFIN (MXI2): Supply cannot be corrected anymore [0x00aa0004]

Module ID (decimal)	**Error ID** (decimal)
170: Extension module - digital frequency in MXI2	4

Reaction (Lenze setting in bold)	**Setting:** C14042 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI2: The encoder voltage controlled by the digital frequency input has reached the voltage limit.	Check encoder.

DFOUT (MXI2): Maximum frequency reached [0x00aa0005]

Module ID (decimal)	**Error ID** (decimal)
170: Extension module - digital frequency in MXI2	5

Reaction (Lenze setting in bold)	**Setting:** C14080 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☒ **Warning** ☑ Information	

Cause	**Remedy**
Digital frequency extension module in MXI2: Limit frequency at the digital frequency output reached. • The digital frequency has reached the limit value set in C014053.	Check limit value set.

CAN module (MXI2): Bus off [0x00ac0000]

Module ID (decimal)	**Error ID** (decimal)
172: CAN module in MXI2: CAN dispatcher	0

Reaction (Lenze setting in bold)	**Setting:** C14595 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
CANopen communication module in MXI2: "Bus-off" state • Received too many faulty telegrams. • Defective cable (e.g. loose contact). • Two nodes with the same ID.	• Remove fault (e.g. EMC). • Remove loose contact, screw down adapter. • Assign different IDs to nodes.

CAN module (MXI2): Invalid node address 0 [0x00ac0001]

Module ID (decimal)	**Error ID** (decimal)
172: CAN module in MXI2: CAN dispatcher	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: Initialisation error • The hardware allocation of the node address was selected via DIP switches, and the DIP switches of the node address are all on zero. **Note:** Instead of the impermissible node address 0, node address 1 is used.	• Set a non-zero node address by means of the DIP switches and then switch mains. • Activation of the software allocation of the node number by switching over DIP switch 2, then switch mains.

CAN module (MXI2): Basic configuration invalid [0x00ac0002]

Module ID (decimal)	**Error ID** (decimal)
172: CAN module in MXI2: CAN dispatcher	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: Configuration error • Faulty download of an Engineer or PLC Designer project • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI2): Heartbeat error index 1 ... 32 [0x00ad0000 ... 0x00ad001f]

Module ID (decimal)	**Error ID** (decimal)
173: CAN module in MXI2: CAN-NMT handler	0 ... 31

Reaction (Lenze setting in bold)	**Setting:** C14613/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: Cyclic node monitoring • Node station has not received a heartbeat telegram from node 1 ... 32 within the defined time.	• Reactivate CAN node by mains switching, restart of the controller (C00002="11000") or CAN reset node. • Select a different heartbeat producer monitoring time or switch off monitoring and reset locked error status, if necessary. Tip: Save the current parameter set before mains switching and restart of the controller (C00002="11").

CAN module (MXI2): Lifeguarding error [0x00ad0020]

Module ID (decimal)	**Error ID** (decimal)
173: CAN module in MXI2: CAN-NMT handler	32

Reaction (Lenze setting in bold)	**Setting:** C14614 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: Cyclic node monitoring • Slave response: Maximum time between two node guarding telegrams (remote transmission request telegram) from the master has been exceeded.	Select a different Lifeguarding monitoring time or switch off monitoring.

CAN module (MXI2): Faulty NMT slave configuration [0x00ad0021]

Module ID (decimal)	**Error ID** (decimal)
173: CAN module in MXI2: CAN-NMT handler	33

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: A configuration error has occurred in the network management of the CAN slave. • Faulty download of an Engineer or PLC Designer project • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer. • Incorrect parameterisation of node guarding or heartbeat.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI2): Faulty emergency configuration [0x00ae0000]

Module ID (decimal)	**Error ID** (decimal)
174: CAN module in MXI2: CAN emergency handler	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: CAN emergency configuration is faulty. • Faulty download of an Engineer or PLC Designer project • Invalid CAN emergency settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI2): Node guarding error 1 ... 32 [0x00af0000 ... 0x00a0001f]

Module ID (decimal)	**Error ID** (decimal)
175: CAN module in MXI2: CAN-NMT master	0 ... 31

Reaction (Lenze setting in bold)	**Setting:** C14612/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: Cyclic node monitoring • CAN master has not received a response to a node guarding telegram (remote transmission request telegram) from node 1 ... 32 within the defined time.	• Reactivate CAN node by mains switching, restart of the controller (C00002="11000") or CAN reset node. • Select a different node guarding monitoring time or switch off monitoring. • Reset potentially caught error status. Tip: Save the current parameter set before mains switching and restart of the controller (C00002="11").

CAN module (MXI2): Faulty NMT master configuration [0x00af0020]

Module ID (decimal)	**Error ID** (decimal)
175: CAN module in MXI2: CAN-NMT master	32

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: A configuration error has occurred in the network management of the CAN master. • Faulty download of an Engineer or PLC Designer project. • Invalid CAN master settings according to DS301V402 and DS405 in the Engineer or PLC Designer. • Incorrect parameterisation of node guarding or heartbeat.	• Repeat download • Correct CAN settings in the project and regenerate project.

CAN module (MXI2) RPDO1: Telegram not received or faulty [0x00b00000]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	0

Reaction (Lenze setting in bold)	**Setting:** C14591/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: CAN-IN 1 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO2: Telegram not received or faulty [0x00b00001]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	1

Reaction (Lenze setting in bold)	**Setting:** C14591/2 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: CAN-IN 2 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO3: Telegram not received or faulty [0x00b00002]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	2

Reaction (Lenze setting in bold)	**Setting:** C14591/3 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: CAN-IN 3 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO4: Telegram not received or faulty [0x00b00003]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	3

Reaction (Lenze setting in bold)	**Setting:** C14591/4 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: CAN-IN 4 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO5: Telegram not received or faulty [0x00b00004]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	4

Reaction (Lenze setting in bold)	**Setting:** C14591/5 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
CANopen communication module in MXI2: CAN-IN 5 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO6: Telegram not received or faulty [0x00b00005]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	5

Reaction (Lenze setting in bold)	**Setting:** C14591/6 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN 6 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO7: Telegram not received or faulty [0x00b00006]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	6

Reaction (Lenze setting in bold)	**Setting:** C14591/7 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN 7 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO8: Telegram not received or faulty [0x00b00007]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	7

Reaction (Lenze setting in bold)	**Setting:** C14591/8 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN 8 error • Incorrect PDO telegram length. • Transmission error. • Time monitoring of the PDOs has tripped.	• Set correct telegram length for CAN master (transmitter). • Eliminate trouble in the environment (e. g. EMC). • Select a different time monitoring or switch off time monitoring.

CAN module (MXI2) PDO manager: Faulty configuration [0x00b00008]

Module ID (decimal)	**Error ID** (decimal)
176: CAN module in MXI2: CAN-PDO handler	8

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	Remedy
CANopen communication module in MXI2: CAN-PDO configuration error • Faulty project download. • Invalid CAN settings according to DS301V402 in the Engineer or PLC Designer. • Mapping variables have incorrect CANopen indices according to DS405.	• Repeat download. • Correct CAN settings in the project and regenerate project.

CAN module (MXI2) SDO server: Faulty configuration [0x00b10000]

Module ID (decimal)	**Error ID** (decimal)
177: CAN module in MXI2: CAN-SDO server	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: In the CAN SDO server a configuration error has occurred. • Faulty project download. • Invalid SDO server settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download. • Correct CAN settings in the project and regenerate project.

CAN module (MXI2) SDO client: Faulty configuration [0x00b20000]

Module ID (decimal)	**Error ID** (decimal)
178: CAN module in MXI2: CAN-SDO client	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
CANopen communication module in MXI2: In the CAN SDO client a configuration error has occurred. • Faulty project download. • Invalid SDO client settings according to DS301V402 in the Engineer or PLC Designer.	• Repeat download • Correct CAN settings in the project and regenerate project.

PLC configuration invalid [0x00b80000]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	0

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
An invalid control configuration has occurred.	Load a different application.

Positive limit switch has triggered [0x00b80001]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	1

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☒ **Quick stop by trouble** ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The travel range limit switch in positive traversing direction has tripped.	Reset fault message and retract limit switch.

Negative limit switch has triggered [0x00b80002]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	2

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☒ **Quick stop by trouble** ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The travel range limit switch in negative traversing direction has tripped.	Reset fault message and retract limit switch.

Motor brake: Angular drift with closed brake too high [0x00b80003]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	3

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☒ **Quick stop by trouble** ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
The stop position of the motor axis has changed by more than the permissible angle of rotation set in C02595, although the brake is engaged.	• Deactivate standstill monitoring (C02595 = 0). • Increase waiting time for status monitoring (C02591). The standstill monitoring only starts after this waiting time has elapsed. • Increase brake closing time (C02589) since during the brake closing time the standstill monitoring is not active. • Reduce threshold for brake activation (C02581).

Motor brake: Automatically activated after waiting time has elapsed [0x00b80004]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	4

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
This time monitoring will only be active if the speed setpoint has reached the threshold for brake activation (C02581). If the actual speed value does not reach/fall below the threshold set in C02581within the parameterised waiting time for brake activation (C02593), the brake will be closed due to time-out.	• Increase waiting time for brake activation (C02593). • Reduce threshold for brake activation (C02581).

Motor brake: Status monitoring error [0x00b80005]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	5

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☒ **Quick stop by trouble** ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
Faulty external feedback of the brake status to the brake control.	• Check brake configuration with regard to the control selection in C02580. • Check setting for status input monitoring in C02583. When monitoring is active, the input *bBrakeApplied* must be triggered correctly (*bBrakeApplied* = *bBrakeReleased*). • Check voltage supply of the brake module.

Positive software limit switch overtravelled [0x00b80007]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	7

Reaction (Lenze setting in bold)	**Setting:** C02716/2 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☒ **Quick stop by trouble** ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
The positive software limit position parameterised in C02702/2 has been overtravelled.	• Position within the software limit positions. • Increase permissible traversing range (change setting of the software limit positions). • Deactivate monitoring of the software limit positions by the basic function "Limiter".

Negative software limit switch overtravelled [0x00b80008]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	8

Reaction (Lenze setting in bold)	**Setting:** C02716/2 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☒ **Quick stop by trouble** ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
The negative software limit position parameterised in C02702/1 has been overtravelled.	• Position within the software limit positions. • Increase permissible traversing range (change setting of the software limit positions). • Deactivate monitoring of the software limit positions by the basic function "Limiter".

Positive direction of rotation limited [0x00b80009]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	9

Reaction (Lenze setting in bold)	**Setting:** C02716/1 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
Due to the setting of C02707 it was tried to traverse in the impermissible positive direction of rotation.	• Only traverse in permissible (negative) direction of rotation. • Change setting of the permissible direction of rotation (C02707).

Negative direction of rotation limited [0x00b8000a]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	10

Reaction (Lenze setting in bold)	**Setting:** C02716/1 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
Due to the setting of C02707 it was tried to traverse in the impermissible negative direction of rotation.	• Only traverse in permissible (positive) direction of rotation. • Change setting of the permissible direction of rotation (C02707).

Speed has been limited [0x00b8000b]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	11

Reaction (Lenze setting in bold)	**Setting:** C02716/3 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
• The requested profile speed is higher than the maximum speed set in C02703 and has been limited to this speed. • The required profile speed cannot be achieved with the motor reference speed set in C00011.	• Reduce speed of the traversing profile of the basic function (manual jog, homing, or positioning). • Increase maximum speed (C02703). • Deactivate monitoring of the limit values by the basic function "Limiter". • Set motor reference speed correctly (C00011).

Acceleration has been limited [0x00b8000c]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	12

Reaction (Lenze setting in bold)	**Setting:** C02716/3 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
The requested profile acceleration is higher than the maximum acceleration set in C02705 and has been limited to this acceleration.	• Reduce acceleration of the traversing profile of the basic function (manual jog, homing, or positioning). • Increase maximum acceleration (C02705). • Deactivate monitoring of the limit values by the basic function "Limiter".

Deceleration has been limited [0x00b8000d]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	13

Reaction (Lenze setting in bold)	**Setting:** C02716/3 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
The requested profile deceleration is higher than the maximum acceleration set in C02705 and has been limited to this acceleration.	• Reduce acceleration of the traversing profile of the basic function (manual jog, homing, or positioning). • Increase maximum acceleration (C02705). • Deactivate monitoring of the limit values by the basic function "Limiter".

Jerk has been limited [0x00b8000e]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	14

Reaction (Lenze setting in bold)	**Setting:** C02716/3 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
The requested S-ramp time is lower than the minimum S-ramp time set in C02706 and has been limited to this S-ramp time.	• Increase S-ramp time of the traversing profile of the basic function (manual jog, homing, or positioning). • Reduce minimum S-ramp time (C02706). • Deactivate monitoring of the limit values by the basic function "Limiter".

Position target outside the software limit positions [0x00b8000f]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	15

Reaction (Lenze setting in bold)	**Setting:** C02716/2 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☒ **Quick stop by trouble** ☑ Warning locked ☑ Warning ☑ Information	

Cause	**Remedy**
It was tried to position to a target outside the software limit positions.	• Select a target within the software limit positions. • Increase permissible traversing range (change setting of the software limit positions). • Deactivate monitoring of the software limit positions by the basic function "Limiter".

Maximum speed exceeded [0x00b80010]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	16

Reaction (Lenze setting in bold)	**Setting:** C02716/3 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
The max. speed parameterised in C02703 or C00011 has been exceeded.	• Reduce speed. • Increase maximum speed (C02703). • Deactivate monitoring of the limit values by the basic function "Limiter".

Maximum acceleration exceeded [0x00b80011]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	17

Reaction (Lenze setting in bold)	**Setting:** C02716/3 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	**Remedy**
The max. acceleration parameterised in C02705 has been exceeded.	• Reduce acceleration. • Increase maximum acceleration (C02705). • Deactivate monitoring of the limit values by the basic function "Limiter".

Time-out torque feedforward control - brake [0x00b80012]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	18

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☒ **Quick stop by trouble** ☐ Warning locked ☐ Warning ☐ Information

Cause	Remedy
After 1 second the actual torque has not yet reached 90 % of the precontrolled setpoint torque for releasing the brake.	Check settings for torque feedforward control. • Possibly the maximum current (C00022) is not sufficient for the required torque feedforward control.

Cam data: Serial number MM does not match [0x00b80013]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	19

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	Remedy
The cam data are provided with an access protection of level 3 (linkage to the memory module), and the serial number contained in the cam data does not correspond to the serial number of the memory module.	Check and, if required, correct the serial number entered in »Cam Designer«. Afterwards redownload the cam data.

Cam data are corrupted [0x00b80014]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	20

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	Remedy
Checksum error during reading the file, or the password was manipulated.	Redownload cam data.

Cam data restored [0x00b80015]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	21

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	Remedy
The last download of the cam data was faulty or has not been completed successfully. The previous cam data – if available – have been downloaded from the backup file.	• Redownload cam data. • Save cam data within the controller in the memory module via device command C00002 = "502: Save cam data".

Cam data locked due to incorrect password [0x00b80016]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	22

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
The cam data were locked since the user password was entered incorrectly for three times. The cam data were not loaded.	Reset parameters to the Lenze setting via device command C00002 = "0: Load Lenze setting". Then download cam data again.

Cam data locked due to incorrect safety key [0x00b80017]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	23

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information

Cause	**Remedy**
The cam data were not loaded because the safety key is damaged. The password in the cam data or the serial number of the memory module has been manipulated.	Reset parameters to the Lenze setting via device command C00002 = "0: Load Lenze setting". Then download cam data again.

Homing mode not allowed [0x00b80019]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	25

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 The homing mode selected in C02640 is not supported in the motor control type selected in C00006.	Select another homing mode in C02640.

Int. overflow C02620 (manual jog: Speed 1) [0x00b8001a]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	26

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02620.

Int. overflow C02621 (manual jog: Speed 2) [0x00b8001b]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	27

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02621.

Int. overflow C02622 (manual jog: Acceleration) [0x00b8001c]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	28

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02622.

Int. overflow C02623 (manual jog: Deceleration) [0x00b8001d]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	29

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02623.

Int. overflow C02701/1 (positive software limit position) [0x00b80020]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	32

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02701/1.

Int. overflow C02701/2 (negative software limit position) [0x00b80021]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	33

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02701/2.

Int. overflow C02703 (maximum speed) [0x00b80022]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	34

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02703.

Int. overflow C02705 (maximum acceleration) [0x00b80023]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	35

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02705.

Int. overflow C02708/1 (limited speed 1) [0x00b80024]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	36

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02708/1.

Int. overflow C02708/2 (limited speed 2) [0x00b80025]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	37

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02708/2.

Int. overflow C02708/3 (limited speed 3) [0x00b80026]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	38

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02708/3.

Int. overflow C02708/4 (limited speed 4) [0x00b80027]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	39

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02708/4.

Int. overflow C02708/1 (decel. limited speed 1) [0x00b80028]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	40

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02710/1.

Int. overflow C02708/2 (decel. limited speed 2) [0x00b80029]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	41

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02710/2.

Int. overflow C02708/3 (decel.limited speed 3) [0x00b8002a]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	42

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02710/3.

Int. overflow C02708/4 (decel. limited speed 4) [0x00b8002b]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	43

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02710/4.

Int. overflow C02713 (max. dist. manual control) [0x00b8002c]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	44

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02713.

Int. overflow C02642 (home position) [0x00b8002d]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	45

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02642.

Int. overflow C02643 (homing: Target position) [0x00b8002e]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	46

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02643.

Int. overflow C02644 (homing: Speed 1) [0x00b8002f]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	47

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02644.

Int. overflow C02645 (homing: Acceleration 1) [0x00b80030]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	48

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02645.

Int. overflow C02646 (homing: Speed 2) [0x00b80031]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	49

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02646.

Int. overflow C02647 (homing: Acceleration 2) [0x00b80032]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	50

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02647.

Int. overflow C02670 (positioner: Tol. for target position) [0x00b80033]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	51

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information

Cause	**Remedy**
From software version V3.0 Due to a subsequent change of the machine parameters for gearbox ratio, feed constant, or resolution of an encoder revolution, the value set in the parameter cannot be displayed in the internal unit. See chapter "Max. position, speed, and acceleration that can be displayed internally".	• Check machine parameters and adapt them if required. • Change setting in C02670.

Cam data: Invalidated due to change of mechanical data [0x00b80034]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	52

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
From software version V4.0 One or several machine parameters have been changed that have an influence on the internal scaling of the Cam data. The Cam data has to be recalculated. See chapter "Invalid Cam data due to changed machine parameters".	Execute device command C00002 = "503: Calculate Cam Data". This automatically resets the warning.

Cam data: invalid product number [0x00b80035]

Module ID (decimal)	**Error ID** (decimal)
184: Basic drive functions	53

Reaction (Lenze setting in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
From software version V5.0 A product number has been created in the system block LS_CamInterface which is not in the range of product number of the downloaded cam data.	Check number of products. • The product number must be higher than 0 and lower than the value displayed in C02908. • C02908 displays the highest product number +1 of the cam data currently being processed.

14 Parameter reference

All parameters for controller parameterising or monitoring are saved as "codes".

- The codes are numbered and indicated by the prefix "C" before the code, e.g. "C00002".
- For the sake of clarity, some codes contain "subcodes" for saving parameters. This Manual uses a slash "/" as a separator between code and subcode, e.g. C00118/3".

Parameters available in the controller only from a certain software version are marked accordingly ("From software version Vx.x").

The parameter descriptions are based on the software version V15.00.xx.

Tip!

For quick reference of a parameter with a certain name simply use the **index** of the online documentation. The index always contains the corresponding code in parentheses behind the name.

For general information on how to read and change parameters, please see the online documentation for the »Engineer«.

14.1 Structure of the parameter descriptions

Each parameter is described in the Parameter list in the form of a table which consists of the following three areas:

Table header

The table header contains the following general information:

- Parameter number (Cxxxxx)
- Parameter name (display text in the »Engineer» and keypad)
- Data type
- Decimal and hexadecimal parameter index for access via bus systems

Table contents

The table contains further general explanations & notes on the parameter and the possible settings, which are represented in different ways depending on the parameter type:

- Parameters with read-only access
- Parameters with write access

Table footer

The table footer contains the Parameter attributes.

14.1.1 Data type

The following data types are available for parameters:

Data type	Meaning
INTEGER_8	8-bit value with sign
INTEGER_16	16-bit value with sign
INTEGER_32	32-bit value with sign
INTEGER_64	64-bit value with sign
UNSIGNED_8	8-bit value without sign
UNSIGNED_16	16-bit value without sign
UNSIGNED_32	32-bit value without sign
UNSIGNED_64	64-bit value without sign
FLOATING_POINT	32-bit floating point number
VISIBLE_STRING	String of characters of printable characters
OCTET_STRING	String of characters of any characters
BITFIELD_8	8-bit value bit-coded
BITFIELD_16	16-bit value bit-coded
BITFIELD_32	32-bit value bit coded

14.1.2 Parameters with read-only access

Parameters for which the "write access" attribute has not been set can only be read and not be changed by the user.

Description structure

Parameter | Name: **Cxxxxx | _____**	Data type: _____ Index: _____
Description	
Display range (min. value | unit | max. value)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

Representation in the »Engineer«

The »Engineer« displays these parameters with a grey background or, with an online connection, with a pale-yellow background:

	C...	S	Name	Value	Unit
	61	0	Heatsink temperature	30	°C

14.1.3 Parameters with write access

Only parameters with a check mark (☑) in front of the "write access" attribute can be changed by the user. The Lenze setting for these parameters is **printed in bold**.

- The settings can either be selected from a selection list or the values can be entered directly.
- Values outside the valid setting range are represented in red in the »Engineer«.

14.1.3.1 Parameters with setting range

Description structure

Parameter | Name: **Cxxxxx | _____**			Data type: _____ Index: _____
Description			
Setting range (min. value | unit | max. value)			**Lenze setting**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

Parameter setting in the »Engineer«

In the »Engineer«, parameters are set by entering the desired value into the input field:

	C...	S	Name	Value	Unit
	22	0	Maximum current	0.00	A

14.1.3.2 Parameters with selection list

Description structure

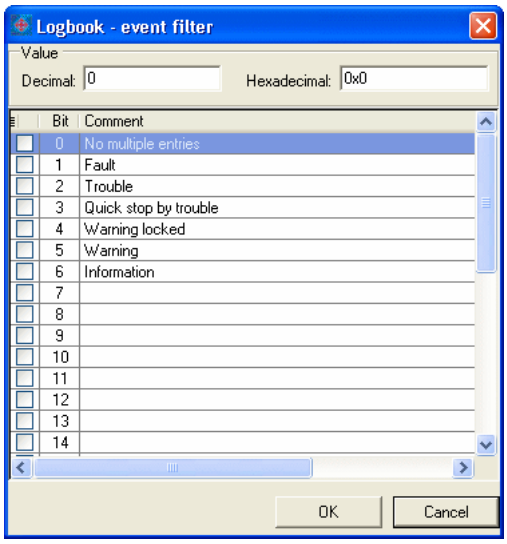
Parameter | Name: **Cxxxxx | _____**		Data type: _____ Index: _____
Description		
Selection list (Lenze setting printed in bold)		
1		
2		
3		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

Parameter setting in the »Engineer«

In the »Engineer«, a list field is used for parameter setting:

	C...	S	Name	Value	Unit
	34	0	Config. analog input 1	0: -10 ... +10 V	

0: -10 ... +10 V
1: -20...-4 mA, +4...+20 mA
2: -20 ... +20 mA



14.1.3.3 Parameters with bit-coded setting

Description structure

Parameter | Name: **Cxxxxx | _____**		Data type: _____ Index: _____
Description		
Value is bit-coded:		
Bit 0		
...		
Bit 31		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

Parameter setting in the »Engineer«

The »Engineer« uses a dialog box for parameter setting in which the individual bits can be set or reset. Alternatively, the value can be entered as a decimal or hexadecimal value:

14.1.3.4 Parameters with subcodes

Description structure

Parameter | Name: **Cxxxxx | _____**			Data type: _____ Index: _____
Description			
Setting range (min. value | unit | max. value)			
Subcodes	**Lenze setting**		
Cxxxxx/1			
Cxxxxx/2			
Cxxxxx/3			
Cxxxxx/4			
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

Parameter setting in the »Engineer«

The »Engineer« parameter list displays each subcode individually. The parameters are set as described in the previous chapters.

C...	S	Name	Value	Unit
114	1	Dig. input. 1: Terminal polarity	0	
114	2	Dig. input. 2: Terminal polarity	0	
114	3	Dig. input. 3: Terminal polarity	0	
114	4	Dig. input. 4: Terminal polarity	0	

14.1.4 Parameter attributes

Description structure

The table footers contain the parameter attributes:

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer

Meaning of the attributes

Attribute	Meaning	
☑ Read access	Read access to parameter possible.	
☑ Write access	Write access to parameter possible. • Please also observe the following attributes:	
	☑ CINH	Parameter value can only be changed when the controller is inhibited.
	☑ PLC STOP	Parameter value can only be changed when the application is stopped.
☑ No transfer	The parameter is **not** transferred to the regenerative power supply module when the command Download parameter set is executed.	

Scaling factor

The "scaling factor" is important for the parameter access via a bus system:

$$\text{Read value (via bus system)} = \text{Scaling factor} \cdot \text{Indicated value (Engineer)}$$

14.1.5 Abbreviations used in parameter & selection texts

Since the character length of the parameter and selection texts is limited, the following abbreviations are used:

Abbreviation	Meaning
CAN module	CANopen communication module (type E94AYCCA)
ENP	Electronic nameplate
Ethernet module	Ethernet communication module (type E94AYCEN)
MXI1	*Module eXtension Interface* 1 - module slot for extension 1
MXI2	*Module eXtension Interface* 2 - module slot for extension 2

14.2 Parameter list

This chapter lists all parameters of the operating system in numerically ascending order.

Note!

The parameter descriptions are based on the software version V15.00.xx.

C00002

Parameter | Name: **C00002 | Device command**		Data type: UNSIGNED_32 Index: $24573_d = 5FFD_h$
Device commands • C00003 shows the status of the last executed device command. • Under C00150 you can query the current status of the device control. **Note:** Before switching off the supply voltage after a device command has been executed, check the successful execution of the device command via the status display in C00003! The meaning of the status display in C00003 can be obtained from the subchapter for the corresponding device command in chapter "Device commands".		
Selection list (Lenze setting printed in bold)		**Info**
0	**Load Lenze setting**	Resets parameters to Lenze setting. • Only possible when the application has stopped and the controller is inhibited.
1	Load start parameters	Loads parameters from the memory module. • Only possible when the application has stopped and the controller is inhibited.
2	ENP: Load plant data	Reads plant data from the electronic motor nameplate. • Only possible when the application has stopped and the controller is inhibited.
5	Activate application	Activates the application selected under C00005. • Whether the application is also started, depends on the auto-start setting selected. • Only possible when the application has stopped.
7	Save selected application	Selects the active application as start application.
11	Save start parameters	Saves parameters fail-safe in the memory module.
20	Delete logbook	Deletes all logbook entries.
21	Archive logbook	Exports logbook entries to file.
27	Device search function ON	
28	Device search function OFF	
31	Start application	
32	Stop application	
33	Reset program	Carries out a reset. • All variables are reset to their initialisation value. • The situation corresponds to the start of a new program loaded into the control (cold start).
34	Delete program	Carries out a reset (source). • All variables are reset to their initialisation value. • The application program is deleted and the controller is reset to its original state.

Parameter | Name: **C00002 | Device command**		Data type: UNSIGNED_32 Index: $24573_d = 5FFD_h$
35	Restart program	Carries out a reset (warm start). • All variables except the RETAIN variables are reset to their initialisation value. • The situation corresponds to a power failure or switching the controller off/on (warm start) while the program is running.
36	Reset runtime measurement	▸ Runtime measurement
41	Inhibit inverter	
42	Enable inverter	
43	Error reset	
45	Activate quick stop	▸ Basic function "Quick stop"
46	Reset quick stop	▸ Basic function "Quick stop"
47	Internal command 47	For Lenze service only
48	Internal command 48	For Lenze service only
51	Identify pole position (360°)	Executes identification of pole position. • The function can only be activated when the controller is inhibited. • After this, the execution of the command starts automatically when the controller is enabled. • During the pole position identification, the motor carries out one electrical revolution. This leads to a mechanical rotation of the motor shaft. • The determined pole position is indicated under code C00058. ▸ Pole position identification
52	Identify pole position (min. motion)	Executes identification of pole position. • The function can only be activated when the controller is inhibited. • After this, the execution of the command starts automatically when the controller is enabled. • During the pole position identification, the rotor aligns itself. This is compensated by a position control. • The determined pole position is indicated under code C00058. ▸ Pole position identification
58	Internal command 58	From software version V15.0 onwards For Lenze service only
59	Resolver error identification	From software version V7.0 Execute resolver error identification. ▸ Resolver error compensation
70	Load Lenze inverter characteristic	From software version V4.0 Load type-dependent inverter error characteristic. • For the case that the determination of the inverter error characteristic with the device command "71: Determine inverter characteristic" was not possible or has supplied incorrect results. • The function can only be activated when the controller is inhibited.
71	Calculate inv. characteristic	Determines inverter error characteristic. • The function can only be activated when the controller is inhibited. • After this, the execution of the command starts automatically when the controller is enabled. ▸ Optimise the switching performance of the inverter

Parameter | Name: **C00002 | Device command**		Data type: UNSIGNED_32 Index: $24573_d = 5FFD_h$
72	Determine motor parameters	Determines motor parameters automatically. • The function can only be activated when the controller is inhibited. • After this, the execution of the command starts automatically when the controller is enabled. ▸ Determine motor parameters
77	Calculate current controller parameters	From software version V5.0 Calculates the gain and reset time of the current controller. • Usually not required for a Lenze motor. • The device command is no identification procedure for determining the current controller parameters! ▸ Calculate current controller parameters
78	Calculate speed controller parameters	From software version V5.0 Calculates the gain, reset, and rate time of the speed controller. • The device command is no identification procedure for determining the speed controller parameters! ▸ Calculate speed controller parameters
91	CAN on-board: Reset node	Reinitialise "CAN on board" interface. • Required when changing the baud rate, node address, or identifiers. ▸ "CAN on board" system bus
92	CAN module: Reset node	Reinitialises CANopen interface of the CANopen communication module. • Required when changing the baud rate, node address, or identifiers.
93	CAN on-board: Pred.Connect.Set	Sets basic identifier for the "CAN on board" interface according to the "Predefined Connection Set" (DS301 V4.02). ▸ "CAN on board" system bus
94	CAN module: Pred.Connect.Set	Sets basic identifier for the CANopen interface of the CANopen communication module according to the Predefined Connection Set" (DS301 V4.02).
95	CAN on-board: Identify node	Detects nodes connected to the "CAN on board" interface. • The result of the CAN bus scan is displayed in C00393. ▸ "CAN on board" system bus
96	CAN module: Identify node	Detects the nodes connected to the CANopen interface of the CANopen communication module. • The result of the CAN bus scan is displayed in C13393 (for MXI1) or C14393 (for MXI2).
101	Unbind/bind Ethernet module MXI1	Reinitialises the Ethernet interface of the Ethernet communication module in module slot MXI1. • Required when a new setting for an IP or gateway address is to be accepted without mains switching.
102	Unbind/bind Ethernet module MXI2	
201	Activate parameter set 1	Loads parameter set 1 from the memory module. • Only possible when the application has stopped and the controller is inhibited.
202	Activate parameter set 2	Loads parameter set 2 from the memory module. • Only possible when the application has stopped and the controller is inhibited.
203	Activate parameter set 3	Loads parameter set 3 from the memory module. • Only possible when the application has stopped and the controller is inhibited.

Parameter | Name: **C00002 | Device command**		Data type: UNSIGNED_32 Index: $24573_d = 5FFD_h$
204	Activate parameter set 4	Loads parameter set 4 from the memory module. • Only possible when the application has stopped and the controller is inhibited.
301	Archive parameter set 1	Saves the current parameter set as parameter set 1 in the memory module.
302	Archive parameter set 2	Saves the current parameter set as parameter set 2 in the memory module.
303	Archive parameter set 3	Saves the current parameter set as parameter set 3 in the memory module.
304	Archive parameter set 4	Saves the current parameter set as parameter set 4 in the memory module.
401	Internal command 401	For Lenze service only
501	Load cam data	From software version V3.0 Reloads cam data from the memory module into the controller. • Only possible when the application has stopped and the controller is inhibited. • If the cam data are provided with an access protection, the user password has to be entered in C02900 first. ▸ Basic function "Cam data management"
502	Save cam data	From software version V3.0 Saves the cam data available in the main memory of the controller in the memory module with mains failure protection. • If the cam data are provided with an access protection, the user password has to be entered in C02900 first. ▸ Basic function "Cam data management"
503	Calculate cam data	From software version V3.0 Converts the cam data available in the main memory of the controller into the internal format and provides them to the application. ▸ Basic function "Cam data management"
504	Calculate cam data checksum	From software version V3.0 Recalculates the checksum of the cam data available in the main memory of the controller. • Required if the cam data in the main memory of the controller have been changed via parameters. ▸ Basic function "Cam data management"
730	Internal command 730	For Lenze service only
731	Internal command 731	For Lenze service only
732	Internal command 732	For Lenze service only
733	Internal command 733	For Lenze service only
800	Internal command 800	For Lenze service only
810	Internal command 810	

Parameter | Name: **C00002 | Device command**		Data type: UNSIGNED_32 Index: $24573_d = 5FFD_h$
811	Internal command 811	
812	Internal command 812	
1001	Internal command 1001	For Lenze service only
1020	Internal command 1020	For Lenze service only
1021	Export parameters to file	For Lenze service only
1030	Format file system	Formats file system of the memory module.
1040	Restore file system	Restores file system of the memory module (low level formatting). • The low level formatting of the file system by the user is only intended for the exceptional case when the standard formatting is not possible anymore, e.g. due to damaged internal management information.
10000	Prepare firmware update	Sets the controller to the firmware update mode.
11000	Restart controller	Restarts controller via parameter setting.
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer		Scaling factor: 1

C00003

Parameter | Name: **C00003 | Device command status**			Data type: UNSIGNED_32 Index: $24572_d = 5FFC_h$
Display of the number/status of the device command last executed (C00002). • The number of the command is situated in the upper 16 bits (for the meaning of the number see code C00002). • The result of the command stands in the lower 16 bits. **Note:** Before switching off the supply voltage after a device command has been executed, check the successful execution of the device command via the status display in C00003! The meaning of the status display in C00003 can be obtained from the subchapter for the corresponding device command in chapter "Device commands".			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

Status	Meaning	Device command
0	Device command executed successfully	0: Load Lenze setting
1	General error	
34050	Device command in process	
39424	CAN fault	
...	...	
39679	CAN fault	
65536	Device command executed successfully	1: Load start parameters
65537	General error	
99371	Fault while reading the parameter set partition	
99374	No memory module available	
99586	Device command in process	
104960	CAN fault	
...	...	
105215	CAN fault	

Status	Meaning	Device command
131072	Device command executed successfully	2: ETS: Load plant data
131073	General error	
165122	Device command in process	
327680	Device command executed successfully	5: Activate application
327681	General error	
361730	Device command in process	
458752	Device command executed successfully	7: Save selected application
458753	General error	
492802	Device command in process	
720896	Device command executed successfully	11: Save start parameters
720897	General error	
754718	Fault while writing into a file	
754734	No memory module available	
754946	Device command in process	
761857	Access to file has been denied since the file is already accessed from another position	
761861	I/O fault when accessing the file system	
761868	RAM is full	
761869	Access authorisation denied	
761884	No free memory on the memory module	
1310720	Device command executed successfully	20: Delete logbook
1310721	General error	
1344770	Device command in process	
1376256	Device command executed successfully	21: Archive logbook
1376257	General error	
1410306	Device command in process	
2031616	Device command executed successfully	31: Start application
2031617	General error	
2065666	Device command in process	
2097152	Device command executed successfully	32: Stop application
2097153	General error	
2131202	Device command in process	
2162688	Device command executed successfully	33: Reset program
2162689	General error	
2196738	Device command in process	
2228224	Device command executed successfully	34: Delete program
2228225	General error	
2262274	Device command in process	
2293760	Device command executed successfully	35: Restart program
2293761	General error	
2327810	Device command in process	
2359296	Device command executed successfully	36: Reset runtime measurement
2359297	General error	
2393346	Device command in process	

Status	Meaning	Device command
3342336	Device command executed successfully	51: Identify pole position (360°)
3342337	General error	
3376386	Device command in process	
3382023	Pole position identification cannot be executed because of wrong motor type (asynchronous motor).	
3382024	Pole position identification has been aborted	
3382025	Pole position identification cannot be executed because another identification is already active.	
3382026	Identification of pole position cannot be executed because U-rotation or I-rotation test mode is active.	
3382027	Identification of pole position cannot be executed because current controller optimisation mode is active.	
3382033	Pole position identification cannot be executed because the motor is blocked (e.g. by a mechanical brake), a motor phase is not connected, or a phase shifter is in the motor cable.	
3382047	Pole position identification cannot be executed because an error or trouble is active.	
3382065 From software version V3.0	Pole position identification cannot be executed because either the entire motor or a motor phase is not connected.	
3407872	Device command executed successfully	52: Identify pole position (min. motion)
3407873	General error	
3441922	Device command in process	
3447559	Pole position identification cannot be executed because of wrong motor type (asynchronous motor).	
3447560	Pole position identification has been aborted	
3447561	Pole position identification cannot be executed because another identification is already active.	
3447562	Identification of pole position cannot be executed because U-rotation or I-rotation test mode is active.	
3447563	Identification of pole position cannot be executed because current controller optimisation mode is active.	
3447569 From software version V4.0	Pole position identification cannot be executed because the motor is blocked (e.g. by a mechanical brake), a motor phase is not connected, or a phase shifter is in the motor cable.	
3447583	Pole position identification cannot be executed because an error or trouble is active.	
3447597	Identification of pole position cannot be executed because the rotor has moved too strongly.	
3447601 From software version V3.0	Pole position identification cannot be executed because either the entire motor or a motor phase is not connected.	

Status	Meaning	Device command
3900674	Device command in process	59: Resolver error identification
3866624	Device command executed successfully	
3866625	General error	
3906358	Resolver error identification cannot be executed since the wrong control type is active (no servo control).	
3906359	Resolver error identification cannot be executed since an error or trouble is active.	
3906360	Resolver error identification cannot be executed because another identification is already active.	
3906361	Resolver error identification cannot be executed because of too small speed (< 500 rpm).	
4587520	Device command executed successfully	70: Load Lenze INV characteristic
4587521	General error	
4621570	Device command in process	
4653056	Device command executed successfully	71: Calculate inv. characteristic
4653057	General error	
4687106	Device command in process	
4692754	The calculation of the inverter characteristic cannot be started since the current controller test mode is active.	
4692755	The calculation of the inverter characteristic cannot be started since the V/f test mode is active.	
4692756	The calculation of the inverter characteristic cannot be started since the pole position identification is active.	
4692757	Calculation of the inverter characteristic has been aborted.	
4692758	Calculation of the inverter characteristic has been interrupted by error.	
4692789 From software version V5.0	Detected inverter error characteristic exceeds internal limits. This situation can for instance occur if the motor power is very much lower than the device power.	
4718592	Device command executed successfully	72: Determine motor parameters
4718593	General error	
4752642	Device command in process	
4758290	Motor identification cannot be started since the current controller test mode is active.	
4758291	Motor identification cannot be started since the V/f test mode is active.	
4758292	Motor identification cannot be started because pole position identification is active.	
4758293	Motor identification has been aborted.	
4758294	Motor identification has been aborted by fault.	
4758332 From software version V7.0	Motor identification aborted due to inconsistent motor parameters.	
5046272	Device command executed successfully	77: Calculate current controller parameters
5046273	General error	
5080322	Device command in process	
5086002	At least one calculated value is outside the valid setting range.	
5086003	Stator resistance (C00084) too small (zero).	

Status	Meaning	Device command
5111808	Device command executed successfully	78: Calculate speed controller parameters
5111809	General error	
5145858	Device command in process	
5151540	At least one calculated value is outside the valid setting range.	
5963776	Device command executed successfully	91: CAN on board: Reset Node
5963777	General error	
5997826	Device command in process	
6003200	CAN fault	
...	...	
6003455	CAN fault	
6029312	Device command executed successfully	92: CAN module: Reset node
6029313	General error	
6063362	Device command in process	
6068736	CAN fault	
...	...	
6068991	CAN fault	
6094848	Device command executed successfully	93: CAN on board: Pred.Connect.Set
6094849	General error	
6128898	Device command in process	
6160384	Device command executed successfully	94: CAN module: Pred.Connect.Set
6160385	General error	
6194434	Device command in process	
6225920	Device command executed successfully	95: CAN on board: Identify node
6225921	General error	
6259970	Device command in process	
6291456	Device command executed successfully	96: CAN module: Identify node
6291457	General error	
6325506	Device command in process	
6619136	Device command executed successfully	101: Unbind/bind Ethernet module MXI1
6619137	General error	
6653186	Device command in process	
6684672	Device command executed successfully	102: Unbind/bind Ethernet module MXI2
6684673	General error	
6718722	Device command in process	

Status	Meaning	Device command
13172731	General error	201: Activate parameter set 1
13172736	Device command executed successfully	
13206532	File could not be opened.	
13206557	Fault while reading out of a file.	
13206558	Fault while writing into a file.	
13206559	Invalid file type.	
13206560	Unexpected end of file.	
13206562	Checksum error	
13206786	Device command in process	
13212160	CAN fault	
...	...	
13212415	CAN fault	
13213697	Access to file has been denied since the file is already accessed from another position	
13213701	I/O fault when accessing the file system	
13213708	RAM is full	
13213709	Access authorisation denied	
13213724	No free memory on the memory module	
13238272	Device command executed successfully	202: Activate parameter set 2
13238273	General error	
13272068	File could not be opened.	
13272093	Fault while reading out of a file.	
13272094	Fault while writing into a file.	
13272095	Invalid file type.	
13272096	Unexpected end of file.	
13272098	Checksum error	
13272322	Device command in process	
13277696	CAN fault	
...	...	
13277951	CAN fault	
13279233	Access to file has been denied since the file is already accessed from another position	
13279237	I/O fault when accessing the file system	
13279244	RAM is full	
13279245	Access authorisation denied	
13279260	No free memory on the memory module	

Status	Meaning	Device command
13303808	Device command executed successfully	203: Activate parameter set 3
13303809	General error	
13337604	File could not be opened.	
13337629	Fault while reading out of a file.	
13337630	Fault while writing into a file.	
13337631	Invalid file type.	
13337632	Unexpected end of file.	
13337634	Checksum error	
13337858	Device command in process	
13343232	CAN fault	
...	...	
13343487	CAN fault	
13344769	Access to file has been denied since the file is already accessed from another position	
13344773	I/O fault when accessing the file system	
13344780	RAM is full	
13344781	Access authorisation denied	
13344796	No free memory on the memory module	
13369344	Device command executed successfully	204: Activate parameter set 4
13369345	General error	
13403140	File could not be opened.	
13403165	Fault while reading out of a file.	
13403166	Fault while writing into a file.	
13403167	Invalid file type.	
13403168	Unexpected end of file.	
13403170	Checksum error	
13403394	Device command in process	
13408768	CAN fault	
...	...	
13409023	CAN fault	
13410305	Access to file has been denied since the file is already accessed from another position	
13410309	I/O fault when accessing the file system	
13410316	RAM is full	
13410317	Access authorisation denied	
13410332	No free memory on the memory module	

Status	Meaning	Device command
19726336	Device command executed successfully	301: Archive parameter set 1
19726337	General error	
19760132	File could not be opened.	
19760157	Fault while reading out of a file.	
19760158	Fault while writing into a file.	
19760160	Unexpected end of file.	
19760386	Device command in process	
19767297	Access to file has been denied since the file is already accessed from another position	
19767301	I/O fault when accessing the file system	
19767308	RAM is full	
19767309	Access authorisation denied	
19767324	No free memory on the memory module	
19791872	Device command executed successfully	302: Archive parameter set 2
19791873	General error	
19825668	File could not be opened.	
19825693	Fault while reading out of a file.	
19825694	Fault while writing into a file.	
19825696	Unexpected end of file.

C00004

Parameter | Name: **C00004 | Service password**			Data type: UNSIGNED_32 Index: $24571_d = 5FFB_h$
Service code to unlock protected device commands (C00002).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C00005

Parameter | Name: **C00005 | Application selection**			Data type: INTEGER_32 Index: $24570_d = 5FFA_h$
Application selection • Use the device command C00002="5" to activate the selected application. Note regarding the setting values: • -1: No response • 0: For Lenze service only • 1: Active application (after download via the Engineer) • 2 ... 16: Application spots cannot be used			
Setting range (min. value | unit | max. value)			**Lenze setting**
-1		16	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C00006

Parameter | Name: **C00006 | Select motor control**		Data type: UNSIGNED_32 Index: $24569_d = 5FF9_h$
		▸ Motor interface
Selection list (Lenze setting printed in bold)		**Info**
1	**SC: Servo control sync. motor**	For synchronous motors with speed sensor ▸ Servo control
2	SC: Servo control async. motor	For asynchronous motors with speed sensor ▸ Servo control
4	SLVC: sensorless vector control	From software version V3.0 ▸ Sensorless vector control
6	VFCplus: V/f control open loop	From software version V3.0 ▸ V/f control
7	VFCplus: V/f control closed loop	From software version V3.0 ▸ V/f control
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00007

Parameter | Name: **C00007 | Active application**			Data type: INTEGER_32 Index: $24568_d = 5FF8_h$
Display range (min. value | unit | max. value)			
-2147483648		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00008

Parameter | Name: **C00008 | Progress of device command**			Data type: UNSIGNED_32 Index: $24567_d = 5FF7_h$
From software version V7.0			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00011

Parameter | Name: **C00011 | Motor reference speed**			Data type: UNSIGNED_32 Index: $24564_d = 5FF4_h$
For parameter setting via interface: In case of bigger changes, only change the setting in one step when the controller is inhibited!			
Setting range (min. value | unit | max. value)			**Lenze setting**
50	rpm	50000	**3000 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00018

Parameter | Name: **C00018 | Switching frequency**		Data type: UNSIGNED_32 Index: $24557_d = 5FED_h$
Selection list (Lenze setting printed in bold)		**Info**
2	1 kHz fixed/drive-optimised	**Note:** • The maximum output frequency of the controller is limited to 1/8 of the switching frequency selected here! • The switching frequencies that can be selected depend on the device type (see Hardware Manual, chapter "Rated data"). • In the case of an offline parameter setting or when exchanging the memory module between different Servo Drives 9400 HighLine device types, always check the setting of this parameter and adapt it, if required, to prevent a parameter error after the parameter set download or module change!
3	2 kHz fixed/drive-optimised	
4	4 kHz fixed/drive-optimised	
5	8 kHz fixed/drive-optimised	
8	2 kHz var./drive-optimised	
9	4 kHz var./drive-optimised	
10	**8 kHz var./drive-optimised**	
11	16 kHz var./drive-optimised	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00019

Parameter | Name: **C00019 | Threshold - standstill recognition**			Data type: UNSIGNED_32 Index: $24556_d = 5FEC_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	450	**5 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00022

Parameter | Name: **C00022 | Maximum current**			Data type: UNSIGNED_32 Index: $24553_d = 5FE9_h$
Note: • To avoid that the motor starts unintentionally without adjusting the plant data, the maximum current in the Lenze setting is set to "0 A"! • The upper limit value is the maximum device current (see display in C00789). • In the case of an offline parameter setting or when exchanging the memory module between different 9400 HighLine device types, always check the setting of this parameter and adapt it, if required, to prevent a parameter error after the parameter set download or module change! • Also check the threshold set for the maximum motor current monitoring (C00620).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	A	21474836.47	**0.00 A**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00034

Parameter | Name: **C00034 | Config. analog input 1**		Data type: UNSIGNED_32 Index: $24541_d = 5FDD_h$
Selection list (Lenze setting printed in bold)		
0	**-10...+10 V**	
1	-20...-4 mA, +4...+20 mA	
2	-20 ... +20 mA	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00050

Parameter | Name: **C00050 | Speed setpoint [rpm]**			Data type: INTEGER_32 Index: $24525_d = 5FCD_h$
Display range (min. value | unit | max. value)			
-480000	rpm	480000	
Subcodes			**Info**
C00050/1			Speed setpoint 1 [rpm]
C00050/2			Speed setpoint 2 [rpm]
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00051

Parameter | Name: **C00051 | Actual speed [rpm]**			Data type: INTEGER_32 Index: $24524_d = 5FCC_h$
Display range (min. value | unit | max. value)			
-480000	rpm	480000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00052

Parameter | Name: **C00052 | Motor voltage**			Data type: UNSIGNED_32 Index: $24523_d = 5FCB_h$
Display range (min. value | unit | max. value)			
0	V	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00053

Parameter | Name: **C00053 | DC-bus voltage**			Data type: UNSIGNED_32 Index: $24522_d = 5FCA_h$
Display range (min. value | unit | max. value)			
0	V	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00054

Parameter | Name: **C00054 | Motor current**			Data type: UNSIGNED_32 Index: $24521_d = 5FC9_h$
Display range (min. value | unit | max. value)			
0.00	A	500.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00055

Parameter | Name: **C00055 | Phase currents**			Data type: INTEGER_32 Index: $24520_d = 5FC8_h$
Display range (min. value | unit | max. value)			
-500.00	A	500.00	
Subcodes			**Info**
C00055/1			Phase zero system
C00055/2			Phase U
C00055/3			Phase V
C00055/4			Phase W
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00056

Parameter | Name: **C00056 | Torque setpoint**			Data type: INTEGER_32 Index: $24519_d = 5FC7_h$
Display range (min. value | unit | max. value)			
-21474836.47	Nm	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00057

Parameter | Name: **C00057 | Torque**			Data type: UNSIGNED_32 Index: $24518_d = 5FC6_h$
Display range (min. value | unit | max. value)			
0.000	Nm	2147483.647	
Subcodes			**Info**
C00057/1			Maximum torque • With regard to the selected motor and the max. short-time output current of the device.
C00057/2			Motor reference torque • Torque at maximum current (C00022).
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C00058

Parameter | Name: **C00058 | Pole position**			Data type: INTEGER_32 Index: $24517_d = 5FC5_h$
Setting range (min. value | unit | max. value)			
-179.9	°	179.9	
Subcodes	**Lenze setting**		**Info**
C00058/1	-90.0 °		Resolver pole position
C00058/2	0.0 °		Encoder pole position
C00058/3	0.0 °		Module pole position
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00059

Parameter | Name: **C00059 | Motor - number of pole pairs**			Data type: UNSIGNED_32 Index: $24516_d = 5FC4_h$
Display range (min. value | unit | max. value)			
0		200	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00060

Parameter | Name: **C00060 | Rotor position**			Data type: INTEGER_32 Index: $24515_d = 5FC3_h$
Display range (min. value | unit | max. value)			
0		2047	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00061

Parameter | Name: **C00061 | Heatsink temperature**			Data type: INTEGER_32 Index: $24514_d = 5FC2_h$
Display range (min. value | unit | max. value)			
-200	°C	200	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00062

Parameter | Name: **C00062 | Temperature inside the controller**			Data type: INTEGER_32 Index: $24513_d = 5FC1_h$
Display range (min. value | unit | max. value)			
-200	°C	200	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00063

Parameter | Name: **C00063 | Motor temperature**			Data type: INTEGER_32 Index: $24512_d = 5FC0_h$
			▸ Motor temperature monitoring
Display range (min. value | unit | max. value)			
-200	°C	200	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00064

Parameter | Name: **C00064 | Device utilisation (Ixt)**			Data type: UNSIGNED_32 Index: 24511_d = $5FBF_h$
Device utilisation during the last 180 seconds • C00064 > 100 % activates error (OC5). • Error reset only possible if C00064 < 95 %.			
Display range (min. value | unit | max. value)			
0	%	250	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00065

Parameter | Name: **C00065 | Ext. 24-V voltage**			Data type: INTEGER_32 Index: 24510_d = $5FBE_h$
Display range (min. value | unit | max. value)			
0.0	V	1000.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00066

Parameter | Name: **C00066 | Thermal motor load (I²xt)**			Data type: UNSIGNED_32 Index: 24509_d = $5FBD_h$
A 100 % load corresponds to a permanently flowing rated motor current ▸ I2xt motor monitoring			
Display range (min. value | unit | max. value)			
0	%	250	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00068

Parameter | Name: **C00068 | Capacitor temperature**			Data type: INTEGER_32 Index: 24507_d = $5FBB_h$
Display range (min. value | unit | max. value)			
-200	°C	200	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00069

Parameter | Name: **C00069 | CPU temperature**			Data type: INTEGER_32 Index: 24506_d = $5FBA_h$
Display range (min. value | unit | max. value)			
-200	°C	200	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00070

Parameter | Name: **C00070 | Speed controller gain**			Data type: UNSIGNED_32 Index: 24505_d = $5FB9_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00000	Nm/rpm	20000.00000	**0.00044 Nm/rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100000

C00071

Parameter | Name: **C00071 | Speed contr. reset time**			Data type: UNSIGNED_32 Index: $24504_d = 5FB8_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
1.0	ms	6000.0	**14.4 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00072

Parameter | Name: **C00072 | Speed contr.D component**			Data type: UNSIGNED_32 Index: $24503_d = 5FB7_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	ms	3.00	**0.00 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00074

Parameter | Name: **C00074 | Feedfwd. ctrl. - current contr.**		Data type: UNSIGNED_8 Index: $24501_d = 5FB5_h$
Selection list (Lenze setting printed in bold)		
0	**Deactivate feedfwd. ctrl**	
1	Activate feedfwd. ctrl	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00075

Parameter | Name: **C00075 | Current controller gain**			Data type: UNSIGNED_32 Index: $24500_d = 5FB4_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	V/A	750.00	**105.00 V/A**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00076

Parameter | Name: **C00076 | Current contr. reset time**			Data type: UNSIGNED_32 Index: $24499_d = 5FB3_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.01	ms	2000.00	**2.00 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00077

Parameter | Name: **C00077 | Field controller gain**			Data type: UNSIGNED_32 Index: $24498_d = 5FB2_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	A/Vs	50000.00	**165.84 A/Vs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00078

Parameter | Name: C00078 | Field contr. reset time			Data type: UNSIGNED_32 Index: $24497_d = 5FB1_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
1.0	ms	6000.0	**15.1 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00079

Parameter | Name: C00079 | Motor - mutual inductance			Data type: UNSIGNED_32 Index: $24496_d = 5FB0_h$
Display range (min. value | unit | max. value)			
0.0	mH	214748364.7	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00080

Parameter | Name: C00080 | Resolver - number of pole pairs			Data type: UNSIGNED_32 Index: $24495_d = 5FAF_h$
			▸ Adaptation of the resolver evaluation dynamics ▸ Homing ▸ Behaviour of the home position after mains switching
Setting range (min. value | unit | max. value)			**Lenze setting**
1		10	**1**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00081

Parameter | Name: C00081 | Rated motor power			Data type: UNSIGNED_32 Index: $24494_d = 5FAE_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.01	kW	500.00	**0.25 kW**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00082

Parameter | Name: C00082 | Motor rotor resistance			Data type: UNSIGNED_32 Index: $24493_d = 5FAD_h$
Display range (min. value | unit | max. value)			
0.0000	Ohm	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C00083

Parameter | Name: C00083 | Motor rotor time constant			Data type: UNSIGNED_32 Index: $24492_d = 5FAC_h$
Display range (min. value | unit | max. value)			
0.00	ms	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00084

Parameter | Name: **C00084 | Motor stator resistance**			Data type: UNSIGNED_32 Index: 24491_d = $5FAB_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Ohm	125.0000	**18.2200 Ohm**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C00085

Parameter | Name: **C00085 | Motor stator leakage inductance**			Data type: UNSIGNED_32 Index: 24490_d = $5FAA_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	mH	500.000	**51.000 mH**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C00087

Parameter | Name: **C00087 | Rated motor speed**			Data type: UNSIGNED_32 Index: 24488_d = $5FA8_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
50	rpm	50000	**4050 rpm**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00088

Parameter | Name: **C00088 | Rated motor current**			Data type: UNSIGNED_32 Index: 24487_d = $5FA7_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.01	A	1500.00	**1.30 A**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00089

Parameter | Name: **C00089 | Rated motor frequency**			Data type: UNSIGNED_32 Index: 24486_d = $5FA6_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.1	Hz	1000.0	**270.0 Hz**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00090

Parameter | Name: **C00090 | Rated motor voltage**			Data type: UNSIGNED_32 Index: 24485_d = $5FA5_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
50	V	15000	**225 V**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00091

Parameter | Name: C00091 | Motor cosine phi			Data type: UNSIGNED_32 Index: $24484_d = 5FA4_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0.50		1.00	**0.80**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00092

Parameter | Name: C00092 | Motor - magnetising current			Data type: UNSIGNED_32 Index: $24483_d = 5FA3_h$
Display range (min. value | unit | max. value)			
0.00	A	500.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00093

Parameter | Name: C00093 | Field weakening for SM		Data type: UNSIGNED_32 Index: $24482_d = 5FA2_h$
From software version V2.0 onwards ▸ Field weakening for synchronous machines		
Selection list (Lenze setting printed in bold)		
0	**Field weakening for SM off**	
1	Field weakening for SM on	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00099

Parameter | Name: C00099 | Firmware version	Data type: VISIBLE_STRING Index: $24476_d = 5F9C_h$
Format: "xx.xx.xx.xx" (main version, subversion, release version, build number)	
☑ Read access ☐ Write access ☐ RSP ☐ PLC-STOP ☐ No transfer Scaling factor: 1 Character length: 12	

C00100

Parameter | Name: C00100 | Resol. of an encoder revolution			Data type: UNSIGNED_32 Index: $24475_d = 5F9B_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
10		24	**16**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00105

Parameter | Name: C00105 | Decel. time - quick stop			Data type: UNSIGNED_32 Index: $24470_d = 5F96_h$
Time between quick stop activation and standstill plus relative S-ramp time (C00106). ▸ Basic function "Quick stop"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	999.999	**0.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C00106

Parameter | Name: **C00106 | Quick stop S-ramp time**			Data type: UNSIGNED_32 Index: $24469_d = 5F95_h$
S-ramp time in [%] relating to the deceleration time set under C00105. ▸ Basic function "Quick stop"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	%	100.00	**0.00 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00107

Parameter | Name: **C00107 | Ref. for quick stop dec. time**		Data type: UNSIGNED_8 Index: $24468_d = 5F94_h$
Reference for the deceleration time set in C00105. ▸ Basic function "Quick stop"		
Selection list (Lenze setting printed in bold)		
0	**Motor reference speed (C00011)**	
1	Current speed	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00114

Parameter | Name: **C00114 | Dig. input x: Terminal polarity**			Data type: UNSIGNED_8 Index: $24461_d = 5F8D_h$
"0" = positive logic (HIGH level = TRUE, LOW level = FALSE) "1" = negative logic (HIGH level = FALSE, LOW level = TRUE)			
Setting range (min. value | unit | max. value)			
0		1	
Subcodes	**Lenze setting**		**Info**
C00114/1	0		Terminal polarity - digital input 1 ... 8
C00114/...			
C00114/8			
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00118

Parameter | Name: **C00118 | Dig. output. x: Terminal polarity**			Data type: UNSIGNED_8 Index: $24457_d = 5F89_h$
"0" ≡ positive logic (TRUE ≡ HIGH level, FALSE ≡ LOW level) "1" ≡ negative logic (FALSE ≡ HIGH level, TRUE ≡ LOW level)			
Setting range (min. value | unit | max. value)			
0		1	
Subcodes	**Lenze setting**		**Info**
C00118/1	0		Terminal polarity - digital output 1 ... 4
C00118/...			
C00118/4			
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00120

Parameter | Name: **C00120 | Mot. overload protection (I²xt)**			Data type: UNSIGNED_32 Index: $24455_d = 5F87_h$
Threshold for I^2 x t disconnection • Disconnection is carried out if the thermal motor load (C00066) is higher than the set threshold. • A 100 % thermal motor load corresponds to a permanently flowing rated motor current **Note:** When the value is parameterised to 200 %, the monitoring mode of the motor overload protection is switched off! ▸ I2xt motor monitoring			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	200	**105 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00121

Parameter | Name: **C00121 | Warning threshold motor temperature**			Data type: UNSIGNED_32 Index: $24454_d = 5F86_h$
Temperature threshold for motor temperature advance warning • The response to reaching the threshold can be selected in C00584. ▸ Motor temperature monitoring			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	°C	150	**120 °C**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00122

Parameter | Name: **C00122 | Heatsink temp. warn. threshold**			Data type: UNSIGNED_32 Index: $24453_d = 5F85_h$
Temperature threshold for heatsink temperature advance warning • The response to reaching the threshold can be selected in C00582.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	°C	85	**85 °C**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00123

Parameter | Name: **C00123 | Warning threshold device util.**			Data type: UNSIGNED_32 Index: $24452_d = 5F84_h$
Adjustable threshold for I x t advance warning • The advance warning is sent if the device utilisation (C00064) is higher than the set threshold. • The response for reaching the threshold can be selected in C00604.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	100	**90 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00126

Parameter | Name: **C00126 | CPU temp. warning threshold**			Data type: UNSIGNED_32 Index: $24449_d = 5F81_h$
Temperature threshold for advance warning of CPU temperature on the control card • The response to reaching the threshold can be selected in C00589.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	°C	85	**70 °C**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00127

Parameter | Name: **C00127 | Mot. overload warning threshold**			Data type: UNSIGNED_32 Index: $24448_d = 5F80_h$
Adjustable threshold for I^2 x t advance warning • The advance warning is sent if the thermal motor load (C00066) is higher than the set threshold. • The response for reaching the threshold can be selected in C00606. ▸ I2xt motor monitoring			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	200	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00128

Parameter | Name: **C00128 | Therm. motor time constant**			Data type: UNSIGNED_32 Index: $24447_d = 5F7F_h$
▸ I2xt motor monitoring			
Setting range (min. value | unit | max. value)			
0.1	min	600.0	
Subcodes	**Lenze setting**		**Info**
C00128/1	1.0 min		Therm. time constant coil
C00128/2	5.0 min		Therm. time constant plates
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00129

Parameter | Name: **C00129 | Brake resistance value**			Data type: INTEGER_32 Index: $24446_d = 5F7E_h$
Required for monitoring of the brake resistor temperature. ▸ Braking operation			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0	Ohm	500.0	**180.0 Ohm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00130

Parameter | Name: C00130 | Rated power - brake resistor			Data type: INTEGER_32 Index: 24445_d = $5F7D_h$
Required for monitoring of the brake resistor temperature. ▸ Braking operation			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	W	800000	**5600 W**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00131

Parameter | Name: C00131 - Rated quantity of heat for brake res.			Data type: INTEGER_32 Index: 24444_d = $5F7C_h$
Required for monitoring of the brake resistor temperature. ▸ Braking operation			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	kWs	100000	**485 kWs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00132

Parameter | Name: C00132 | Service code	Data type: INTEGER_32 Index: 24443_d = $5F7B_h$
This code is for device-internal use only and must not be written to by the user!	

C00133

Parameter | Name: C00133 | Ref.: Brake chopper utilisation		Data type: UNSIGNED_8 Index: 24442_d = $5F7A_h$
From software version V1.5 ▸ Braking operation		
Selection list (Lenze setting printed in bold)		**Info**
0	**Minimum resistance (C00134)**	▸ C00134
1	Resistance in C00129	▸ C00129
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00134

Parameter | Name: C00134 | Minimum brake resistance			Data type: INTEGER_32 Index: 24441_d = $5F79_h$
From software version V1.5 ▸ Braking operation			
Display range (min. value | unit | max. value)			
0.0	Ohm	500.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00137

Parameter | Name: **C00137 | Brake transistor utilisation**			Data type: INTEGER_32 Index: $24438_d = 5F76_h$
From software version V1.5			▸ Braking operation
Display range (min. value | unit | max. value)			
0	%	250	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00138

Parameter | Name: **C00138 | Brake resistor utilisation**			Data type: INTEGER_32 Index: $24437_d = 5F75_h$
From software version V1.5			▸ Braking operation
Display range (min. value | unit | max. value)			
0	%	250	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00142

Parameter | Name: **C00142 | Autom. restart after mains ON**		Data type: UNSIGNED_32 Index: $24433_d = 5F71_h$
Starting performance of the controller after mains connection and reset of "Trouble", "Fault" or "Safe torque off active". ⚠ **Danger!** • If automatic restart is enabled (C00142 = "1: Enabled"), the drive can restart automatically from the "Trouble" and "Safe torque off" device states when the trouble or request for "Safe torque off active" has been eliminated! • The controller enable generated by the application via a connection of the terminal 28 (RFR) with one of the digital outputs *DIGOUT_bOut(x)* is not permissible if the following functions are active: "Auto-start after mains ON" (C00142 = "1") and "Program auto-start after mains switching" (C02104 = "1") **If this is not observed, the controller can start automatically after mains connection!** ▸ Automatic restart after mains connection ▸ Activate application		
Selection list (Lenze setting printed in bold)		
0	**Blocked**	
1	Released	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00150

Parameter | Name: **C00150 | Status word device control 1**			Data type: BITFIELD_16 Index: $24425_d = 5F69_h$
Status word 1 of the drive interface			
Display area			
0x0000		0xFFFF	
Value is bit-coded:			**Info**
Bit 0	Reserved		For the meaning of bits 8 ... 11 see chapter "Device states".
Bit 1	Pulse inhibit active		
Bit 2	Reserved		
Bit 3	Reserved		
Bit 4	Reserved		
Bit 5	Reserved		
Bit 6	Actual speed value = 0		
Bit 7	Controller inhibit active		
Bit 8	Device state - Bit 1		
Bit 9	Device state - Bit 2		
Bit 10	Device state - Bit 3		
Bit 11	Device state - Bit 4		
Bit 12	Warning is active		
Bit 13	Trouble active		
Bit 14	Reserved		
Bit 15	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00155

Parameter | Name: **C00155 | Status word device control 2**			Data type: BITFIELD_16 Index: $24420_d = 5F64_h$
Status word 2 of the drive interface			
Display area			
0x0000		0xFFFF	
Value is bit-coded:			
Bit 0	Error status active		
Bit 1	Torque limit reached		
Bit 2	Current limit reached		
Bit 3	Reserved		
Bit 4	Drive switched on/in operation		
Bit 5	Drive ready for operation		
Bit 6	Fault active		
Bit 7	Drive initialisation		
Bit 8	Motor CCW rotation active		
Bit 9	Quick stop by trouble active		
Bit 10	Safe torque off active		
Bit 11	Application active		
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Quick stop active		
Bit 15	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00156

Parameter | Name: **C00156 | Status/Control word MCTRL**			Data type: UNSIGNED_32 Index: $24419_d = 5F63_h$
Status and control word of the motor interface			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Info**
C00156/1			Status word motor control
C00156/2			Control word motor control
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00158

Parameter | Name: **C00158 | Controller inhibit by (source)**			Data type: BITFIELD_16 Index: $24417_d = 5F61_h$
Display of the sources for controller inhibit			
Display area			
0x0000		0xFFFF	
Value is bit-coded:			
Bit 0	Terminal		
Bit 1	Reserved		
Bit 2	Reserved		
Bit 3	Reserved		
Bit 4	Application		
Bit 5	Device command		
Bit 6	Error response		
Bit 7	Internal PLC		
Bit 8	Reserved		
Bit 9	Energy saving mode		
Bit 10	Operating system		
Bit 11	Identification program		
Bit 12	Brake		
Bit 13	Limiter		
Bit 14	PPI		
Bit 15	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00159

Parameter | Name: **C00159 | Quick stop by (source)**			Data type: BITFIELD_16 Index: $24416_d = 5F60_h$
Display area			
0x0000		0xFFFF	
Value is bit-coded:			
Bit 0	Reserved		
Bit 1	Reserved		
Bit 2	Reserved		
Bit 3	Reserved		
Bit 4	Application		
Bit 5	Device command		
Bit 6	Error response		
Bit 7	Internal PLC		
Bit 8	Reserved		
Bit 9	Reserved		
Bit 10	Reserved

Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1	

C00162

Parameter | Name: **C00162 | Masked Error number**			Data type: UNSIGNED_32 Index: $24413_d = 5F5D_h$
From software version V5.0 Display of the individual components of the error number shown in C00168.			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Info**
C00162/1			Module ID + error number • As described in the chapter "Error messages".
C00162/2			Instance number
C00162/3			Error response
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1	

C00166

Parameter | Name: **C00166 | Error description**	Data type: VISIBLE_STRING Index: $24409_d = 5F59_h$
Error description for error number indicated in C00168	
☑ Read access ☐ Write access ☐ RSP ☐ PLC-STOP ☐ No transfer Scaling factor: 1 Character length: 64	

C00167

Parameter | Name: **C00167 | Service code**	Data type: VISIBLE_STRING Index: $24408_d = 5F58_h$
This code is for device-internal use only and must not be written to by the user!	

C00168

Parameter | Name: **C00168 | Error number**			Data type: UNSIGNED_32 Index: $24407_d = 5F57_h$
Display of the error number of the first error with highest priority			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00169

Parameter | Name: **C00169 | Logbook - event filter**			Data type: BITFIELD_32 Index: $24406_d = 5F56_h$
Bit coded word for filtering system events (trouble, warning, information) • A set filter bit inhibits entry of the corresponding event into the logbook. • From software version V5.0 the option that identical consecutive entries ("Multiple entries") into the logbook are suppressed can be additionally activated via bit 0. Then only the time stamp of the last (latest) entry and the number of times the same event has occurred successively are saved. ▸ Logbook			
Setting range			**Lenze setting**
0x00000000		0xFFFFFFFF	**0x00000001** (decimal: 1)
Value is bit-coded: (☑ = bit set)			**Info**
Bit 0 ☑	No multiple entries		Bits not listed are reserved for future extensions!
Bit 1 ☐	Error		
Bit 2 ☐	Fault		
Bit 3 ☐	Quick stop by trouble		
Bit 4 ☐	Warning locked		
Bit 5 ☐	Warning		
Bit 6 ☐	Information		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00171

Parameter | Name: **C00171 | Service code**	Data type: UNSIGNED_32 Index: $24404_d = 5F54_h$
This code is for device-internal use only and must not be written to by the user!	

C00173

Parameter | Name: **C00173 | Mains voltage**		Data type: UNSIGNED_8 Index: $24402_d = 5F52_h$
Adjustment of the DC bus voltage thresholds • Check during commissioning and adapt, if necessary. • All drive components connected via the DC bus must have the same thresholds. • For selection 0 ... 3, the undervoltage threshold is firmly defined depending on the device type (see "Rated data" chapter in the Hardware Manual). **Note:** Altering this setting also has an impact on the permissible device utilisation! In the chapter "Rated data" of the hardware manual the device types and their permissible device utilisation at a certain mains voltage and switching frequency are specified.		
Selection list (Lenze setting printed in bold)		**Info**
0	230 V	Operation on 230 V mains • Threshold for "Undervoltage on" = 200 V • Threshold for "Undervoltage off" = 225 V • Overvoltage threshold = 400 V • Brake chopper threshold = 390 V
1	**400/415 V**	Operation on 400 V mains/415 V mains • Threshold for "Undervoltage on" = 285 V (BF1 to BF7) • Threshold for "Undervoltage on" = 400 V (BF8 to BF10) • Threshold for "Undervoltage off" = 430 V • Overvoltage threshold = 800 V • Brake chopper threshold = 725 V
2	460/480 V	Operation on 460 V mains/480 V mains • Threshold for "Undervoltage on" = 490 V • Threshold for "Undervoltage off" = 535 V • Overvoltage threshold = 800 V • Brake chopper threshold = 765 V
3	500 V	Operation on 500 V mains • Threshold for "Undervoltage on" = 540 V • Threshold for "Undervoltage off" = 585 V • Overvoltage threshold = 800 V • Brake chopper threshold = 790 V
4	230 V, LU configurable	Operation on 230 V mains • Undervoltage threshold is defined in C00174. • Overvoltage threshold = 400 V • Brake chopper threshold = 390 V
5	400/415 V, LU configurable	Operation on 400 V mains/415 V mains • Undervoltage threshold is defined in C00174. • Overvoltage threshold = 800 V • Brake chopper threshold = 725 V
6	460/480 V, LU configurable	Operation on 460 V mains/480 V mains • Undervoltage threshold is defined in C00174. • Overvoltage threshold = 800 V • Brake chopper threshold = 765 V
7	500 V, LU configurable	Operation on 500 V mains • Undervoltage threshold is defined in C00174. • Overvoltage threshold = 800 V • Brake chopper threshold = 790 V
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00174

Parameter | Name: **C00174 | Undervoltage (LU) threshold**			Data type: UNSIGNED_32 Index: $24401_d = 5F51_h$
When C00173 = 4 ... 7, the undervoltage threshold (LU) can be freely selected. **Note:** The minimum adjustable undervoltage threshold depends on the device type: • Single-axis controller (Single Drive) up to and including BF7: 210 V • Single-axis controller (Single Drive) from BF8s: 400 V • Multi-axis controller (Multi Drive): 15 V In the case of an offline parameter setting or when exchanging the memory module between different 9400 HighLine device types, always check the setting of this parameter and adapt it, if required, to prevent a parameter error after the parameter set download or module change!			
Setting range (min. value | unit | max. value)			**Lenze setting**
15	V	400	**285 V**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00175

Parameter | Name: **C00175 | Service code**	Data type: UNSIGNED_32 Index: $24400_d = 5F50_h$
This code is for device-internal use only and must not be written to by the user!	

C00176

Parameter | Name: **C00176 | Service code**	Data type: UNSIGNED_32 Index: $24399_d = 5F4F_h$
This code is for device-internal use only and must not be written to by the user!	

C00177

Parameter | Name: **C00177 | Service code**	Data type: UNSIGNED_32 Index: $24398_d = 5F4E_h$
This code is for device-internal use only and must not be written to by the user!	

C00178

Parameter | Name: **C00178 | Elapsed-hour meter**			Data type: UNSIGNED_32 Index: $24397_d = 5F4D_h$
Display range (min. value | unit | max. value)			
0	s	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00179

Parameter | Name: **C00179 | Power-on time meter**			Data type: UNSIGNED_32 Index: $24396_d = 5F4C_h$
Display range (min. value | unit | max. value)			
0	s	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00180

Parameter | Name: **C00180 | Service code**	Data type: VISIBLE_STRING Index: $24395_d = 5F4B_h$
For Lenze service only	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer	Character length: 192

C00181

Parameter | Name: **C00181 | Red. brake chopper threshold**			Data type: UNSIGNED_32 Index: $24394_d = 5F4A_h$
			▸ Braking operation
Setting range (min. value | unit | max. value)			**Lenze setting**
0	V	100	**0 V**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00182

Parameter | Name: **C00182 | Time for device search function**			Data type: UNSIGNED_16 Index: $24393_d = 5F49_h$
From software version V9.0			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		6000	**5**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00183

Parameter | Name: **C00183 | Device status**		Data type: UNSIGNED_32 Index: $24392_d = 5F48_h$
Display of the device state for diagnostic purposes		
Selection list (read only)		
0	Operation

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00186

Parameter | Name: **C00186 | ENP: Identified motor type**	Data type: VISIBLE_STRING Index: $24389_d = 5F45_h$
Motor type read from the electronic nameplate (ENP)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1 Character length: 19	

C00187

Parameter | Name: **C00187 | ENP: Identified serial number**	Data type: VISIBLE_STRING Index: $24388_d = 5F44_h$
Serial number read from the electronic nameplate (ENP)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1 Character length: 22	

C00188

Parameter | Name: **C00188 | ENP: Status**		Data type: UNSIGNED_8 Index: $24387_d = 5F43_h$
Selection list (read only)		
0	No ENP found	
1	ENP data loaded	
2	Known ENP found	
3	ENP found but not read	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1	

C00198

Parameter | Name: **C00198 | Service code**	Data type: UNSIGNED_32 Index: $24377_d = 5F39_h$
This code is for device-internal use only and must not be written to by the user!	

C00199

Parameter | Name: **C00199 | Device name**	Data type: VISIBLE_STRING Index: $24376_d = 5F38_h$
Device name to be defined by the user (e.g. "Cross cutter" or "hoist axis 1") with max. 128 characters	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1 Character length: 128	

C00200

Parameter | Name: **C00200 | Firmware product type**	Data type: VISIBLE_STRING Index: $24375_d = 5F37_h$
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1 Character length: 18	

C00201

C00217

Parameter | Name: **C00217 | Parameter error information**	Data type: UNSIGNED_32 Index: $24358_d = 5F26_h$
This code is for device-internal use only and must not be written to by the user!	

C00218

Parameter | Name: **C00218 | Application: ID number**			Data type: UNSIGNED_32 Index: $24357_d = 5F25_h$
Display range (min. value | unit | max. value)			
0		0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1	

C00219

Parameter | Name: **C00219 | CAN/EPL device type**	Data type: UNSIGNED_32 Index: $24356_d = 5F24_h$
This code is for device-internal use only and must not be written to by the user!	

C00220

Parameter | Name: **C00220 | Memory module Firmw. Rev.**			Data type: UNSIGNED_32 Index: $24355_d = 5F23_h$
Display range (min. value | unit | max. value)			
0		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1	

C00225

Parameter | Name: **C00225 | Check configuration**	Data type: UNSIGNED_32 Index: $24350_d = 5F1E_h$
This code is for device-internal use only and must not be written to by the user!	

C00227

Parameter | Name: C00227 | Behaviour due to change of parameter set			Data type: UNSIGNED_32 Index: $24348_d = 5F1C_h$
From software version V5.0 By selecting "1" in the corresponding subcode a module plugged into module slot MXI1 or MXI2 can be excepted from the parameter set changeover via the device command "Activate parameter set n". • By this the parameter set changeover, in particular for active modules, is carried out much more quickly. • An exception from the parameter set changeover for instance is reasonable if different parameter sets are used (e. g. for different tools within the machine), but if the parameters are always the same for the module (e. g. communication parameters).			
Selection list (Lenze setting printed in bold)			
0	Included		
1	Excluded		
Subcodes	**Lenze setting**		**Info**

Selection list (Lenze setting printed in bold)		
0	**SpeedAdd signal**	
1	Differentiated PosSet signal	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00276

Parameter | Name: **C00276 | Signal source - torque setpoint**		Data type: UNSIGNED_16 Index: $24299_d = 5EEB_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**TorqueAdd/AccAdd signal**	
1	Differentiated SpeedSet signal	
2	2x diff. PosSet signal	This setting only exists due to compatibility reasons and should not be used anymore. Use the setting 3 instead: "Differentiated SpeedAdd signal" that both can be used for the FB **LS_SpeedFollower** and the FB **LS_PositionFollower**.
3	Differentiated SpeedAdd signal	From software version V5.0 This alternative selection to the differentiated SpeedSet signal is recommended if the position controller works with a high gain. By the position controller also troubles within to the actual position value are detected and like this reach the speed setpoint. In the following differentiation of the feedforward control, these troubles in particular in the case of high position controller gains result in a very unsettled torque feedforward control value. By means of this selection the problem can be avoided, because then only the trouble-free speed feedforward control value is differentiated.
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00280

Parameter | Name: **C00280 | Filter time const. DC detection**			Data type: UNSIGNED_32 Index: $24295_d = 5EE7_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
1.0	ms	1000.0	**25.0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00281

Parameter | Name: **C00281 | Filter for PWM adjustment**		Data type: UNSIGNED_8 Index: $24294_d = 5EE6_h$
From software version V7.0 The output voltage of the inverter is generated from the DC-bus voltage by a pulse width modulation (PWM). The product from the DC-bus voltage and the control factor of the PWM corresponds to the height of the output voltage. If the DC-bus voltage changes due to mains fluctuations or load changes, the control factor of the PWM must be adapted if the output voltage is to remain constant. This correction is carried out in the control software by measuring the DC-bus voltage. In order that no response takes place to faults in the DC-bus voltage measurement, a filter can be activated for the measured signal via this parameter. • The filter time constant is selected so that a quick correction can be carried out even under bad EMC conditions. • A disadvantage of this filter is that the responses to real flickers on the DC-bus voltage are too slow. In positioning tasks, this may cause an extreme increase of the following error. • Under good EMC conditions, this filter is not required (Lenze setting). • For devices > BF7 the filter is ineffective.		
Selection list (Lenze setting printed in bold)		
0	**Deactivated**	
1	enabled	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00308

Parameter | Name: **C00308 | Service code**	Data type: UNSIGNED_16 Index: $24267_d = 5ECB_h$
This code is for device-internal use only and must not be written to by the user!	

C00309

Parameter | Name: **C00309 | Service code**	Data type: UNSIGNED_32 Index: $24266_d = 5ECA_h$
This code is for device-internal use only and must not be written to by the user!	

C00310

Parameter | Name: **C00310 | Service code**	Data type: UNSIGNED_8 Index: $24265_d = 5EC9_h$
This code is for device-internal use only and must not be written to by the user!	

C00311

Parameter | Name: **C00311 | CAN TPDO1 mask byte x**	Data type: BITFIELD_8 Index: $24264_d = 5EC8_h$

For each byte of the TPDO1 a mask can be parameterised in the corresponding subcode.
- In case of an event-controlled PDO transmission, only the masked bits will be considered for event control.
- Mask "0x0" means that no bit of the corresponding byte actuates the transmission.
- Mask "0xff" means that every bit of the corresponding byte can actuate the transmission.

C00323

Parameter | Name: **C00323 | CAN RPDOx Rx mode**			Data type: UNSIGNED_8 Index: $24252_d = 5EBC_h$
RPDO transmission type according to DS301 V4.02 • For the RPDO, it serves as monitoring setting in the case of sync-controlled PDOs. • Types 0 (acyclic sync), 1-240 (cyclic sync), 254 (event-controlled manufacturer-specific), 255 (event-controlled device-profile-specific) are supported. • The basic PDO setting is "254" (event-controlled). • Illustration of the CANopen objects I-1400/2 ... I-1403/2 (see DS301 V4.02). ▸ "CAN on board" system bus			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C00323/1	254		Transmission mode for RPDO1 ... RPDO4
C00323/...			
C00323/4			
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00324

Parameter | Name: **C00324 | CAN TPDOx delay time**			Data type: UNSIGNED_16 Index: $24251_d = 5EBB_h$
TPDO inhibit time according to DS301 V4.02 • Minimum time between the transmission of two identical TPDOs. • The time is entered in 1/10 ms and automatically rounded to full milliseconds by the code. • Mapping of the CANopen objects I-1800/3 ... I-1803/3 (see DS301 V4.02). ▸ "CAN on board" system bus			
Setting range (min. value | unit | max. value)			
0	1/10 ms	65535	
Subcodes	**Lenze setting**		**Info**
C00324/1	0 1/10 ms		Delay time for TPDO1 ... TPDO4
C00324/...			
C00324/4			
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00325

Parameter | Name: **C00325 | Service code**	Data type: UNSIGNED_8 Index: $24250_d = 5EBA_h$
This code is for device-internal use only and must not be written to by the user!	

C00326

Parameter | Name: **C00326 | Service code**	Data type: UNSIGNED_8 Index: $24249_d = 5EB9_h$
This code is for device-internal use only and must not be written to by the user!	

C00327

Parameter | Name: **C00327 | Service code**	Data type: BITFIELD_32 Index: $24248_d = 5EB8_h$
This code is for device-internal use only and must not be written to by the user!	

C00328

Parameter | Name: **C00328 | Service code**	Data type: BITFIELD_32 Index: $24247_d = 5EB7_h$
This code is for device-internal use only and must not be written to by the user!	

C00329

Parameter | Name: **C00329 | Service code**	Data type: BITFIELD_32 Index: $24246_d = 5EB6_h$
This code is for device-internal use only and must not be written to by the user!	

C00330

Parameter | Name: **C00330 | Service code**	Data type: BITFIELD_32 Index: $24245_d = 5EB5_h$
This code is for device-internal use only and must not be written to by the user!	

C00335

Parameter | Name: **C00335 | Service code**	Data type: BITFIELD_32 Index: $24240_d = 5EB0_h$
This code is for device-internal use only and must not be written to by the user!	

C00336

Parameter | Name: **C00336 | Service code**	Data type: BITFIELD_32 Index: $24239_d = 5EAF_h$
This code is for device-internal use only and must not be written to by the user!	

C00337

Parameter | Name: **C00337 | Service code**	Data type: BITFIELD_32 Index: $24238_d = 5EAE_h$
This code is for device-internal use only and must not be written to by the user!	

C00338

Parameter | Name: **C00338 | Service code**	Data type: BITFIELD_32 Index: $24237_d = 5EAD_h$
This code is for device-internal use only and must not be written to by the user!	

C00343

Parameter | Name: **C00343 | CAN TPDO counter**			Data type: UNSIGNED_32 Index: $24232_d = 5EA8_h$
Display range (min. value | unit | max. value)			
0		4294967295

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00359

Parameter | Name: **C00359 | CAN status**	Data type: UNSIGNED_8 Index: $24216_d = 5E98_h$
▸ "CAN on board" system bus	

Selection list (read only)	
0	Operational
1	Pre-Operational
4	Boot-up
5	Stopped
7	Reset
8	Initialisation
9	Unknown
10	Baud rate autom. detected

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00360

Parameter | Name: **C00360 | CAN telegram and error counter**			Data type: UNSIGNED_16 Index: $24215_d = 5E97_h$
• After mains connection, all counters start with "0". • After the maximum value has been reached, counting restarts with "0". ▸ "CAN on board" system bus			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C00360/1			Stuffing bit error counter • More than five identical bits have been detected.
C00360/2			Format error counter • CAN frame has not been observed.
C00360/3			Acknowledge error counter • No node has confirmed the telegram.
C00360/4			Bit1 error counter • "1" should be sent after bus arbitration, but "0" was read.
C00360/5			Bit0 error counter • "0" should be sent after bus arbitration, but "1" was read.
C00360/6			CRC error counter • Checksum check has indicated an error.
C00360/7			Tx telegram counter • Telegrams received without errors.
C00360/8			Rx telegram counter • Telegrams sent without errors.
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00361

Parameter | Name: **C00361 | CAN bus load**			Data type: UNSIGNED_32 Index: $24214_d = 5E96_h$
The display of the node peak load (subcodes 4 ... 6) is reset by repeated mains switching or via the "Reset node" device command (C00002). ▸ "CAN on board" system bus			
Display range (min. value | unit | max. value)			
0	%	100	
Subcodes			**Info**
C00361/1			Current node load in Tx direction
C00361/2			Current node load in Rx direction
C00361/3			Current node load by faulty telegrams
C00361/4			Node peak load in Tx direction
C00361/5			Node peak load in Rx direction
C00361/6			Node peak load by faulty telegrams
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00367

Parameter | Name: **C00367 | CAN SYNC Rx identifier**			Data type: UNSIGNED_32 Index: $24208_d = 5E90_h$
Identifier by means of which the sync slave is to receive sync telegrams. • Mapping of the CANopen object I-1005 (see DS301 V4.02). ▸ "CAN on board" system bus: sync telegram			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		2047	**128**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00368

Parameter | Name: **C00368 | CAN SYNC Tx identifier**			Data type: UNSIGNED_32 Index: $24207_d = 5E8F_h$
Identifier by means of which the sync master is to transmit sync telegrams. • Mapping of the CANopen object I-1005 (see DS301 V4.02). ▸ "CAN on board" system bus: sync telegram			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		2047	**128**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00369

Parameter | Name: **C00369 | CAN sync transmission cycle time**			Data type: UNSIGNED_16 Index: $24206_d = 5E8E_h$
Cycle during which the sync master is to transmit sync telegrams. • If "0 ms" is set (Lenze setting), no sync telegrams are generated. • Mapping of the CANopen object I-1006 (see DS301 V4.02). ▸ "CAN on board" system bus: sync telegram			
Setting range (min. value | unit | max. value)			
0	ms	65535	
Subcodes	**Lenze setting**		**Info**
C00369/1	0 ms		Transmission cycle time for CAN on board

C00369/3	0 ms		- (no meaning)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00372

Parameter | Name: **C00372 | CAN SDO server Rx identifier**			Data type: BITFIELD_32 Index: $24203_d = 5E8B_h$
Identifier with which the corresponding SDO server can be reached. • If bit 31 is set (0x8nnnnnnn), the corresponding SDO server is deactivated. • Mapping of the CANopen objects I-1200/1 ... I-1209/1 (see DS301 V4.02). ▸ "CAN on board" system bus			
Setting range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	COB-ID bit 0		• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...		
Bit 31	SDO invalid		
Subcodes	**Lenze setting**		**Info**
C00372/1	0x00000601		SDO server channel 1 RX • Subcode 1 contains the basic SDO channel which can neither be changed nor deactivated, according to DS301 V4.02. Writing to the subcode has no effect. • The value under subcode 1 results from the node address (C00350) + 0x600.
C00372/2	0x80000000		SDO server channel 2 RX
C00372/3	0x80000000		SDO server channel 3 RX
C00372/4	0x80000000		SDO server channel 4 RX
C00372/5	0x80000000		SDO server channel 5 RX
C00372/6	0x80000000		SDO server channel 6 RX
C00372/7	0x80000000		SDO server channel 7 RX
C00372/8	0x80000000		SDO server channel 8 RX
C00372/9	0x80000000		SDO server channel 9 RX
C00372/10	0x80000000		SDO server channel 10 RX
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00373

Parameter | Name: **C00373 | CAN SDO server Tx identifier**			Data type: BITFIELD_32 Index: $24202_d = 5E8A_h$
Identifier with which the corresponding SDO server can carry out transmissions. • If bit 31 is set (0x8nnnnnnn), the corresponding SDO server is deactivated. • Mapping of the CANopen objects I-1200/2 ... I-1209/2 (see DS301 V4.02). ▸ "CAN on board" system bus			
Setting range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	COB-ID bit 0		• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...		
Bit 31	SDO invalid		
Subcodes	**Lenze setting**		**Info**
C00373/1	0x00000581		SDO server channel 1 TX • Subcode 1 contains the basic SDO channel which can neither be changed nor deactivated, according to DS301 V4.02. Writing to the subcode has no effect. • The value under subcode 1 results from the node address (C00350) + 0x580.
C00373/2	0x80000000		SDO server channel 2 TX
C00373/3	0x80000000		SDO server channel 3 TX
C00373/4	0x80000000		SDO server channel 4 TX
C00373/5	0x80000000		SDO server channel 5 TX
C00373/6	0x80000000		SDO server channel 6 TX

C00377/10			
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00378

Parameter | Name: **C00378 | CAN delay boot-up - Operational**			Data type: UNSIGNED_16 Index: $24197_d = 5E85_h$
Time that has to elapse after mains switching before the CAN NMT master places the "Start Remote Node" telegram to the bus. • This time is only used if the master bit is activated (C00352) and after mains switching. ▸ "CAN on board" system bus			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**3000 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00379

Parameter | Name:	Data type: UNSIGNED_8
C00379 | Service code	Index: $24196_d = 5E84_h$

This code is for device-internal use only and must not be written to by the user!

C00381

Parameter | Name:	Data type: UNSIGNED_16
C00381 | CAN Heartbeat producer time	Index: $24194_d = 5E82_h$

Time interval for the transmission of the heartbeat telegram to the consumer(s).
- The parameterised time is rounded down to an integer multiple of 5 ms.
- The heartbeat telegram is transmitted automatically as soon as a time > 0 ms is set. The monitoring function "Node Guarding" is deactivated in this case.
- Mapping of the CANopen object I-1017 (see DS301 V4.02).

▸ "CAN on board" system bus: heartbeat protocol

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C00382

Parameter | Name:	Data type: UNSIGNED_16
C00382 | CAN Guard Time	Index: $24193_d = 5E81_h$

After the set guard time multiplied by the life time factor (C00383), a node guarding telegram must have been received.
- Mapping of the CANopen object I-100C (see DS301 V4.02).

▸ "CAN on board" system bus: node guarding protocol

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C00383

Parameter | Name:	Data type: UNSIGNED_8
C00383 | CAN Life Time Factor	Index: $24192_d = 5E80_h$

The life time factor multiplied by the guard time (C00382) results in the time in which a node guarding telegram must have been received.
- Mapping of the CANopen object I-100D (see DS301 V4.02).

▸ "CAN on board" system bus: node guarding protocol

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C00385

Parameter | Name: C00385 | CAN Heartbeat Consumer Time			Data type: BITFIELD_32 Index: $24190_d = 5E7E_h$
The 32 subcodes represent the nodes which are to be monitored via heartbeat. • Each subcode entry contains the expected "heartbeat" time and the node ID (node address) from which the heartbeat telegram is expected in the form of a bit code. • The parameterised time is rounded down to an integer multiple of 5 ms and must have a greater value than the heartbeat producer time of the node to be monitored. • The response to a missing heartbeat telegram can be parameterised in C00613. • Mapping of the CANopen object I-1016 (see DS301 V4.02). ▸ "CAN on board" system bus: heartbeat protocol			
Setting range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	Heartbeat time bit 0		• Bit 0 ... 15: Heartbeat time • Bit 16 ... 23: Node address • Bit 24 ... 31: Reserved
...	...		
Bit 31	Reserved		
Subcodes	**Lenze setting**		**Info**
C00385/1	0x00000000		Monitoring entry 1 ... 32

C00390

Parameter | Name: **C00390 | CAN Error Register (DS301V402)**			Data type: BITFIELD_8 Index: $24185_d = 5E79_h$
Mapping of the CANopen object I-1001 (see DS301 V4.02). ▸ "CAN on board" system bus			
Display area			
0x00		0xFF	
Value is bit-coded:			**Info**
Bit 0	Generic error		Currently only bits 0 and 4 contain the corresponding information.
Bit 1	Current error (not used)		
Bit 2	Voltage error (not used)		
Bit 3	Temperature error (not used)		
Bit 4	Communication error		
Bit 5	Dev. prof. spec. err (not used)		
Bit 6	Reserved		
Bit 7	Manuf. spec. error (not used)		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00391

Parameter | Name: **C00391 | CAN Emergency Object**			Data type: BITFIELD_32 Index: $24184_d = 5E78_h$
Identifier of the emergency telegram • If bit 31 of this code is set (0x8nnnnnnn), the generation of emergency telegrams is deactivated. • Mapping of the CANopen object I-1014 (see DS301 V4.02). ▸ "CAN on board" system bus			
Setting range			**Lenze setting**
0x00000000		0xFFFFFFFF	**0x00000081** (decimal: 129)
Value is bit-coded: (☑ = bit set)			**Info**

Bit 31 ☐	Emergency inactive/active		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00392

Parameter | Name: C00392 | CAN emergency delay time			Data type: UNSIGNED_16 Index: $24183_d = 5E77_h$
Minimum time that has to elapse between two successive emergency telegrams. • If "0" is set, checking of the inhibit time is deactivated. • The time is entered in 1/10 ms. The code automatically rounds the entries down to the preceding full millisecond. • Mapping of the CANopen object I-1015 (see DS301 V4.02). ▸ "CAN on board" system bus			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00393

Parameter | Name: C00393 | CAN result - bus scan			Data type: UNSIGNED_8 Index: $24182_d = 5E76_h$
Result of CAN bus scanning (see controller commands under C00002). • Subcode number 1 ... 128 corresponds to CAN node address 1 ... 128. ▸ "CAN on board" system bus			
Display range (min. value | unit | max. value)			
0		1	
Subcodes			**Info**
C00393/1			Result of CAN bus scanning for CAN node address 1 ... 128 • The value "1" means that a device with the corresponding node address has been found.
C00393/...			
C00393/128			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00394

C00394/10			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00395

Parameter | Name: C00395 | Service code	Data type: UNSIGNED_32 Index: $24180_d = 5E74_h$
This code is for device-internal use only and must not be written to by the user!	

C00396

Parameter | Name: C00396 | Service code	Data type: UNSIGNED_32 Index: $24179_d = 5E73_h$
This code is for device-internal use only and must not be written to by the user!	

C00397

Parameter | Name: **C00397 | Service code**	Data type: UNSIGNED_32 Index: $24178_d = 5E72_h$
This code is for device-internal use only and must not be written to by the user!	

C00398

Parameter | Name: **C00398 | Test mode motor control**		Data type: UNSIGNED_32 Index: $24177_d = 5E71_h$
⚠ **Danger!** **When the test mode is activated, the parameterisable error response "Quick stop by trouble" has no effect!** If the test mode is active and a monitoring function responds with this error response, no quick stop is executed but the motor continues to rotate with the frequency set for the test mode!		
Selection list (Lenze setting printed in bold)		**Info**
0	**Test mode deactivated**	
1	U rotation test mode	
2	I rotation test mode	
3	Current controller optimisation mode	After controller enable, the motor is supplied with current as long as the controller is enabled.
4	Current controller optimisation mode impulse	From software version V7.0 The motor is supplied with voltage for 50 ms after controller enable. Due to this time limit, the load of the machine is reduced. Afterwards, the controller is inhibited automatically.
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☑ No transfer		Scaling factor: 1

C00399

Parameter | Name: **C00399 | Settings for test mode**			Data type: INTEGER_32 Index: $24176_d = 5E70_h$
Setting range (min. value | unit | max. value)			
-1000.0	Hz/1°	1000.0	
Subcodes	**Lenze setting**		**Info**
C00399/1	0.0 Hz/1°		Frequency [Hz] for test mode
C00399/2	0.0 Hz/1°		Start angle [°] for test mode
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10

C00412

Parameter | Name: **C00412 | Hiperface: Initialisation time**			Data type: UNSIGNED_32 Index: $24163_d = 5E63_h$
From software version V11.0 ▸ Parameterisation of a Hiperface encoder with increased initialisation time			
Setting range (min. value | unit | max. value)			**Lenze setting**
150	ms	2000	**650 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00413

Parameter | Name: C00413 | Hiperface: detected TypeCode			Data type: UNSIGNED_32 Index: $24162_d = 5E62_h$
From software version V4.0 Type code read out of the connected Hiperface encoder ▸ Parameterisation of an unknown Hiperface encoder			
Display range (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00414

Parameter | Name: C00414 | Hiperface: TypeCode			Data type: UNSIGNED_32 Index: $24161_d = 5E61_h$
From software version V4.0 Setting the type code for a Hiperface encoder unknown to the controller ▸ Parameterisation of an unknown Hiperface encoder			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		255	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00415

Parameter | Name: C00415 | Hiperface: number of rev.			Data type: UNSIGNED_32 Index: $24160_d = 5E60_h$
From software version V4.0 Number of displayable revolutions for a multi-turn encoder ▸ Parameterisation of an unknown Hiperface encoder			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		16384	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00416

Parameter | Name: C00416 | Service code	Data type: UNSIGNED_32 Index: $24159_d = 5E5F_h$
This code is for device-internal use only and must not be written to by the user!	

C00417

Parameter | Name: C00417 | Dynamic of resolver evaluation			Data type: UNSIGNED_32 Index: $24158_d = 5E5E_h$
From software version V5.0 ▸ Adaptation of the resolver evaluation dynamics			
Setting range (min. value | unit | max. value)			**Lenze setting**
100	%	1000	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00418

Parameter | Name: **C00418 | Activate resolver error compensation**			Data type: UNSIGNED_8 Index: $24157_d = 5E5D_h$
From software version V7.0 ▸ Resolver error compensation			
Selection list (Lenze setting printed in bold)			
0	**Deactivated**		
1	enabled		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00420

Parameter | Name: **C00420 | Number of encoder increments**			Data type: UNSIGNED_16 Index: $24155_d = 5E5B_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
1		16384	**512**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00421

C00462

Parameter | Name:	Data type: UNSIGNED_8
C00462 | Noise signal activation	Index: $24113_d = 5E31_h$
This code is for device-internal use only and must not be written to by the user!	

C00464

Parameter | Name:	Data type: UNSIGNED_16
C00464 | Keypad: Mode	Index: $24111_d = 5E2F_h$

From software version V5.0

Definition of the mode in which the keypad attached is to be activated.

- If both keypad versions (V1.0 and V2.0) are used, the Lenze setting is to be maintained.
- If only the new keypad V2.0 is used, the initialisation time of the keypad can be reduced by changing over to mode 2. Furthermore mode 2 supports greater future keypad files.

Note: If mode 2 is selected, the keypad V1.0 can no longer be operated on the controller!

Selection list (Lenze setting printed in bold)		Info
0	Mode 1	For keypad V1.0 and V2.0
1	**Mode 2**	Only for keypad V2.0

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C00465

Parameter | Name:	Data type: UNSIGNED_8
C00465 | Keypad: Timeout welcome screen	Index: $24110_d = 5E2E_h$

Parameter | Name: **C00494 | Motor standstill time constant**			Data type: UNSIGNED_32 Index: $24081_d = 5E11_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	100000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00495

Parameter | Name: **C00495 | Motor encoder selection**		Data type: UNSIGNED_16 Index: $24080_d = 5E10_h$
Selection list (Lenze setting printed in bold)		
0	**Resolver on X7**	
1	Encoder on X8	
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00497

Parameter | Name: **C00497 | Speed act. val. time const.**			Data type: UNSIGNED_32 Index: $24078_d = 5E0E_h$
Time constant for actual speed filter • In order to maximise the dynamics of the speed control loop, the actual speed filter should be operated with a time constant as low as possible. The lower the time constant the higher the gain of the speed controller. Since actual value filters have the task to dampen measuring errors or interference components, it must be found a compromise between filter task and the resulting delay. • If a Lenze motor is selected from the motor catalogue, a time constant is automatically preset here which serves to operate the motor even with a faulty detection (e.g. in case of a bad shield connection). ▸ Servo control (SC): Optimise speed controller ▸ Sensorless vector control (SLVC): Optimise speed controller			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0	ms	50.0	**2.0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00512

Parameter | Name: **C00512 | Service code**	Data type: UNSIGNED_32 Index: $24063_d = 5DFF_h$
This code is for device-internal use only and must not be written to by the user!	

C00513

Parameter | Name: **C00513 | Service code**	Data type: VISIBLE_STRING Index: $24062_d = 5DFE_h$
This code is for device-internal use only and must not be written to by the user!	

C00514

Parameter | Name: **C00514 | Service code**	Data type: UNSIGNED_32 Index: $24061_d = 5DFD_h$
This code is for device-internal use only and must not be written to by the user!	

C00515

Parameter | Name: **C00515 | Service code**	Data type: UNSIGNED_32 Index: $24060_d = 5DFC_h$
This code is for device-internal use only and must not be written to by the user!	

C00516

Parameter | Name: **C00516 | Service code**	Data type: UNSIGNED_32 Index: $24059_d = 5DFB_h$
This code is for device-internal use only and must not be written to by the user!	

C00569

Parameter | Name: C00569 | Resp. brake trans. ixt > C00570	Data type: UNSIGNED_32 Index: $24006_d = 5DC6_h$

From software version V1.5
Response if adjustable warning threshold (C00570) of brake chopper monitoring is reached.

▸ Braking operation

Selection list (Lenze setting printed in bold)	
1	Error
2	Fault
5	**Warning**
4	Warning locked
3	Quick stop by trouble
0	No response

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00570

Parameter | Name: C00570 | Warning thres. brake transistor	Data type: UNSIGNED_32 Index: $24005_d = 5DC5_h$

From software version V1.5
Warning threshold for brake chopper monitoring
- The response to reaching the threshold can be selected in C00569.

▸ Braking operation

Setting range (min. value | unit | max. value)			Lenze setting
0	%	100	**90 %**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00571

Parameter | Name: C00571 | Resp. to brake res. i²xt > C00572	Data type: UNSIGNED_32 Index: $24004_d = 5DC4_h$

From software version V1.5
Response if adjustable warning threshold (C00572) of brake resistor monitoring is reached.

▸ Braking operation

Selection list (Lenze setting printed in bold)	
1	Error
2	Fault
5	**Warning**
4	Warning locked
3	Quick stop by trouble
0	No response

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00572

Parameter | Name: **C00572 | Warning thres. brake resistor**			Data type: UNSIGNED_32 Index: $24003_d = 5DC3_h$
From software version V1.5 Warning threshold for brake resistor monitoring • The response to reaching the threshold can be selected in C00571. ▸ Braking operation			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	100	**90 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00573

Parameter | Name: **C00573 | Resp. to overload brake trans.**		Data type: UNSIGNED_32 Index: $24002_d = 5DC2_h$
Response to activation of brake chopper monitoring ▸ Braking operation		
Selection list (Lenze setting printed in bold)		
1	Error	
2	Fault	
5	Warning	
4	Warning locked	
3	Quick stop by trouble	
0	**No response**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00574

Parameter | Name: **C00574 | Resp. to brake resist. overtemp.**		Data type: UNSIGNED_32 Index: $24001_d = 5DC1_h$
Response to activation of brake resistor monitoring ▸ Braking operation		
Selection list (Lenze setting printed in bold)		
1	Error	
2	Fault	
5	Warning	
4	Warning locked	
3	Quick stop by trouble	
0	**No response**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00576

Parameter | Name: **C00576 | Speed monitoring tolerance**			Data type: UNSIGNED_32 Index: $23999_d = 5DBF_h$
Monitoring window for speed control error in [%] of nmax			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	100	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00577

Parameter | Name: **C00577 | Field weakening controller gain**			Data type: UNSIGNED_32 Index: 23998_d = $5DBE_h$
At "0" the P component is deactivated, a pure I-controller is used.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	Vs/V	2147483.647	**0.000 Vs/V**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C00578

Parameter | Name: **C00578 | Field weak. contr. reset time**			Data type: UNSIGNED_32 Index: 23997_d = $5DBD_h$
At "240000.0 ms" the I component of the field weakening controller is deactivated.			
Setting range (min. value | unit | max. value)			**Lenze setting**
1.0	ms	240000.0	**2000.0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00579

Parameter | Name: **C00579 | Resp. to speed monitoring**		Data type: UNSIGNED_32 Index: 23996_d = $5DBC_h$
Response to activation of speed monitoring		
Selection list (Lenze setting printed in bold)		
1	Error	
2	Fault	
5	Warning	
4	Warning locked	
3	Quick stop by trouble	
0	**No response**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00580

Parameter | Name: **C00580 | Resp. to encoder open circuit**		Data type: UNSIGNED_32 Index: 23995_d = $5DBB_h$
Response to open circuit in encoder ⚠ **Danger!** **If the encoder is used as motor encoder:** In the event of a fault, safe operation of the motor is no longer guaranteed! For safety reasons, the "Fault" response should always be set for this case!		
Selection list (Lenze setting printed in bold)		
1	**Error**	
2	Fault	
5	Warning	
4	Warning locked	
3	Quick stop by trouble	
13	Quick Stop open loop by trouble

C00581

Parameter | Name: **C00581 | Resp. to external fault**	Data type: UNSIGNED_32 Index: $23994_d = 5DBA_h$
Response to an external error ▸ Drive interface	
Selection list (Lenze setting printed in bold)	
1 **Error**	
2 Fault	
3 Quick stop by trouble	
4 Warning locked	
5 Warning	
6 Information	
0 No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C00582

Parameter | Name: **C00582 | Resp. to heatsink temp. > C00122**	Data type: UNSIGNED_32 Index: $23993_d = 5DB9_h$
Response if heatsink temperature > variable limit temperature (C00122).	
Selection list (Lenze setting printed in bold)	
1 Error	
5 **Warning**	
0 No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C00583

Parameter | Name: **C00583 | Resp. to motor KTY overtemp.**	Data type: UNSIGNED_32 Index: $23992_d = 5DB8_h$
Response if motor temperature > fixed limit temperature. ▸ Motor temperature monitoring	
Selection list (Lenze setting printed in bold)	
1 **Error**	
5 Warning	
0 No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C00584

Parameter | Name: **C00584 | Resp. to motor temp. > C00121**	Data type: UNSIGNED_32 Index: $23991_d = 5DB7_h$
Response if motor temperature > variable limit temperature (C00121). ▸ Motor temperature monitoring	
Selection list (Lenze setting printed in bold)	
1 Error	
5 **Warning**	
0 No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C00585

Parameter | Name: **C00585 | Resp. to motor overtemp. PTC**		Data type: UNSIGNED_32 Index: $23990_d = 5DB6_h$
Response if motor temperature across PTC input T1/T2 too high.		
Selection list (Lenze setting printed in bold)		
1	Error	
5	Warning	
0	**No response**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00586

Parameter | Name: **C00586 | Resp. to resolver open circuit**		Data type: UNSIGNED_32 Index: $23989_d = 5DB5_h$
Response to open circuit in resolver ⚠ **Danger!** **If the resolver is used as motor encoder:** In the event of a fault, safe operation of the motor is no longer guaranteed! For safety reasons, the "Fault" response should always be set for this case!		
Selection list (Lenze setting printed in bold)		
1	**Error**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00635

Parameter | Name: C00635 | Resp to new firmw. standard dev.		Data type: UNSIGNED_32 Index: $23940_d = 5D84_h$
Selection list (Lenze setting printed in bold)		
1	**Error**	
6	Information	
5	Warning	
4	Warning locked	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00636

Parameter | Name: C00636 | Resp. to new module in MXI1		Data type: UNSIGNED_32 Index: $23939_d = 5D83_h$
Selection list (Lenze setting printed in bold)		
1	Error	
6	Information	
5	Warning	
4	**Warning locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00637

Parameter | Name: C00637 | Resp. to new module in MXI2		Data type: UNSIGNED_32 Index: $23938_d = 5D82_h$
Selection list (Lenze setting printed in bold)		
1	Error	
6	Information	
5	Warning	
4	**Warning locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00640

Parameter | Name: **C00640 | Resp. to pole pos. id. monit.**			Data type: UNSIGNED_32 Index: 23935_d = $5D7F_h$
From software version V4.0 Error response for abort of the pole position identification ▸ Adjustment of the pole position identification			
Selection list (Lenze setting printed in bold)			
1	**Error**		
4	Warning locked		
0	No response		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00641

Parameter | Name: **C00641 | PLI 360° current amplitude**			Data type: UNSIGNED_32 Index: 23934_d = $5D7E_h$
From software version V4.0 Percentage adjustment of the current amplitude for the pole position identification **Stop!** If there is no temperature monitoring in the motor and/or the I2xt motor monitoring is not parameterised correctly, the motor may be permanently damaged when the current amplitude is set too high (e.g. to the maximum value)! ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
1	%	1000	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00642

Parameter | Name: **C00642 | PolePosId 360° ramp time**			Data type: UNSIGNED_32 Index: 23933_d = $5D7D_h$
From software version V4.0 Percentage adjustment of the ramp time for the pole position identification ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
5	%	1000	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00643

Parameter | Name: **C00643 | PLI 360° traversing direction**			Data type: UNSIGNED_32 Index: 23932_d = $5D7C_h$
From software version V4.0 Selection of the traversing direction for the pole position identification ▸ Adjustment of the pole position identification			
Selection list (Lenze setting printed in bold)			
0	**Right rotating field**		
1	Left rotating field		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00644

Parameter | Name: **C00644 | PolePosId 360° fault tol.**			Data type: INTEGER_32 Index: 23931_d = $5D7B_h$
From software version V4.0 Fault tolerance for the plausibility check of the pole position identification ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
-6.0	°	30.0	**0.0 °**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00645

Parameter | Name: **C00645 | PLI 360° absolute current amplitude**			Data type: UNSIGNED_32 Index: 23930_d = $5D7A_h$
From software version V7.0 ▸ Adjustment of the pole position identification			
Display range (min. value | unit | max. value)			
0.00	A	1000.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00646

Parameter | Name: **C00646 | PLI min.mov. curr. amplitude**			Data type: UNSIGNED_32 Index: 23929_d = $5D79_h$
From software version V4.0 Percentage adjustment of the current amplitude for the pole position identification **Stop!** If there is no temperature monitoring in the motor and/or the I2xt motor monitoring is not parameterised correctly, the motor may be permanently damaged when the current amplitude is set too high (e.g. to the maximum value)! ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
1	%	1000	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00647

Parameter | Name: **C00647 | PolePosId min.mov. cur.rise rate**			Data type: UNSIGNED_32 Index: 23928_d = $5D78_h$
From software version V4.0 Percentage adjustment of the rate of current rise for the pole position identification ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
5	%	1000	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00648

Parameter | Name: **C00648 | PolePosId min.mov. gain**			Data type: UNSIGNED_32 Index: $23927_d = 5D77_h$
From software version V4.0 P component of the PI controller for the pole position identification ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00		10.00	**0.00**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00649

Parameter | Name: **C00649 | PLI min. mov. reset time**			Data type: UNSIGNED_32 Index: $23926_d = 5D76_h$
From software version V4.0 I component of the PI controller for the pole position identification ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.01	ms	6000.00	**62.50 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00650

Parameter | Name: **C00650 | PolePosId min.mov. max.perm.mov.**			Data type: INTEGER_32 Index: $23925_d = 5D75_h$
From software version V4.0 Max. movement permitted during the pole position identification ▸ Adjustment of the pole position identification			
Setting range (min. value | unit | max. value)			**Lenze setting**
1	°	90	**20 °**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00651

Parameter | Name: **C00651 | PLI min. motion absolute cur. amp.**			Data type: UNSIGNED_32 Index: $23924_d = 5D74_h$
From software version V7.0 ▸ Adjustment of the pole position identification			
Display range (min. value | unit | max. value)			
0.00	A	1000.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00658

Parameter | Name: **C00658 | Noise signal amplitude**	Data type: UNSIGNED_32 Index: $23917_d = 5D6D_h$
This code is for device-internal use only and must not be written to by the user!	

C00659

Parameter | Name:	Data type: UNSIGNED_32
C00659 | Noise signal period	Index: $23916_d = 5D6C_h$
This code is for device-internal use only and must not be written to by the user!	

C00691

Parameter | Name:	Data type: INTEGER_32
C00691 | Total speed setpoint	Index: $23884_d = 5D4C_h$

Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00692

Parameter | Name:	Data type: INTEGER_32
C00692 | Speed setpoint [%]	Index: $23883_d = 5D4B_h$

Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00693

Parameter | Name:	Data type: INTEGER_32
C00693 | Actual speed [%]	Index: $23882_d = 5D4A_h$

Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00694

Parameter | Name:	Data type: INTEGER_32
C00694 | Speed controller output	Index: $23881_d = 5D49_h$

Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00695

Parameter | Name:	Data type: INTEGER_32
C00695 | Total torque setpoint	Index: $23880_d = 5D48_h$

Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00696

Parameter | Name:	Data type: INTEGER_32
C00696 | Torque setpoint [%]	Index: $23879_d = 5D47_h$

Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00697

Parameter | Name: **C00697 | Filtered torque setpoint**			Data type: INTEGER_32 Index: $23878_d = 5D46_h$
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00698

Parameter | Name: **C00698 | Actual torque [%]**			Data type: INTEGER_32 Index: $23877_d = 5D45_h$
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00730

Parameter | Name: **C00730 | GDO general parameters**	Data type: INTEGER_32 Index: $23845_d = 5D25_h$
This code is for device-internal use only and must not be written to by the user!	

C00731

Parameter | Name: **C00731 | GDO channel 1/trigger 1**	Data type: INTEGER_32 Index: $23844_d = 5D24_h$
This code is for device-internal use only and must not be written to by the user!	

C00732

Parameter | Name: **C00732 | GDO channel 2/trigger 2**	Data type: INTEGER_32 Index: $23843_d = 5D23_h$
This code is for device-internal use only and must not be written to by the user!	

C00733

Parameter | Name: **C00733 | GDO channel 3**	Data type: INTEGER_32 Index: $23842_d = 5D22_h$
This code is for device-internal use only and must not be written to by the user!	

C00734

Parameter | Name: **C00734 | GDO channel 4**	Data type: INTEGER_32 Index: $23841_d = 5D21_h$
This code is for device-internal use only and must not be written to by the user!	

C00735

Parameter | Name: **C00735 | GDO channel 5**	Data type: INTEGER_32 Index: $23840_d = 5D20_h$
This code is for device-internal use only and must not be written to by the user!	

C00736

Parameter | Name: **C00736 | GDO channel 6**	Data type: INTEGER_32 Index: $23839_d = 5D1F_h$
This code is for device-internal use only and must not be written to by the user!	

C00737

Parameter | Name: **C00737 | GDO channel 7**	Data type: INTEGER_32 Index: $23838_d = 5D1E_h$
This code is for device-internal use only and must not be written to by the user!	

C00738

Parameter | Name: **C00738 | GDO channel 8**	Data type: INTEGER_32 Index: $23837_d = 5D1D_h$
This code is for device-internal use only and must not be written to by the user!	

C00739

Parameter | Name: **C00739 | GDO status information**	Data type: INTEGER_32 Index: $23836_d = 5D1C_h$
This code is for device-internal use only and must not be written to by the user!	

C00770

Parameter | Name: **C00770 | MCTRL_dnMotorPosAct**			Data type: UNSIGNED_32 Index: $23805_d = 5CFD_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes			**Info**
C00770/1			LOW word
C00770/2			High word
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00771

Parameter | Name: **C00771 | MCTRL_dnLoadPosAct**			Data type: UNSIGNED_32 Index: $23804_d = 5CFC_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes			**Info**
C00771/1			LOW word
C00771/2			High word
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00772

Parameter | Name: **C00772 | MCTRL_dnMotorSpeedAct**			Data type: INTEGER_32 Index: $23803_d = 5CFB_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-480000	rpm	480000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00773

Parameter | Name: **C00773 | MCTRL_dnLoadSpeedAct**			Data type: INTEGER_32 Index: $23802_d = 5CFA_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-480000	rpm	480000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00774

Parameter | Name: **C00774 | MCTRL_dnTorqueAct**			Data type: INTEGER_32 Index: $23801_d = 5CF9_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-21474836.47	Nm	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00775

Parameter | Name: **C00775 | MCTRL_dnOutputSpeedCtrl**			Data type: INTEGER_32 Index: $23800_d = 5CF8_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-21474836.47	Nm	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00776

Parameter | Name: **C00776 | MCTRL_dnInputJerkCtrl**			Data type: INTEGER_32 Index: $23799_d = 5CF7_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-21474836.47	Nm	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00777

Parameter | Name: **C00777 | MCTRL_dnInputTorqueCtrl**			Data type: INTEGER_32 Index: $23798_d = 5CF6_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-21474836.47	Nm	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00778

Parameter | Name: **C00778 | MCTRL_dnFluxAct**			Data type: INTEGER_32 Index: $23797_d = 5CF5_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00779

Parameter | Name: **C00779 | MCTRL_dnDCBusVoltage**			Data type: INTEGER_32 Index: $23796_d = 5CF4_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	V	1000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00780

Parameter | Name: **C00780 | MCTRL_dnImotAct**			Data type: INTEGER_32 Index: $23795_d = 5CF3_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-500.00	A	500.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00781

Parameter | Name: **C00781 | MCTRL_dwMaxMotorSpeed**			Data type: UNSIGNED_32 Index: $23794_d = 5CF2_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	rpm	480000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00782

Parameter | Name: **C00782 | MCTRL_dwMaxMotorTorque**			Data type: UNSIGNED_32 Index: $23793_d = 5CF1_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0.000	Nm	2147483.647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C00783

Parameter | Name: **C00783 | MCTRL_dwMotorVoltageAct**			Data type: UNSIGNED_32 Index: $23792_d = 5CF0_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	V	2000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00784

Parameter | Name: **C00784 | MCTRL_dnMotorFreqAct**			Data type: INTEGER_32 Index: $23791_d = 5CEF_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-800.0	Hz	800.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

Parameter | Name: **C00807 | MCTRL_dnTorqueHighLimit**			Data type: INTEGER_32 Index: $23768_d = 5CD8_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-21474836.47	Nm	21474836.47	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00808

Parameter | Name: **C00808 | MCTRL_dnPosCtrlOutLimit**			Data type: INTEGER_32 Index: $23767_d = 5CD7_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-480000	rpm	480000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00809

Parameter | Name: **C00809 | MCTRL_dnTorqueCtrlAdapt**			Data type: INTEGER_32 Index: $23766_d = 5CD6_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00810

Parameter | Name: **C00810 | MCTRL_dnSpeedCtrlAdapt**			Data type: INTEGER_32 Index: $23765_d = 5CD5_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00811

Parameter | Name: **C00811 | MCTRL_dnPosCtrlAdapt**			Data type: INTEGER_32 Index: $23764_d = 5CD4_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00812

Parameter | Name: **C00812 | MCTRL_dnMotorPosRefValue**			Data type: UNSIGNED_32 Index: $23763_d = 5CD3_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes			**Info**
C00812/1			LOW word
C00812/2			High word
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00813

Parameter | Name: **C00813 | MCTRL_dnLoadPosRefValue**			Data type: UNSIGNED_32 Index: $23762_d = 5CD2_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes			**Info**
C00813/1			LOW word
C00813/2			High word
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00814

Parameter | Name: **C00814 | MCTRL_dnBoost**			Data type: INTEGER_32 Index: $23761_d = 5CD1_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-1000	V	1000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00815

Parameter | Name: **C00815 | MCTRL_dnSpeedCtrlIntegrator**			Data type: INTEGER_32 Index: $23760_d = 5CD0_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-2147483.647	Nm	2147483.647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C00816

Parameter | Name: **C00816 | MCTRL_dnFieldWeak**			Data type: INTEGER_32 Index: $23759_d = 5CCF_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00817

Parameter | Name: **C00817 | MCTRL_dnSpeedSet_s**			Data type: INTEGER_32 Index: $23758_d = 5CCE_h$
Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-480000	rpm	480000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00818

Parameter | Name: **C00818 | MCTRL_dnMvorAdapt**			Data type: INTEGER_32 Index: $23757_d = 5CCD_h$
From software version V1.5 Internal motor control (MCTRL) signal			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C00854

Parameter | Name: **C00854 | ID status**			Data type: UNSIGNED_32 Index: $23721_d = 5CA9_h$
From software version V3.0			
Display range (min. value | unit | max. value)			
0		100	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00878

Parameter | Name: **C00878 | Status DCTRL control input**			Data type: UNSIGNED_8 Index: $23697_d = 5C91_h$
Display range (min. value | unit | max. value)			
0		1	
Subcodes			**Info**
C00878/1			Status of control inputs
C00878/...			
C00878/5			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00909

Parameter | Name: **C00909 | Speed limitation**			Data type: INTEGER_16 Index: $23666_d = 5C72_h$
Speed limitation for speed setpoint • For the upper speed limit value only positive values are permissible (0.0 % ... 175.0 %). • For the lower speed limit value only negative values are permissible (-175.0 % ... 0.0 %).			
Setting range (min. value | unit | max. value)			
-175.0	%	175.0	
Subcodes	**Lenze setting**		**Info**
C00909/1	175.0 %		Upper speed limit value
C00909/2	-175.0 %		Lower speed limit value
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C00950

Parameter | Name: **C00950 | VFC: V/f characteristic shape**		Data type: UNSIGNED_32 Index: $23625_d = 5C49_h$
From software version V3.0 ▸ V/f control		
Selection list (Lenze setting printed in bold)		
0	**Linear (V/f)**	
1	Quadratic (V/f^2)	
2	Curve	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C00951

Parameter | Name: **C00951 | VFC: V/f base frequency**			Data type: INTEGER_32 Index: $23624_d = 5C48_h$
From software version V3.0 ▸ V/f control			
Setting range (min. value | unit | max. value)			**Lenze setting**
1	Hz	5000	**50 Hz**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C00952

Parameter | Name: **C00952 | VFC: Frequency interpol. point n**			Data type: INTEGER_32 Index: $23623_d = 5C47_h$
From software version V3.0			▸ V/f control
Setting range (min. value | unit | max. value)			
-5000	Hz	5000	
Subcodes	**Lenze setting**		**Info**
C00952/1	-50 Hz		
C00952/2	-40 Hz		
C00952/3	-30 Hz		
C00952/4	-20 Hz		
C00952/5	-10 Hz

C01121

Parameter | Name: **C01121 | Sync cycle time**			Data type: UNSIGNED_32 Index: $23454_d = 5B9E_h$
Time interval at which the phase control loop (PLL) in the controller expects the synchronisation signals. • The time interval set must correspond to the cycle of the synchronisation source. **Note:** For synchronisation via the system bus (CANopen), only integer multiples of 1000 µs should be set. Example: For the system bus, the interval between two synchronisation signals is set to 2 ms. If the system bus is to be used as the synchronisation source, a synchronisation cycle of 2000 µs must be set in C01121. ▸ "CAN on board" system bus: sync telegram			
Setting range (min. value | unit | max. value)			**Lenze setting**
250	µs	20000	**1000 µs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C01122

Parameter | Name: **C01122 | Sync phase position**			Data type: UNSIGNED_32 Index: $23453_d = 5B9D_h$
The phase position defines the zero point of time for the application relating to the synchronisation signal (bus cycle). Since PDO processing is integrated in the system part of the application, the instant of the PDO acceptance also changes if the phase position is changed. • If 0 is set, the application is started together with the synchronisation signal. • If a value > 0 is set, the application starts by the set time interval before the synchronisation signal arrives (the phase position acts negatively). Example: If the phase position is set to 400 µs, the system part of the application starts 400 µs before the synchronisation signal arrives. From software version V3.0: The effect of the sync phase position can be affected by the application cycle set in C01130. For the Lenze setting of C01130 the behaviour remains as before. ▸ "CAN on board" system bus: sync telegram			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	µs	64000	**400 µs**

C01123

Parameter | Name: **C01123 | Sync tolerance**			Data type: UNSIGNED_32 Index: $23452_d = 5B9C_h$
Time slot for monitoring the synchronisation signal via the **LS_SyncInput** system block • If the last synchronisation signal has been within this time slot around the expected value, the *SYNC_bSyncInsideWindow* output of the **LS_SyncInput** system block is set to TRUE. • This setting does not affect the synchronisation process. ▸ "CAN on board" system bus: sync telegram			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	µs	1000	**0 µs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C01124

Parameter | Name: **C01124 | Sync-PLL increment**	Data type: UNSIGNED_8 Index: $23451_d = 5B9B_h$

When the cycle times of the synchronisation signal and the phase control loop (PLL) differ, this setting defines the increment to be used to readjust the phase control loop.

- If the system bus (CANopen) is used as the synchronisation source, the recommended value is 109 ns.

This code is for device-internal use only and must not be written to by the user!	

C01129

Parameter | Name:	Data type: UNSIGNED_32
C01129 | Service code	Index: $23446_d = 5B96_h$
This code is for device-internal use only and must not be written to by the user!	

C01130

Parameter | Name:	Data type: UNSIGNED_16
C01130 | CAN SYNC application cycle	Index: $23445_d = 5B95_h$

From software version V3.0

This parameter affects the effect of the sync phase position (C01122) regarding the instant of acceptance of the synchronous PDOs in the application and the instant of transmission of the synchronous PDOs on the system bus (CANopen).

- The resulting PDO delay can be calculated with the following formula taking into account an internal processing time of 150 µs: PDO delay = (C01121 - C01122 + 150 µs) modulo C01130
- For the Lenze setting, the behaviour remains as before, the sync phase position (C01122) is always calculated modulo 1000.
- The set value is automatically rounded down to multiples of 1000 µs.

▸ Effect of C01130 on the sync phase position

Note: Setting the application cycle to a higher value than the sync cycle time (C01121) results in undefined behaviour. The same applies if the value set for the sync phase position (C01122) is higher than the sync cycle time (C01121). In this case, the drive usually cannot send synchronous PDOs on the system bus anymore.

This code is for device-internal use only and must not be written to by the user!	

C01214

Parameter | Name: **C01214 | Internal clock**	Data type: VISIBLE_STRING Index: $23361_d = 5B41_h$
Display of the system time of the controller in the format "dd/mm/yyyy hh:mm:ss" • Time and date are set via C01215. If the MM440 memory module with real-time clock is plugged into the controller, the internal clock is adjusted to the real-time clock every time the mains is switched on and every 24 hours at 0:00 o'clock. • The daily adjustment is executed on a low-priority level. This is why it may take some seconds until the adjusted time is displayed. • During the adjustment process, status information of the real-time clock is also queried and entered into the logbook. **Note:** If a memory module without real-time clock is plugged into the controller, the internal clock is initialised with "01.01.1970 00:00:00" every time the mains is switched on.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	Scaling factor: 1 Character length: 21

C01215

Parameter | Name: **C01215 | Set time and date**			Data type: UNSIGNED_16 Index: $23360_d = 5B40_h$
From software version V1.5 Setting of the system time of the controller displayed in C01214. • If the MM440 memory module with real-time clock is plugged into the controller, the real-time clock is set simultaneously. Set time and date. • Before writing to a subcode for the first time, the current time information according to the internal clock is displayed in the subcodes. • When a value has been written into a subcode, the displays in the subcodes freeze to the last values. • The new system time set is only accepted after a value has been written into each subcode at least once. • After the new system time has been accepted, the display in the subcodes is updated according to the internal clock. **Note:** If a memory module without real-time clock is plugged into the controller, the internal clock is initialised with "01.01.1970 00:00:00" every time the mains is switched on.

C01704/1	0x00000000	Energy m. 1: Comp. to be sw. off
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C01705

Parameter | Name: **C01705 | Energy: Power input**			Data type: UNSIGNED_32 Index: $22870_d = 5956_h$
From software version V9.0			
Setting range (min. value | unit | max. value)			
0	W	4294967295	
Subcodes	**Lenze setting**		**Info**
C01705/1	0 W		Energy m. 1: Power input
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C01902

Parameter | Name: **C01902 | Diagnostics X6: Max. baud rate**	Data type: UNSIGNED_32 Index: $22673_d = 5891_h$
Maximum permissible baud rate of the standard device after determination of the baud rate at the diagnostic interface X6 • Communication starts with the default standard device baud rate of 19200 baud.	
Selection list (Lenze setting printed in bold)	
9600	9600 baud
19200	19.200 baud
38400	38.400 baud
57600	57.600 baud
115200	115.200 baud
230400	230.400 baud
375000	375.000 baud
750000	750.000 baud
1500000	1.500.000 baud
3000000	**3.000.000 baud**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C01903

Parameter | Name: **C01903 | Diagnostics X6: Change baud rate**	Data type: UNSIGNED_32 Index: $22672_d = 5890_h$
New determination of the baud rate at the diagnostic interface X6	
Selection list (Lenze setting printed in bold)	
1	Set a higher baud rate
0	**Ignore changes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer	Scaling factor: 1

C01905

Parameter | Name: **C01905 | Diagnostics X6: Curr. baud rate**			Data type: UNSIGNED_32 Index: $22670_d = 588E_h$
Current baud rate at diagnostics interface X6			
Display range (min. value | unit | max. value)			
0		3000000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02104

Parameter | Name: C02104 | Program auto-start	Data type: UNSIGNED_32 Index: $22471_d = 57C7_h$

⚠ **Danger!**
The controller enable generated by the application via a connection of the terminal 28 (RFR) with one of the digital outputs *DIGOUT_bOut(x)* is not permissible if the following functions are active:
"Auto-start after mains ON" (C00142 = "1") and "Program auto-start after mains switching" (C02104 = "1")
If this is not observed, the controller can start automatically after mains connection!

▸ Automatic restart after mains connection
▸ Activate application

Selection list (Lenze setting printed in bold)	
0	Off
1	**Autom. after mains connection**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02108

Parameter | Name: C02108 | Program status	Data type: UNSIGNED_8 Index: $22467_d = 57C3_h$

Selection list (read only)	
1	Program stopped
0	Program is running
2	Program stopped at breakpoint

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02109

Parameter | Name: C02109 | Program runtime	Data type: UNSIGNED_16 Index: $22466_d = 57C2_h$

Display range (min. value | unit | max. value)		
0	µs	65535

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02110

Parameter | Name: C02110 | User code memory load	Data type: UNSIGNED_32 Index: $22465_d = 57C1_h$

From software version V2.0 onwards

Display range (min. value | unit | max. value)		
0	%	100

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02111

Parameter | Name: **C02111 | Resp. to task overflow**			Data type: UNSIGNED_8 Index: $22464_d = 57C0_h$
From software version V5.0 Response to an application or user task overflow.			
Selection list (Lenze setting printed in bold)			
1	**Error**		
3	Quick stop by trouble		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02112

Parameter | Name: **C02112 | B. code: Read non-vol. memory**			Data type: UNSIGNED_32 Index: $22463_d = 57BF_h$
From software version V9.0			
Display range (min. value | unit | max. value)			
0	%	1000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02113

Parameter | Name: **C02113 | Program name**			Data type: VISIBLE_STRING Index: $22462_d = 57BE_h$
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1 Character length: 32

C02119

Parameter | Name: **C02119 | Active target ID**			Data type: UNSIGNED_32 Index: $22456_d = 57B8_h$
From software version V9.0			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02121

Parameter | Name: **C02121 | Runtime ApplicationTask**			Data type: UNSIGNED_32 Index: $22454_d = 57B6_h$
▸ Runtime measurement			
Display range (min. value | unit | max. value)			
0	µs	3600000000	
Subcodes			**Info**
C02121/1			Curr. runtime ApplicationTask
C02121/2			Max. runtime ApplicationTask
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02122

Parameter | Name: **C02122 | Runtime UserTask**			Data type: UNSIGNED_32 Index: $22453_d = 57B5_h$
▸ Runtime measurement			
Display range (min. value | unit | max. value)			
0	µs	3600000000	
Subcodes			**Info**
C02122/1			Curr. runtime UserTask
C02122/2			Max. runtime UserTask
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02123

Parameter | Name: **C02123 | Runtime IdleTask**			Data type: UNSIGNED_32 Index: $22452_d = 57B4_h$
▸ Runtime measurement			
Display range (min. value | unit | max. value)			
0	µs	3600000000	
Subcodes			**Info**
C02123/1			Curr. runtime IdleTask
C02123/2			Max. runtime IdleTask
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02520

Parameter | Name: **C02520 | Gearbox factor numerator: Motor**			Data type: INTEGER_32 Index: $22055_d = 5627_h$
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
1		2147483647	**1**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02521

Parameter | Name: **C02521 | Gearbox factor denom.: Motor**			Data type: INTEGER_32 Index: $22054_d = 5626_h$
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
1		2147483647	**1**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02522

Parameter | Name: **C02522 | Gearbox factor num.: Pos. enc.**			Data type: INTEGER_32 Index: $22053_d = 5625_h$
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
1		2147483647	**1**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02523

Parameter | Name: C02523 | Gearbox fac. denom.: Pos. enc.			Data type: INTEGER_32 Index: $22052_d = 5624_h$
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
1		2147483647	**1**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02524

Parameter | Name: C02524 | Feed constant			Data type: UNSIGNED_32 Index: $22051_d = 5623_h$
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0001	Unit/rev.	214748.3647	**360.0000 Unit/rev.**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02525

Parameter | Name: C02525 | Unit		Data type: UNSIGNED_32 Index: $22050_d = 5622_h$
		▸ Drive interface
Selection list (Lenze setting printed in bold)		**Info**
0	User-defined	The text entered in C02526 is displayed for the unit.
1	Incr.	
2	µm	
3	mm	
4	m	
5	inch	
6	yard	
7	**°**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02526

Parameter | Name: C02526 | User-defined unit			Data type: VISIBLE_STRING Index: $22049_d = 5621_h$
User-defined unit which is displayed when C02525="0" is selected.			▸ Drive interface
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1	Character length: 8

C02527

Parameter | Name: C02527 | Motor mounting direction		Data type: UNSIGNED_32 Index: $22048_d = 5620_h$
		▸ Drive interface
Selection list (Lenze setting printed in bold)		
0	**Motor rotating CW**	
1	Motor rotating CCW	
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02528

Parameter | Name: **C02528 | Traversing range**	Data type: UNSIGNED_32 Index: $22047_d = 561F_h$
▸ Drive interface	

Selection list (Lenze setting printed in bold)	
0	**Unlimited**
1	Limited
2	Modulo

☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02529

Parameter | Name: **C02529 | Position encoder mounting dir.**	Data type: UNSIGNED_32 Index: $22046_d = 561E_h$
▸ Drive interface	

Selection list (Lenze setting printed in bold)	
0	**Encoder rotating CW**
1	Encoder rotating CCW

☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02530

Parameter | Name: **C02530 | Active function state**	Data type: INTEGER_32 Index: $22045_d = 561D_h$
Displays the basic drive function that currently controls the drive. ▸ Basic drive functions: Internal state machine	

Selection list (read only)	
0	Program stopped
1	Initial/boot state active
2	Torque follower active
3	Speed follower active
4	Position follower active
5	Setpoint follower active
6	Positioning active
7	Homing active
8	Manual jog active
9	Brake test active
10	Drive at standstill
11	Drive is stopped
12	Quick stop active
13	Reserve 1
14	Controller is not ready
15	Initialisation
16	Error
17	Encoderless manual jog active
18	Pole position identification active

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C02531

Parameter | Name: **C02531 | Gearbox factors (decimal)**			Data type: UNSIGNED_32 Index: $22044_d = 561C_h$
Note: In subcode 3 the effective gearbox factor resulting form the motor and the load is displayed if a separate position encoder is configured and the position control is activated (C02570="2"). For a different encoder configuration (without a separate position encoder) the value "1" is shown in subcode 3.			
▸ Drive interface			
Display range (min. value | unit | max. value)			
0.000		2147483.647	
Subcodes			**Info**
C02531/1			Motor gearbox factor (dec.)
C02531/2			Pos. enc. gearbox factor (dec.)
C02531/3			Effective gearbox factor (dec.)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02532

Parameter | Name: **C02532 | Resolution of a unit**			Data type: UNSIGNED_32 Index: $22043_d = 561B_h$
▸ Drive interface			
Display range (min. value | unit | max. value)			
0.0000	Incr./unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02533

Parameter | Name: **C02533 | Time unit**		Data type: UNSIGNED_32 Index: $22042_d = 561A_h$
▸ Drive interface		
Selection list (read only)		
2	s	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02534

Parameter | Name: **C02534 | Used time unit**	Data type: VISIBLE_STRING Index: $22041_d = 5619_h$
Display of the time unit as a character string	
▸ Drive interface	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1 Character length: 8

C02535

Parameter | Name: **C02535 | Used unit**	Data type: VISIBLE_STRING Index: $22040_d = 5618_h$
Display of the unit set in C02525 and C02526 as a character string	
▸ Drive interface	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1 Character length: 8

C02536

Parameter | Name: C02536 | Cycle			Data type: UNSIGNED_32 Index: $22039_d = 5617_h$
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit	214748.3647	**360.0000 Unit**
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02537

Parameter | Name: C02537 | Speed unit			Data type: VISIBLE_STRING Index: $22038_d = 5616_h$
			▸ Drive interface
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1 Character length: 16

C02538

Parameter | Name: C02538 | Acceleration unit			Data type: VISIBLE_STRING Index: $22037_d = 5615_h$
			▸ Drive interface
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1 Character length: 16

C02539

Parameter | Name: C02539 | Max. presentable position			Data type: INTEGER_32 Index: $22036_d = 5614_h$
			▸ Drive interface
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02540

Parameter | Name: C02540 | Max. presentable speed			Data type: INTEGER_32 Index: $22035_d = 5613_h$
			▸ Drive interface
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02541

Parameter | Name: C02541 | Max. presentable acceleration			Data type: INTEGER_32 Index: $22034_d = 5612_h$
			▸ Drive interface
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s²	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02542

Parameter | Name: C02542 | Load reference speed			Data type: UNSIGNED_32 Index: $22033_d = 5611_h$
			▸ Drive interface
Display range (min. value | unit | max. value)			
0.000	rpm	4294967.295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02543

Parameter | Name: C02543 | Load reference torque			Data type: UNSIGNED_32 Index: $22032_d = 5610_h$
			▸ Drive interface
Display range (min. value | unit | max. value)			
0.000	Nm	4294967.295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02544

Parameter | Name: C02544 | Reference speed			Data type: INTEGER_32 Index: $22031_d = 560F_h$
From software version V1.5			
			▸ Drive interface
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02545

Parameter | Name: C02545 | Reference S-ramp time			Data type: UNSIGNED_32 Index: $22030_d = 560E_h$
From software version V7.0			
			▸ Drive interface
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	2147483.647	**0.001 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02547

Parameter | Name: C02547 | DI_dnState			Data type: INTEGER_32 Index: $22028_d = 560C_h$
Bit coded status of the drive interface.			
Display range (min. value | unit | max. value)			
-2147483648		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02548

Parameter | Name: **C02548 | DI_bErrors**		Data type: UNSIGNED_32 Index: $22027_d = 560B_h$
Display of the digital error signals of the drive interface.		
Selection list (read only)		
0	FALSE	
1	TRUE	
Subcodes		**Info**
C02548/1		DI_bResetError1
C02548/2		DI_bResetError2

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 100

C02554

Parameter | Name: **C02554 | Position controller reset time**		Data type: UNSIGNED_32 Index: $22021_d = 5605_h$
▸ Motor interface		
Setting range (min. value | unit | max. value)		**Lenze setting**
0.001	s 60.000	**60.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1000

C02555

Parameter | Name: **C02555 | D component position controller**		Data type: UNSIGNED_32 Index: $22020_d = 5604_h$
▸ Motor interface		
Setting range (min. value | unit | max. value)		**Lenze setting**
0.000	100.000	**0.000**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1000

C02556

Parameter | Name: **C02556 | Pos. contr. limitation**			Data type: INTEGER_32 Index: $22019_d = 5603_h$
			▸ Motor interface
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s	214748.3647	**214748.3647 Unit/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02557

Parameter | Name: **C02557 | Phase controller output**			Data type: INTEGER_32 Index: $22018_d = 5602_h$
			▸ Motor interface
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02558

Parameter | Name: **C02558 | Pos. contr. output**			Data type: INTEGER_32 Index: $22017_d = 5601_h$
			▸ Motor interface
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02559

Parameter | Name: **C02559 | Internal torque limits**			Data type: INTEGER_32 Index: $22016_d = 5600_h$
			▸ Motor interface
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes			**Info**
C02559/1			Upper int. torque limit
C02559/2			Lower int. torque limit
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02560

Parameter | Name: **C02560 | Messages - motor interface**			Data type: UNSIGNED_32 Index: $22015_d = 55FF_h$
			▸ Motor interface
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02561

Parameter | Name: C02561 | Speed feedforw. control gain			Data type: INTEGER_32 Index: $22014_d = 55FE_h$
From software version V1.5 Percentage reduction of the speed feedforward control of the profile generator • Required in some applications if a 100 % speed feedforward control causes overshoots. • Only effective for the basic functions "Positioning", "Homing" and "Motor jog". ▸ Motor interface			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	%	200.00	**100.00 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02562

Parameter | Name: C02562 | Filter time constant			Data type: UNSIGNED_32 Index: $22013_d = 55FD_h$
From software version V7.0 ▸ Motor interface			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	60.000	**0.002 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02564

Parameter | Name: C02564 | Service code			Data type: BITFIELD_8 Index: $22011_d = 55FB_h$
From software version V9.0 ▸ Motor interface			
Setting range			**Lenze setting**
0x00		0xFF	**0x00** (decimal: 0)
Value is bit-coded: (☑ = bit set)			**Info**
Bit 0 ☐	Option 0		
Bit 1 ☐	Option 1		
Bit 2 ☐	Option 2		
Bit 3 ☐	Option 3		
Bit 4 ☐	Option 4		
Bit 5 ☐	Option 5		
Bit 6 ☐	Option 6		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02567

Parameter | Name: C02567 | Control mode		Data type: UNSIGNED_32 Index: $22008_d = 55F8_h$
▸ Motor interface		
Selection list (read only)		
0	Position control	
1	closed-loop speed control	
2	Closed-loop torque control	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02568

Parameter | Name: **C02568 | Motor interface: % signals**			Data type: INTEGER_32 Index: $22007_d = 55F7_h$
Display of the scaled signals of the motor interface.			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes			**Info**
C02568/1			MI_dnPosCtrlAdaptLoad_n

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02570

Parameter | Name: **C02570 | Position control structure**			Data type: UNSIGNED_32 Index: $22005_d = 55F5_h$
Chapter "Controller configuration" provides you with more information on parameter setting. ▸ Encoder evaluation			
Selection list (Lenze setting printed in bold)			**Info**
1	**Phase controller is active**		Motor encoder selection is effected in C00495.
2	Position controller active (<= FW V5.xx)		Position controller selection is effected in C00490.
3	Position controller is active		Position controller selection is effected in C00490.
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02571

Parameter | Name: **C02571 | Source - actual position**	Data type: UNSIGNED_32 Index: $22004_d = 55F4_h$
This code is for device-internal use only and must not be written to by the user!	

C02572

Parameter | Name: **C02572 | Speed setpoint (enc. eval.)**			Data type: INTEGER_32 Index: $22003_d = 55F3_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02573

Parameter | Name: **C02573 | Position setpoint (enc. eval.)**			Data type: INTEGER_32 Index: $22002_d = 55F2_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02574

Parameter | Name: **C02574 | Actual speed (enc. eval.)**			Data type: INTEGER_32 Index: $22001_d = 55F1_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit/s	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02575

Parameter | Name: **C02575 | Actual position (enc. eval.)**			Data type: INTEGER_32 Index: $22000_d = 55F0_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02576

Parameter | Name: **C02576 | Following error**			Data type: INTEGER_32 Index: $21999_d = 55EF_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02577

Parameter | Name: **C02577 | External actual position**			Data type: INTEGER_32 Index: $21998_d = 55EE_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02578

Parameter | Name: **C02578 | Offset actual pos. value/setp.**			Data type: INTEGER_32 Index: $21997_d = 55ED_h$
▸ Encoder evaluation			
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02579

Parameter | Name: **C02579 | Encoder eval.: Dig. signals**		Data type: UNSIGNED_32 Index: $21996_d = 55EC_h$
Display of the digital signals of the encoder evaluation.		
Selection list (read only)		
0	FALSE	
1	TRUE	

Subcodes	Info
C02579/1	FDB_bResolverError
C02579/2	FDB_bSinCosSignalError

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C02580

Parameter | Name: C02580 | Operating mode brake		Data type: UNSIGNED_32 Index: $21995_d = 55EB_h$
▸ Basic function "Brake control"		
Selection list (Lenze setting printed in bold)		
0	**Brake control off**	
1	Directly with brake module	
2	Autom. with brake module	
11	Directly - external switching	
12	Autom. - external switching	
22	Autom. - DC brake	
☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02581

Parameter | Name: C02581 | Threshold - brake activation			Data type: INTEGER_32 Index: $21994_d = 55EA_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	50000	**50 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02582

Parameter | Name: C02582 | Brake resp. to pulse inhibit		Data type: UNSIGNED_32 Index: $21993_d = 55E9_h$
▸ Basic function "Brake control"		
Selection list (Lenze setting printed in bold)		
0	**Activate the brake immediately**	
1	Activate brake when n < nmin	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02583

Parameter | Name: C02583 | Status input monitoring		Data type: UNSIGNED_32 Index: $21992_d = 55E8_h$
▸ Basic function "Brake control"		
Selection list (Lenze setting printed in bold)		
0	**Not active**	
1	Active	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02585

Parameter | Name: **C02585 | Brake control polarity**			Data type: UNSIGNED_32 Index: $21990_d = 55E6_h$
▸ Basic function "Brake control"			
Selection list (Lenze setting printed in bold)			
0	**Not inverted**		
1	Inverted		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02586

Parameter | Name: **C02586 | Starting torque 1**			Data type: INTEGER_32 Index: $21989_d = 55E5_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
-21474836.47	Nm	21474836.47	**0.00 Nm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02587

Parameter | Name: **C02587 | Starting torque 2**			Data type: INTEGER_32 Index: $21988_d = 55E4_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
-21474836.47	Nm	21474836.47	**0.00 Nm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02588

Parameter | Name: **C02588 | Source of starting torque**			Data type: UNSIGNED_32 Index: $21987_d = 55E3_h$
▸ Basic function "Brake control"			
Selection list (Lenze setting printed in bold)			
0	**Starting torque 1/2**		
1	Stopping value		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02589

Parameter | Name: **C02589 | Brake closing time**			Data type: UNSIGNED_32 Index: $21986_d = 55E2_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	60000	**100 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02590

Parameter | Name: C02590 | Brake opening time			Data type: UNSIGNED_32 Index: $21985_d = 55E1_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	60000	**100 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02591

Parameter | Name: C02591 | Waiting time - state monitoring			Data type: UNSIGNED_32 Index: $21984_d = 55E0_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	60000	**100 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02593

Parameter | Name: C02593 | Waiting time - brake activation			Data type: UNSIGNED_32 Index: $21982_d = 55DE_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	1000.000	**0.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02594

Parameter | Name: C02594 | Test torque			Data type: INTEGER_32 Index: $21981_d = 55DD_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
-21474836.47	Nm	21474836.47	**0.00 Nm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02595

Parameter | Name: C02595 | Permissible angle of rotation			Data type: INTEGER_32 Index: $21980_d = 55DC_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	°	36000	**5 °**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02596

Parameter | Name: **C02596 | Grinding speed**			Data type: INTEGER_32 Index: $21979_d = 55DB_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	300	**100 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02597

Parameter | Name: **C02597 | Accel./decel. time - grinding**			Data type: UNSIGNED_32 Index: $21978_d = 55DA_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	60.000	**1.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02598

Parameter | Name: **C02598 | Grinding ON time**			Data type: UNSIGNED_32 Index: $21977_d = 55D9_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.2	s	2.0	**0.5 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02599

Parameter | Name: **C02599 | Grinding OFF time**			Data type: UNSIGNED_32 Index: $21976_d = 55D8_h$
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.2	s	2.0	**0.5 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02600

Parameter | Name: **C02600 | Acceleration time feedf. control**			Data type: UNSIGNED_32 Index: $21975_d = 55D7_h$
From software version V3.0			
▸ Basic function "Brake control"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	1000.000	**0.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02601

Parameter | Name: **C02601 | Ref. for Accel. time of brake**			Data type: UNSIGNED_32 Index: $21974_d = 55D6_h$
From software version V3.0			▸ Basic function "Brake control"
Selection list (Lenze setting printed in bold)			
0	**Motor reference value**		
1	Current starting value		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02602

Parameter | Name: **C02602 | Source for feedf. control brake**			Data type: UNSIGNED_32 Index: $21973_d = 55D5_h$
From software version V3.0			▸ Basic function "Brake control"
Selection list (Lenze setting printed in bold)			
0	**Torque**		
1	Speed		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02603

Parameter | Name: **C02603 | Threshold 1 for opening brake**			Data type: INTEGER_32 Index: $21972_d = 55D4_h$
From software version V3.0			▸ Basic function "Brake control"
Setting range (min. value | unit | max. value)			**Lenze setting**
-50000	rpm	50000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02604

Parameter | Name: **C02604 | Threshold 2 for opening brake**			Data type: INTEGER_32 Index: $21971_d = 55D3_h$
From software version V3.0			▸ Basic function "Brake control"
Setting range (min. value | unit | max. value)			**Lenze setting**
-50000	rpm	50000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02605

Parameter | Name: **C02605 | Brake test - time**			Data type: UNSIGNED_16 Index: $21970_d = 55D2_h$
From software version V10.0			
Setting range (min. value | unit | max. value)			
0.001	s	65.535	
Subcodes	**Lenze setting**		**Info**
C02605/1	1.024 s		Brake test - ramp-up time
C02605/2	4.000 s		Brake test - constant ph. time
C02605/3	1.024 s		Brake test - ramp-down time
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02606

Parameter | Name: **C02606 | Minimum starting torque**			Data type: INTEGER_32 Index: $21969_d = 55D1_h$
From software version V15.0 onwards Minimum starting torque that is built when the holding brake is released. ▸ Brake control			
Setting range (min. value | unit | max. value)			**Lenze setting**
-21474836.47	Nm	21474836.47	**0.00 Nm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02607

Parameter | Name: **C02607 | BRK_dnState**			Data type: INTEGER_32 Index: $21968_d = 55D0_h$
Bit coded status of the basic function "Brake control".			
Display range (min. value | unit | max. value)			
-2147483648		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02608

Parameter | Name: **C02608 | BRK_dnTorqueAdd_n**			Data type: INTEGER_32 Index: $21967_d = 55CF_h$
Display of the additive torque value of the basic function "brake control".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02609

Parameter | Name: **C02609 | Brake control: Dig. signals**			Data type: UNSIGNED_32 Index: $21966_d = 55CE_h$
Display of the digital signals of the basic function "brake control".			
Selection list (read only)			
0	FALSE		
1	TRUE		
Subcodes			**Info**

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02610

Parameter | Name: **C02610 | Deceleration time for stop**			Data type: UNSIGNED_32 Index: $21965_d = 55CD_h$
			▸ Basic function "Stop"
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	1000.000	**1.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02611

Parameter | Name: **C02611 | S-ramp time for stop**			Data type: UNSIGNED_32 Index: $21964_d = 55CC_h$
			▸ Basic function "Stop"
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	10.000	**0.100 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02612

Parameter | Name: **C02612 | Ref. for decel. time of stop**		Data type: UNSIGNED_32 Index: $21963_d = 55CB_h$
		▸ Basic function "Stop"
Selection list (Lenze setting printed in bold)		
0	**Motor reference speed (C00011)**	
1	Current speed	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02616

Parameter | Name: **C02616 | STP_dnState**			Data type: INTEGER_32 Index: $21959_d = 55C7_h$
Bit coded status of the basic function "Stop".			
Display range (min. value | unit | max. value)			
-2147483648		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02617

Parameter | Name: **C02617 | STP_bStopActive**		Data type: UNSIGNED_32 Index: $21958_d = 55C6_h$
Status of the basic function "Stop".		
Selection list (read only)		
0	Normal stop not active	
1	Normal stop active	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02619

Parameter | Name: **C02619 | Quick stop: Dig. signals**		Data type: UNSIGNED_32 Index: $21956_d = 55C4_h$
Display of the digital signals of the basic function "Quick stop".		
Selection list (read only)		
0	FALSE	
1	TRUE	
Subcodes		**Info**
C02619/1		QSP_bActivate1
C02619/2		QSP_bActivate2
C02619/3		QSP_bActivate3
C02619/4		QSP_bActive
C02619/5		QSP_bActivateDCBrake
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02620

Parameter | Name: **C02620 | Manual jog: Speed 1**			Data type: INTEGER_32 Index: $21955_d = 55C3_h$
			▸ Basic function "Manual jog"
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s	214748.3647	**360.0000 Unit/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02621

Parameter | Name: **C02621 | Manual jog: Speed 2**			Data type: INTEGER_32 Index: $21954_d = 55C2_h$
▸ Basic function "Manual jog"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s	214748.3647	**720.0000 Unit/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02622

Parameter | Name: **C02622 | Manual jog: Acceleration**			Data type: INTEGER_32 Index: $21953_d = 55C1_h$
▸ Basic function "Manual jog"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s²	214748.3647	**360.0000 Unit/s²**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02623

Parameter | Name: **C02623 | Manual jog: Deceleration**			Data type: INTEGER_32 Index: $21952_d = 55C0_h$
▸ Basic function "Manual jog"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s²	214748.3647	**1440.0000 Unit/s²**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02624

Parameter | Name: **C02624 | Manual jog: S-ramp time**			Data type: UNSIGNED_32 Index: $21951_d = 55BF_h$
▸ Basic function "Manual jog"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	10.000	**0.100 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02625

Parameter | Name: **C02625 | Manual jog: Step size**			Data type: INTEGER_32 Index: $21950_d = 55BE_h$
From software version V5.0 Step distance for "Manual jog with step limitation" mode.			
▸ Basic function "Manual jog"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit	214748.3647	**360.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02626

Parameter | Name: C02626 | Manual jog:Index Stop position			Data type: INTEGER_32 Index: $21949_d = 55BD_h$
From software version V5.0 Selection of the breakpoint positions for "Manual jog with breakpoint" mode. • In connection with a function block instance of type **L_PosPositionerTable**: The index [1...75] of the table position in the VTPOS table has to be specified, which contains the intermediate stop position x that is to be used. • In connection with a function block instance of type **L_PosProfileTable**: The index [1...4] of the profile data set in the VTPOS table has to be specified, which contains the intermediate stop position x that is to be used. ▸ Basic function "Manual jog"			
Setting range (min. value | unit | max. value)			
0		75	
Subcodes	**Lenze setting**		**Info**
C02626/1	0		Index of the breakpoint positions 1 ... 16
C02626/...			
C02626/16			
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02627

Parameter | Name: C02627 | Manual jog:Selected Stop position			Data type: INTEGER_32 Index: $21948_d = 55BC_h$
From software version V5.0 Display of the breakpoint positions selected via C02626/1...16 for "Manual jog with breakpoints". ▸ Basic function "Manual jog"			
Display range (min. value | unit | max. value)			
-214748.3648	Unit	214748.3647	
Subcodes			**Info**
C02627/1			Breakpoint position 1 ... 16
C02627/...			
C02627/16			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02637

Parameter | Name: C02637 | MAN_dnSpeedOverride_n			Data type: INTEGER_32 Index: $21938_d = 55B2_h$
From software version V5.0 Display of the speed override for the basic function "Manual jog".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02638

Parameter | Name: **C02638 | Manual jog: Status**			Data type: INTEGER_32 Index: $21937_d = 55B1_h$
Status of the basic function "Manual jog".			
Display range (min. value | unit | max. value)			
0		8	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02639

Parameter | Name: **C02639 | Manual jog: Dig. signals**		Data type: UNSIGNED_32 Index: $21936_d = 55B0_h$
Display of the digital signals of the basic function "Manual jog".		
Selection list (read only)		
0	FALSE	
1	TRUE

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02641

Parameter | Name: C02641 | Action after detect Home position			Data type: UNSIGNED_32 Index: $21934_d = 55AE_h$
From software version V4.0			▸ Basic function "Homing"
Selection list (Lenze setting printed in bold)			
0	**Move absolute on target position**		
1	Move relative by Target position		
2	Stop immediately		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02642

Parameter | Name: C02642 | Home position			Data type: INTEGER_32 Index: $21933_d = 55AD_h$
			▸ Basic function "Homing"
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02643

Parameter | Name: C02643 | Homing: Target position			Data type: INTEGER_32 Index: $21932_d = 55AC_h$
			▸ Basic function "Homing"
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02644

Parameter | Name: C02644 | Homing: Speed 1			Data type: INTEGER_32 Index: $21931_d = 55AB_h$
			▸ Basic function "Homing"
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s	214748.3647	**360.0000 Unit/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02645

Parameter | Name: C02645 | Homing: Acceleration 1			Data type: INTEGER_32 Index: $21930_d = 55AA_h$
			▸ Basic function "Homing"
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s²	214748.3647	**720.0000 Unit/s²**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02646

Parameter | Name: **C02646 | Homing: Speed 2**			Data type: INTEGER_32 Index: $21929_d = 55A9_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s	214748.3647	**0.0000 Unit/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02647

Parameter | Name: **C02647 | Homing: Acceleration 2**			Data type: INTEGER_32 Index: $21928_d = 55A8_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s²	214748.3647	**360.0000 Unit/s²**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02648

Parameter | Name: **C02648 | Homing: S-ramp time**			Data type: INTEGER_32 Index: $21927_d = 55A7_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	10000	**100 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02649

Parameter | Name: **C02649 | Homing: Torque limit**			Data type: INTEGER_32 Index: $21926_d = 55A6_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.00	%	200.00	**10.00 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02650

Parameter | Name: **C02650 | Homing: Blocking time**			Data type: UNSIGNED_32 Index: $21925_d = 55A5_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.000	s	120.000	**1.000 s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02651

Parameter | Name: C02651 | Homing: TP configuration			Data type: UNSIGNED_32 Index: $21924_d = 55A4_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**16**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02652

Parameter | Name: C02652 | Ref. pos. after mains switching		Data type: UNSIGNED_32 Index: $21923_d = 55A3_h$
▸ Basic function "Homing"		
Selection list (Lenze setting printed in bold)		
0	**Delete**	
1	Retain	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02653

Parameter | Name: C02653 | Max. rot. ang. aft. mns. swtch.			Data type: INTEGER_32 Index: $21922_d = 55A2_h$
▸ Basic function "Homing"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	°	1000000	**180 °**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02655

Parameter | Name: C02655 | HM_dnSpeedOverride_n			Data type: INTEGER_32 Index: $21920_d = 55A0_h$
From software version V5.0 Display of the speed override for the basic function "Homing".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02656

Parameter | Name: C02656 | Actual position (homing)			Data type: INTEGER_32 Index: $21919_d = 559F_h$
▸ Basic function "Homing"			
Display range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02657

Parameter | Name: **C02657 | HM_dnState**			Data type: INTEGER_32 Index: $21918_d = 559E_h$
Bit coded status of the basic function "Homing".			
Display range (min. value | unit | max. value)			
-2147483648		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02658

Parameter | Name: **C02658 | HM_dnHomePos_p**			Data type: INTEGER_32 Index: $21917_d = 559D_h$
Display of the *HM_dnHomePos_p* input signal of the basic function "Homing".			
Display range (min. value | unit | max. value)			
-214748.3647		214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02659

Parameter | Name: **C02659 | Homing: Dig. signals**	Data type: UNSIGNED_32 Index: $21916_d = 559C_h$
Display of the digital signals of the basic function "Homing".	
Selection list (read only)	
0 FALSE	
1 TRUE	

Subcodes	Info

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C02670

Parameter | Name: **C02670 | Tolerance for POS_bActPosInTarget**			Data type: INTEGER_32 Index: $21905_d = 5591_h$
From software version V1.5 Tolerance window for actual value-based evaluation "Target position reached" (Output *POS_bActPosInTarget*) ▸ Basic function "Positioning"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02671

Parameter | Name: C02671 | Tolerance for POS_bDriveInTarget			Data type: INTEGER_32 Index: $21904_d = 5590_h$
From software version V5.0 Tolerance window for actual value and setpoint-based evaluation "Drive in the target" (Output *POS_bDriveInTarget*) ▸ Basic function "Positioning"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0001	Unit	214748.3647	**2.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02672

Parameter | Name: C02672 | Hysteresis for POS_bDriveInTarget			Data type: INTEGER_32 Index: $21903_d = 558F_h$
From software version V5.0 Hysteresis window for actual value and setpoint-based evaluation "Drive in the target" (Output *POS_bDriveInTarget*) ▸ Basic function "Positioning"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit	214748.3647	**1.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02673

Parameter | Name: C02673 | Activate DriveInTarget Modulo		Data type: UNSIGNED_32 Index: $21902_d = 558E_h$
From software version V5.0 For actual value and setpoint-based evaluation "Drive in target" (output *POS_bDriveInTarget*): Definition how the modulo evaluation is to be carried out if the actual position value enters the tolerance and hysteresis window again. ▸ Basic function "Positioning"		
Selection list (Lenze setting printed in bold)		
0	Only setpoint Cycle	
1	**All cycles**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02674

Parameter | Name: C02674 | POS_dwActualProfileNumber			Data type: UNSIGNED_32 Index: $21901_d = 558D_h$
Current profile of the basic function "Positioning".			
Display range (min. value | unit | max. value)			
0		1000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02675

Parameter | Name: **C02675 | POS_dnState**			Data type: INTEGER_32 Index: $21900_d = 558C_h$
Bit coded status of the basic function "Positioning".			
Display range (min. value | unit | max. value)			
-2147483648		2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02676

Parameter | Name: **C02676 | POS_dnProfileSpeed_s**			Data type: INTEGER_32 Index: $21899_d = 558B_h$
Display of the max. speed of the current profile of the basic function "Positioning".			
Display range (min. value | unit | max. value)			
-214748.3647		214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02677

Parameter | Name: **C02677 | Positioning: % signals**			Data type: INTEGER_32 Index: $21898_d = 558A_h$
Display of the scaled signals of the basic function "Positioning".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes			**Info**

C02681

Parameter | Name: **C02681 | Source add. speed**		Data type: UNSIGNED_32 Index: $21894_d = 5586_h$
		▸ Basic function "Positioning"
Selection list (Lenze setting printed in bold)		
0	**Add. speed input**	
1	From position setpoint	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02685

Parameter | Name: **C02685 | PF_dnMotorAcc_x**			Data type: INTEGER_32 Index: $21890_d = 5582_h$
Display of the motor acceleration of the basic function "Position follower".			
Display range (min. value | unit | max. value)			
-7680000.0		7680000.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02686

Parameter | Name: **C02686 | PF_dnSpeedAdd1_s**			Data type: INTEGER_32 Index: $21889_d = 5581_h$
Display of the speed feedforward control value of the basic function "Position follower".			
Display range (min. value | unit | max. value)			
-480000.0	rpm	480000.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02687

Parameter | Name: **C02687 | Position follower: % signals**			Data type: INTEGER_32 Index: $21888_d = 5580_h$
Display of the scaled signals of the basic function "Position follower".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes			**Info**
C02687/1			PF_dnSpeedAdd2_n
C02687/2			PF_dnTorqueAdd_n
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02688

Parameter | Name: **C02688 | PF_dnPositionSet_p**			Data type: INTEGER_32 Index: $21887_d = 557F_h$
Display of the position signals of the basic function "Position follower".			
Display range (min. value | unit | max. value)			
-214748.3648	Revolution	214748.3647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02689

Parameter | Name: **C02689 | Position follower: Dig. signals**		Data type: UNSIGNED_32 Index: $21886_d = 557E_h$
Display of the digital signals of the basic function "Position follower".		
Selection list (read only)		
0	FALSE	
1	TRUE	
Subcodes		**Info**
C02689/1		PF_bEnable
C02689/2		PF_bEnabled
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02692

Parameter | Name: **C02692 | SF_dnMotorAcc_x**			Data type: INTEGER_32 Index: $21883_d = 557B_h$
Display of the motor acceleration of the basic function "Speed follower".			
Display range (min. value | unit | max. value)			
-7680000.0		7680000.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02693

Parameter | Name: **C02693 | SF_dnSpeedAdd_s**			Data type: INTEGER_32 Index: $21882_d = 557A_h$
Display of the additive speed setpoint of the basic function "Speed follower".			
Display range (min. value | unit | max. value)			
-480000.0	rpm	480000.0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02694

Parameter | Name: **C02694 | Speed follower: % signals**			Data type: INTEGER_32 Index: $21881_d = 5579_h$
Display of the scaled signals of the basic function "Speed follower".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes			**Info**
C02694/1			SF_dnSpeedSet_n
C02694/2			SF_dnTorqueAdd_n
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02695

Parameter | Name: **C02695 | Speed follower: Dig. signals**		Data type: UNSIGNED_32 Index: $21880_d = 5578_h$
Display of the digital signals of the basic function "Speed follower".		
Selection list (read only)		
0	FALSE	
1	TRUE	
Subcodes		**Info**
C02695/1		SF_bEnable
C02695/2		SF_bEnabled
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02698

Parameter | Name: **C02698 | Torque follower: % signals**			Data type: INTEGER_32 Index: $21877_d = 5575_h$
Display of the scaled signals of the basic function "Torque follower".			
Display range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes			**Info**
C02698/1			TF_TorqueSet_n
C02698/2			TF_dnSpeedHighLimit_n
C02698/3			TF_dnSpeedLowLimit_n
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02699

Parameter | Name: **C02699 | Torque follower: Dig. signals**		Data type: UNSIGNED_32 Index: $21876_d = 5574_h$
Display of the digital signals of the basic function "Torque follower".		
Selection list (read only)		
0	FALSE	
1	TRUE	
Subcodes		**Info**
C02699/1		TF_bEnable
C02699/2		TF_bEnabled
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02700

Parameter | Name: **C02700 | Software limits pos. effective**		Data type: UNSIGNED_32 Index: $21875_d = 5573_h$
		▸ Basic function "Limiter"
Selection list (Lenze setting printed in bold)		
0	**Deactivated**	
1	enabled	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02701

Parameter | Name: **C02701 | Software limit positions**			Data type: INTEGER_32 Index: $21874_d = 5572_h$
			▸ Basic function "Limiter"
Setting range (min. value | unit | max. value)			
-214748.3647	Unit	214748.3647	
Subcodes	**Lenze setting**		**Info**
C02701/1	0.0000 Unit		Positive software limit position
C02701/2	0.0000 Unit		Negative software limit position
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02702

Parameter | Name: **C02702 | Limitations effective**			Data type: UNSIGNED_32 Index: $21873_d = 5571_h$
▸ Basic function "Limiter"			
Selection list (Lenze setting printed in bold)			
0	**Deactivated**		
1	enabled		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02703

Parameter | Name: **C02703 | Max. speed**			Data type: INTEGER_32 Index: $21872_d = 5570_h$
▸ Basic function "Limiter"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s	214748.3647	**3600.0000 Unit/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02704

Parameter | Name: **C02704 | Max. speed [rpm]**			Data type: INTEGER_32 Index: $21871_d = 556F_h$
▸ Basic function "Limiter"			
Display range (min. value | unit | max. value)			
0.0	rpm	214748364.7	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02705

Parameter | Name: **C02705 | Max. acceleration**			Data type: INTEGER_32 Index: $21870_d = 556E_h$
▸ Basic function "Limiter"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit/s²	214748.3647	**3600.0000 Unit/s²**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02706

Parameter | Name: **C02706 | Min. S-ramp time**			Data type: UNSIGNED_32 Index: $21869_d = 556D_h$
▸ Basic function "Limiter"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	10000	**100 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02707

Parameter | Name: **C02707 | Permissible direction of rot.**		Data type: UNSIGNED_32 Index: $21868_d = 556C_h$
▸ Basic function "Limiter"		
Selection list (Lenze setting printed in bold)		
0	**Positive and negative**	
1	Positive only	
2	Negative only	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02708

Parameter | Name: **C02708 | Limited speed**		Data type: INTEGER_32 Index: $21867_d = 556B_h$
▸ Basic function "Limiter"		
Setting range (min. value | unit | max. value)		
0.0000	Unit/s 214748.3647	
Subcodes	**Lenze setting**	**Info**
C02708/1	3600.0000 Unit/s	Limited speed 1 ... 4
C02708/2	7200.0000 Unit/s	
C02708/3	14400.0000 Unit/s	
C02708/4	28800.0000 Unit/s	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 10000

C02709

Parameter | Name: **C02709 | Limited speed [rpm]**		Data type: INTEGER_32 Index: $21866_d = 556A_h$
▸ Basic function "Limiter"		
Display range (min. value | unit | max. value)		
0.0	rpm 214748364.7	
Subcodes		**Info**
C02709/1		Limited speed 1 ... 4
C02709/2		
C02709/3		
C02709/4		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 10

C02710

Parameter | Name: **C02710 | Delay lim. speed**			Data type: UNSIGNED_32 Index: $21865_d = 5569_h$
▸ Basic function "Limiter"			
Setting range (min. value | unit | max. value)			
0.0000	Unit/s²	214748.3647	
Subcodes	**Lenze setting**		**Info**
C02710/1	0.0100 Unit/s²		Delays for limited speed 1 ... 4
C02710/2	0.0100 Unit/s²		
C02710/3	0.0100 Unit/s²		
C02710/4	0.0100 Unit/s²		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02711

Parameter | Name: **C02711 | S-ramp time lim. speed**			Data type: UNSIGNED_32 Index: $21864_d = 5568_h$
▸ Basic function "Limiter"			
Setting range (min. value | unit | max. value)			
0	ms	10000	
Subcodes	**Lenze setting**		**Info**
C02711/1	100 ms		S-ramp times for limited speed 1 ... 4
C02711/2	100 ms		
C02711/3	100 ms		
C02711/4	100 ms		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02712

Parameter | Name: **C02712 | Decel. time lim. speed**			Data type: UNSIGNED_32 Index: $21863_d = 5567_h$
▸ Basic function "Limiter"			
Display range (min. value | unit | max. value)			
0	ms	10000	
Subcodes			**Info**
C02712/1			Deceleration times for limited speed 1 ... 4
C02712/2			
C02712/3			
C02712/4			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02713

Parameter | Name: **C02713 | Max. dist. manual control**			Data type: UNSIGNED_32 Index: $21862_d = 5566_h$
▸ Basic function "Limiter"			
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	Unit	214748.3647	**360.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10000

C02714

Parameter | Name: C02714 | Max. dist. manual jog [inc.]			Data type: UNSIGNED_32 Index: $21861_d = 5565_h$
▸ Basic function "Limiter"			
Display range (min. value | unit | max. value)			
0	Incr.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02715

Parameter | Name: C02715 | Limitation active		Data type: UNSIGNED_32 Index: $21860_d = 5564_h$
▸ Basic function "Limiter"		
Selection list (read only)		
0	Deactivated	
1	enabled	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1	

C02716

Parameter | Name: C02716 | Resp. to limitation		Data type: UNSIGNED_32 Index: $21859_d = 5563_h$
▸ Basic function "Limiter"		
Selection list		
1	Error	
2	Fault	
3	Quick stop by trouble	
4	Warning locked	
5	Warning	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C02716/1	6: Information	Resp. to rotation limitation
C02716/2	3: Quick stop by trouble	Resp. to SW lim. pos. exceeded
C02716/3	6: Information	Resp. to max. value exceeded
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1	

C02717

Parameter | Name: C02717 | LIM_dwControl		Data type: UNSIGNED_32 Index: $21858_d = 5562_h$
Bit coded control word of the basic function "Limiter".		
Display range (min. value | unit | max. value)		
0	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1	

C02718

Parameter | Name: **C02718 | LIM_dnState**			Data type: INTEGER_32 Index: $21857_d = 5561_h$
Status of the basic function "Limiter".			
Display range (min. value | unit | max. value)			
0		1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02719

Parameter | Name: **C02719 | Limiter: Dig. signals**	Data type: UNSIGNED_32 Index: $21856_d = 5560_h$
Display of the digital input signals of the basic function "Limiter".	
Selection list (read only)	
0 FALSE	
1 TRUE	
Subcodes	**Info**
C02719/1	LIM_bLimitSwitchPositive
C02719/2	LIM_bLimitSwitchNegative
C02719/3	LIM_bActivateLimitedSpeed1
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C02720

Parameter | Name: **C02720 | observation software limit positions**	Data type: UNSIGNED_32 Index: $21855_d = 555F_h$
From software version V4.0 ▸ Basic function "Limiter"	
Selection list (Lenze setting printed in bold)	
0 Based on set value	
1 Based on set and actual value	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C02730

Parameter | Name: **C02730 | Analog inputs: Gain**			Data type: INTEGER_32 Index: $21845_d = 5555_h$
Setting range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes	**Lenze setting**		**Info**
C02730/1	100.00 %		Gain - analog input 1
C02730/2	100.00 %		Analog input 2: Gain
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02731

Parameter | Name: **C02731 | Analog inputs: Offset**			Data type: INTEGER_32 Index: $21844_d = 5554_h$
Setting range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes	**Lenze setting**		**Info**
C02731/1	0.00 %		Offset - analog input 1
C02731/2	0.00 %		Analog input 2: Offset
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02732

Parameter | Name: **C02732 | Analog inputs: Dead band**			Data type: INTEGER_32 Index: $21843_d = 5553_h$
Setting range (min. value | unit | max. value)			
0.00	%	100.00	
Subcodes	**Lenze setting**		**Info**
C02732/1	0.00 %		Dead band - analog input 1
C02732/2	0.00 %		Analog input 2: Dead band
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02733

Parameter | Name: **C02733 | Analog outputs: Gain**			Data type: INTEGER_32 Index: $21842_d = 5552_h$
Setting range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes	**Lenze setting**		**Info**
C02733/1	100.00 %		Gain - analog output 1
C02733/2	100.00 %		Analog output 2: Gain
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02734

Parameter | Name: **C02734 | Analog outputs: Offset**			Data type: INTEGER_32 Index: $21841_d = 5551_h$
Setting range (min. value | unit | max. value)			
-200.00	%	200.00	
Subcodes	**Lenze setting**		**Info**
C02734/1	0.00 %		Offset - analog output 1
C02734/2	0.00 %		Analog output 2: Offset
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02760

Parameter | Name: C02760 | Activate encoder			Data type: UNSIGNED_32 Index: $21815_d = 5537_h$
From software version V7.0			▸ Encoder evaluation: Provision of the encoder signal of input X8
Selection list (Lenze setting printed in bold)			
0	**Deactivated**		
1	enabled		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02761

Parameter | Name: C02761 | Multiturn resolution			Data type: UNSIGNED_32 Index: $21814_d = 5536_h$
From software version V7.0			▸ Encoder evaluation: Provision of the encoder signal of input X8
Display range (min. value | unit | max. value)			
0	Rev.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02762

Parameter | Name: C02762 | Encoderpos			Data type: INTEGER_32 Index: $21813_d = 5535_h$
From software version V7.0			▸ Encoder evaluation: Provision of the encoder signal of input X8
Display range (min. value | unit | max. value)			
-2147483647	Steps	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02763

Parameter | Name: C02763 | Encoderrev			Data type: INTEGER_32 Index: $21812_d = 5534_h$
From software version V7.0			▸ Encoder evaluation: Provision of the encoder signal of input X8
Display range (min. value | unit | max. value)			
-2147483647	Steps	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02764

Parameter | Name: C02764 | Encoderspeed			Data type: INTEGER_32 Index: $21811_d = 5533_h$
From software version V7.0			▸ Encoder evaluation: Provision of the encoder signal of input X8
Display range (min. value | unit | max. value)			
-214748364.7	rpm	214748364.7	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02765

Parameter | Name: **C02765 | Enc_bError**		Data type: UNSIGNED_32 Index: $21810_d = 5532_h$
From software version V7.0		▸ Encoder evaluation: Provision of the encoder signal of input X8
Selection list (read only)		
0	FALSE	
1	TRUE	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02770

Parameter | Name: **C02770 | Operating mode**		Data type: UNSIGNED_32 Index: $21805_d = 552D_h$
From software version V7.0		▸ Basic function "Manual jog open loop"
Selection list (Lenze setting printed in bold)		
0	Deactivate	
1	Activation	
Subcodes	**Lenze setting**	**Info**
C02770/1	0: Deactivate	EnableManualMode
C02770/2	0: Deactivate	JogPositive
C02770/3	0: Deactivate	JogNegative
C02770/4	0: Deactivate	SelectTab1
C02770/5	0: Deactivate	SelectTab2
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C02771

Parameter | Name: **C02771 | Frequency**		Data type: INTEGER_32 Index: $21804_d = 552C_h$
From software version V7.0		▸ Basic function "Manual jog open loop"
Setting range (min. value | unit | max. value)		
0.0	Hz	1000.0
Subcodes	**Lenze setting**	**Info**
C02771/1	1.0 Hz	Frequency 1
C02771/2	1.0 Hz	Frequency 2
C02771/3	1.0 Hz	Frequency 3
C02771/4	1.0 Hz	Frequency 4
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 10

C02772

Parameter | Name: **C02772 | Starting angle**			Data type: INTEGER_32 Index: $21803_d = 552B_h$
From software version V7.0			▸ Basic function "Manual jog open loop"
Setting range (min. value | unit | max. value)			
-180.0	°	180.0	
Subcodes	**Lenze setting**		**Info**
C02772/1	0.0 °		Startangle 1
C02772/2	0.0 °		Startangle 2
C02772/3	0.0 °		Startangle 3
C02772/4	0.0 °		Startangle 4
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 10

C02773

Parameter | Name: **C02773 | Current**			Data type: INTEGER_32 Index: $21802_d = 552A_h$
From software version V7.0 100 % ≙ I_{max_device} (C00022)			▸ Basic function "Manual jog open loop"
Setting range (min. value | unit | max. value)			
0.00	%	100.00	
Subcodes	**Lenze setting**		**Info**
C02773/1	10.00 %		Current 1
C02773/2	10.00 %		Current 2
C02773/3	10.00 %		Current 3
C02773/4	10.00 %		Current 4
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 100

C02774

Parameter | Name: **C02774 | Acceleration time**			Data type: INTEGER_32 Index: $21801_d = 5529_h$
From software version V7.0			▸ Basic function "Manual jog open loop"
Setting range (min. value | unit | max. value)			
0.001	s	2147483.647	
Subcodes	**Lenze setting**		**Info**
C02774/1	1.000 s		Acceleration time 1
C02774/2	1.000 s		Acceleration time 2
C02774/3	1.000 s		Acceleration time 3
C02774/4	1.000 s		Acceleration time 4
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1000

C02775

Parameter | Name: **C02775 | Deceleration time**			Data type: INTEGER_32 Index: $21800_d = 5528_h$
From software version V7.0			▸ Basic function "Manual jog open loop"
Setting range (min. value | unit | max. value)

This code is for device-internal use only and must not be written to by the user!	

C02869

Parameter | Name: C02869 | Service code	Data type: UNSIGNED_32 Index: $21706_d = 54CA_h$
This code is for device-internal use only and must not be written to by the user!	

C02870

Parameter | Name:	Data type: UNSIGNED_32
C02870 | Service code	Index: $21705_d = 54C9_h$
This code is for device-internal use only and must not be written to by the user!	

C02871

Parameter | Name:	Data type: UNSIGNED_32
C02871 | Voltage reserve	Index: $21704_d = 54C8_h$

From software version V12.0

Voltage reserve at the transition point to field weakening

- Only relevant for servo control for asynchronous motor (selection "2" in C00006).

Setting range (min. value | unit | max. value)			Lenze setting
1	%	20	**5 %**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C02872

Parameter | Name:	Data type: UNSIGNED_32
C02872 | PLI 360° result in C58	Index: $21703_d = 54C7_h$

From software version V15.0 onwards

▸ Result in C0058

Selection list (Lenze setting printed in bold)		Info
0	**OFF**	
1	ON	In the case of PLI 360°, the absolute position determined is not saved in the encoder, but is transferred to code C0058:2 instead. This is the response compatble with i700 / i900.

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C02900

Parameter | Name:	Data type: VISIBLE_STRING
C02900 | User Password	Index: $21675_d = 54AB_h$

From software version V3.0

If the cam data are provided with a user password, the defined user password must be entered once to execute the following actions:

- Changing the cam data via parameter setting
- Loading/saving the cam data

Validity

The user password entered is maintained until the next download, mains switching, or until reset by the user (logout).

- You can "logout" deliberately by entering an invalid password.

▸ Basic function "Cam data management"

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer — Character length: 22

C02901

Parameter | Name: **C02901 | CamMemory**			Data type: UNSIGNED_32 Index: $21674_d = 54AA_h$
From software version V5.0			▸ Basic function "Cam data management": Memory mapping
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Info**
C02901/1			Size of the memory for quick download to RAM

Parameter | Name: C02909 | Active Product			Data type: UNSIGNED_32 Index: $21666_d = 54A2_h$
From software version V3.0 Display of the product number of the active product of the cam data currently being processed ▸ Basic function "Cam data management"			
Display range (min. value | unit | max. value)			
0		0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02910

Parameter | Name: **C02910 | Product Name**	Data type: VISIBLE_STRING Index: $21665_d = 54A1_h$
From software version V3.0	
▸ Basic function "Cam data management"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1 Character length: 16

C02911

Parameter | Name: **C02911 | Product Choice**			Data type: UNSIGNED_32 Index: $21664_d = 54A0_h$
From software version V3.0			
▸ Changing cam data via parameterisation			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		255	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02912

Parameter | Name: **C02912 | Product Count**			Data type: UNSIGNED_32 Index: $21663_d = 549F_h$
From software version V3.0			
▸ Changing cam data via parameterisation			
Display range (min. value | unit | max. value)			
0		65536	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02919

Parameter | Name: **C02919 | Number Of Cam Tracks**			Data type: UNSIGNED_32 Index: $21656_d = 5498_h$
From software version V3.0			
▸ Changing cam data via parameterisation			
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02920

Parameter | Name: **C02920 | Cam Track Choice**			Data type: UNSIGNED_32 Index: $21655_d = 5497_h$
From software version V3.0			
▸ Changing cam data via parameterisation			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02921

Parameter | Name: C02921 | Cam Track Type			Data type: UNSIGNED_32 Index: $21654_d = 5496_h$
From software version V3.0			▸ Changing cam data via parameterisation
Selection list (read only)			
1	Linear		
5	Spline		
11	LinearPC		
15	SplinePC		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02922

Parameter | Name: C02922 | Number Of Cam Data Points			Data type: UNSIGNED_32 Index: $21653_d = 5495_h$
From software version V3.0			▸ Changing cam data via parameterisation
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02923

Parameter | Name: C02923 | Cam Data Point Choice			Data type: UNSIGNED_32 Index: $21652_d = 5494_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02924

Parameter | Name: C02924 | Change Cam Data Point X			Data type: INTEGER_32 Index: $21651_d = 5493_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02925

Parameter | Name: C02925 | Change Cam Data Point Y			Data type: INTEGER_32 Index: $21650_d = 5492_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02926

Parameter | Name: C02926 | Change Cam Data Point M			Data type: INTEGER_32 Index: $21649_d = 5491_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-200.00	%	200.00	**0.00 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 100

C02927

Parameter | Name: C02927 | Auto Inc Cam Data Points		Data type: UNSIGNED_32 Index: $21648_d = 5490_h$
From software version V3.0		▸ Changing cam data via parameterisation
Selection list (Lenze setting printed in bold)		
0	**Deactivate**	
1	Activation	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer		Scaling factor: 1

C02939

Parameter | Name: C02939 | Number Of Cont Tracks			Data type: UNSIGNED_32 Index: $21636_d = 5484_h$
From software version V3.0			▸ Changing cam data via parameterisation
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02940

Parameter | Name: C02940 | Cont Track Choice			Data type: UNSIGNED_32 Index: $21635_d = 5483_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02941

Parameter | Name: **C02941 | Cont Type**			Data type: UNSIGNED_32 Index: $21634_d = 5482_h$
From software version V3.0			▸ Changing cam data via parameterisation
Selection list (read only)			
1	Pos. position cam		
2	Neg. position cam		
3	Bidirect. position cam		
11	Pos. time cam		
12	Neg. time cam		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02942

Parameter | Name: **C02942 | Number Of Cont Data Points**			Data type: UNSIGNED_32 Index: $21633_d = 5481_h$
From software version V3.0			▸ Changing cam data via parameterisation
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02943

Parameter | Name: **C02943 | Cont Data Point Choice**			Data type: UNSIGNED_32 Index: $21632_d = 5480_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02944

Parameter | Name: **C02944 | Cont Pos X0**			Data type: INTEGER_32 Index: $21631_d = 547F_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02945

Parameter | Name: C02945 | Cont Pos X1			Data type: INTEGER_32 Index: $21630_d = 547E_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02946

Parameter | Name: C02946 | Cont Time			Data type: UNSIGNED_32 Index: $21629_d = 547D_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
0.0000	ms	214748.3647	**0.0000 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02959

Parameter | Name: C02959 | Number of Pos Tracks			Data type: UNSIGNED_32 Index: $21616_d = 5470_h$
From software version V3.0			▸ Changing cam data via parameterisation
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02960

Parameter | Name: C02960 | Pos Track Choice			Data type: UNSIGNED_32 Index: $21615_d = 546F_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02962

Parameter | Name: C02962 | Number of Pos Data Points			Data type: UNSIGNED_32 Index: $21613_d = 546D_h$
From software version V3.0			▸ Changing cam data via parameterisation
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C02963

Parameter | Name: C02963 | Pos Data Point Choice			Data type: UNSIGNED_32 Index: $21612_d = 546C_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65535	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 1

C02964

Parameter | Name: C02964 | Change Pos Data Point X			Data type: INTEGER_32 Index: $21611_d = 546B_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02965

Parameter | Name: C02965 | Change Pos Data Point Y			Data type: INTEGER_32 Index: $21610_d = 546A_h$
From software version V3.0			▸ Changing cam data via parameterisation
Setting range (min. value | unit | max. value)			**Lenze setting**
-214748.3647	Unit	214748.3647	**0.0000 Unit**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer			Scaling factor: 10000

C02996

Parameter | Name: C02996 | Service code	Data type: UNSIGNED_32 Index: $21579_d = 544B_h$
This code is for device-internal use only and must not be written to by the user!	

C02997

Parameter | Name: C02997 | Service code	Data type: UNSIGNED_32 Index: $21578_d = 544A_h$
This code is for device-internal use only and must not be written to by the user!	

C02998

Parameter | Name: C02998 | Service code	Data type: UNSIGNED_32 Index: $21577_d = 5449_h$
This code is for device-internal use only and must not be written to by the user!	

C02999

Parameter | Name: C02999 | Service code	Data type: UNSIGNED_32 Index: $21576_d = 5448_h$
This code is for device-internal use only and must not be written to by the user!	

14.3 Table of attributes

The table of attributes contains information required for communication with the inverter via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Type		Parameter type	Selection list	Value from selection list
			Bit coded	Bit coded value
			Linear value	Value with setting range
			String	String
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes bit-coded
			BITFIELD_32	4 bytes bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes without sign
			VISIBLE_STRING [xx]	ASCII string (with character length xx)
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 ≡ No decimal positions 10 ≡ 1 decimal position 100 ≡ 2 decimal positions 1000 ≡ 3 decimal positions 10000 ≡ 4 decimal positions
	CINH	Writing is only possible if the controller is inhibited	CINH	

code	Name	Parameter type	Index		Data				
			dec	hex	DS	DA	Data type	Factor	CINH
C00002	Device commands	Selection list	24573	5FFD	E	1	UNSIGNED_32	1

Lenze

Overview of technical documentation for 9400 Servo Drives

Project planning, selection & order
☐ 9400 Hardware Manual
🖹 Catalogue / electronic catalogue (DSC - Drive Solution Catalogue)

Mounting & wiring
🖹 MA 9400 HighLine
🖹 MA - communication module
🖹 MA - extension module
🖹 MA - safety module
🖹 MA - accessories
🖹 MA - remote maintenance components

Parameter setting	
🖹 BA keypad	
☐ SW - Lenze software »Engineer«	
☐ SW - 9400 HighLine	
☐ KHB - communication module	
☐ SW - extension module	
☐ SW - safety module	
☐ SW - Lenze technology application	
☐ **SW - 9400 function library**	← **This documentation**

Configuring & programming	
☐ SW - Lenze software »Engineer«	
☐ SW - Lenze software »PLC Designer«	
☐ SW - 9400 HighLine	
☐ KHB - communication module	
☐ SW - extension module	
☐ SW - safety module	
☐ SW - Lenze technology application	
☐ **SW - 9400 function library**	← **This documentation**

Drive commissioning
🖹 Commissioning guide
☐ SW - 9400 HighLine
→ Chapter "Commissioning"
→ Chapter "Oscilloscope"
→ Chapter "Diagnostics & fault analysis"
☐ Remote maintenance manual

Networking structure
☐ KHB - communication medium used

Legend:

- 🖹 Printed documentation
- ☐ Online documentation (PDF/Engineer online help)

Abbreviations used:

BA	Operating Instructions
KHB	Communication Manual
MA	Mounting Instructions
SW	Software Manual

Contents

1 About this documentation 12
1.1 Conventions used 14
1.2 Definition of the notes used 15

2 Introduction 16
2.1 How to create applications: 16
2.2 What is a function block? 17
2.3 Parameterisable function blocks 18
2.4 Further objects of an interconnection 20
2.4.1 System block 21
2.4.2 Port block 21
2.4.3 Variable 22
2.4.4 User code 23
2.5 Functional ranges of an interconnection 24
2.6 Conventions used for input/output identifiers 27
2.7 Signal types & scaling 29
2.7.1 Data type check/implicit type conversion 30
2.8 Multitasking in the Servo Drive 9400 32
2.8.1 Runtime measurement 33
2.8.2 Optimising the runtime behaviour 35
2.8.3 Exchanging data between tasks 36

3 Working with the FB editor 37
3.1 Short overview of new functions in the FB Editor 37
3.2 User interface 38
3.2.1 Control and function elements 40
3.2.2 Toolbar 41
3.2.3 Search function 42
3.2.4 Task selection 43
3.2.5 Editor view/overview 44
3.2.6 Context menu 45
3.2.7 Overview window 46
3.3 Using the FB-Editor as "Viewer" 48
3.3.1 Following connections of inputs and outputs 49
3.3.2 Keyboard commands for navigation 50
3.4 Creating/reconfiguring the interconnection 51
3.4.1 Enabling the FB Editor 51
3.4.2 Insert/delete objects 52
3.4.2.1 Inserting a function block 53
3.4.2.2 Inserting a system block 56
3.4.2.3 Inserting a port block 58
3.4.2.4 Creating/inserting a variable 59
3.4.2.5 Configuring/inserting a user code 62
3.4.2.6 Inserting a comment 67
3.4.2.7 Deleting objects that are no longer required 70
3.4.2.8 Deleting variables and user codes from the application 71
3.4.3 Changing connector visibilities 72
3.4.4 Arranging objects in the drawing area 73
3.4.5 Creating/deleting connections 74
3.4.5.1 Creating a connection using the connection line 77
3.4.5.2 Creating a connection using port identifiers 78
3.4.5.3 Creating a connection via connection dialog 79
3.4.5.4 Deleting connections that are no longer required 80
3.4.6 Changing the processing order 81
3.4.7 Configuring the task properties 83

Contents

3.4.8 Configuring the exception handling 84
3.4.9 Compiling the completed interconnection 86
3.4.10 Testing the interconnection in the device 86
3.4.11 Copying interconnection elements (across all devices) 88
3.4.11.1 Insert options for copied elements 90
3.5 Printing the interconnection 92
3.6 Comparing interconnections 93
3.6.1 Comparison examples 94
3.6.2 Contents and representation of the comparison 96
3.7 Copying complete interconnection 97
3.8 Inserting complete interconnection from reference project 98

4 Short overview 100
4.1 Analog signal processing 100
4.2 Digital signal processing 102
4.3 Data type conversion 104
4.4 Mathematical functions 105
4.5 Conversion of physical units 105
4.6 Speed conditioning 106
4.7 Special functions 107
4.8 Output of status signals 108
4.9 FBs for system via electrical shaft 108
4.10 FBs for positioning tasks 111
4.11 FBs for winding technology 112
4.12 All function blocks [A-Z] 113
4.13 FB reference list - 9300 Servo PLC 123
4.14 FB reference list - 9300 servo inverter 131

5 Function blocks 134
5.1 L_CamClutchPos - clutch (path-controlled) 135
5.2 L_CamContactor - cam group with switch-on and switch-off dynamisation 138
5.2.1 Typical application 141
5.2.2 Data flow 142
5.2.3 Switching performance for position cams 143
5.2.4 Switching performance for position-time cams 144
5.2.5 Dynamic displacement of the cams 146
5.2.6 Selection of the cam data 146
5.2.7 Interconnection examples 147
5.3 L_CamCurve - curve interpolation for characteristics 149
5.3.1 Data flow 151
5.3.2 Function 152
5.3.3 Track switch-over 153
5.3.4 Interconnection examples 154
5.4 L_CamGetAxisData - reading out machine parameters from cam data 155
5.5 L_CamPosMarker - reading out position marks from cam data 158
5.5.1 Data flow 161
5.6 L_CamProfiler - curve interpolation for motion profiles 162
5.6.1 Data flow 166
5.6.2 Track switch-over 167
5.6.3 Feedforward control 167
5.6.4 Output of the machine parameters 167
5.7 L_CamSetContDataPDO - contactor data selection via inputs/PDOs 168
5.7.1 Exception handling 171
5.7.2 Interconnection example 171

Contents

5.8 L_CamSetContDataSDO - contactor data selection via codes/SDOs 172
5.8.1 Exception handling 174
5.8.2 Interconnection example 174
5.9 L_CamStretchAbs - stretching/compressing the position (absolute) 175
5.9.1 Typical application 177
5.9.2 Signal characteristics 178
5.9.3 Interconnection example 179
5.10 L_CamStretchFeed - stretching/compressing the position (relative) 180
5.10.1 Typical application 183
5.10.2 Signal characteristics 184
5.10.3 Interconnection example 185
5.11 L_CamSyncIn - synchronous/oversynchronous clutch-in 186
5.11.1 Application example: "Flying saw" 189
5.11.2 Synchronous clutch-in 191
5.11.3 Oversynchronous clutch-in 194
5.11.4 Signal characteristics 195
5.11.5 Interconnection example 196
5.12 L_Dc2BytesToWord - type converter 197
5.13 L_Dc2WordsToDWord- type converter 198
5.14 L_Dc4BytesToDWord - type converter 199
5.15 L_DcBitShift - shift operation 200
5.16 L_DcBitShiftByte - shift operation 201
5.17 L_DcBitShiftDWord - shift operation 202
5.18 L_DcBitShiftInt - shift operation 203
5.19 L_DcBitShiftWord - shift operation 204
5.20 L_DcBitsToByte - bit multiplexer 205
5.21 L_DcBitsToDWord - bit multiplexer 206
5.22 L_DcBitsToWord - bit multiplexer 208
5.23 L_DcByteBitand - bit combination 209
5.24 L_DcByteBitor - bit combination 210
5.25 L_DcByteBitxor - bit combination 211
5.26 L_DcByteToBits - bit demultiplexer 212
5.27 L_DcByteToInt - type converter 213
5.28 L_DcByteToWord - type converter 214
5.29 L_DcDIntToDWord - type converter 215
5.30 L_DcDIntToInt - type converter 216
5.31 L_DcDWordBitand - bit combination 217
5.32 L_DcDWordBitor - bit combination 218
5.33 L_DcDWordBitxor - bit combination 219
5.34 L_DcDWordTo2Words - type converter 220
5.35 L_DcDWordTo4Bytes - type converter 221
5.36 L_DcDWordToBits - bit demultiplexer 222
5.37 L_DcDWordToDInt - type converter 224
5.38 L_DcDWordToWord - type converter 225
5.39 L_DcGetBitOfByte - bit operation 226
5.40 L_DcGetBitOfDWord - bit operation 227
5.41 L_DcGetBitOfWord - bit operation 228
5.42 L_DcIntToDInt - type converter 229
5.43 L_DcIntToWord - type converter 230
5.44 L_DcNorm_aToNorm_n - signal converter 231
5.45 L_DcNorm_nToNorm_a - signal converter 232
5.46 L_DcNorm_nToSpeed_s - signal converter 233
5.47 L_DcResetBitOfByte - bit operation 234
5.48 L_DcResetBitOfDWord - bit operation 235
5.49 L_DcResetBitOfWord - bit operation 236

Contents

5.50 L_DcSetBitOfByte - bit operation 237
5.51 L_DcSetBitOfDWord - bit operation 238
5.52 L_DcSetBitOfWord - bit operation 239
5.53 L_DcSpeed_sToNorm_n - signal converter 240
5.54 L_DcSpeed_sToSpeed_v - signal converter 241
5.55 L_DcSpeed_vToSpeed_s - signal converter 242
5.56 L_DcWordBitand - bit combination 243
5.57 L_DcWordBitor - bit combination 244
5.58 L_DcWordBitxor - bit combination 245
5.59 L_DcWordTo2Bytes - type converter 246
5.60 L_DcWordToBits - bit demultiplexer 247
5.61 L_DcWordToByte - type converter 248
5.62 L_DcWordToDWord - type converter 249
5.63 L_DcWordToInt - type converter 250
5.64 L_DevApplErr - error tripping 251
5.65 L_DevApplErrFix - error tripping 253
5.66 L_DevBrakeStateDecoder - status signals of the basic function "Brake control" 255
5.67 L_DevDriveInterfaceStateDecoder - status signals of the drive interface 257
5.68 L_DevHomingStateDecoder - status signals of the basic function "Homing" 259
5.69 L_DevLimiterStateDecoder - status signals of the basic function "Limiter" 261
5.70 L_DevManualJogStateDecoder - status signals of the basic function "ManualJog" 263
5.71 L_DevParReadFix - read parameter 265
5.71.1 Example 268
5.72 L_DevParWriteFix - write parameter 271
5.73 L_DevPositionerStateDecoder - positioning status signals 275
5.74 L_DevReadParDInt - reading parameters of the DINT type 277
5.75 L_DevSMControlDecoder - control signals from the safety module 280
5.76 L_DevSMControlEncoder - control word for limiter 282
5.77 L_DevSMStateDecoder - status signals from the safety module 284
5.78 L_DevSMStateDecoderIO - status signals from the safety module 286
5.79 L_DevWriteParDInt - writing to parameters of the DINT type 287
5.80 L_EsClutchPos - clutch (time-controlled) 290
5.80.1 Signal characteristics 295
5.80.2 Interconnection example 297
5.81 L_EsEncoderConv - encoder signal conditioning 298
5.81.1 Typical application 301
5.81.2 Encoder settings 301
5.81.3 64 bit encoder signal evaluation 302
5.81.4 Signal characteristics 303
5.82 L_EsStretchIntegrate - synchronously stretching/compressing the master value 304
5.82.1 Signal characteristics 307
5.83 L_LdAddOffsetCyclic - offset addition 308
5.84 L_LdClutchAxisP - virtual clutch for synchronism 309
5.85 L_LdClutchV - virtual clutch for electronic gearboxes 312
5.86 L_LdConvAxisV - speed ratio 315
5.87 L_LdDifferentiateCyclic - cyclic differentiation 318
5.88 L_LdExtrapolate - extrapolation 319
5.88.1 Function 321
5.89 L_LdIntegrateCyclic - cyclic integration 322
5.90 L_LdLinearCoupling - master value connection 324
5.90.1 Interconnection example 326
5.91 L_LdMarkSync - mark synchronisation 327
5.91.1 Typical application 330
5.91.2 Signal characteristics 332
5.91.3 Interconnection example 333

Contents

5.92 L_LdMonitFollowError - following error monitoring 335
5.93 L_LdMPot - master value adjustment 337
5.93.1 Monitoring for counter overflow 339
5.94 L_LdPosCtrlLin - Master value adjustment via position 340
5.94.1 Monitoring for counter overflow 345
5.94.2 Interconnection examples 346
5.94.2.1 Printing roller trimming via x offset 346
5.94.2.2 Time-based compensation of mark correction 350
5.95 L_LdSetAxisVelocity - master value processing 354
5.96 L_LdStateDecoder - LineDrive status signals 358
5.97 L_LdToolControl - setpoint conditioning 360
5.98 L_LdSyncOperation - master value connection 363
5.98.1 Operating mode 0: Coupling via feed constants 368
5.98.2 Operating mode 1: Coupling via cycles 369
5.98.3 Operating mode 2: Free coupling 370
5.98.4 Angular trimming via x offset 371
5.99 L_LdVirtualMasterP - virtual master for synchronism 373
5.99.1 Functions 377
5.99.2 Monitoring for counter overflow 378
5.100 L_LdVirtualMasterV - virtual master for electronic gearboxes 379
5.100.1 Functions 382
5.100.2 Monitoring for counter overflow 383
5.101 L_LdZeroDetect - zero crossing detection 384
5.102 L_PosDecoderStatePositioner - positioning status signals 385
5.103 L_PosDecoderStateSequencer - status signals of the sequence control 387
5.104 L_PosGetProfile - profile data tables 388
5.105 L_PosGetProfileData - profile data output 389
5.106 L_PosGetTableAcc - acceleration table 392
5.107 L_PosGetTableJerk - S-ramp time table 394
5.108 L_PosGetTablePos - position table 395
5.109 L_PosGetTableSpeed - speed table 396
5.110 L_PosPositionerInterface - positioning interface 397
5.110.1 Interconnection 398
5.110.2 Applications 399
5.111 L_PosPositionerTable - profile data record management 400
5.111.1 Variable tables 407
5.111.2 "Teach" function 408
5.111.3 Positioning modes 409
5.111.4 Positioning with final speed 411
5.111.5 Touch probe positioning 412
5.111.6 Monitoring for counter overflow 413
5.112 L_PosProfileInterface - profile data interface 414
5.112.1 Positioning modes 416
5.112.2 Positioning with final speed 418
5.112.3 Touch probe positioning 419
5.112.4 Touch probe configuration 419
5.113 L_PosProfileTable - profile data record management (simple) 420
5.113.1 Profile data table 424
5.113.2 "Teach" function 425
5.113.3 Positioning modes 426
5.113.4 Touch probe positioning 428
5.113.5 Monitoring for counter overflow 429

Contents

5.114 L_PosSequencer - sequence control 430
5.114.1 Priorities of the control signals 436
5.114.2 States of the sequencer 437
5.114.3 Action types available for creating the positioning program 438
5.114.3.1 Action type "Program end" 439
5.114.3.2 Action type "Positioning" 440
5.114.3.3 Action type "Switching" 442
5.114.3.4 Action type "Branching" 443
5.114.3.5 Action type "Variable branching" 444
5.114.3.6 Action type "Homing" 445
5.114.3.7 Action type "Waiting" 446
5.114.3.8 Action type "Counter setting" 447
5.114.3.9 Action type "Counting" 448
5.114.3.10 Action type "Stand-by" 449
5.114.4 Example: Sequence table 450
5.115 L_PosSequencerStateDecoder - status signals of the sequence control 451
5.116 L_SdAccToUnit - acceleration conversion 452
5.117 L_SdDelayComp - dead time compensation 453
5.118 L_SdDifferentiate - differentiation 454
5.119 L_SdFactor - stretch factor 455
5.120 L_SdGetAxisData - Reading out machine parameters from axis data 456
5.121 L_SdGetPosition - position conversion 458
5.122 L_SdGetSpeed - speed conversion 459
5.123 L_SdIntegrate - integration of speed to position 460
5.124 L_SdIntegrateAxis - speed to position integration (with TP correction) 461
5.124.1 Typical application 463
5.124.2 Interconnection of the touch probe inputs 464
5.124.3 Signal characteristics 465
5.125 L_SdIntegrateLimit - integration of speed to position 467
5.125.1 Basics 469
5.125.2 Signal characteristics 470
5.126 L_SdInterExtrapolateAny - signal interpolation 471
5.126.1 Extrapolation function 472
5.126.2 Interpolation function 472
5.126.3 Signal characteristics 472
5.127 L_SdInterExtrapolatePosition - signal interpolation 474
5.127.1 Extrapolation function 476
5.127.2 Interpolation function 476
5.127.3 Telegram failure detection 477
5.127.4 Signal characteristics 477
5.128 L_SdInterpolate - signal interpolation 483
5.128.1 Function 484
5.129 L_SdLimitSpeed - speed limitation 486
5.130 L_SdMotorPot - motor potentiometer 488
5.130.1 Acceleration and deceleration time 490
5.130.2 Control signals 490
5.130.3 Signal characteristics 491
5.130.4 Deactivation function 492
5.130.5 Behaviour for incorrect parameterisation of the limit values 494
5.131 L_SdPosToUnit - position conversion 495
5.132 L_SdProcessController - PID controller with limitation 496
5.132.1 Controller characteristic 500
5.132.2 Adaptation of the controller gain via characteristic function 501
5.132.3 System deviation in the area of reduced sensitivity 502
5.132.4 Controller influence 502

Contents

5.132.5 Ramp function generator 503
5.132.6 Low pass in actual value path 503
5.133 L_SdRampGenerator - ramp function generator - S-ramp 504
5.133.1 Loading the ramp function generator 505
5.133.2 Acceleration and jerk 506
5.134 L_SdRampGeneratorAny - ramp function generator - S-ramp 507
5.135 L_SdRuntimeComp - runtime compensation 509
5.136 L_SdSetAxisData - machine parameters 510
5.136.1 Typical application 512
5.136.2 Selection and input of machine parameters 513
5.136.3 Resolution of an encoder revolution 514
5.136.3.1 Detecting the optimum resolution 516
5.136.4 Example 517
5.137 L_SdSetPosition - position conversion 518
5.137.1 Monitoring for counter overflow 519
5.138 L_SdSetSpeed - speed conversion 520
5.138.1 Monitoring for counter overflow 521
5.139 L_SdSpeedFilter - speed signal delay 522
5.139.1 Monitoring for counter overflow 523
5.140 L_SdSpeedSet - setpoint ramp generator 524
5.140.1 Setpoint path 528
5.140.2 Fixed setpoints 528
5.140.3 Ramp generator 529
5.140.4 Setting and selection of the Ti times 530
5.140.5 Display of the machine-based variables 530
5.141 L_SdSpeedToUnit - speed conversion 531
5.142 L_SdSwitchPoint - position switch points 532
5.142.1 Monitoring for counter overflow 534
5.143 L_SdTouchProbe - touch probe evaluation 535
5.143.1 Actual value interpolation (principle) 536
5.143.2 Example 536
5.144 L_SdUnitToAcc - acceleration conversion 537
5.145 L_SdUnitToPos - position conversion 538
5.146 L_SdUnitToSpeed - speed conversion 539
5.147 L_Tb5And - AND with 5 inputs 540
5.148 L_Tb5Nand - NAND with 5 inputs 541
5.149 L_Tb5Nor - NOR with 5 inputs 542
5.150 L_Tb5Or - OR with 5 inputs 543
5.151 L_Tb5Xor - XOR with 5 inputs 544
5.152 L_Tb8Select - 1-out-of-8 selector (for data type "DINT") 545
5.153 L_Tb8SelectByte - 1-out-of-8 selector (for data type "BYTE") 546
5.154 L_Tb8SelectWord - 1-out-of-8 selector (for data type "WORD") 547
5.155 L_TbAbs - absolute value 548
5.156 L_TbAdd - addition 549
5.157 L_TbAddLim - addition with limitation 550
5.158 L_TbAddSubLim - addition and subtraction with limitation 551
5.159 L_TbAnd - AND with 2 inputs 552
5.160 L_TbCompare - comparison 553
5.160.1 Function 1: dnIn1 = dnIn2 554
5.160.2 Function 2: dnIn1 > dnIn2 555
5.160.3 Function 3: dnIn1 < dnIn2 556
5.160.4 Function 4: |dnIn1| = |dnIn2| 557
5.160.5 Function 5: |dnIn1| > |dnIn2| 557
5.160.6 Function 6: |dnIn1| < |dnIn2| 557

Contents

5.161 L_TbCompare_n - scaled comparison 558
5.161.1 Function 1: dnIn1_n = dnIn2_n 559
5.161.2 Function 2: dnIn1_n > dnIn2_n 560
5.161.3 Function 3: dnIn1_n < dnIn2_n 561
5.161.4 Function 4: |dnIn1_n| = |dnIn2_n| 562
5.161.5 Function 5: |dnIn1_n| > |dnIn2_n| 562
5.161.6 Function 6: |dnIn1_n| < |dnIn2_n| 562
5.162 L_TbCount - up/downcounter 563
5.162.1 Function 1: Automatic counter reset 564
5.162.2 Function 2: Counter stop at upper limit 564
5.163 L_TbCurve - characteristic function 565
5.163.1 Selection of the characteristic 566
5.163.2 Characteristic mode 0: Entire range 568
5.163.3 Characteristic mode 1: Symmetrically to y axis 569
5.163.4 Characteristic mode 2: Symmetrically to zero point 569
5.164 L_TbCurveAny - Characteristic function 570
5.164.1 Selection of the characteristic 571
5.164.2 Characteristic mode 0: Entire range 573
5.164.3 Characteristic mode 1: Symmetrically to y axis 574
5.164.4 Characteristic mode 2: Symmetrically to zero point 574
5.165 L_TbDeadband - dead band with gain 575
5.166 L_TbDeadband_n - scaled dead band with gain 577
5.167 L_TbDelay - delay 579
5.167.1 Function 1: ON-delay 580
5.167.2 Function 2: OFF-delay 580
5.167.3 Function 3: General delay 581
5.168 L_TbDifferentiate - differentiator with low-pass filter 582
5.168.1 Function 583
5.168.2 Adapting the time reference 584
5.169 L_TbDiv - division 585
5.170 L_TbDiv_n - scaled division 586
5.171 L_TbFlipFlopD - D flipflop 587
5.172 L_TbFlipFlopRS - status-controlled RS flipflop 589
5.173 L_TbGainLim - gain with limitation 590
5.174 L_TbIntegrate - integration with limitation 591
5.174.1 Adapting the time reference 592
5.175 L_TbLimit - limitation (for "DINT" data type) 593
5.176 L_TbLimit_n - scaled limitation 594
5.177 L_TbLimitInt - limitation (for "INT" data type) 595
5.178 L_TbMaskOut - zone masking 596
5.179 L_TbMul - multiplication 598
5.180 L_TbMul_n - scaled multiplication with limitation 599
5.181 L_TbMulDivLim - multiplication and division with limitation 600
5.182 L_TbMulLim - multiplication with limitation 601
5.183 L_TbNand - NAND with 2 inputs 602
5.184 L_TbNeg - negation (for "DINT" data type) 603
5.185 L_TbNegInt - negation (for "INT" data type) 604
5.186 L_TbNegSel - optional negation (for "DINT" data type) 605
5.187 L_TbNegSelInt - optional negation (for "INT" data type) 606
5.188 L_TbNor - NOR with 2 inputs 607
5.189 L_TbNormalize - signal scaling with limitation 608
5.190 L_TbNot - negation 609
5.191 L_TbOr - OR with 2 inputs 610

Contents

5.192 L_TbOscillator - rectangular signal generator 611
5.192.1 Function 611
5.192.2 Optimising the accuracy of the output signal 612
5.193 L_TbPIController - PI controller with limitation 613
5.194 L_TbPT1Filter - delay 615
5.195 L_TbRateAction - rate action with limitation 616
5.196 L_TbSampleHold - sample & hold (for "DINT" data type) 618
5.197 L_TbSampleHoldWord - sample & hold (for "WORD"data type) 619
5.198 L_TbSelect - selector (for "DINT" data type) 620
5.199 L_TbSelectByte - selector (for "BYTE" data type) 621
5.200 L_TbSelectWord - selector (for "WORD" data type) 622
5.201 L_TbSub - subtraction 623
5.202 L_TbSubLim - subtraction with limitation 624
5.203 L_TbTransition - edge evaluation 625
5.203.1 Function 1: Evaluating rising edges 626
5.203.2 Function 2: Evaluating falling edges 626
5.203.3 Function 3: Evaluating rising and falling edges 627
5.204 L_TbXor - XOR with 2 inputs 628
5.205 L_WndCalcDiameter - diameter calculation 629
5.205.1 Setting an initial value 632
5.205.2 Calculating the diameter 632
5.205.3 Holding the current value 632
5.205.4 Selecting the direction of change/web break monitoring 633
5.205.5 Limit value monitoring 633
5.206 L_WndCalcLength - length calculation 634
5.206.1 Display of the length/residual length/residual runtime reached 636
5.206.2 Activating the braking process 636
5.206.3 Triggering a limit stop 636
5.206.4 Resetting the calculation & trigger signals 636
5.207 L_WndFrictionCompensation - friction compensation 637
5.207.1 Basics: Friction response 640
5.207.2 Basic interconnection 640
5.207.3 Identifying the friction characteristic automatically 641
5.207.4 Activating the friction compensation 643
5.208 L_WndIdentMInertia - identification of the moment of inertia 644
5.208.1 Basic interconnection 646
5.208.2 Carrying out the identification 646
5.209 L_WndStopCtrl - stop controller 649
5.209.1 Display of the residual length/residual runtime 651
5.209.2 Activating the braking process 651
5.209.3 Triggering a limit stop 651
5.209.4 Resetting the calculation & trigger signals 651
5.210 L_WndTensionCurve - tensile force characteristic 652
5.210.1 Selection of the characteristic 653
5.210.1.1 Characteristic for a linear course of the tensile force 653
5.210.1.2 Characteristic for a linear course of the torque 654
5.210.1.3 Course of the tensile force according to a specified characteristic 655

6 Table of attributes 656

1 About this documentation

This documentation contains information on the Lenze function blocks which can be used in the L-force »Engineer« for the Servo Drives 9400.

The function block editor is available in the »Engineer« HighLevel for Servo Drives 9400 with the runtime software licence Motion Control HighLevel or higher.

Target group

This documentation is intended for all persons who want to reconfigure the application interconnection of the controller with the function block editor and extend it by individual functions.

Document history

Version			Description
6.7	08/2014	TD05	Error corrections
6.6	02/2013	TD05	Amendments & error corrections
6.5	12/2012	TD05	New layout
6.4	04/2012	TD05	Amendments & error corrections
6.3	11/2011	TD05	Amendments & error corrections
6.2	09/2011	TD05	Amendments & error corrections xtended by new function block: • LenzeToolbox.lib: L_TbCurveAny
6.1	06/2011	TD05	Amendments & error corrections
6.0	03/2011	TD05	Extended by "LenzeWinder.lib" function library with function blocks for winding technology: L_WndCalcDiameter, L_WndCalcLength, L_WndFrictionCompensation, L_WndIdentMInertia, L_WndStopCtrl, L_WndTensionCurve Amendments & error corrections
5.6	10/2010	TD05	Amendments & error corrections
5.5	03/2010	TD05	Amendments & error corrections Extended by new function blocks: • LenzeServoDrive.lib: L_SdIntegrateLimit, L_SdInterExtrapolateAny, L_SdInterExtrapolatePosition, L_SdRampGeneratorAny
5.4	02/2010	TD05	Error corrections
5.3	08/2009	TD05	Error corrections
5.2	08/2009	TD05	Amendments & error corrections Extended by new function block: • LenzeServoDrive.lib: L_SdGetAxisData
5.1	03/2009	TD05	New subchapter "Multitasking in the Servo Drive 9400" Extension of the main chapter "Working with the FB editor" by new functions of the »Engineer« V2.10
5.0	11/2008	TD05	Extension of the main chapter "Working with the FB editor" by new functions of the »Engineer« V2.9 Extended by new function blocks: • LenzeCam.lib: L_CamSetContDataPDO, L_CamSetContDataSDO • LenzeDataConversion.lib: L_DcBitShiftByte, L_DcBitShiftDWord, L_DcBitShiftInt, L_DcBitShiftWord, L_DcByteBitand, L_DcByteBitor, L_DcByteBitxor, L_DcByteToInt, L_DcWordBitand, L_DcWordBitor, L_DcWordBitxor • LenzeElectricalShaft.lib: L_EsClutchPos • LenzeToolbox.lib: L_Tb8SelectByte, L_Tb8SelectWord, L_TbLimitInt, L_TbNegInt, L_TbNegSelInt, L_TbSampleHoldWord, L_TbSelectByte, L_TbSelectWord New: Table of attributes with information required for a communication to the controller via parameters.

Version			Description
4.1	04/2008	TD05	Extended by new function block: • LenzeCam.lib: L_CamSyncIn
4.0	03/2008	TD05	New main chapter "Working with the FB editor" Extended by new function block: • LenzeServoDrive.lib: L_SdProcessController
3.0	09/2007	TD05	Extended by new function blocks: • LenzeCam.lib: L_CamClutchPos, L_CamContactor, L_CamCurve, L_CamGetAxisData, L_CamPosMarker, L_CamProfiler, L_CamStretchAbs, L_CamStretchFeed • LenzeElectricalShaft.lib: L_EsEncoderConv, L_EsStretchIntegrate • LenzeServoDrive.lib: L_SdIntegrateAxis, L_SdMotorPot • LenzeToolbox.lib: L_TbAddSubLim, L_TbMaskOut
2.1	03/2007	TD05	Extended by new function blocks: • LenzeDevice9400.lib: L_DevApplErr, L_DevApplErrFix, L_DevParReadFix, L_DevParWriteFix • LenzeServoDrive.lib: L_SdAccToUnit, L_SdSpeedToUnit, L_SdUnitToAcc • LenzeToolbox.lib: L_TbMulDivLim, L_TbNegSel
2.0	10/2006	TD05	Extended by new function blocks: • LenzeDevice9400.lib: L_DevPositionerStateDecoder, L_DevReadParDInt, L_DevWriteParDInt, L_DevSMControlDecoder, L_DevSMControlEncoder, L_DevSMStateDecoder, L_DevSMStateDecoderIO • LenzePositioning.lib: L_PosPositionerInterface, L_PosSequencerStateDecoder • LenzeServoDrive.lib: L_SdInterpolate
1.4	08/2006	TD05	First edition

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Spelling of numbers		
Decimal separators	Point	The decimal point is generally used. For example: 1234.56
Text		
Version information	Text colour blue	Information that is only valid for or from a certain software version of the controller is marked accordingly in this manual. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze »Engineer« PC software...
Window	*italics*	The *Message* window ... / The *Options* dialog box...
Variable identifier		Set *bEnable* to TRUE to...
Control element	**bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Shortcut	**<bold>**	Press **<F1>** to open the online help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program code	`Courier`	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**`Courier bold`**	
Hyperlink	underlined	Optically highlighted reference to another topic. In this documentation activated by mouse-click.
Symbols		
Page reference	(📖 14)	Optically highlighted reference to another page. In this documentation activated by mouse-click.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Definition of the notes used

This documentation uses the following signal words and symbols to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

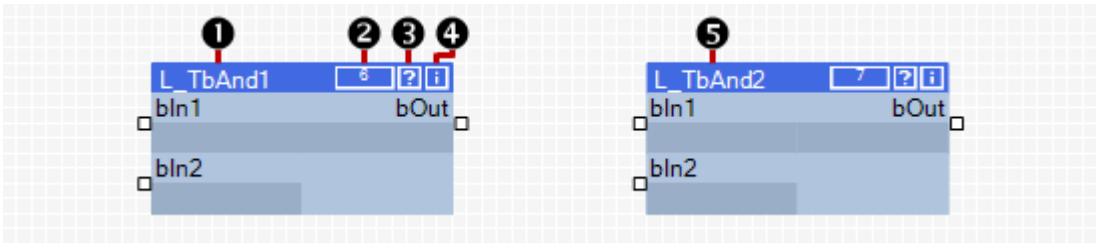
Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another documentation

2 Introduction

2.1 How to create applications:

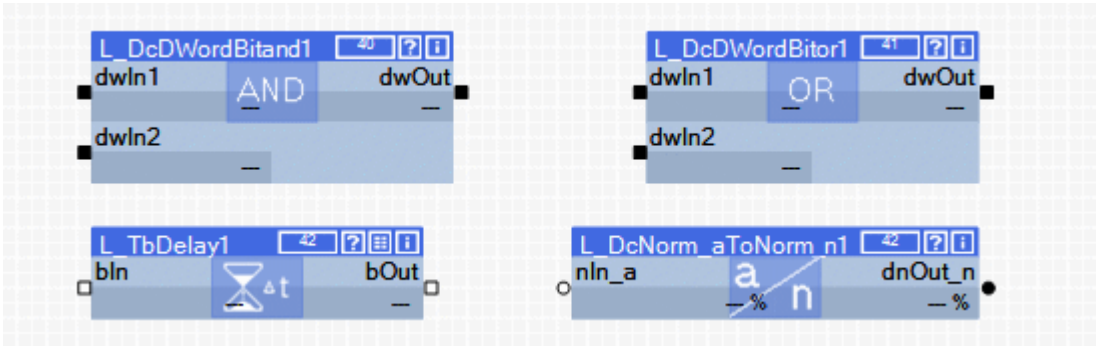


An application is the configured function of a device. To create an application for the controller, there are two solutions:

1. You use a ready-made technology application supplied by Lenze.
   - For this purpose, simply select the required technology application from the catalogue in the »Engineer« for the controller.
   - The selected technology application can be changed and extended by further functions, if required.
2. You create the application completely by yourself using the function block editor.
   - For this purpose, select no application for the controller. In this case, an "empty application" is assigned to the controller.

2.2 What is a function block?

A function block (FB) can be compared with an integrated circuit that contains a specific control logic and delivers one or several values when being executed.



- Function blocks are classified in function libraries according to their functions.
- An instance (reproduction, copy) of the function block is always inserted into the interconnection.
- It is also possible to insert several instances of a function block into an interconnection.
- Each instance has an unequivocal identifier (the instance name) and an order index which defines the position at which the function block is calculated during runtime.

❶ Name of the instance of the function block (freely selectable)
❷ Order index (is simultaneously the button for changing the order index)
❸ Button for opening the online help for the function block
❹ Button for displaying/changing the function block properties
❺ Other instance of the function block

[2-1] Information on a function block in the function block editor

As of »Engineer« V2.9 icons are displayed for simple functions blocks which symbolise their basic functions to ensure a better readability of the interconnection.

[2-2] Display of symbolic icons for simple function blocks

Tip!

An overview of all available function blocks is provided in the chapter "Short overview". (📖 100)

A detailed description for each function block is provided in the chapter "Function blocks". (📖 134)

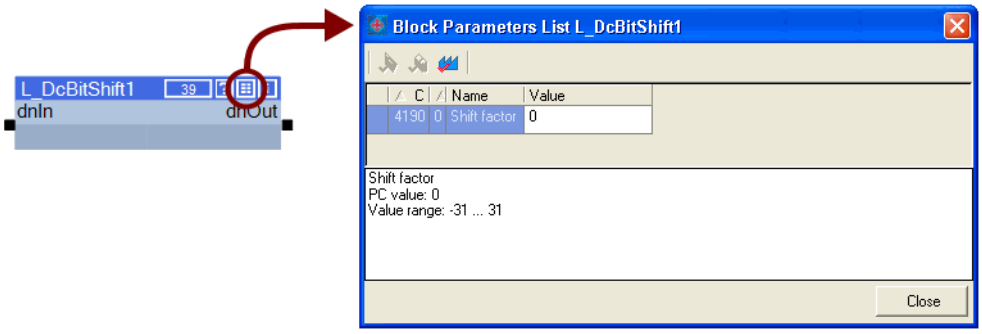
2.3 Parameterisable function blocks

Some function blocks have parameters which serve to change particular settings during operation, if required, or which display actual values & status information.

Parameters, codes & subcodes

All parameters are stored in "codes".

- The codes are numbered and indicated in the documentation with a preceding "C", e.g. "C00002".
- For the sake of clarity some codes contain "subcodes" in which parameters are stored. In the documentation, code and subcode are divided by a "/", e.g. "C00118/3".



Code ranges

The codes for the 9400 Servo Drives are divided into the following ranges:

Assignment	Range	Contents
Firmware	C00000 ... C02999	Codes of the standard device
TA	C03000 ... C03099	Basic codes of the technology application
	C03100 ... C03499	Multiplexer codes of the technology application
	C03500 ... C03999	Codes of used function blocks
Libraries	C04000 ... C04199	LenzeToolbox
	C04200 ... C04399	LenzeServoDrive
	C04400 ... C04499	LenzeDataConversion
	C04500 ... C04799	LenzePositioning
	C04800 ... C04999	LenzeWinder
	C05000 ... C05299	LenzeLineDrive
	C05300 ... C05599	LenzeCam
	C05600 ... C05899	- Reserve -
	C05900 ... C05999	LenzeDevice9400
User	C06000 ... C08999	Free range for user codes
	C09000 ... C12999	- Reserve -

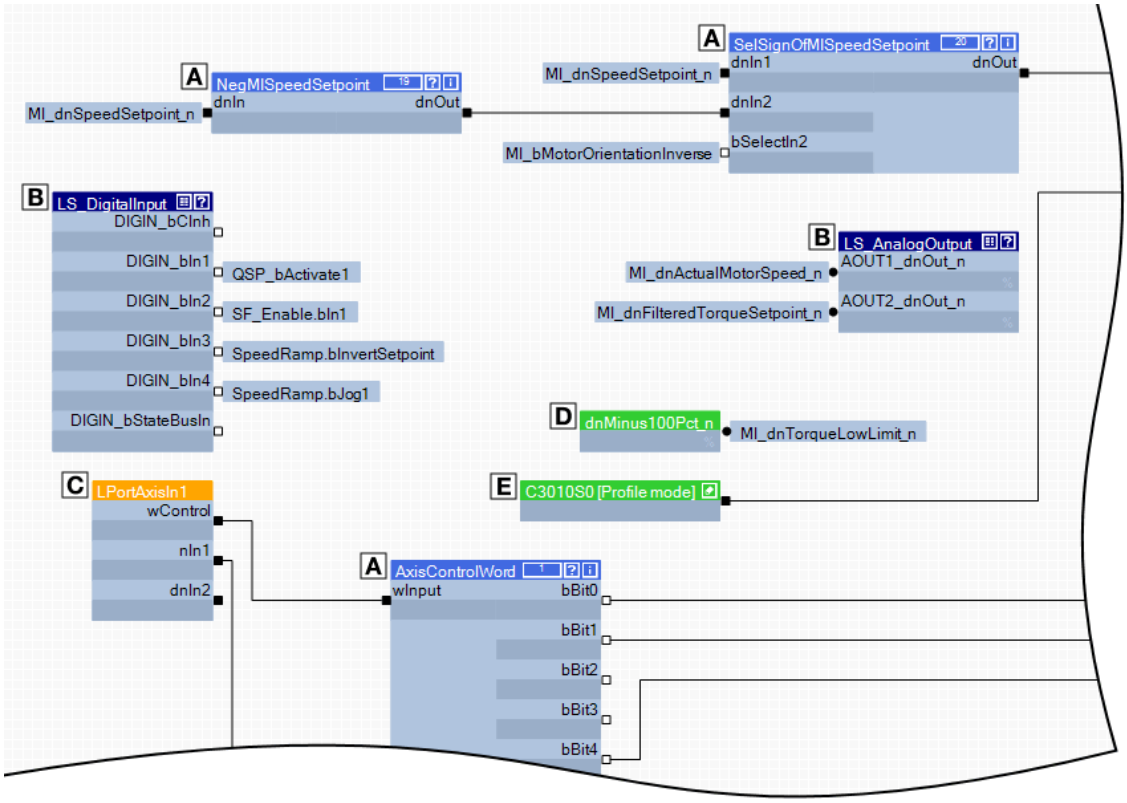
Parameter list

- By clicking the icon the parameter list of a function block can be opened.

Wildcard "unit" for the real unit of the machine



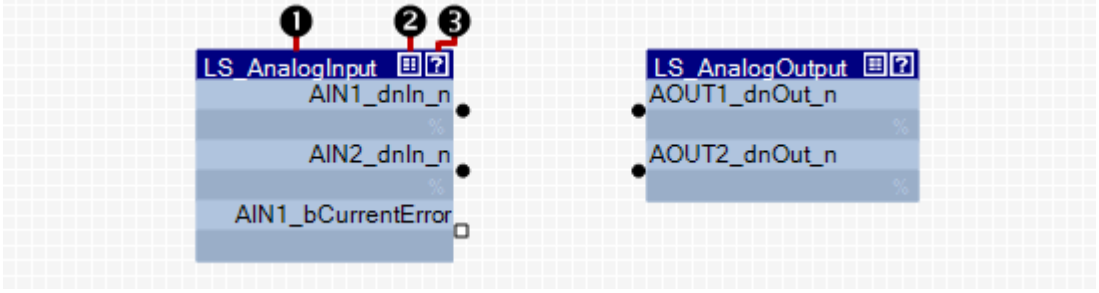
The parameters for a travel profile (e.g. position, speed, acceleration and deceleration) are selected in real units with regard to the slide, e.g. 1000 mm as relative position.

- The machine parameters of the drive interface (system block **LS_DriveInterface**) are used to define the real unit.
- This documentation uses the term "unit" in the parameter unit information only as a wildcard for the real unit of the machine.

Resolution	Value range	Number of decimal positions
32 bits	± 214748.3647	4

2.4 Further objects of an interconnection

In addition to function blocks, an interconnection also contains system blocks which are required for accessing the basic functions of the controller and the physical interfaces (e.g. digital inputs). Furthermore, an interconnection can contain port blocks as well as variables and user codes.



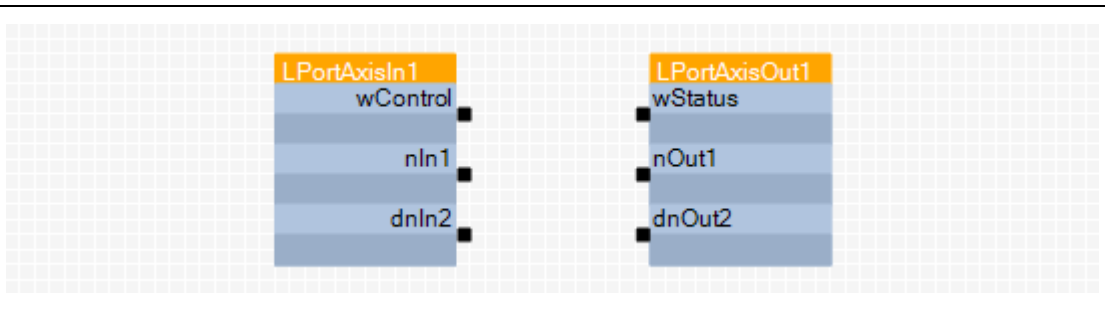
A Function block B System block C Port block D Variable E User code

2.4.1 System block

System blocks can be considered as a specific variant of a function block.

- In contrast to function blocks, system blocks are firmly integrated in the runtime system of the controller and therefore are not instanceable.
- System blocks partly activate real hardware, e. g. the digital and analog inputs/outputs and the motor control.
- The system blocks which are provided for a controller in the function block editor depend on the respective device type.

❶ Name of the system block
❷ Button for opening the parameterisation dialog or the parameter list for the system block
❸ Button for opening the online help for the system block



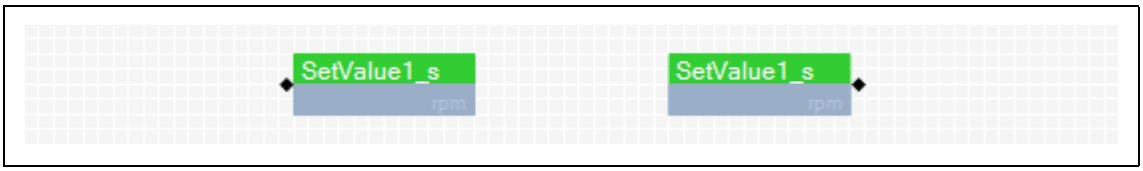
[2-3] Example: System blocks "LS_AnalogInput" and "LS_AnalogOutput" for representing the analog inputs/outputs

Tip!

The system blocks are described in detail in the software manual and in the online help for the controller.

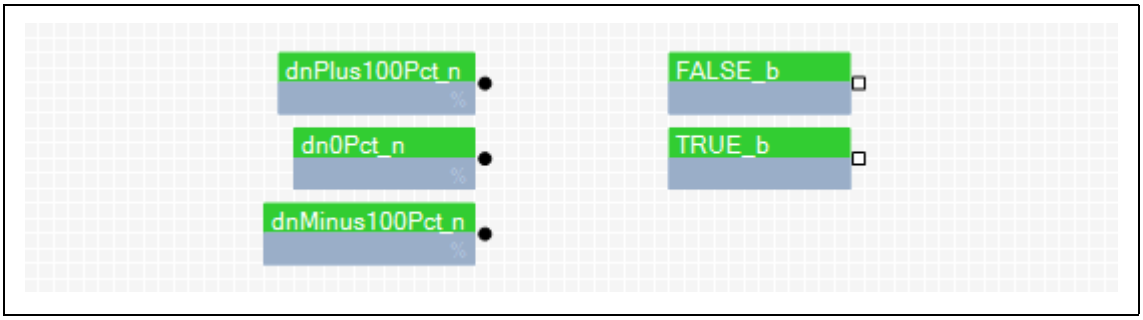
2.4.2 Port block

All input/output ports of the application can be inserted in the interconnection in the form of port blocks, in order to receive access to the associated element variables.



[2-4] Example: Input port "LPortAxisIn1" and output port "LPortAxisOut1"

Input/output ports enable, for instance, the data exchange in an interconnection or with a master control via a corresponding transmission medium (e.g. system bus).

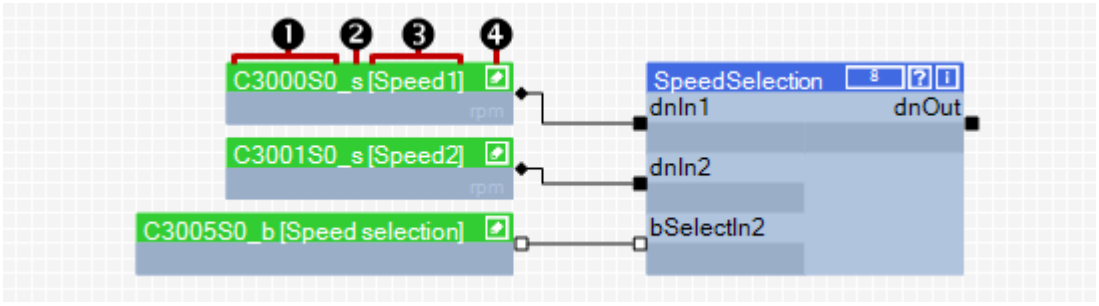


2.4.3 Variable

Variables can be used for a cross-task value exchange and for the use of constant values. The use of significantly named variables can make the interconnection more clear and easier to maintain.

- If you assign the "safe against mains failure" property to a variable, the value of the variable remains stored even after mains switching.
- A variable can be inserted exactly once with an input (for value assignment) into the interconnection and as often as required with an output (for read access).

[2-5] Example 1: Variable "SetValue1_s" on the left with input for value assignment and on the right with output for reading access

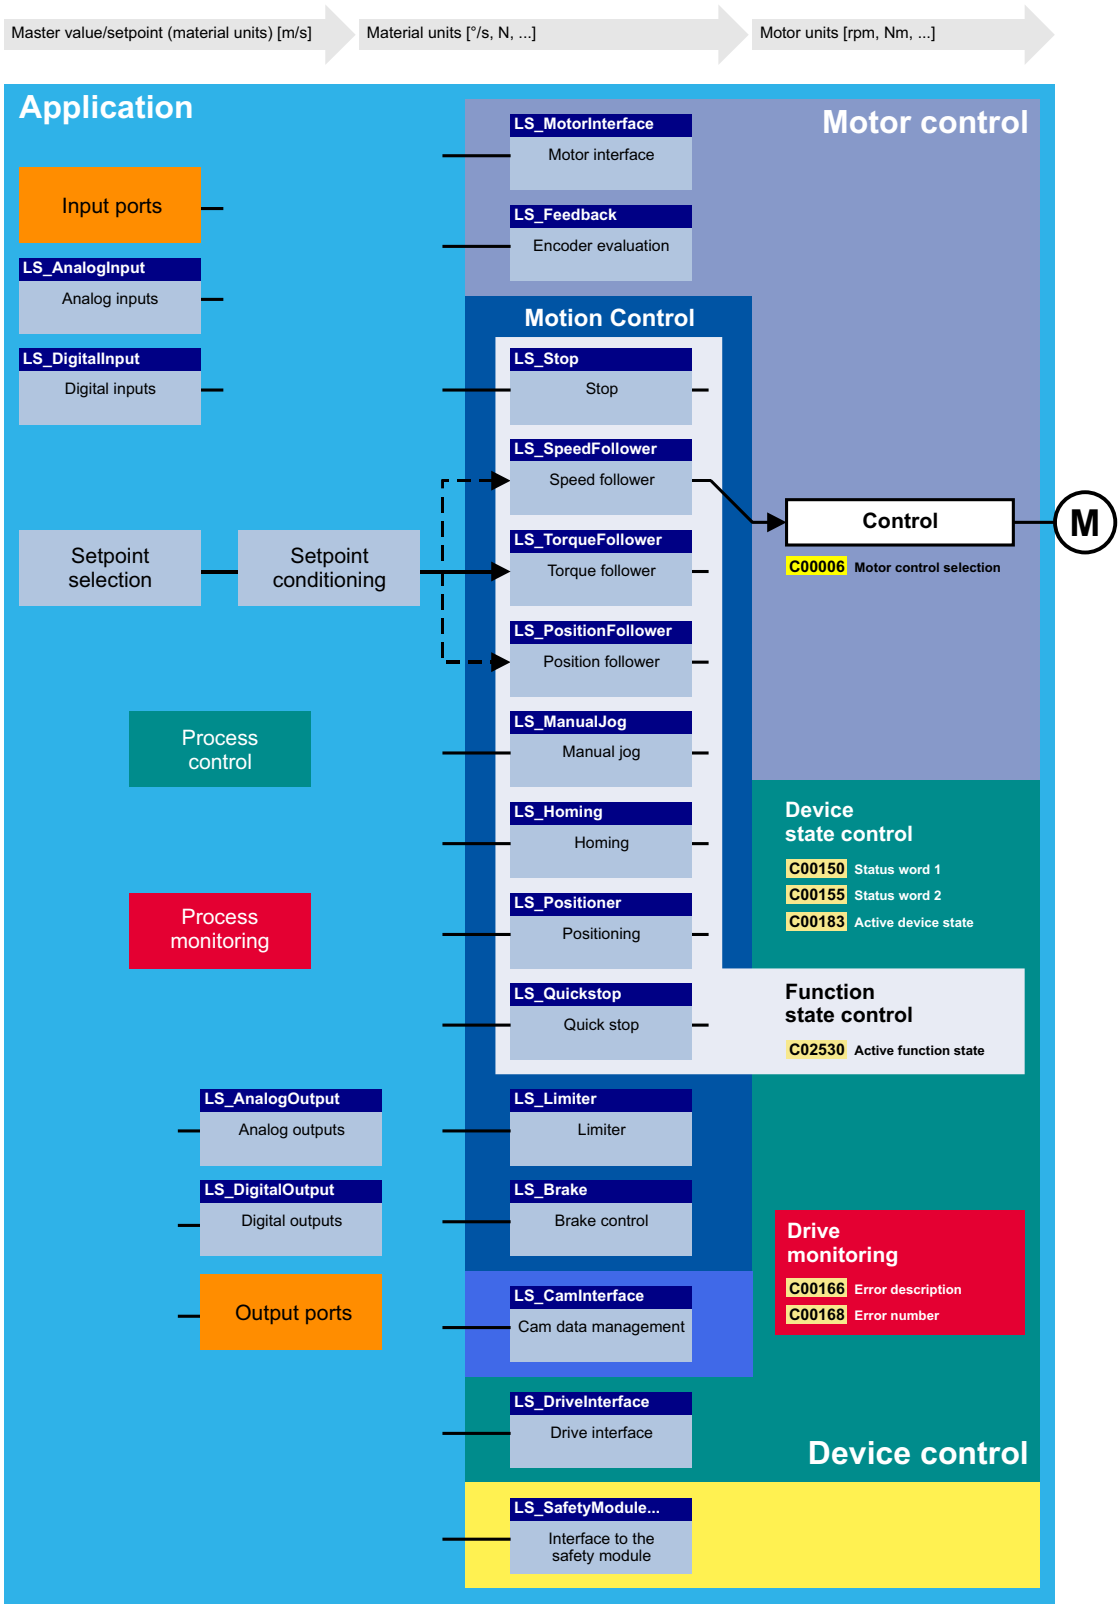


[2-6] Example 2: Variables (with output) for the constant values 100 %, 0 %, -100 % as well as FALSE and TRUE

Note!

Variables are only assigned at the end of the task cycle! Thus, the variable value will only be effective in the next task cycle!

2.4.4 User code



For the interconnection, user codes can be configured and linked with inputs/outputs of port blocks, function blocks, and system blocks. Thus, the linked inputs/outputs can be accessed using the keypad.

❶ Code number/number of subcodes
❷ Signal type entry
❸ Display text of the user code
❹ Button for opening the parameter list for the user code

[2-7] Example: User codes for the selection of a speed setpoint using the keypad

2.5 Functional ranges of an interconnection

[2-8] Schema: Functional ranges of an interconnection

The illustration [2-8] shows the different functional ranges within a typical application in a simplified way.

Application

Setpoints and control signals are read into the application and application-specific functions as setpoint conditioning, process control, and process monitoring are implemented by a corresponding function block interconnection.

- Here, you can access comprehensive Lenze function libraries, which contain, among other things, process controllers, arithmetic functions, logic modules as well as ramp generators and integrators.
- Actual values and status signals can be provided via the output terminals of the controller and via ports when communicating via a network.
- All parameters are selected and displayed in the real machine or material units.

Motor control

Here, all control and monitoring functions of the specific motor functions are implemented.

- All parameters are selected and displayed in motor units.
- In the function block editor, the motor control is accessed via the motor interface (system block **LS_MotorInterface**).

Device control

The device control contains all control and monitoring functions of the controller.

- In the function block editor, the device control is accessed via the drive interface (system block **LS_DriveInterface**).
- The machine constants for the motor end are also entered via the drive interface.

Basic drive functions (Motion Control)

Standard functions of the motion control (e.g. manual jog/inching, homing, brake control, positioning) are already included in the firmware of the controller as basic drive functions.

- In the function block editor, the basic drive functions are accessed via system blocks.
- The basic drive functions which are required in the interconnection in the form of a system block depend on the drive task to be solved.
- All parameters are selected and displayed in machine units. Thus, the user is able to work with the familiar units.

The implementation of the basic drive functions into the firmware offers many advantages for the user:

- The basic functions are always directly available.
- The interfaces to the basic functions are standardised and thus identical for all technology functions.
- Uniform dialogs provide a uniform "look & feel".
- The internal function state control guarantees that
  - only one basic function at a time controls the drive.
  - only one basic function with the highest priority is executed if several basic functions are activated at the same time.
  - the drive is always in a defined state, both in case of an error and in standard operation.
- All basic functions are synchronised to each other. You can change between the basic functions online while the drive is rotating.
- The processing speed is optimal.

2.6 Conventions used for input/output identifiers

This chapter describes the conventions used for the identifiers of the inputs/outputs of the function blocks. The conventions ensure a uniform and consistent terminology and make reading and comprehending the interconnection and application easier.

Tip!

The conventions used by Lenze are based on the "Hungarian Notation". This ensures that the most significant characteristics of the corresponding input/output (e.g. the data type) can be instantly recognised from its identifier.

An identifier consists of

- a data type entry
- an identifier (the "proper" name of the input/output)
- an (optional) signal type specification

Data type entry

The data type entry provides information about the data type of the corresponding input/output:

Data type entry	Meaning	Resolution	Value range
B	BOOL	1 bit	0 ≡ FALSE / 1 ≡ TRUE
by	BYTE	8 bits1	0 ... 255
dn	DINT	32 bits	-2147483647 ... 2147483647
dw	DWORD	32 bits	0 ... 4294967295
n	INT	16 bits	-32767 ... 32767
s	STRING	-	-
t	TIME	32 bits	-
W	WORD	16 bits	0 ... 65535

Identifier

The identifier is the proper name of the input/output and should indicate the application or function.

- Identifiers always start with a capital letter.
- If an identifier consists of several "words", then each "word" must start with a capital letter.
- All other letters are written in lower case.

Signal type entry

In general, it is possible to assign a certain signal type to the inputs and outputs of the Lenze function blocks. There are e.g. digital, scaled, position, acceleration and speed signals.

- A corresponding ending (preceded by an underscore) is added to the identifier of the corresponding input/output to indicate the signal type.

Signal type entry	Meaning	Resolution	Value range
_a	Scaled	16 bits	± 199.99 %
_n	Scaled	32 bits	± 200.00 %
_v	Speed	16 bits	± 30000.0 rpm
_s	Speed	32 bits	± 480000.0 rpm
_p	Position/angle	32 bits	-2^{31} ... 2^{31}-1 increments*
* As of controller software version V3.0 the resolution of an encoder revolution can be parameterised in C00100 (Lenze setting: 16 bits/encoder revolution).			

- An overview of the different signal types and their scaling is provided in the following subchapter "Signal types & scaling (📖 29)".

2.7 Signal types & scaling

With regard to the parameter setting & configuration of the controller it is very helpful to know the signal types and their scaling listed in the following table, which are used to process physical values (e.g. a speed or position) in the function block interconnection.

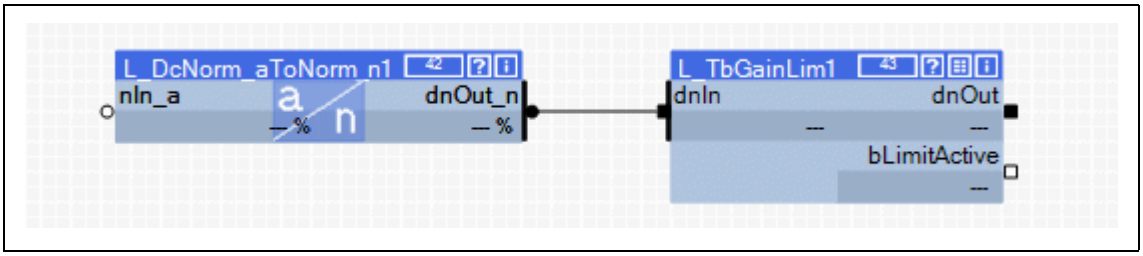
Signal type (data type)	Port symbol in the FB editor	Resolution	Value range (external)	Decimal positions/ Signal type indication in the identifier	
Scaled (INT)	○	16 bits	± 199.99 %	2	_a
Scaled (DINT)	●	32 bits	± 200.00 %	2	_n
Speed (INT)	◁ / ▷	16 bits	± 30000.0 rpm	1	_v
Speed (DINT)	◆	32 bits	± 480000.0 rpm	1	_s
Position/angle (DINT)	◀ / ▶	32 bits	-2^{31} ... 2^{31}-1 increments*	3	_p
Digital (BOOL)	□	1 bit	0 ≡ FALSE; 1 ≡ TRUE	0	
Acceleration (DINT)	■	32 bits	± 7.69 * 10^9 rpm/s	3	_x
Time	■	28 bits1	0 ... 268435.456 s	3	
Other (BYTE)	■	8 bits1	0 ... 255	0	
Other (WORD)	■	16 bits	0 ... 65535	0	
Other (DWORD)	■	32 bits	0 ... 4294967295	0	
Other (INT)	■	16 bits	-32767 ... 32767	0	
Other (DINT)	■	32 bits	-2147483647 ... 2147483647	0	

* As of controller software version V3.0 the resolution of an encoder revolution can be parameterised in C00100 (Lenze setting: 16 bits/encoder revolution).

Scaling of physical units

Signal type	Port symbol in the FB editor	Resolution	Scaling	
			external value	≡ internal value
Scaled (INT)	○	16 bits	100 %	≡ 2^{14} ≡ 16384
Scaled (DINT)	●	32 bits	100 %	≡ 2^{30} ≡ 1073741824
Speed (INT)	◁ / ▷	16 bits	15000 rpm	≡ 2^{14} ≡ 16384
Speed (DINT)	◆	32 bits	15000 rpm	≡ 2^{26} ≡ 67108864
Position/angle (DINT)	◀ / ▶	32 bits	1 encoder revolution	≡ 2^{16} increments*
Acceleration (DINT)	■	32 bits	15000000 rpm/s	≡ 2^{22} ≡ 4194304

* As of controller software version V3.0 the resolution of an encoder revolution can be parameterised in C00100 (Lenze setting: 16 bits/encoder revolution).



2.7.1 Data type check/implicit type conversion

For the »Engineer« up to and including V2.7 the following applies:

- Only inputs/outputs of the same signal type (with the same port symbol) can be connected in the »Engineer« function block editor.
- Non-standardised inputs/outputs can be connected if the input and output have the same resolution.
- If different types are to be connected, corresponding conversion modules must be placed in the function block editor.

As of the »Engineer« V2.9 the following applies:

- Signals of the DINT data type can now also be connected to signals of the DWORD data type. Signals of the INT data type can now also be connected to signals of the WORD data type.
- 32-bit-, 16-bit- and 8-bit data types can only be connected among each other.
- A type conversion does not require any conversion modules anymore which need more calculating time. Instead, the type conversion is implicit.
- The implicit type conversion is represented by a black bar at the port symbol in the function block editor.

[2-9] Representation of the implicit type conversion in the function block editor

- The following three tables show all permissible connections:

32-bit data types and signal types	Scaled (DINT)	Speed (DINT)	Position/ angle (DINT)	Accelerati- on (DINT)	Other (DWORD)	Other (DINT)	Port (UDINT)	Port (DINT)	Port (DWORD)
Scaled (DINT)	●				●	●		●	●
Speed (DINT)		●			●	●		●	●
Position/angle (DINT)			●		●	●		●	●
Acceleration (DINT)				●	●	●		●	●
Other (DWORD)	●	●	●	●	●	●	●	●	●
Other (DINT)	●	●	●	●	●	●		●	●
Port (UDINT)					●		●		●
Port (DINT)	●	●	●	●	●	●		●	●
Port (DWORD)	●	●	●	●	●	●	●	●	●

16-bit data types and signal types	Scaled (INT)	Speed (INT)	Other (WORD)	Other (INT)	Port (UINT)	Port (INT)	Port (WORD)	
Scaled (INT)	●		●	●		●	●	
Speed (INT)		●	●	●		●	●

Port (UINT)			●		●		●	
Port (INT)	●	●	●	●		●	●	
Port (WORD)	●	●	●	●	●	●	●	

8-bit data types and signal types	Other (BYTE)	Port (USINT)	Port (SINT)	Port (BYTE)	
Other (BYTE)	●	●	●	●	
Port (USINT)	●	●		●	
Port (SINT)	●		●	●	
Port (BYTE)	●	●	●	●	

2.8 Multitasking in the Servo Drive 9400

The Servo Drive 9400 has three different user tasks:

1. ApplicationTask
2. UserTask
3. IdleTask

ApplicationTask

The ApplicationTask is a time-controlled user task.

- Two different interval times (1 ms and 2 ms) can be set for the ApplicationTask.
- Compared to the other two user tasks, the ApplicationTask has the higher priority with regard to processing.
- The system blocks can only be accessed in the ApplicationTask. Thus, new setpoints are provided in the same interval time as defined for the ApplicationTask.

UserTask

The UserTask is, like the ApplicationTask, a time-controlled user task.

- Three different interval times (2 ms, 4 ms and 8 ms) can be set for the UserTask.
- The UserTask has a higher priority than the IdleTask.

IdleTask

The IdleTask is an idling user task.

- After the logic has been processed in the IdleTask, the IdleTask restarts. Thus, the IdleTask is not time-equidistant.
- The IdleTask has the lowest priority.
- The processing of the IdleTask is interrupted by the ApplicationTask and the UserTask.

Tip!

The task properties (interval time and runtime monitoring) are configured in a dialog which is called from the FB Editor.

▸ Configuring the task properties (📖 83)

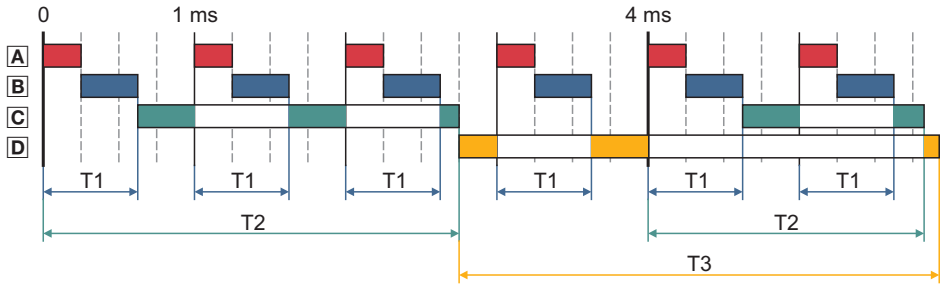
2.8.1 Runtime measurement

When the application has been started, the controller continuously carries out a runtime measurement for the interval-controlled ApplicationTask, the interval-controlled UserTask and the idling IdleTask.

- The runtime is the time from the starting time of the task to the time where the processing of the task logic has been completed, including all interruptions (e.g. by higher-priority tasks).
- The runtime measurement also includes an operating system part of the Servo Drive 9400, the runtime of which depends among other things on the plugged-in modules.
- The current and maximum task runtimes are displayed in the following display parameters:

Parameter	Information	Lenze setting	
		Value	Unit
C02121/1	Current runtime of ApplicationTask	-	µs
C02121/2	Maximum runtime of ApplicationTask	-	µs
C02122/1	Current runtime of UserTask	-	µs
C02122/2	Maximum runtime of UserTask	-	µs
C02123/1	Current runtime of IdleTask	-	µs
C02123/2	Maximum runtime of IdleTask	-	µs
Grayed out = display parameter			

- The device command C00002 = "36: Reset runtime measurement" serves to reset the runtime measurement, e.g. the memory for the maximum values is reset to "0".



Note!

The runtime measurement is also reset by the following actions:
- Start application
- Reset/delete/restart program

Example of runtime measurement

In the following example, the ApplicationTask is called in a 1 ms interval. The ApplicationTask interrupts the UserTask which is called in a 4 ms interval. Both tasks, in turn, interrupt the IdleTask. The interruptions cause a runtime extension both in the UserTask and in the IdleTask. This means that already a small runtime extension has a significant effect on the runtime of the other two tasks!

A System task B Application task (here: Task interval = 1 ms) C User task (here: Task interval = 4 ms) D Idling idle task	T1 = runtime of the application task T2 = runtime of the user task T3 = runtime of the idle task

[2-10] Example: Runtimes of the different tasks

2.8.2 Optimising the runtime behaviour

The following points should be considered for an optimum runtime behaviour of the controller:

- Before you start programming, check which response times are required for which functions. This defines in which task the corresponding functions are to be programmed and which interval time must be set for the corresponding task. A subsequent optimisation of programs is very time-consuming and error-prone!
- High-priority, quick tasks must always be programmed runtime-efficiently. The less logic is executed in the quick task, the more resources are available for the other tasks!
- The runtimes of the time-controlled user tasks must not be higher than 95 % of the interval time of the corresponding task.
  - If, for example, the ApplicationTask is loaded with 70 %, only the 25 % are available for the UserTask and the IdleTask.
  - Check the runtimes by means of the runtime measurement. ▸ Runtime measurement (📖 33)
- If the runtime of the ApplicationTask is higher than 950 µs with an interval time of 1 ms, check first if the interval time of the ApplicationTask can be increased from 1 ms to 2 ms. This is the case if:
  - the setpoints in the application are generated in an interval higher than 2 ms, as for example with positioning drives or actuating drives with internal ramp generation or slave drives with a setpoint selection. Slave drives with a setpoint generation in an interval lower than 2 ms are excluded.
  - no time-critical operation of digital outputs is required as for example with a cam group.
- An increase of the interval time only causes a minimum deterioration of the drive behaviour if the motion setpoints are generated in the controller.
- The activation/deactivation of the three setpoint interpolators (C02550/1...3) has no influence on the task runtime.
- In a second step, the logics from the ApplicationTask should be sourced out into one of the other two tasks.
  - Time-critical logics should remain in the ApplicationTask.
  - Logics (modules) which require a time-equidistant execution and do not need to be executed in the ApplicationTask should be transferred to the UserTask.
  - Logics (modules) the execution of which is not time-critical and not time-equidistant should be transferred to the IdleTask.
- When the project is based on a technology application by Lenze, the logic which has no influence on the application function, e.g. non-used ports with connected signal converters, should be deleted from the ApplicationTask after activating the FB Editor.
  - Deleting non-required system blocks from the FB interconnection does not influence the task runtime.

2.8.3 Exchanging data between tasks

There are two options to exchange data between tasks:

1. via global variables
2. via user codes

In order to e.g. transfer a value from the ApplicationTask to the UserTask, first a global variable or a user code is defined. The value is assigned to this variable/code in the ApplicationTask and read from the same variable/code in the UserTask and e.g. assigned to a block input.

Note!

When creating the FB interconnection please bear in mind that the value of a global variable or user code may change while processing the lower-priority task when being interrupted by a higher-priority task.

The FB Editor prevents that the same variable or user code can be written several times. Thus, a variable or user code cannot be changed in different tasks.

3 Working with the FB editor

The function block editor (in the following called "FB editor) is available in the »Engineer« HighLevel 9400 Servo Drives with the runtime software licence Motion Control HighLevel or higher.

The FB editor serves to extend the supplied technology applications by individual functions. You can optionally also create an application completely of your own. Here you can access the comprehensive Lenze libraries which, among other things, contain process controllers, arithmetic functions, logic modules and ramp generators and integrators.

Note!

The illustrations of the FB Editor user interface and the dialog boxes in this documentation are based on the »Engineer« V2.9 (or higher).

Functions which are only available as of the Engineer version V2.9 (or higher) are marked correspondingly in this documentation.

3.1 Short overview of new functions in the FB Editor

As of »Engineer« V2.10

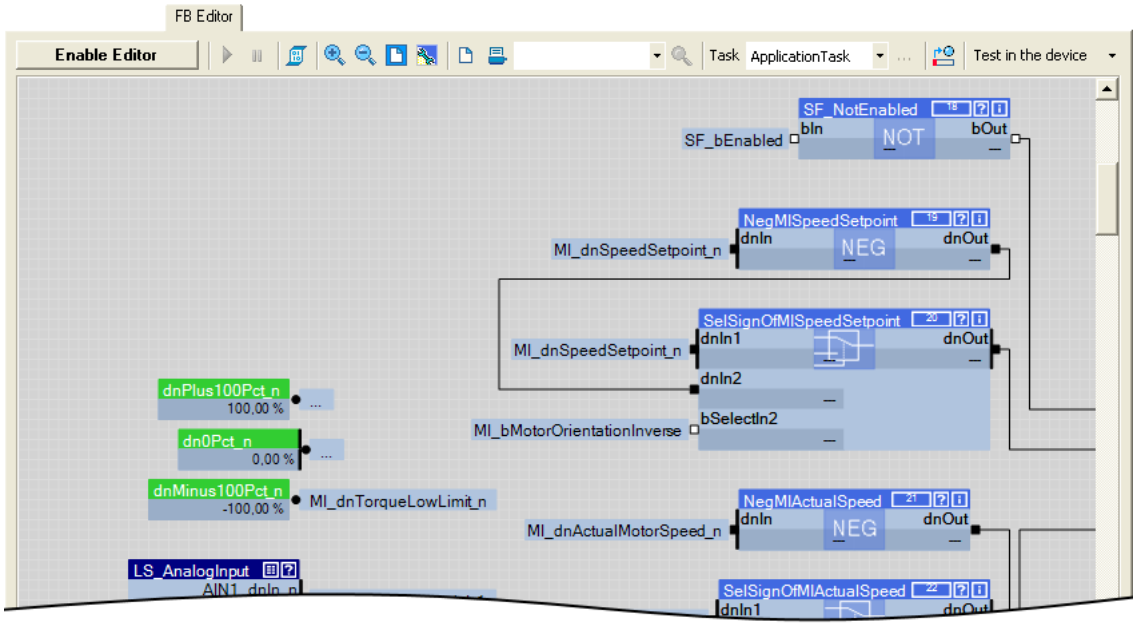
- Configuring the exception handling (📖 84)
- Inserting a comment with extended properties (📖 67)
  - The interior colour and text alignment of a comment can be changed via a properties dialog. The size of a comment can also be changed easily using the mouse pointer.
  - When using different interior colours you can use comments to graphically arrange areas that belong together in terms of function or separate them from other areas.

As of »Engineer« V2.9

- Data type check/implicit type conversion (📖 30)
- Testing the interconnection in the device (📖 86)
- Copying interconnection elements (across all devices) (📖 88)
- Comparing interconnections (📖 93)
- Copying complete interconnection (📖 97)
- Inserting complete interconnection from reference project (📖 98)

3.2 User interface

How to access the FB editor:



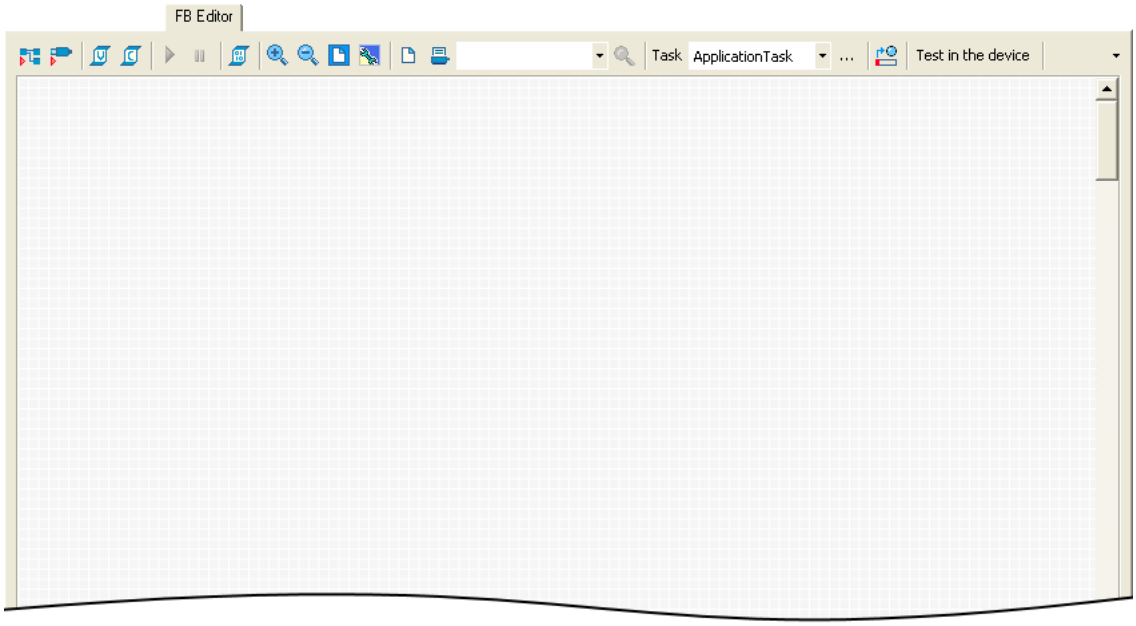
1. Go to *Project View* and select the 9400 controller.
2. Go to *Workspace* and select the **FB Editor** tab.

Note!

The first representation on the **FB Editor** tab depends on whether you have selected a technology application for the controller from the catalogue or not.

Controller with selected technology application

If you have selected a technology application for the controller from the catalogue, the FB Editor displays the interconnection of the technology application defined by Lenze:

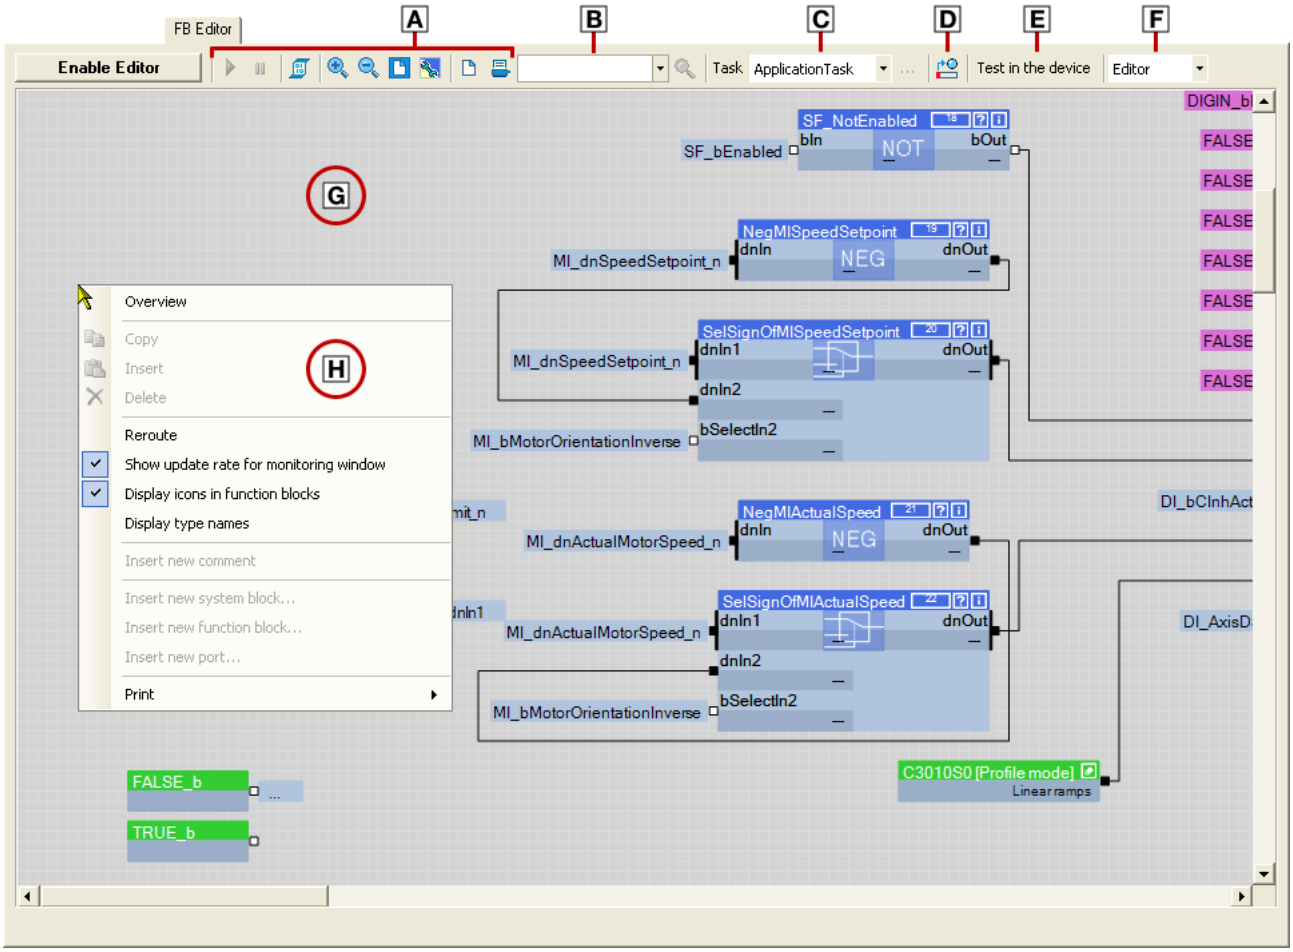


- First the FB Editor is in the "Viewer" mode, in which the displayed objects/connections cannot be changed. ▸ Using the FB-Editor as "Viewer" (📖 48)
- To be able to reconfigure the defined interconnection and to add further functions, the FB Editor must be enabled explicitly. ▸ Enabling the FB Editor (📖 51)

Controller with empty application

If no technology function has been selected from the catalogue when the controller has been entered into the *Project View*, the controller is automatically assigned to an "empty application".

In this case, the FB Editor contains an empty and already enabled drawing area where you can recreate the required interconnection from scratch:



Tip!

You can replace the empty application any time by another technology application from the catalogue.

1. Select the controller in the *Project View*.
2. Select the command **Insert→Application**.

3.2.1 Control and function elements

The user interface of the FB Editor includes the following control and function elements:

A Toolbar
B Search function
C Task selection
D Configuring the exception handling
E Testing the interconnection in the device
F Editor view/overview
G Drawing area
H Context menu
Not shown: Overview window

Tip!

Go to the *»Engineer« toolbar* and click the icon to hide the *Project View* and the *Message Window*. This increases the *Workspace* available for the FB Editor. A renewed click on the symbol shows the *Project View* and the *Message Window* again.

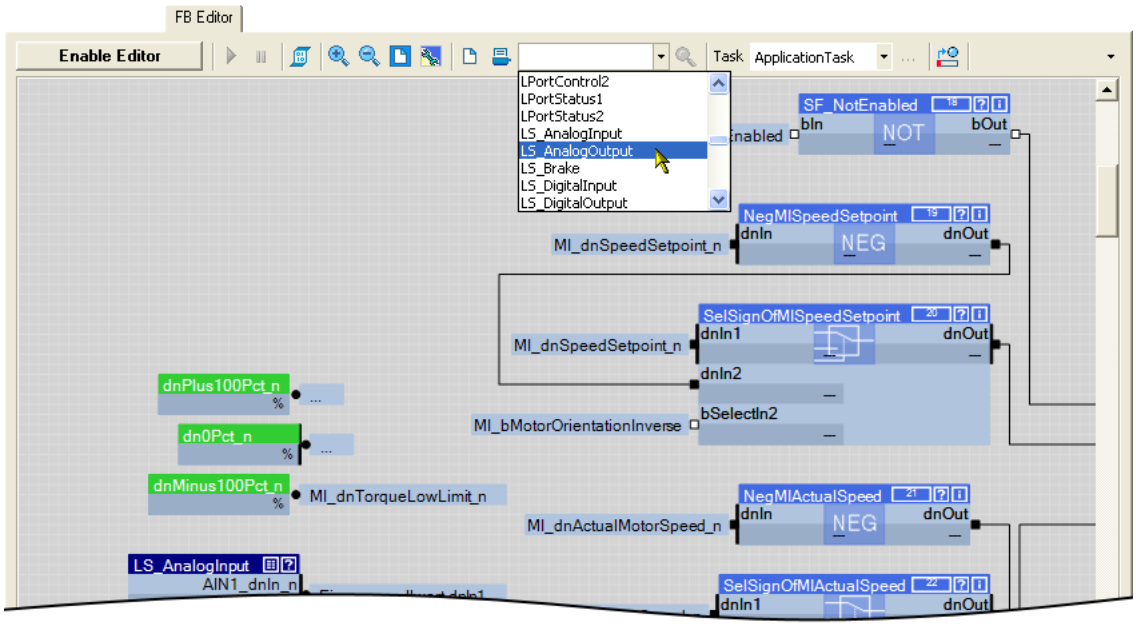
3.2.2 Toolbar

The FB Editor is provided with an individual toolbar in the upper position which in the following text is called *FB Editor toolbar*.

- Click an icon to execute the corresponding function.

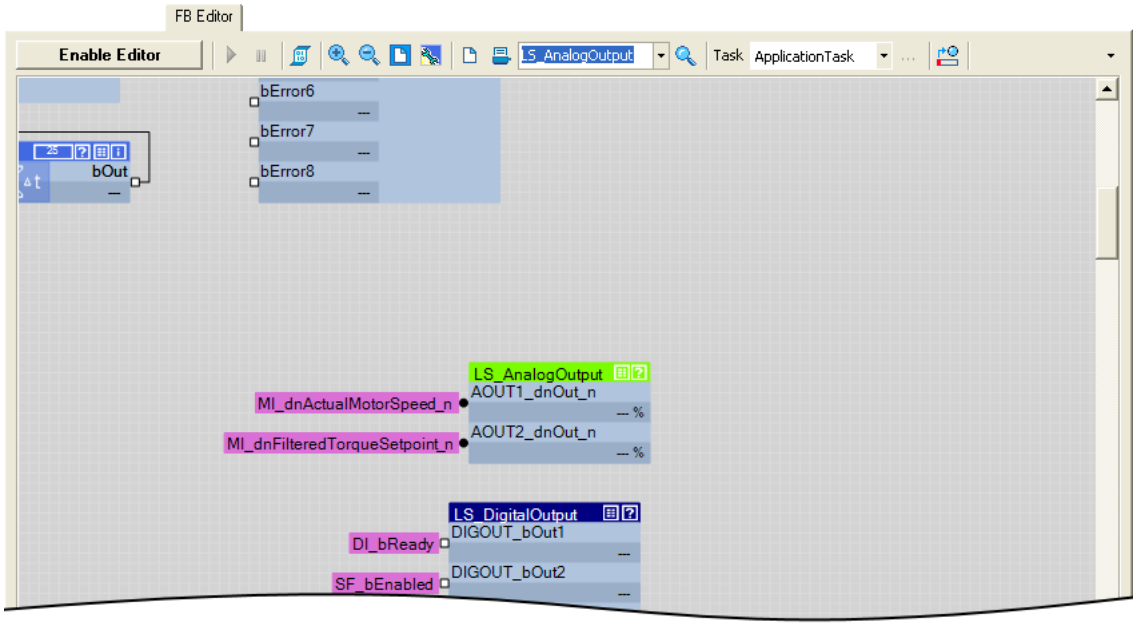
Icons/functions in the "Viewer" mode

Icon	Function
	Start online monitoring (as of »Engineer« V2.10)
	Interrupt online monitoring (as of »Engineer« V2.10)
	Stop online monitoring (as of »Engineer« V2.10)
	Enlarge view of interconnection
	Reduce view of interconnection
	Enlarge cutout of interconnection
	Show total interconnection in the drawing area
	Show FB type names (instead of FB instance names)
	Show print view
	Printing the interconnection (📖 92)
	Search function (📖 42)
	Configuring the exception handling (📖 84) (as of »Engineer« V2.10)



Additional icons/functions in the activated FB Editor

Icon	Function
	Insert function block or system block ▸ Inserting a function block (📖 53) ▸ Inserting a system block (📖 56)
	Inserting a port block (📖 58)
	Creating/inserting a variable (📖 59)
	Configuring/inserting a user code (📖 62)
	Compiling interconnection (📖 86)



3.2.3 Search function

Use the search function to get quickly to a certain module of the interconnection.

- The list field of the search function contains all function blocks, system blocks, and port blocks of the interconnection:

- When you select a module in the list field, this module is zoomed in and selected at the same time (the following example shows the **LS_AnalogOutput** system block):

Tip!

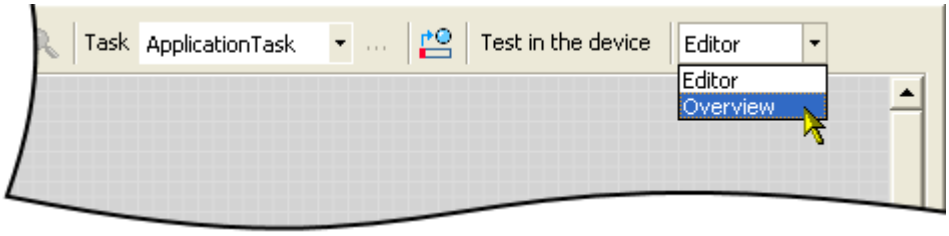
You can also enter any search text in the input field.

- If you click the icon, the cutout is moved to the object which contains this search text.
- Another click on the icon leads to a new search. Thus, you can navigate successively to all objects which contain the entered search text.
- The search text does not consider case sensitivity.

3.2.4 Task selection

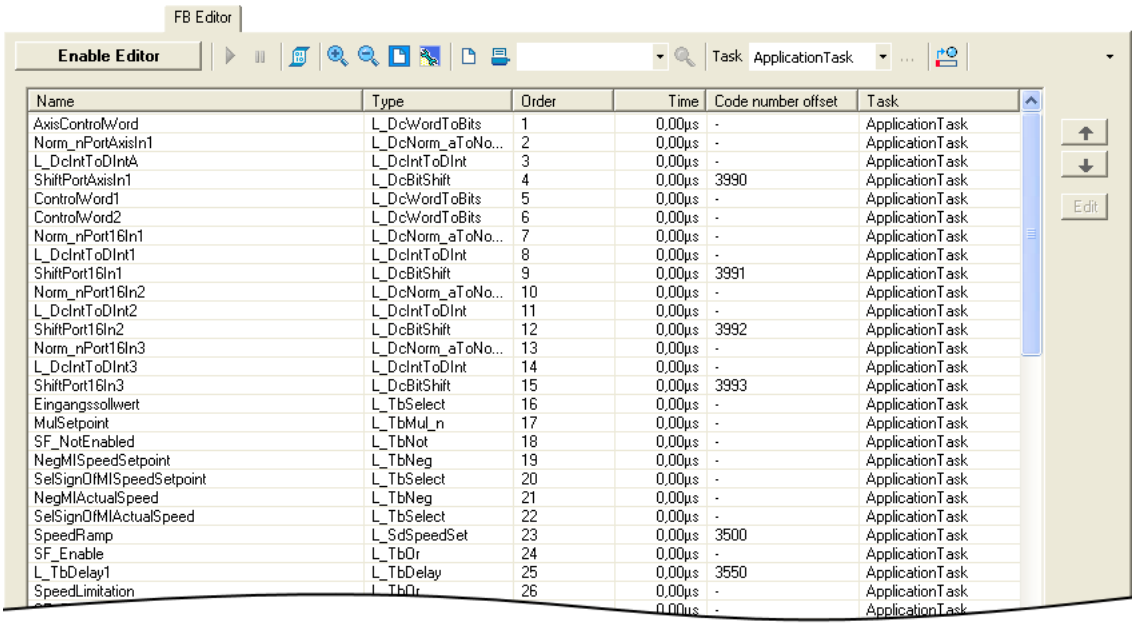
A task describes the runtime characteristics, such as the cycle time and the priority of one or several programs running within the controller. Together with the program, the task makes a runtime system.

- The task to be displayed in the drawing area or edited in the activated FB Editor can be selected via the list field (same name):



- By clicking the **...** button right beside the list field, you open a dialog field where you can see the properties (interval, type, watchdog, sensitivity) of the selected task. The task properties can also be changed, if required, in the activated FB Editor.

Related topics:

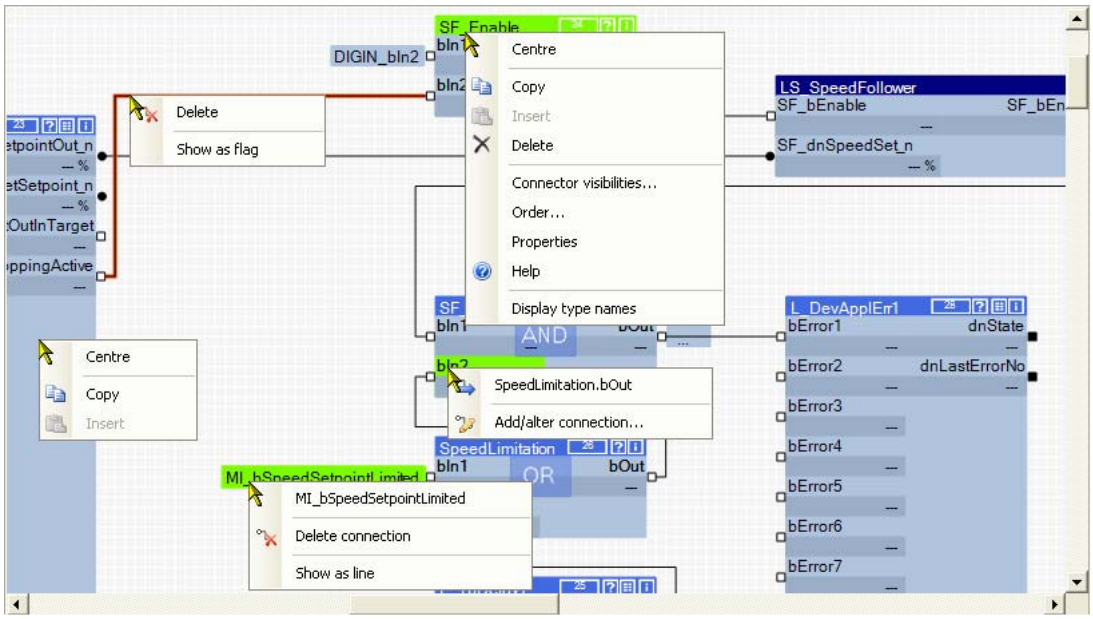


▸ Multitasking in the Servo Drive 9400 (📖 32)
▸ Configuring the task properties (📖 83)

3.2.5 Editor view/overview

Use the rightmost list field to change from the Editor to the overview and vice versa:

The overview displays all function blocks, system blocks, and port blocks of the interconnection in the order of their processing:



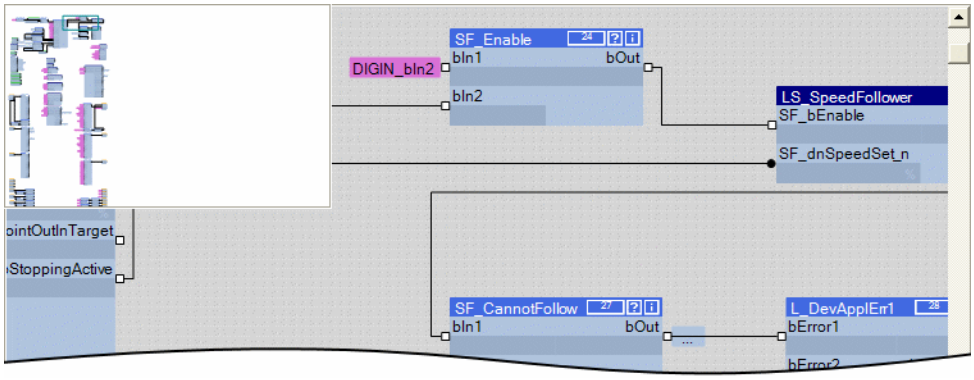
Name	Type	Order	Time	Code number offset	Task
AxisControlWord	L_DcWordToBits	1	0,00µs	-	ApplicationTask
Norm_nPortAxisIn1	L_DcNorm_aToNo...	2	0,00µs	-	ApplicationTask
L_DcIntToDIntA	L_DcIntToDInt	3	0,00µs	-	ApplicationTask
ShiftPortAxisIn1	L_DcBitShift	4	0,00µs	3990	ApplicationTask
ControlWord1	L_DcWordToBits	5	0,00µs	-	ApplicationTask
ControlWord2	L_DcWordToBits	6	0,00µs	-	ApplicationTask
Norm_nPort16In1	L_DcNorm_aToNo...	7	0,00µs	-	ApplicationTask
L_DcIntToDInt1	L_DcIntToDInt	8	0,00µs	-	ApplicationTask
ShiftPort16In1	L_DcBitShift	9	0,00µs	3991	ApplicationTask
Norm_nPort16In2	L_DcNorm_aToNo...	10	0,00µs	-	ApplicationTask
L_DcIntToDInt2	L_DcIntToDInt	11	0,00µs	-	ApplicationTask
ShiftPort16In2	L_DcBitShift	12	0,00µs	3992	ApplicationTask
Norm_nPort16In3	L_DcNorm_aToNo...	13	0,00µs	-	ApplicationTask
L_DcIntToDInt3	L_DcIntToDInt	14	0,00µs	-	ApplicationTask
ShiftPort16In3	L_DcBitShift	15	0,00µs	3993	ApplicationTask
Eingangssollwert	L_TbSelect	16	0,00µs	-	ApplicationTask
MulSetpoint	L_TbMul_n	17	0,00µs	-	ApplicationTask
SF_NotEnabled	L_TbNot	18	0,00µs	-	ApplicationTask
NegMISpeedSetpoint	L_TbNeg	19	0,00µs	-	ApplicationTask
SelSignOfMISpeedSetpoint	L_TbSelect	20	0,00µs	-	ApplicationTask
NegMIActualSpeed	L_TbNeg	21	0,00µs	-	ApplicationTask
SelSignOfMIActualSpeed	L_TbSelect	22	0,00µs	-	ApplicationTask
SpeedRamp	L_SdSpeedSet	23	0,00µs	3500	ApplicationTask
SF_Enable	L_TbOr	24	0,00µs	-	ApplicationTask
L_TbDelay1	L_TbDelay	25	0,00µs	3550	ApplicationTask
SpeedLimitation	L_TbOr	26	0,00µs	-	ApplicationTask

- As of the controller firmware V5.0 the average runtime is displayed for each function block.
- When the FB Editor is activated, the processing order of the function blocks can be changed via the arrow keys on the right side. ▸ Changing the processing order (📖 81)

3.2.6 Context menu

You can open a *context menu* via the right mouse button for each object (function block, variable, line, etc.) and for the drawing area:

- The contents of the *context menu* depend on the type of object you click on.
- As of the »Engineer« V2.10 small icons are shown in front of the entries in the *Context menu*.

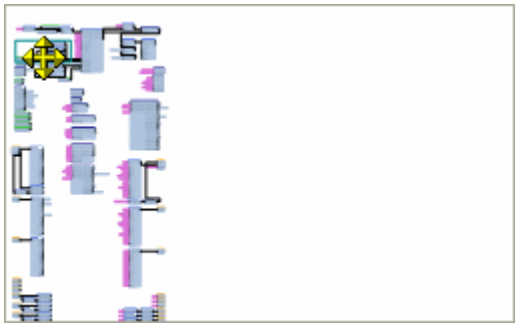


3.2.7 Overview window

The overview window shows the entire interconnection in a reduced view. The overview window serves to e.g. move quickly through a more complex interconnection.

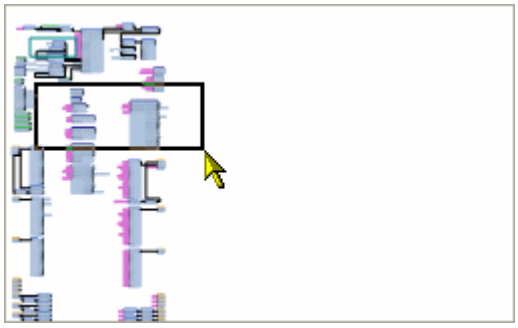
How to show the monitor window:

Go to the *Context Menu* of the drawing area and select the **Overview Window**.



- If you execute this command again, the overview window is hidden again.

- The green frame in the overview window indicates the interconnection cutout that is currently displayed in the drawing area.
- Use the mouse pointer to shift and resize the cutout to be displayed.

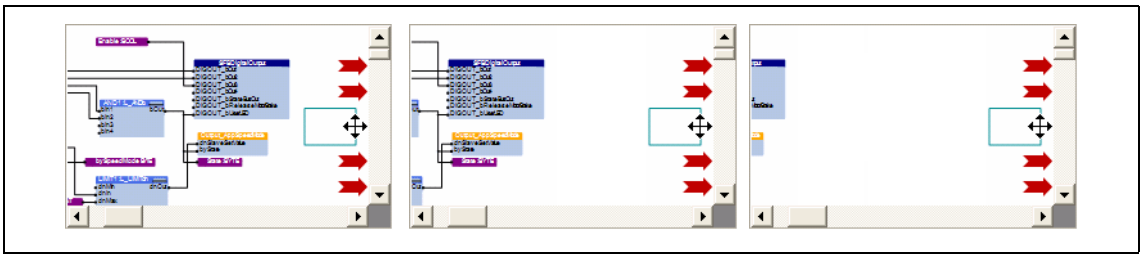


How to shift the cutout presented in the drawing area:

1. Position the mouse pointer to the green frame in the overview window.
2. Click left mouse button and shift the green frame to its new position by keeping the mouse button pressed, so that the desired cutout of the interconnection is displayed in the drawing area.

How to redefine the cutout to be presented:

In the overview window draw a frame around the area of the interconnection which is to be presented in the drawing window by keeping the left mouse button pressed:



- The aspect ratio of the frame is automatically adapted to the aspect ratio of the drawing area.
- According to the size of the frame that is drawn, also the presentation size of the objects in the drawing area changes.

Tip!

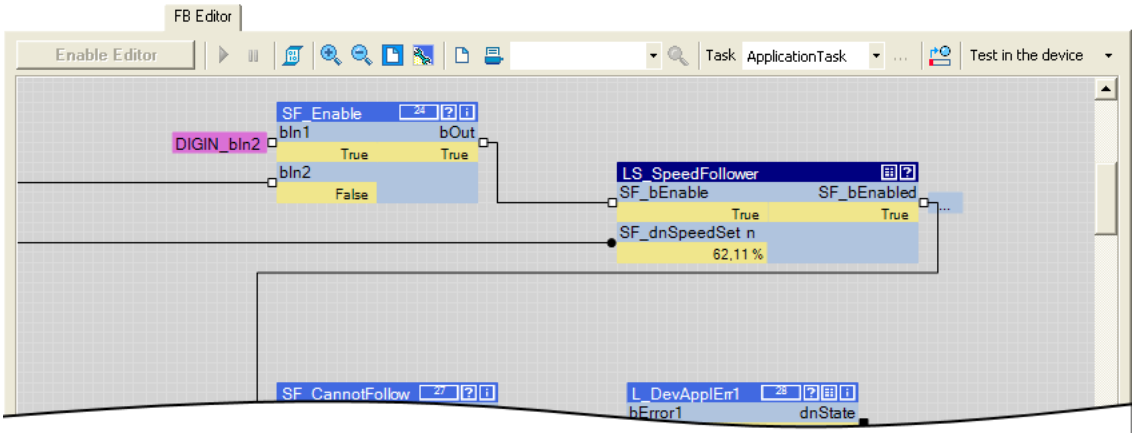
Go to the *FB Editor toolbar* and click the icon to adapt the view size so that all objects included in the interconnection are visible in the drawing area.

Automatic scrolling ("AutoScroll function")

If you reach a window limitation in the drawing area when shifting an object or in the overview window when shifting the green frame, and if you then shortly hold the mouse pointer in this position, an automatic scrolling into the corresponding direction is carried out:

[3-1] Example: automatic scrolling to the right in the overview window

3.3 Using the FB-Editor as "Viewer"



If you have selected a technology application from the catalogue for the controller, the FB Editor is first in the "Viewer" mode. The interconnection of the technology application is displayed but cannot be modified.

You can use this "Viewer" mode to:

- make a diagnosis of the application (when an online connection has been established),
- get a better understanding for the operating mode of the application,
- use the interconnection as an alternative parameterisation access.

Diagnostics of the application

When an online connection to the controller has been established, the current values are displayed at the inputs and outputs of the objects.

Getting a better understanding for the operating mode of the application

Make yourself familiar with the signal flow of the interconnection to get a better understanding of the operating mode of the application or individual functional areas.

The following buttons serve to get more information:

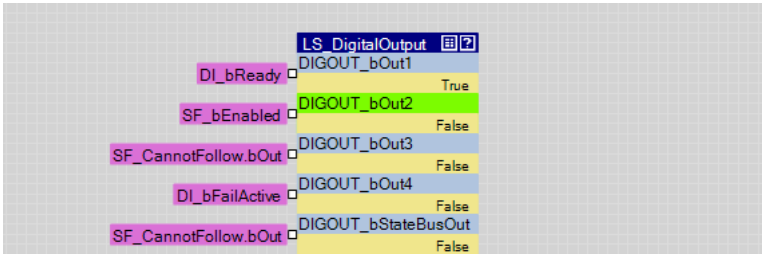
	Command	Function
	Help	Show online help for the function block.
	Help	Show online help for the system block.

Using the interconnection as an alternative parameterisation access

The following buttons serve to get to the parameterisation dialog or parameter list of an object:

	Command	Function
	Parameter...	Open parameter list or parameterisation dialog of the function block. • Only if function block is parameterisable.
	Parameter...	Open parameter list or parameterisation dialog of the system block.
	Changing a value	Display/change value of the user code.

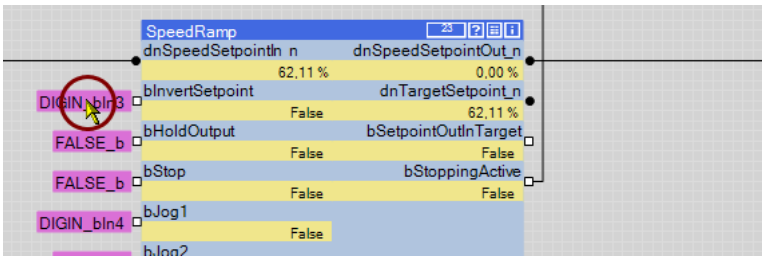
3.3.1 Following connections of inputs and outputs



In addition to the Search function and the Overview window you can use the *context menu* of inputs and outputs to follow connections and quickly reach certain signals.

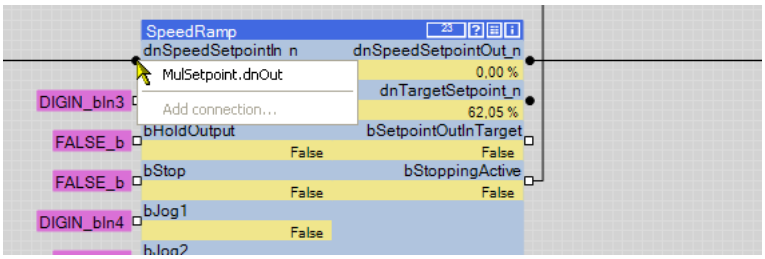
How to navigate from one output to another connected input:

1. Open the *context menu* (right mouse button) of the port symbol at the output.
   - If one output is connected to several inputs, three points ("...") are shown at the output instead of the concrete input identifier.
   - The *context menu* for the port symbol contains all inputs which are connected to the output:



2. Select input in the *context menu* to which you want to navigate.
   - As a result, the selected input is displayed in the centre of the drawing area (in this example: Input DIGOUT_bOut2):

How to navigate from one input to another connected output:



If the input is connected to a flag:

- Double-click the flag:

If the input is connected to a line:

- Open the *context menu* (right mouse button) of the port symbol at the input and select the output in the *context menu*.
- Since an output can only be connected to an input, the *context menu* contains only an output:

The output is displayed in the centre of the drawing area.

3.3.2 Keyboard commands for navigation

Keyboard command	Function
<Picture ▲ >	Scroll up
<Picture ▼ >	Scroll down
<Shift> + <picture ▲ >	Scroll to the left
<Shift> + <picture ▼ >	Scroll to the right
<POS1>	Scroll to the left edge of the interconnection
<END>	Scroll to the right edge of the interconnection
<Ctrl> + <Pos1>	Scroll to the left upper corner of the interconnection
<Ctrl> + <End>	Scroll to the right lower corner of the interconnection

3.4 Creating/reconfiguring the interconnection

How to proceed:

1. Enable FB Editor.
   - Only required if a Lenze technology application is to be reconfigured.
   - If no application or the "empty application" from the catalogue has been selected, the FB Editor is already enabled.
2. Insert required objects into the interconnection.
3. Hide unneeded inputs/outputs of function blocks and system blocks to obtain a clearly arranged interconnection.
4. Arrange the objects in the drawing area in a reasonable manner.
5. Establish the connections required for the desired function.
6. If required, change (optimise) the processing order of the function blocks.
7. Compile the completed interconnection.

Tip!

Detailed information on the individual steps can be obtained from the following subchapters!

3.4.1 Enabling the FB Editor

If you have selected a technology application from the catalogue for the controller, the FB Editor is first in the "Viewer" mode. The interconnection of the technology application is displayed but cannot be modified.

To be able to reconfigure the defined interconnection and to add further functions, the FB Editor must be enabled explicitly.

Note!

When the FB Editor is enabled, the parameter dialogs for the technology application are replaced by general dialogs. The dialogs for the parameterisation of the system and function blocks contained in the interconnection can still be used.

Furthermore, all multiplexers are removed from the interconnection and the currently parameterised signal combinations are replaced by connections.

How to enable the FB Editor:

1. When being in offline mode, press the **Enable Editor** button.
2. Confirm the query whether the FB Editor is to be enabled with **OK**.

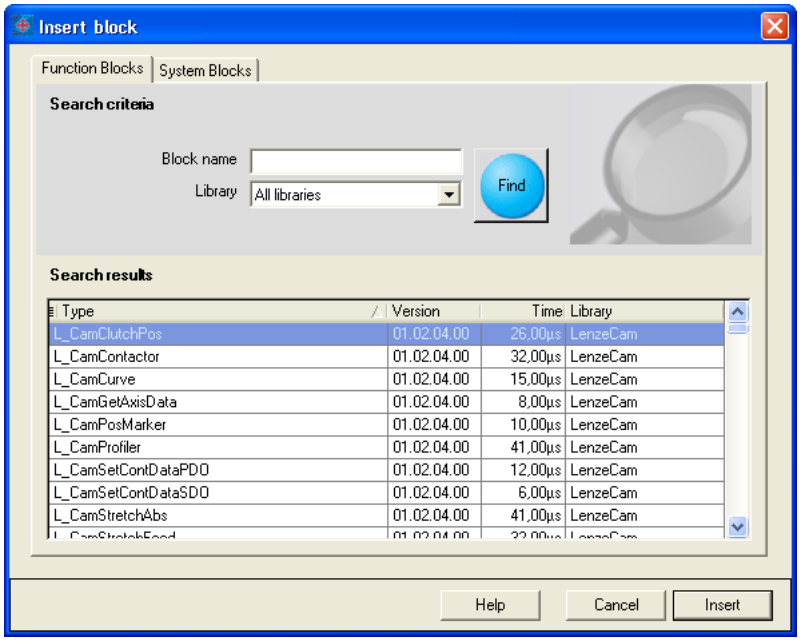
3.4.2 Insert/delete objects

Objects can be inserted in the interconnection via the *FB Editor toolbar* and the *context menu* of the drawing area. The following subchapters provide detailed information on how to insert/delete the different objects.

Icon	Function
	Inserting a function block (📖 53)
	Inserting a system block (📖 56)
	Inserting a port block (📖 58)
	Creating/inserting a variable (📖 59)
	Configuring/inserting a user code (📖 62)
	Inserting a comment (📖 67)

Tip!

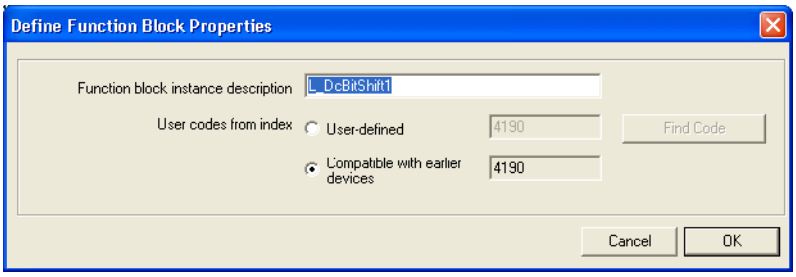
Use the *context menu* of the drawing area to insert a function block, system block, port block or comment directly to the current position of the mouse pointer in the drawing area.



If you insert an object via the corresponding icon in the *FB Editor toolbar*, the object is always placed at the top left corner in the drawing area.

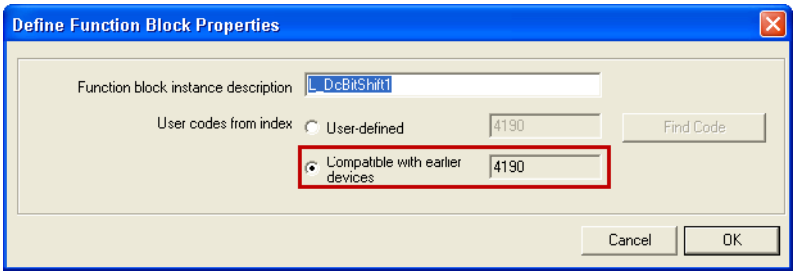
As of the »Engineer« V2.9, interconnection elements cannot only be copied within the same interconnection but also across all devices within the same project, as long as the devices stem from the same product family. ▸ Copying interconnection elements (across all devices) (📖 88)

3.4.2.1 Inserting a function block

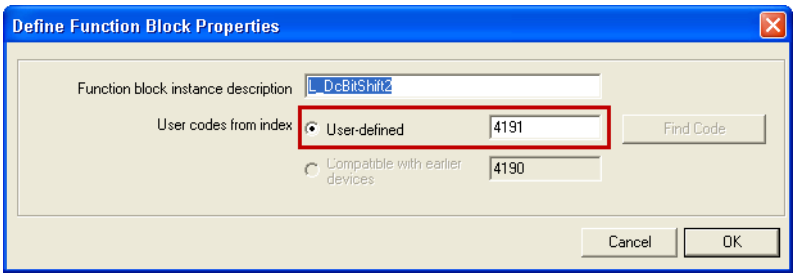


How to insert a function block into the interconnection:

1. Click the icon in the *FB editor toolbar*.
   - The *Insert block* dialog box appears.
2. Unless it is already displayed, select the **Function Blocks** tab.
   - All function blocks available are displayed in the **Search results** list field.



3. If required, define **search criterions** to accordingly narrow down the function blocks available:
   - **Block name**:
     String which must be contained in the name of the function block.
   - **Library**:
     Limitation of the selection to a specific function library.
4. After changing the search criteria, press the **Find** button to update the selection.
   - Then, only the function blocks complying with the features set in the search criteria are shown in the **Search Results** list field.
   - If no search criteria are set, all function blocks available are shown.
5. Select the function block to be inserted in the **Search results** list field.



6. Press **Insert** button.
   - The *Define Function Block Properties* dialog box appears.

7. If required, change the name preselected for the function block into a more significant name.
   - The instance name must not already be allocated within the interconnection.
8. If required, adapt the index for a parameterisable function block from which on the assignment of user codes for the parameters is to start.
   - If the user codes for the compatibility with earlier devices are not yet assigned, these are suggested for the function block:

   - If the user codes for the compatibility with earlier devices are already assigned, e.g. since an instance of the function block is already available in the interconnection, a free (user-defined) index will be automatically suggested which can also be changed, if required:

9. Press **OK**.
   - The function block selected is inserted in the interconnection.

Note!

The parameters described in this documentation are always listed together with the user code index that results from the selection of the option **Compatible with earlier devices**!

Context menu for the function block

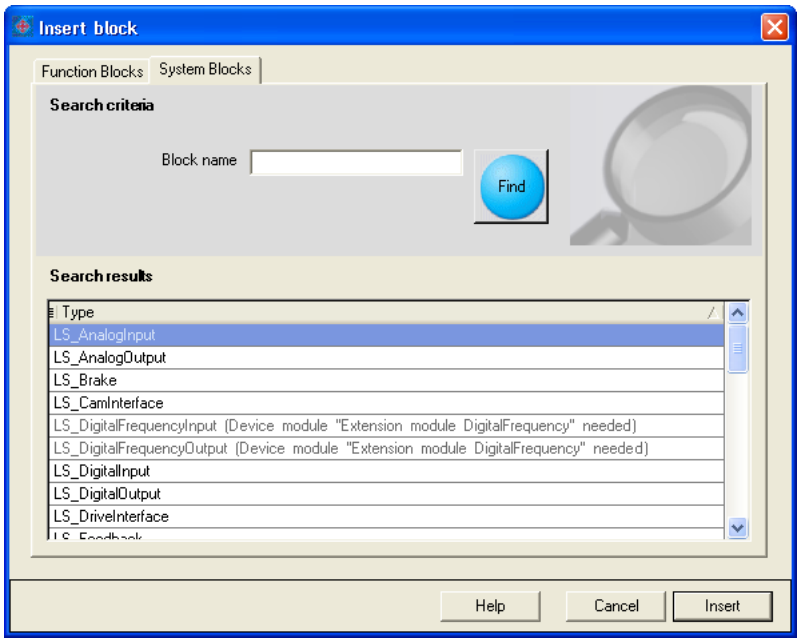
If you right-click on the header of a function block, a *context menu* opens via which you can execute the following functions in addition to the general processing functions (Copy, Insert, Delete):

	Command	Function
	Connector visibilities...	Define visible inputs and outputs for function blocks. ▸ Changing connector visibilities (📖 72)
	Order...	Change order index of the function block. ▸ Changing the processing order (📖 81)
	**Parameter...**	Open parameter list or parameterisation dialog of the function block. • Only if function block is parameterisable.
	**Properties**	Define function block properties.
	Display type names	Show FB type names (instead of FB instance names).

Related topics:

- Deleting objects that are no longer required (📖 70)
- Changing connector visibilities (📖 72)
- Arranging objects in the drawing area (📖 73)
- Creating/deleting connections (📖 74)
- Changing the processing order (📖 81)

3.4.2.2 Inserting a system block



A system block is inserted similarly to the way a function block is inserted.

Note!

In the FB editor, system blocks are only available in the *ApplicationTask*!

How to insert a system block into the interconnection:

1. Click the icon in the *FB editor toolbar*.
   - The *Insert block* dialog box appears.
2. Unless it is already displayed, select the **System Blocks** tab.
   - All system blocks available are displayed in the **Search results** list field.

   - System blocks which are not included already in the interconnection are not shown in the list field anymore.
   - System blocks which are displayed in grey cannot be inserted. Either a certain extension module is required or the function is not supported due to the licence level given by the memory module.
3. If required, define **Search criterions** to accordingly narrow down the system blocks available:
   - **Block name**:
     String which must be contained in the name of the system block.
4. After changing the search criteria, press the **Find** button to update the selection.
   - Then, only the system blocks complying with the features set in the search criteria are shown in the **Search Results** list field.
   - If no search criteria are set, all system blocks available are shown.
5. Select the system block to be inserted in the **Search results** list field.

6. Press **Insert** button.
   - The system block selected is inserted in the interconnection.

Context menu for the system block

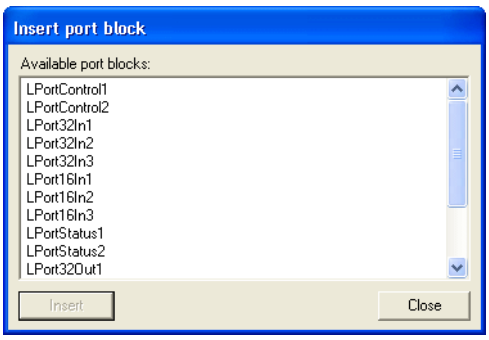
If you right-click on the header of a system block, a *context menu* opens via which you can execute the following functions in addition to the general processing functions (Copy, Insert, Delete):

	Command	Function
	Connector visibilities...	Define visible inputs and outputs for system blocks. ▸ Changing connector visibilities (📖 72)
	**Parameter...**	Open parameter list or parameterisation dialog of the system block.
	**Help**	Show online help for the system block.

Related topics:

- Deleting objects that are no longer required (📖 70)
- Changing connector visibilities (📖 72)
- Arranging objects in the drawing area (📖 73)
- Creating/deleting connections (📖 74)

3.4.2.3 Inserting a port block



All input/output ports defined for the application on the **Ports** tab can be inserted into the interconnection in the form of port blocks in order to receive access to the associated element variables.

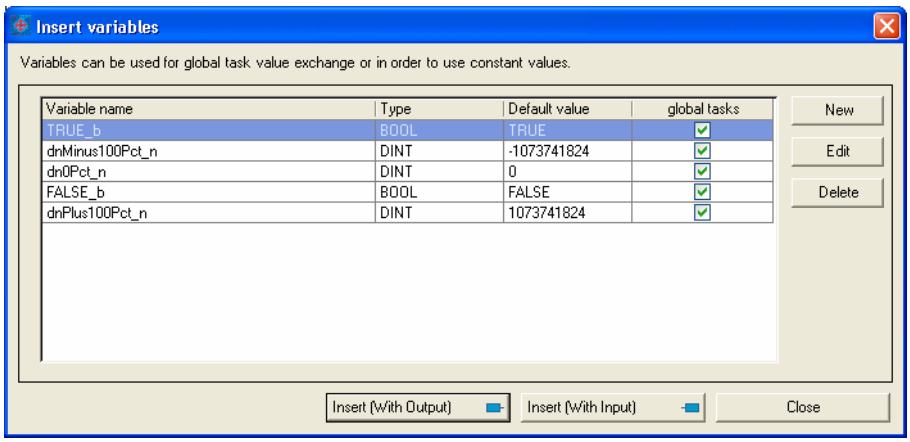
Tip!

You can change between the **Ports** and **FB Editor** tabs at any time to define new ports and afterwards insert them into the interconnection.

How to insert a port block into the interconnection:

1. Click the icon in the *FB editor toolbar*.
   - The *Insert port block* dialog box appears:

2. Select the desired port in the **Available port blocks** list field.
   - Ports which have already been inserted in the interconnection no longer are provided for selection in the **Available port blocks** list field.
3. Press **Insert** button.
   - The dialog box is closed and the port selected is inserted in the interconnection.



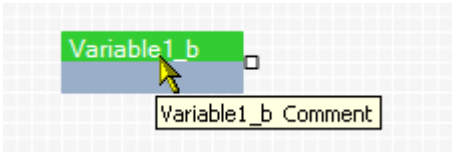
Related topics:

- Deleting objects that are no longer required (📖 70)
- Arranging objects in the drawing area (📖 73)
- Creating/deleting connections (📖 74)

3.4.2.4 Creating/inserting a variable

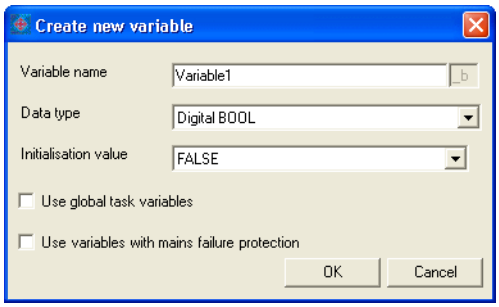
Click the icon in the *FB Editor toolbar* to open the *Insert variables* dialog box.

- The list field contains all variables created for the application:



- The buttons serve to execute the following functions:

Button	Function
New	Create new variable.
Edit	Edit selected variable.
Delete	Delete selected variable. • You can only delete a variable if it is not used anymore in the interconnection.
Insert (with output)	Insert selected variable with output into the interconnection and close dialog box.
Insert (with input)	Insert selected variable with input into the interconnection and close dialog box. • For a value assignment (write access), a variable can be inserted exactly once into the interconnection. • If the selected variable is already included in the interconnection with input, this button is deactivated.
Close	Close dialog box without inserting a variable into the interconnection.



Tip!

As of the »Engineer« V2.10 a comment can be inserted for variables when being declared. The comment is then shown as "tooltip" in the drawing area if you keep the mouse pointer for a short time on the variable block:

How to create a new variable:

1. Go to the *Insert variables* dialog box and press the **New** button.
   - The *Create new variable* dialog box for the declaration of a new variable is displayed:

2. If required, change the variable name preselected in the **Variable name** input field into a more significant name.
   - The variable name must not already be allocated within the interconnection.
3. Select the data type for the variable from the **Data type** list field.
   - In accordance with IEC 61131-3 integer data types can be selected.
   - The data types are prenamed according to their designation.
4. If required, adapt the value preselected in the **Initialisation value** input field the variable is to be initialised with.
   - The initialisation value must be given in the internal quantity.
   ▸ Signal types & scaling (📖 29)
5. Optionally enter a comment on the variable in the **Comment** input field.
6. Activate the **Use global task variables** control field if the variable is to be used in several tasks.
7. Activate the **Use variables with mains failure protection** if the value is to be saved with mains failure protection.
8. Press **OK**.
   - The *Create new variable* dialog box is closed and the newly created variable is listed in the *Insert variables* dialog box.

Insert a variable into the interconnection

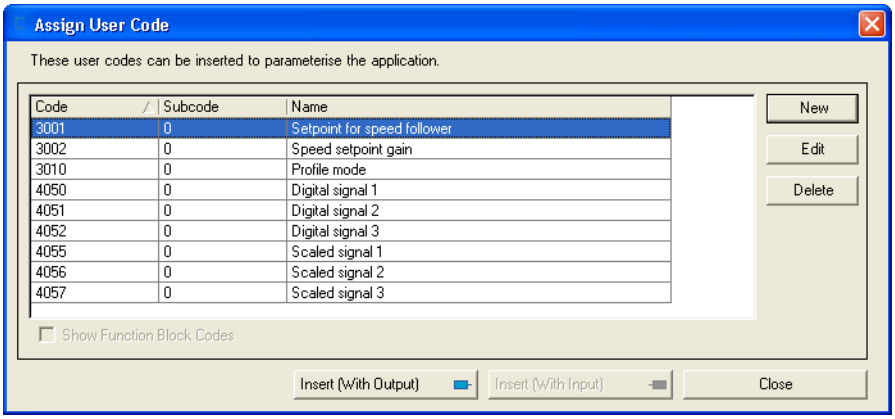
A variable contained in the list field can be inserted exactly once with an input (for value assignment) into the interconnection and as often as required with an output (for read access).

How to insert a variable into the interconnection:

1. Go to the *Insert variables* dialog box and select the variable to be inserted in the list field.
2. Press the **Insert (with output)** or **Insert (with input)** button to insert a variable with input or output into the interconnection.

Note!

Variables are only assigned at the end of the task cycle! Thus, the variable value will only be effective in the next task cycle!



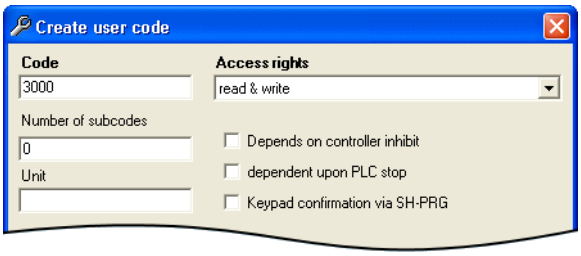
Related topics:

- Deleting objects that are no longer required (📖 70)
- Deleting variables and user codes from the application (📖 71)
- Arranging objects in the drawing area (📖 73)
- Creating/deleting connections (📖 74)

3.4.2.5 Configuring/inserting a user code

Click the icon in the *FB Editor toolbar* to open the *Assign User Code* dialog box.

- The list field contains all configured user codes created for the application:

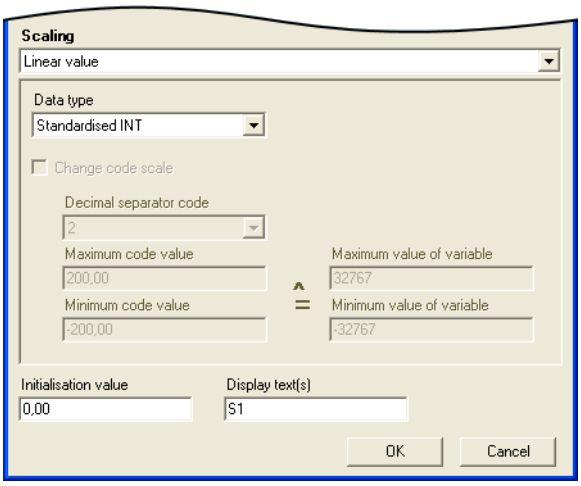


- The buttons serve to execute the following functions:

Button	Function
New	Configure new user codes.
Edit	Edit selected user code.
Delete	Delete selected user code. • You can only delete a user code if it is not used anymore in the interconnection.
Insert (with output)	Insert selected user code with output into the interconnection and close dialog box.
Insert (with input)	Insert selected user code with input into the interconnection and close dialog box. • For a value assignment (write access), a user code can be inserted exactly once into the interconnection. • If the selected user code is already included in the interconnection with input, this button is deactivated.
Close	Close dialog box without inserting a user code into the interconnection.

How to configure a new user code:

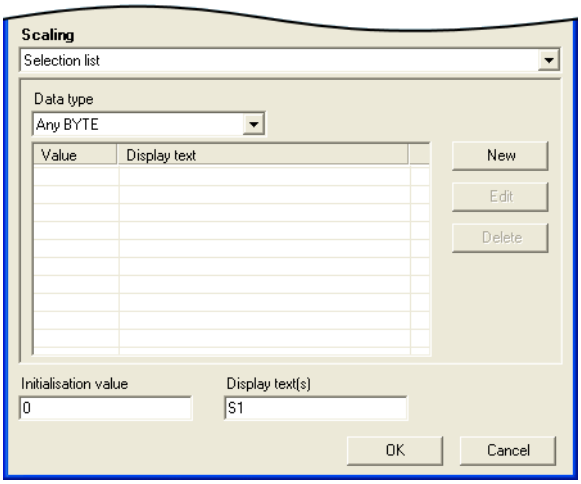
1. Go to the *Assign User Code* dialog box and press the **New** button.
   - The *Create user code* dialog box for configuring a new user code is displayed.



2. Configure the properties of the user code.
   - See the following section "Properties of a user code".
3. Press **OK**.
   - The *Create user code* dialog box is closed and the newly configured user code is listed in the *Assign User Code* dialog box.

Properties of a user code

Input field	Information	
Code	Code number • The next free code number is already entered into the input field. • The range of 3000 ... 9999 is available for user codes. • The code number must not already be allocated within the application.	
Access rights	Selection whether only read or also write access to user code should be possible. For a user code with write access, the following properties can be configured in addition:	
	Depends on controller inhibit	Set a checkmark in this control field if the user code should only be parameterised when the controller is inhibited.
	Dependent upon PLC stop	Set a checkmark into this control field if the user code should only be parameterised when the application is stopped.
	Keypad confirmation via SH-PRG	Set a checkmark into this control field if the parameterisation of the user code should be confirmed using the keypad.
Number of subcodes	Number of subcodes (0 ... 255) • If subcodes have been defined, the initialisation values and display texts are configured in the *Initialisation values* dialog box, which you open via the **Subcodes...** button.	
Unit	Optional text • The unit is displayed in the »Engineer« parameter list and in the keypad for the user code.	
Scaling	Selection whether the user code is to be displayed with a linear value or a selection list. • Depending on the selection, the other possible settings for the user code change.	



Input field	Information
Initialisation value	Value the user code is initialised with. • If subcodes have been defined, the initialisation values are configured in the *Initialisation values* dialog box instead, which you open via the **Subcodes...** button.
Display text(s)	Any display text for the user code • The display text is displayed in the FB Editor in the header of the user code, in the »Engineer« parameter list, and in the keypad for the user code. • If subcodes have been defined, the display texts are configured in the *Initialisation values* dialog box instead, which you open via the **Subcodes...** button.

User code with "Linear value" scaling

Input field	Information
Data type	Data type • The available data types are prenamed according to their designation.
Change code scaling	Set a checkmark in this control field if you want to change the preset scaling of the user code. • Then you can change the preset scaling and the number of decimal positions via the activated input fields. • The preset scaling can only be changed for the "Other BYTE/ WORD/ DWORD/INT/DINT" data types.

User code with "selection list" scaling

Input field	Information
Data type	Data type • The available data types are prenamed according to their designation.
Value	The value assigned to the selection
Display text	Any display text for the selection • The text is displayed in the »Engineer« parameter list and in the keypad in the selection list for the user code.

Button	Function
New	Create a new entry for the selection list.
Edit	Edit selected entry.
Delete	Delete selected entry from the selection list.

Insert a user code into the interconnection

A user code contained in the list field can be inserted exactly once with input (for value assignment) into the interconnection and as often as required with one output (for read access).

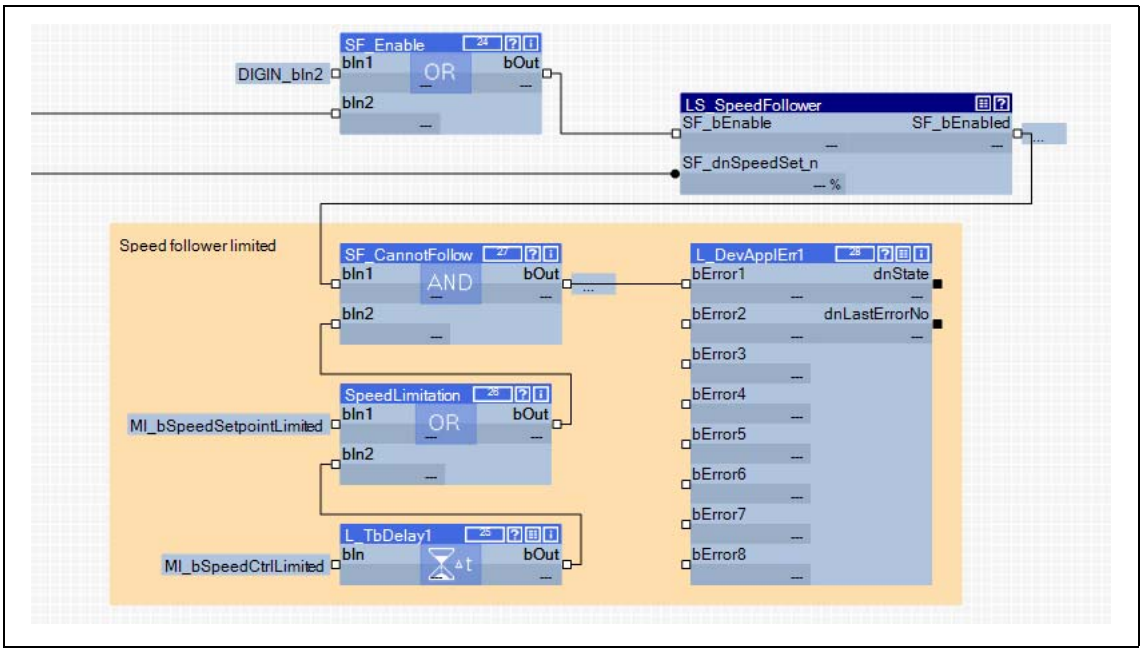
How to insert a user code into the interconnection:

1. Go to the *Assign User Code* dialog box and select the user code to be inserted in the list field.
2. Press the **Insert (with output)** or **Insert (with input)** button to insert a user code with input or output into the interconnection.

Context menu for user code

If you right-click on the header of a user code, a *context menu* opens via which you can execute the following functions in addition to the general processing functions (Copy, Insert, Delete):

	Command	Function
	**Changing a value**	Display/change value of the user code.



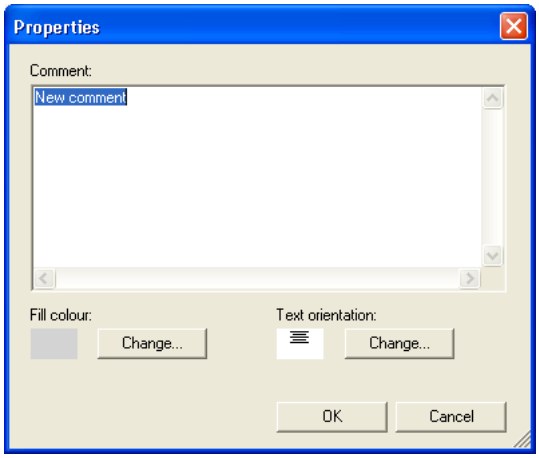
Related topics:

- Deleting objects that are no longer required (📖 70)
- Deleting variables and user codes from the application (📖 71)
- Arranging objects in the drawing area (📖 73)
- Creating/deleting connections (📖 74)

3.4.2.6 Inserting a comment

Comments can be entered into any position in the drawing area.

As of the »Engineer« V2.10 the interior colour and text alignment of a comment can be changed via a properties dialog. Now the sizes of comments can also be changed using the mouse pointer. When using different interior colours you can use comments to graphically arrange areas that belong together in terms of function or separate them from other areas:



[3-2] Example: Graphical arrangement of FBs by means of a comment

Note!

The term "Arrangement" does not mean a logical arrangement of the function blocks. The comments are only graphical presentation elements of the FB Editor.

How to insert a new comment into the interconnection:

1. Move the mouse pointer to the (free) position in the drawing area where the comment is to be inserted.
2. Select the **New comment** command in the *context menu* (right mouse button).
   - The *Properties* dialog is displayed:

3. Enter the required comment into the text field.
4. Optional: Change preset interior colour.
   - For this purpose, click the left **Change...** button to open the *Colour* dialog box to select another interior colour.
5. Optional: Change preset text alignment.
   - For this purpose, click the right **Change...** button to open the *Text alignment* dialog box to select another interior colour.
6. Press **OK** to close the *Properties* dialog box and insert the comment.
   - After being inserted, the corner points of the comments are shown:

7. Optional: Change size of the comment.
   - For this purpose click one of the corner points with the left mouse button and enlarge the comment to the required size with the mouse button pressed.

8. Optional: Drag comment.
   - For this purpose click the comment with the left mouse button and move the comment to the required position with the mouse button pressed.

Tip!

The *Properties* dialog box for a comment already available can be opened by double-clicking the comment.

Related topics:

- Deleting objects that are no longer required (📖 70)
- Arranging objects in the drawing area (📖 73)
- Creating/deleting connections (📖 74)

3.4.2.7 Deleting objects that are no longer required

Objects that are no longer required can be easily deleted again. "Delete" only means that the object is removed from the drawing area. If you have deleted an object from the drawing area, you can reinsert it any time into the interconnection.

Note!

Deleting an object cannot be undone.

Together with the object, all available connections to this object are deleted.

How to delete objects that are no longer required:

1. Select objects to be deleted.
   - You can select a single object by clicking the header of the object.
   - You can select objects that are placed together by drawing a frame around these objects while keeping the mouse button pressed.
   - If you click the header of further objects while pressing **<Ctrl>**, these will be added to an already existing selection (multi-selection).
   - All selected objects are highlighted by a light green header.
2. Press **<Del>**.

Related topics:

- Deleting variables and user codes from the application (📖 71)
- Deleting connections that are no longer required (📖 80)

3.4.2.8 Deleting variables and user codes from the application

Variables and user codes that are no longer required can be also deleted completely from the application.

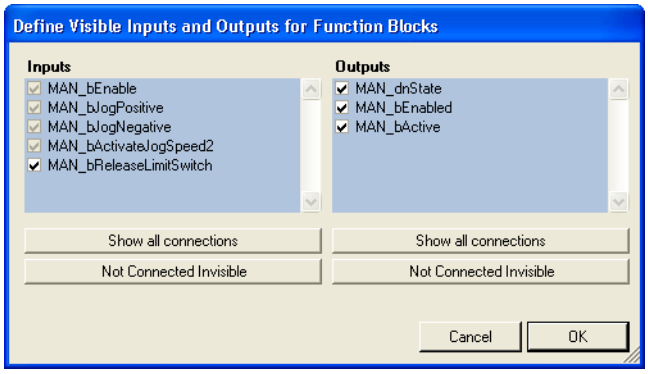
How to delete a variable completely from the application:

1. Delete all occurrences of the variable in the interconnection.
2. Click the icon to open the *Insert variables* dialog box.
3. Select the variable from the list field.
4. Press **Delete**.
5. Confirm the query whether the variable is to be deleted irrevocably with **OK**.
6. Press **Close** to close the *Insert variables* dialog box again.

How to delete a user code completely from the application:

1. Delete all occurrences of the user code in the interconnection.
2. Click the icon to open the *Assign User Code* dialog box.
3. Select the user code from the list field.
4. Press **Delete**.
5. Confirm the query whether the user code is to be deleted irrevocably with **OK**.
6. Press **Close** to close the *Assign User Code* dialog box again.

Related topics:



- Deleting objects that are no longer required (📖 70)
- Deleting connections that are no longer required (📖 80)

3.4.3 Changing connector visibilities

Inputs and outputs that are not connected can be hidden for each function and system block. This serves to reduce the dimension of the block. The interconnection becomes clearer.

How to define the visible inputs and outputs:

1. Go to the context menu of the block and select the **Connector visibilities** command.
   - The *Define Visible Inputs and Outputs for Function Blocks* is displayed:

   - All visible connections have a checkmark.
   - In case of a block that is inserted anew, all inputs and outputs are visible at first.
   - Inputs and outputs with a light grey checkbox are already connected and thus cannot be hidden.
2. By setting/removing the checkmarks or via the buttons you can define the visible inputs and outputs.
3. Press **OK** to accept the selected definition and close the dialog box.

3.4.4 Arranging objects in the drawing area

All objects can be freely arranged in the drawing area by dragging with the mouse.

We recommend to make an arrangement in which the required connections between the inputs and outputs can be created easily. A division into functional areas may also be sensible to get a better understanding of the application.

Objects which are already connected, can also be dragged to another (free) position in the drawing area. The available connections will be automatically re-routed after dragging.

How to drag an object:

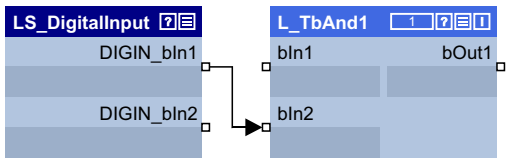
1. Click the header of the object (and keep the button pressed).
2. Keep the button pressed and drag the object to the required position in the drawing area.
   - Via **<Esc>** you can cancel this action.

How to drag several objects at the same time:

1. Select the objects to be dragged.
   - You can select a single object by clicking the header of the object.
   - If you click the header of further objects while pressing **<Ctrl>**, these will be added to an already existing selection (multi-selection).
   - You can easily select objects that are placed together by drawing a frame around these objects while keeping the mouse button pressed.
   - All selected objects are highlighted by a light green header.
2. Keep the mouse button pressed on the header of one of the selected objects and drag it to the required position in the drawing area.
   - Via **<Esc>** you can cancel this action.

Note!

A red header indicates that the object overlaps with other objects in the drawing area!

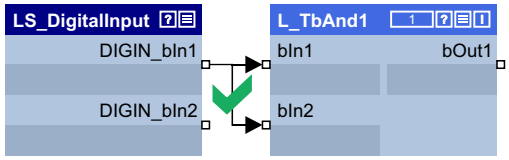


Arrange the objects so that no overlap occurs.

3.4.5 Creating/deleting connections

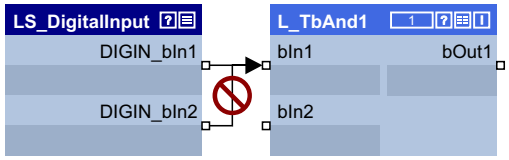
After adding objects and arranging them in a reasonable manner within the drawing area, you can create the connections between the available objects which are required for the desired function.

A connection always has a direction and therefore always has a source and a target.



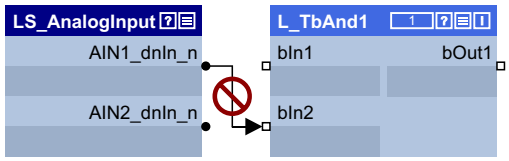
- An output represents a possible source in the interconnection.
- An input represents a possible target in the interconnection.

Permissible/impermissible connections



Several connections can lead from one output.

- Therefore it is always possible to start a new connection from an output.

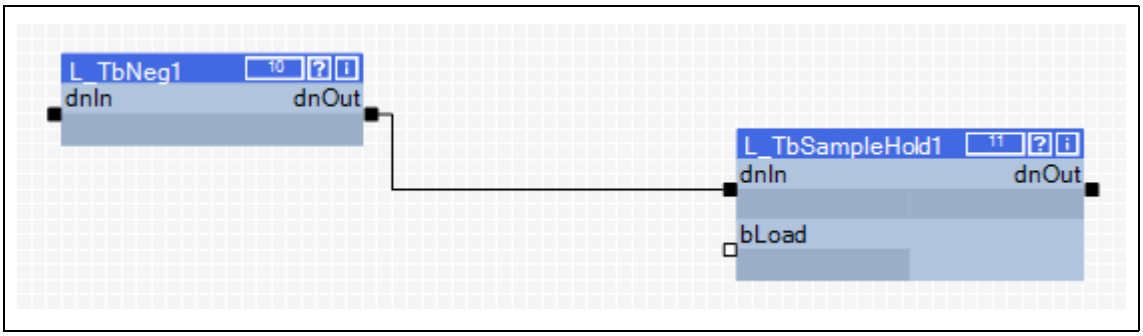


However, maximally one connection may end in an input.

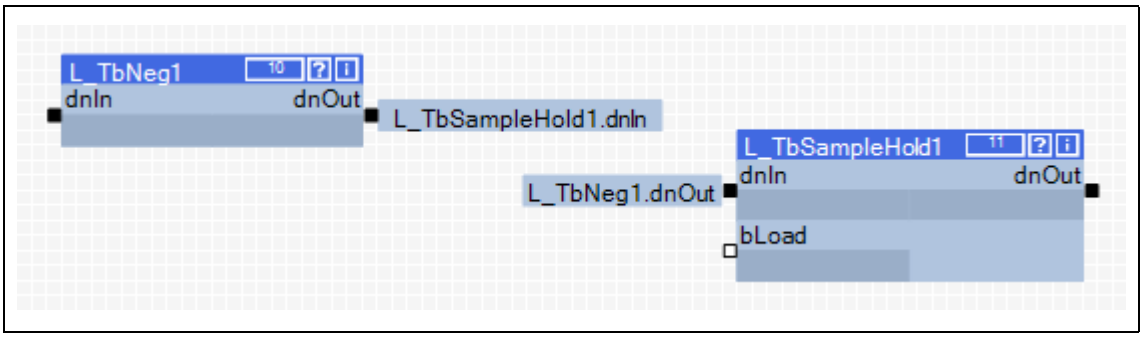
- Therefore it is only possible to start a new connection from an input if there is no connection already ending in this input.

Only inputs/outputs of the same signal type (with the same port symbol) can be connected.

- Non-standardised inputs/outputs can be connected if the input and output have the same resolution.



Tip!

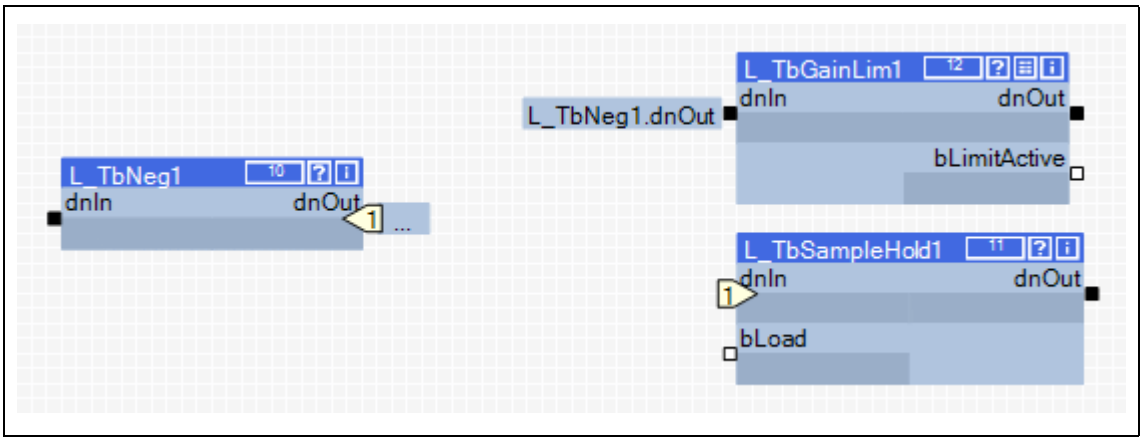


From »Engineer« V2.9, conversion blocks requiring additional computing time are not needed anymore for type conversion purposes. Instead, type conversion is performed implicitly. ▸ Data type check/implicit type conversion (📖 30)

Connection types

Connections can either be created by means of connection lines or port identifiers ("flags")

[3-3] Example 1: Connection via connection line



[3-4] Example 2: Connection via flags

Tip!

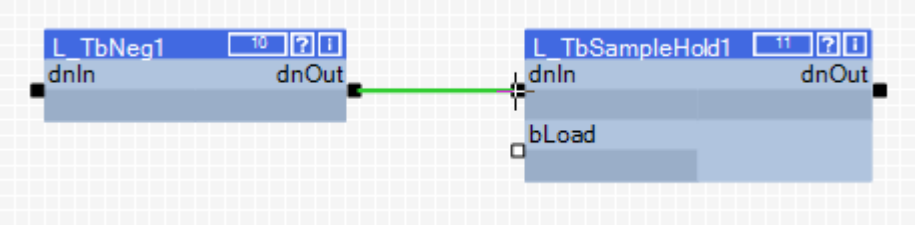
The commands **Show as flag** or **Show as line** in the *context menu* of a connection serve to change the representation of the connection at any time.

If both connection types are used for an output, the available connection lines are converted into small yellow flags with an automatically assigned number:

[3-5] Example 3: Connection of an output once with port identifier, once with connection line

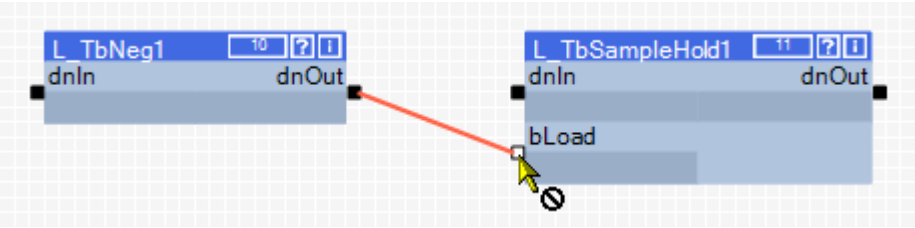
- Three points ("...") are shown at the output instead of the concrete input identifier.
- The *context menu* for the port symbol contains all inputs which are connected to the output.

3.4.5.1 Creating a connection using the connection line



How to create a connection using the connection line:

1. Click the port symbol from which the new connection is to be started.
   - It is only possible to start a new connection from an input if there is no connection already ending in this input.
   - If you then move the mouse pointer away from the port symbol, a new connection is "drawn" from this port symbol.
   - Via **<Esc>** you can cancel this action.
2. Click the port symbol where the connection is to end.
   - Thereupon the corresponding connection is routed automatically if the connection is permissible.



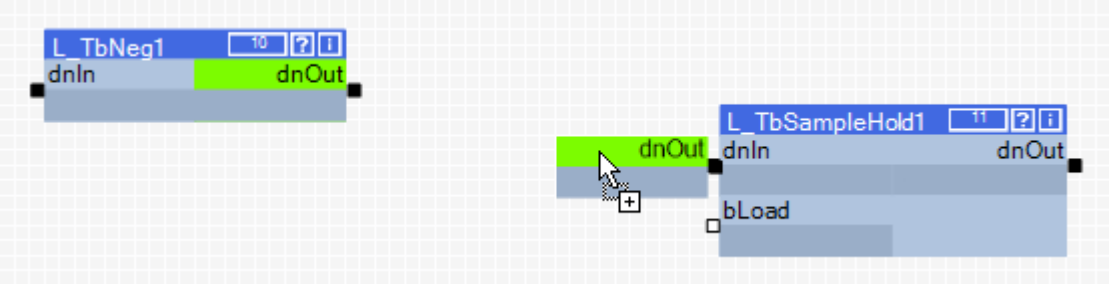
Tip!

If you move the mouse pointer across the port symbol while drawing a new connection, you can see whether the connection is permissible or not from the colour of the drawn line and from the mouse pointer symbol.

- Permissible connection:

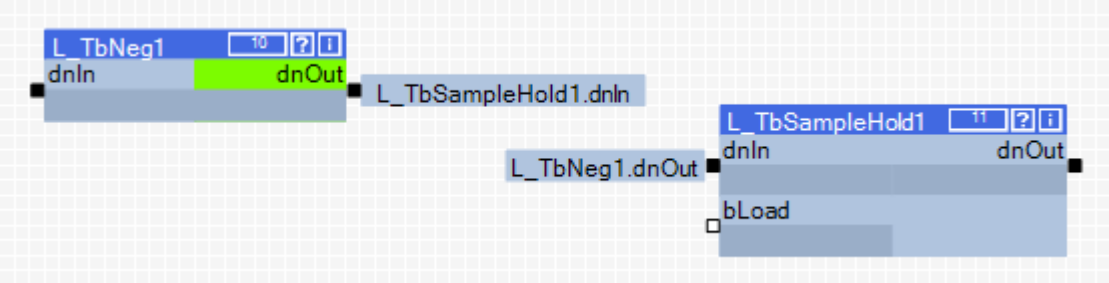
- Impermissible connection (different port symbol):

The command **Show as flag** in the *context menu* of a line serves to change the representation of the connection at any time.



3.4.5.2 Creating a connection using port identifiers

How to create a connection with port identifiers:

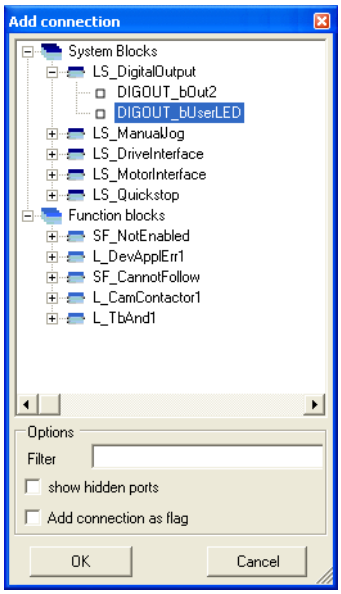


1. Click the port identifier.
   - The selected port is highlighted in light green:

2. Drag the port segment to the required port while keeping the left mouse button pressed:

After releasing the mouse button, the connection via port identifiers (flags) is created. The corresponding port identifier consists of the instance name and the name of the input/output:

Tip!



The command **Show as line** in the *context menu* of a flag serves to change the representation of the connection at any time.

3.4.5.3 Creating a connection via connection dialog

You can also create connections by means of a selection dialog instead of dragging by mouse. This especially makes sense if there is a great distance between the ports to be connected in the drawing area.

How to create a connection using the selection dialog:

1. Right-click the port identifier or click the port symbol from which the connection is to start.
   - The *context menu* for the port is displayed.
2. Go to the *context menu* for the port and select the **Add connection...** command.
   - The *Add connection* dialog box is displayed:

   - In a tree structure all inputs and outputs of the application are shown to which a connection is permissible.
   - You can enter an optional text into the **Filter** input field to reduce the selection to the blocks or ports which contain the entered text.
   - If you activate the **Show hidden ports** control field, the hidden ports for system and function blocks are shown as well.
3. Select the port where the connection is to end from the tree structure.
4. Activate the **Add connection as flag** control field if a port identifier (flag) is to be inserted instead of a connection line.
5. Press **OK** to create the connection to the selected port and close the dialog box.

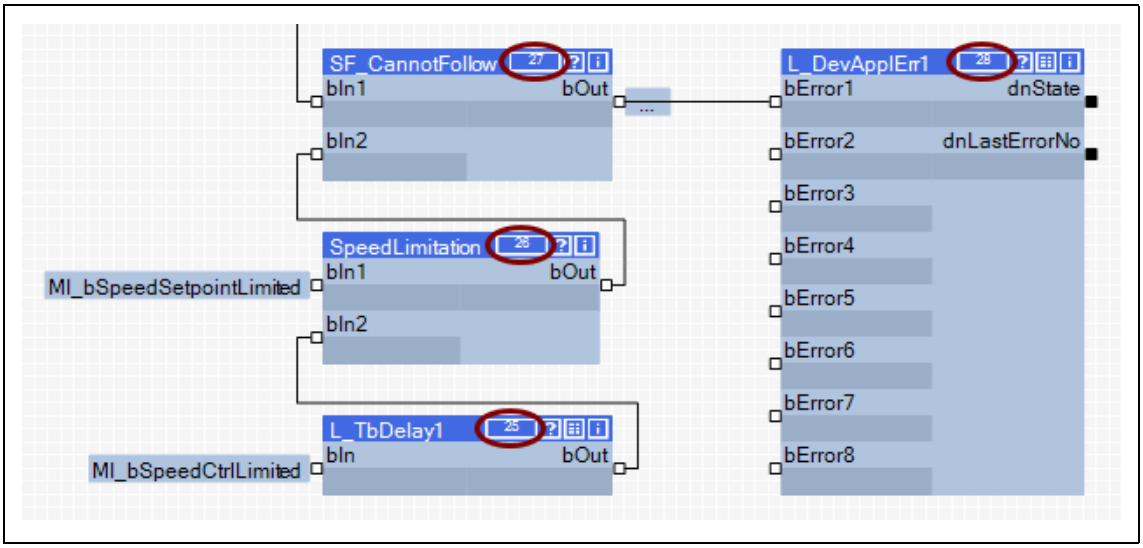
3.4.5.4 Deleting connections that are no longer required

How to delete connection lines:

1. Select connection lines to be deleted.
   - Select a single connection line by directly clicking on the connection line with the right mouse button.
   - If you click further connection lines while pressing **<Ctrl>** they are added to an already existing selection (multi-selection).
   - All connection lines are highlighted in red.
2. Press **<Del>**.

How to delete port identifiers/flags:

1. Select the port identifiers to be deleted.
   - Select a single port identifier by directly clicking on the port identifier with the left mouse button.
   - If you click further port identifiers while pressing **<Ctrl>** they are added to an already existing selection (multi-selection).
   - All selected port identifiers are highlighted by a light green header.
2. Press **<Del>**.



Related topics:

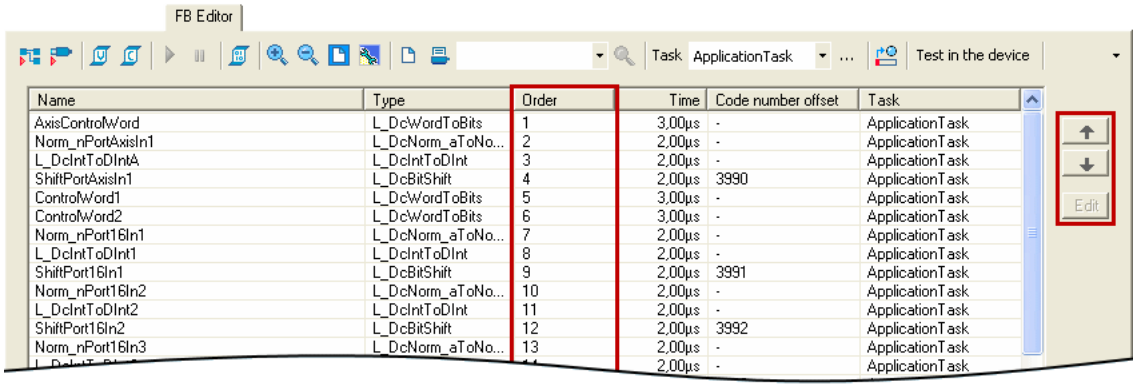
▸ Deleting objects that are no longer required (📖 70)

3.4.6 Changing the processing order

If you insert a function block into the interconnection, an order index is automatically assigned to this function block. By means of this order index it is defined in which order the individual function blocks are calculated with regard to the runtime.

- The first function block inserted contains the order index "1", the next function block inserted contains the order index "2", etc.
- The respective order index is displayed in the header of the function block in the rectangle after the instance name.

[3-6] Example: Function blocks with order index 25 ... 28



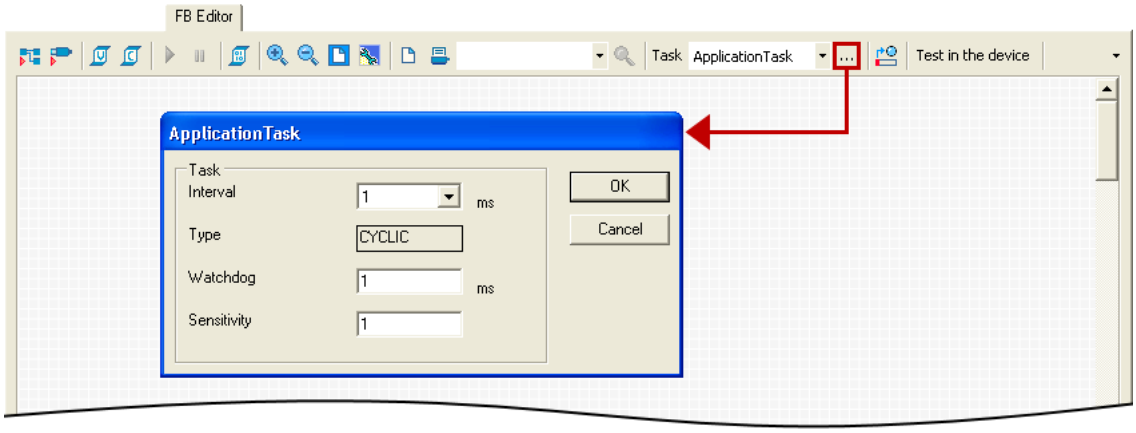
Note!

When a function block is shifted, its order index is maintained.

The order of processing has an impact on the result and has to be altered in specific cases.

How to change the processing order:

1. Use the list field at the top right to change from the Editor to the overview.
   - The overview displays all function blocks, system blocks, and port blocks of the interconnection in the order of their processing
   - In the "Order" column the order index of each function block is listed.



Name	Type	Order	Time	Code number offset	Task
AxisControlWord	L_DcWordToBits	1	3,00µs	-	ApplicationTask
Norm_nPortAxisIn1	L_DcNorm_aToNo...	2	2,00µs	-	ApplicationTask
L_DcIntToDIntA	L_DcIntToDInt	3	2,00µs	-	ApplicationTask
ShiftPortAxisIn1	L_DcBitShift	4	2,00µs	3990	ApplicationTask
ControlWord1	L_DcWordToBits	5	3,00µs	-	ApplicationTask
ControlWord2	L_DcWordToBits	6	3,00µs	-	ApplicationTask
Norm_nPort16In1	L_DcNorm_aToNo...	7	2,00µs	-	ApplicationTask
L_DcIntToDInt1	L_DcIntToDInt	8	2,00µs	-	ApplicationTask
ShiftPort16In1	L_DcBitShift	9	2,00µs	3991	ApplicationTask
Norm_nPort16In2	L_DcNorm_aToNo...	10	2,00µs	-	ApplicationTask
L_DcIntToDInt2	L_DcIntToDInt	11	2,00µs	-	ApplicationTask
ShiftPort16In2	L_DcBitShift	12	2,00µs	3992	ApplicationTask
Norm_nPort16In3	L_DcNorm_aToNo...	13	2,00µs	-	ApplicationTask
			2,00µs	-	ApplicationTask

2. Select the function block which is to receive a different position within the processing order.
3. Move the function block to the desired position using the ↑ and ↓ buttons.
   - The Edit button serves to directly assign another order index to the selected function block per dialog.

3.4.7 Configuring the task properties

By clicking the ... button right beside the **Task** list field, you open a dialog box where you can see and, if required, change the properties (interval, type, watchdog, sensitivity) of the selected task.

Monitoring of the task runtime

The runtime of the UserTask and ApplicationTask is monitored by the controller. A "watchdog" is used for monitoring by continuously checking if both tasks are executed correctly within the defined time frame.

- The **Watchdog** input field serves to set the maximum runtime for the selected task.
- The **Sensitivity** input field serves to define how many times the set maximum runtime of the task can be exceeded before the monitoring mode is activated.
  - The sensitivity is provided with a counter which is reset to zero when the current runtime of the task is within the set maximum runtime again.
- When the monitoring mode of the task runtime is activated:
  - The "Error" response takes place in the Lenze setting, i.e. pulse inhibit and controller inhibit are set. The error response can be parameterised in C02111.
  - The error message "ApplicationTask: Overflow" or "UserTask: Overflow" is entered.

Note!

The runtime of the IdleTask is not monitored by the controller.

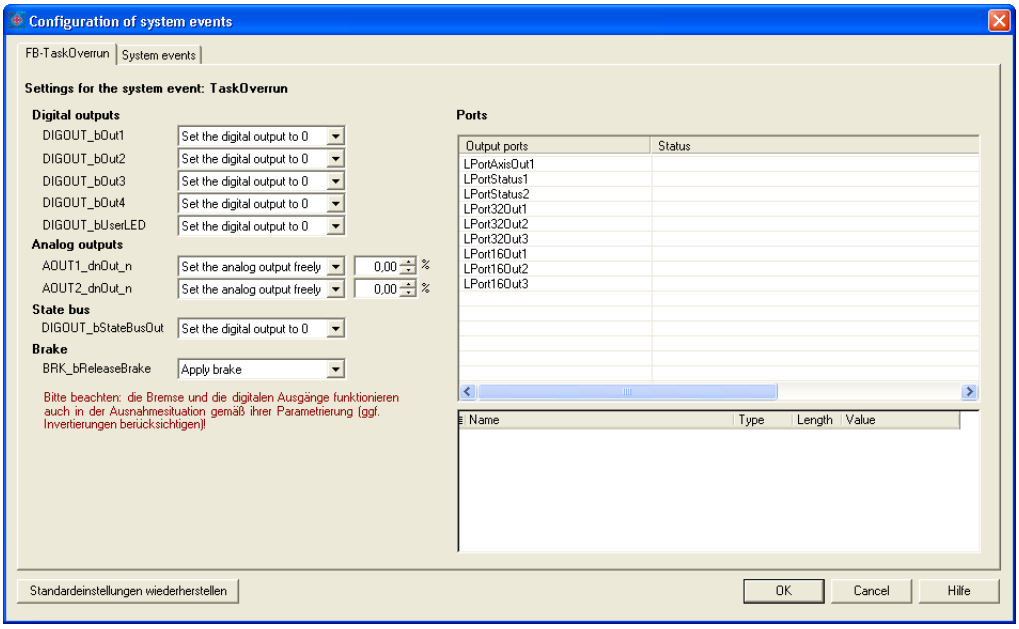
- Multitasking in the Servo Drive 9400 (📖 32)
- Task selection (📖 43)



3.4.8 Configuring the exception handling

This function will be available as of »Engineer« V2.10!

For the 9400 HighLine controller, the behaviour after a task overflow can be configured for the analog and digital outputs, the brake control, and the output ports and thus be adapted to the corresponding application.

How to configure the exception handling:

1. Go to the *FB Editor toolbar* and click the icon to open the *Exception handling* dialog box:

   - The **FB-TaskOverrun** tab serves to configure the behaviour of the outputs of the controller and the output ports defined in the application in case of a task overflow.
   - In the **FB System Events** tab, the behaviour of the outputs of the drive controller and the application are only displayed and cannot be configured.

2. Carry out the desired configuration.
   - Each output can be configured individually. A free value can be set for the analog outputs (-200.00 ... 200.00 %).
   - If you select an output port in the "Ports" area on the right, all application variables for this output port are shown in the table below. In the "Value" column a value can be set for each application variable to which it is to be set if an event occurs can be specified.
   - If a value has been set for at least one application variable, the status "Exceptional behaviour parameterised" is shown for the corresponding output port.
   - If the **Restore standard settings** button is clicked, the default setting for task overflow is restored. In this case, all output terminals would be set to LOW level or 0 V in the event of a task overflow and the output ports would retain their last value.

3. Click **OK** to accept the configuration and close the dialog box.

Danger!

In case a task overflow occurs, the brake can be configured to "open". This setting should be used with care as the brake is then forcibly opened and does not close even if the drive controller is inhibited!

Note!

- To render the changes effective within the controller, the project has to be updated, and the changed application has to be transferred to the controller.
- During the reset or download of an application, all output signals are set to LOW level or 0 V for a short time (the state bus, in contrast, is set to HIGH level due to harware inversion).

3.4.9 Compiling the completed interconnection

How to compile the completed interconnection:

1. Click the icon in the *FB editor toolbar*.
   - The *Update project* dialog box appears.
2. Press the **Create** button to update the project.
   - After the update is completed successfully, a corresponding note appears.

3.4.10 Testing the interconnection in the device

This function will be available as of »Engineer« V2.9!

This function serves to transfer the compiled interconnection for testing to the volatile memory (RAM) of the controller after the FB interconnection has changed.

Since only the binary file and the connection table are transmitted to the device instead of the complete application, the transfer is quicker than with the regular function "Download program".

Note!

This function will be supported as of controller firmware V5.0.

After mains switching, the original application is reloaded which is stored in the memory module.

In order to store the application, which has been transferred to the volatile memory (RAM) for test purposes, completely and with mains failure protection in the memory module, the regular function "Download program" must be executed. Thus, the corresponding »Engineer« project is required to save the tested application with mains failure protection.

To check the current function block interconnection in the device:
Go to the *FB Editor toolbar* and click the **Test in the device** button.

Sequence

1. If the current status of the FB Editor does not correspond to the device update executed last, first the available function for updating a single device is called.
   - This generates all files to be transferred to the device.
   - A note may appear that first the networks should be updated.
2. If there was no online connection to the device yet, it will be established now.
3. A note appears that the controller is automatically inhibited for this function and the application is stopped and the application will be automatically started after the transfer and the controller will be enabled.
4. The »Engineer« checks if the function is supported by the device and if the memory available in the device is sufficient.
   - If not, the function is closed with a corresponding note. In this case, use the regular function "Download program".
5. The controller is inhibited and the function is stopped.
6. The application is transferred to the volatile memory of the device.
7. After successful download:
   - The transferred application is started automatically and the controller is enabled.
   - The value "99" is displayed in C00007 (active application).
   - The "Application program volatile in the device" is displayed in the *FB Editor status bar* .

Tip!

When an online connection has been established, the parameters of the application stored in the volatile memory can be read and changed using the »Engineer« as usual if the corresponding »Engineer« project is open.

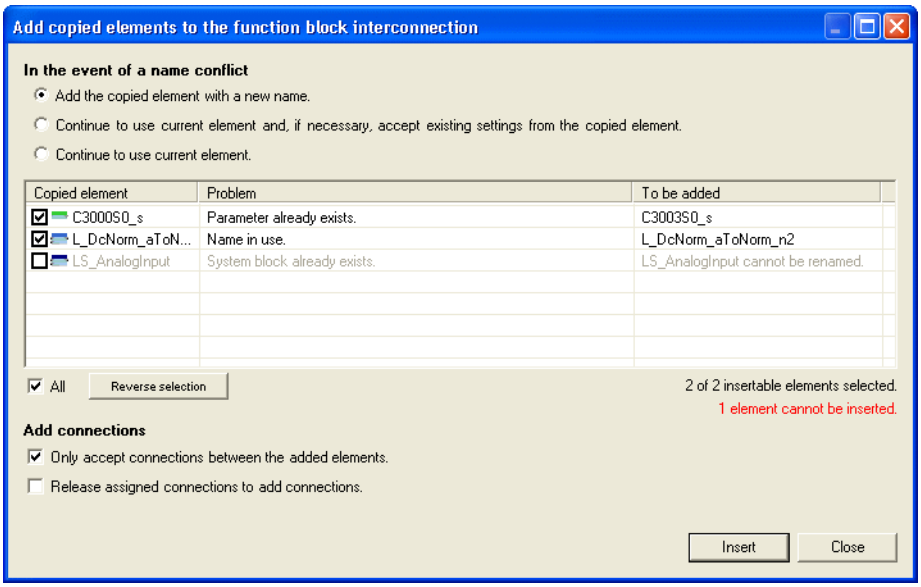
3.4.11 Copying interconnection elements (across all devices)

This function will be available as of »Engineer« V2.9!

As of the »Engineer« V2.9, interconnection elements cannot only be copied within the same interconnection but also across all devices within the same project, as long as the devices stem from the same product family (e.g. Servo Drives 9400).

All types of blocks and comments can be copied to the clipboard via the **Copy** command or the **<Ctrl>+<c>** shortcut and then be inserted into the FB interconnection of the same or another project device of the same product family using the **Insert** command or the **<Ctrl>+<v>** shortcut.

- During the copy process into the clipboard, existing connections between copied blocks are copied as well, and the layout is kept too. Moreover, the separate technical objects (port definition, variable declaration, and user code declaration) are copied. Selected connections cannot be copied on their own.
- The **Insert** command is available if the clipboard is not empty and if it was copied from a device of the same product family. Within this product family, all device types (e.g. 9400 xxxxLine Vxx.xx) are permitted.
- After the **Insert** command has been selected, a dialog box is displayed which serves to select which elements are to be inserted from the clipboard and how to solve name conflicts, if any.
- After inserting the elements, they are marked in the target interconnection in order to be repositioned or deleted again to undo the insertion.
- Inserting from the clipboard can be repeated. The originally copied contents of the clipboard remains unchanged when it is inserted.



How to copy one or several interconnection elements:

1. Select the objects to be copied.
   - You can select a single object by clicking the header of the object.
   - If you click the header of further objects while pressing **<Ctrl>**, these will be added to an already existing selection (multi-selection).
   - You can easily select elements that are placed together by drawing a frame around these elements while keeping the mouse button pressed.
   - All selected objects are highlighted by a light green header.
2. Go to the *context menu* and select the **Copy** command (or **<Ctrl>+<c>**).
   - The selected elements are copied into the clipboard of the FB Editor.
3. If the elements are to be copied into a function block interconnection of another project device, change to the corresponding interconnection via the *project view*.
4. Go to the *context menu* and select the **Insert** command (or **<Ctrl>+<v>**).
5. Go to the *Insert copied elements into the FB interconnection* and select which elements from the clipboard are to be inserted and how to solve name conflicts, if any.
   - Detailed information on this dialog box can be obtained from the following subchapter "Insert options for copied elements". (📖 90)

6. Click **Insert** to insert the selected elements into the target interconnection as defined.
   - Only possible if at least one element in the list has been selected for insertion.
   - Insertion is also possible via the **<Enter>** button if at least one element is selected in the list for insertion.
   - The original layout and the relative position of the inserted blocks to each other are maintained.
   - When copying across the devices, you also insert the corresponding separate technical objects (port definition, variable declaration and user code declaration).
   - The inserted elements are deleted from the list. If the list is empty, the dialog box is closed and the connections are inserted depending on the selected option.
7. If there are still elements to be entered in the list, repeat steps 5 and 6 until all elements are inserted as intended.
8. Press **Close** to stop the insertion and close the dialog box.
   - You can also use **<Esc>** or **<Enter>** to close the dialog box if "Insert" is not active.
   - The elements inserted into the target interconnection so far are maintained.
   - The connections for the blocks inserted so far are inserted depending on the selected option.

3.4.11.1 Insert options for copied elements

If interconnection elements have been copied to the clipboard, the »Engineer« displays a list of all elements contained in the clipboard after the **Insert** command has been inserted in the *Add copied elements to the function block interconnection* dialog box:

The list shows the elements which can be added to the target interconnection without any further action, and the elements with problems and those which cannot be added.

- Each element only appears once in the list even if there are several problems.
- If there is at least one name conflict, there are three options of how to solve name conflicts. If the option is changed, the list is updated accordingly.
- The first column "Copied element" serves to define which elements are to be inserted by setting/resetting checkmarks.
  - In the default setting, all elements to be inserted are always selected.
  - When you deselect the **All** option, all elements in the list are deselected.
  - The **Reverse selection** button serves to reverse the existing selection.
- The second column "Problem" shows the currently existing problems.
- The third column "To be added" contains changes for conflicts with already available elements in the target interconnection to be able to accept the elements. The automatic suggestions depend on the selected option how to solve name conflicts.

- Connections are only inserted when the dialog box is closed, which applies to all modules inserted so far. They are displayed as lines or flags, like in the original, but re-routed.
  - When the option **Only accept connections between the added elements** is selected, only those connections are added which are between the inserted elements. If this option is deselected, also those connections are added which are between the added elements and external elements outside the selection if an element of the same type and instance name is available in the target interconnection.
  - When the **Release assigned connections ...** option is selected, connections are deleted in the target interconnection to be able to add connections from the clipboard to inputs already assigned.
- The buttons serve to execute the following functions:

Button	Function
Insert	Add elements selected in the list to the target interconnection • Only possible if at least one element in the list has been selected for insertion. • Insertion is also possible via the **<Enter>** button if at least one element is selected in the list for insertion. • The original layout and the relative position of the inserted blocks to each other are maintained. • When copying across the devices, you also insert the corresponding separate technical objects (port definition, variable declaration and user code declaration). • The inserted elements are deleted from the list. If the list is empty, the dialog box is closed and the connections are inserted depending on the selected option.
Close	Close dialog box. • You can also use **<Esc>** or **<Enter>** to close the dialog box if "Insert" is not active. • The elements inserted into the target interconnection so far are maintained. • The connections for the blocks inserted so far are inserted depending on the selected option.

Tip!

It is not compulsory to add all elements to be inserted in one step. If required, you can first add single elements and in further worksteps other elements of the list with another option for solving name conflicts.

3.5 Printing the interconnection

The interconnection can be printed for documentation purposes, optionally on one page, on four pages, or not scaled.

Tip!

By clicking the icon in the *FB Editor toolbar*, you can get a print view before printing.

How to print the interconnection:

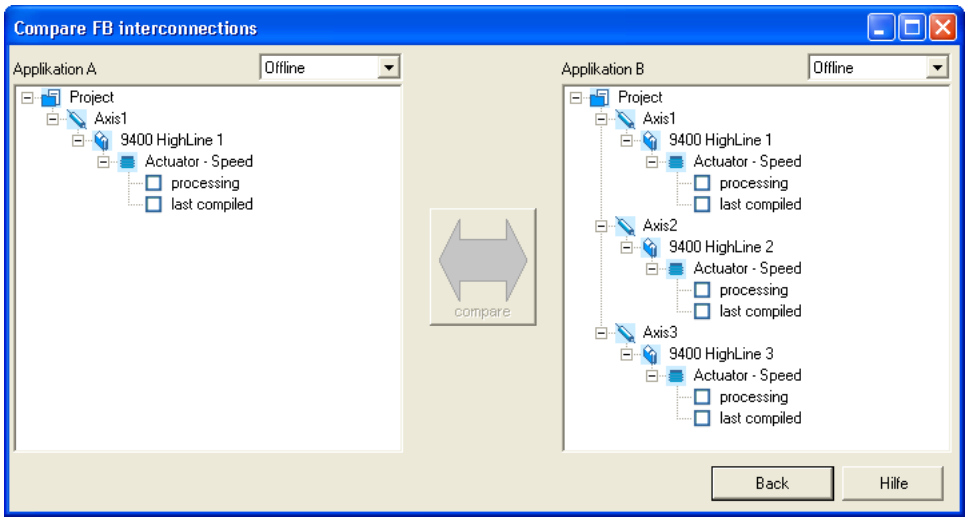
1. Click the icon in the *FB editor toolbar*.
   - The *Circuit print size* dialog box is displayed.
2. Select the desired size and press **OK**.
   - The standard dialog box *Print* appears.
3. Press **OK** to start the printing process.

3.6 Comparing interconnections

This function will be available as of »Engineer« V2.9!

The comparison operation serves to compare function block interconnections for the device series 9400 within the project.

- In the project, it is distinguished between the status of the FB interconnection at the device update updated last ("last compiled") and the current processing status in the FB Editor ("processing").
- An offline<>online comparison and the comparison of two online devices are possible.
- The comparison result can be output as simple text. This can be copied to the clipboard and used for documentation purposes.



Note!

Only applications can be compared which have been enabled in the FB editor!

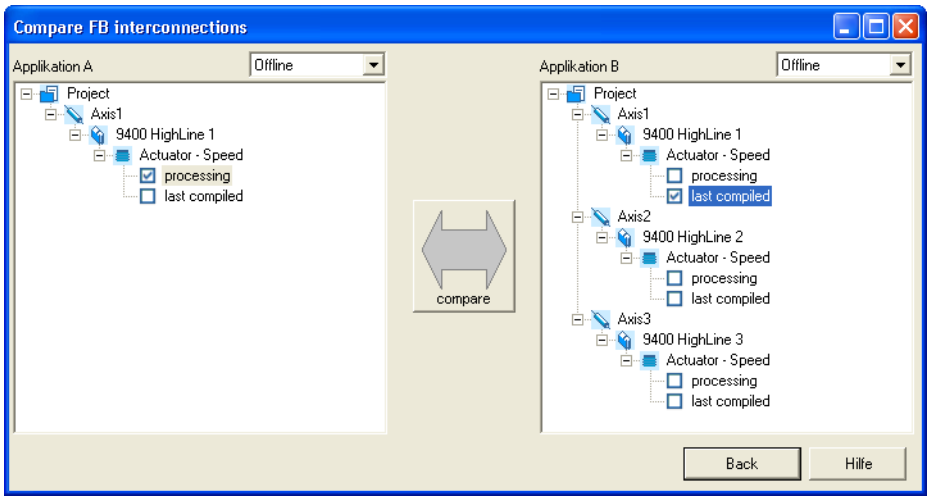
Parameter values, comments, module positions, line representations, and connector visibilities are not compared.

How to compare two FB interconnections:

1. Select the command **Application data→Compare FB interconnections...**.
   - The *Compare FB interconnections* dialog box is displayed:

   - For comparing two interconnections, the left project view displays **Application A** with only one selected device.
   - The right project view with **Application B** selected for the comparison shows all devices available in the project.
2. Select the applications to be compared in the project view represented on the left and right.
   - In order to execute a comparison with an online device, select "Online" in one of the two upper list fields. Then all available online devices are displayed for selection.
   - If you select "Online" in one of the two upper list fields, you can also compare the interconnections of two available online devices.

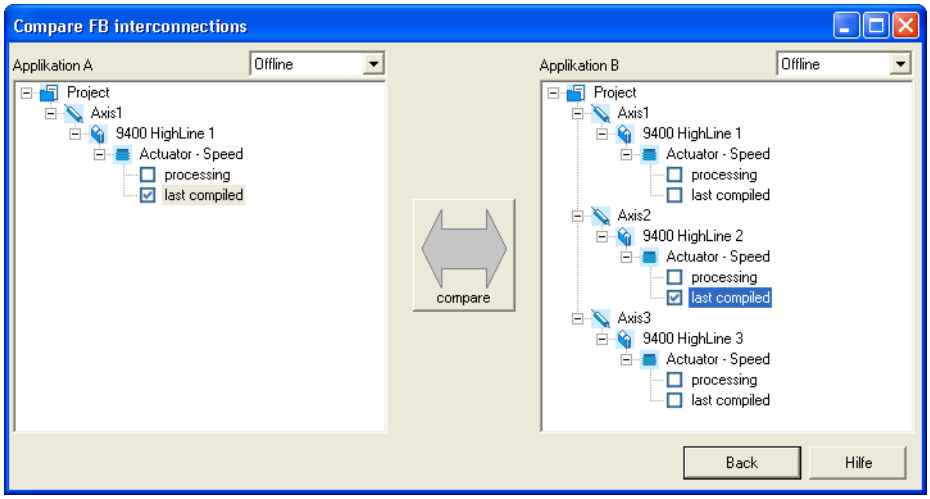
3. Click **Compare**.
   - If the comparison was executed successfully, the comparison result is displayed as simple text. ▸ Contents and representation of the comparison (📖 96)
   - If a comparison of the selected application is not possible, a corresponding message is displayed.
   - The dialog box remains open for a new selection.
4. In order to stop the comparison operation and close the dialog box: Press **Back**.



3.6.1 Comparison examples

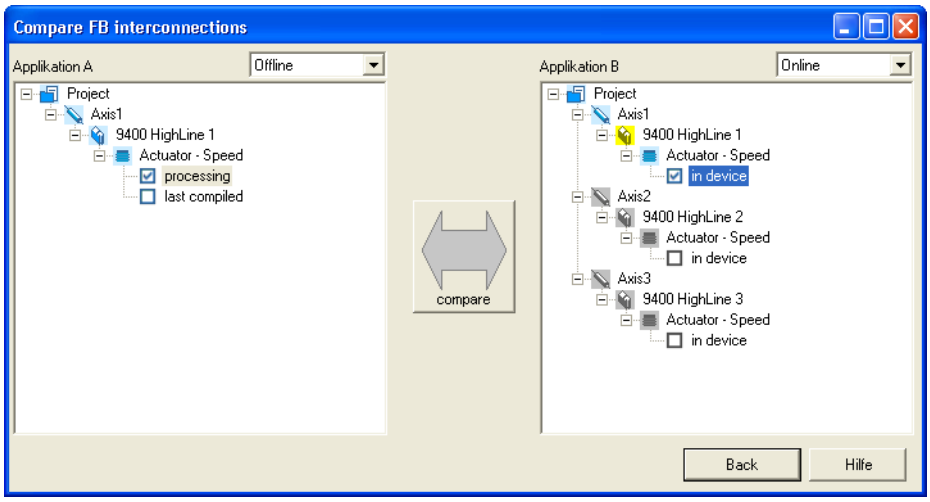
The following comparisons can be executed among each other:

- FB interconnection in the Engineer (offline, processing)
- FB interconnection in the Engineer (offline, last compiled)
- FB interconnection in the controller (online)



Example 1: Device A (processing) <--> device A (last compiled)

Comparison of the current processing status in the FB Editor with the status of the FB interconnection with the last device update:



Example 2: Device A (last compiled) <--> device B (last compiled)

Comparison of FB interconnections of two different devices in the project:

Example 3: Device A (processing) <--> real device A (in the memory module)

Comparison of the current processing status in the FB Editor with the FB interconnection in the real device (in the memory module):

3.6.2 Contents and representation of the comparison

The following elements of an FB interconnection are considered in a comparison. The features of the elements to be compared are listed as well:

Element	Properties
Task	Name Cycle time Type
Function blocks to be instanced freely	Processing sequence Library version Instance name Type
System blocks	Name Version
Port blocks	Name Data types of the element variables
Variable declarations (local & global)	Variable name Data type
Variable assignments	Number
User parameter declarations	Name Code number Data type Setting range (lower limit, upper limit) Unit Variable instance name Variable setting range (lower limit, upper limit) Write/read permissions Dependencies on the controller inhibit and Plc-stop
User parameter assignments	Number Code number
Signal flows (connection lines)	Signal sources and target

Every object available in an FB interconnection is checked for existence in the other interconnection. If the object concerned is available but with another declaration or version, the deviating features are displayed by values in the report.

Example: The freely instanced module A is available in the project and the device but has been taken from a different library version in the device. Both version numbers are presented next to each other in the report in order to recognise the deviation.

3.7 Copying complete interconnection

This function will be available as of »Engineer« V2.9!

In contrast to copying/inserting selected interconnection elements via the clipboard, the function described in this chapter serves to replace the current FB interconnection of a device completely by the FB interconnection of another project device.

Note!

The complete FB interconnection can only be copied between devices of the same device type and version (e.g. 9400 HighLine V3).

A complete interconnection comprises:

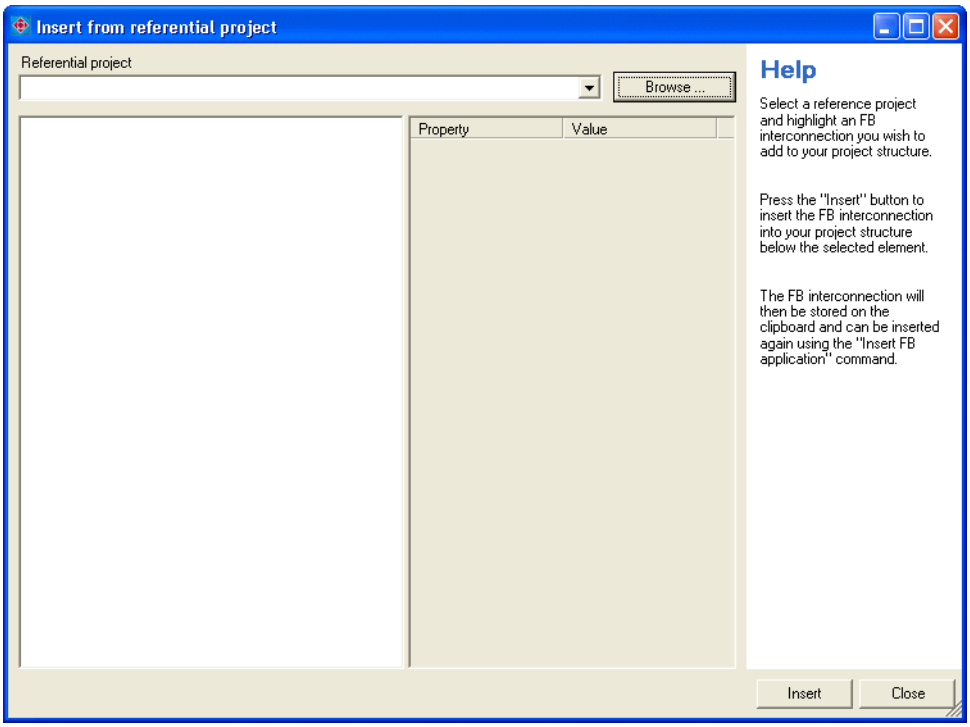
- ApplicationTask, UserTask and IdleTask:
  - Function blocks (instances and parameter values)
  - System blocks (application and parameter values)
  - Port blocks (application)
  - Variables (variable declaration and value)
  - User codes (user code declaration and value)
  - Connections (fixed connections, MUXer and their setting)
  - Comments
  - Interconnection layout (arrangement of the modules)
- Global configuration:
  - Activation status
  - Task configuration
- Port definition of the ports used in the FB interconnection

How to copy the complete interconnection into another project device:

1. Select the application with the FB interconnection to be copied in the *project view*.
2. Select the command **Application data→Copy FB interconnections...**.
3. Go to *project view* and select the application which is to be inserted into the copied FB interconnection.
4. Select the command **Application data→Add FB interconnection...**.
   - The command can only be activated if an FB interconnection has been copied from a device of the same device type and version.
   - After the command has been executed, the module assembly is compared. If there are relevant deviations, the insertion is refused and a corresponding message is displayed.
   - If an insertion is possible, you are asked if the FB interconnection is to be inserted.
5. Confirm the question if the copied FB interconnection is to be inserted with **Yes**.
   - After the insertion, an update of the project is required.

3.8 Inserting complete interconnection from reference project

This function will be available as of »Engineer« V2.9!



The function described in this chapter serves to replace the current FB interconnection of the device completely by the FB interconnection of a reference project.

Note!

Inserting from a reference project is only possible if the device in the reference project has the same device type and version as the project device (e.g. 9400 HighLine V3).

How to insert the complete interconnection from a reference project:

1. Go to the *project view* and select the command **Insert FB interconnection from referential project...** in the *context menu* of the application in which the FB interconnection of a referential project is to be inserted.
   - The *Insert from referential project* dialog box appears:

2. Select reference project.
   - Option 1: Press **Search...** to select the required reference project in the desktop environment in the *Open reference project* dialog box.
   - Option 2: Direct selection in the **Reference project** list field. This list field shows the reference projects already selected for quick selection.
   - After the selection, a project tree with all components of the selected reference project is displayed.
3. Select the application with the FB interconnection to be copied in the project tree.

4. Press **Insert** button.
   - The button can only be activated if the device in the reference project has the same device type and version as the project device.
   - After the button has been pressed, the module assembly is compared. If there are relevant deviations, the insertion is refused and a corresponding message is displayed.
   - If an insertion is possible, you are asked if the FB interconnection is to be inserted.
5. Confirm the question if the copied FB interconnection is to be inserted with **Yes**.
   - The FB interconnection is inserted and the *Insert from referential project* dialog box is closed.
   - After the insertion, an update of the project is required.

4 Short overview

4.1 Analog signal processing

Function block	Function	From library
L_SdDelayComp	Extrapolation • The FB extrapolates a signal by the time set.	LenzeServoDrive V01.00.xx.xx
L_SdProcessController	Comprehensive PID controller with setpoint and actual value processing as well as parameterisable characteristic function and limitation	LenzeServoDrive V02.05.xx.xx
L_Tb8Select	1-out-of-8 selector (for data type "DINT") • The FB connects one of eight input signals through to the output.	LenzeToolbox V01.00.xx.xx
L_Tb8SelectByte	1-out-of-8 selector (for data type "BYTE") • The FB connects one of eight input signals through to the output.	LenzeToolbox V02.05.xx.xx
L_Tb8SelectWord	1-out-of-8 selector (for data type "WORD") • The FB connects one of eight input signals through to the output.	LenzeToolbox V02.05.xx.xx
L_TbAbs	Absolute value generation • The function block converts a bipolar signal to a unipolar signal, i.e. the absolute value of the input signal is generated.	LenzeToolbox V01.00.xx.xx
L_TbCompare	Comparison • The function block compares two signals of the "DINT" data type and can be used e.g. for implementing a trigger.	LenzeToolbox V01.00.xx.xx
L_TbCompare_n	Comparison (scaled) • The function block compares two scaled signals and can be used e.g. for implementing a trigger.	LenzeToolbox V01.00.xx.xx
L_TbCurve	Characteristic function (scaled) • The FB produces the corresponding value of the Y axis for the X axis value with a parameterisable characteristic function y = f(x).	LenzeToolbox V01.00.xx.xx
L_TbCurveAny	Characteristic function • The FB produces the corresponding value of the Y axis for the X axis value with a parameterisable characteristic function y = f(x).	LenzeToolbox V02.06.xx.xx
L_TbDeadband	Dead band • The FB produces a symmetrical dead band around zero.	LenzeToolbox V01.00.xx.xx
L_TbDeadband_n	Dead band (scaled) • The FB produces a symmetrical dead band (scaled) around zero.	LenzeToolbox V01.00.xx.xx
L_TbDifferentiate	Differentiator with low pass	LenzeToolbox V01.00.xx.xx
L_TbGainLim	Gain with limitation	LenzeToolbox V01.00.xx.xx
L_TbLimit	Signal limitation (for data type "DINT") • The FB limits a signal of "DINT" data type to an adjustable value range.	LenzeToolbox V01.00.xx.xx
L_TbLimit_n	Signal limitation (scaled) • The FB limits a scaled signal [%] to an adjustable value range.	LenzeToolbox V01.00.xx.xx

Function block	Function	From library
L_TbLimitInt	Signal limitation (for data type "INT") • The FB limits a signal of "INT" data type to an adjustable value range.	LenzeToolbox V02.05.xx.xx
L_TbMaskOut	Zone masking • The FB masks up to four parameterisable blocking zones within a continuous signal characteristic.	LenzeToolbox V01.00.xx.xx
L_TbNeg	Negation (for data type "DINT") • The function block inverts the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.	LenzeToolbox V01.00.xx.xx
L_TbNegInt	Negation (for data type "INT") • The function block inverts the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.	LenzeToolbox V02.05.xx.xx
L_TbNegSel	Optional negation (for data type "DINT") • The function block inverts (optionally) the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output. • In contrast to the L_TbNeg FB, this FB is only inverted if the *bNeg* control input is set to TRUE.	LenzeToolbox V02.02.xx.xx
L_TbNegSelInt	Optional negation (for data type "INT") • The function block inverts (optionally) the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output. • In contrast to the L_TbNegInt FB, this FB is only inverted if the *bNeg* control input is set to TRUE.	LenzeToolbox V02.05.xx.xx
L_TbNormalize	Signal scaling • The FB scales any signal to a parameterisable reference variable.	LenzeToolbox V01.00.xx.xx
L_TbPIController	Simple PI controller with different control functions and parameterisable limitation	LenzeToolbox V01.00.xx.xx
L_TbPT1Filter	PT1 filter • The FB filters and delays analog signals.	LenzeToolbox V01.00.xx.xx
L_TbRateAction	Rate action function to compensate disturbing low passes	LenzeToolbox V01.00.xx.xx
L_TbSampleHold	Sample & Hold (for data type "DINT") • The FB stores a value of the "DINT" data type in order to keep it even after mains switching.	LenzeToolbox V01.00.xx.xx
L_TbSampleHoldWord	Sample & Hold (for data type "WORD") • The FB stores a value of the "WORD" data type in order to keep it even after mains switching.	LenzeToolbox V02.05.xx.xx
L_TbSelect	Selector (for data type "DINT") • The function block switches between two signals of "DINT" data type. The switch-over is controlled via a boolean input signal.	LenzeToolbox V01.00.xx.xx
L_TbSelectByte	Selector (for data type "BYTE") • The function block switches between two signals of "BYTE" data type. The switch-over is controlled via a boolean input signal.	LenzeToolbox V02.02.xx.xx
L_TbSelectWord	Selector (for data type "WORD") • The function block switches between two signals of "WORD" data type. The switch-over is controlled via a boolean input signal.	LenzeToolbox V02.05.xx.xx

4.2 Digital signal processing

Function block	Function	From library
L_TbCount	Upcounter and downcounter with adjustable limitation	LenzeToolbox V01.00.xx.xx
L_TbDelay	Binary delay element	LenzeToolbox V01.00.xx.xx
L_TbFlipFlopD	D flipflop • Can be used for evaluation and storage of digital signal edges.	LenzeToolbox V01.00.xx.xx
L_TbFlipFlopRS	RS flipflop • Can be used for evaluation and storage of digital signals.	LenzeToolbox V01.00.xx.xx
L_TbOscillator	Rectangular pulse generator with parameterisable pulse/dead time	LenzeToolbox V01.00.xx.xx
L_TbTransition	Signal edge evaluation • Can be used to generate timed and retriggerable pulses.	LenzeToolbox V01.00.xx.xx

Logic operations for "BOOL" data type

Function block	Logic operation	From library
L_TbAnd	AND (2 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5And	AND (5 inputs)	LenzeToolbox V01.00.xx.xx
L_TbOr	OR (2 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Or	OR (5 inputs)	LenzeToolbox V01.00.xx.xx
L_TbNand	NOT-AND (2 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Nand	NOT-AND (5 inputs)	LenzeToolbox V01.00.xx.xx
L_TbNor	NOT-OR (2 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Nor	NOT-OR (5 inputs)	LenzeToolbox V01.00.xx.xx
L_TbXor	EXCLUSIVE-OR (2 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Xor	EXCLUSIVE-OR (5 inputs)	LenzeToolbox V01.00.xx.xx
L_TbNot	Negation (inverter)	LenzeToolbox V01.00.xx.xx

Bit operations for "INT" data type

Function block	Function	From library
L_DcBitShiftInt	Bit shift operation	LenzeDataConversion V02.02.xx.xx

Bit operations for "DINT" data type

Function block	Function	From library
L_DcBitShift	Bit shift operation	LenzeDataConversion V01.00.xx.xx

Bit operations for "BYTE" data type

Function block	Function	From library
L_DcBitShiftByte	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcByteBitand	Bit-by-bit AND operation of two BYTE values.	LenzeDataConversion V02.02.xx.xx
L_DcByteBitor	Bit-by-bit OR operation of two BYTE values.	LenzeDataConversion V02.02.xx.xx
L_DcByteBitxor	Bit-by-bit EXCLUSIVE-OR operation of two BYTE values.	LenzeDataConversion V02.02.xx.xx
L_DcByteToBits	Bit demultiplexer • BYTE → BOOL (8 x)	LenzeDataConversion V01.00.xx.xx
L_DcGetBitOfByte	Bit operation • Output a status of a single bit.	LenzeDataConversion V01.00.xx.xx
L_DcSetBitOfByte	Bit operation • Set a single bit to "1".	LenzeDataConversion V01.00.xx.xx
L_DcResetBitOfByte	Bit operation • Reset a single bit to "0".	LenzeDataConversion V01.00.xx.xx

Bit operations for "WORD" data type

Function block	Function	From library
L_DcBitShiftWord	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcWordBitand	Bit-by-bit AND operation of two WORD values.	LenzeDataConversion V02.02.xx.xx
L_DcWordBitor	Bit-by-bit OR operation of two WORD values.	LenzeDataConversion V02.02.xx.xx
L_DcWordBitxor	Bit-by-bit EXCLUSIVE-OR operation of two WORD values.	LenzeDataConversion V02.02.xx.xx
L_DcWordToBits	Bit demultiplexer • WORD → BOOL (16 x)	LenzeDataConversion V01.00.xx.xx
L_DcGetBitOfWord	Bit operation • Output a status of a single bit.	LenzeDataConversion V01.00.xx.xx
L_DcSetBitOfWord	Bit operation • Set a single bit to "1".	LenzeDataConversion V01.00.xx.xx
L_DcResetBitOfWord	Bit operation • Reset a single bit to "0".	LenzeDataConversion V01.00.xx.xx

Bit operations for "DWORD" data type

Function block	Function	From library
L_DcBitShiftDWord	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcDWordToBits	Bit demultiplexer • DWORD → BOOL (32 x)	LenzeDataConversion V01.00.xx.xx
L_DcGetBitOfDWord	Bit operation • Output a status of a single bit.	LenzeDataConversion V01.00.xx.xx
L_DcSetBitOfDWord	Bit operation • Set a single bit to "1".	LenzeDataConversion V01.00.xx.xx
L_DcResetBitOfDWord	Bit operation • Reset a single bit to "0".	LenzeDataConversion V01.00.xx.xx
L_DcDWordBitand	Bit-by-bit AND operation of two DWORD values.	LenzeDataConversion V01.00.xx.xx

Function block	Function	From library
L_DcDWordBitor	Bit-by-bit OR operation of two DWORD values.	LenzeDataConversion V01.00.xx.xx
L_DcDWordBitxor	Bit-by-bit EXCLUSIVE-OR operation of two DWORD values.	LenzeDataConversion V01.00.xx.xx

4.3 Data type conversion

Function block	Function	From library
L_DcBitsToByte	Bit multiplexer • BOOL (8 x) → BYTE	LenzeDataConversion V01.00.xx.xx
L_DcBitsToWord	Bit multiplexer • BOOL (16 x) → WORD	LenzeDataConversion V01.00.xx.xx
L_DcBitsToDWord	Bit multiplexer • BOOL (32 x) → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcByteToBits	Bit demultiplexer • BYTE → BOOL (8 x)	LenzeDataConversion V01.00.xx.xx
L_DcByteToInt	Type converter • BYTE → INT	LenzeDataConversion V02.02.xx.xx
L_DcByteToWord	Type converter • BYTE → WORD	LenzeDataConversion V01.00.xx.xx
L_Dc2BytesToWord	Type converter • BYTE (2 x) → WORD	LenzeDataConversion V01.00.xx.xx
L_Dc4BytesToDWord	Type converter • BYTE (4 x) → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcIntToDInt	Type converter • INT → DINT	LenzeDataConversion V01.00.xx.xx
L_DcIntToWord	Type converter • INT → WORD	LenzeDataConversion V01.00.xx.xx
L_DcDIntToInt	Type converter • DINT → INT	LenzeDataConversion V01.00.xx.xx
L_DcDIntToDWord	Type converter • DINT → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcWordToBits	Bit demultiplexer • WORD → BOOL (16 x)	LenzeDataConversion V01.00.xx.xx
L_DcWordTo2Bytes	Type converter • WORD → BYTE (2 x)	LenzeDataConversion V01.00.xx.xx
L_DcWordToByte	Type converter • WORD → BYTE	LenzeDataConversion V01.00.xx.xx
L_DcWordToInt	Type converter • WORD → INT	LenzeDataConversion V01.00.xx.xx
L_DcWordToDWord	Type converter • WORD → DWORD	LenzeDataConversion V01.00.xx.xx
L_Dc2WordsToDWord	Type converter • WORD (2 x) → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcDWordToBits	Bit demultiplexer • DWORD → BOOL (32 x)	LenzeDataConversion V01.00.xx.xx
L_DcDWordTo4Bytes	Type converter • DWORD → BYTE (4 x)	LenzeDataConversion V01.00.xx.xx

Function block	Function	From library
L_DcDWordToDInt	Type converter • DWORD → DINT	LenzeDataConversion V01.00.xx.xx
L_DcDWordToWord	Type converter • DWORD → WORD	LenzeDataConversion V01.00.xx.xx
L_DcDWordTo2Words	Type converter • DWORD → WORD (2 x)	LenzeDataConversion V01.00.xx.xx

4.4 Mathematical functions

Function block	Mathematical function	From library
L_TbAbs	Absolute value generation	LenzeToolbox V01.00.xx.xx
L_TbAdd	Addition without limitation	LenzeToolbox V01.00.xx.xx
L_TbAddLim	Addition with limitation	LenzeToolbox V01.00.xx.xx
L_TbAddSubLim	Addition and subtraction with limitation	LenzeToolbox V02.04.xx.xx
L_TbDiv	Division with remainder	LenzeToolbox V01.00.xx.xx
L_TbDiv_n	Division divisor selected as scaled signal [%]	LenzeToolbox V01.00.xx.xx
L_TbIntegrate	Integration with limitation	LenzeToolbox V01.00.xx.xx
L_TbMul	Multiplication without limitation	LenzeToolbox V01.00.xx.xx
L_TbMul_n	Multiplication with the multiplicand selected as scaled signal [%]	LenzeToolbox V01.00.xx.xx
L_TbMulDivLim	Multiplication and division with limitation	LenzeToolbox V02.02.xx.xx
L_TbMulLim	Multiplication with limitation	LenzeToolbox V01.00.xx.xx
L_TbNeg	Sign inversion	LenzeToolbox V01.00.xx.xx
L_TbNegSel	Sign inversion (optional)	LenzeToolbox V02.02.xx.xx
L_TbSub	Subtraction without limitation	LenzeToolbox V01.00.xx.xx
L_TbSubLim	Subtraction with limitation	LenzeToolbox V01.00.xx.xx

4.5 Conversion of physical units

Function block	Function	From library
L_DcNorm_aToNorm_n	Signal converter • 16-bit signal (scaled) → 32-bit signal (scaled)	LenzeDataConversion V01.00.xx.xx
L_DcNorm_nToNorm_a	Signal converter • 32-bit signal (scaled) → 16-bit signal (scaled)	LenzeDataConversion V01.00.xx.xx
L_DcNorm_nToSpeed_s	Signal converter • 32-bit signal (scaled) → 32-bit-speed signal	LenzeDataConversion V01.00.xx.xx
L_DcSpeed_vToSpeed_s	Signal converter • 16-bit speed signal → 32-bit speed signal	LenzeDataConversion V01.00.xx.xx
L_DcSpeed_sToSpeed_v	Signal converter • 32-bit speed signal → 16-bit speed signal	LenzeDataConversion V01.00.xx.xx
L_DcSpeed_sToNorm_n	Signal converter • 32-bit speed signal → 32-bit signal (scaled)	LenzeDataConversion V01.00.xx.xx
L_SdDifferentiate	Differentiation (position → speed)	LenzeServoDrive V01.00.xx.xx
L_SdIntegrate	Integration (speed → position)	LenzeServoDrive V01.00.xx.xx

Function block	Function	From library
L_SdSetPosition	Position conversion • Position [unit] (selected as parameter value) → position [increments]	LenzeServoDrive V01.00.xx.xx
L_SdGetPosition	Position conversion • Position [increments] → position [unit] (displayed as parameter value)	LenzeServoDrive V01.00.xx.xx
L_SdPosToUnit	Position conversion • Position [increments] → position [unit]	LenzeServoDrive V01.00.xx.xx
L_SdUnitToPos	Position conversion • Position [unit] → position [increments]	LenzeServoDrive V01.00.xx.xx
L_SdSetSpeed	Speed conversion • Velocity [unit/s] (selected as parameter value) → speed	LenzeServoDrive V01.00.xx.xx
L_SdGetSpeed	Speed conversion • Speed → velocity [unit/s] (displayed as parameter value)	LenzeServoDrive V01.00.xx.xx
L_SdSpeedToUnit	Speed conversion • Speed → velocity [unit/s]	LenzeServoDrive V01.00.xx.xx
L_SdUnitToSpeed	Speed conversion • Velocity [unit/s] → speed	LenzeServoDrive V01.00.xx.xx
L_SdAccToUnit	Acceleration conversion • Speed variation/time → acceleration [unit/s^2]	LenzeServoDrive V01.00.xx.xx
L_SdUnitToAcc	Acceleration conversion • Acceleration [unit/s^2] → speed variation/time	LenzeServoDrive V01.00.xx.xx

4.6 Speed conditioning

Function block	Function	From library
L_SdDifferentiate	Differentiation (position → speed)	LenzeServoDrive V01.00.xx.xx
L_SdIntegrate	Integration (speed → position)	LenzeServoDrive V01.00.xx.xx
L_SdIntegrateAxis	Integration (speed → position) with TP correction	LenzeServoDrive V02.03.xx.xx
L_SdIntegrateLimit	Integration (speed → position) with adjustable upper/lower limit for return purposes	LenzeServoDrive V02.09.xx.xx
L_SdLimitSpeed	Speed limitation • Leads a speed setpoint to defined limit ranges.	LenzeServoDrive V01.00.xx.xx
L_SdSpeedFilter	Speed signal delay • Filters or decelerates speed signal according to the PT1 principle.	LenzeServoDrive V01.00.xx.xx
L_SdRampGenerator	Ramp generator (ramp function generator) with S-shaped ramps	LenzeServoDrive V01.00.xx.xx
L_SdRampGeneratorAny	Ramp generator (ramp function generator) with S-shaped ramps. • Unlike the L_SdRampGenerator FB, this FB is also able to process speeds (_s). Separate acceleration and deceleration times can be set.	LenzeServoDrive V02.09.xx.xx
L_SdSpeedSet	Ramp generator (ramp function generator) with S-shaped ramps, parameterisable fixed setpoints and comprehensive parameter setting and control options.	LenzeServoDrive V01.00.xx.xx

4.7 Special functions

Function block	Function	From library
L_DevApplErr	Error tripping • The FB can trip up to 8 different application messages out of the application. • Error ID and error response as well as the module ID can be set via parameters.	LenzeDevice9400 V01.00.xx.xx
L_DevApplErrFix	Error tripping • The FB can trip up to 8 different application messages out of the application. • Error ID and error response as well as the module ID can be set via FB inputs.	LenzeDevice9400 V02.00.xx.xx
L_DevParReadFix	One-time or cyclic reading of parameters • Only internal parameters (codes) of the controller can be read. • In contrast to the L_DevReadParDInt FB, the parameter of this FB to be read is addressed via FB inputs and not via parameters.	LenzeDevice9400 V02.00.xx.xx
L_DevParWriteFix	One-time or cyclic writing of parameters • Only internal parameters (codes) of the controller can be written. • In contrast to the L_DevWriteParDInt FB, the parameter of this FB to be written is addressed via FB inputs and not via parameters.	LenzeDevice9400 V02.00.xx.xx
L_DevReadParDInt	One-time or cyclic reading of parameters of "DINT" data type • Only internal parameters (codes) of the controller can be read.	LenzeDevice9400 V01.00.xx.xx
L_DevWriteParDInt	One-time or cyclic writing of parameters of the "DINT" data type • Only internal parameters (codes) of the controller can be written.	LenzeDevice9400 V02.00.xx.xx
L_DevSMControlEncoder	Control word for limiter • The FB generates the bit-coded control signal *dwControl* from individual boolean control signals for the SB **LS_Limiter** and thus allows control of the basic function "Limiter" if no SM3xx safety module is available.	LenzeDevice9400 V02.00.xx.xx
L_SdGetAxisData	Reading out machine parameters from axis data	LenzeServoDrive V02.07.xx.xx
L_SdInterpolate	Interpolation of position information • E.g. to compensate for longer bus transfer cycles or smooth low-resolution absolute value encoders.	LenzeServoDrive V02.00.xx.xx
L_SdInterExtrapolateAny	Interpolation/extrapolation of setpoints	LenzeServoDrive V02.00.xx.xx
L_SdInterExtrapolatePosition	Interpolation/extrapolation of position information	LenzeServoDrive V02.00.xx.xx
L_SdMotorPot	Motor potentiometer function • Can be used as an alternative setpoint source that is controlled via two inputs.	LenzeServoDrive V02.04.xx.xx
L_SdSetAxisData	Represented machine parameters of a master drive	LenzeServoDrive V01.00.xx.xx
L_SdTouchProbe	Touch probe processing • The FB takes over the interpolation of the input signal based on the time stamp handed over by a touch probe system block and outputs the interpolated value and the difference compared with the last input signal.	LenzeServoDrive V01.00.xx.xx

4.8 Output of status signals

The following FBs decode the status output signal *dnState*, which is made available by some system and function blocks, into single boolean status signals for further use in the FB interconnection:

Function block	Function	From library
L_DevDriveInterfaceStateDecoder	Status signals of the drive interface (SB **LS_DriveInterface**)	LenzeDevice9400 V01.00.xx.xx
L_DevManualJogStateDecoder	Status signals of the basic function "Manual jog" (SB **LS_ManualJog**)	LenzeDevice9400 V01.00.xx.xx
L_DevHomingStateDecoder	Status signals of the basic function "Homing" (SB **LS_Homing**)	LenzeDevice9400 V01.00.xx.xx
L_DevLimiterStateDecoder	Status signals of the basic function "Limiter" (SB **LS_Limiter**)	LenzeDevice9400 V01.00.xx.xx
L_DevBrakeStateDecoder	Status signals of the basic function "Brake control" (SB **LS_Brake**)	LenzeDevice9400 V01.00.xx.xx
L_DevPositionerStateDecoder	Status signals of the basic function "Positioning" (SB **LS_Positioner**) • From firmware 1.50, the FB L_DevPositionerStateDecoder replaces the FB L_PosDecoderStatePositioner.	LenzeDevice9400 V02.00.xx.xx
L_PosDecoderStatePositioner		LenzePositioning V01.00.xx.xx
L_PosSequencerStateDecoder	Status signals of the sequence control (FB L_PosSequencer) • From firmware 1.50, the FB L_PosSequencerStateDecoder replaces the FB L_PosDecoderStateSequencer.	LenzePositioning V02.00.xx.xx
L_PosDecoderStateSequencer		LenzePositioning V01.00.xx.xx
L_LdStateDecoder	Status signals of the FBs of the function library "LenzeLineDrive.lib"	LenzeLineDrive V01.00.xx.xx
L_DevSMControlDecoder	Control signals from the SM3xx safety module	LenzeDevice9400 V02.00.xx.xx
L_DevSMStateDecoder	Status signals from the SM3xx safety module	LenzeDevice9400 V02.00.xx.xx
L_DevSMStateDecoderIO	I/O status signals from the SM3xx safety module	LenzeDevice9400 V02.00.xx.xx

4.9 FBs for system via electrical shaft

General functions

Function block	Function	From library
L_EsEncoderConv	Encoder signal conditioning	LenzeElectricalShaft V01.00.xx.xx
L_EsStretchIntegrate	Stretching and compression of a master value in the "Modulo" or "Unlimited" traversing range	LenzeElectricalShaft V01.00.xx.xx

"Electronic cam" application

Function block	Function	From library
L_CamClutchPos	Clutch (path-controlled) • Clutch in or declutch a master position via a fifth order polynomial in a path-controlled manner.	LenzeCam V01.00.xx.xx
L_CamContactor	Cam group with switch-on and switch-off dynamisation	LenzeCam V01.00.xx.xx
L_CamCurve	Curve interpolation for characteristics	LenzeCam V01.00.xx.xx

Function block	Function	From library
L_CamGetAxisData	Reading out machine parameters from cam data	LenzeCam V01.00.xx.xx
L_CamPosMarker	Reading out position marks from cam data	LenzeCam V01.00.xx.xx
L_CamProfiler	Curve interpolation for motion profiles	LenzeCam V01.00.xx.xx
L_CamSetContDataPDO	Contactor data selection via inputs/PDOs • The inputs can be connected, for instance, to a corresponding port block to accept contactor data from a master control via process data objects (PDOs).	LenzeCam V01.02.xx.xx
L_CamSetContDataSDO	Contactor data selection via codes/SDOs • The codes can be written, for instance, via parameter data objects (SDOs) by a master control.	LenzeCam V01.02.xx.xx
L_CamStretchAbs	Stretch/compress position (absolute) • Simple absolute stretching and compression of a position in the limited traversing range.	LenzeCam V01.00.xx.xx
L_CamStretchFeed	Stretch/compress position (relative) • Relative stretching and compression of a position in the "Modulo" or "Unlimited" traversing range.	LenzeCam V01.00.xx.xx
L_CamSyncIn	Synchronous/oversynchronous clutch-in • Synchronising a tool (drive) to a running material (relative master speed).	LenzeCam V01.01.xx.xx
L_EsClutchPos	Clutch (time-controlled) • Clutch in or declutch a master position via a fifth order polynomial in a time-controlled manner.	LenzeElectricalShaft V01.01.xx.xx
L_LdVirtualMasterP	Virtual master for synchronism	LenzeLineDrive V01.00.xx.xx

Application "Electronic gearbox"

Function block	Function	From library
L_LdClutchV	Time-controlled virtual clutch with speed reference	LenzeLineDrive V01.00.xx.xx
L_LdExtrapolate	Extrapolation of position information • E.g. to compensate for longer bus transfer cycles or smooth low-resolution absolute value encoders.	LenzeLineDrive V01.00.xx.xx
L_LdMonitFollowError	Following error monitoring with adjustable switching threshold and hysteresis	LenzeLineDrive V01.00.xx.xx
L_LdMPot	Master value adjustment in positive/negative traversing direction with parameterisable speeds	LenzeLineDrive V01.00.xx.xx
L_LdSetAxisVelocity	Stretching/compression of the x axis and synchronisation via touch probe • Within the cycle, the master speed is integrated to the position.	LenzeLineDrive V01.00.xx.xx
L_LdStateDecoder	LineDrive status signals • Decoding of the status output signal *dnState* of an FB from the function library "LenzeLineDrive.lib" into individual boolean status signals for further use in the FB interconnection.	LenzeLineDrive V01.00.xx.xx
L_LdToolControl	Setpoint conditioning for the tool axis	LenzeLineDrive V01.00.xx.xx
L_LdVirtualMasterV	Virtual master for electronic gearbox	LenzeLineDrive V01.00.xx.xx
L_SdFactor	Stretch factor	LenzeServoDrive V01.00.xx.xx

Function block	Function	From library
L_SdRuntimeComp	Compensation of the runtime by a leading master value	LenzeServoDrive V01.00.xx.xx
L_SdSetAxisData	Represented machine parameters of a master drive	LenzeServoDrive V01.00.xx.xx

"Synchronism" application"

Function block	Function	From library
L_LdAddOffsetCyclic	Offset addition to a clocked position	LenzeLineDrive V01.00.xx.xx
L_LdClutchAxisP	Time-controlled virtual clutch with position reference	LenzeLineDrive V01.00.xx.xx
L_LdConvAxisV	Speed ratio between two axes	LenzeLineDrive V01.00.xx.xx
L_LdDifferentiateCyclic	Differentiation of a position considering the cycle	LenzeLineDrive V01.00.xx.xx
L_LdExtrapolate	Extrapolation of position information • E.g. to compensate for longer bus transfer cycles or smooth low-resolution absolute value encoders	LenzeLineDrive V01.00.xx.xx
L_LdIntegrateCyclic	Integration of a speed to a position considering the cycle	LenzeLineDrive V01.00.xx.xx
L_LdLinearCoupling	Master value connection	LenzeLineDrive V01.00.xx.xx
L_LdMarkSync	Mark synchronisation in synchronism and cam profiler applications	LenzeLineDrive V01.00.xx.xx
L_LdMonitFollowError	Following error monitoring with adjustable switching threshold and hysteresis	LenzeLineDrive V01.00.xx.xx
L_LdPosCtrlLin	Master value adjustment (related to position)	LenzeLineDrive V01.00.xx.xx
L_LdStateDecoder	LineDrive status signals • Decoding of the status output signal *dnState* of an FB from the function library "LenzeLineDrive.lib" into individual boolean status signals for further use in the FB interconnection.	LenzeLineDrive V01.00.xx.xx
L_LdSyncOperation	Master value connection	LenzeLineDrive V01.00.xx.xx
L_LdToolControl	Setpoint conditioning for the tool axis	LenzeLineDrive V01.00.xx.xx
L_LdVirtualMasterP	Virtual master for synchronism	LenzeLineDrive V01.00.xx.xx
L_LdZeroDetect	Detection of zero crossings in case of a clocked position	LenzeLineDrive V01.00.xx.xx
L_SdRuntimeComp	Compensation of the runtime by a leading master value	LenzeServoDrive V01.00.xx.xx
L_SdSetAxisData	Represented machine parameters of a master drive	LenzeServoDrive V01.00.xx.xx
L_SdSwitchPoint	Position switch points (cams)	LenzeServoDrive V01.00.xx.xx

4.10 FBs for positioning tasks

Function block	Function	From library
L_PosPositionerInterface	Interface to basic function "Positioning" • Use this interface to control the SB **LS_Positioner** via level-controlled signals, e.g. from a higher-level control.	LenzePositioning V02.00.xx.xx
L_PosPositionerTable	Profile data record management • Storing and managing (traversing) profiles and "teaching" positions, speeds, accelerations/decelerations and S-ramp times.	LenzePositioning V01.00.xx.xx
L_PosProfileTable	Profile data record management (simple) • Storing and managing up to four traversing profiles and "teaching" target positions. • Unlike the FB L_PosPositionerTable, this FB does not use any variable tables, but profile parameter data is directly entered under the assigned codes. • Furthermore, the position assigned to the input *dnExtPos_p* will be used as target position if profile number 1 is selected.	LenzePositioning V01.00.xx.xx
L_PosSequencer	Sequence control • Parameterisable sequence table for implementing a sequence control.	LenzePositioning V01.00.xx.xx
L_PosProfileInterface	Profile data interface • Profile data selection for the SB **LS_Positioner**.	LenzePositioning V01.00.xx.xx
L_SdSwitchPoint	Position switch points (cams)	LenzeServoDrive V01.00.xx.xx
L_LdMonitFollowError	Following error monitoring with adjustable switching threshold and hysteresis.	LenzeLineDrive V01.00.xx.xx
L_PosGetProfile	Profile data tables • Together with an FB instance of type L_PosPositionerTable or L_PosProfileTable, this FB provides five profile data sets that can be selected.	LenzePositioning V01.00.xx.xx
L_PosGetProfileData	Profile data output	LenzePositioning V01.00.xx.xx
L_PosGetTableAcc	Acceleration table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five acceleration values from the VTACC variable table. • ...of type L_PosProfileTable this FB provides accelerations which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx
L_PosGetTableJerk	S-ramp time table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five S-ramp times from the VTJERK variable table . • ...of type L_PosProfileTable this FB provides S-ramp times which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx
L_PosGetTablePos	Position table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five position values from the VTPOS variable table. • ...of type L_PosProfileTable this FB provides positions which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx

Function block	Function	From library
L_PosGetTableSpeed	Speed table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five speed values from the VTSPEED variable table. • ...of type L_PosProfileTable this FB provides speeds which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx
L_DevPositionerStateDecoder	Status signals of the basic function "Positioning" (SB **LS_Positioner**) • From firmware 1.50, the FB L_DevPositionerStateDecoder replaces the FB L_PosDecoderStatePositioner.	LenzeDevice9400 V02.00.xx.xx
L_PosDecoderStatePositioner		LenzePositioning V01.00.xx.xx
L_PosSequencerStateDecoder	Status signals of the sequence control (FB L_PosSequencer) • From firmware 1.50, the FB L_PosSequencerStateDecoder replaces the FB L_PosDecoderStateSequencer.	LenzePositioning V02.00.xx.xx
L_PosDecoderStateSequencer		LenzePositioning V01.00.xx.xx

4.11 FBs for winding technology

Function block	Function	From library
L_WndCalcDiameter	Diameter calculation	LenzeWinder V01.00.xx.xx
L_WndCalcLength	Length calculation	LenzeWinder V01.00.xx.xx
L_WndFrictionCompensation	Friction compensation	LenzeWinder V01.00.xx.xx
L_WndIdentMInertia	Identification of the moment of inertia	LenzeWinder V01.00.xx.xx
L_WndStopCtrl	Stop controller	LenzeWinder V01.00.xx.xx
L_WndTensionCurve	Tensile force characteristic	LenzeWinder V01.00.xx.xx

4.12 All function blocks [A-Z]

Function block	Function	From library
L_CamClutchPos	Clutch (path-controlled) • Clutch in or declutch a master position via a fifth order polynomial in a path-controlled manner.	LenzeCam V01.00.xx.xx
L_CamContactor	Cam group with switch-on and switch-off dynamisation	LenzeCam V01.00.xx.xx
L_CamCurve	Curve interpolation for characteristics	LenzeCam V01.00.xx.xx
L_CamGetAxisData	Reading out machine parameters from cam data	LenzeCam V01.00.xx.xx
L_CamPosMarker	Reading out position marks from cam data	LenzeCam V01.00.xx.xx
L_CamProfiler	Curve interpolation for motion profiles	LenzeCam V01.00.xx.xx
L_CamSetContDataPDO	Contactor data selection via inputs/PDOs • The inputs can be connected, for instance, to a corresponding port block to accept contactor data from a master control via process data objects (PDOs).	LenzeCam V01.02.xx.xx
L_CamSetContDataSDO	Contactor data selection via codes/SDOs • The codes can be written, for instance, via parameter data objects (SDOs) by a master control.	LenzeCam V01.02.xx.xx
L_CamStretchAbs	Stretch/compress position (absolute) • Simple absolute stretching and compression of a position in the limited traversing range.	LenzeCam V01.00.xx.xx
L_CamStretchFeed	Stretch/compress position (relative) • Relative stretching and compression of a position in the "Modulo" or "Unlimited" traversing range.	LenzeCam V01.00.xx.xx
L_CamSyncIn	Synchronous/oversynchronous clutch-in • Synchronising a tool (drive) to a running material (relative master speed).	LenzeCam V01.01.xx.xx
L_Dc2BytesToWord	Type converter • BYTE (2 x) → WORD	LenzeDataConversion V01.00.xx.xx
L_Dc2WordsToDWord	Type converter • WORD (2 x) → DWORD	LenzeDataConversion V01.00.xx.xx
L_Dc4BytesToDWord	Type converter • BYTE (4 x) → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcBitShift	Bit shift operation	LenzeDataConversion V01.00.xx.xx
L_DcBitShiftByte	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcBitShiftDWord	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcBitShiftInt	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcBitShiftWord	Bit shift operation	LenzeDataConversion V02.02.xx.xx
L_DcBitsToByte	Bit multiplexer • BOOL (8 x) → BYTE	LenzeDataConversion V01.00.xx.xx
L_DcBitsToDWord	Bit multiplexer • BOOL (32 x) → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcBitsToWord	Bit multiplexer • BOOL (16 x) → WORD	LenzeDataConversion V01.00.xx.xx
L_DcByteBitand	Bit-by-bit AND operation of two BYTE values	LenzeDataConversion V02.02.xx.xx
L_DcByteBitor	Bit-by-bit OR operation of two BYTE values	LenzeDataConversion V02.02.xx.xx
L_DcByteBitxor	Bit-by-bit EXCLUSIVE-OR operation of two BYTE values	LenzeDataConversion V02.02.xx.xx

Function block	Function	From library
L_DcByteToBits	Bit demultiplexer • BYTE → BOOL (8 x)	LenzeDataConversion V01.00.xx.xx
L_DcByteToBits	Bit demultiplexer • BYTE → BOOL (8 x)	LenzeDataConversion V01.00.xx.xx
L_DcByteToInt	Type converter • BYTE → INT	LenzeDataConversion V02.02.xx.xx
L_DcByteToWord	Type converter • BYTE → WORD	LenzeDataConversion V01.00.xx.xx
L_DcDIntToDWord	Type converter • DINT → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcDIntToInt	Type converter • DINT → INT	LenzeDataConversion V01.00.xx.xx
L_DcDWordBitand	Bit-by-bit AND operation of two DWORD values	LenzeDataConversion V01.00.xx.xx
L_DcDWordBitor	Bit-by-bit OR operation of two DWORD values	LenzeDataConversion V01.00.xx.xx
L_DcDWordBitxor	Bit-by-bit EXCLUSIVE-OR operation of two DWORD values	LenzeDataConversion V01.00.xx.xx
L_DcDWordTo2Words	Type converter • DWORD → WORD (2 x)	LenzeDataConversion V01.00.xx.xx
L_DcDWordTo4Bytes	Type converter • DWORD → BYTE (4 x)	LenzeDataConversion V01.00.xx.xx
L_DcDWordToBits	Bit demultiplexer • DWORD → BOOL (32 x)	LenzeDataConversion V01.00.xx.xx
L_DcDWordToBits	Bit demultiplexer • DWORD → BOOL (32 x)	LenzeDataConversion V01.00.xx.xx
L_DcDWordToDInt	Type converter • DWORD → DINT	LenzeDataConversion V01.00.xx.xx
L_DcDWordToWord	Type converter • DWORD → WORD	LenzeDataConversion V01.00.xx.xx
L_DcGetBitOfByte	Bit operation • Output a status of a single bit.	LenzeDataConversion V01.00.xx.xx
L_DcGetBitOfDWord	Bit operation • Output a status of a single bit.	LenzeDataConversion V01.00.xx.xx
L_DcGetBitOfWord	Bit operation • Output a status of a single bit.	LenzeDataConversion V01.00.xx.xx
L_DcIntToDInt	Type converter • INT → DINT	LenzeDataConversion V01.00.xx.xx
L_DcIntToWord	Type converter • INT → WORD	LenzeDataConversion V01.00.xx.xx
L_DcNorm_aToNorm_n	Signal converter • 16-bit signal (scaled) → 32-bit signal (scaled)	LenzeDataConversion V01.00.xx.xx
L_DcNorm_nToNorm_a	Signal converter • 32-bit signal (scaled) → 16-bit signal (scaled)	LenzeDataConversion V01.00.xx.xx
L_DcNorm_nToSpeed_s	Signal converter • 32-bit signal (scaled) → 32-bit-speed signal	LenzeDataConversion V01.00.xx.xx
L_DcResetBitOfByte	Bit operation • Reset a single bit to "0".	LenzeDataConversion V01.00.xx.xx
L_DcResetBitOfDWord	Bit operation • Reset a single bit to "0".	LenzeDataConversion V01.00.xx.xx
L_DcResetBitOfWord	Bit operation • Reset a single bit to "0".	LenzeDataConversion V01.00.xx.xx

Function block	Function	From library
L_DcSetBitOfByte	Bit operation • Set a single bit to "1".	LenzeDataConversion V01.00.xx.xx
L_DcSetBitOfDWord	Bit operation • Set a single bit to "1".	LenzeDataConversion V01.00.xx.xx
L_DcSetBitOfWord	Bit operation • Set a single bit to "1".	LenzeDataConversion V01.00.xx.xx
L_DcSpeed_sToNorm_n	Signal converter • 32-bit speed signal → 32-bit signal (scaled)	LenzeDataConversion V01.00.xx.xx
L_DcSpeed_sToSpeed_v	Signal converter • 32-bit speed signal → 16-bit speed signal	LenzeDataConversion V01.00.xx.xx
L_DcSpeed_vToSpeed_s	Signal converter • 16-bit speed signal → 32-bit speed signal	LenzeDataConversion V01.00.xx.xx
L_DcWordBitand	Bit-by-bit AND operation of two WORD values	LenzeDataConversion V02.02.xx.xx
L_DcWordBitor	Bit-by-bit OR operation of two WORD values	LenzeDataConversion V02.02.xx.xx
L_DcWordBitxor	Bit-by-bit EXCLUSIVE-OR operation of two WORD values	LenzeDataConversion V02.02.xx.xx
L_DcWordTo2Bytes	Type converter • WORD → BYTE (2 x)	LenzeDataConversion V01.00.xx.xx
L_DcWordToBits	Bit demultiplexer • WORD → BOOL (16 x)	LenzeDataConversion V01.00.xx.xx
L_DcWordToBits	Bit demultiplexer • WORD → BOOL (16 x)	LenzeDataConversion V01.00.xx.xx
L_DcWordToByte	Type converter • WORD → BYTE	LenzeDataConversion V01.00.xx.xx
L_DcWordToDWord	Type converter • WORD → DWORD	LenzeDataConversion V01.00.xx.xx
L_DcWordToInt	Type converter • WORD → INT	LenzeDataConversion V01.00.xx.xx
L_DevApplErr	Error tripping • The FB can trip up to 8 different application messages out of the application. • Error ID and error response as well as the module ID can be set via parameters.	LenzeDevice9400 V01.00.xx.xx
L_DevApplErrFix	Error tripping • The FB can trip up to 8 different application messages out of the application. • Error ID and error response as well as the module ID can be set via FB inputs.	LenzeDevice9400 V02.00.xx.xx
L_DevBrakeStateDecoder	Status signals of the basic function "Brake control" (SB **LS_Brake**)	LenzeDevice9400 V01.00.xx.xx
L_DevDriveInterfaceStateDecoder	Status signals of the drive interface (SB **LS_DriveInterface**)	LenzeDevice9400 V01.00.xx.xx
L_DevHomingStateDecoder	Status signals of the basic function "Homing" (SB **LS_Homing**)	LenzeDevice9400 V01.00.xx.xx
L_DevLimiterStateDecoder	Status signals of the basic function "Limiter" (SB **LS_Limiter**)	LenzeDevice9400 V01.00.xx.xx
L_DevManualJogStateDecoder	Status signals of the basic function "Manual jog" (SB **LS_ManualJog**)	LenzeDevice9400 V01.00.xx.xx

Function block	Function	From library
L_DevParReadFix	One-time or cyclic reading of parameters • Only internal parameters (codes) of the controller can be read. • In contrast to the L_DevReadParDInt FB, the parameter of this FB to be read is addressed via FB inputs and not via parameters.	LenzeDevice9400 V02.00.xx.xx
L_DevParWriteFix	One-time or cyclic writing of parameters • Only internal parameters (codes) of the controller can be written. • In contrast to the L_DevWriteParDInt FB, the parameter of this FB to be written is addressed via FB inputs and not via parameters.	LenzeDevice9400 V02.00.xx.xx
L_DevPositionerStateDecoder	Status signals of the basic function "Positioning" (SB **LS_Positioner**)	LenzeDevice9400 V02.00.xx.xx
L_DevReadParDInt	One-time or cyclic reading of parameters of "DINT" data type • Only internal parameters (codes) of the controller can be read.	LenzeDevice9400 V01.00.xx.xx
L_DevSMControlDecoder	Control signals from the SM3xx safety module	LenzeDevice9400 V02.00.xx.xx
L_DevSMControlEncoder	Control word for limiter • The FB generates the bit-coded control signal *dwControl* from individual boolean control signals for the SB **LS_Limiter** and thus allows control of the basic function "Limiter" if no SM3xx safety module is available.	LenzeDevice9400 V02.00.xx.xx
L_DevSMStateDecoder	Status signals from the SM3xx safety module	LenzeDevice9400 V02.00.xx.xx
L_DevSMStateDecoderIO	I/O status signals from the SM3xx safety module	LenzeDevice9400 V02.00.xx.xx
L_DevWriteParDInt	One-time or cyclic writing of parameters of the "DINT" data type • Only internal parameters (codes) of the controller can be written.	LenzeDevice9400 V02.00.xx.xx
L_EsClutchPos	Clutch (time-controlled) • Clutch in or declutch a master position via a fifth order polynomial in a time-controlled manner.	LenzeElectricalShaft V01.01.xx.xx
L_EsEncoderConv	Encoder signal conditioning	LenzeElectricalShaft V01.00.xx.xx
L_EsStretchIntegrate	Stretching and compression of a master value in the "Modulo" or "Unlimited" traversing range	LenzeElectricalShaft V01.00.xx.xx
L_LdAddOffsetCyclic	Offset addition to a clocked position	LenzeLineDrive V01.00.xx.xx
L_LdClutchAxisP	Time-controlled virtual clutch with position reference	LenzeLineDrive V01.00.xx.xx
L_LdClutchV	Time-controlled virtual clutch with speed reference	LenzeLineDrive V01.00.xx.xx
L_LdConvAxisV	Speed ratio between two axes	LenzeLineDrive V01.00.xx.xx
L_LdDifferentiateCyclic	Differentiation of a position considering the cycle	LenzeLineDrive V01.00.xx.xx
L_LdExtrapolate	Extrapolation of position information • E.g. to compensate for longer bus transfer cycles or smooth low-resolution absolute value encoders.	LenzeLineDrive V01.00.xx.xx
L_LdIntegrateCyclic	Integration of a speed to a position considering the cycle	LenzeLineDrive V01.00.xx.xx
L_LdLinearCoupling	Master value connection	LenzeLineDrive V01.00.xx.xx

Function block	Function	From library
L_LdMarkSync	Mark synchronisation in synchronism and cam profiler applications	LenzeLineDrive V01.00.xx.xx
L_LdMonitFollowError	Following error monitoring with adjustable switching threshold and hysteresis	LenzeLineDrive V01.00.xx.xx
L_LdMPot	Master value adjustment in positive/negative traversing direction with parameterisable speeds	LenzeLineDrive V01.00.xx.xx
L_LdPosCtrlLin	Master value adjustment (related to position)	LenzeLineDrive V01.00.xx.xx
L_LdSetAxisVelocity	Stretching/compression of the x axis and synchronisation via touch probe • Within the cycle, the master speed is integrated to the position.	LenzeLineDrive V01.00.xx.xx
L_LdStateDecoder	LineDrive status signals • Decoding of the status output signal *dnState* of an FB from the function library "LenzeLineDrive.lib" into individual boolean status signals for further use in the FB interconnection.	LenzeLineDrive V01.00.xx.xx
L_LdSyncOperation	Master value connection	LenzeLineDrive V01.00.xx.xx
L_LdToolControl	Setpoint conditioning for the tool axis.	LenzeLineDrive V01.00.xx.xx
L_LdVirtualMasterP	Virtual master for synchronism	LenzeLineDrive V01.00.xx.xx
L_LdVirtualMasterV	Virtual master for electronic gearbox	LenzeLineDrive V01.00.xx.xx
L_LdZeroDetect	Detection of zero crossings in case of a clocked position	LenzeLineDrive V01.00.xx.xx
L_PosDecoderStatePositioner	Status signals of the basic function "Positioning" (SB **LS_Positioner**) • From firmware 1.50, the FB is replaced by the FB L_DevPositionerStateDecoder.	LenzePositioning V01.00.xx.xx
L_PosDecoderStateSequencer	Status signals of the sequence control (FB L_PosSequencer) • From firmware 1.50, the FB is replaced by the FB L_PosSequencerStateDecoder.	LenzePositioning V01.00.xx.xx
L_PosGetProfile	Profile data tables • Together with an FB instance of type L_PosPositionerTable or L_PosProfileTable, this FB provides five profile data sets that can be selected.	LenzePositioning V01.00.xx.xx
L_PosGetProfileData	Profile data output	LenzePositioning V01.00.xx.xx
L_PosGetTableAcc	Acceleration table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five acceleration values from the VTACC variable table. • ...of type L_PosProfileTable this FB provides accelerations which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx
L_PosGetTableJerk	S-ramp time table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five S-ramp times from the VTJERK variable table . • ...of type L_PosProfileTable this FB provides S-ramp times which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx

Function block	Function	From library
L_PosGetTablePos	Position table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five position values from the VTPOS variable table. • ...of type L_PosProfileTable this FB provides positions which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx
L_PosGetTableSpeed	Speed table • Together with an FB instance • ...of type L_PosPositionerTable this FB provides five speed values from the VTSPEED variable table. • ...of type L_PosProfileTable this FB provides speeds which are directly defined in the profiles.	LenzePositioning V01.00.xx.xx
L_PosPositionerInterface	Interface to basic function "Positioning" • Use this interface to control the SB **LS_Positioner** via level-controlled signals, e.g. from a higher-level control.	LenzePositioning V02.00.xx.xx
L_PosPositionerTable	Profile data record management • Storing and managing (traversing) profiles and "teaching" positions, speeds, accelerations/decelerations and S-ramp times.	LenzePositioning V01.00.xx.xx
L_PosProfileInterface	Profile data interface • Profile data selection for the SB **LS_Positioner**.	LenzePositioning V01.00.xx.xx
L_PosProfileTable	Profile data record management (simple) • Storing and managing up to four traversing profiles and "teaching" target positions. • Unlike the FB L_PosPositionerTable, this FB does not use any variable tables, but profile parameter data is directly entered under the assigned codes. • Furthermore, the position assigned to the input *dnExtPos_p* will be used as target position if profile number 1 is selected.	LenzePositioning V01.00.xx.xx
L_PosSequencer	Sequence control • Parameterisable sequence table for implementing a sequence control.	LenzePositioning V01.00.xx.xx
L_PosSequencerStateDecoder	Status signals of the sequence control (FB L_PosSequencer)	LenzePositioning V02.00.xx.xx
L_SdAccToUnit	Acceleration conversion • Speed variation/time ➞ acceleration [unit/s^2]	LenzeServoDrive V01.00.xx.xx
L_SdDelayComp	Extrapolation • The FB extrapolates a signal by the time set.	LenzeServoDrive V01.00.xx.xx
L_SdDifferentiate	Differentiation (position ➞ speed)	LenzeServoDrive V01.00.xx.xx
L_SdFactor	Stretch factor	LenzeServoDrive V01.00.xx.xx
L_SdGetAxisData	Reading out machine parameters from axis data	LenzeServoDrive V02.07.xx.xx
L_SdGetPosition	Position conversion • Position [increments] ➞ position [unit] (displayed as parameter value)	LenzeServoDrive V01.00.xx.xx
L_SdGetSpeed	Speed conversion • Speed ➞ velocity [unit/s] (displayed as parameter value)	LenzeServoDrive V01.00.xx.xx
L_SdIntegrate	Integration (speed ➞ position)	LenzeServoDrive V01.00.xx.xx

Function block	Function	From library
L_SdIntegrateAxis	Integration (speed → position) with TP correction	LenzeServoDrive V02.03.xx.xx
L_SdIntegrateLimit	Integration (speed → position) with adjustable upper/lower limit for return purposes	LenzeServoDrive V02.09.xx.xx
L_SdInterExtrapolateAny	Interpolation/extrapolation of setpoints	LenzeServoDrive V02.09.xx.xx
L_SdInterExtrapolatePosition	Interpolation/extrapolation of position information	LenzeServoDrive V02.09.xx.xx
L_SdInterpolate	Interpolation of position information • E.g. to compensate for longer bus transfer cycles or smooth low-resolution absolute value encoders.	LenzeServoDrive V02.00.xx.xx
L_SdLimitSpeed	Speed limitation • Leads a speed setpoint to defined limit ranges.	LenzeServoDrive V01.00.xx.xx
L_SdMotorPot	Motor potentiometer function • Can be used as an alternative setpoint source that is controlled via two inputs.	LenzeServoDrive V02.04.xx.xx
L_SdPosToUnit	Position conversion • Position [increments] → position [unit]	LenzeServoDrive V01.00.xx.xx
L_SdProcessController	Comprehensive PID controller with setpoint and actual value processing as well as parameterisable characteristic function and limitation	LenzeServoDrive V02.05.xx.xx
L_SdRampGenerator	Ramp generator (ramp function generator) with S-shaped ramps	LenzeServoDrive V01.00.xx.xx
L_SdRampGeneratorAny	Ramp generator (ramp function generator) with S-shaped ramps. • Unlike the L_SdRampGenerator FB, this FB is also able to process speeds (_s). Separate acceleration and deceleration times can be set.	LenzeServoDrive V02.09.xx.xx
L_SdRuntimeComp	Compensation of the runtime by a leading master value	LenzeServoDrive V01.00.xx.xx
L_SdSetAxisData	Represented machine parameters of a master drive	LenzeServoDrive V01.00.xx.xx
L_SdSetPosition	Position conversion • Position [unit] (selected as parameter value) → position [increments]	LenzeServoDrive V01.00.xx.xx
L_SdSetSpeed	Speed conversion • Velocity [unit/s] (selected as parameter value) → speed	LenzeServoDrive V01.00.xx.xx
L_SdSpeedFilter	Speed signal delay • Filters or decelerates speed signal according to the PT1 principle.	LenzeServoDrive V01.00.xx.xx
L_SdSpeedSet	Ramp generator (ramp function generator) with S-shaped ramps, parameterisable fixed setpoints and comprehensive parameter setting and control options	LenzeServoDrive V01.00.xx.xx
L_SdSpeedToUnit	Speed conversion • Speed → velocity [unit/s]	LenzeServoDrive V01.00.xx.xx
L_SdSwitchPoint	Position switch points (cams)	LenzeServoDrive V01.00.xx.xx
L_SdTouchProbe	Touch probe processing • The FB takes over the interpolation of the input signal based on the time stamp handed over by a touch probe system block and outputs the interpolated value and the difference compared with the last input signal.	LenzeServoDrive V01.00.xx.xx
L_SdUnitToAcc	Acceleration conversion • Acceleration [unit/s^2] → speed variation/time	LenzeServoDrive V01.00.xx.xx

Function block	Function	From library
L_SdUnitToPos	Position conversion • Position [unit] ➞ position [increments]	LenzeServoDrive V01.00.xx.xx
L_SdUnitToSpeed	Speed conversion • Velocity [unit/s] ➞ speed	LenzeServoDrive V01.00.xx.xx
L_Tb5And	AND (5 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Nand	NOT-AND (5 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Nor	NOT-OR (5 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Or	OR (5 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb5Xor	EXCLUSIVE-OR (5 inputs)	LenzeToolbox V01.00.xx.xx
L_Tb8Select	1-out-of-8 selector (for data type "DINT") • The FB connects one of eight input signals through to the output.	LenzeToolbox V01.00.xx.xx
L_Tb8SelectByte	1-out-of-8 selector (for data type "BYTE") • The FB connects one of eight input signals through to the output.	LenzeToolbox V02.05.xx.xx
L_Tb8SelectWord	1-out-of-8 selector (for data type "WORD") • The FB connects one of eight input signals through to the output.	LenzeToolbox V02.05.xx.xx
L_TbAbs	Absolute value generation • The function block converts a bipolar signal into a unipolar signal, i.e. the absolute value of the input signal is generated.	LenzeToolbox V01.00.xx.xx
L_TbAdd	Addition without limitation	LenzeToolbox V01.00.xx.xx
L_TbAddLim	Addition with limitation	LenzeToolbox V01.00.xx.xx
L_TbAddSubLim	Addition and subtraction with limitation	LenzeToolbox V02.04.xx.xx
L_TbAnd	AND (2 inputs)	LenzeToolbox V01.00.xx.xx
L_TbCompare	Comparison • The function block compares two signals of the "DINT" data type and can be used e.g. for implementing a trigger.	LenzeToolbox V01.00.xx.xx
L_TbCompare_n	Comparison (scaled) • The function block compares two scaled signals and can be used e.g. for implementing a trigger.	LenzeToolbox V01.00.xx.xx
L_TbCount	Upcounter and downcounter with adjustable limitation	LenzeToolbox V01.00.xx.xx
L_TbCurve	Characteristic function (scaled) • The FB produces the corresponding value of the Y axis for the X axis value with a parameterisable characteristic function y = f(x).	LenzeToolbox V01.00.xx.xx
L_TbCurveAny	Characteristic function • The FB produces the corresponding value of the Y axis for the X axis value with a parameterisable characteristic function y = f(x).	LenzeToolbox V02.06.xx.xx
L_TbDeadband	Dead band • The FB produces a symmetrical dead band around zero.	LenzeToolbox V01.00.xx.xx
L_TbDeadband_n	Dead band (scaled) • The FB produces a symmetrical dead band (scaled) around zero.	LenzeToolbox V01.00.xx.xx
L_TbDelay	Binary delay element	LenzeToolbox V01.00.xx.xx
L_TbDifferentiate	Differentiator with low pass	LenzeToolbox V01.00.xx.xx
L_TbDiv	Division with remainder	LenzeToolbox V01.00.xx.xx

Function block	Function	From library
L_TbDiv_n	Division divisor selected as scaled signal [%]	LenzeToolbox V01.00.xx.xx
L_TbFlipFlopD	D flipflop • Can be used for evaluation and storage of digital signal edges.	LenzeToolbox V01.00.xx.xx
L_TbFlipFlopRS	RS flipflop • Can be used for evaluation and storage of digital signals.	LenzeToolbox V01.00.xx.xx
L_TbGainLim	Gain with limitation	LenzeToolbox V01.00.xx.xx
L_TbIntegrate	Integration with limitation	LenzeToolbox V01.00.xx.xx
L_TbLimit	Signal limitation (for data type "DINT") • The FB limits a signal of "DINT" data type to an adjustable value range.	LenzeToolbox V01.00.xx.xx
L_TbLimit_n	Signal limitation (scaled) • The FB limits a scaled signal [%] to an adjustable value range.	LenzeToolbox V01.00.xx.xx
L_TbLimitInt	Signal limitation (for data type "INT") • The FB limits a signal of "INT" data type to an adjustable value range.	LenzeToolbox V02.05.xx.xx
L_TbMaskOut	Zone masking • The FB masks up to four parameterisable blocking zones within a continuous signal characteristic.	LenzeToolbox V01.00.xx.xx
L_TbMul	Multiplication without limitation	LenzeToolbox V01.00.xx.xx
L_TbMul_n	Multiplication with the multiplicand selected as scaled signal [%]	LenzeToolbox V01.00.xx.xx
L_TbMulDivLim	Multiplication and division with limitation	LenzeToolbox V02.02.xx.xx
L_TbMulLim	Multiplication with limitation	LenzeToolbox V01.00.xx.xx
L_TbNand	NOT-AND (2 inputs)	LenzeToolbox V01.00.xx.xx
L_TbNeg	Negation (for data type "DINT") • The function block inverts the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.	LenzeToolbox V01.00.xx.xx
L_TbNegInt	Negation (for data type "INT") • The function block inverts the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.	LenzeToolbox V02.05.xx.xx
L_TbNegSel	Optional negation (for data type "DINT") • The function block inverts (optionally) the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output. • In contrast to the L_TbNeg FB, this FB is only inverted if the *bNeg* control input is set to TRUE.	LenzeToolbox V02.02.xx.xx
L_TbNegSelInt	Optional negation (for data type "INT") • The function block inverts (optionally) the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output. • In contrast to the L_TbNegInt FB, this FB is only inverted if the *bNeg* control input is set to TRUE.	LenzeToolbox V02.05.xx.xx
L_TbNor	NOT-OR (2 inputs)	LenzeToolbox V01.00.xx.xx
L_TbNormalize	Signal scaling • The FB scales any signal to a parameterisable reference variable.	LenzeToolbox V01.00.xx.xx
L_TbNot	Negation (inverter)	LenzeToolbox V01.00.xx.xx
L_TbOr	OR (2 inputs)	LenzeToolbox V01.00.xx.xx
L_TbOscillator	Rectangular pulse generator with parameterisable pulse/dead time	LenzeToolbox V01.00.xx.xx

Function block	Function	From library
L_TbPIController	Simple PI controller with different control functions and parameterisable limitation	LenzeToolbox V01.00.xx.xx
L_TbPT1Filter	PT1 filter • The FB filters and delays analog signals.	LenzeToolbox V01.00.xx.xx
L_TbRateAction	Rate action function to compensate disturbing low passes	LenzeToolbox V01.00.xx.xx
L_TbSampleHold	Sample & Hold (for data type "DINT") • The FB stores a value of the "DINT" data type in order to keep it even after mains switching.	LenzeToolbox V01.00.xx.xx
L_TbSampleHoldWord	Sample & Hold (for data type "WORD") • The FB stores a value of the "WORD" data type in order to keep it even after mains switching.	LenzeToolbox V02.05.xx.xx
L_TbSelect	Selector (for data type "DINT") • The function block switches between two signals of "DINT" data type. The switch-over is controlled via a boolean input signal.	LenzeToolbox V01.00.xx.xx
L_TbSelectByte	Selector (for data type "BYTE") • The function block switches between two signals of "BYTE" data type. The switch-over is controlled via a boolean input signal.	LenzeToolbox V02.02.xx.xx
L_TbSelectWord	Selector (for data type "WORD") • The function block switches between two signals of "WORD" data type. The switch-over is controlled via a boolean input signal.	LenzeToolbox V02.05.xx.xx
L_TbSub	Subtraction without limitation	LenzeToolbox V01.00.xx.xx
L_TbSubLim	Subtraction with limitation	LenzeToolbox V01.00.xx.xx
L_TbTransition	Signal edge evaluation • Can be used to generate timed and retriggerable pulses.	LenzeToolbox V01.00.xx.xx
L_TbXor	EXCLUSIVE-OR (2 inputs)	LenzeToolbox V01.00.xx.xx
L_WndCalcDiameter	Diameter calculation	LenzeWinder V01.00.xx.xx
L_WndCalcLength	Length calculation	LenzeWinder V01.00.xx.xx
L_WndFrictionCompensation	Friction compensation	LenzeWinder V01.00.xx.xx
L_WndIdentMInertia	Identification of the moment of inertia	LenzeWinder V01.00.xx.xx
L_WndStopCtrl	Stop controller	LenzeWinder V01.00.xx.xx
L_WndTensionCurve	Tensile force characteristic	LenzeWinder V01.00.xx.xx

4.13 FB reference list - 9300 Servo PLC

The following reference list shall assist you in finding the correct function block to simulate a function known from 9300 servo PLC.

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_32BitTransferDINT	Data-consistent copying of a DINT variable	Lenze32BitTransferDrv	-	-
L_32BitTransferDWORD	Data-consistent copying of a DWORD variable	Lenze32BitTransferDrv	-	-
L_8200CtrlWord	Control word for the frequency inverter	Lenze8200Drive	-	-
L_8200DataControl	Process data exchange with frequency inverter	Lenze8200Drive	-	-
L_8200Initialization	Initialise frequency inverter	Lenze8200Drive	-	-
L_8200Parameter	Initialise codes	Lenze8200Drive	-	-
L_8200StatusWord	Status word of frequency inverters	Lenze8200Drive	-	-
L_ABS	Absolute value generation	LenzeDrive.lib	L_TbAbs	Absolute value generation
L_ADD	Addition	LenzeDrive.lib	L_TbAdd	Addition without limitation
			L_TbAddLim	Addition with limitation
L_AifParMapClose*	Deactivate code mapping	LenzeAifParMapDrv	-	-
L_AifParMapInit*	Configure code mapping	LenzeAifParMapDrv	-	-
L_AifParMapOpen*	Activate code mapping	LenzeAifParMapDrv	-	-
L_AIN	Input gain & offset	LenzeDrive.lib	**LS_AnalogInput** SB	Analog inputs
L_AND	AND	LenzeDrive.lib	L_TbAnd	AND (2 inputs)
			L_Tb5And	AND (5 inputs)
L_ANEG	Inversion	LenzeDrive.lib	L_TbNeg	Negation
			L_TbNegSel	Negation (optional)
L_AOUT	Output gain & offset	LenzeDrive.lib	L_TbGainLim	Gain with limitation
			L_TbAdd	Addition without limitation
			L_TbAddLim	Addition with limitation
			L_TbAddSubLim	Addition and subtraction with limitation
L_ARIT	Arithmetic	LenzeDrive.lib	L_TbAdd	Addition without limitation
			L_TbAddLim	Addition with limitation
			L_TbAddSubLim	Addition and subtraction with limitation
			L_TbDiv	Division with remainder
			L_TbDiv_n	Division divisor selected as scaled signal [%]
			L_TbMul	Multiplication without limitation
			L_TbMul_n	Multiplication with the multiplicand selected as scaled signal [%]
			L_TbMulLim	Multiplication with limitation
			L_TbSub	Subtraction without limitation
			L_TbSubLim	Subtraction with limitation
* Function (no function block)				

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_ARITPH	Arithmetic	LenzeDrive.lib	L_TbAdd	Addition without limitation
			L_TbAddLim	Addition with limitation
			L_TbAddSubLim	Addition and subtraction with limitation
			L_TbDiv	Division with remainder
			L_TbDiv_n	Division divisor selected as scaled signal [%]
			L_TbMul	Multiplication without limitation
			L_TbMul_n	Multiplication with the multiplicand selected as scaled signal [%]
			L_TbMulLim	Multiplication with limitation
			L_TbSub	Subtraction without limitation
			L_TbSubLim	Subtraction with limitation
L_ASW	Switch-over	LenzeDrive.lib	L_Tb8Select	1-from-8-selector
			L_TbSelect	Selector
L_BRK	Holding brake	Lenze9300Servo.lib	**LS_Brake** SB	Basic function "Brake control"
L_ByteArrayToDint	Type conversion	LenzeDrive.lib	-	-
L_CamAddVelocity	Speed addition	LenzeCamControl2	-	-
L_CamAdjustDfIn	Digital frequency adjustment	LenzeCamControl2	-	-
L_CamClutchXAxis	Virtual clutch	LenzeCamControl1	L_CamClutchPos	Virtual clutch (path-controlled)
			L_LdClutchAxisP	Time-controlled virtual clutch with position reference
			L_LdClutchV	Time-controlled virtual clutch with speed reference
L_CamContactor	Cam group	LenzeCamControl1	L_CamContactor	Cam group with switch-on and switch-off dynamisation
			L_SdSwitchPoint	Position switch points (cams)
L_CamContactorVPos	Dynamic adjustment of the cams/hysteresis	LenzeCamControl1	L_CamContactor	Cam group with switch-on and switch-off dynamisation
L_CamControl	Setpoint conditioning	LenzeCamControl1	**LS_CamInterface** SB	Basic drive function "Cam data management"
L_CamData	Profile management and curve profile generator	LenzeCamControl1	**LS_CamInterface** SB	Basic drive function "Cam data management"
			L_CamProfiler	Curve interpolation
			L_CamCurve	Characteristic interpolation
L_CamDifferentiate	Converter/differentiator	LenzeCamControl2	L_SdDifferentiate	Differentiation (position → speed)
L_CamEditProfileData	Online change of the profile points	LenzeCamControl2	**LS_CamInterface** SB	Basic drive function "Cam data management"
L_CamExtrapolate	Extrapolation	LenzeCamControl2	L_LdExtrapolate	Extrapolation of position information
			L_SdInterExtrapolateAny	Interpolation/extrapolation of setpoints
			L_SdInterExtrapolatePosition	Interpolation/extrapolation of position information

* Function (no function block)

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_CamGetPosition	Unit conversion	LenzeCamControl1	L_SdPosToUnit	Position [increments] → position [unit]
			L_SdGetPosition	Position [increments] → position [unit] (displayed as parameter value)
L_CamIntegrateVarLim	Phase integrator	LenzeCamControl2	L_SdIntegrate	Integration (speed → position)
L_CamLimitVelocity	Limiting element	LenzeCamControl1	L_SdLimitSpeed	Leads a speed setpoint to defined limit ranges
L_CamMachineData	Machine parameters	LenzeCamControl1	L_CamGetAxisData	Reading out machine parameters from cam data
			L_SdSetAxisData	Represented machine parameters of a master drive
L_CamMonitFollowError	Following error monitoring	LenzeCamControl1	L_LdMonitFollowError	Following error monitoring with adjustable switching threshold and hysteresis
L_CamPosCtrlLin	Linear profile generator	LenzeCamControl1	-	-
L_CamProfileData	Loading of important profile points	LenzeCamControl1	-	-
L_CamSectionShift	Section shift	LenzeCamControl2	-	-
L_CamSelPosition	Master value selection	LenzeCamControl2	L_Tb8Select	1-from-8-selector
L_CamSelVelocity	Digital frequency selection	LenzeCamControl2	L_Tb8Select	1-from-8-selector
L_CamSequence	Selection of a profile sequence	LenzeCamControl1	-	-
L_CamSetPosition	Unit conversion	LenzeCamControl1	L_SdUnitToPos	Position [unit] → position [increments]
			L_SdSetPosition	Position [unit] (selected as parameter value) → position [increments]
L_CamSetXAxisVelocity	Stretching & compressing the master value	LenzeCamControl1	L_CamStretchAbs	Stretch/compress position (absolute)
			L_CamStretchFeed	Stretch/compress position (relative)
			L_LdSetAxisVelocity	Stretching/compression of the X axis and synchronisation via touch probe. The master speed is integrated to the position within the cycle.
L_CamSetYAxisVelocity	Stretching & compressing the setpoint	LenzeCamControl1	L_CamStretchAbs	Stretch/compress position (absolute)
			L_CamStretchFeed	Stretch/compress position (relative)
L_CamVelocityFilter	Filter (PT1) for speed signals	LenzeCamControl2	L_TbPT1Filter	PT1 filter
L_CamVMasterPosition	Virtual master with positioning function	LenzeCamControl1	L_LdVirtualMasterP	Virtual master with position reference
L_CamVMasterVelocity	Virtual master	LenzeCamControl1	L_LdVirtualMasterV	Virtual master with speed reference
L_CanClose*	Deactivation	LenzeCanDrv	-	-
L_CanDSxClose*	Deactivate index mapping	LenzeCanDSxDrv	-	-
L_CanDSxCloseHeartBeat*	Deactivate "Heartbeat"	LenzeCanDSxDrv	-	-
L_CanDSx CloseNodeGuarding*	Deactivate "Node Guarding"	LenzeCanDSxDrv	-	-
L_CanDSxHeartBeat	Execute "Heartbeat"	LenzeCanDSxDrv	-	-
L_CanDSxInitIndexCode*	Configure index mapping	LenzeCanDSxDrv	-	-
L_CanDSxNodeGuarding	Execute "Node Guarding"	LenzeCanDSxDrv	-	-
L_CanDSxOpen*	Initialise CanDSx driver	LenzeCanDSxDrv	-	-
L_CanDSxOpenHeartBeat*	Initialise "Heartbeat"	LenzeCanDSxDrv	-	-
L_CanDSx OpenNodeGuarding*	Initialise "Node Guarding"	LenzeCanDSxDrv	-	-
L_CanGetRelocCobId*	Query - COB-ID area	LenzeCanDrv	-	-
* Function (no function block)				

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_CanGetState*	Driver status	LenzeCanDrv	-	-
L_CanInit*	Initialisation	LenzeCanDrv	-	-
L_CanPdoReceive	Receive CAN object	LenzeCanDrv	-	-
L_CanPdoTransmit	Transmit CAN object	LenzeCanDrv	-	-
L_CMP	Comparison	LenzeDrive.lib	L_TbCompare	Comparison
			L_TbCompare_n	Comparison (scaled)
L_CONV	Scaling	LenzeDrive.lib	L_TbGainLim	Gain with limitation
			L_TbNormalize	Signal scaling
L_CONVPA	Conversion of angle to analog	LenzeDrive.lib	-	-
L_CONVPP	Conversion of phase signal	LenzeDrive.lib	-	-
L_CONVVV	Conversion	LenzeDrive.lib	-	-
L_CONVX	Scaling with limitation	LenzeDrive.lib	L_TbNormalize	Signal scaling
L_CURVE	Characteristic function	LenzeDrive.lib	L_TbCurve	Characteristic function (scaled)
			L_TbCurveAny	Characteristic function
L_DB	Dead band	LenzeDrive.lib	L_TbDeadband	Dead band
			L_TbDeadband_n	Dead band (scaled)
L_DFRFG	Digital frequency ramp function generator	LenzeElectricalShaft	L_CamSyncIn	Synchronous/oversynchronous clutch-in
L_DFSET	Digital frequency processing	LenzeElectricalShaft	-	-
L_DIGDEL	Binary delay element	LenzeDrive.lib	L_TbDelay	Binary delay element
L_DintToByteArray	Type conversion	LenzeDrive.lib	-	-
L_Display9371BB	Transparent mode with operating unit 9371BB	LenzeDrive.lib	-	-
L_DT1_	Differentiation	LenzeDrive.lib	L_TbDifferentiate	Differentiator with low pass
L_FCNT	Up/downcounter	LenzeDrive.lib	L_TbCount	Upcounter and downcounter with adjustable limitation.
L_FIXSET	Programming of fixed setpoints	LenzeDrive.lib	L_SdSpeedSet	Ramp generator (ramp function generator) with S-shaped ramps, parameterisable fixed setpoints and comprehensive parameter setting and control options.
L_FLIP	D flipflop	LenzeDrive.lib	L_TbFlipFlopD	D flipflop
			L_TbFlipFlopRS	RS flipflop
L_FUNCodeIndexConv	Index of a code (function)	LenzeDrive.lib	-	-
L_FWM	Error tripping	LenzeDrive.lib	L_DevApplErr	Error tripping
			L_DevApplErrFix	Error tripping
L_GEARCOMP	Gearbox compensation	LenzeElectricalShaft	-	-
L_IOAInModule	Signal conversion	LenzeIOSystem	-	-
L_IOAOutModule	Signal conversion	LenzeIOSystem	-	-
L_IOCompactModule	Coordinate data	LenzeIOSystem	-	-
L_IOConvByteArrayToByte	Conversion function	LenzeIOSystem	-	-
L_IOConvByteToByteArray	Conversion function	LenzeIOSystem	-	-
L_IOCounterDataFromIO	Counter function	LenzeIOSystem	-	-
L_IOCounterDataToIO	Counter function	LenzeIOSystem	-	-
L_IOCounterDIModuleDataFromIO	Counter function	LenzeIOSystem	-	-
L_IOCounterDIModuleDataToIO	Counter function	LenzeIOSystem	-	-
L_IOData15	Coordinate data	LenzeIOSystem	-	-
L_IOData610	Coordinate data	LenzeIOSystem	-	-

* Function (no function block)

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_IODInModule	Bit conversion	LenzeIOSystem	-	-
L_IODOutModule	Bit conversion	LenzeIOSystem	-	-
L_IOParAIAOModule	Parameter function	LenzeIOSystem	-	-
L_IOParAInModule	Parameter function	LenzeIOSystem	-	-
L_IOParAOutModule	Parameter function	LenzeIOSystem	-	-
L_IOParComGuarding	Monitoring function	LenzeIOSystem	-	-
L_IOParCompactModule	Parameter function	LenzeIOSystem	-	-
L_IOParCounterDIModule	Counter function	LenzeIOSystem	-	-
L_IOParCounterModule	Counter function	LenzeIOSystem	-	-
L_IOParPDO15	Parameter function	LenzeIOSystem	-	-
L_IOParPDO610	Parameter function	LenzeIOSystem	-	-
L_IOParSSIModule	Parameter function	LenzeIOSystem	-	-
L_IOSSIDataFromIO	Counter function	LenzeIOSystem	-	-
L_IOSSIDataToIO	Counter function	LenzeIOSystem	-	-
L_LIM	Limit	LenzeDrive.lib	-	-
L_MCAutoResetInterface	Process control	LenzeMotionControl	-	-
L_MCGetPosition	Unit conversion	LenzeMotionControl	L_SdPosToUnit	Position [increments] → position [unit]
			L_SdGetPosition	Position [increments] → position [unit] (displayed as parameter value)
L_MCGetVelocity	Unit conversion	LenzeMotionControl	L_SdGetSpeed	Speed → velocity [unit/s] (displayed as parameter value)
L_MCInterpolator	Signal interpolation	LenzeMotionControl	-	-
L_MCMachineData	Machine parameters	LenzeMotionControl	**LS_DriveInterface** SB	The machine parameters for the drive/motor are set via the drive interface.
			L_SdSetAxisData	Represented machine parameters of a master drive.
L_MCPhiDiff	Integration and subtraction of speed signals	LenzeMotionControl	L_TbDifferentiate	Differentiator with low pass
L_MCPhiIntegrator	Integrator with TP set function	LenzeMotionControl	L_SdIntegrate	Integration (speed → position)
			L_TbIntegrate	Integration with limitation
L_MCPhiTrim	Phase trimming is speed-dependent	LenzeMotionControl	-	-
L_MCPhiTrimTime	Phase trimming is time-dependent	LenzeMotionControl	-	-
L_MCPositionCorrection	Feed correction	LenzeMotionControl	-	-
L_MCProfileGenerator	Profile generator	LenzeMotionControl	-	-
L_MCResidualDistance	Residual path calculation	LenzeMotionControl	-	-
L_MCSetAcceleration	Unit conversion	LenzeMotionControl	-	-
L_MCSetDeceleration	Unit conversion	LenzeMotionControl	-	-
L_MCSetPosition	Unit conversion	LenzeMotionControl	-	-
L_MCSetProfileConverter	Unit conversion	LenzeMotionControl	-	-
L_MCSetProfileValues	Unit conversion	LenzeMotionControl	-	-
L_MCSetVelocity	Unit conversion	LenzeMotionControl	-	-
L_MCSignalDerive	Signal differentiation	LenzeMotionControl	-	-
L_MCSwitchCam	Switching points	LenzeMotionControl	-	-
L_MCSwitchPoint	Switching points	LenzeMotionControl	L_SdSwitchPoint	Position switch points (cams)
L_MCTouchProbeCtrl	Touch probe pre-processing	LenzeMotionControl	L_SdTouchProbe	Touch probe processing
L_MemClearFlash*	Delete flash memory segment	LenzeMemDrv	-	-

* Function (no function block)

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_MemCopyFromRam*	Copy data from RAM into variable memory	LenzeMemDrv	-	-
L_MemCopyToRam*	Copy data from variable memory into RAM	LenzeMemDrv	-	-
L_MemGetStateDriver*	Driver status	LenzeMemDrv	-	-
L_MemGetStateOfMemory	PLC memory status	LenzeMemDrv	-	-
L_MemLoadRamFromFlash*	Copy data from flash memory into RAM	LenzeMemDrv	-	-
L_MemReadDINT*	Read DINT value out of RAM	LenzeMemDrv	-	-
L_MemReadDWORD*	Read DWORD value out of RAM	LenzeMemDrv	-	-
L_MemReadINT*	Read INT value out of RAM	LenzeMemDrv	-	-
L_MemReadWORD*	Read WORD value out of RAM	LenzeMemDrv	-	-
L_MemSaveRamToFlash*	Copy data from RAM into flash memory	LenzeMemDrv	-	-
L_MemWriteDINT*	Write DINT value into RAM	LenzeMemDrv	-	-
L_MemWriteDWORD*	Write DWORD value into RAM	LenzeMemDrv	-	-
L_MemWriteINT	Write INT value into RAM	LenzeMemDrv	-	-
L_MemWriteWORD*	Write WORD value into RAM	LenzeMemDrv	-	-
L_MFAIL	Mains failure control	Lenze9300Servo.lib	-	-
L_MPOT	Motor potentiometer	LenzeDrive.lib	L_SdMotorPot	Motor potentiometer
L_NOT	NOT	LenzeDrive.lib	L_TbNot	Negation (inverter)
L_NSET	Speed pre-processing	LenzeDrive.lib	L_SdSpeedSet	Ramp generator (ramp function generator) with S-shaped ramps, parameterisable fixed setpoints and comprehensive parameter setting and control options.
L_OR	OR	LenzeDrive.lib	L_TbOr	OR (2 inputs)
			L_Tb5Or	OR (5 inputs)
L_ParRead	Reading of codes	LenzeDrive.lib	L_DevParReadFix	One-time or cyclic reading of parameters
			L_DevReadParDInt	One-time or cyclic reading of parameters of data type DINT
L_ParWrite	Writing of codes	LenzeDrive.lib	L_DevParWriteFix	One-time or cyclic writing of parameters
			L_DevWriteParDInt	One-time or cyclic writing of parameters of data type DINT
L_PCTRL	Process controller	LenzeDrive.lib	-	-
L_PHADD	Addition	LenzeDrive.lib	L_TbAdd	Addition without limitation
			L_TbAddLim	Addition with limitation
			L_TbAddSubLim	Addition and subtraction with limitation
L_PHCMP	Comparison	LenzeDrive.lib	L_TbCompare	Comparison
			L_TbCompare_n	Comparison (scaled)
L_PHDIFF	Difference	LenzeDrive.lib	L_TbDifferentiate	Differentiator with low pass
L_PHDIV	Division	LenzeDrive.lib	L_TbDiv	Division with remainder
			L_TbDiv_n	Division divisor selected as scaled signal [%]
L_PHINT	Integration	LenzeDrive.lib	L_SdIntegrate	Integration (speed → position)
			L_SdIntegrateLimit	Integration (speed → position) with adjustable upper/lower limit for return purposes

* Function (no function block)

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_PHINTK	Integration	LenzeDrive.lib	L_SdIntegrate	Integration (speed → position)
			L_SdIntegrateLimit	Integration (speed → position) with adjustable upper/lower limit for return purposes
L_PT1_	Delay	LenzeDrive.lib	L_TbPT1Filter	PT1 filter
L_REF	Homing function	LenzeElectricalShaft	**LS_Homing** SB	Basic function "Homing"
L_RFG	Ramp function generator	LenzeDrive.lib	L_SdRampGenerator	Ramp generator (ramp function generator) with S-shaped ramps.
			L_SdRampGeneratorAny	Unlike the L_SdRampGenerator FB, this FB is also able to process speeds (_s). Separate acceleration and deceleration times can be set.
			L_SdSpeedSet	Ramp generator (ramp function generator) with S-shaped ramps, parameterisable fixed setpoints and comprehensive parameter setting and control options.
L_RLQ	Right/left quick stop	LenzeDrive.lib	-	-
L_Rs232Close	Deactivation (function)	LenzeFpiDrv	-	-
L_Rs232GetReceiveState	Receive status (function)	LenzeFpiDrv	-	-
L_Rs232GetSendState	Transmit status (function)	LenzeFpiDrv	-	-
L_Rs232Open	Initialisation (function)	LenzeFpiDrv	-	-
L_Rs232ReceiveData	Receiving data (function)	LenzeFpiDrv	-	-
L_Rs232SendData	Transmitting data (function)	LenzeFpiDrv	-	-
L_SH	Sample & Hold	LenzeDrive.lib	L_TbSampleHold	Sample & Hold
L_SRFG	Ramp function generator with S ramp	LenzeDrive.lib	L_SdRampGenerator	Ramp generator (ramp function generator) with S-shaped ramps.
			L_SdRampGeneratorAny	Unlike the L_SdRampGenerator FB, this FB is also able to process speeds (_s). Separate acceleration and deceleration times can be set.
			L_SdSpeedSet	Ramp generator (ramp function generator) with S-shaped ramps, parameterisable fixed setpoints and comprehensive parameter setting and control options.
L_TBConvBitsToByte*	BOOL (8 x) → BYTE	LenzePLCToolBox	L_DcBitsToByte	BOOL (8 x) → BYTE
L_TBConvBitsToDword*	BOOL (32 x) → DWORD	LenzePLCToolBox	L_DcBitsToDWord	BOOL (32 x) → DWORD
L_TBConvBitsToWord*	BOOL (16 x) → WORD	LenzePLCToolBox	L_DcBitsToWord	BOOL (16 x) → WORD
L_TBConvByteToBits	BYTE → BOOL (8 x)	LenzePLCToolBox	L_DcByteToBits	BYTE → BOOL (8 x)
L_TBConvCharToByte*	ASCII character → ASCII code	LenzePLCToolBox	-	-
L_TBConvDwordToBits	DWORD → BOOL (32 x)	LenzePLCToolBox	L_DcDWordToBits	DWORD → BOOL (32 x)
L_TBConvWordToBits	WORD → BOOL (16 x)	LenzePLCToolBox	L_DcWordToBits	WORD → BOOL (16 x)
L_TBGetBitOfByte*	Outputs a bit of a BYTE value	LenzePLCToolBox	L_DcGetBitOfByte	Outputs a bit of a BYTE value
L_TBGetBitOfDword*	Outputs a bit of a DWORD value	LenzePLCToolBox	L_DcGetBitOfDWord	Outputs a bit of a DWORD value
L_TBGetBitOfWord*	Outputs a bit of a WORD value	LenzePLCToolBox	-	-
L_TBResetBitOfByte*	Resets a bit of a BYTE value to "0".	LenzePLCToolBox	L_DcResetBitOfByte	Resets a bit of a BYTE value to "0".
L_TBResetBitOfDword*	Resets a bit of a DWORD value to "0".	LenzePLCToolBox	L_DcResetBitOfDWord	Resets a bit of a DWORD value to "0".
* Function (no function block)				

Function block for 9300 servo PLC			Function block for 9400 Servo Drives	
Name	**Description**	**Function library**	**Name**	**Description**
L_TBResetBitOfWord*	Resets a bit of a WORD value to "0".	LenzePLCToolBox	L_DcResetBitOfWord	Resets a bit of a WORD value to "0".
L_TBSetBitOfByte*	Sets a bit of a BYTE value to "1".	LenzePLCToolBox	L_DcSetBitOfByte	Sets a bit of a BYTE value to "1".
L_TBSetBitOfDword*	Sets a bit of a DWORD value to "1".	LenzePLCToolBox	L_DcSetBitOfDWord	Sets a bit of a DWORD value to "1".
L_TBSetBitOfWord*	Sets a bit of a WORD value to "1".	LenzePLCToolBox	L_DcSetBitOfWord	Sets a bit of a WORD value to "1".
L_TBSquareWave	Rectangular pulse generator with variable pulse/dead time.	LenzePLCToolBox	L_TbOscillator	Rectangular pulse generator with parameterisable pulse/dead time.
L_TpConfigDigInX	Configures a touch probe input (function)	LenzeTpDrv	-	-
L_TpGetLastScanDigIn1...4	Provides touch-probe signals	LenzeTpDrv	L_SdTouchProbe	Touch probe processing
L_TRANS	Edge evaluation	LenzeDrive.lib	L_TbTransition	Signal edge evaluation
L_WndAccTorque	Acceleration compensation	LenzeWinder	-	-
L_WndCalcDiameter	Diameter calculation	LenzeWinder	L_WndCalcDiameter	Diameter calculation
L_WndCalcLength	Length calculation	LenzeWinder	L_WndCalcLength	Length calculation
L_WndCalcThickness	Thickness calculation	LenzeWinder	-	-
L_WndConvActPos	Actual dancer value conditioning	LenzeWinder	-	-
L_WndConvMSet	Torque setpoint converter	LenzeWinder	-	-
L_WndConvNSet	Speed setpoint converter	LenzeWinder	-	-
L_WndFrictionCurve	Friction compensation	LenzeWinder	L_Wnd FrictionCompensation	Friction compensation
L_WndGearRatio	Gearbox factor changeover	LenzeWinder	-	-
L_WndIdentFriction	Identification of the friction characteristic	LenzeWinder	L_Wnd FrictionCompensation	Friction compensation
L_WndIdentMInertia	Identification of the moment of inertia	LenzeWinder	L_WndIdentMInertia	Identification of the moment of inertia
L_WndMInertia	Mass inertia calculation	LenzeWinder	-	-
L_WndProcessCtrl	Dancer / tension control	LenzeWinder	-	-
L_WndStopCtrl	Stop controller	LenzeWinder	L_WndStopCtrl	Stop controller
L_WndTensionCurve	Tensile force characteristic	LenzeWinder	L_WndTensionCurve	Tensile force characteristic
* Function (no function block)				

4.14 FB reference list - 9300 servo inverter

The following reference list shall assist you in finding the correct function block to simulate a function known from the 9300 servo inverter.

Function block for 9300 servo inverter		Function block for 9400 Servo Drives	
Name	**Description**	**Name**	**Description**
ABS	Absolute value generator	L_TbAbs	Absolute value generation
ADD	Addition block	L_TbAdd	Addition without limitation
		L_TbAddLim	Addition with limitation
		L_TbAddSubLim	Addition and subtraction with limitation
AIF-IN	Fieldbus	-	-
AIF-OUT	Fieldbus	-	-
AIN	Analog inputs	**LS_AnalogInput** SB	Analog inputs
AND	AND	L_TbAnd	AND (2 inputs)
		L_Tb5And	AND (5 inputs)
ANEG	Analog inverter	L_TbNeg	Sign inversion
AOUT	Analog outputs	**LS_AnalogOutput** SB	Analog outputs
ARIT	Arithmetic block	L_TbAdd	Addition without limitation
		L_TbAddLim	Addition with limitation
		L_TbAddSubLim	Addition and subtraction with limitation
		L_TbDiv	Division with remainder
		L_TbDiv_n	Division divisor selected as scaled signal [%]
		L_TbMul	Multiplication without limitation
		L_TbMul_n	Multiplication with the multiplicand selected as scaled signal [%]
		L_TbMulLim	Multiplication with limitation
		L_TbSub	Subtraction without limitation
		L_TbSubLim	Subtraction with limitation
ARITPH	32 bit arithmetic block	L_TbAdd	Addition without limitation
		L_TbAddLim	Addition with limitation
		L_TbAddSubLim	Addition and subtraction with limitation
		L_TbDiv	Division with remainder
		L_TbDiv_n	Division divisor selected as scaled signal [%]
		L_TbMul	Multiplication without limitation

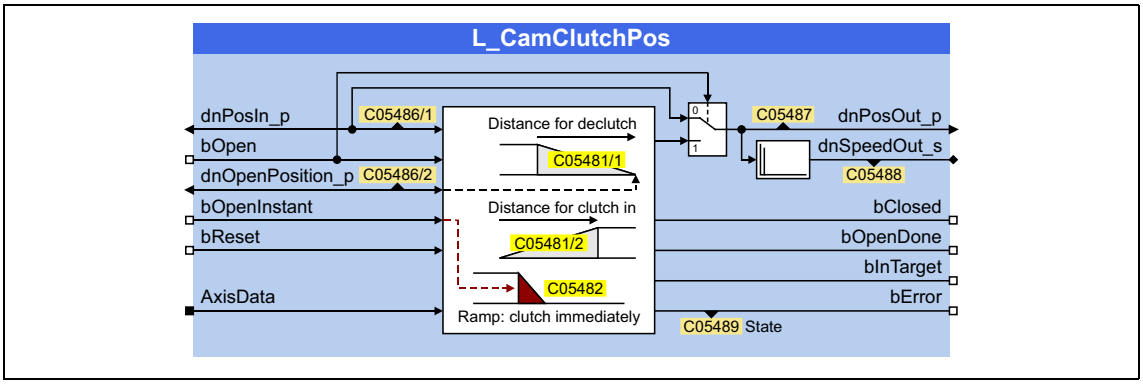
5 Function blocks

This chapter describes all function blocks (FBs) that are provided by the »Engineer« function block editor for the "9400 Servo Drives".

Note!

The grayed out area at the beginning of each FB description informs you on the function library which contains the corresponding FB and provides information concerning the "9400 Servo Drives" that can be used with the FB.

Tip!



For an external access (e.g. from a master control) to the parameters of the parameterisable function blocks: The Table of attributes contains information required for communication to the controller via parameters. (📖 656)

5.1 L_CamClutchPos - clutch (path-controlled)

Function library:	LenzeCam	**FB permissible for firmware as of V3.0 only!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB serves to implement a path-controlled clutching and declutching of the master position for all traversing ranges (Modulo/limited/unlimited) via a fifth-order polynomial.

- More functions:
  - Positive opening operation of the clutch (for emergency situations)
  - "Hard clutch-in"
- For time-controlled clutching and declutching, use the L_EsClutchPos FB. (📖 290)

Inputs

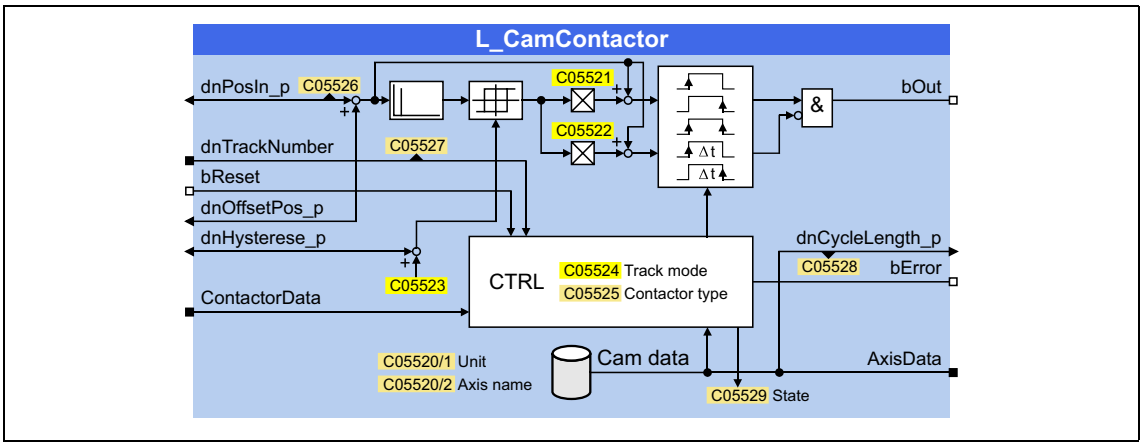
Identifier/data type	Information/possible settings	
dnPosIn_p DINT	Input position in [increments] • Selection of an external master position. • C05486/1 indicates the input position in the real unit of the machine.	
bOpen BOOL	Control of the clutch function	
	TRUE	"Open clutch" request (declutch process). • The *dnPosOut_p* output position from the declutch position disengages from the *dnPosIn_p* master position and is decelerated to the *dnOpenPosition_p* standstill position. • The declutch position indirectly results from the relative declutch path set in C05481/1. • If the *dnPosOut_p* output position has reached the standstill position, the two outputs *bInTarget* and *bOpenDone* are set to TRUE.
	FALSE	"Close clutch" request (clutch-in process). • The clutch-in process can only be started after the declutch process has been totally completed; an early abort of the declutch process is not possible. • The *dnPosOut_p* output position is resynchronised to the *dnPosIn_p* master position and then follows it. • The position from which the input and output position are synchronous again indirectly results from the relative clutch-in path set in C05481/2. • If the input and output position are synchronous again, the output *bClosed* is set to TRUE.
dnOpenPosition_p DINT	Standstill position after the declutch process in [increments] • C05486/2 indicates the standstill position in the real unit of the machine.	

Identifier/data type	Information/possible settings	
bOpenInstant BOOL	Positive opening operation of the clutch (for emergency situations) • This input has a higher priority than the input *bOpen*.	
	FALSE↗TRUE	The *dnPosOut_p* output position is separated immediately from the *dnPosIn_p* master position and brought to standstill within the deceleration time set in C05482. • It is not possible to abort the positive opening operation early. • If the *dnPosOut_p* output position is at standstill, the output *bOpenDone* is set to TRUE. • Afterwards a clutch-in process by a FALSE-TRUE edge at the input *bOpen* can only be effected again after the input *bOpenInstant* has been reset to FALSE.
bReset BOOL	Reset declutch process. • This function allows for a "hard clutch-in" and can be used for certain interruption mechanisms or for starting up the machine. • The reset of the declutch process should be only effected during controller inhibit or a decoupled setpoint path. • This input has the highest priority.	
	TRUE	The *dnPosOut_p* output position is set immediately to the *dnPosIn_p* master position. • The output *bClosed* is set to TRUE.
AxisData	Machine parameters • If the FB is to relate to the measuring system of the drive axis, connect this input to the output *DI_AxisData* of the **LS_DriveInterface** SB for accepting the machine parameters of the drive/motor. • If the FB within a cam application is to relate to the measuring system of the master selection (master), connect this input to the output *XAxisData* of the L_CamProfiler FB instead. (📖 162) • If this input is left unconnected, the position values are processed with the following resolution: 1 encoder revolution ≡ 2^{16} increments	

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Output position in [increments] • C05487 indicates the output position in the real unit of the machine.	
dnSpeedOut_s DINT	Output speed given as speed in [rpm] • C05488 indicates the output speed in the real unit of the machine.	
bClosed BOOL	Status signal to the clutch status	
	FALSE	The clutch is open, or an active clutch-in/declutch process is active. • The output position is at standstill or within an acceleration/deceleration phase.
	TRUE	The clutch is closed. • Output position *dnPosOut_p* and input position *dnPosIn_p* are synchronous.
bOpenDone BOOL	Status signal "Declutch process completed"	
	TRUE	The declutch process activated via *bOpen* or *bOpenInstant* has been totally completed; a clutch-in process can be effected again.
bInTarget BOOL	Status signal "Standstill position reached"	
	TRUE	The standstill position *dnOpenPosition_p* after a declutch process activated via *bOpen* has been reached.
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameters C05489.

Parameter



Parameter	Possible settings			Information
C05480/1	String of digits			Position unit • Read only
C05480/2	String of digits			Speed unit • Read only
C05481/1	-214748.3647	Unit	214748.3647	Relative declutch path • Relating to the *dnOpenPosition_p* standstill position. • Initialisation: 90.0000 unit
C05481/2	-214748.3647	Unit	214748.3647	Relative clutch-in path • Relating to the position from which the output position *dnPosOut_p* and input position *dnPosIn_p* are synchronous again. • Initialisation: 90.0000 unit
C05482	0.000	s	130.000	Deceleration time for positive opening operation • Initialisation: 1.000 s
C05486/1	-214748.3647	Unit	214748.3647	Input position • Display of the *dnPosIn_p* input signal in the real unit of the machine.
C05486/2	-214748.3647	Unit	214748.3647	Standstill position • Position after declutch process • Display of the *dnOpenPosition_p* input signal in the real unit of the machine.
C05487	-214748.3647	Unit	214748.3647	Output position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05488	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C05489	Status messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits8	Clutch closed		
	bits9	Declutch position reached		
	Error messages:			
	bit16	Position is beyond the cycle		
	bits23	Invalid axis data structure		
	bits31	General error		

5.2 L_CamContactor - cam group with switch-on and switch-off dynamisation

Function library:	LenzeCam	**FB permissible for firmware as of V3.0 only!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

From the cam data under the current product number (specified by the **LS_CamInterface** SB), this FB reads the cam track selected via the input *dnTrackNumber* and outputs the cam status on the specified position.

- A cam track can contain up to four cams of the same type (path or time cam); however, the cam type can be different for each product.
- As of Engineer version 2.9 up to 16 cams per cam track are supported.
- By means of a parameterisable dynamic displacement of the cams, deceleration times of switching elements connected can be compensated.
- If further cam tracks are to be evaluated, further instances of this FB just have to be added to the application.

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Input position in [increments] • Position of the x axis or y axis (according to the application). • C05526 indicates the input position in the real unit of the machine.
dnTrackNumber DINT	Selection of the cam track of the cam data available in the memory module. **Note:** If the *ContactorData* input is assigned, the contactor data transferred via the *ContactorData* input are used. ▸ Selection of the cam data (📖 146)
bReset BOOL	Reset output signals & operating times TRUE: The outputs *bOut* and *bError* are reset to FALSE. • In the case of time cams, a time that has possibly started is reset. The "Cam ON" status is only output again if the switch-on condition has been met again.
dnOffsetPos_p DINT From library V01.02.xx.xx	Offset in [inc] • For position-dependent offset of the cam track.

Identifier/data type	Information/possible settings
dnHysteresePos_p DINT From library V01.02.xx.xx	Switching hysteresis in [increments] • Is added to the switching hysteresis set in C05523.
ContactorData From library V01.02.xx.xx	Cam data • Interface for optional acceptance of the contactor data from the FB L_CamSetContDataPDO or FB L_CamSetContDataSDO. These two FBs enable the direct selection of contactor data via inputs/PDOs or codes/SDOs (e.g. from a master control). • If contactor data are pending at this input, these will be used instead of the contactor data available in the cam data.

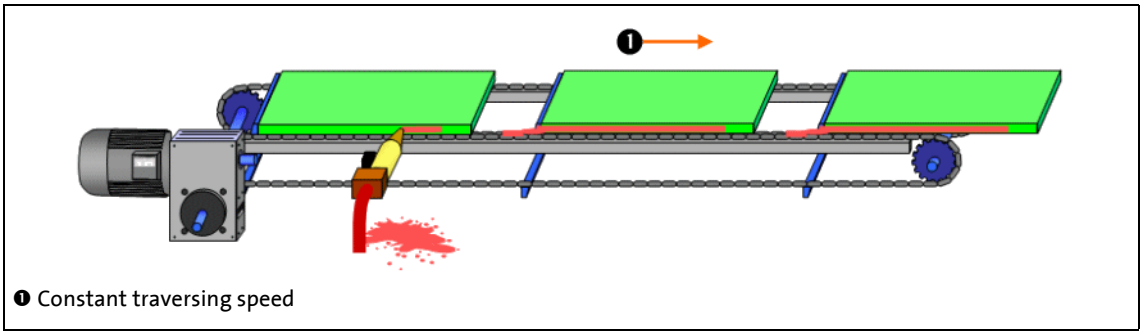
Outputs

Identifier/data type	Value/meaning	
bOut BOOL	Cam status of the cam track selected	
	FALSE	Cam switched off.
	TRUE	Cam switched on.
dnCycleLength_p DINT From library V01.01.xx.xx	Cycle in [increments] • C05528 indicates the cycle in the real unit of the machine.	
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameters C05529.
AxisData	Machine parameters • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.	

Parameter

Parameter	Possible settings			Information
C05520/1	String of digits			Position unit • Read only
C05520/2	String of digits			Designation of the measuring system • Read only
C05521	-1000.000	ms	1000.000	Switch-on position displacement • Initialisation: 0.000 ms
C05522	-1000.000	ms	1000.000	Output position displacement • Initialisation: 0.000 ms
C05523	-214748.3647	Unit	214748.3647	Hysteresis for switching threshold • If the input position is not stable and the output *bOut* oscillates.
C05524				Track switch-over mode
	0	In the zero crossing/cycle		Lenze setting • Use for modulo traversing range.
	1	Immediately		This setting should be used for a limited traversing range.

Parameter	Possible settings			Information
C05525				Cam type • Read only
	0	Unknown cam type		
	1	Positive travel cams		
	2	Negative travel cams		
	3	Bidirectional travel cams		
	11	Positive time cams		
	12	Negative time cams		
C05526	-214748.3647	Unit	214748.3647	Input position • Display of the *dnPosIn_p* input signal in the real unit of the machine.
C05527	0		2147483647	Cam track • Display of the track number *dnTrackNumber*.
C05528 From library V01.01.xx.xx	0.0000	Unit	214748.3647	Cycle • Display of the *dnCycleLength_p* output signal in the real unit of the machine.
C05529	Status messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 15 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 15 ... 30) are set.
	bits6	Reset of cam active		
	bits10	Zero crossing active		
	bits11	Cam switched on		
	Error messages:			
	Bit15	Limitation of dynamic cam sampling		
	bit16	Position is beyond the cycle		
	bits23	Invalid axis data structure		
	bits25	Invalid data track number		
	bits26	Invalid data track type		
	bits31	General error		



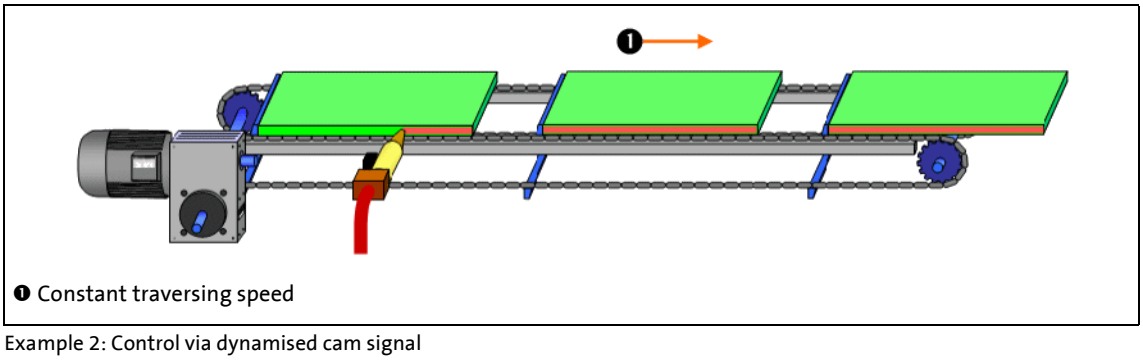
5.2.1 Typical application

Via the function of the cam group binary output signals with a reference to curves can be generated very simply.

Via digital switch cams for instance the quick control of external valves, glue nozzles, or similar peripheral elements can be carried out, which are connected to the digital outputs of the controller for this purpose. Of course the switch cams can also be used for controlling internal functions.

Example 1

Glueing of furniture panels by means of a glue nozzle controlled via a static cam signal (no compensation of the operating delay time of the glue valve):



❶ Constant traversing speed

[5-1] Example 1: Control via static cam signal

Because the glue valve switches on/off in a delayed manner (operating delay time), the furniture panels are not glued from the leading edge. Correspondingly late the glue nozzle is switched off again: Due to the switch-off delay time, glue continues to emit from the nozzle although the furniture panel has already left the glue area.

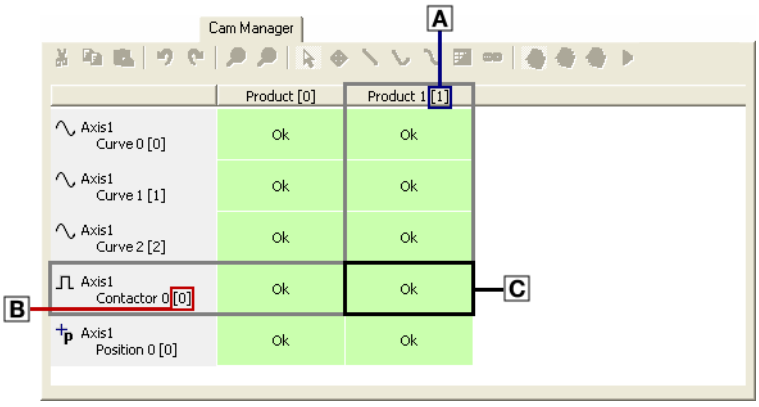
Example 2

Glueing of furniture panels by means of a glue nozzle controlled via a dynamised cam signal (no compensation of the operating delay time of the glue valve):

❶ Constant traversing speed

[5-2] Example 2: Control via dynamised cam signal

5.2.2 Data flow



The cams are entered in the »Cam Designer«. The transmission of the cam data to the controller(s) – together with the corresponding parameter set – is effected via the »Engineer« by executing the command **Transfer parameter set to the device**. Afterwards the parameter set and the cam data have to be saved in the memory module with mains failure protection (e. g. with the device command C00002 = "11: Save starting parameters").

Tip!

The cams can also be entered directly via the parameters of the basic drive function "Cam data management" (**LS_CamInterface** SB) if cam data have already been downloaded to the controller.

Selection of the cam data to be used within the application

Within the application the selection of the cam data to be used is then carried out via the product number and the track number which have been defined for the axis in the »Cam Manager«:

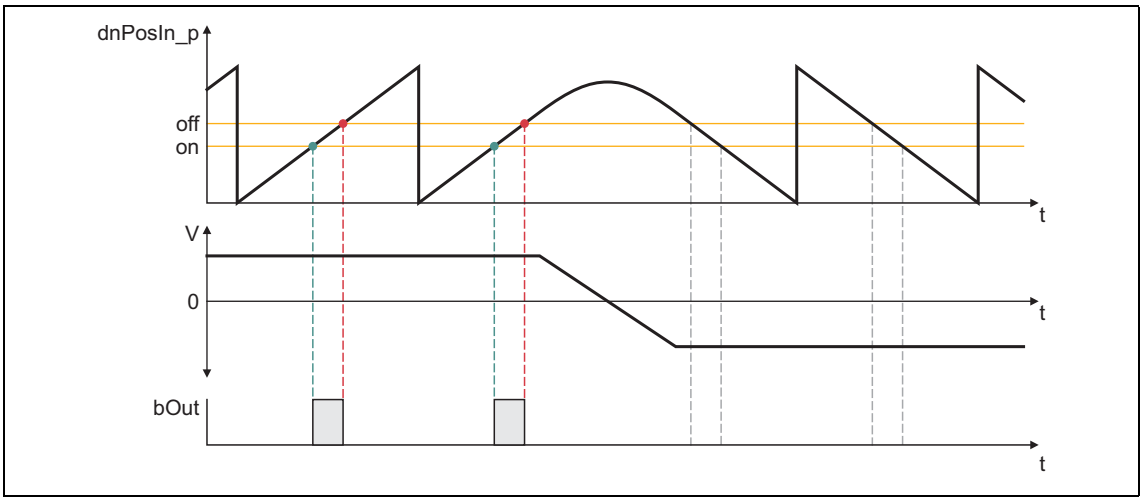
Ⓐ Product number

Ⓑ Track number

Ⓒ Cam data

- The selection of the product number Ⓐ and therefore the selection of the product to be manufactured for the application is effected globally via the input *CAM_dnProductNumber* of the **LS_CamInterface** SB and has to be carried out synchronously for all cam drives in the interconnection.

- The selection of the track number Ⓑ of the cam data track, however, is effected individually via the input *dnTrackNumber* of the corresponding entity of the **L_CamContactor** FB.

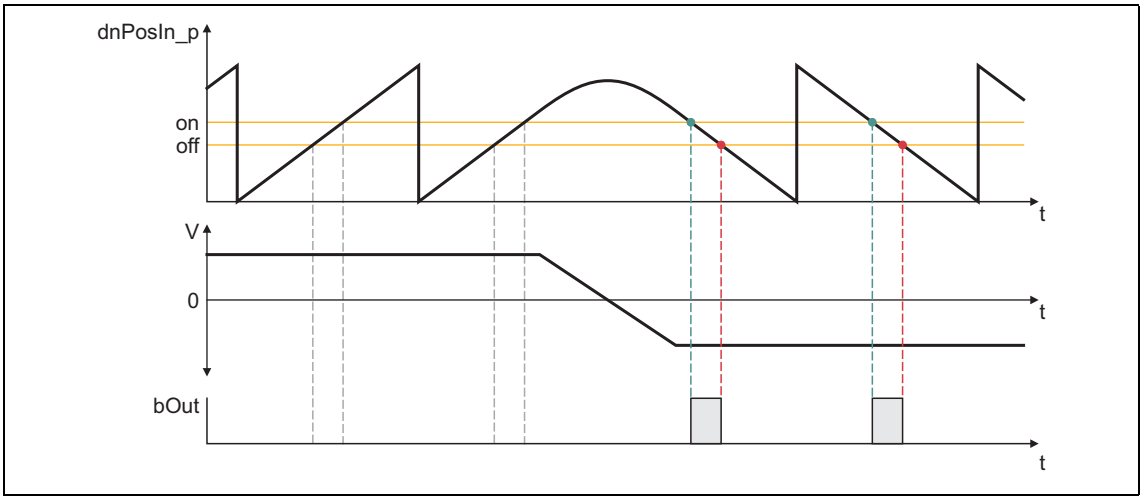


5.2.3 Switching performance for position cams

Position cams in positive effective direction

If the input position *dnPosIn_p* reaches the cam switch-on position in positive effective direction, the output *bOut* is set to TRUE and is reset to FALSE if the switch-off position is exceeded.

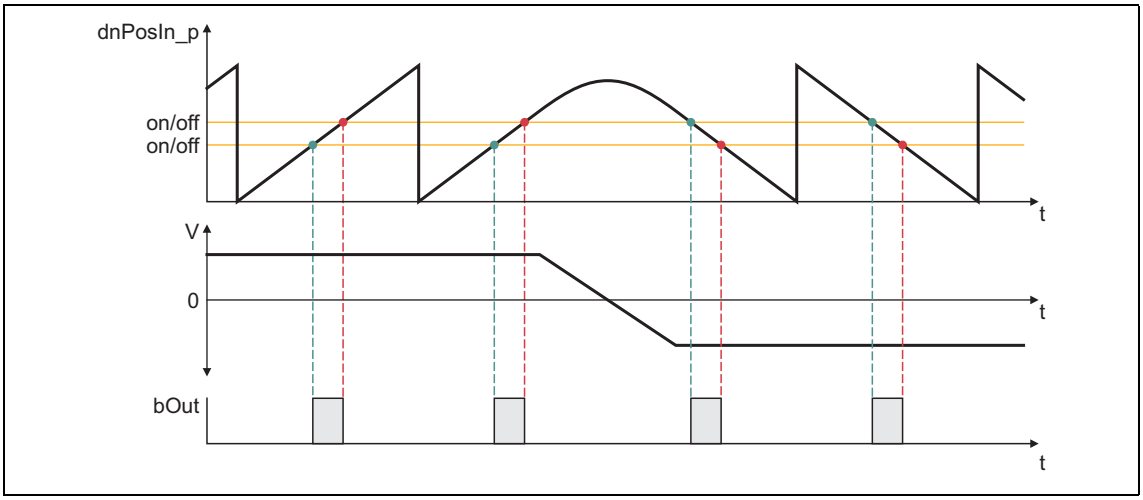
- If a change in direction is effected after the switch-on position has been reached, the output *bOut* is reset to FALSE immediately.



[5-3] Example: Position cams in positive effective direction

Position cams in negative effective direction

If the input position *dnPosIn_p* reaches the cam switch-on position in negative effective direction, the output *bOut* is set to TRUE and is reset to FALSE if the switch-off position is exceeded.



- If a change in direction is effected after the switch-on position has been reached, the output *bOut* is reset to FALSE immediately.

[5-4] Example: Position cams in negative effective direction

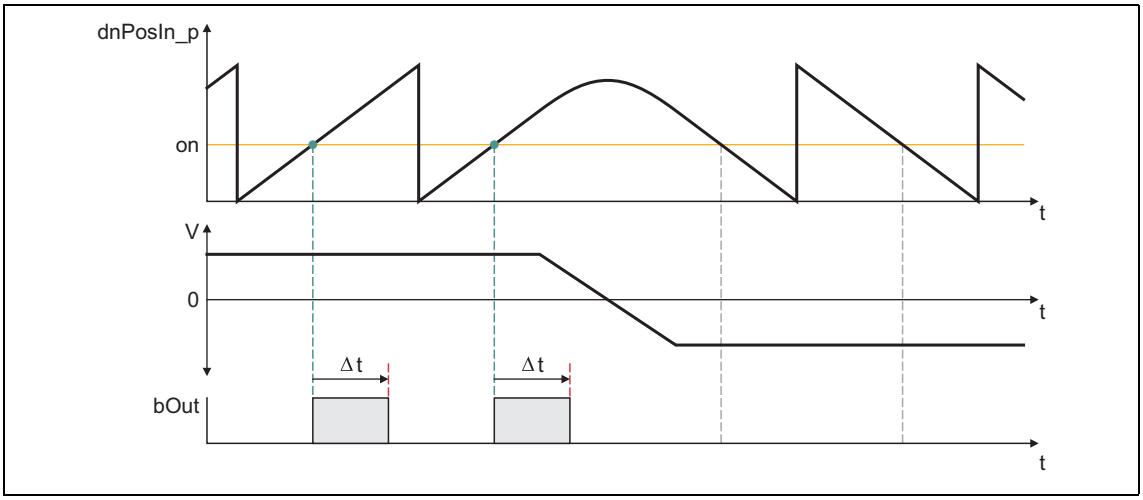
Position cams with bipolar effective direction

If the input position *dnPosIn_p* is positioned within the cam switch-on and switch-off position, the output *bOut* is set to TRUE, irrespective of the process flow direction.

[5-5] Example: Position cams with bipolar effective direction

5.2.4 Switching performance for position-time cams

Note!



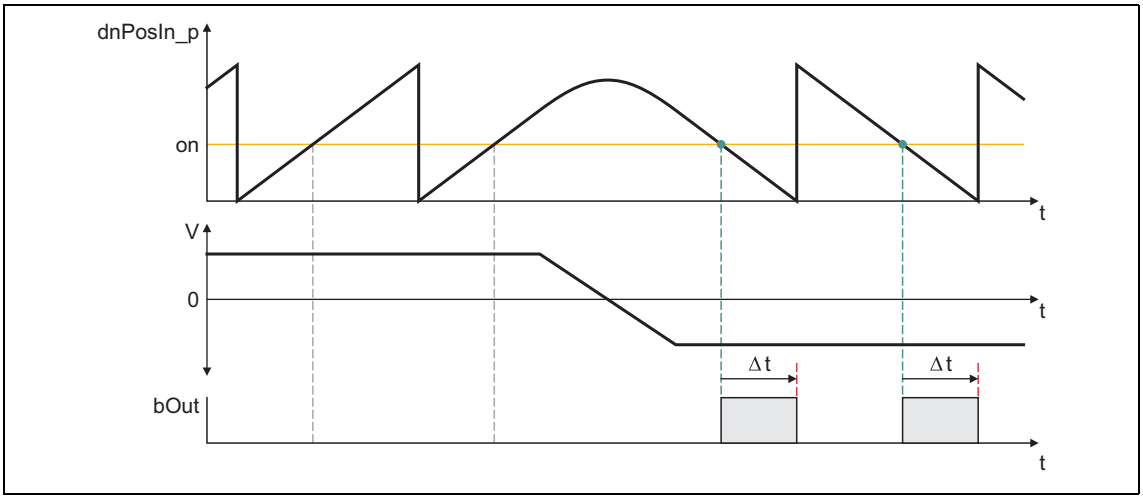
When position-time cams are used, overlapping switch-on states of subsequent cams can occur if the operating time of the position-time cams is longer than the interval to the switch-on position of the following position-time cams (post-trigger function).

If the operating time of a position-time cam is longer than the total cycle time, the output *bOut* remains on TRUE permanently.

Position-time cams in positive effective direction

If the input position *dnPosIn_p* reaches the cam switch-on position in positive effective direction, the output *bOut* is set to TRUE and is only reset to FALSE after the time defined has elapsed.

- Once the output is set to TRUE, a following change in direction has no impact on the cam signal.

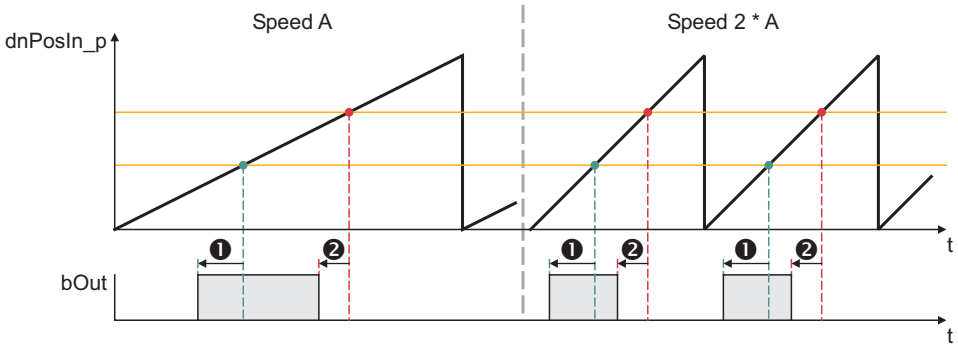


[5-6] Example: Position-time cams in positive effective direction

Position-time cams in negative effective direction

If the input position *dnPosIn_p* reaches the cam switch-on position in negative effective direction, the output *bOut* is set to TRUE and is only reset to FALSE after the time defined has elapsed.

- Once the output is set to TRUE, a following change in direction has no impact on the cam signal.



[5-7] Example: Position-time cams in negative effective direction

5.2.5 Dynamic displacement of the cams

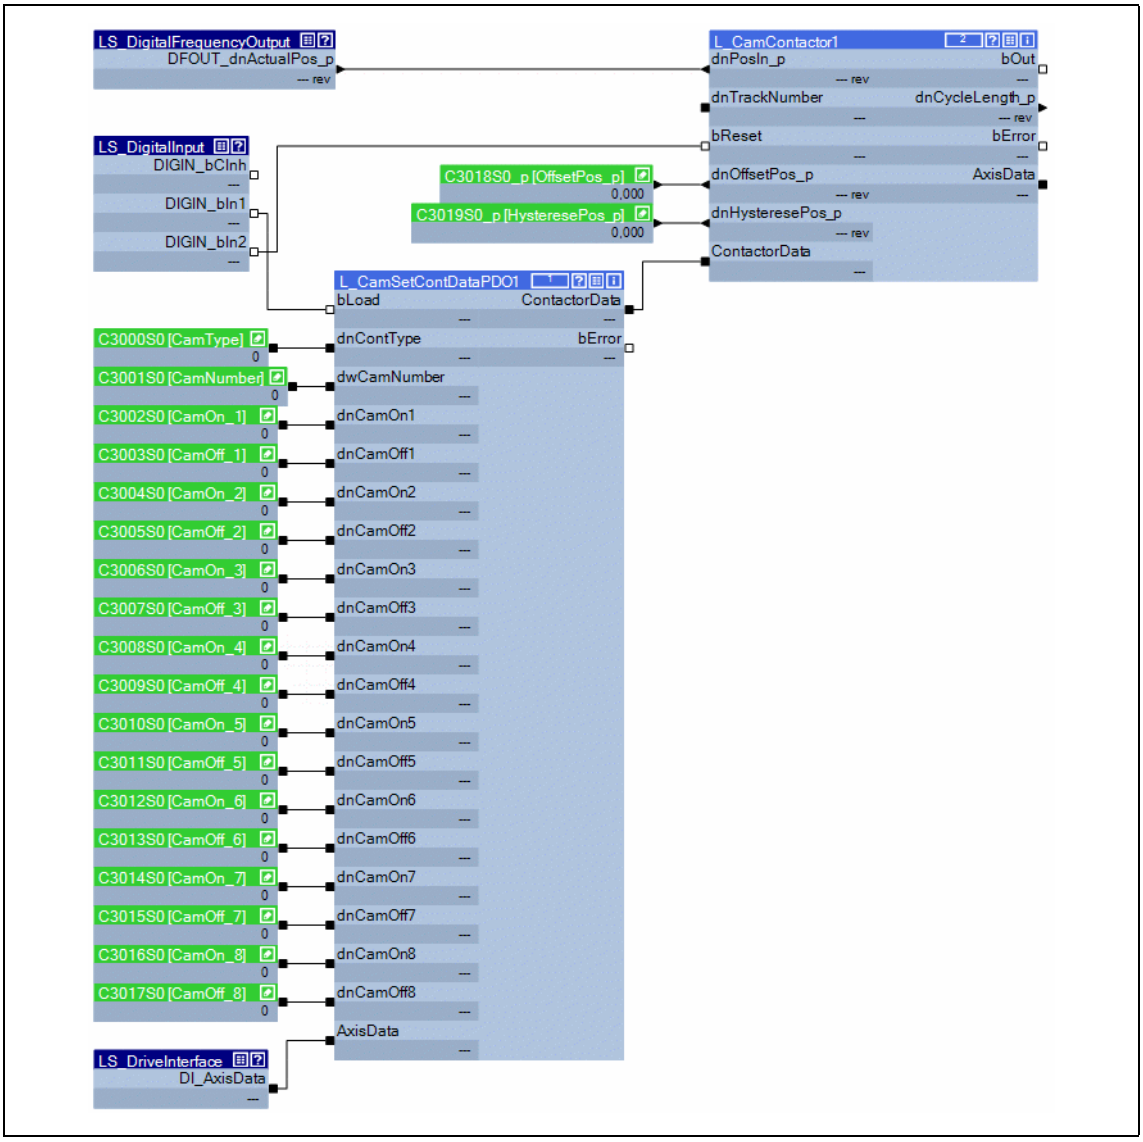
In C05521 and C05522 a time displacement of the switch-on and switch-off positions can be set for the cams, e. g. to implement a compensation of delay times of switching elements connected.

- A positive time period causes the cam to be switched earlier, a negative time period accordingly causes the switching operation to occur later.
- For position-time cams only a time displacement of the switch-on position is effected via C05521; the setting in C05522 has no effect.
- Dynamic cam sampling is limited by the half-cycle period. If the limitation is activated, the *bError* output is set to TRUE and the limitation is signalled via error bit 15 in C05529.

❶ Positive time displacement of the switch-on position (causes earlier switch-on)
❷ Negative time displacement of the switch-off position (causes late switch-off)

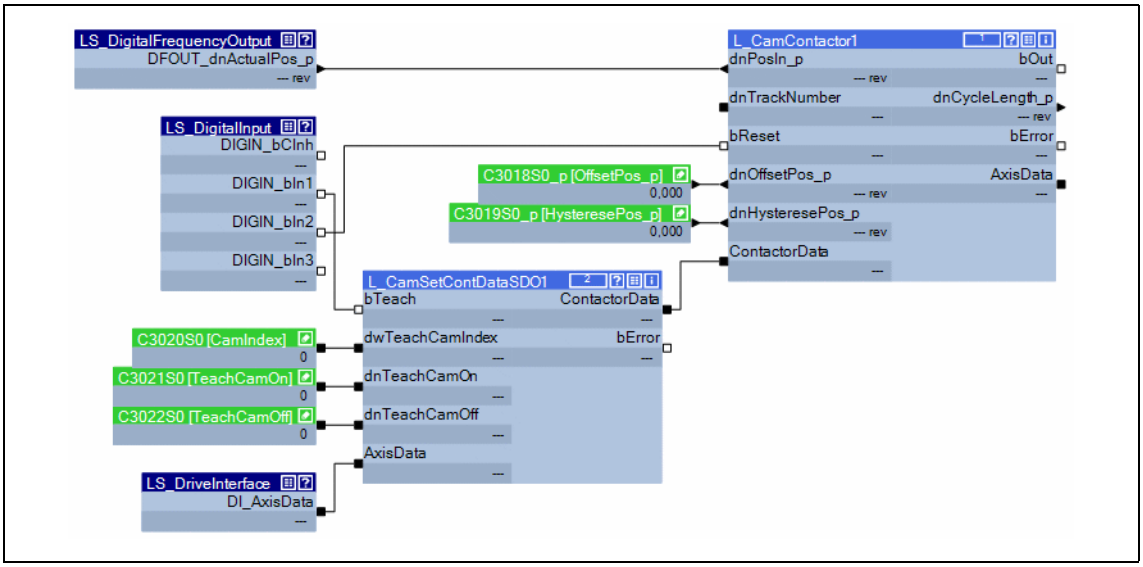
[5-8] Displacement of the switch-on and switch-off position for different speeds

5.2.6 Selection of the cam data



The contactor data can either be part of the cam data available in the memory module or be determined by a master control via PDOs or SDOs.

- If the FB uses the contactor data stored in the memory module, the corresponding track number must be determined in the *dnTrackNumber* input.
- The FB L_CamSetContDataPDO serves to determine the contactor data via inputs/PDOs. The contactor data are transferred to the FB **L_CamContactor** via the *ContactorData* input (see fig. [5-9]).
- The FB L_CamSetContDataSDO serves to determine the contactor data via inputs/SDOs. The contactor data are transferred to the FB **L_CamContactor** via the *ContactorData* input (see fig. [5-10]).



Note!

If the inputs *dnTrackNumber* and *ContactorData* are assigned simultaneously, the contactor data transferred via the *ContactorData* input is used. If this connection is separated, it is changed over to the contactor data stored in the memory module.

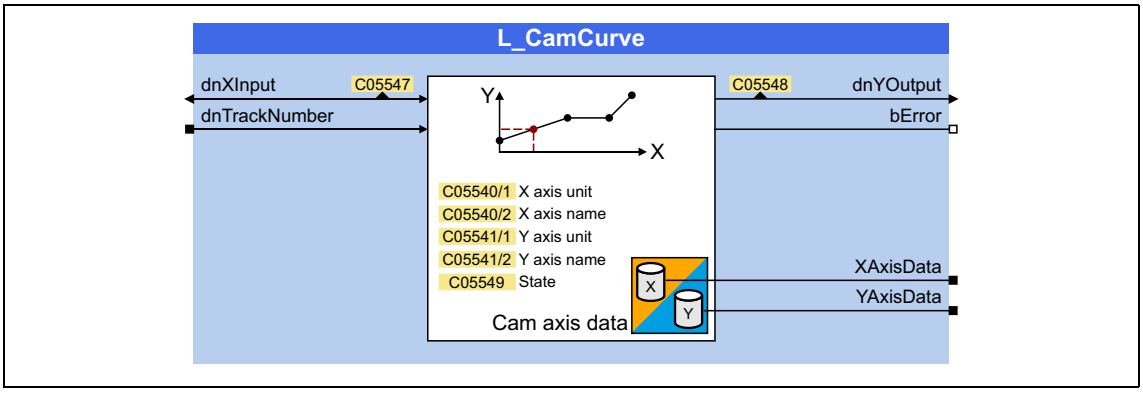
5.2.7 Interconnection examples

[5-9] Interconnection example 1: Selection of the contactor data via PDOs

[5-10] Interconnection example 2: Selection of the contactor data via SDOs

5.3 L_CamCurve - curve interpolation for characteristics

Function library:	LenzeCam	**FB permissible for firmware as of V3.0 only!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel



From the cam data under the current product number (specified by the **LS_CamInterface** SB), this FB reads the table of values of the curve track selected via the input *dnTrackNumber* and outputs the corresponding y value for the x value specified.

- Between two points of the table of values a linear interpolation takes place.
- This FB presents a reduced variant of the L_CamProfiler FB:
  - The FB does not process modulo measuring systems, but reverts solely to the interpolation point table stored.
  - The FB does not have a synchronised track change algorithm.
- For a curve interpolation of a motion profile the L_CamProfiler FB is to be used instead.

Stop!

Ensure that the x measuring system of the curve track matches the input signal, as otherwise serious malfunctions within the application may occur!

The y measuring system has to be defined as characteristic, otherwise an error is generated.

Inputs

Identifier/data type	Information/possible settings
dnXInput DINT	Input value (x axis) • C05546 indicates the input value in the real unit of the machine.
dnTrackNumber DINT	Selection of the curve track • The acceptance is effected immediately. • A switch-over of the track number (not product number) synchronised with the zero crossing can be implemented with an additional function block interconnection. ▸ Track switch-over (📖 153)

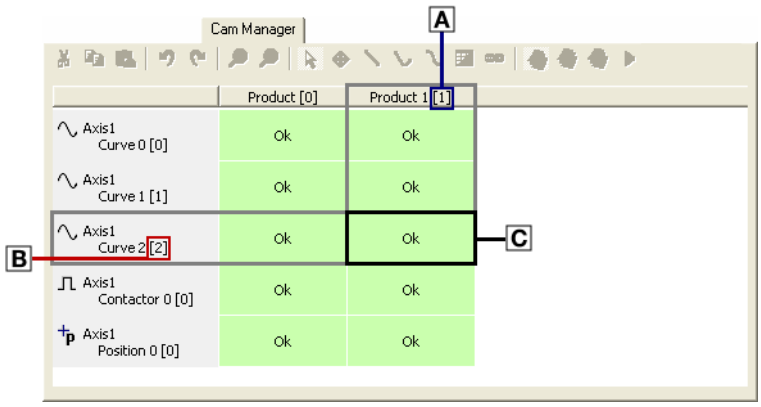
Outputs

Identifier/data type	Value/meaning	
dnYOutput DINT	Output value (y axis) • C05547 indicates the output value in the real unit of the machine.	
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameters C05549.
XAxisData	Machine parameters of the x axis (zero for characteristic) • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.	
YAxisData	Machine parameters of the y axis (zero for characteristic) • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.	

Parameter

Parameter	Possible settings			Information
C05540/1	String of digits			Unit of the x axis • Read only
C05540/2	String of digits			Designation of the x axis • Read only
C05541/1	String of digits			Unit of the y axis • Read only
C05541/2	String of digits			Designation of the y axis • Read only
C05547	-214748.3647	Unit	214748.3647	Input position • Display of the *dnXInput* input signal in the real unit of the machine.
C05548	-214748.3647	Unit	214748.3647	Output position • Display of the output signal *dnYOutput* in the real unit of the machine.
C05549	Error messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits25	Invalid data track number		
	bits26	Invalid data track type		
	bits31	General error		

5.3.1 Data flow



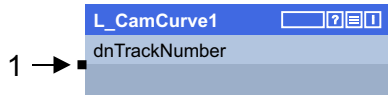
The characteristics (curves) are entered or imported in the »Cam Designer« by means of graphical objects (point, line, polynomial). The transmission of the cam data to the controller(s) – together with the corresponding parameter set – is effected via the »Engineer« by executing the command **Transfer parameter set to the device**. Afterwards the parameter set and the cam data have to be saved in the memory module with mains failure protection (e. g. with the device command C00002 = "11: Save starting parameters").

Tip!

The characteristics (curves) can also be entered directly via the parameters of the basic drive function "Cam data management" (**LS_CamInterface** SB) if cam data have already been downloaded to the controller.

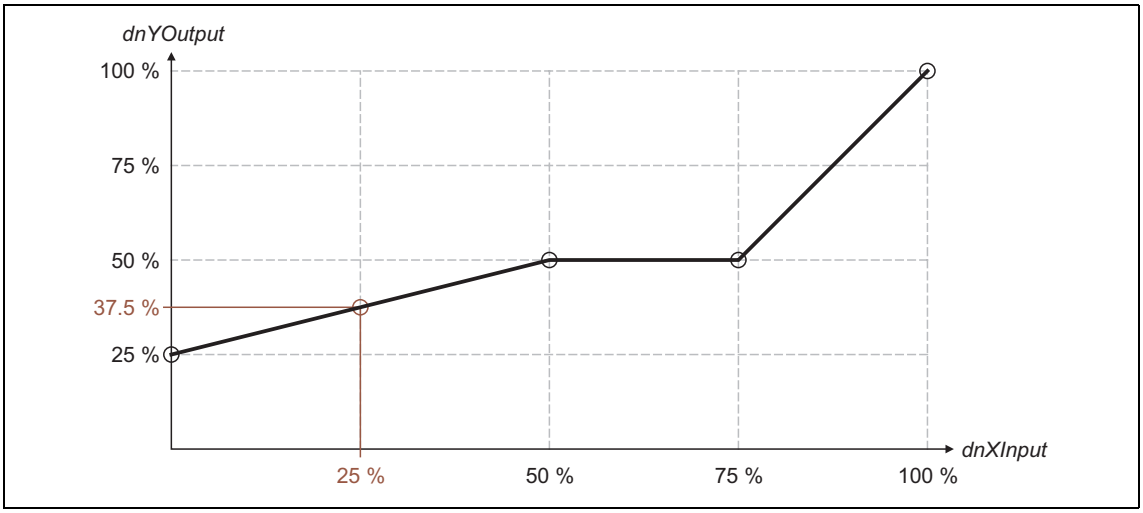
Selection of the cam data to be used within the application

Within the application the selection of the data to be used is then carried out via the product number and the track number which have been defined for the axis in the »Cam Manager«:



A Product number
B Track number
C Characteristic data

- The selection of the product number A is effected globally for the application via the input *CAM_dnProductNumber* of the **LS_CamInterface** SB:



- The selection of the track number B of the characteristic, however, is effected individually via the input *dnTrackNumber* of the corresponding entity of the **L_CamCurve** FB.

5.3.2 Function

The following characteristic with 4 grid points and a percentage scaling of the x and y axis are given:

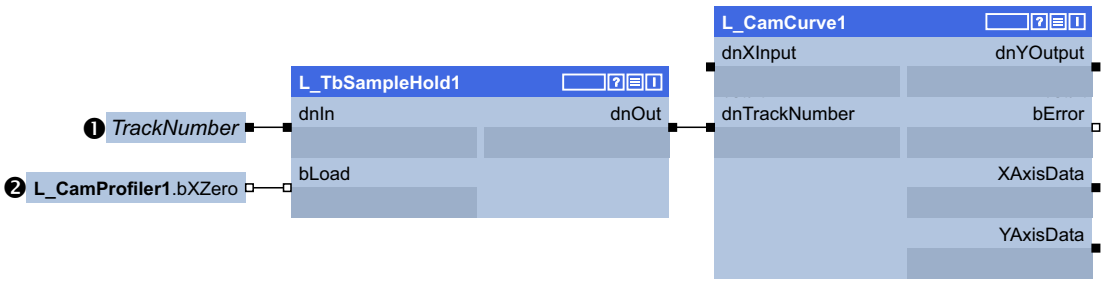
Grid point	1	2	3	4
x value	0 %	50 %	75 %	100 %
y value	25 %	50 %	50 %	100 %

[5-11] Example: characteristic

Assumption: At the input *dnXInput* the value "25 %" is available.

1. The FB first identifies the two adjacent grid points, in the example the grid points 1 and 2.
2. Afterwards the FB interpolates linearly between the two grid points and shows the interpolated value (in our example "37.5 %") at the output *dnYOutput*.

Scaling of characteristics

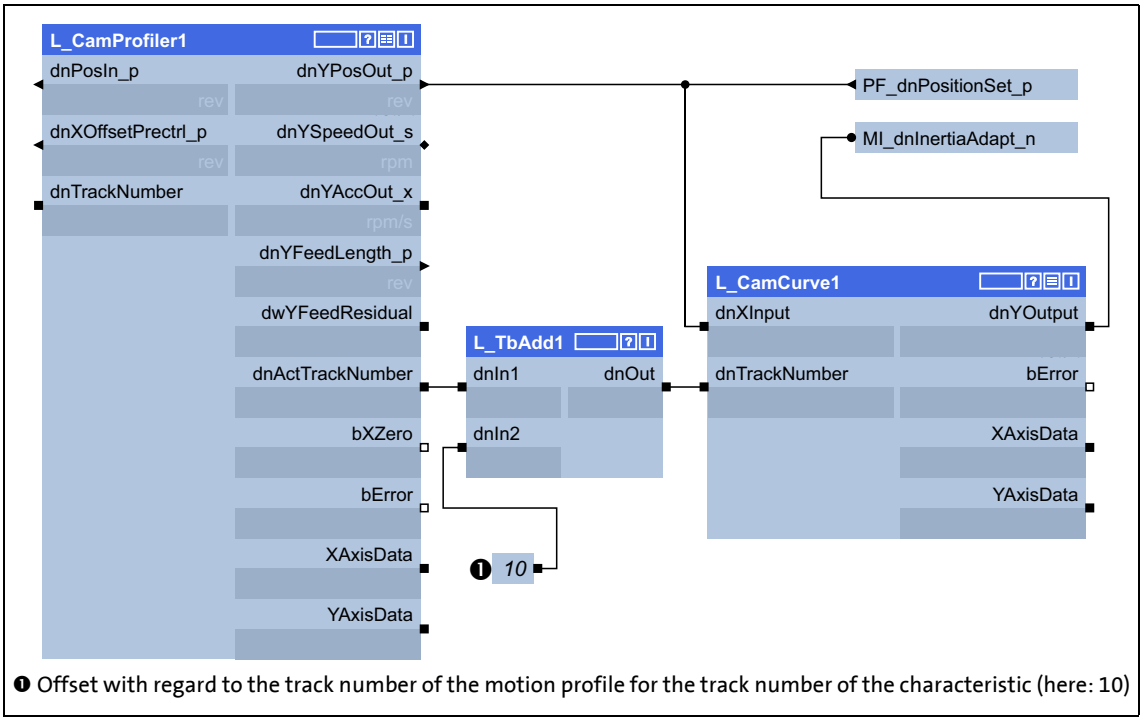


The scaling of characteristics cannot only be preselected in the »Cam Designer«/»Cam Editor« in percent, but can be set independently for the x axis and the y axis (e. g. percent, increments, or every other application unit of an existing measuring system).

Note!

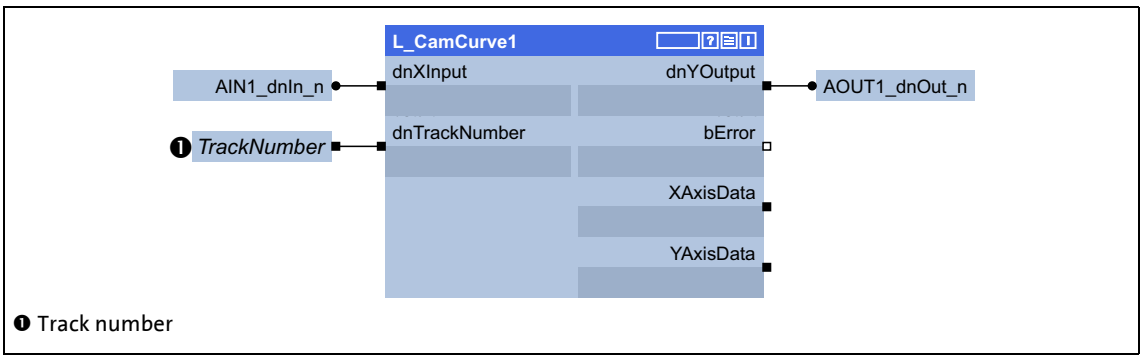
Observe that the corresponding input and output signals are correctly processed according to the respective scaling.

5.3.3 Track switch-over



A switch-over to another characteristic via the input *dnTrackNumber* is effected immediately. A switch-over of the track number (not product number) synchronised with the zero crossing – derived from the display of the zero crossing at the L_CamProfiler FB – can be implemented with the following interconnection:

❶ Track number
❷ Status output signal "zero crossing" of the L_CamProfiler FB



[5-12] Interconnection example for only accepting new cam data in the zero crossing of the x axis

5.3.4 Interconnection examples

❶ Offset with regard to the track number of the motion profile for the track number of the characteristic (here: 10)

[5-13] Interconnection example 1: Use of a characteristic for load adaption

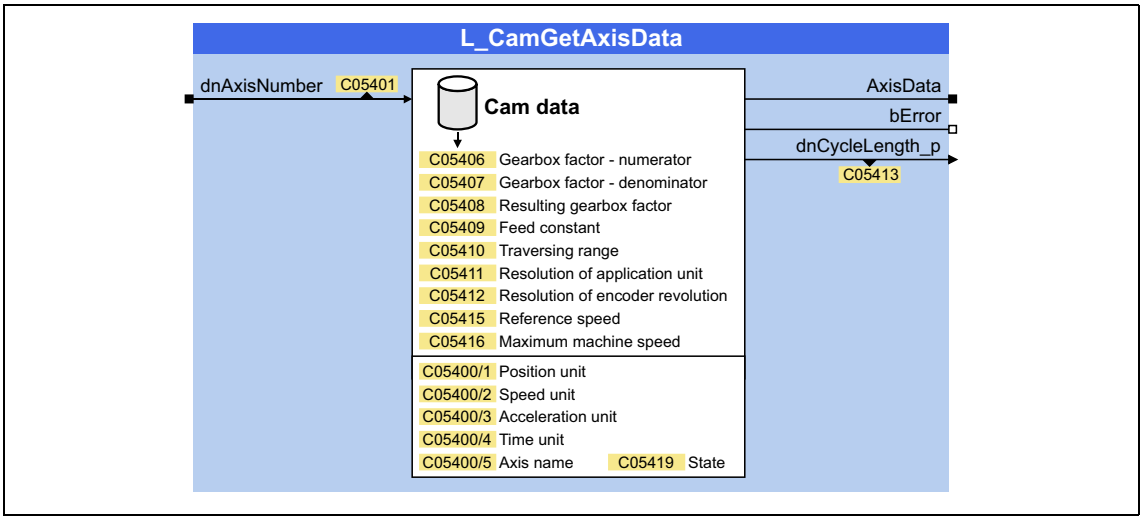
❶ Track number

[5-14] Interconnection example 2: Simple analog characteristics

5.4 L_CamGetAxisData - reading out machine parameters from cam data

Function library:	LenzeCam	**FB only permissible for firmware from V3.0 onwards!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB reads out the machine parameters of the axis selected via the input *dnAxisNumber* from the cam data and via the output *AxisData* provides them to subsequent FBs requiring these data for internal calculations (e. g. master value integrators, FBs for stretching/compression and other FBs for processing cam data).



- If it is used within curve applications, the FB at least has to be instanced twice:
  - Instance 1 for the 1-measuring system (e. g. the measuring system of the x axis)
  - Instance 2 for the 2-measuring system (e. g. the measuring system of the y axis)
- Further instances for other measuring systems available (e. g. characteristic) are then to be added according to the application.

Note!

In order to enable the FB to read out machine parameters from a measuring system, the corresponding measuring system must be used in the »Cam Manager« at least once in a curve, cam, or position marker track!

Access to the machine parameters of the drive/motor

The machine parameters of the drive/motor via the output *DI_AxisData* of the **LS_DriveInterface** SB are provided to other function blocks requiring these data for internal calculations.

Inputs

Identifier/data type	Information/possible settings
dnAxisNumber DINT	Number of the axis the machine data of which are to be output at *AxisData*.

Outputs

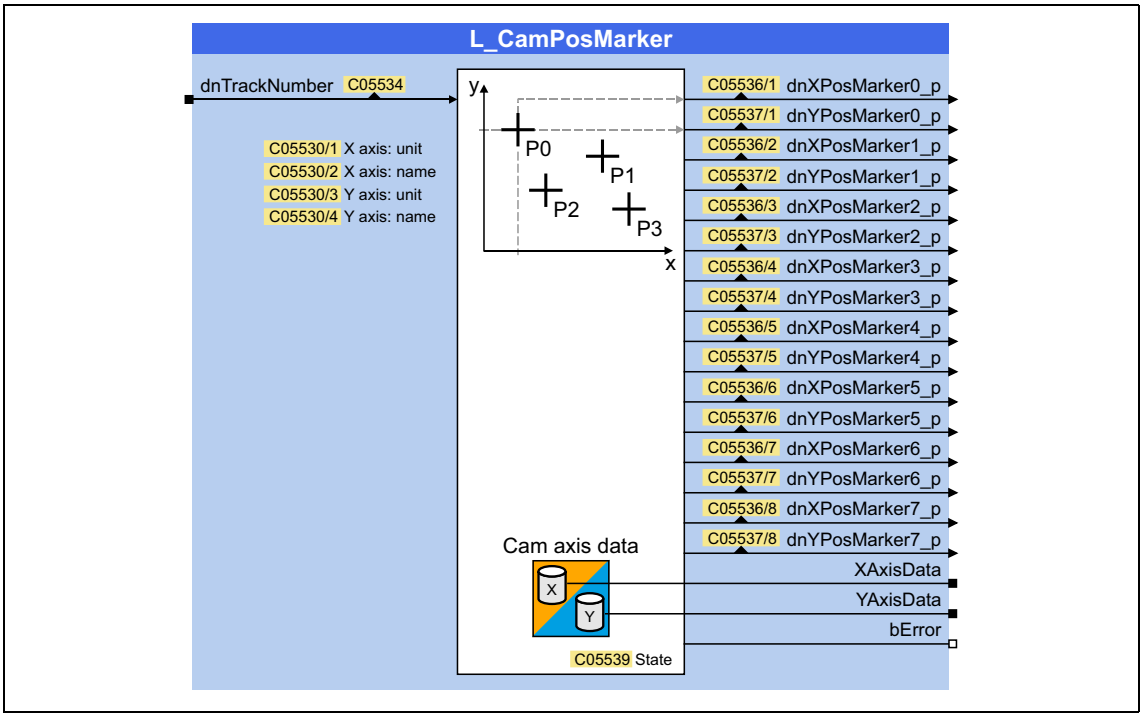
Identifier/data type	Value/meaning	
AxisData	Machine parameters of the axis selected • In order to transfer the machine parameters to another FB, this output just has to be connected to the input *AxisData* of the corresponding FBs.	
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameters C05419.
dnCycleLength_p DINT From library V01.01.xx.xx	Cycle in [increments] • C05413 indicates the cycle in the real unit of the machine.	

Parameters

Note!

Observe that the index of the codes listed in the following only applies to the first instance!

Parameter	Possible settings			Info
C05400/1	Character string			Position unit • Read only
C05400/2	Character string			Speed unit • Read only
C05400/3	Character string			Acceleration unit • Read only
C05400/4	Character string			Time unit • Read only
C05400/5	Character string			Axis designation • Read only
C05401	0		65535	Axis number • Display of the currently valid axis number from the axis data.
C05406	1		2147483647	Gearbox factor numerator • Read only
C05407	1		2147483647	Gearbox factor denominator • Read only
C05408	0.0000		214748.3647	Resulting gearbox factor • Read only
C05409	0.0001	Unit	214748.3647	Feed constant • Read only
C05410				Measuring system • Read only
	0	Unlimited		
	1	Limited		
	2	Modulo		
C05411	0.0000	Incr./unit	214748.3647	Resolution - application unit • Read only
C05412	10	Bit	24	Resolution of encoder revolution • Read only



Parameter	Possible settings			Info
C05413	0.0000	Unit	214748.3647	Cycle • Read only
C05414	0.0000	Unit/t	214748.3647	Reference speed • Read only
C05415	0.0000	Unit/t	214748.3647	Max. machine speed • Read only
C05419	Error messages:			Status (bit-coded) • Bits that are not listed are reserved for future extensions. • Bit 31 is always set if one or more of the other error bits (bit 16 ... bit 30) are set.
	Bit16	Position is beyond the cycle		
	Bit 31	General error		

5.5 L_CamPosMarker - reading out position marks from cam data

Function library:	LenzeCam	**FB permissible for firmware as of V3.0 only!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

From the cam data under the current product number (specified via the **LS_CamInterface** SB), this FB reads out the track with position markers selected via the input *dnTrackNumber* and provides the corresponding x and y positions for processing within the function block interconnection.

- A position data track can contain up to four position markers.
- As of Engineer version 2.9 up to eight position markers per position data track are supported.

Inputs

Identifier/data type	Information/possible settings
dnTrackNumber DINT	Selection of the position marker track

Outputs

Identifier/data type	Value/meaning
dnXPosMarker0_p DINT	Position marker 0: x position in [increments] • C05536/1 indicates the position in the real unit of the machine.
dnYPosMarker0_p DINT	Position marker 0: y position in [increments] • C05537/1 indicates the position in the real unit of the machine.
dnXPosMarker1_p DINT	Position marker 1: x position in [increments] • C05536/2 indicates the position in the real unit of the machine.
dnYPosMarker1_p DINT	Position marker 1: y position in [increments] • C05537/2 indicates the position in the real unit of the machine.

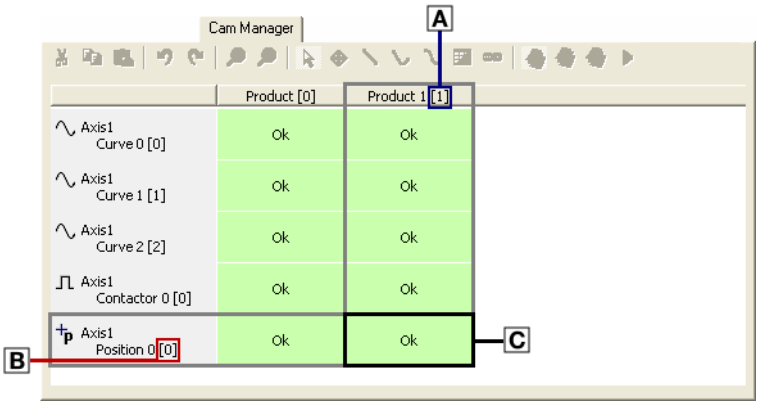
Identifier/data type	Value/meaning
dnXPosMarker2_p DINT	Position marker 2: x position in [increments] • C05536/3 indicates the position in the real unit of the machine.
dnYPosMarker2_p DINT	Position marker 2: y position in [increments] • C05537/3 indicates the position in the real unit of the machine.
dnXPosMarker3_p DINT	Position marker 3: x position in [increments] • C05536/4 indicates the position in the real unit of the machine.
dnYPosMarker3_p DINT	Position marker 3: y position in [increments] • C05537/4 indicates the position in the real unit of the machine.
dnXPosMarker4_p DINT From library V01.02.xx.xx	Position marker 4: x position in [increments] • C05536/5 indicates the position in the real unit of the machine.
dnYPosMarker4_p DINT From library V01.02.xx.xx	Position marker 4: y position in [increments] • C05537/5 indicates the position in the real unit of the machine.
dnXPosMarker5_p DINT From library V01.02.xx.xx	Position marker 5: x position in [increments] • C05536/6 indicates the position in the real unit of the machine.
dnYPosMarker5_p DINT From library V01.02.xx.xx	Position marker 5: y position in [increments] • C05537/6 indicates the position in the real unit of the machine.
dnXPosMarker6_p DINT From library V01.02.xx.xx	Position marker 6: x position in [increments] • C05536/7 indicates the position in the real unit of the machine.
dnYPosMarker6_p DINT From library V01.02.xx.xx	Position marker 6: y position in [increments] • C05537/7 indicates the position in the real unit of the machine.
dnXPosMarker7_p DINT From library V01.02.xx.xx	Position marker 7: x position in [increments] • C05536/8 indicates the position in the real unit of the machine.
dnYPosMarker7_p DINT From library V01.02.xx.xx	Position marker 7: y position in [increments] • C05537/8 indicates the position in the real unit of the machine.
XAxisData	Machine parameters of the x axis • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.
YAxisData	Machine parameters of the y axis • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.
bError BOOL	"Error" status TRUE: An error has occurred (group signal). • For details see display parameter C05539.

Parameter

Parameter	Possible settings	Information
C05530/1	String of digits	Position unit of x axis • Read only
C05530/2	String of digits	Designation of the x axis • Read only
C05530/3	String of digits	Position unit of y axis • Read only
C05530/4	String of digits	Designation of the y axis • Read only

Parameter	Possible settings			Information
C05534	0		2147483647	Number of the position data track • Display of the *dnTrackNumber* input signal.
C05536/1...4	-214748.3647	Unit	214748.3647	Position marker 0 ... 3: x position • Display of the x positions in the real unit of the machine.
C05536/5...8 From library V01.02.xx.xx	-214748.3647	Unit	214748.3647	Position marker 4 ... 7: x position • Display of the x positions in the real unit of the machine.
C05537/1...4	-214748.3647	Unit	214748.3647	Position marker 0 ... 3: y position • Display of the y positions in the real unit of the machine.
C05537/5...8 From library V01.02.xx.xx	-214748.3647	Unit	214748.3647	Position marker 4 ... 7: y position • Display of the y positions in the real unit of the machine.
C05539	Error messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits22	Invalid X axis data structure		
	bits23	Invalid Y axis data structure		
	bits25	Invalid data track number		
	bits31	General error		

5.5.1 Data flow



The position markers are entered in the »Cam Designer«. The transmission of the cam data to the controller(s) – together with the corresponding parameter set – is effected via the »Engineer« by executing the command **Transfer parameter set to the device**. Afterwards the parameter set and the cam data have to be saved in the memory module with mains failure protection (e. g. with the device command C00002 = "11: Save starting parameters").

Tip!

The position markers can also be entered directly via the parameters of the basic drive function "Cam data management" (**LS_CamInterface** SB) if cam data have already been downloaded to the controller.

Selection of the cam data to be used within the application

Within the application the selection of the position data to be used is then carried out via the product number and the track number which have been defined for the axis in the »Cam Manager«:

A Product number
B Track number
C Position data

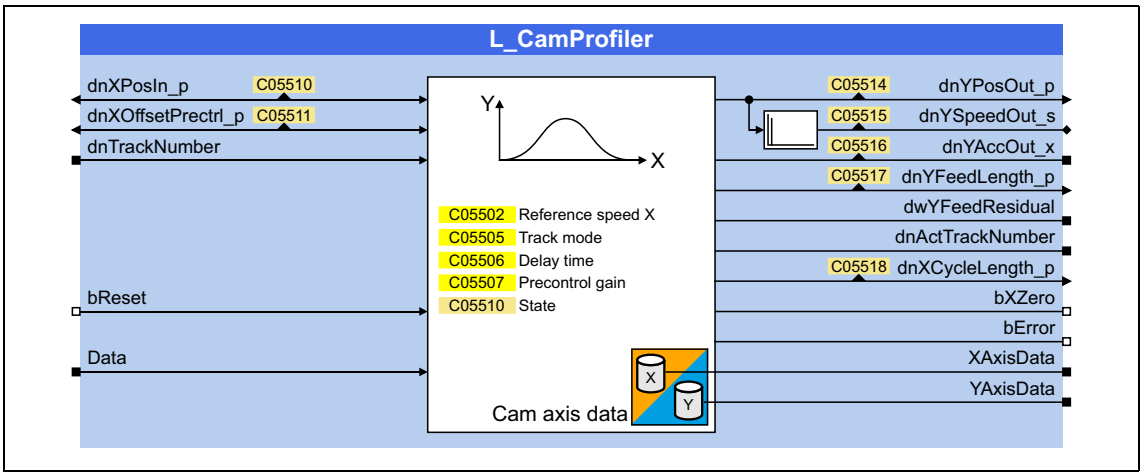
- The selection of the product number A and therefore the selection of the product to be manufactured for the application is effected globally via the input *CAM_dnProductNumber* of the **LS_CamInterface** SB and has to be carried out synchronously for all cam drives in the interconnection.

- The selection of the track number B of the profile data track, however, is effected individually via the input *dnTrackNumber* of the corresponding entity of the **L_CamPosMarker** FB.

5.6 L_CamProfiler - curve interpolation for motion profiles

Function library:	LenzeCam	**FB only permissible for firmware from V3.0 onwards!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

From the cam data under the current product number (specified by the **LS_CamInterface**) SB, this FB reads the table of values of the curve track selected via the input *dnTrackNumber* and outputs the corresponding y position for the x position specified.



- Between two points of the table of values a linear interpolation is effected (similar to the **L_CamData** FB of the "Software Package CAM" for 9300ET).
- The y position is output in the corresponding y measuring system (modulo/limited/unlimited).
- Additionally, the y speed and the acceleration curve are output which are used for the acceleration feedforward control.
- Furthermore, for feed profiles (unlimited measuring system), the feed length for the use in a subsequent FB for stretching and compression is output.
- For the curve interpolation of a characteristic, as a reduced variant of this FB, the L_CamCurve FB is provided instead.

Stop!

Ensure that the selected curve track contains machine parameters matching the input signals, as otherwise serious malfunctions within the application may occur!

Note!

The minimum x value must be "0" to ensure that the FB can work without errors. If the x value range of a curve starts with x <> 0, an error will be output (*bError* = TRUE).

Inputs

Identifier/data type	Information/possible settings
dnXPosIn_p DINT	Input position in [increments] • Position of the x axis of an encoder via bus system. • C05510 indicates the input position in the real unit of the machine.
dnXOffsetPrectrl_p DINT	Offset for feedforward control in [increments] • Position offset for displacing the acceleration track shown at the output *dnYAccOut_x*. • C05511 indicates the position offset in the real unit of the machine.
dnTrackNumber DINT	Selection of the curve track • The acceptance is effected immediately, depending on the mode for the track switch-over selected in C05505, or in the next zero crossing of the x axis.
bReset BOOL From library V01.04.xx.xx	Reset output position FALSE↗TRUE: The *dnYPosOut_p* output is set to "0".
Data From library V01.04.xx.xx	Data interface – For Lenze service only! **For the "Electronic cam" application:** Leave the input blank. • If the *Data* input is not energised, the FB reads the table of values of the curve track selected via the *dnTrackNumber* input from the cam data under the current product number (specified by the **LS_CamInterface** SB) and outputs the corresponding y position for the x position specified. • In this case, the **LS_CamInterface** SB has full online change functionality.

Outputs

Identifier/data type	Value/meaning
dnYPosOut_p DINT	Output position in [increments] • Unlimited position of the y axis. • This output position can be directly transferred to the basic function "Position follower" (**LS_PositionFollower** SB), if an unlimited measuring system is used in the drive axis. • C05514 indicates the output position in the real unit of the machine.
dnYSpeedOut_s DINT	Output speed given as speed in [rpm] • C05515 indicates the output speed in the real unit of the machine.
dnYAccOut_x DINT	Acceleration feedforward value • The acceleration feedforward value results from the acceleration curve stored in the cam data and the mass information stored in the machine parameters for the y axis (YAxisData). • The output of the acceleration feedforward value is only effected if the motion profile selected also contains the corresponding information. • In some applications the dynamic performance can still be increased by means of an acceleration feedforward. • Output as speed change/time in [rpm/s] • Display parameter: C05516
dnYFeedLength_p DINT	Feed length of the current profile in [increments] • Only if a feed profile is available. • C05517 indicates the feed length in the real unit of the machine.
dwYFeedResidual DWORD	Residual value of the feed length of the current profile • Only if a feed profile is available.
dnActTrackNumber DINT	Number of the currently processed motion profile (current curve track number)
dnXCycleLength_p DINT From library V01.01.xx.xx	Cycle in [increments] • C05518 indicates the cycle in the real unit of the machine.

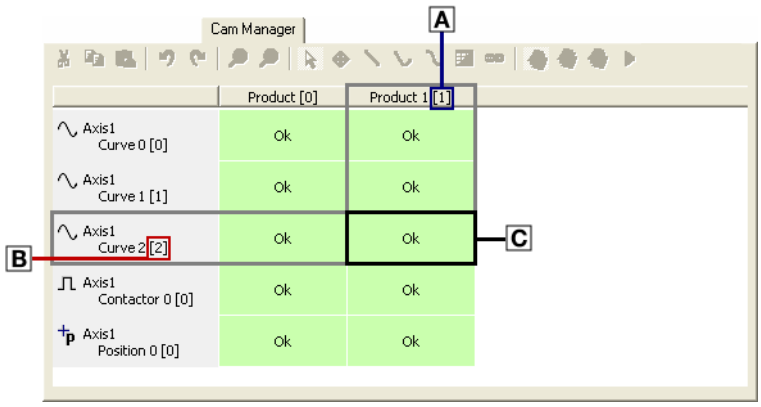
Identifier/data type	Value/meaning	
bXZero BOOL	Status signal "Zero position/zero crossing" • The input signal *dnXPosIn_p* is the reference.	
	FALSE	Master value is at any position in the master value cycle (register)
	TRUE	**Permanently:** Master value is at zero position. **For one cycle:** Zero crossing of the master value.
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C05519.
XAxisData	Machine parameters of the x axis • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.	
YAxisData	Machine parameters of the y axis • Via this output the machine parameters used by the FB can be easily transferred to subsequent FBs.	

Parameters

Parameter	Possible settings			Info
C05500/1	Character string			X position unit • Read only
C05500/2	Character string			X speed unit • Read only
C05500/3	Character string			X acceleration unit • Read only
C05500/4	Character string			Designation of the x axis • Read only
C05501/1	Character string			Y position unit • Read only
C05501/2	Character string			Y speed unit • Read only
C05501/3	Character string			Y acceleration unit • Read only
C05501/4	Character string			Designation of the y axis • Read only
C05502	-214748.3647	Unit/t	214748.3647	X reference speed • Initialisation: 0.0000 unit/t
C05505				Track switch-over mode
	0	In the zero crossing of the x axis		Lenze setting
	1	Immediately		
C05506	-8.000	ms	8.000	Dynamisation time • For trimming the feedforward control • Initialisation: 0.000 ms
C05507	0.00	%	200.00	Feed forward gain • Initialisation: 100.00 %
C05510	-214748.3647	Unit	214748.3647	Input position • Display of the *dnXPosIn_p* in the real unit of the machine.

Parameter	Possible settings			Info
C05511	-214748.3647	Unit	214748.3647	Feedforward control offset • Refers to the acceleration track shown at output *dnYAccOut_x*. • Display of the *dnXOffsetPrectrl_p* input signal in the real unit of the machine.
C05514	-214748.3647	Unit	214748.3647	Output position • Display of the *dnYPosOut_p* output signal in the real unit of the machine.
C05515	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnYSpeedOut_s* output signal in the real unit of the machine.
C05516	-214748.3647	Unit/t^2	214748.3647	Acceleration feedforward control • Display of the *dnYAccOut_x* output signal in the real unit of the machine.
C05517	0.0000	Unit	214748.3647	Feed length • Display of the *dnYFeedLength_p* output signal in the real unit of the machine.
C05518 From library V01.01.xx.xx	0.0000	Unit	214748.3647	Cycle • Display of the *dnXCycleLength_p* output signal in the real unit of the machine.
C05519	Status messages:			Status (bit-coded) • Bits that are not listed are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (Bit 16 ...Bit 31) is issued. • Bit 31 is always set if one or more of the other error bits (bit 16 ... bit 30) are set.
	bits10	Zero crossing active		
	Error messages:			
	Bit 16	Position is beyond the cycle		
	Bit 22	Invalid X axis data structure		
	bits23	Invalid Y axis data structure		
	bits25	Invalid data track number		
	Bit 26	Invalid data track type		
	Bit 31	General error		

5.6.1 Data flow



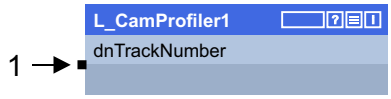
The motion profiles (curves) are entered or imported in the »Cam Designer« by means of graphical objects (point, line, polynomial). The transmission of the cam data to the controller(s) – together with the corresponding parameter set – is effected via the »Engineer« by executing the command **Transfer parameter set to the device**. Afterwards the parameter set and the cam data have to be saved in the memory module with mains failure protection (e. g. with the device command C00002 = "11: Save starting parameters").

Tip!

The motion profiles (curves) can also be entered directly via the parameters of the basic drive function "Cam data management" (**LS_CamInterface** SB) if cam data have already been downloaded to the controller.

Selection of the cam data to be used within the application

Within the application the selection of the profile data to be used is then carried out via the product number and the track number which have been defined for the axis in the »Cam Manager«:



A Product number
B Track number
C Profile data

- The selection of the product number A and therefore the selection of the product to be manufactured for the application is effected globally via the input *CAM_dnProductNumber* of the **LS_CamInterface** SB and has to be carried out synchronously for all cam drives in the interconnection.

- The selection of the track number B of the motion profile, however, is effected individually via the input *dnTrackNumber* of the corresponding entity of the **L_CamProfiler** FB.

5.6.2 Track switch-over

A switch-over to another motion profile can be effected during operation.

- In the Lenze setting the acceptance of the new cam data is carried out in the next zero crossing of the x axis.
- Alternatively, the immediate acceptance of the new cam data can be selected in C05505.

5.6.3 Feedforward control

Via the output *dnYAccOut_x* the FB provides an acceleration feedforward value, if an acceleration curve for the motion profile selected is stored in the cam data, and corresponding mass information is stored in the machine parameters for the y axis.

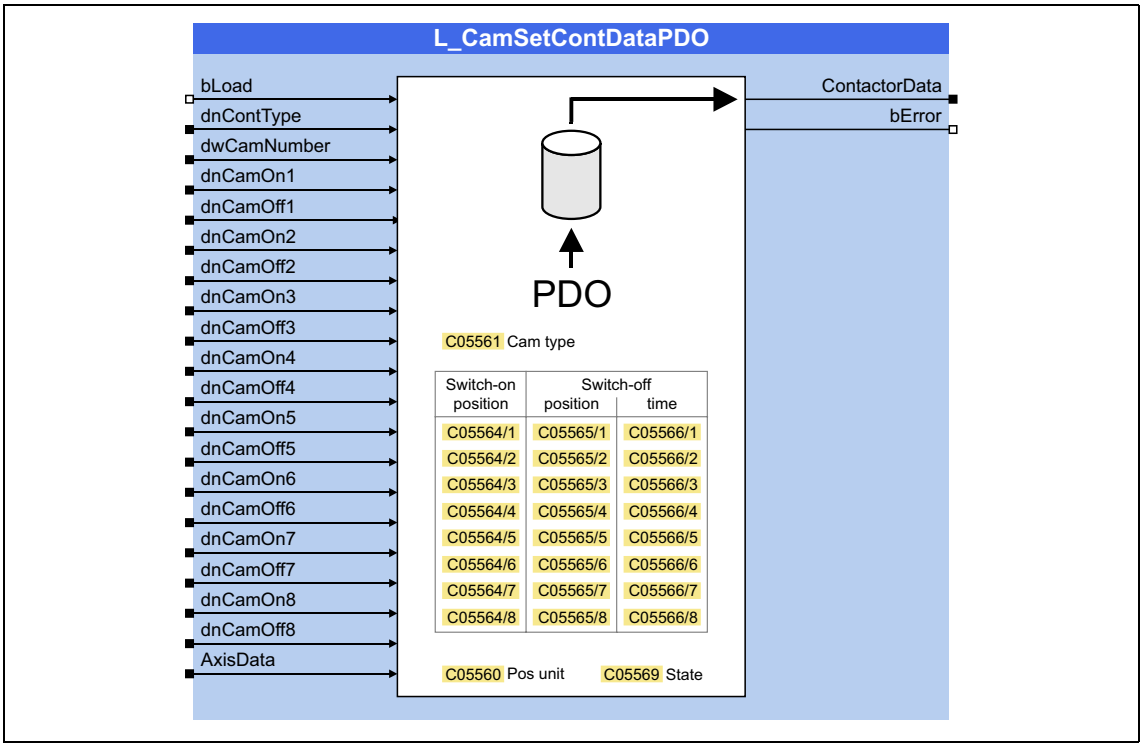
- Optionally a dynamisation time can be set in C05506, by which the x position for the calculation of the acceleration signal is trimmed.
- Additionally a user-definable position offset can be specified via the input *dnXOffsetPrectrl_p*, which also displaces the acceleration track.
- Via the feedforward gain that can be set in C05507, additionally a systematic adjustment of the feedforward control can be carried out.

5.6.4 Output of the machine parameters

Via the outputs *XAxisData* and *YAxisData* the machine parameters of the x and y axis are provided for the optional further use in other FBs.

- For purposes of information, the designation of the x axis is displayed in C05500/4 and the designation of the y axis is shown in C05501/4.

Tip!



In more complex interconnections, for purposes of clarity, it is recommended to read out the machine parameters specifically via an instance of the L_CamGetAxisData FB instead of using the outputs *XAxisData* and *YAxisData*.

5.7 L_CamSetContDataPDO - contactor data selection via inputs/PDOs

Function library:	LenzeCam	**FB is available as of library V01.02.xx.xx! FB may only be used for firmware as of V3.0!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB serves to select contactor data independent of the cam technology (CamDesigner/LC1 file) directly via inputs.

- The inputs can be connected, for instance, to a corresponding port block to accept contactor data from a master control via process data objects (PDOs).
- The read contactor data are transferred to the FB L_CamContactor via the *ContactorData* output.
- The read contactor data are saved with mains failure protection and thus will be available even after mains switching.
- The FB L_CamSetContDataSDO serves to select the contactor data via codes/SDOs.

Inputs

Identifier/data type	Information/possible settings	
bLoad BOOL	Accept contactor data	
	TRUE	The contactor data pending at the inputs are transferred via the *ContactorData* output to the FB L_CamContactor. • Changing the inputs has an immediate effect on the cams.
	TRUE↘FALSE	The contactor data valid last are saved internally with mains failure protection and transferred via the *ContactorData* output to the FB L_CamContactor. • Now, input changes do not affect the cams anymore. They remain unchanged.

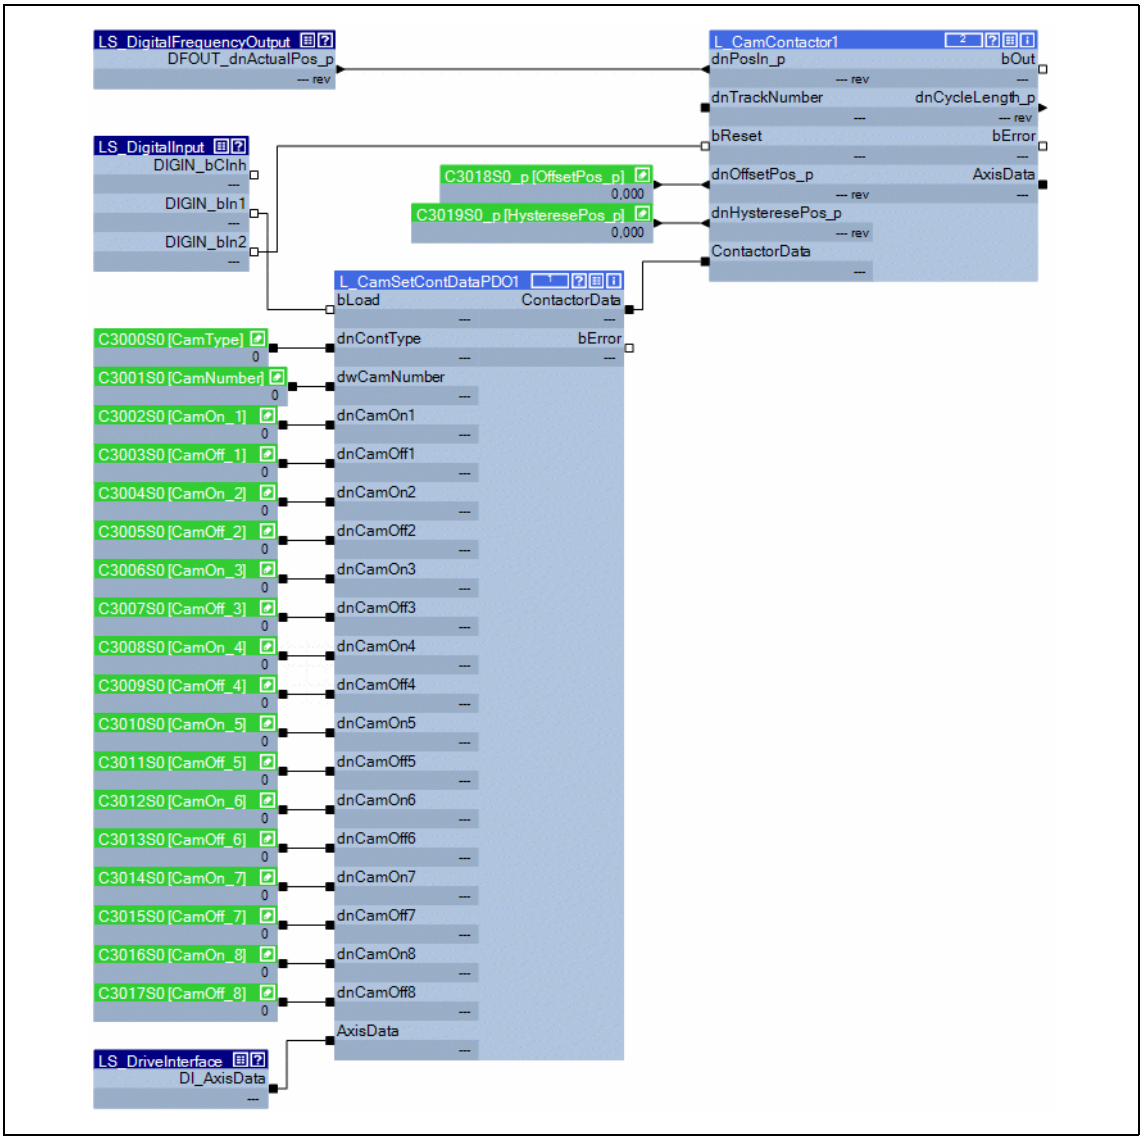
Identifier/data type	Information/possible settings	
dnContType DINT	Cam type	
	1	Positive travel cams
	2	Negative travel cams
	3	Bidirectional travel cams
	11	Positive time cams
	12	Negative time cams
dwCamNumber DWORD	Number of cams in the track	
dnCamOn1 ... dnCamOn8 DINT	Cam switch-on position in [increments] • C05564/1...8 indicates the cam switch-on position in the real unit of the machine.	
dnCamOff1 ... dnCamOff8 DINT	With travel cams: Cam switch-off position in [increments] • C05565/1...8 indicates the cam switch-off position in the real unit of the machine.	
	With time cams: Cam break time in [s] • "e3" representation (fixed point with three decimal positions): "1" ≡ 1 ms, "1000" ≡ 1 s • Display parameter: C05566/1...8	
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
ContactorData	Output of the contactor data • Connect this output with the input of the same name of the FB L_CamContactor.	
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C05569.

Parameter

Parameter	Possible settings			Information
C05560	String of digits			Position unit • Read only
C05561				Cam type • Read only
	1	Positive travel cams		
	2	Negative travel cams		
	3	Bidirectional travel cams		
	11	Positive time cams		
	12	Negative time cams		
C05564/1...8	-214748.3647	Unit	214748.3647	Cam switch-on position 1 ... 8 • Display of the input signal *dnCamOn1...8* in the real unit of the machine.



Parameter	Possible settings			Information
C05565/1...8	-214748.3647	Unit	214748.3647	Cam switch-off position 1 ... 8 • Only with travel cams • Display of the input signal *dnCamOff1...8* in the real unit of the machine.
C05566/1...8	0.000	s	134217.728	Cam break time 1 ... 8 • Only with time cams • Display of the input signal *dnCamOff1...8*.
C05567/1...8				Cam status 1 ... 8 • Read only
	0	Undefined cam		
	1	Cam is not active		
	2	Cam is active		
C05569	Status messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits7	Invalid cam number		
	Error messages:			
	bits23	Invalid axis data structure		
	bits27	Invalid cam type		
	bits28	Invalid contactor data (wrong parameterisation)		
	bits31	General error		

5.7.1 Exception handling

The following table contains the behaviour of the FB in various special cases:

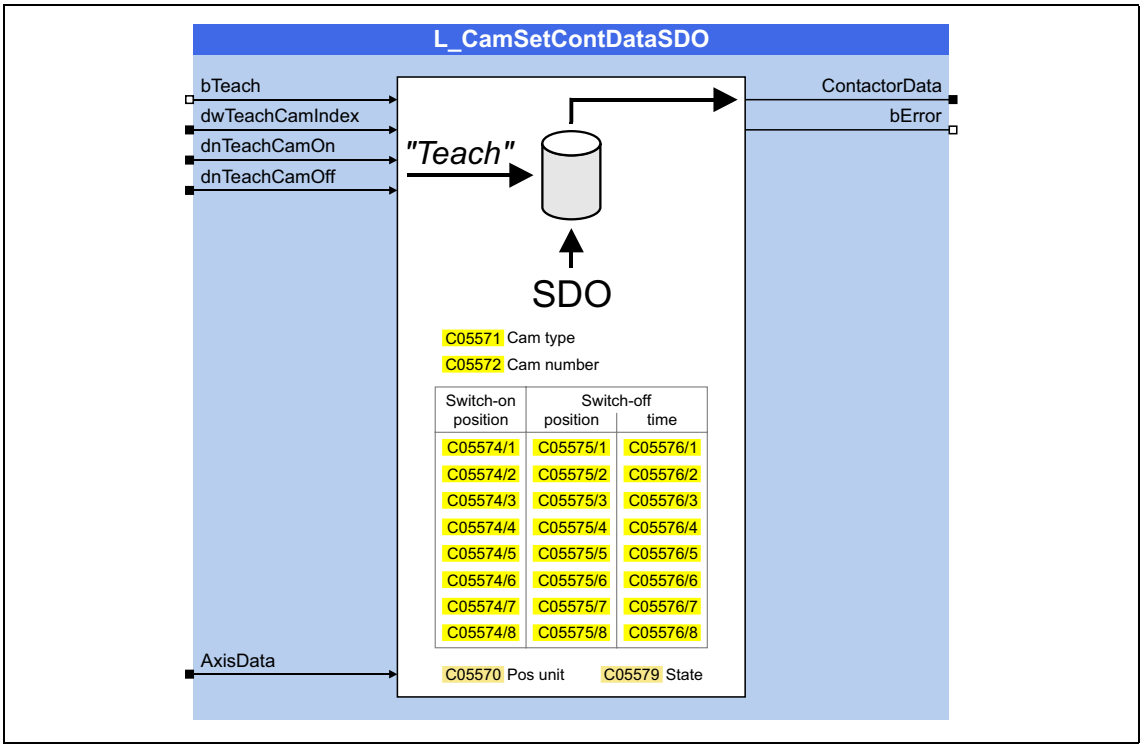
Special case	Behaviour
Invalid axis data	The *bError* output is set to TRUE.
Wrong parameterisation of the contactor data	A cam track is output without the wrong cams.
Selection of an invalid cam number	The number of cams is limited to 8, i.e. a cam track with max. 8 cams is output. In this case, the *bError* output is not set to TRUE.
Selection of an invalid cam type	No cam track is output. The *bError* output is set to TRUE.

5.7.2 Interconnection example

[5-15] Interconnection example: Selection of the cam data via PDOs

5.8 L_CamSetContDataSDO - contactor data selection via codes/SDOs

Function library:	LenzeCam	**FB is available as of library V01.02.xx.xx! FB may only be used for firmware as of V3.0!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel



This FB serves to select contactor data independent of the cam technology (CamDesigner/LC1 file) directly via codes.

- The codes can be written, for instance, via parameter data objects (SDOs) by a master control.
- The FB supports "Teaching" of cams.
- The contactor data are transferred to the FB L_CamContactor via the *ContactorData* output.
- The FB L_CamSetContDataPDO serves to select the contactor data via inputs/PDOs.

Note!

After changing the contactor data during operation:

Save the parameter set and the cam data with mains failure protection in the memory module (e.g. using the device command C00002 = "11: Save start parameter").

Inputs

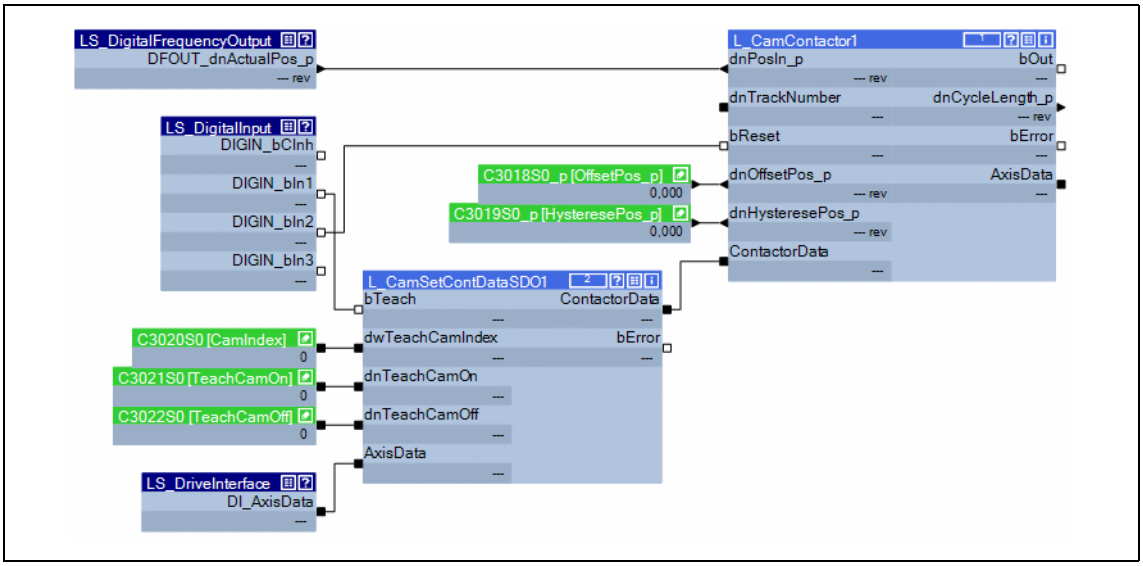
Identifier/data type	Information/possible settings	
bTeach BOOL	"Teach" cam	
	FALSE	"Teach" function is deactivated.
	TRUE	The cam parameters pending at the inputs *dnTeachCamOn* and *dnTeachCamOff* are accepted for the cam with the index *dwTeachCamIndex*.
dwTeachCamIndex DWORD	Selection of the cam to be "taught" • Index 0 ... 7 ≡ cam 1 ... 8	
dnTeachCamOn DINT	Cam switch-on position to be "taught" in [increments]	
dnTeachCamOff DINT	With travel cams: Cam switch-off position to be "taught" in [increments]	
	With time cams: Cam break time to be "taught" in [s] • "e3" representation (fixed point with three decimal positions): "1" ≡ 1 ms, "1000" ≡ 1 s	
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
ContactorData	Output of the contactor data • Connect this output with the input of the same name of the FB L_CamContactor.	
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C05579.

Parameter

Parameter	Possible settings			Information
C05570	String of digits			Position unit • Read only
C05571				Cam type
	1	Positive travel cams		
	2	Negative travel cams		
	3	Bidirectional travel cams		
	11	Positive time cams		
	12	Negative time cams		
C05572	0		8	Number of cams
C05574/1...8	-214748.3647	Unit	214748.3647	Cam switch-on position 1 ... 8
C05575/1...8	-214748.3647	Unit	214748.3647	Cam switch-off position 1 ... 8 • Only with travel cams
C05576/1...8	0.000	s	134217.728	Cam break time 1 ... 8 • Only with time cams



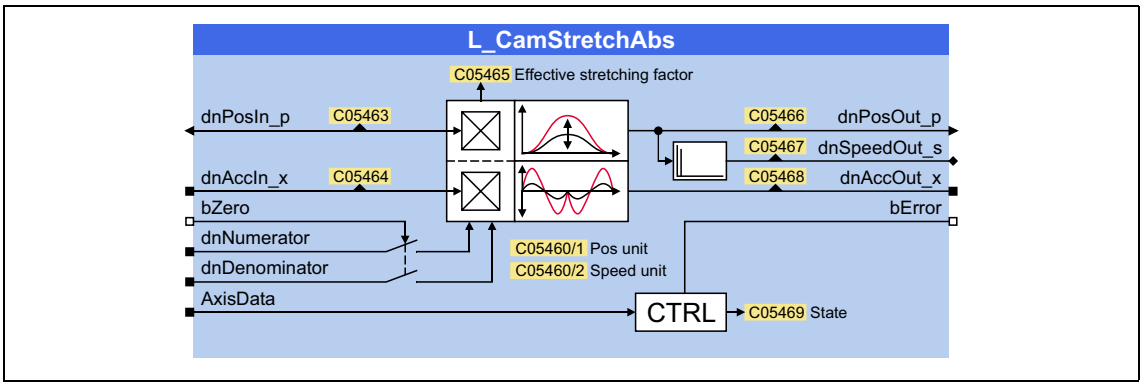
Parameter	Possible settings		Information
C05577/1...8			Cam status 1 ... 8 Read only
	0	Undefined cam	
	1	Cam is not active	
	2	Cam is active	
C05579	Status messages:		Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	-	-	
	Error messages:		
	bits23	Invalid axis data structure	
	bits27	Invalid cam type	
	bits28	Invalid contactor data (wrong parameterisation)	
	bits31	General error	

5.8.1 Exception handling

The following table contains the behaviour of the FB in various special cases:

Special case	Behaviour
Invalid axis data	The *bError* output is set to TRUE.
Wrong parameterisation of the contactor data	A cam track is output without the wrong cams.
Error while teaching in	The cam is not taught in.
Changing the cam break time with active cam in the FB L_CamContactor	A value change for the cam break time in C05576/1...8 is only accepted after the break time set before in the FB L_CamContactor has elapsed.

5.8.2 Interconnection example



[5-16] Interconnection example: Selection of the contactor data via SDOs

5.9 L_CamStretchAbs - stretching/compressing the position (absolute)

Function library:	LenzeCam	**FB permissible for firmware as of V3.0 only!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

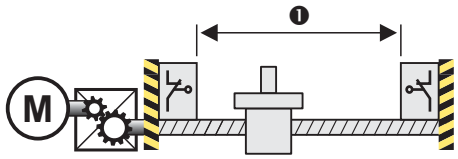
This FB is used for simple absolute stretching and compression of a position in the limited traversing range.

- Via the inputs *dnNumerator* and *dnDenominator* a free stretch factor for the position transmission can be defined. A changed stretch factor is only accepted internally with a TRUE signal at the input *bZero*.
- At the same time, the FB can stretch/compress the acceleration feedforward value, which the L_CamProfiler FB provides to downstream FBs.

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Input position in [increments] • C05463 indicates the input position in the real unit of the machine.
dnAccIn_x DINT	Acceleration feedforward value • For accepting the acceleration feedforward value for the y axis, given by the L_CamProfiler FB, just connect this input with its output *dnYAccOut_x*. • Selection as speed change/time in [rpm/s] • Display parameter: C05464
bZero BOOL	Accept changed stretch factor • Apply an acceptance signal to this input, which for instance signalises the zero crossing of the x axis (synchronised stretching/compression).
	TRUE: The changed stretch factor is accepted internally. • At the same time the status bit 10 ("Zero crossing active") is set in C05469.
dnNumerator DINT	Stretch factor (numerator) • $\pm 2^{31}-1$
dnDenominator DINT	Stretch factor (denominator) • 1 ... $2^{31}-1$ • A negative stretch factor can only be defined via *dnNumerator*. • In the case of an input value < 1, processing is continued internally with 1.
AxisData	Machine parameters • If the FB is to relate to the measuring system of the drive axis, connect this input to the output *DI_AxisData* of the **LS_DriveInterface** SB for accepting the machine parameters of the drive/motor. • If the FB within a cam application is to relate to the measuring system of the master selection (master), connect this input to the output *XAxisData* of the L_CamProfiler FB instead. (📖 162)

Outputs

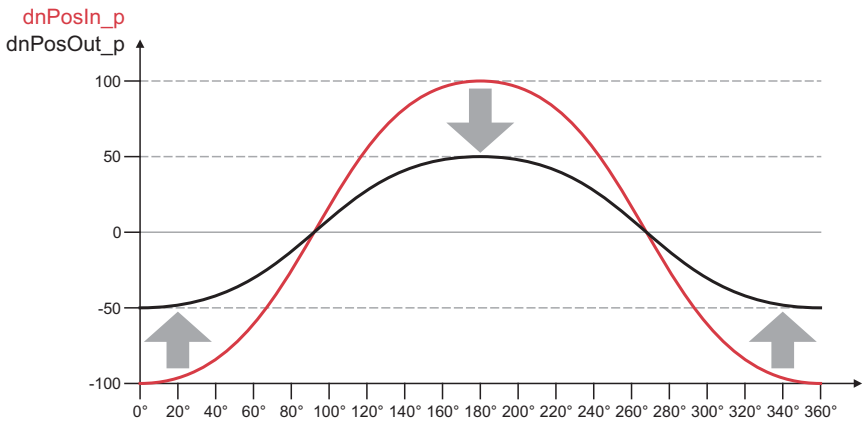


Identifier/data type	Value/meaning	
dnPosOut_p DINT	Output position in [increments] • Limitation can be effected (display via *bLimit*) • C05466 indicates the output position in the real unit of the machine.	
dnSpeedOut_s DINT	Output speed given as speed in [rpm] • C05467 indicates the output speed in the real unit of the machine.	
dnAccOut_x DINT	Acceleration feedforward value • Output as speed change/time in [rpm/s] • Display parameter: C05468	
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C05469.

Parameter

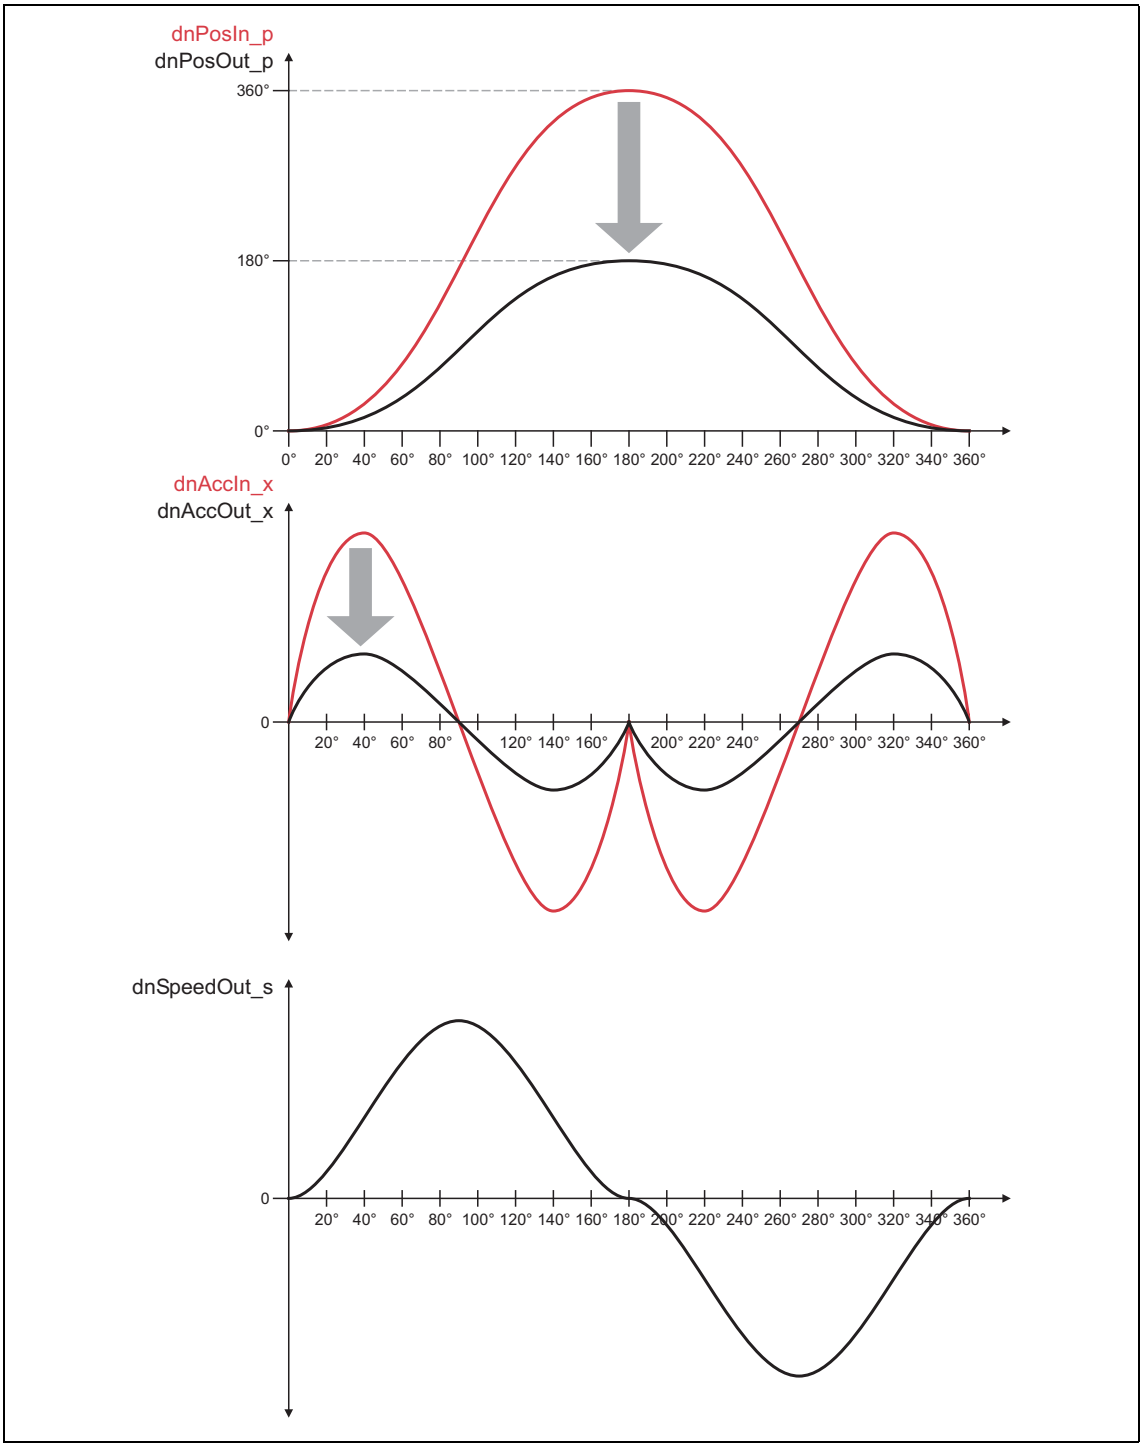
Parameter	Possible settings			Information
C05460/1	String of digits			Position unit • Read only
C05460/2	String of digits			Speed unit • Read only
C05463	-214748.3647	Unit	214748.3647	Input position • Display of the *dnPosIn_p* input signal in the real unit of the machine.
C05464	-214748.3647	Unit/t^2	214748.3647	Input acceleration feedforward control • Display of the *dnAccIn_x* input signal in the real unit of the machine.
C05465	-214748.3647		214748.3647	Effective stretch factor
C05466	-214748.3647	Unit	214748.3647	Output position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05467	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C05468	-214748.3647	Unit/t^2	214748.3647	Output acceleration feedforward control • Display of the *dnAccOut_x* output signal in the real unit of the machine.
C05469	Status messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits10	Zero crossing active		
	Error messages:			
	bits17	Initial speed too high		
	bits23	Invalid axis data structure		
	bits24	Stretched position too great		
	bits31	General error		

5.9.1 Typical application



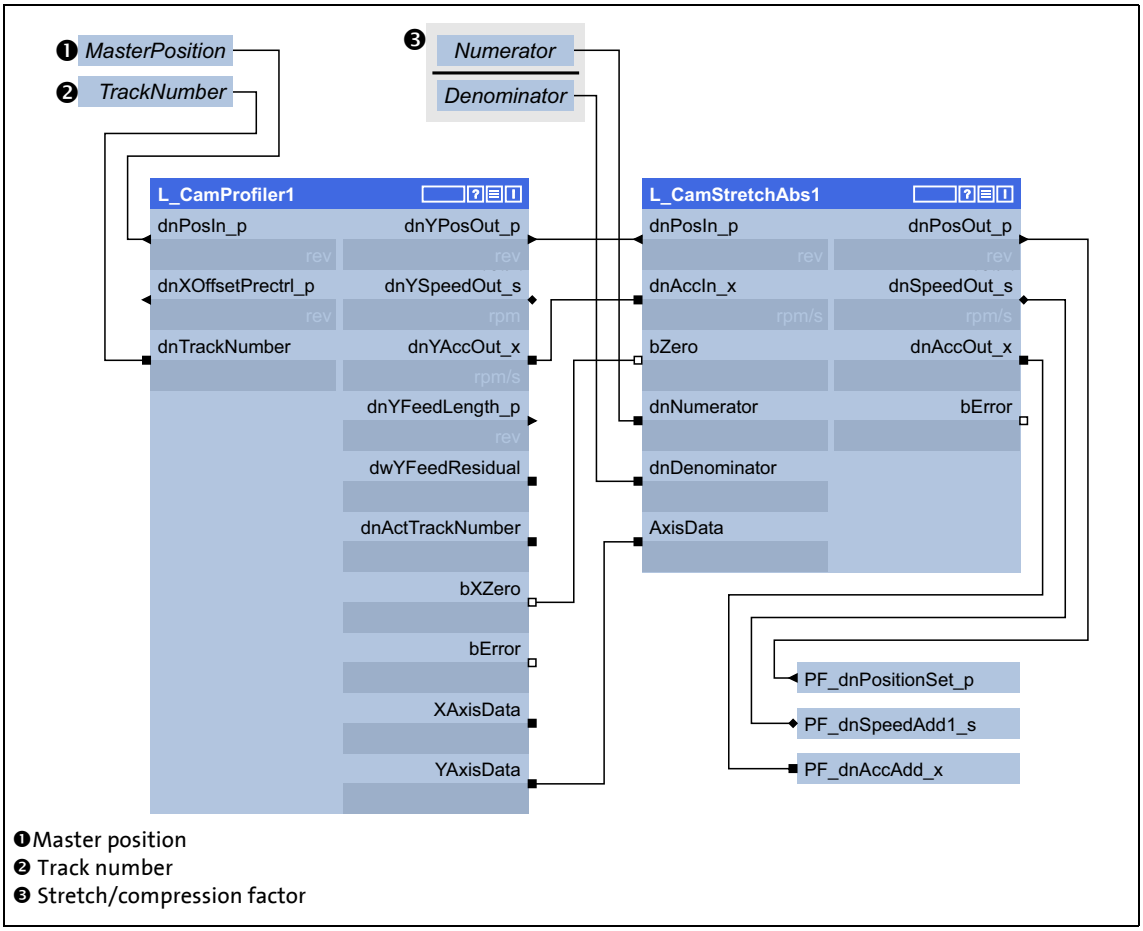
By means of this FB a traversing path within the limited traversing range can be simply changed via factors. By this, the motion profile can be maintained.

❶ Limited traversing range



[5-17] Example: spindle drive

- Thereby the factors always relate to the zero point of the motion profile on the y axis.



[5-18] Example: Decrease of the lift to 50 % with stretch factor = 0.5

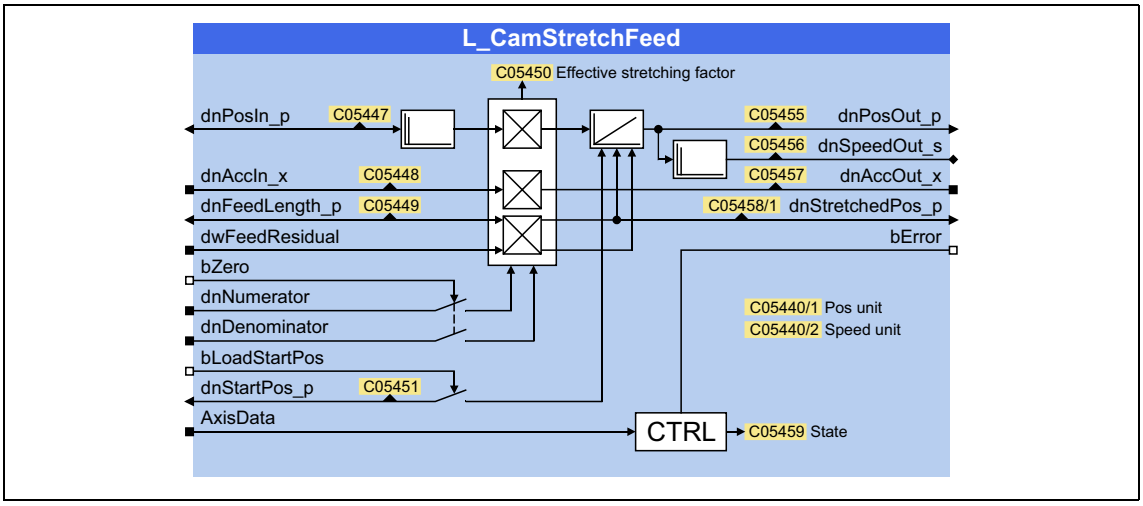
5.9.2 Signal characteristics

[5-19] Example: Compression of the position with stretch factor = 0.5

5.9.3 Interconnection example

[5-20] Interconnection example

Note!



If the stretch/compression factor is to be altered online, it may only be changed over in the zero position of the motion profile, or it has to be directed via a profile generator.

5.10 L_CamStretchFeed - stretching/compressing the position (relative)

Function library:	LenzeCam	**FB permissible for firmware as of V3.0 only!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB is used for relative stretching and compression of a position in the "modulo" or "unlimited" traversing range. For this the FB differentiates the input position to a position difference and stretches or compresses it. Afterwards the position difference stretched/compressed is integrated to a continuous position for the "unlimited" traversing range, or cycle-related for the "modulo" traversing range.

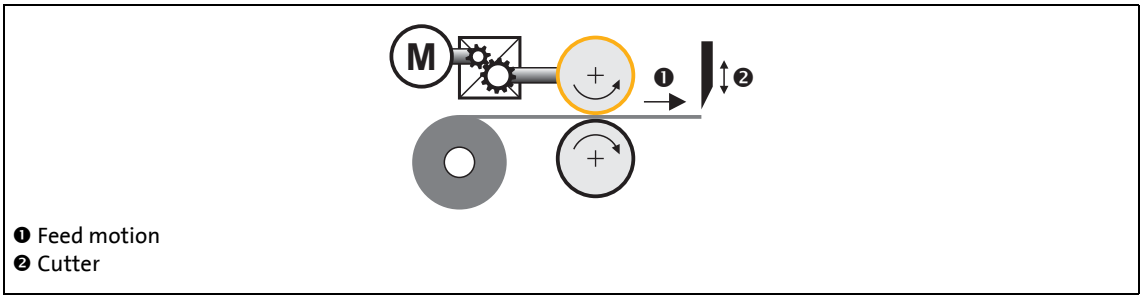
- The output continuous position can be directly transferred to the basic function "position follower" (**LS_PositionFollower** SB).
- Via the inputs *dnNumerator* and *dnDenominator* a free stretch factor for the speed transmission can be defined. A changed stretch factor is only immediately accepted internally with a TRUE signal at the input *bZero*.
- Via the input *bLoadStartPos* the position output can be set to the starting position pending at the input *dnStartPos_p*.

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Input position in [increments] • C05447 indicates the input position in the real unit of the machine.
dnAccIn_x DINT	Acceleration feedforward value • For accepting the acceleration feedforward value for the y axis, given by the L_CamProfiler FB, just connect this input with its output *dnYAccOut_x*. • Selection as speed change/time in [rpm/s] • Display parameter: C05448
dnFeedLength_p DINT	Feed length of the current profile in [increments] • For accepting the feed length for the y axis, output by the L_CamProfiler FB, you simply connect this input to its output *dnYFeedLength_p*. • Display parameter: C05449
dwFeedResidual DWORD	Residual value of the feed length of the current profile • For accepting the residual value for the y axis, output by the L_CamProfiler FB, you simply connect this input to its output *dwYFeedResidual*.

Identifier/data type	Information/possible settings
bZero BOOL	Accept changed stretch factor • Apply an acceptance signal to this input, which for instance signalises the zero crossing of the x axis (synchronised stretching/compression).
	TRUE: The changed stretch factor is immediately accepted internally.
dnNumerator DINT	Stretch factor (numerator) • $\pm 2^{31}-1$
dnDenominator DINT	Stretch factor (denominator) • 1 ... $2^{31}-1$ • A negative stretch factor can only be defined via *dnNumerator*. • In the case of an input value < 1, processing is continued internally with 1.
bLoadStartPos BOOL	Load the integrator with starting position
	TRUE: Load the integrator with the value at the *dnStartPos_p* input.
dnStartPos_p DINT	Starting position in [inc] with which the integrator is loaded by setting *bLoadStartPos* to TRUE. • C05451 indicates the starting position in the real unit of the machine.
AxisData	Machine parameters • If the FB is to relate to the measuring system of the drive axis, connect this input to the output *DI_AxisData* of the **LS_DriveInterface** SB for accepting the machine parameters of the drive/motor. • If the FB within a cam application is to relate to the measuring system of the master selection (master), connect this input to the output *XAxisData* of the L_CamProfiler FB instead. (📖 162)

Outputs



Identifier/data type	Value/meaning
dnPosOut_p DINT	Output position in [increments] • C05455 indicates the output position in the real unit of the machine.
dnSpeedOut_s DINT	Output speed given as speed in [rpm] • C05456 indicates the output speed in the real unit of the machine.
dnAccOut_x DINT	Acceleration feedforward value • Output as speed change/time in [rpm/s] • Display parameter: C05457
dnStretchedPos_p DINT	Output of the stretched/compressed input position • For example for position comparators. • The position is calculated from the stretch factors valid within the cycle multiplied with the input position, i. e. relating to the stretch factors at the input side, the output can only change in the next cycle. The loading of a starting position has no effect on the output. • C05458/1 indicates the stretched/compressed position in the real unit of the machine.
bError BOOL	"Error" status
	TRUE: An error has occurred (group signal). • For details see display parameters C05459.

Parameter

Parameter	Possible settings			Information
C05440/1	String of digits			Position unit • Read only
C05440/2	String of digits			Speed unit • Read only

5.11 L_CamSyncIn - synchronous/oversynchronous clutch-in

Function library:	LenzeCam	**FB is available as of library V01.01.xx.xx! FB may only be used for firmware as of V3.0!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB serves to synchronise a tool (drive) to a running material (relative master speed).

- Types of synchronisation:
  - Mark-controlled (touch probe)
  - Manually controlled (e.g. manually controlled top cut with flying saw)
- The synchronisation is path-based and functionally corresponds to a subset of the L_EsClutchPos clutch module. Synchronous or oversynchronous synchronisations are possible.
- The function corresponds to the "DFRFG" function of the 9300EK servo inverter and additionally supports a path-controlled clutch-in.

Inputs

Identifier/data type	Information/possible settings	
dnSpeedIn_s DINT	Input speed (master speed) as speed in [rpm] • Example: Material speed of the web with flying saw. • C05605 indicates the input speed in the real unit of the machine.	
dnTpPos_p DINT	Position of the touch probe sensor in [increments]. • C05606/1 indicates the position in the real unit of the machine.	
dnTpTimeLag DINT	Input for accepting the time stamp • Connect this input with the output *dnTouchProbeTimeLag* of the corresponding touch probe system block.	
bTpReceived BOOL	Input for taking over the status "Touch probe detected" • Connect this input with the output *dnTouchProbeReceived* of the corresponding touch probe system block.	
	FALSE↗TRUE	Touch probe detected. **Note:** At the same time, a speed must be applied at the *dnSpeedIn_s* input for the clutch-in ramp to be calculated. Otherwise, the clutch-in process will not be started in the FB.
dnOpenPos_p DINT	Clutch-in position in [increments] • Starting position for synchronising. • Is generally also used as target position for the **LS_Positioner** system block for re-positioning. • C05606/2 indicates the clutch-in position in the real unit of the machine.	

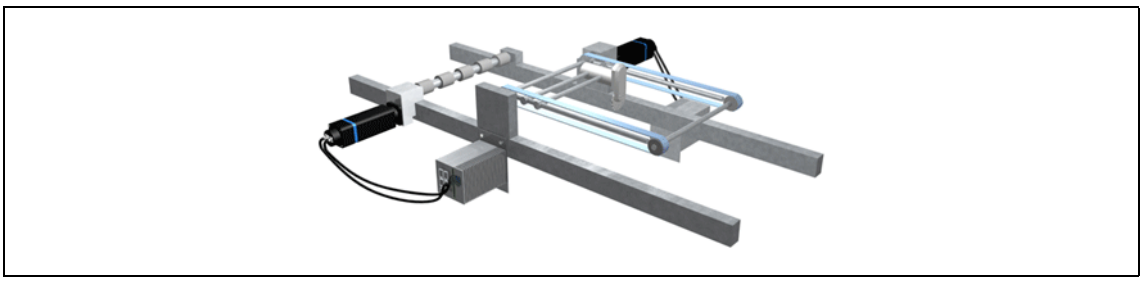
Identifier/data type	Information/possible settings	
dnSyncPos_p DINT	Synchronous position in [increments] • Starting position of the synchronous range. • C05606/3 indicates the synchronous position in the real unit of the machine.	
bReset BOOL	Reset function	
	TRUE	Function is reset to evaluate a new touch probe or the "Manual clutch-in" via *bManualSync* request.
bManualSync BOOL	Manual clutch-in • Example: Manually controlled top cut with flying saw.	
	TRUE	Start clutch-in process immediately. **Note:** At the same time, a speed must be applied at the *dnSpeedIn_s* input for the clutch-in ramp to be calculated. Otherwise, the clutch-in process will not be started in the FB.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**.	

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Output position in [increments] • C05607 indicates the output position in the real unit of the machine.	
dnSpeedOut_s DINT	Output speed given as speed in [rpm] • C05608 indicates the output speed in the real unit of the machine.	
bSync BOOL	"Clutched-in" status	
	TRUE	Input and output run synchronously.
bAcc BOOL	"Acceleration phase active" status	
	TRUE	Acceleration phase is active.
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C05609.

Parameter

Parameter	Possible settings			Information
C05600/1	String of digits			Position unit • Read only
C05600/2	String of digits			Speed unit • Read only
C05601	0.0000	Unit/t	214748.3647	Reference speed • Read only
C05602	0.0000	Unit/t	214748.3647	Maximum speed • For oversynchronous clutch-in. • Initialisation: 0.0000 unit/t
C05603	0.001	s	100.000	Minimum clutch-in time • Time for the clutch-in process which must not be undershot. • Initialisation: 1.000 s
C05605	-214748.3647	Unit/t	214748.3647	Input speed • Display of the *dnSpeedIn_s* input signal in the real unit of the machine.



Parameter	Possible settings			Information
C05606/1	-214748.3647	Unit	214748.3647	Sensor position • Display of the *dnTpPos_p* input signal in the real unit of the machine.
C05606/2	-214748.3647	Unit	214748.3647	Clutch-in position • Display of the *dnOpenPos_p* input signal in the real unit of the machine.
C05606/3	-214748.3647	Unit	214748.3647	Synchronous position • Display of the *dnSyncPos_p* input signal in the real unit of the machine.
C05607	-214748.3647	Unit	214748.3647	Output position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05608	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C05609	Error messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits18	Clutch-in not possible		
	Bit 19	Resulting acceleration too high		
	bits23	Invalid axis data structure		
	bits31	General error		

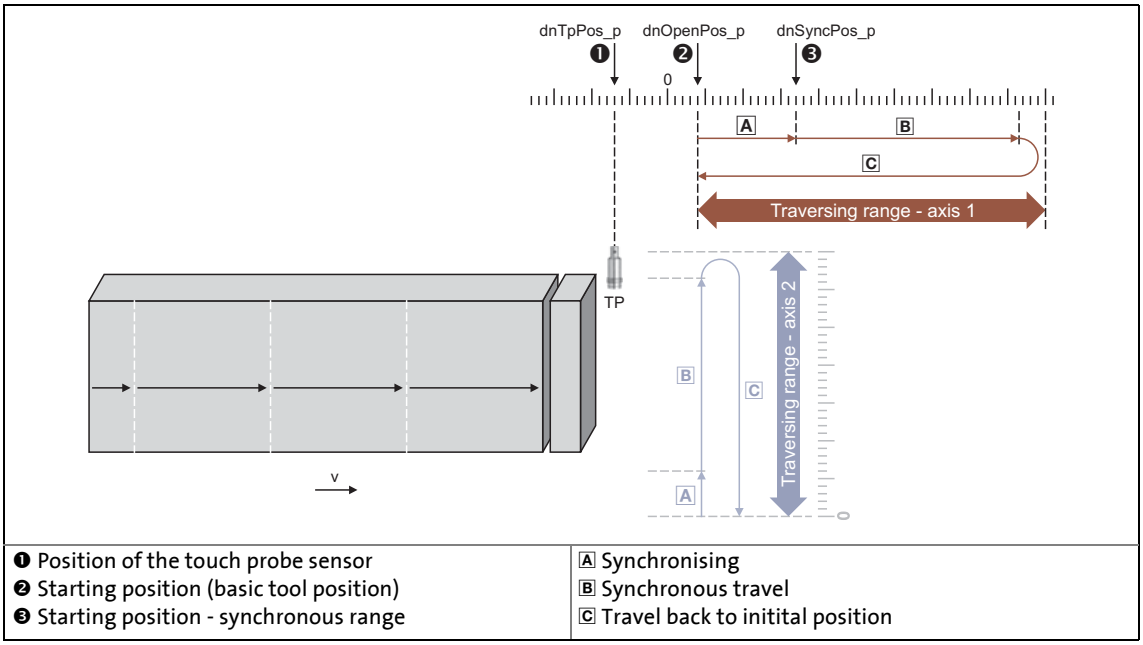
5.11.1 Application example: "Flying saw"

When a flying saw is used, the tool moves in synchronism with the moving material during the machining process. For this purpose, the tool must first be moved on a slide in parallel to the material.

To create the feed of the tool during the machining process, a second drive moves it with constant speed at 90° to the material. At the end of the machining process, the drive must be repositioned to its initial position.

A third drive from the tool drive group moves the tool, e.g., by means of the basic function "Positioning" (**LS_Positioner** system block).

[5-24] Example "flying saw"



Motion sequence

The motion sequence of the flying saw drive consists of the following phases:

A. **Synchronising:** First the tool must be accelerated from the basic position to the material speed. When the material speed has been reached, the tool must be in the cutting position. The exact position of the points of intersection on the web is detected by a touch probe sensor.

B. **Synchronous travel:** The tool immerses into the material, then moves in synchronism with the material speed until the machining process is terminated including the lifting of the tool.

C. **Travel back to initial position:** Finally the tool is repositioned to the basic position, e.g. with the **LS_Positioner** system block.

❶ Position of the touch probe sensor	A Synchronising
❷ Starting position (basic tool position)	B Synchronous travel
❸ Starting position - synchronous range	C Travel back to initital position

[5-25] Phases and positions in the motion sequence of a "flying saw""

Synchronisation processes

In this example, always three movements are to be synchronised:

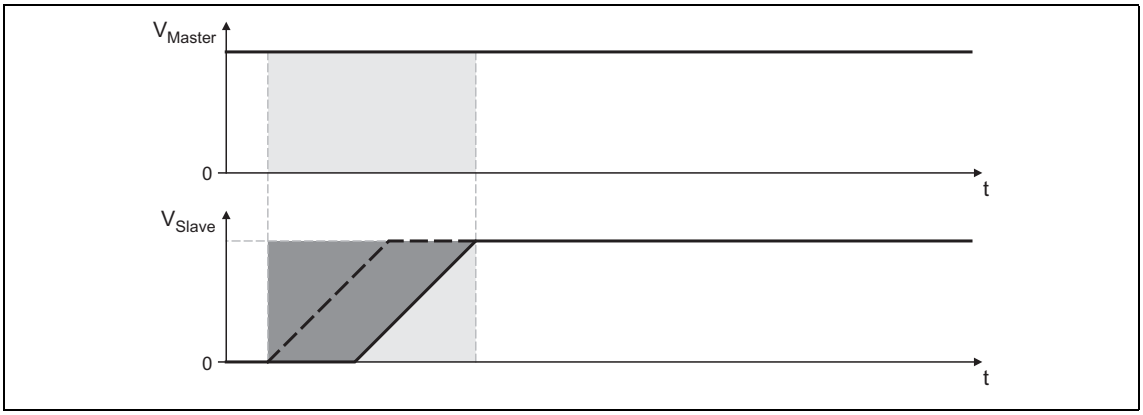
1. Running material to web (master value/master position).
2. Synchronising the slide with saw to web.
3. Releasing the cut with the saw.

Thus, three different measuring systems must be related to each other. In a path-controlled system, synchronising and the release of the cut can be started simultaneously, since the master value/master position ensure that both synchronisation processes are terminated at the same time. This, however, does not apply to the traverse path with different master speeds.

Operating mode

The traversing range has a starting position which can be defined via the *dnOpenPos_p* input. This starting position is also the target position for the **LS_Positioner** system block for repositioning.

As soon as the start of the synchronous range is reached, the cutting process can be started. The starting position of the synchronous range is defined via the *dnSyncPos_p* input.



Afterwards the tool reports the end of the cutting process, e.g. using the boolean signals. This signal serves to activate the **LS_Positioner** system block to traverse the saw back into the *dnOpenPos_p* starting position.

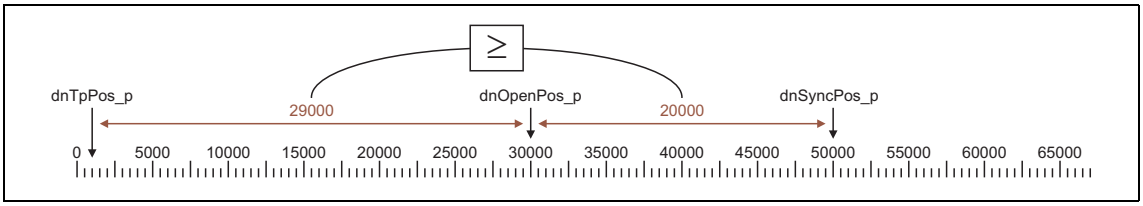
During or after the termination of the re-positioning, the *bReset* input must be set from FALSE to TRUE once to activate the function block for the synchronisation of the next purpose.

A "top cut" can be activated by setting the *bManualSync* input to TRUE. In this case, synchronising is immediately started independent of the mark detection/position of the material.

5.11.2 Synchronous clutch-in

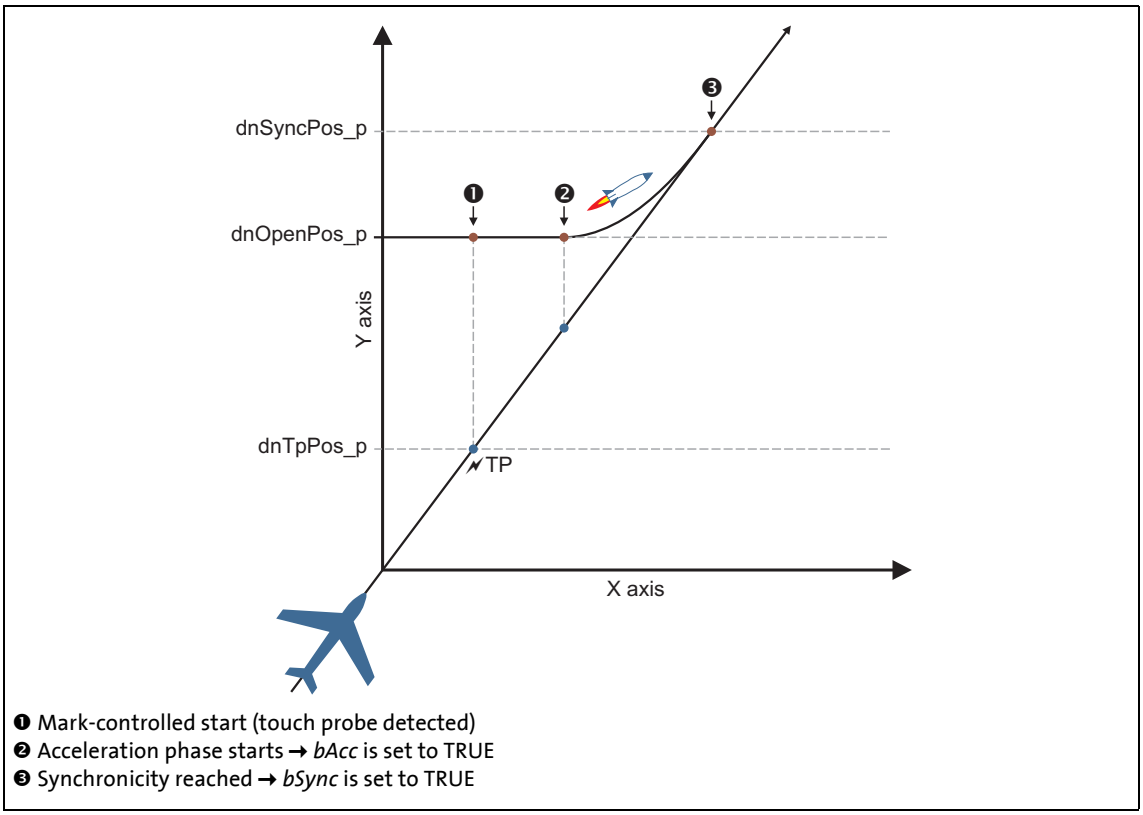
Due to the set ramps and the position of the touch probe sensor, no distance needs to be caught up. After clutch-in, the *dnSpeedOut_s* speed output follows the *dnSpeedIn_s* master speed.

[5-26] Principle "Synchronous clutch-in"



Tip!

Prefer the synchronous clutch-in to the oversynchronous clutch-in, since it prevents the material and tools from damage.



Preconditions

The following conditions must be fulfilled for synchronous clutch-in:

1. The difference between the position of the touch probe sensor and the basic position of the tool at standstill must be equal or greater than the difference between the basic function and the starting function of the synchronous range:

[5-27] Example: Distances of the individual positions

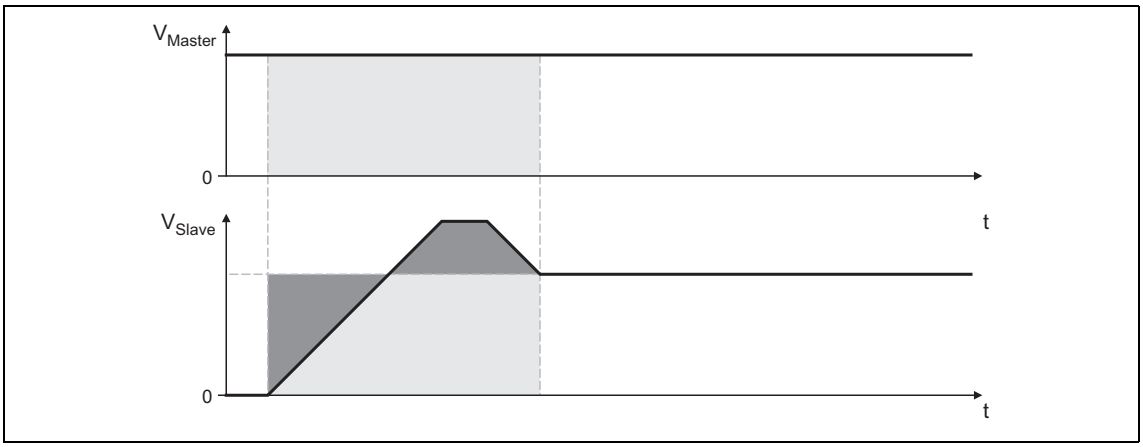
[5-28] Characteristics of positions for synchronous clutch-in

2. When *bTpReceived* or *bManualSync* are enabled, the resulting clutch-in time must not fall below the minimum clutch-in time parameterised in C05603.
   - The time refers to the reference speed when being reached and is thus reduced proportionately when the master speed is lower than the reference speed.

If the preconditions mentioned before are not fulfilled, clutch-in does not take place. The *bError* output is set to TRUE and the cause of error is displayed bit coded in C05609.

Sequence

Usually, the clutch-in process is started mark-controlled by setting the *bTpReceived* input to TRUE. For this purpose, the inputs *dnTpTimeLag* and *bTpReceived* must be connected to the touch probe system block for the digital input which is connected to the touch probe sensor.



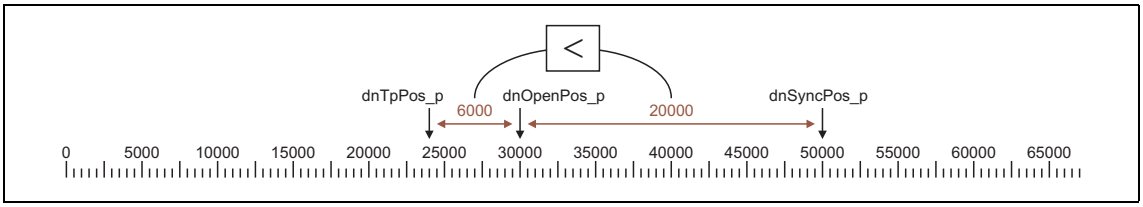
A manual clutch-in can be activated anytime via the *bManualSync* input (e.g. for "top cut" with a flying saw).

During the synchronising process, the *bAcc* output is set to TRUE. As soon as synchronicity has been reached (*dnPosOut_p* >= *dnSyncPos_p*), the *bSync* output is set to TRUE instead.

By setting the *bReset* input from FALSE to TRUE, the function block for the next synchronising can be activated.

5.11.3 Oversynchronous clutch-in

Oversynchronous clutch-in is always done in time-controlled mode. In contrast to the synchronous clutch-in, a distance must always be caught up. The distance may be caught up due to the defined ramp and/or the position of the touch probe sensor. After the catching-up process, the *dnSpeedOut_s* speed output follows the *dnSpeedIn_s* master speed.



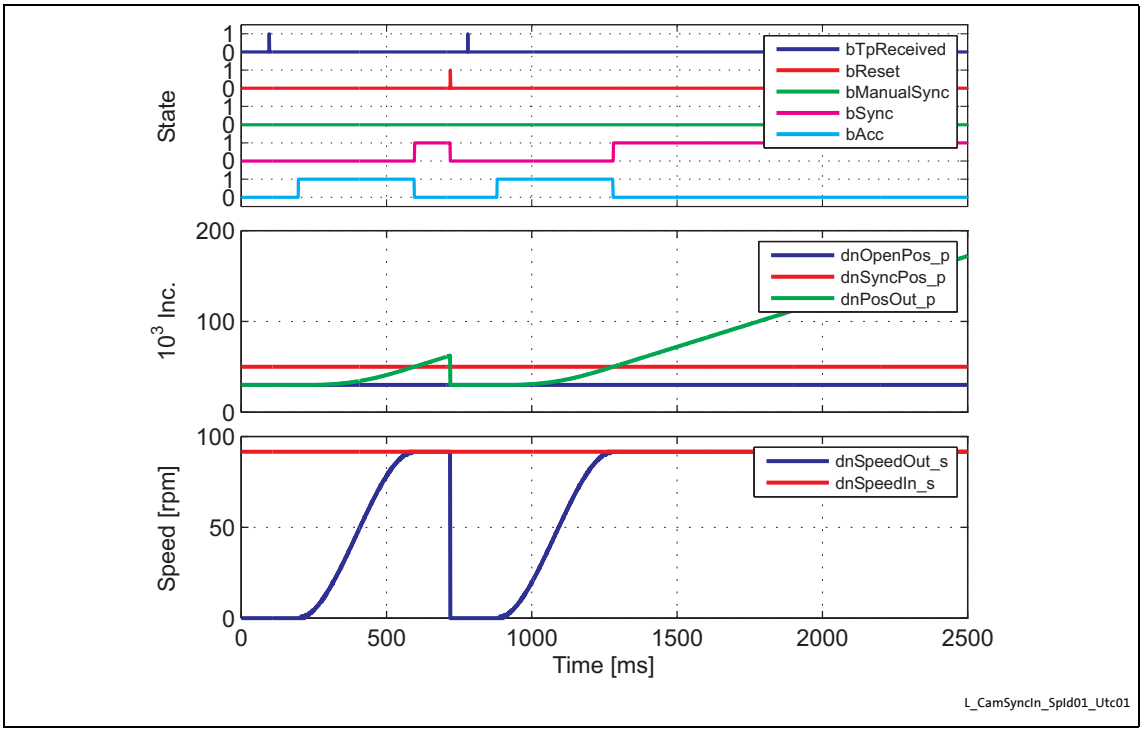
[5-29] Principle "Oversynchronous clutch-in"

Preconditions

The following conditions must be fulfilled for oversynchronous clutch-in:

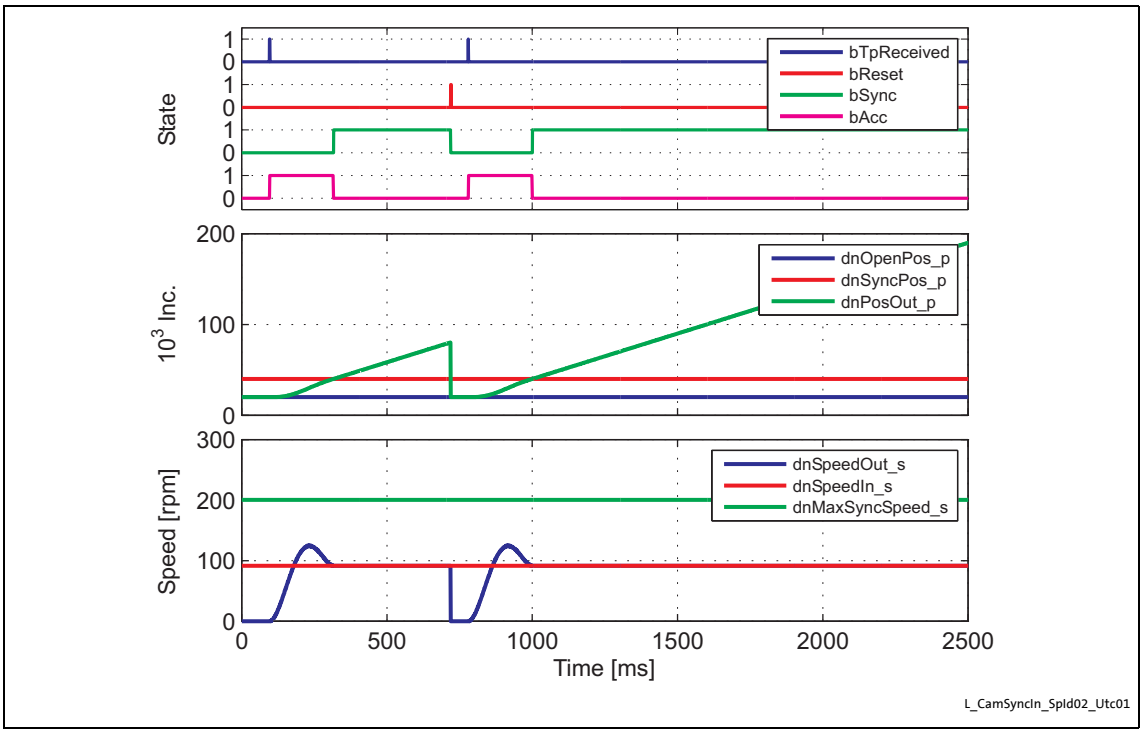
1. The difference between the position of the touch probe sensor and the basic position of the tool at standstill must be lower than the difference between the basic function and the starting function of the synchronous range:

[5-30]



2. The maximum oversynchronous speed to be parameterised in C05602 must be greater than the master speed. The lower the distance of the touch probe sensor from the starting position of the synchronous range, the greater must be the oversynchronous speed.

If the preconditions mentioned before are not fulfilled, clutch-in does not take place. The *bError* output is set to TRUE and the cause of error is displayed bit-coded in C05609. Remedy: Increase value of C05602 until the error does not occur anymore.



Sequence

The sequence corresponds to the sequence for a synchronous clutch-in described in the previous chapter. ▸ Synchronous clutch-in (📖 191)

[5-33] Interconnection example "flying saw"

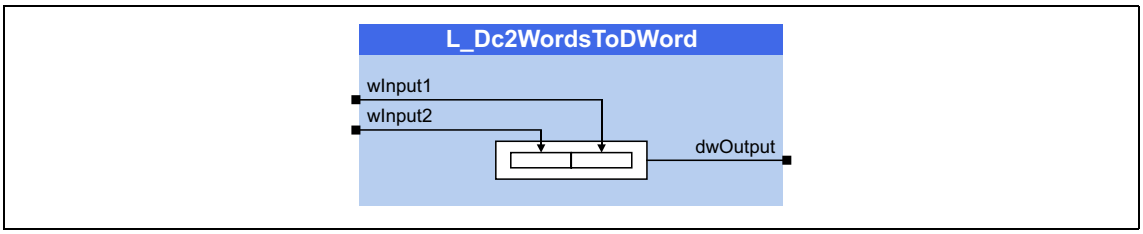
5.12 L_Dc2BytesToWord - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts two input values of type "BYTE" into an output value of type "WORD".

Inputs

Identifier/data type	Information/possible settings
byInput1 BYTE	Input value 1 ≡ bit 0 ... bit 7 of *wOut*
byInput2 BYTE	Input value 2 ≡ bit 8 ... bit 15 of *wOut*



Outputs

Identifier/data type	Value/meaning
wOut WORD	Value of type "word" according to the transmitted input values

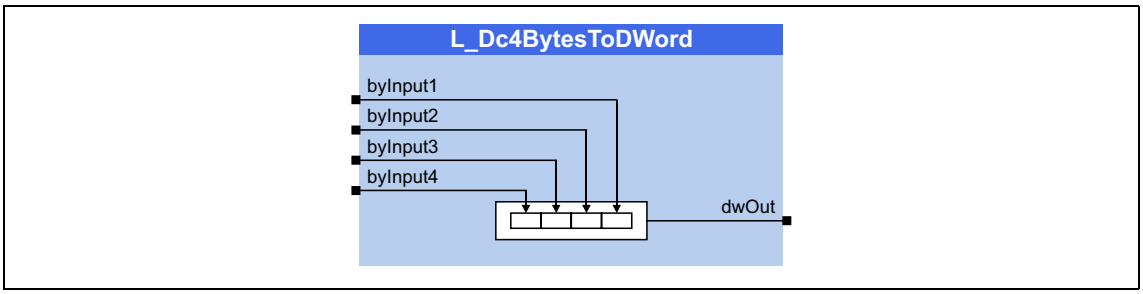
5.13 L_Dc2WordsToDWord- type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts two input values of type "WORD" into an output value of type "DWORD".

Inputs

Identifier/data type	Information/possible settings
wInput1 WORD	Input value 1 ≡ bit 0 ... bit 15 of *dwOutput*
wInput2 WORD	Input value 2 ≡ bit 16 ... bit 31 of *dwOutput*



Outputs

Identifier/data type	Value/meaning
dwOutput DWORD	Value of type "double word" according to the transmitted input values

5.14 L_Dc4BytesToDWord - type converter

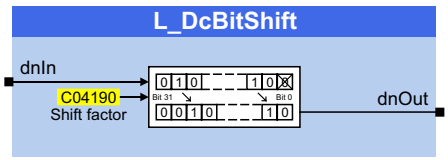
Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts four input values of type "BYTE" into an output value of type "DWORD".

Inputs

Identifier/data type	Information/possible settings
byInput1 BYTE	Input value 1 ≡ bit 0 ... bit 7 of *dwOut*
byInput2 BYTE	Input value 2 ≡ bit 8 ... bit 15 of *dwOut*
byInput3 BYTE	Input value 3 ≡ bit 16 ... bit 23 of *dwOut*
byInput4 BYTE	Input value 4 ≡ bit 24 ... bit 31 of *dwOut*

Outputs



Identifier/data type	Value/meaning
dwOut DWORD	Value of type "double word" according to the transmitted input values

5.15 L_DcBitShift - shift operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a bit shift operation with a "DINT" value.

- The shift factor, i.e. the number of bits by which the input value is shifted to the left or right, is defined by a parameter.
- The result of the shift operation is output at the output *dnOut*.
- The sign remains.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal

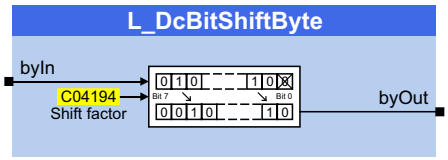
Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal according to the parameterised bit shift operation

Parameter

Parameter	Possible settings			Information
C04190	-31		31	Shift factor • Initialisation: 0

Example



5.16 L_DcBitShiftByte - shift operation

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit shift operation with a "BYTE" value.

- The shift factor, i.e. the number of bits by which the input value is shifted to the left or right, is defined by a parameter.
- The result of the shift operation is output at the output *byOut*.

Inputs

Identifier/data type	Information/possible settings
byIn BYTE	Input signal

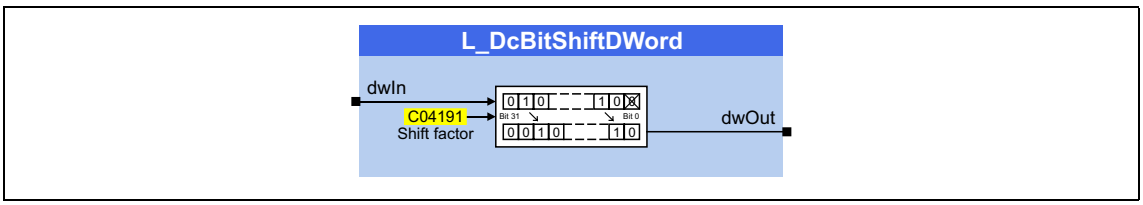
Outputs

Identifier/data type	Value/meaning
byOut BYTE	Output signal according to the parameterised bit shift operation

Parameter

Parameter	Possible settings			Information
C04194	-7		7	Shift factor • Initialisation: 0

Example



5.17 L_DcBitShiftDWord - shift operation

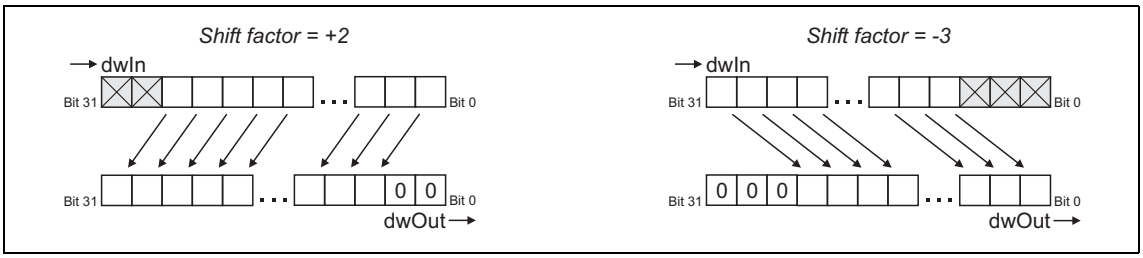
Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit shift operation with a "DWORD" value.

- The shift factor, i.e. the number of bits by which the input value is shifted to the left or right, is defined by a parameter.
- The result of the shift operation is output at the output *dwOut*.

Inputs

Identifier/data type	Information/possible settings
dwIn DWORD	Input signal



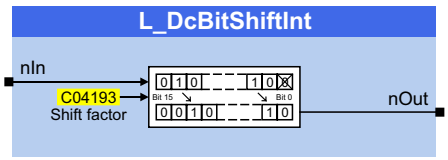
Outputs

Identifier/data type	Value/meaning
dwOut DWORD	Output signal according to the parameterised bit shift operation

Parameter

Parameter	Possible settings			Information
C04191	-31		31	Shift factor • Initialisation: 0

Example



5.18 L_DcBitShiftInt - shift operation

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit shift operation with a "INT" value.

- The shift factor, i.e. the number of bits by which the input value is shifted to the left or right, is defined by a parameter.
- The result of the shift operation is output at the output *nOut*.
- The sign remains.

Inputs

Identifier/data type	Information/possible settings
nIn INT	Input signal

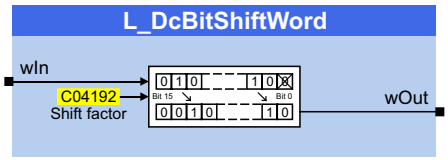
Outputs

Identifier/data type	Value/meaning
nOut INT	Output signal according to the parameterised bit shift operation

Parameter

Parameter	Possible settings			Information
C04193	-15		15	Shift factor • Initialisation: 0

Example



5.19 L_DcBitShiftWord - shift operation

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit shift operation with a "WORD" value.

- The shift factor, i.e. the number of bits by which the input value is shifted to the left or right, is defined by a parameter.
- The result of the shift operation is output at the output w*Out*.

Inputs

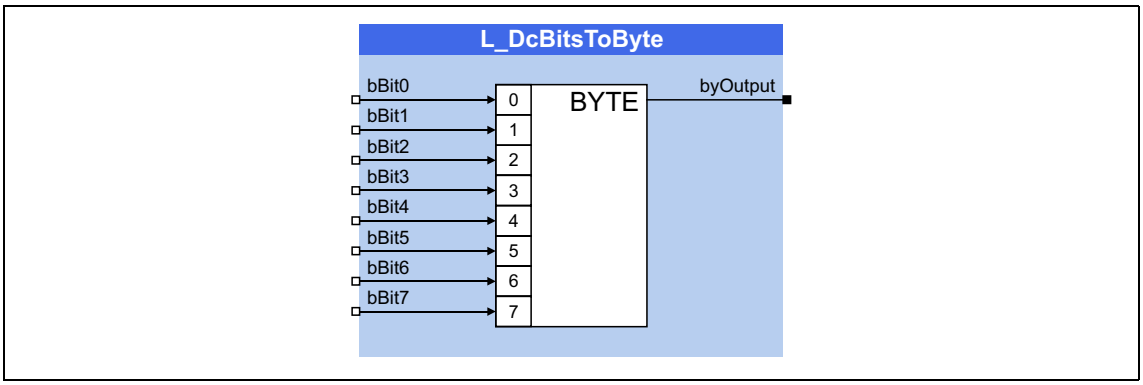
Identifier/data type	Information/possible settings
wIn WORD	Input signal

Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal according to the parameterised bit shift operation

Parameter

Parameter	Possible settings			Information
C04192	-15		15	Shift factor • Initialisation: 0



Example

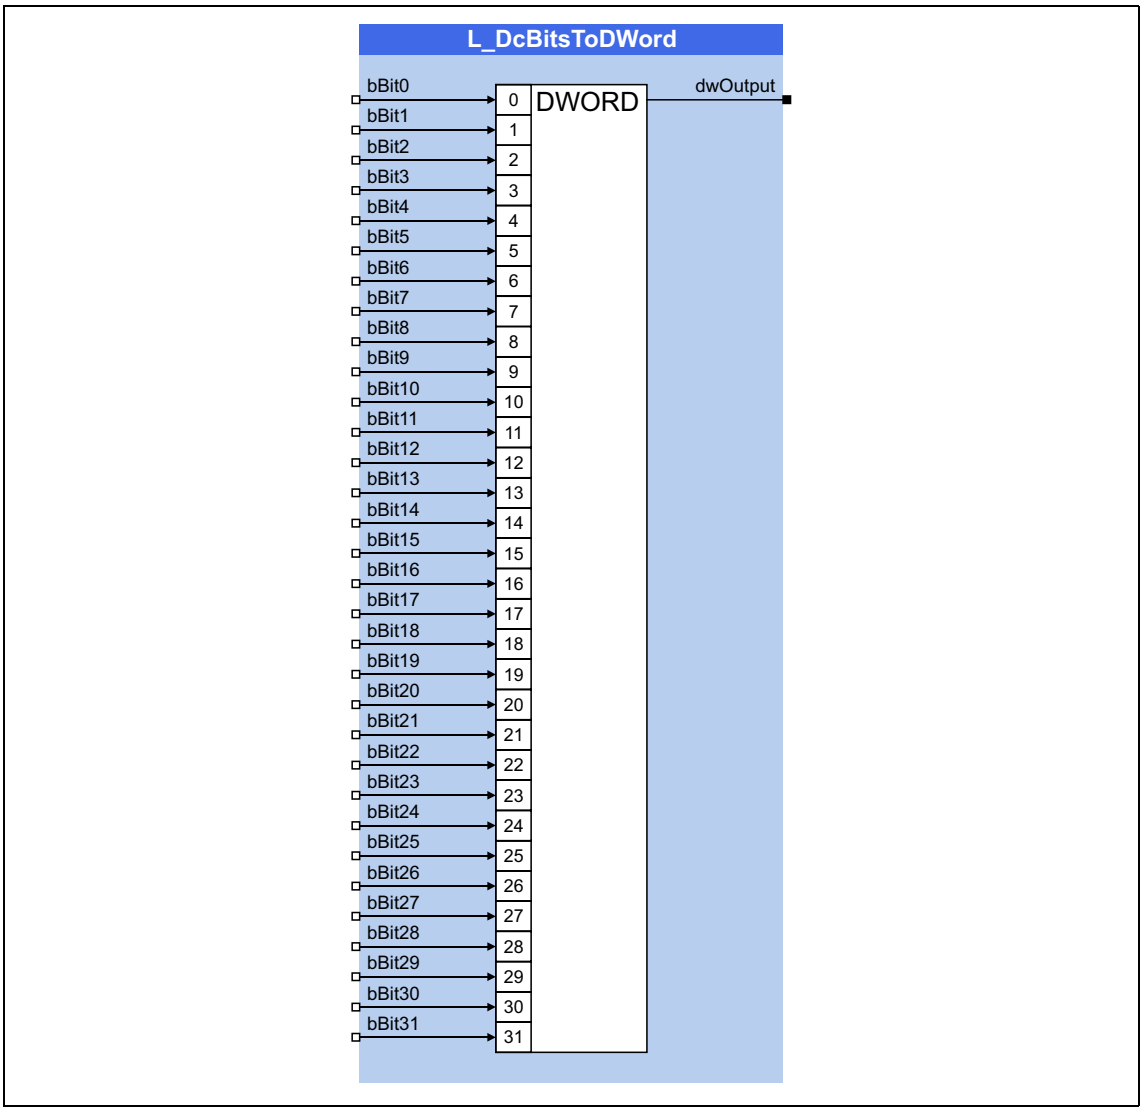
5.20 L_DcBitsToByte - bit multiplexer

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts 8 single bit values into a value of type "BYTE".

Inputs

Identifier/data type	Information/possible settings
bBit0 BOOL	Input for bit value with valency 2^0
...	...
bBit7 BOOL	Input for bit valency 2^7



Outputs

Identifier/data type	Value/meaning
byOutput BYTE	Value of type "byte" according to the transmitted bit values

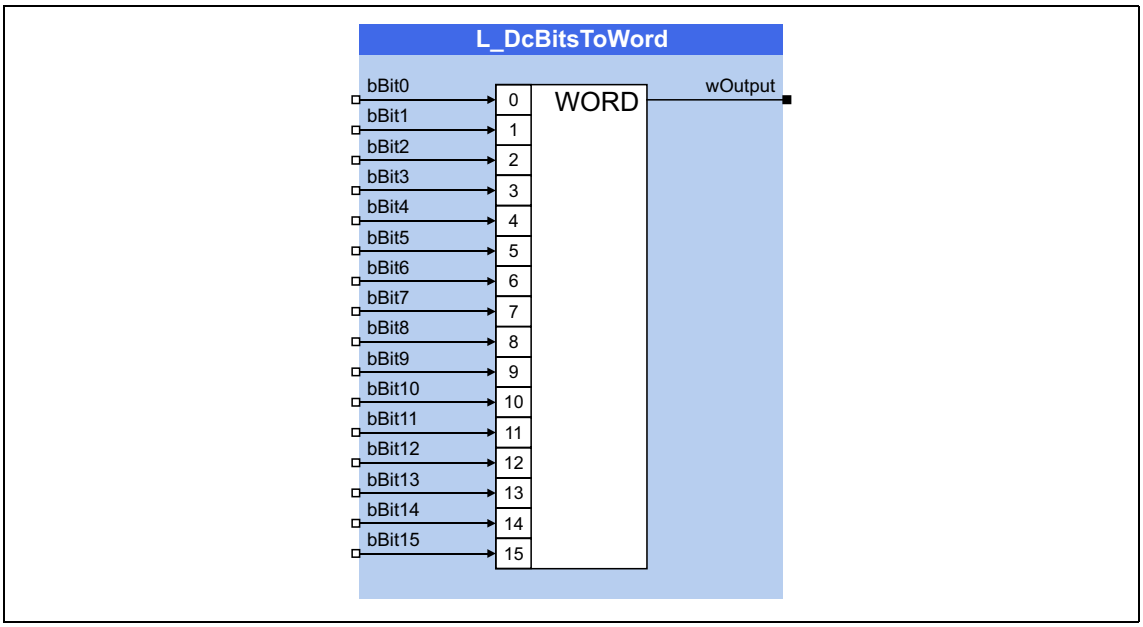
5.21 L_DcBitsToDWord - bit multiplexer

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts 32 single bit values into a value of "DWORD" type.

Inputs

Identifier/data type	Information/possible settings
bBit0 BOOL	Input for bit value with valency 2^0
...	...
bBit31 BOOL	Input for bit value with valency 2^{31}



Outputs

Identifier/data type	Value/meaning
dwOutput DWORD	Value of type "double word" according to the transmitted bit values

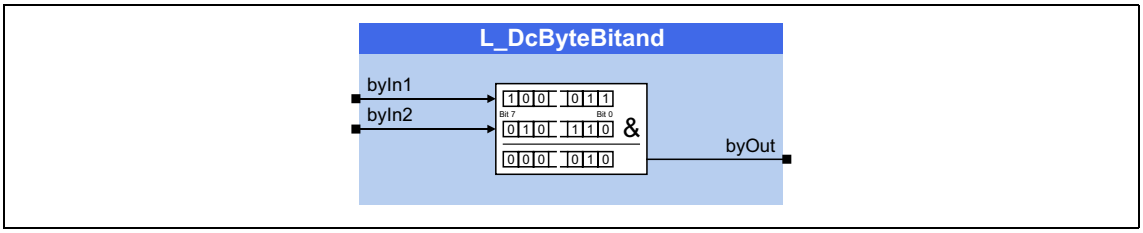
5.22 L_DcBitsToWord - bit multiplexer

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts 16 single bit values into a value of "WORD" type.

Inputs

Identifier/data type	Information/possible settings
bBit0 BOOL	Input for bit value with valency 2^0
...	...
bBit15 BOOL	Input for bit value with valency 2^{15}



Outputs

Identifier/data type	Value/meaning
wOutput WORD	Value of "word" type according to the transmitted bit values.

5.23 L_DcByteBitand - bit combination

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit-by-bit AND operation of two input values of "BYTE" type and also outputs the results as "BYTE".

Inputs

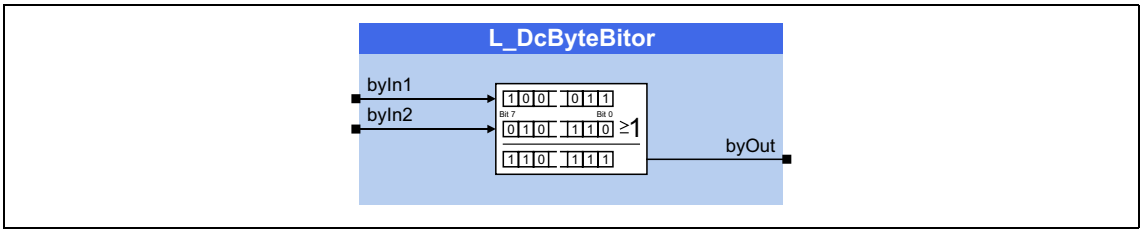
Identifier/data type	Information/possible settings
byIn1 BYTE	Value 1 for bit-by-bit AND combination
byIn2 BYTE	Value 2 for bit-by-bit AND combination

Outputs

Identifier/data type	Value/meaning
byOut BYTE	Result of the bit-by-bit AND operation of *byIn1* and *byIn2*

Function

byIn1 - bit n	byIn2 - bit n	byOut - bit n
0	0	0
0	1	0
1	0	0
1	1	1



Example

```
byIn1 = 00101001
byIn2 = 01111000
        --------
byOut = 00101000
```

5.24 L_DcByteBitor - bit combination

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit-by-bit OR operation of two input values of "BYTE" type and also outputs the results as "BYTE".

Inputs

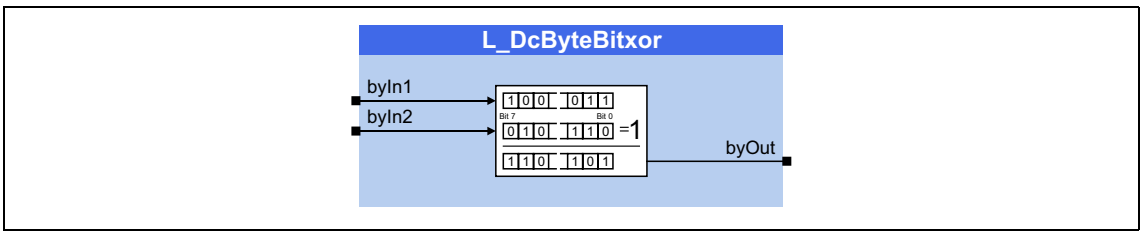
Identifier/data type	Information/possible settings
byIn1 BYTE	Value 1 for bit-by-bit OR combination
byIn2 BYTE	Value 2 for bit-by-bit OR combination

Outputs

Identifier/data type	Value/meaning
byOut BYTE	Result of the bit-by-bit OR operation of *byIn1* and *byIn2*

Function

byIn1 - bit n	byIn2 - bit n	byOut - bit n
0	0	0
0	1	1
1	0	1
1	1	1



Example

```
byIn1 = 00101001
byIn2 = 01111000
        --------
byOut = 01111001
```

5.25 L_DcByteBitxor - bit combination

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit-by-bit EXCLUSIVE/OR operation of two input values of "BYTE" type and also outputs the results as "BYTE".

Inputs

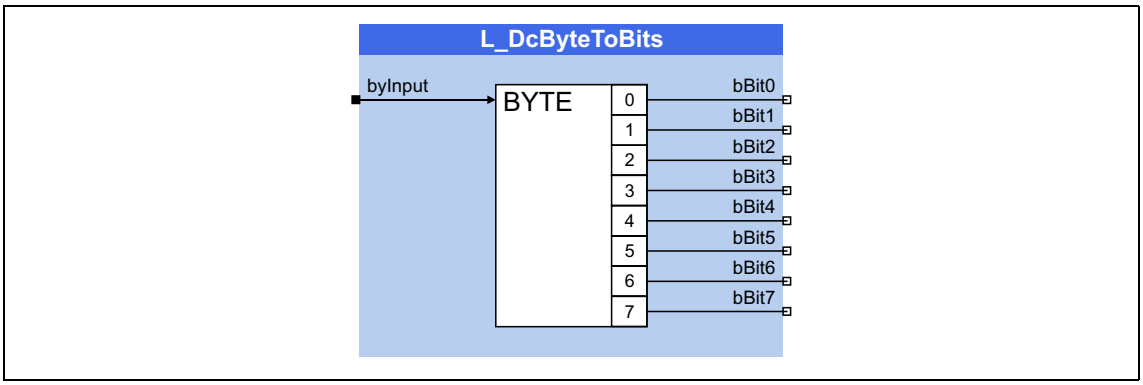
Identifier/data type	Information/possible settings
byIn1 BYTE	Value 1 for bit-by-bit EXCLUSIVE OR combination
byIn2 BYTE	Value 2 for bit-by-bit EXCLUSIVE OR combination

Outputs

Identifier/data type	Value/meaning
byOut BYTE	Result of the bit-by-bit EXCLUSIVE/OR operation of *byIn1* and *byIn2*

Function

byIn1 - bit n	byIn2 - bit n	byOut - bit n
0	0	0
0	1	1
1	0	1
1	1	0



Example

```
byIn1 = 00101001
byIn2 = 01111000
        --------
byOut = 01010001
```

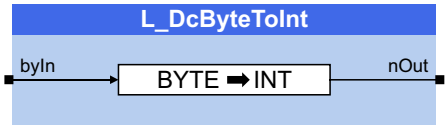
5.26 L_DcByteToBits - bit demultiplexer

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB outputs the 8 corresponding bit values for an input value of type "BYTE".

Inputs

Identifier/data type	Information/possible settings
byInput BYTE	Value to be converted



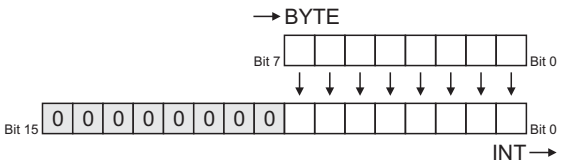
Outputs

Identifier/data type	Value/meaning
bBit0 BOOL	Bit 0 output of *byInput* (valency: 20)
bBit1 BOOL	Bit 1 output of *byInput* (valency: 2^1)
bBit2 BOOL	Bit 2 output of *byInput* (valency: 2^2))
...	...
bBit7 BOOL	Bit 7 output of *byInput* (valency: 27)

5.27 L_DcByteToInt - type converter

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB converts a data type "BYTE" into the data type "INT".

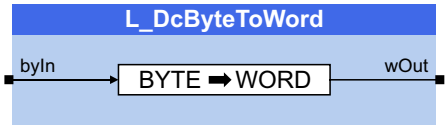


Inputs

Identifier/data type	Information/possible settings
byIn BYTE	Input signal

Outputs

Identifier/data type	Value/meaning
nOut INT	Output signal

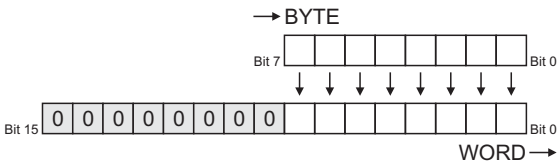


Function

5.28 L_DcByteToWord - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "BYTE" into the data type "WORD".

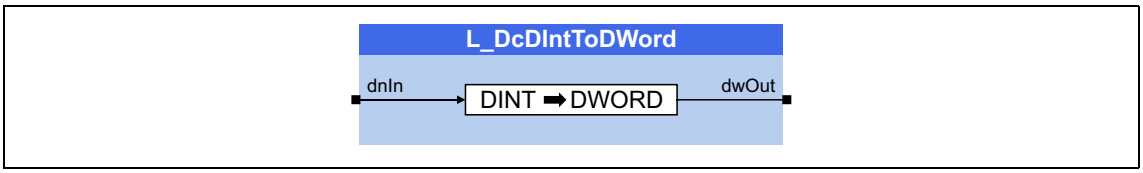


Inputs

Identifier/data type	Information/possible settings
byIn BYTE	Input signal

Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal



Function

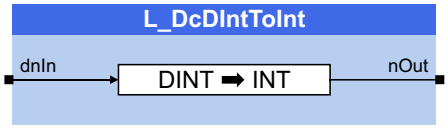
5.29 L_DcDIntToDWord - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "DINT" into the data type "DWORD".

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal



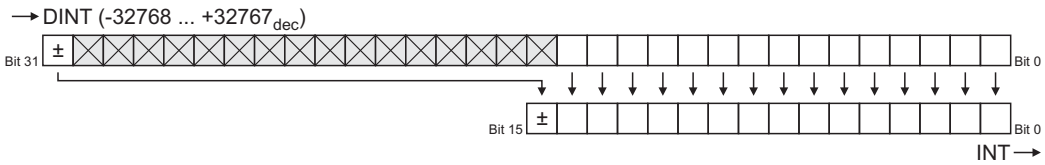
Outputs

Identifier/data type	Value/meaning
dwOut DWORD	Output signal

5.30 L_DcDIntToInt - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "DINT" into the data type "INT".

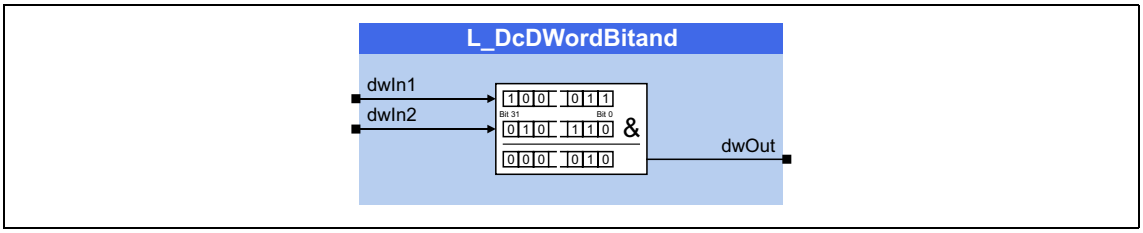


Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal • Internal limitation to -32768 ... +32767 (INT display area).

Outputs

Identifier/data type	Value/meaning
nOut INT	Output signal



Function

5.31 L_DcDWordBitand - bit combination

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a bit-by-bit AND operation of two input values of "DWORD" type and also outputs the results as "DWORD".

Inputs

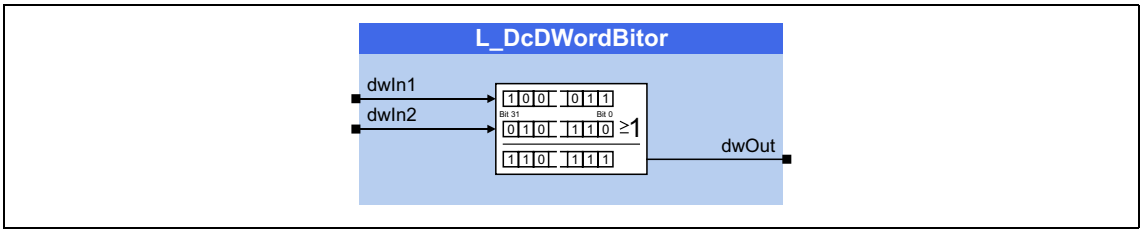
Identifier/data type	Information/possible settings
dwIn1 DWORD	Value 1 for bit-by-bit AND combination
dwIn2 DWORD	Value 2 for bit-by-bit AND combination

Outputs

Identifier/data type	Value/meaning
dwOut DWORD	Result of the bit-by-bit AND operation of *dwIn1* and *dwIn2*

Function

dwIn1 - bit n	dwIn2 - bit n	dwOut - bit n
0	0	0
0	1	0
1	0	0
1	1	1



Example

```
dwIn1 = 00011001010011100001011000101000
dwIn2 = 01010001100001100100100001111000
        --------------------------------
dwOut = 00010001000001100000000000101000
```

5.32 L_DcDWordBitor - bit combination

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a bit-by-bit OR operation of two input values of "DWORD" type and also outputs the results as "DWORD".

Inputs

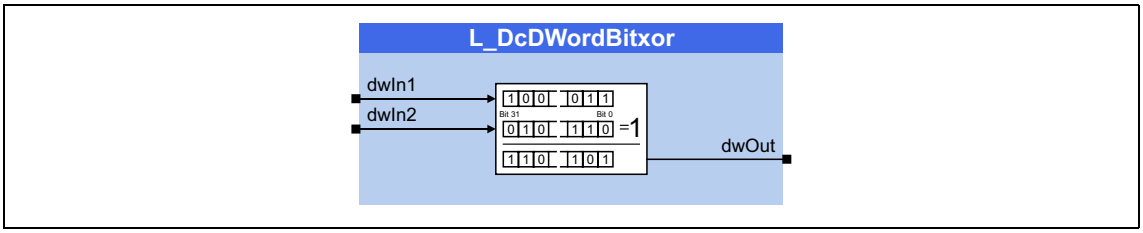
Identifier/data type	Information/possible settings
dwIn1 DWORD	Value 1 for bit-by-bit OR combination
dwIn2 DWORD	Value 2 for bit-by-bit OR combination

Outputs

Identifier/data type	Value/meaning
dwOut DWORD	Result of the bit-by-bit OR operation of *dwIn1* and *dwIn2*

Function

dwIn1 - bit n	dwIn2 - bit n	dwOut - bit n
0	0	0
0	1	1
1	0	1
1	1	1



Example

```
dwIn1 = 00011001010011100001011000101000
dwIn2 = 01010001100001100100100001111000
        --------------------------------
dwOut = 01011001110011100101111001111000
```

5.33 L_DcDWordBitxor - bit combination

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a bit-by-bit EXCLUSIVE OR operation of two input values of "DWORD" type and also outputs the results as "DWORD".

Inputs

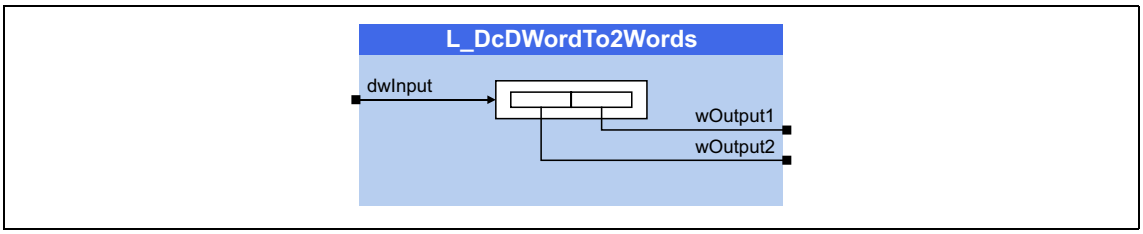
Identifier/data type	Information/possible settings
dwIn1 DWORD	Value 1 for bit-by-bit EXCLUSIVE OR combination
dwIn2 DWORD	Value 2 for bit-by-bit EXCLUSIVE OR combination

Outputs

Identifier/data type	Value/meaning
dwOut DWORD	Result of the bit-by-bit EXCLUSIVE OR operation of *dwIn1* and *dwIn2*

Function

dwIn1 - bit n	dwIn2 - bit n	dwOut - bit n
0	0	0
0	1	1
1	0	1
1	1	0



Example

```
dwIn1 = 00011001010011100001011000101000
dwIn2 = 01010001100001100100100001111000
        --------------------------------
dwOut = 01001000110010000101111001010000
```

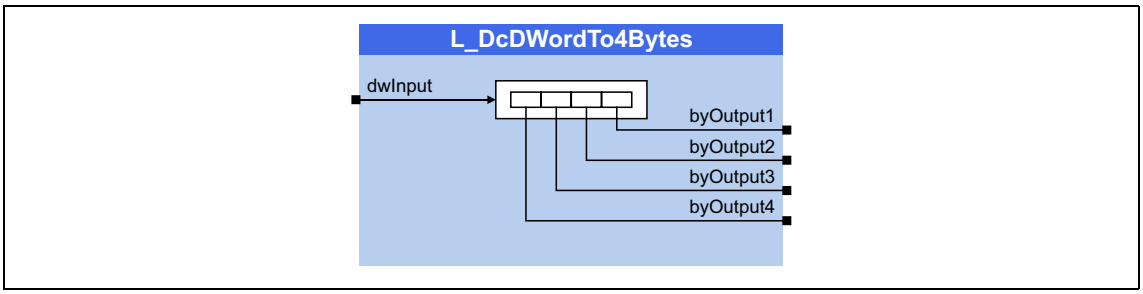
5.34 L_DcDWordTo2Words - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts an input value of type "DWORD" into two output values of type "WORD".

Inputs

Identifier/data type	Information/possible settings
dwInput DWORD	Input value



Outputs

Identifier/data type	Value/meaning
wOutput1 WORD	Output value 1 ≡ bit 0 ... bit 15 of *dwInput*
wOutput2 WORD	Output value 2 ≡ bit 16 ... bit 31 of *dwInput*

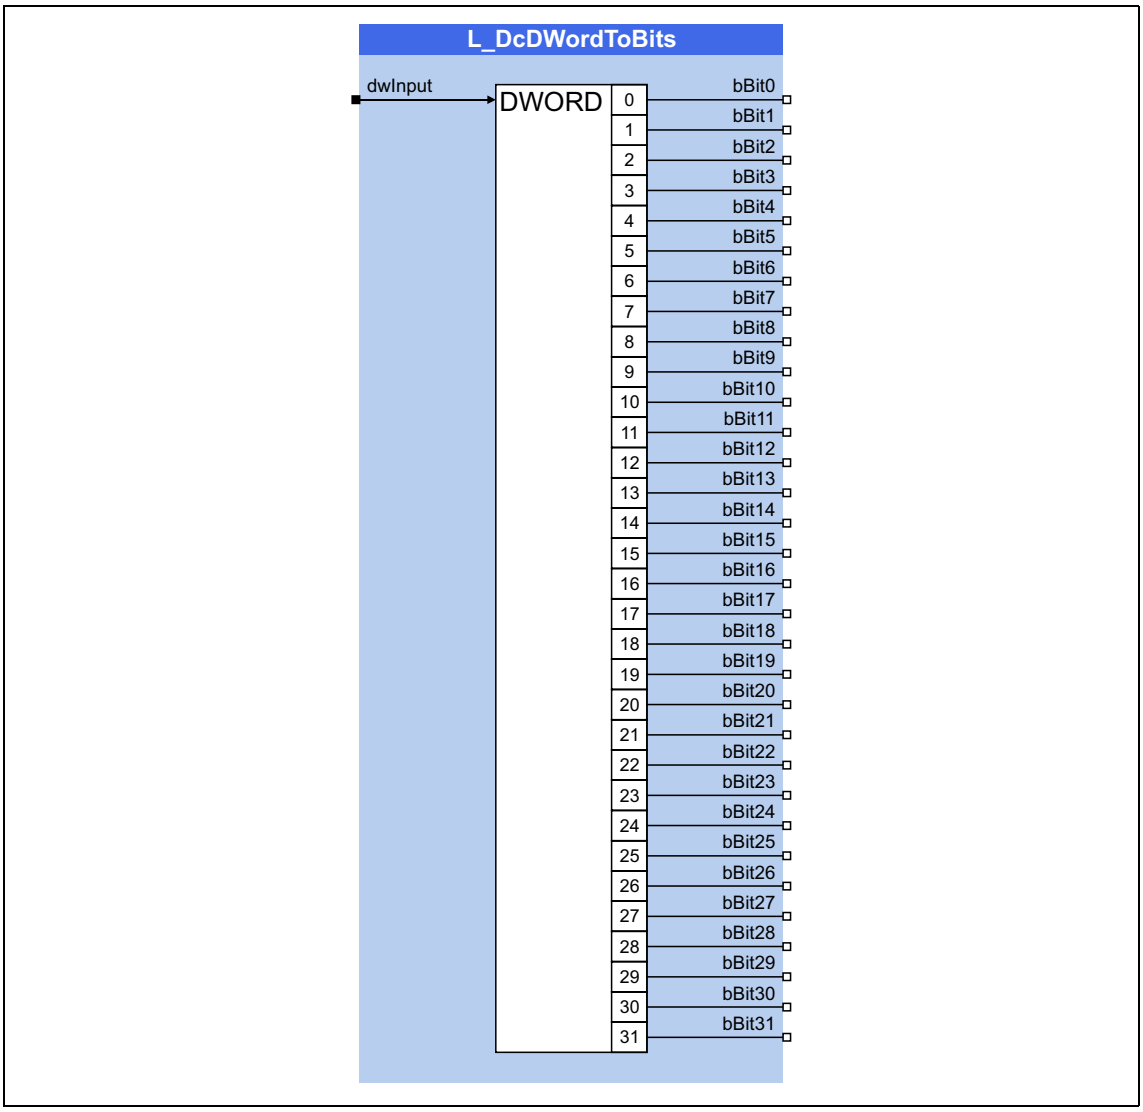
5.35 L_DcDWordTo4Bytes - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts an input value of type "DWORD" into four output values of type "BYTE".

Inputs

Identifier/data type	Information/possible settings
dwInput DWORD	Input value



Outputs

Identifier/data type	Value/meaning
byOutput1 BYTE	Output value 1 ≡ bit 0 ... bit 7 of *dwInput*
byOutput2 BYTE	Output value 2 ≡ bit 8 ... bit 15 of *dwInput*
byOutput3 BYTE	Output value 3 ≡ bit 16 ... bit 23 of *dwInput*
byOutput4 BYTE	Output value 4 ≡ bit 24 ... bit 31 of *dwInput*

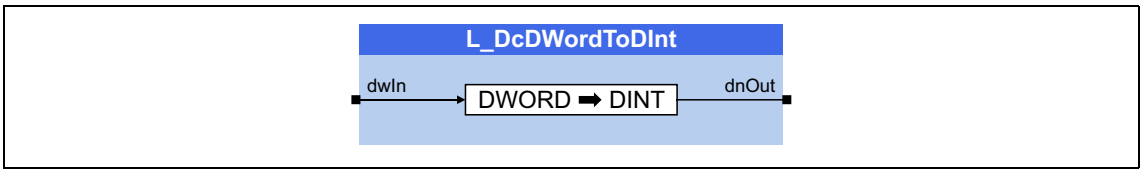
5.36 L_DcDWordToBits - bit demultiplexer

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB outputs the 32 corresponding bit values for an input value of "DWORD" type.

Inputs

Identifier/data type	Information/possible settings
dwInput DWORD	Value to be converted



Outputs

Identifier/data type	Value/meaning
bBit0 BOOL	Bit 0 output of *dwInput* (valency: 2^0)
bBit1 BOOL	Bit 1 output of *dwInput* (valency: 21)
bBit2 BOOL	Bit 2 output of *dwInput* (valency: 2^2)
...	...
bBit31 BOOL	Bit 31 output of *dwInput* (valency: 2^{31})

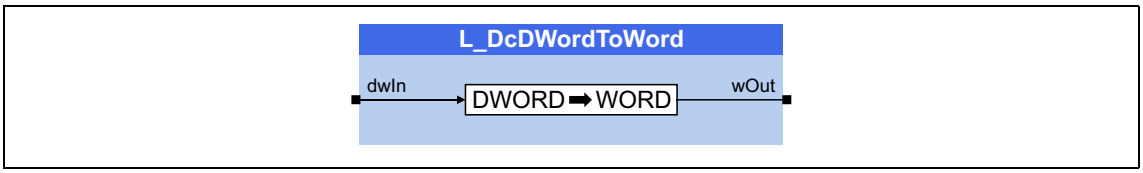
5.37 L_DcDWordToDInt - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "DWORD" into the data type "DINT".

Inputs

Identifier/data type	Information/possible settings
dwIn DWORD	Input signal



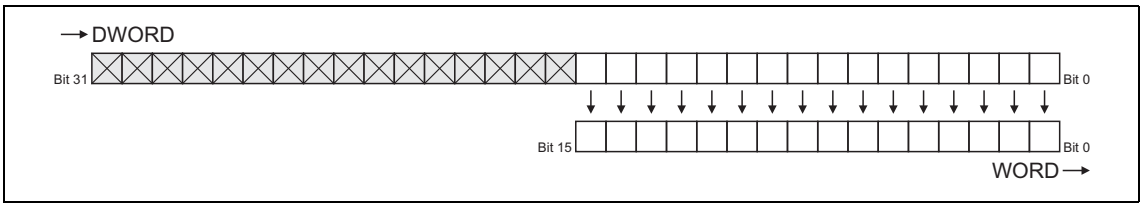
Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal

5.38 L_DcDWordToWord - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "DWORD" into the data type "WORD".

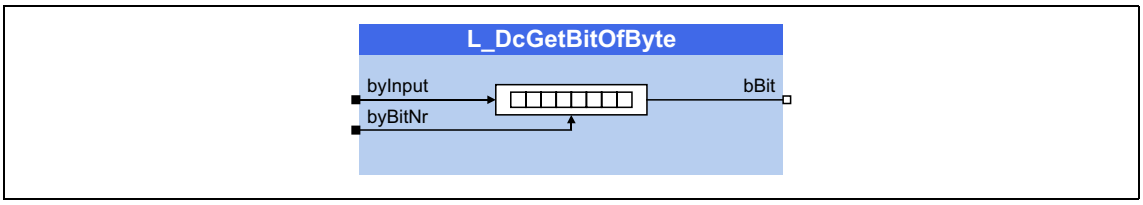


Inputs

Identifier/data type	Information/possible settings
dwIn DWORD	Input signal

Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal



Function

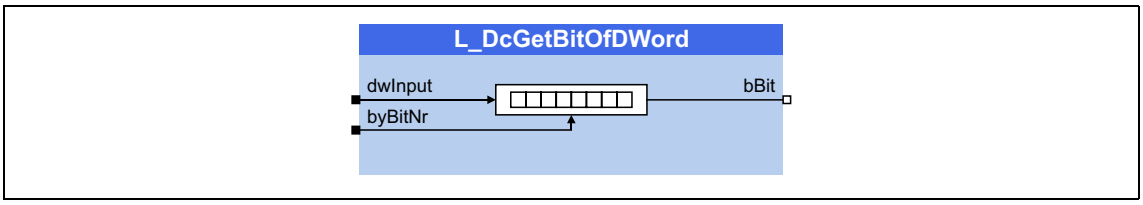
5.39 L_DcGetBitOfByte - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB returns the state of a single bit within a "BYTE" value.

Inputs

Identifier/data type	Information/possible settings
byInput BYTE	Input signal
byBitNr BYTE	No. (0 ... 7) of the bit of *byInput* the state of which is to be detected.



Outputs

Identifier/data type	Value/meaning
bBit BOOL	State of bit *byBitNr* of *byInput*.

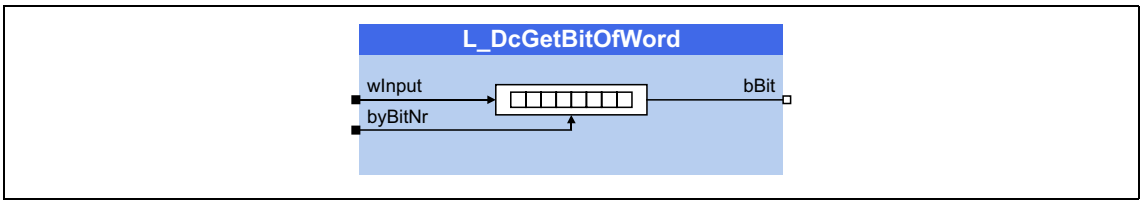
5.40 L_DcGetBitOfDWord - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB returns the state of a single bit within a "DWORD" value.

Inputs

Identifier/data type	Information/possible settings
dwInput DWORD	Input signal
byBitNr BYTE	No. (0 ... 31) of the bit of *dwInput* the state of which is to be detected.



Outputs

Identifier/data type	Value/meaning
bBit BOOL	State of bit *byBitNr* of *dwInput*.

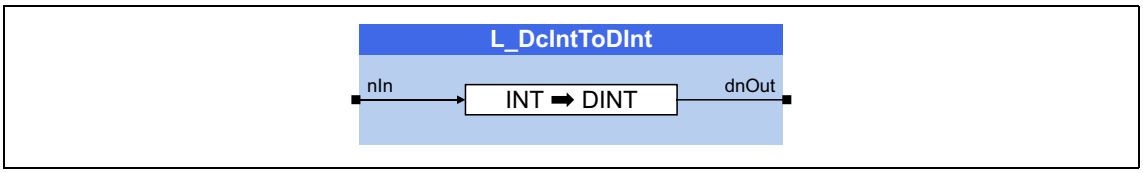
5.41 L_DcGetBitOfWord - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB returns the state of a single bit within a "WORD" value.

Inputs

Identifier/data type	Information/possible settings
wInput WORD	Input signal
byBitNr BYTE	No. (0 ... 15) of the bit of *wInput* the state of which is to be detected.



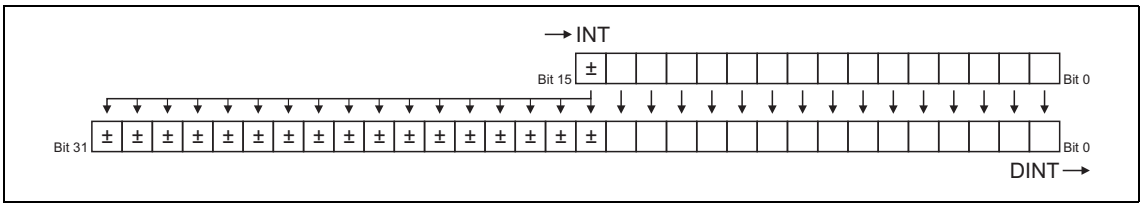
Outputs

Identifier/data type	Value/meaning
bBit BOOL	State of bit *byBitNr* of *wInput*.

5.42 L_DcIntToDInt - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "INT" into the data type "DINT".

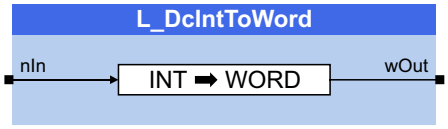


Inputs

Identifier/data type	Information/possible settings
nIn INT	Input signal

Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal



Function

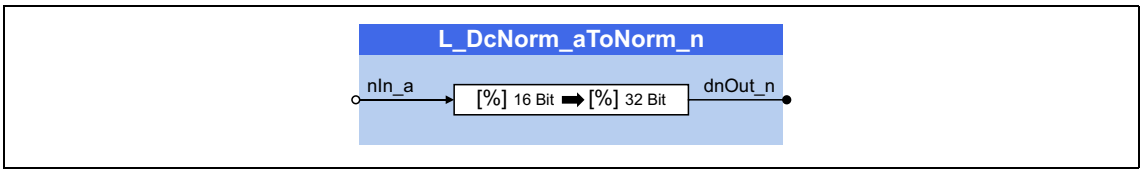
5.43 L_DcIntToWord - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "INT" into the data type "WORD" .

Inputs

Identifier/data type	Information/possible settings
nIn INT	Input signal



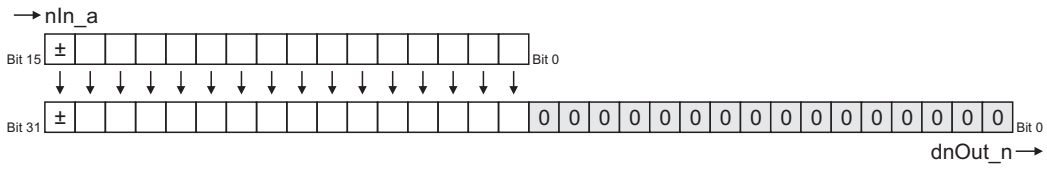
Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal

5.44 L_DcNorm_aToNorm_n - signal converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a scaled 16-bit signal into a scaled 32-bit signal.

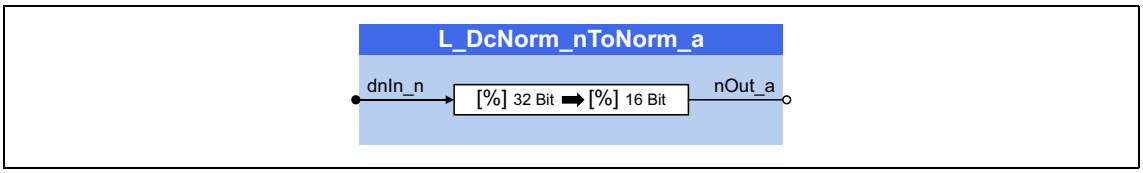


Inputs

Identifier/data type	Information/possible settings
nIn_a INT	Input signal • 100 % ≡ 214 ≡ 16384 **Note:** If the input information has a value of "-32768", the value will internally be limited to "-32767" and copied to the HighWord of the *dnOut_n* output. Therefore, this FB cannot be used to combine the LowWord and the HighWord in order to form a double word.

Outputs

Identifier/data type	Value/meaning
dnOut_n DINT	Output signal • 100 % ≡ 2^{30} ≡ 1073741824

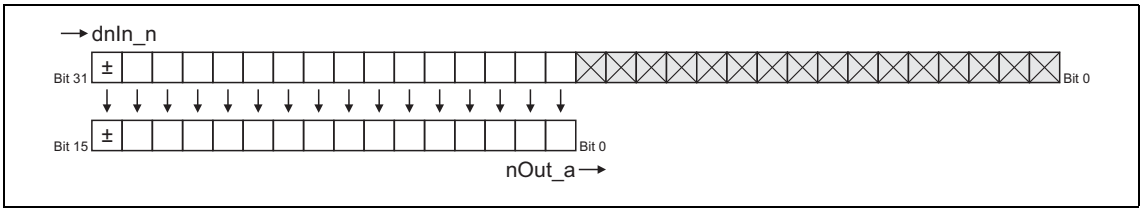


Function

5.45 L_DcNorm_nToNorm_a - signal converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a scaled 32-bit signal into a scaled 16-bit signal.

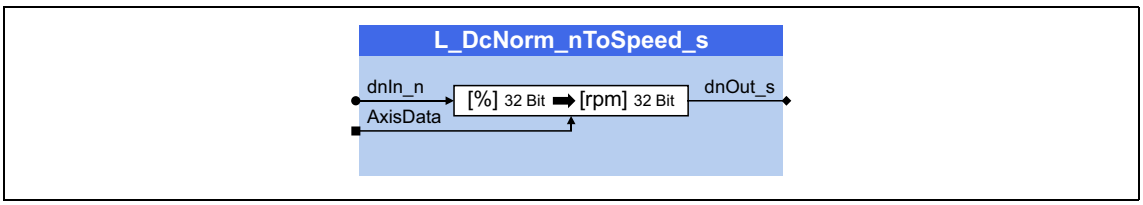


Inputs

Identifier/data type	Information/possible settings
dnIn_n DINT	Input signal • 100 % ≡ 2^{30} ≡ 1073741824

Outputs

Identifier/data type	Value/meaning
nOut_a INT	Output signal • 100 % ≡ 214 ≡ 16384



Function

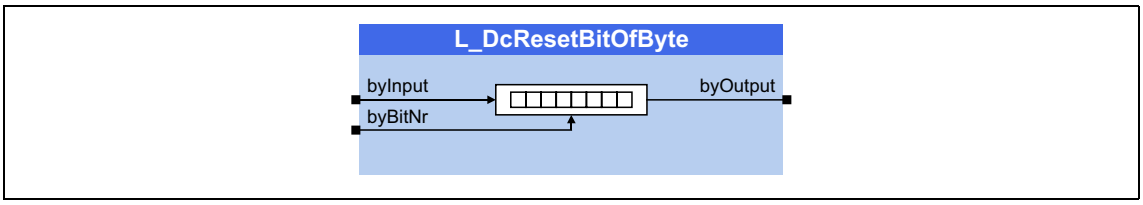
5.46 L_DcNorm_nToSpeed_s - signal converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a scaled 32-bit signal into a 32-bit speed signal.

Inputs

Identifier/data type	Information/possible settings
dnIn_n DINT	Input signal in [%] • 100 % ≡ 2^{30} ≡ 1073741824
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)



Outputs

Identifier/data type	Value/meaning
dnOut_s DINT	Output signal in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864

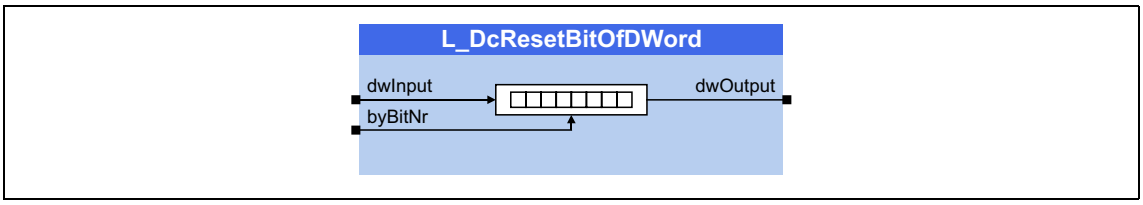
5.47 L_DcResetBitOfByte - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB resets a single bit in a "BYTE" type value to "0".

Inputs

Identifier/data type	Information/possible settings
byInput BYTE	Input signal
byBitNr BYTE	No. (0 ... 7) of the bit to be reset.



Outputs

Identifier/data type	Value/meaning
byOutput BYTE	Value of type "byte" resulting from the reset bit.

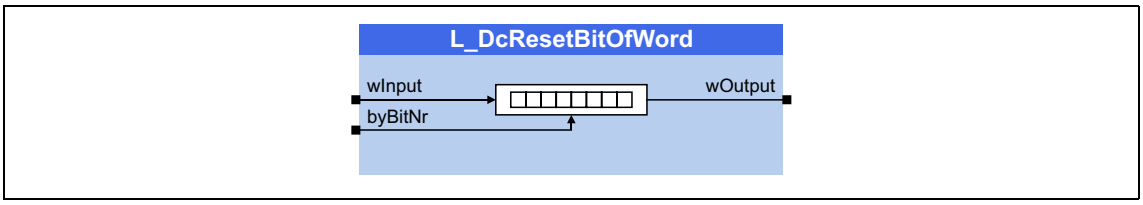
5.48 L_DcResetBitOfDWord - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB resets a single bit in a "DWORD" type value to "0".

Inputs

Identifier/data type	Information/possible settings
dwInput DWORD	Input signal
byBitNr BYTE	No. (0 ... 31) of the bit to be reset.



Outputs

Identifier/data type	Value/meaning
dwOutput DWORD	Value of type "double word" resulting from the reset bit.

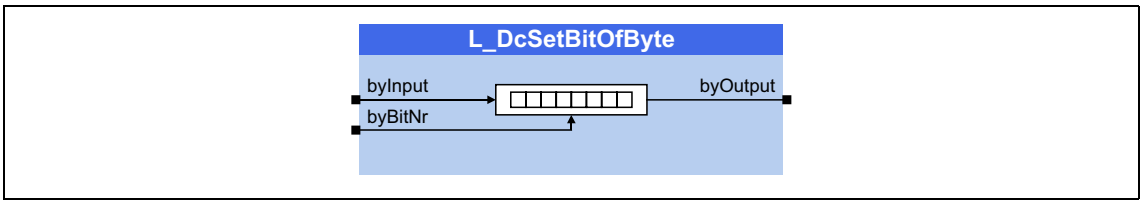
5.49 L_DcResetBitOfWord - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB resets a single bit in a "WORD" type value to "0".

Inputs

Identifier/data type	Information/possible settings
wInput WORD	Input signal
byBitNr BYTE	No. (0 ... 15) of the bit to be reset.



Outputs

Identifier/data type	Value/meaning
wOutput WORD	Value of type "word" resulting from the reset bit.

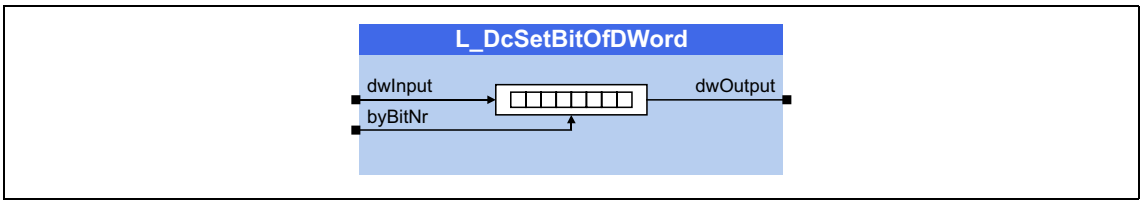
5.50 L_DcSetBitOfByte - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB sets a single bit in a "BYTE" type value to "1".

Inputs

Identifier/data type	Information/possible settings
byInput BYTE	Input signal
byBitNr BYTE	No. (0 ... 7) of the bit to be set.



Outputs

Identifier/data type	Value/meaning
byOutput BYTE	Value of type "byte" resulting from the set bit.

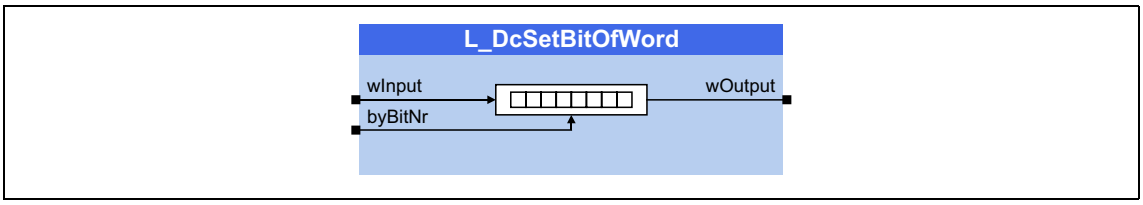
5.51 L_DcSetBitOfDWord - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB sets a single bit in a "DWORD" type value to "1".

Inputs

Identifier/data type	Information/possible settings
dwInput DWORD	Input signal
byBitNr BYTE	No. (0 ... 31) of the bit to be set.



Outputs

Identifier/data type	Value/meaning
dwOutput DWORD	Value of type "double word" resulting from the set bit.

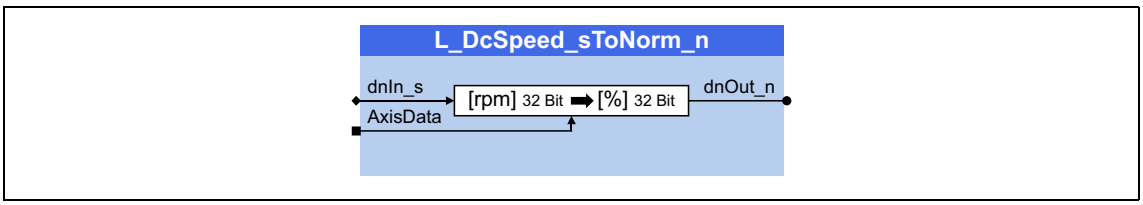
5.52 L_DcSetBitOfWord - bit operation

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB sets a single bit in a "WORD" type value to "1".

Inputs

Identifier/data type	Information/possible settings
wInput WORD	Input signal
byBitNr BYTE	No. (0 ... 15) of the bit to be set.



Outputs

Identifier/data type	Value/meaning
wOutput WORD	Value of type "word" resulting from the set bit.

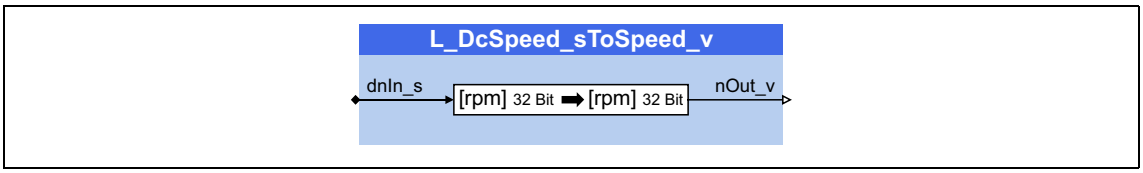
5.53 L_DcSpeed_sToNorm_n - signal converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a 32-bit speed signal into a scaled 32-bit signal.

Inputs

Identifier/data type	Information/possible settings
dnIn_s DINT	Input signal in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)



Outputs

Identifier/data type	Value/meaning
dnOut_n DINT	Output signal in [%] • 100 % ≡ 2^{30} ≡ 1073741824

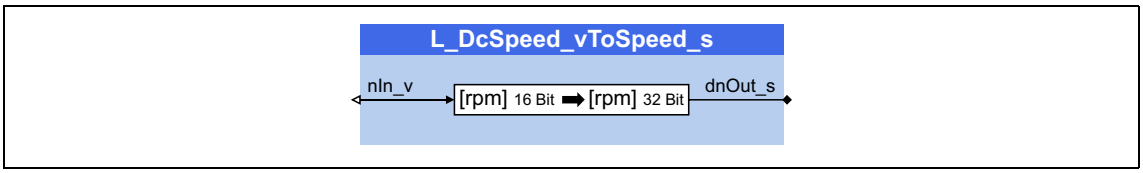
5.54 L_DcSpeed_sToSpeed_v - signal converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a 32-bit speed signal into a 16-bit speed signal.

Inputs

Identifier/data type	Information/possible settings
dnIn_s DINT	Input signal in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864



Outputs

Identifier/data type	Value/meaning
nOut_v INT	Output signal in [rpm] • 15000 rpm ≡ ^{214} ≡ 16384

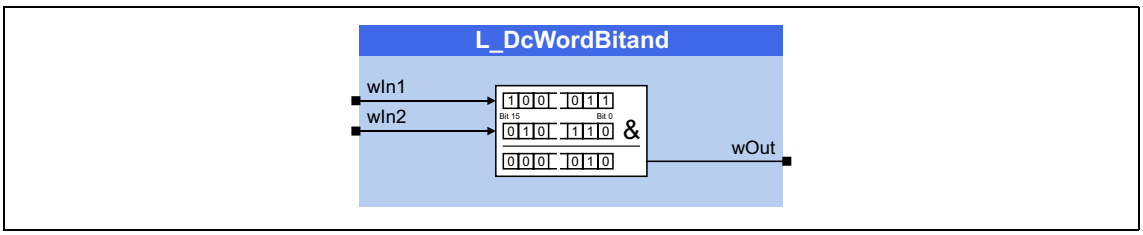
5.55 L_DcSpeed_vToSpeed_s - signal converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a 16-bit speed signal into a 32-bit speed signal.

Inputs

Identifier/data type	Information/possible settings
nIn_v INT	Input signal in [rpm] • 15000 rpm ≡ 2^{14} ≡ 16384



Outputs

Identifier/data type	Value/meaning
dnOut_s DINT	Output signal in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864

5.56 L_DcWordBitand - bit combination

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit-by-bit AND operation of two input values of "WORD" type and also outputs the results as "WORD".

Inputs

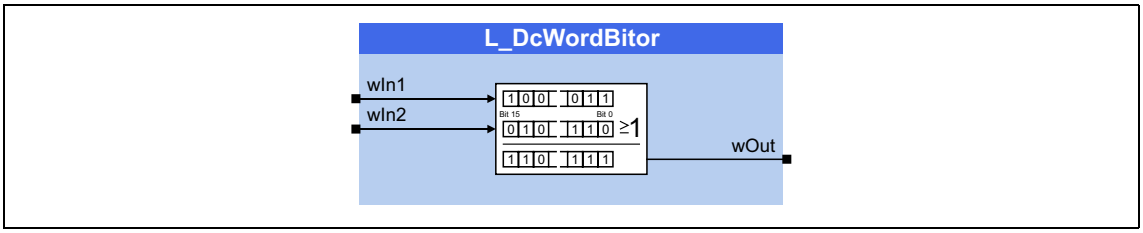
Identifier/data type	Information/possible settings
wIn1 WORD	Value 1 for bit-by-bit AND combination
wIn2 WORD	Value 2 for bit-by-bit AND combination

Outputs

Identifier/data type	Value/meaning
wOut WORD	Result of the bit-by-bit AND operation of *wIn1* and *wIn2*

Function

wIn1 - bit n	wIn2 - bit n	wOut - bit n
0	0	0
0	1	0
1	0	0
1	1	1



Example

```
wIn1 = 0001011000101000
wIn2 = 0100100001111000
       ----------------
wOut = 0000000000101000
```

5.57 L_DcWordBitor - bit combination

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit-by-bit OR operation of two input values of "WORD" type and also outputs the results as "WORD".

Inputs

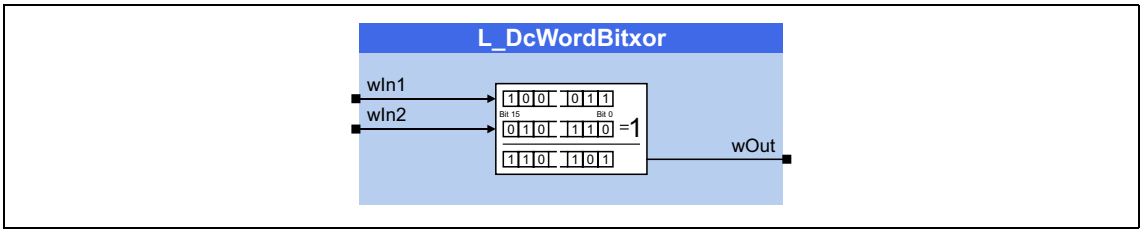
Identifier/data type	Information/possible settings
wIn1 WORD	Value 1 for bit-by-bit OR combination
wIn2 WORD	Value 2 for bit-by-bit OR combination

Outputs

Identifier/data type	Value/meaning
wOut WORD	Result of the bit-by-bit OR operation of *wIn1* and *wIn2*

Function

wIn1 - bit n	wIn2 - bit n	wOut - bit n
0	0	0
0	1	1
1	0	1
1	1	1



Example

```
wIn1 = 0001011000101000
wIn2 = 0100100001111000
       ----------------
wOut = 0101111001111000
```

5.58 L_DcWordBitxor - bit combination

Function library:	LenzeDataConversion	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out a bit-by-bit EXCLUSIVE OR operation of two input values of "WORD" type and also outputs the results as "WORD".

Inputs

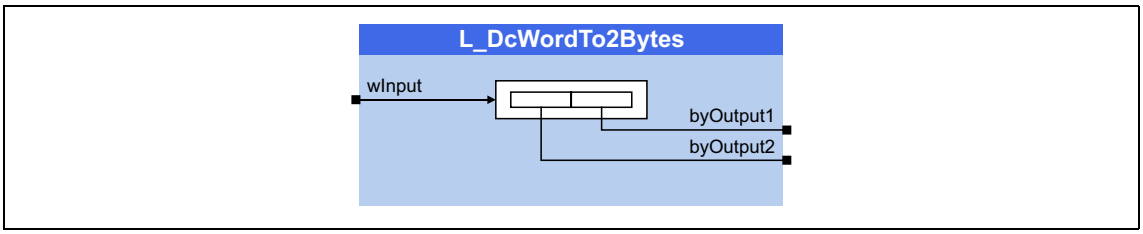
Identifier/data type	Information/possible settings
wIn1 WORD	Value 1 for bit-by-bit EXCLUSIVE OR combination
wIn2 WORD	Value 2 for bit-by-bit EXCLUSIVE OR combination

Outputs

Identifier/data type	Value/meaning
wOut WORD	Result of the bit-by-bit EXCLUSIVE OR operation of *wIn1* and *wIn2*

Function

wIn1 - bit n	wIn2 - bit n	wOut - bit n
0	0	0
0	1	1
1	0	1
1	1	0



Example

```
wIn1 = 0001011000101000
wIn2 = 0100100001111000
       ----------------
wOut = 0101111001010000
```

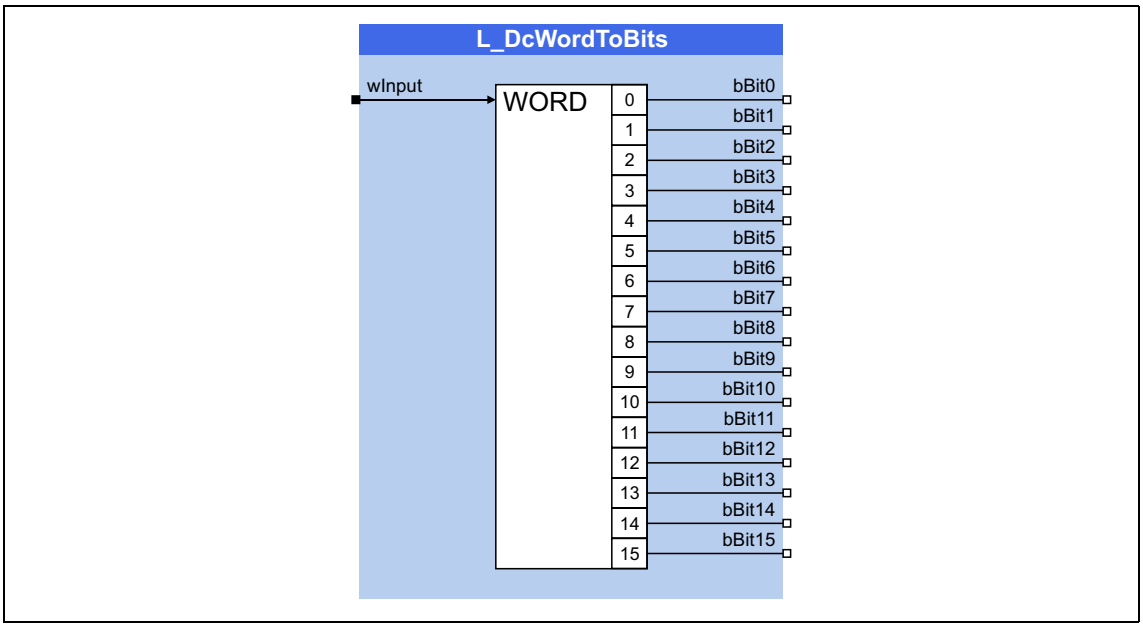
5.59 L_DcWordTo2Bytes - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts an input value of type "WORD" into two output values of type "BYTE".

Inputs

Identifier/data type	Information/possible settings
wInput WORD	Input value



Outputs

Identifier/data type	Value/meaning
byOutput1 BYTE	Output value 1 ≡ bit 0 ... bit 7 of *wInput*
byOutput2 BYTE	Output value 2 ≡ bit 8 ... bit 15 of *wInput*

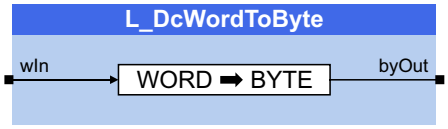
5.60 L_DcWordToBits - bit demultiplexer

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB outputs the 16 corresponding bit values for an input value of type "WORD".

Inputs

Identifier/data type	Information/possible settings
wInput WORD	Value to be converted



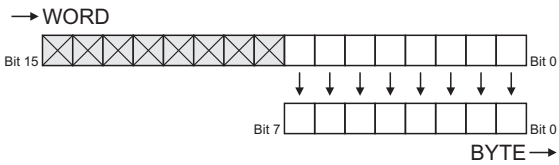
Outputs

Identifier/data type	Value/meaning
bBit0 BOOL	Bit 0 output of *byInput* (valency: 20)
bBit1 BOOL	Bit 1 output of *byInput* (valency: 2^1)
bBit2 BOOL	Bit 2 output of *byInput* (valency: 2^2))
...	...
bBit15 BOOL	Bit 15 output of *byInput* (valency: 2^{15})

5.61 L_DcWordToByte - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "WORD" into the data type "BYTE" .

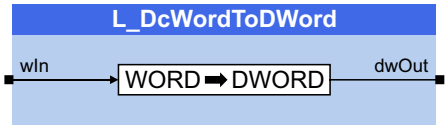


Inputs

Identifier/data type	Information/possible settings
wIn WORD	Input signal

Outputs

Identifier/data type	Value/meaning
byOut BYTE	Output signal

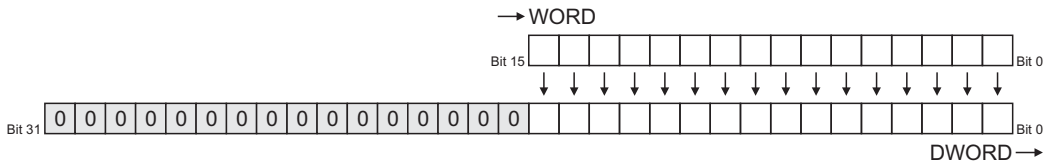


Function

5.62 L_DcWordToDWord - type converter

Function library:	LenzeDataConversion
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts a data type "WORD" into the data type "DWORD" .

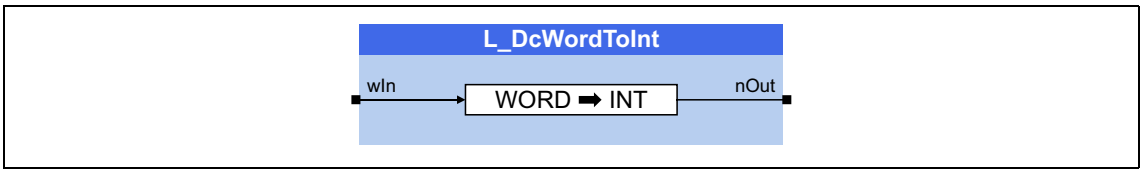


Inputs

Identifier/data type	Information/possible settings
wIn WORD	Input signal

Outputs

Identifier/data type	Value/meaning
dwOut DWORD	Output signal



Function

5.63 L_DcWordToInt - type converter

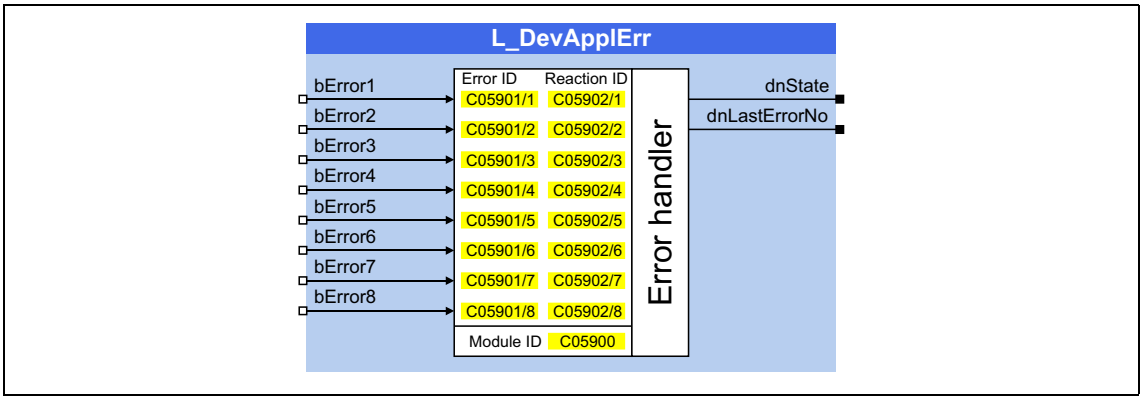
Function library:	LenzeDataConversion	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB converts a data type "WORD" into the data type "INT".

Inputs

Identifier/data type	Information/possible settings
wIn WORD	Input signal

Outputs



Identifier/data type	Value/meaning
nOut INT	Output signal

5.64 L_DevApplErr - error tripping

Function library:	LenzeDevice9400
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is used for error handling in the application.

- Via the 8 boolean inputs up to 8 different application error messages with parameterisable module ID, error ID and error response can be released by the application.
- In contrast to FB L_DevApplErrFix the module ID; error ID, and the error response of this FB can be set via parameters and not via inputs.
- If more than 8 application error messages are required, the FB can be instanced.
- If several inputs are set to TRUE at the same time, the input with the lowest number will activate the error message.

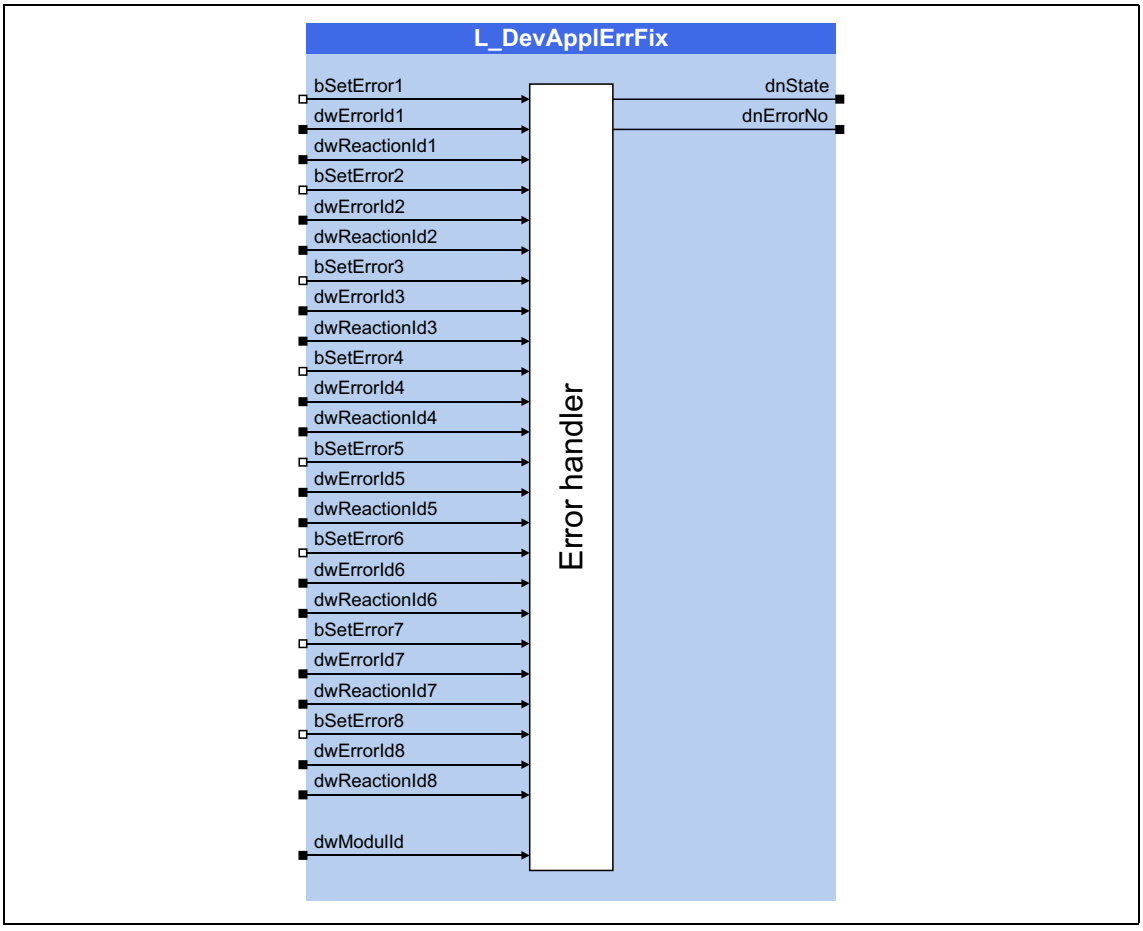
Inputs

Identifier/data type		Information/possible settings	
bError1	BOOL	Input for error message 1 (highest priority)	
		FALSE↗TRUE	Error condition 1 is met and the parameterised application error message is output by the operating system.
		FALSE	Error condition 1 is no longer met.
...		...	
bError8	BOOL	Input for error message 8 (lowest priority)	
		FALSE↗TRUE	Error condition 8 is met and the parameterised application error message is output by the operating system.
		FALSE	Error condition 8 is no longer met.

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Display of the error message last transmitted to the operating system.	
	1	Error message 1 is active.
	2	Error message 2 is active.
	4	Error message 3 is active.
	8	Error message 4 is active.
	16	Error message 5 is active.
	32	Error message 6 is active.
	64	Error message 7 is active.
	128	Error message 8 is active.
dnLastErrorNo DINT	Error number of the error message last transmitted to the operating system.	

Parameter



Parameter	Possible settings			Information
C05900	980		999	Module ID • Initialisation: 999
C05901/1...8	0		65535	Error ID • Initialisation: 0
C05902/1...8				Error response
	0	None		
	1	Error		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

5.65 L_DevApplErrFix - error tripping

Function library:	LenzeDevice9400	**FB is available as of library V02.00!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

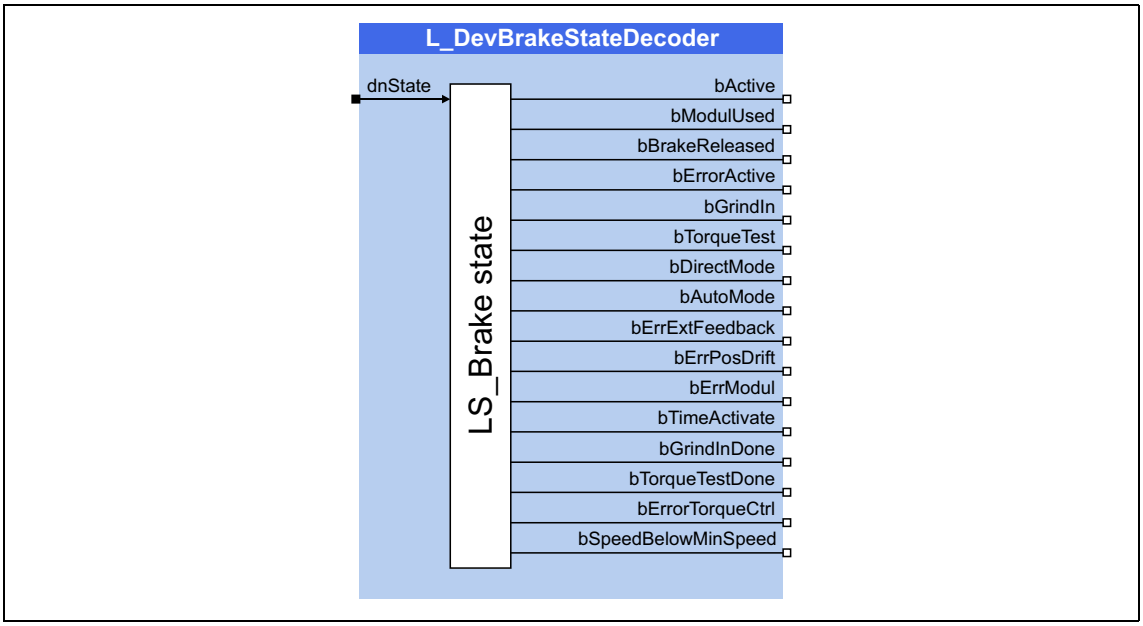
This FB is used for error handling in the application.

- Via the 8 boolean inputs up to 8 different application error messages can be released by the application.
- In contrast to the L_DevApplErr FB the module ID, error ID, and the error response of this FB can be set via inputs and not via parameters.
- If more than 8 application error messages are required, the FB can be instanced.
- If several inputs are set to TRUE at the same time, the input with the lowest number will activate the error message.

Inputs

Identifier/data type	Information/possible settings	
bSetError1 BOOL	Input for error message 1 (highest priority)	
	FALSE↗TRUE	Error condition 1 is met and the parameterised application error message is output by the operating system.
	FALSE	Error condition 1 is no longer met.
...	...	
bSetError8 BOOL	Input for error message 8 (lowest priority)	
	FALSE↗TRUE	Error condition 8 is met and the parameterised application error message is output by the operating system.
	FALSE	Error condition 8 is no longer met.
dwErrorId1...8 DWORD	Error ID (0 ... 65535) for error message 1 ... 8	
dwReactionId1...8 DWORD	Error response for error message 1 ... 8	
	0	None
	1	Error
	2	Trouble
	3	Quick stop by trouble
	4	Warning locked
	5	Warning
	6	Information
dwModulId DWORD	Module ID (980 ... 990)	

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Display of the error message last transmitted to the operating system.	
	1	Error message 1 is active.
	2	Error message 2 is active.
	4	Error message 3 is active.
	8	Error message 4 is active.
	16	Error message 5 is active.
	32	Error message 6 is active.
	64	Error message 7 is active.
	128	Error message 8 is active.
dnErrorNo DINT	Current error number	

5.66 L_DevBrakeStateDecoder - status signals of the basic function "Brake control"

Function library:	LenzeDevice9400
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of the SB **LS_Brake** into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT→BOOL", but the boolean outputs of this FB have the same names according to their meaning.

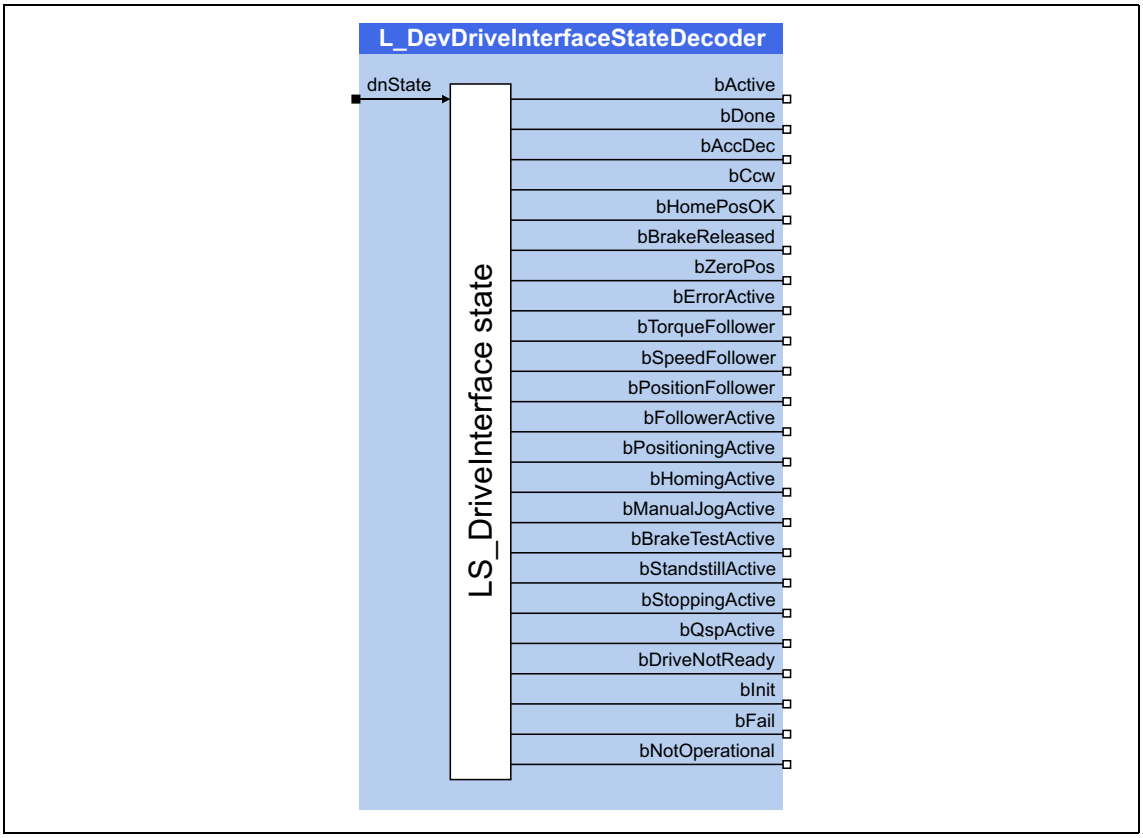
Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the basic function "Brake control". • Connect this input with the output of the same name of the SB **LS_Brake**.

Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
1	bActive	Brake control is active.
4	bModulUsed	Brake module is used.
8	bBrakeReleased	Brake status (internal status signal).
15	bErrorActive	Brake error is active (collective message).
16	bGrindIn	Status "Brake grinding-in".
17	bTorqueTest	Status "Brake test".
18	bDirectMode	Status "Direct control".
19	bAutoMode	Status "Automatic control".
20	bErrExtFeedback	Error: External feedback.
21	bErrPosDrift	Error: Position drift when brake is applied/during brake test.
22	bErrModul	Error: Brake module monitoring.
23	bTimeActivate	Information: Brake activation via waiting time.
24	bGrindInDone	Information: Brake grinding-in is completed.
25	bTorqueTestDone	Information: Brake test is completed.
26	bErrorTorqueCtrl	Error: feedforward control torque could not be established within one second.
27	bSpeedBelowMin-Speed	Information: Current speed has fallen below the threshold for the brake activation set in C02581.



* Relating to the input signal *dnState*.

5.67 L_DevDriveInterfaceStateDecoder - status signals of the drive interface

Function library:	LenzeDevice9400
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of the SB **LS_DriveInterface** into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

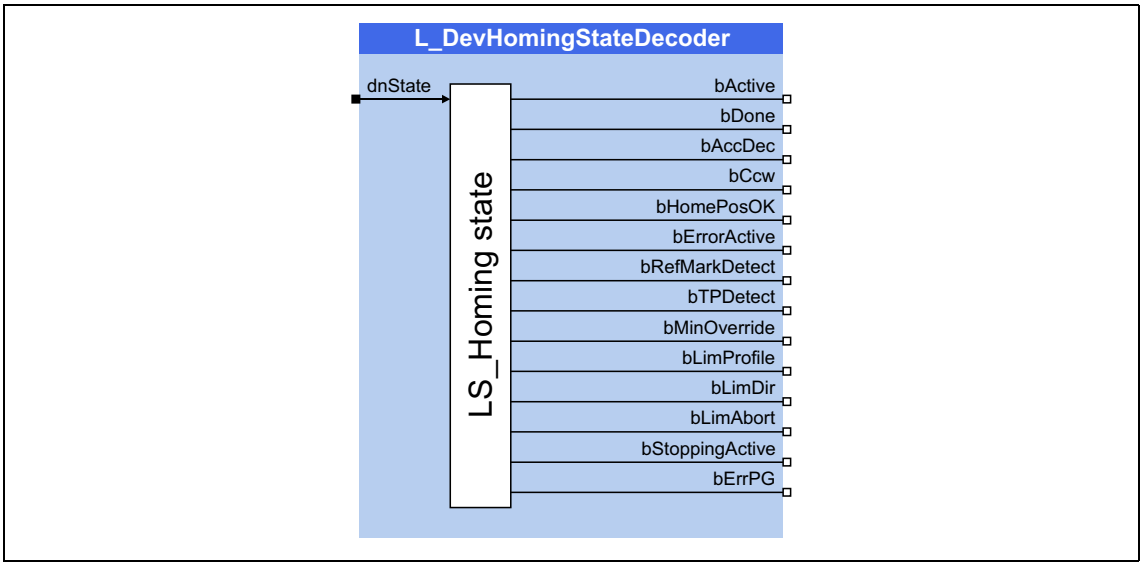
Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the drive interface. • Connect this input with the output of the same name of the SB **LS_DriveInterface**.

Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
1	bActive	Basic function is active.
2	bDone	Basic function is completed.
3	bAccDec	Acceleration/deceleration phase is active.
5	bCcw	Counter-clockwise rotation is active.
7	bHomePosOK	Home position is known.
8	bBrakeReleased	Brake is released.
10	bZeroPos	Zero crossing detected or position = "0".
15	bErrorActive	Error is active.
16	bTorqueFollower	Torque follower is active.
17	bSpeedFollower	Speed follower is active.
18	bPositionFollower	Position follower is active.
19	bFollowerActive	Setpoint follower is active (group signal for bit 16 ...18.)
20	bPositioningActive	Positioning is active.
21	bHomingActive	Homing is active.
22	bManualJogActive	Manual jog is active.
23	bBrakeTestActive	Brake test is active.
24	bStandstillActive	Drive is at standstill.
25	bStoppingActive	Stopping (standard stop) is active.
26	bQspActive	Quick stop is active.
28	bDriveNotReady	Controller is not ready.
29	bInit	Controller is being initialised.
30	bFail	Error
31	bNotOperational	State machine for the basic functions is not ready.



* Relating to the input signal *dnState*.

5.68 L_DevHomingStateDecoder - status signals of the basic function "Homing"

Function library:	LenzeDevice9400
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of the SB **LS_Homing** into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

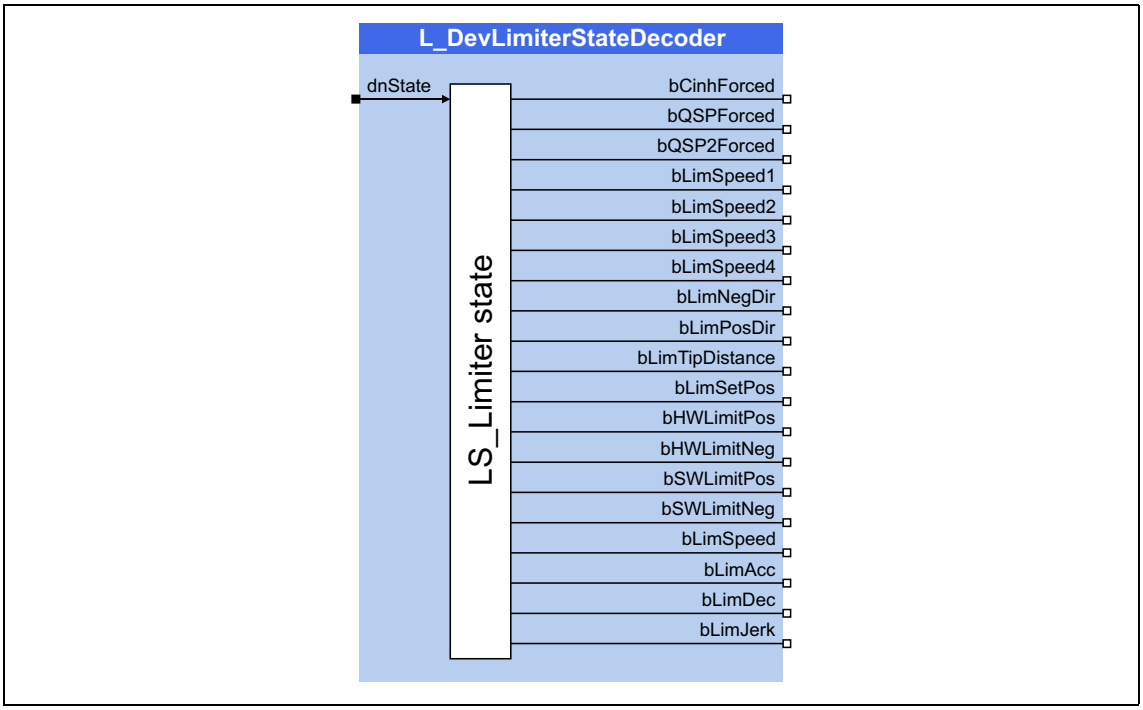
Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the basic function "Homing". • Connect this input with the output of the same name of the SB **LS_Homing**.

Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
1	bActive	Homing is active.
2	bDone	Homing is completed.
3	bAccDec	Acceleration/deceleration phase is active.
5	bCcw	Counter-clockwise rotation is active.
7	bHomePosOK	Home position is known.
15	bErrorActive	Error is active.
16	bRefMarkDetect	Pre-stop (home switch) has been detected.
17	bTPDetect	Touch probe/zero pulse has been detected.
19	bMinOverride**	Override ≤ 1 %
21	bLimProfile	Profile data is limited by the basic function "Limiter" (SB **LS_Limiter**).
22	bLimDir	Direction is inhibited by the basic function "Limiter" (SB **LS_Limiter**).
23	bLimAbort	Abort by basic function "Limiter" (SB **LS_Limiter**).
25	bStoppingActive	Stopping (standard stop) is active.
30	bErrPG	Error during profile generation.



* With regard to the *dnState* input signal. ** As of library V02.04.xx.xx

5.69 L_DevLimiterStateDecoder - status signals of the basic function "Limiter"

Function library:	LenzeDevice9400
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of the SB **LS_Limiter** into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

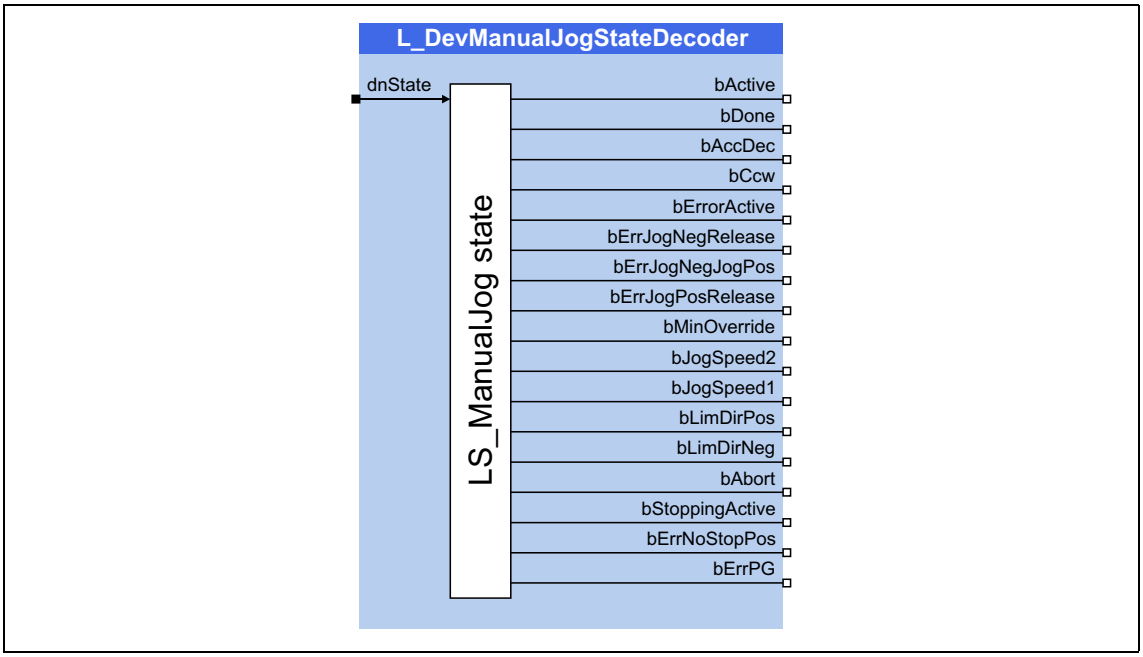
Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the basic function "Limiter". • Connect this input with the output of the same name of the SB **LS_Limiter**.

Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
0	bCinhForced	Controller inhibit is initiated. (Safe torque off is requested.)
1	bQSPForced	Quick stop is initiated. (Safe stop 1 is requested.)
2	bQSP2Forced	Quick stop is initiated. (Safe stop 2 is requested.)
3	bLimSpeed1	Profile change due to speed limitation. (Limited speed 1 is requested.)
4	bLimSpeed2	Profile change due to speed limitation. (Limited speed 2 is requested.)
5	bLimSpeed3	Profile change due to speed limitation. (Limited speed 3 is requested.)
6	bLimSpeed4	Profile change due to speed limitation. (Limited speed 4 is requested.)
7	bLimNegDir	Only positive direction of rotation is permissible. • When the direction of rotation is negative while requesting "Only positive direction of rotation", the drive is braked to standstill.
8	bLimPosDir	Only negative direction of rotation is permissible. • When the direction of rotation is negative while requesting "Only negative direction of rotation", the drive is braked to standstill.
10	bLimTipDistance	Increment in manual jog mode is limited.
12	bLimSetPos	Limitation of the set position is active.
16	bHWLimitPos	Positive limit switch inhibits travel in positive direction.
17	bHWLimitNeg	Negative limit switch inhibits travel in positive direction.
18	bSWLimitPos	Positive software limit position inhibits travel in positive direction.
19	bSWLimitNeg	Negative software limit position inhibits travel in negative direction.
20	bLimSpeed	Limitation of speed is active.
21	bLimAcc	Limitation of acceleration is active.
22	bLimDec	Limitation of deceleration is active.
23	bLimJerk	Limitation of jerk is active (S-ramp time is increased).



* Relating to the input signal *dnState*.

5.70 L_DevManualJogStateDecoder - status signals of the basic function "ManualJog"

Function library:	LenzeDevice9400
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of the SB **LS_ManualJog** into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the basic function "ManualJog". • Connect this input with the output of the same name of the SB **LS_ManualJog**.

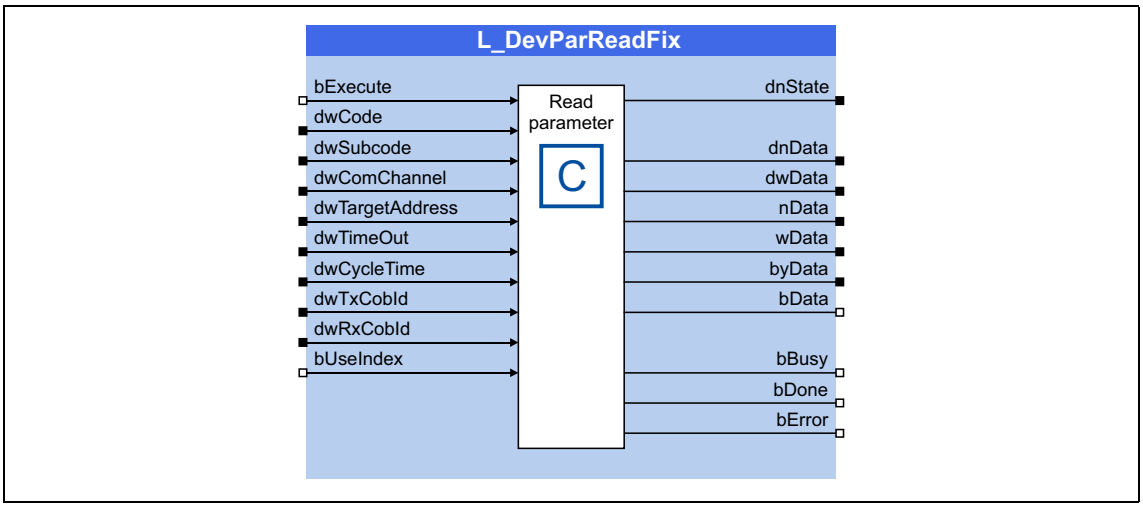
Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
1	bActive	Manual jog is active.
2	bDone	Manual jog is completed.
3	bAccDec	Acceleration/deceleration phase is active.
5	bCcw	Counter-clockwise rotation is active.
15	bErrorActive	Impermissible state (see bit 16, 17, 18, 22, 23).
16	bErrJogNegRelease	Stop by simultaneous selection of negative direction and retraction from limit switch.
17	bErrJogNegJogPos	Stop by simultaneous selection of positive and negative direction.
18	bErrJogPosRelease	Stop by simultaneous selection of positive direction and retraction from limit switch.
19	bMinOverride**	Override ≤ 1 %
20	bJogSpeed2	Manual jog speed 2 is active.
21	bJogSpeed1	Manual jog speed 1 is active.
22	bLimDirPos	Stop by selection of positive direction and simultaneous activation of the positive software limit position or the positive limit switch.
23	bLimDirNeg	Stop by selection of negative direction and simultaneous activation of the negative software limit position or the negative limit switch.
24	bAbort	General abort (ramping down of the speed setpoint) • E.g. when a direction initiator for manual jog is released or an impermissible state occurs (see bit 16, 17, 18, 22, 23).
25	bStoppingActive	Stopping is active.
27	bErrNoStopPos**	No stop position defined.
30	bErrPG	Error during profile generation.

* With regard to the *dnState* input signal. ** As of library V02.04.xx.xx

5.71 L_DevParReadFix - read parameter



Function library:	LenzeDevice9400	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB reads a parameter and provides the read value to the application via the outputs *dnData* ... *bData*.

- All internal parameters (codes) of the controller can be read.
- From controller software version V08 and library V02.05.xx.xx, parameters of another node connected to the system bus (CAN) can also be read if a suitable SDO server channel has been parameterised at the remote node for this purpose.
  - The parameters of the remote node can be addressed by entering either the code or the CANopen index.
- In contrast to the L_DevReadParDInt FB, the parameter of this FB to be read is addressed via FB inputs and not via parameters.
- The FB supports both one-time and cyclic reading in an adjustable time interval.

Note!

The following applies to the 9400 ServoPLC: The FB must not be called with the same instance in several tasks.

Inputs

Identifier/data type		Information/possible settings	
bExecute	BOOL	Activates a read request.	
		FALSE↗TRUE	If the cycle time (*dwCycleTime*) = "0 ms" or the *dwCycleTime* input is not assigned: Read parameter value once which has been addressed via the inputs *dwCode*, *dwSubcode*, *dwComChannel* and *dwTargetAddress*.
			If cycle time (*dwCycleTime*) > "0 ms": Read parameter value cyclically which has been addressed via the inputs *dwCode*, *dwSubcode*, *dwComChannel* and *dwTargetAddress*.
		TRUE↘FALSE	Deactivate cyclic reading again.

Identifier/data type	Information/possible settings
dwCode DWORD	• If *dwComChannel* = "1" or *bUseIndex* = FALSE: Code (0 ... 16000) • If *dwComChannel* = "2" or "3" and *bUseIndex* = TRUE: CANopen index (0x0 ... 0xFFFF)
dwSubcode DWORD	Subcode (0 ... 255)
dwComChannel DWORD	Interface • Up to and including controller software version V07, only the selection "1" (own device) is supported.
	1 Own device
	2 CAN on-board
	3 CAN module
dwTargetAddress DWORD	This input does not have any function.
dwTimeOut DWORD	Time-out (0 ... 10000 [ms]) • Time in which the read request must have been processed. • If the input is not assigned or if "0 s" is selected, time-out monitoring is deactivated.
dwCycleTime DWORD	Cycle time (0 ... 100000 [ms]) • Interval for the cyclic reading of a parameter. • If an input is not assigned or if "0 ms" is selected, cyclic reading is deactivated.
dwTxCobId DWORD From library V02.05.xx.xx	SDO client transmit identifier (0x0 ... 0x7FF) towards the remote CAN node • Identifier to be used for the communication with the remote node if *dwComChannel* = "2" or "3". • The identifier must correspond to an SDO server channel RX identifier (not to the basic SDO server channel 0). • If *dwComChannel* = "1", this input does not have any function.
dwRxCobId DWORD From library V02.05.xx.xx	SDO client receive identifier (0x0 ... 0x7FF) from the remote CAN node • Identifier to be used for the communication with the remote node if *dwComChannel* = "2" or "3". • The identifier must correspond to an SDO server channel TX identifier (not to the basic SDO server channel 0). • If *dwComChannel* = "1", this input does not have any function.
bUseIndex BOOL From library V02.05.xx.xx	Selection of the addressing of a parameter in the remote CAN node. • Selection only relevant if *dwComChannel* = "2" or "3".
	FALSE Value at *dwCode* is addressing a code (0 ... 16000).
	TRUE Value at *dwCode* is addressing a CANopen index (0x0 ... 0xFFFF).

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit-coded) • Bits that are not listed have not been assigned with a status (always "0").	
	bits0	Read request has been sent to the operating system and the FB is waiting for a response from the device addressed (signal *bBusy*).
	bits1	Read request has been executed correctly (signal *bDone*).
	Bit 15	Error (group signal for bit 16 ...31).
	bit16	Configuration error: Invalid code.
	bits17	Configuration error: Invalid subcode.
	Bit 19	Configuration error: Invalid target address.
	Bit 20	Time-out error: The addressed device did not respond within the time-out time, the read request has been deleted.
	Bit 22	Error: Limit value has been exceeded.
	Bit 23	Error: Parameter reading is not permitted.
	Bit 24	Error: Access is not permitted.
	bits25	Error: No element of selection list.
	bit29	Error: Invalid identifier.
dnData DINT	Parameter set read (converted into different data types)	
dwData DWORD		
nData INT		
wData WORD		
byData BYTE		
bData BOOL		
bBusy BOOL	Status output "Read request transmitted"	
	TRUE	The read request has been sent to the operating system and the FB is waiting for a response from the device addressed.
	TRUE↘FALSE	The read request has been completed.
bDone BOOL	Status output "Read request executed correctly" • The output remains set until *bExecute* is reset to FALSE (however, at least for one task cycle).	
	TRUE	The read request has been executed correctly and the read parameter value is available at the *dnData* ... *bData* outputs.
bError BOOL	Status output "Error"	
	TRUE	An error has occurred during processing. • For details, please see the status output *dnState*.

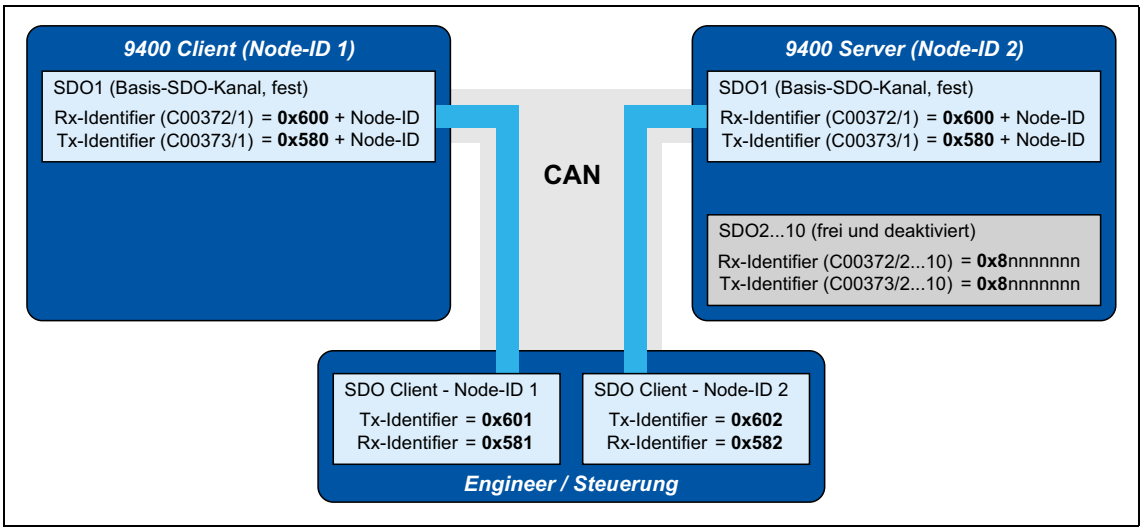
Note!

The cycle time specified via the input *dwCycleTime* is only valid for the use of the FB in a 1-ms task! For a longer task cycle the cycle time is extended accordingly:

$$\text{Cycle time} = \frac{\text{dwCycleTime [ms]} \cdot \text{Task cycle [ms]}}{\text{1 [ms]}}$$

When the FB is used in the unsolicited task, the cycle time set is not effective. In this case, use a preceding FB L_TbOscillator instead to activate the read request cyclically:

- Connect the output *bOut* of the FB L_TbOscillator to the input *bExecute*.
- Set the desired cycle time via the parameters of the FB L_TbOscillator.



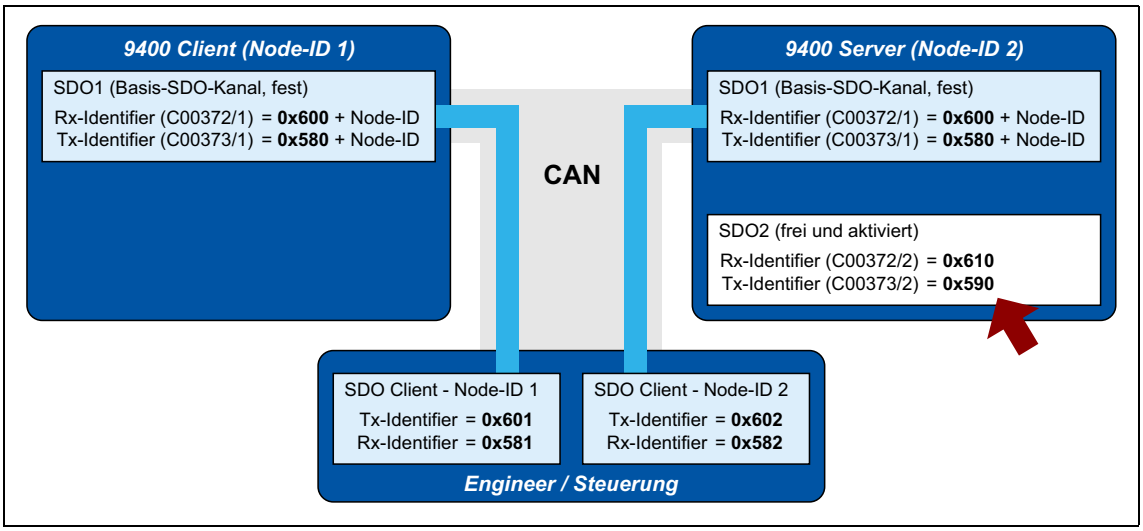
5.71.1 Example

The following example is intended to serve you as an installation guide for your own plant.

Task

The client, a 9400 controller, is supposed to read out code C00011 of the server, another 9400 controller, via a free SDO channel of the "CAN on board" system and provide the information to the application. At the same time, communication from the »Engineer« towards the client and the server is enabled via the basic SDO channel.

Initial situation



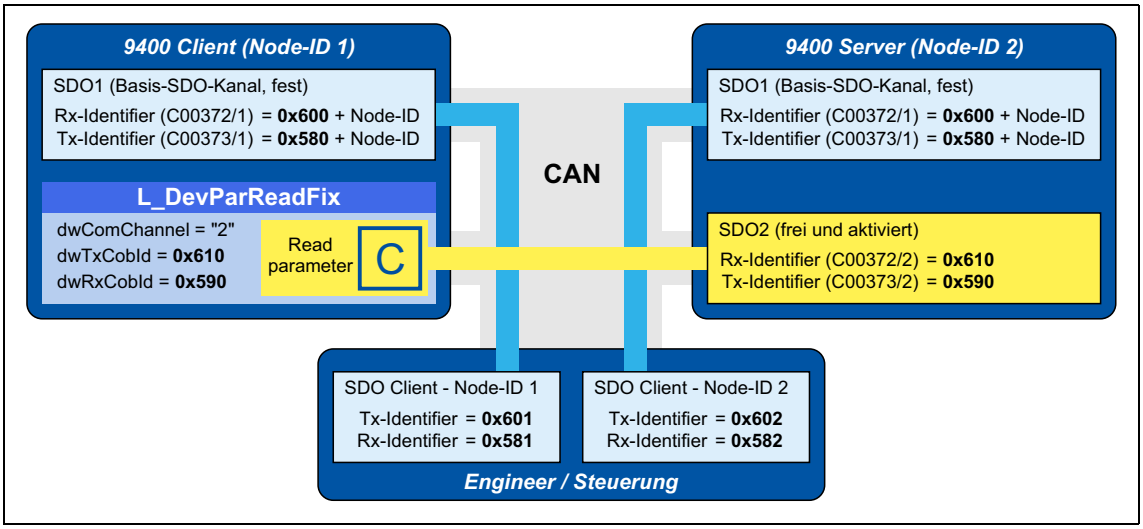
[5-34] Initial situation

- Parameter data channel 1 (the basic SDO channel) is always used for the communication towards the »Engineer«.
  - The basic SDO channel is permanently set to 0x600 + node number or 0x580 + node number, respectively, and can neither be changed nor deactivated according to CiA301.
- In the Lenze setting, the 9400 server has deactivated SDO server channels 2 ... 10 (bit 31 of the Rx/Tx identifiers has been set).

Step 1: Activate SDO server channel 2

To gain read access via the **L_DevParReadFix** FB, the remote node ("9400 server") must have a parameterised SDO server channel suitable for this purpose. SDO server channels 2 ... 10 can be set via codes C00372 and C00373 at the 9400 server.

- Subcodes 2 ... 10 stand for SDO server channels 2 ... 10.
- To activate SDO server channel 2, a receive identifier (RX identifier) must be entered in C00372/2 and a transmit identifier (TX identifier) must be entered in C00373/2 at the 9400 server:



[5-35] Activation of parameter data channel 2 at the 9400 server

Now SDO server channel 2 which has been activated at the 9400 server can be used for communication via a client.

Step 2: Read access to the 9400 server

To gain read access to the parameters of the 9400 server, the **L_DevParReadFix** FB must be implemented into the application of the 9400 client.

- The receive identifier of the server (in our example: 0x610) must be assigned to the *dwTxCobId* input.
- The transmit identifier of the server (in our example: 0x590) must be assigned to the *dwRxCobId* input.
- A numerical value of "2" must be assigned to the *dwComChannel* input for the communication via "CAN on board" to be accomplished.

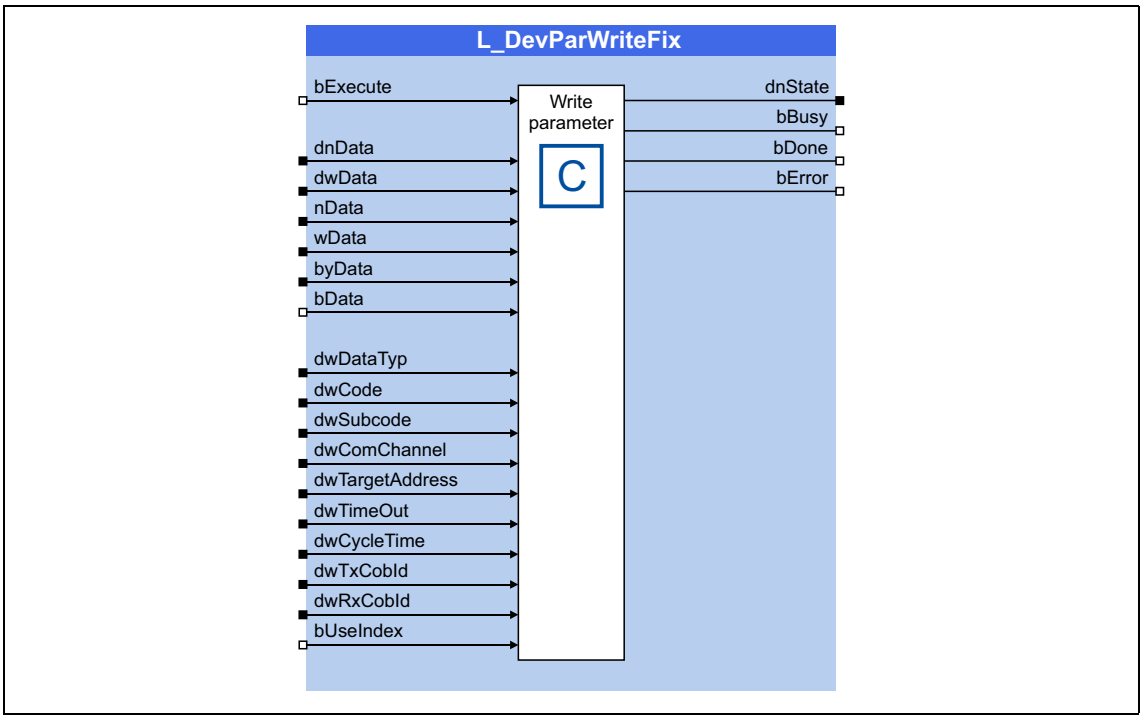
[5-36] Read access via parameter data channel 2 via the L_DevParReadFix FB

Due to the previously described measures, a connection has been established and the code addressed via inputs *dwCode* and *dwSubcode* can be queried in the remote server now.

Every time the block is executed via the *bExecute* input, the switching operation highlighted in yellow as shown in illustration [5-36] is carried out for a short time, the addressed code is queried, and a disconnection is made afterwards.

Write access with the FB L_DevParWriteFix is executed in the same way.

5.72 L_DevParWriteFix - write parameter



Function library:	LenzeDevice9400	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB writes a parameter with the value of the data input *dnData* ... *bData* which has been selected via the *dwDataTyp* input.

- All internal parameters (codes) of the controller can be written to.
- From controller software version V08 and library V02.05.xx.xx, parameters of another node connected to the system bus (CAN) can also be written to if a suitable SDO server channel has been parameterised at the remote node for this purpose.
  - The parameters of the remote node can be addressed by entering either the code or the CANopen index.
- In contrast to the L_DevWriteParDInt FB, the parameter of this FB to be written is addressed via FB inputs and not via parameters.
- The FB supports both one-time and cyclic writing in an adjustable time interval.

Note!

The following applies to the 9400 ServoPLC: The FB must not be called with the same instance in several tasks.

Inputs

Identifier/data type	Information/possible settings	
bExecute BOOL	Activates a write request.	
	FALSE↗TRUE	If the cycle time (*dwCycleTime*) = "0 ms" or the *dwCycleTime* input is not assigned: Write the parameter addressed via the inputs *dwCode*, *dwSubcode*, *dwComChannel* and *dwTargetAddress* once with the value of the data input which has been selected via *dwDataTyp*.
		If cycle time (*dwCycleTime*) > "0 ms": Write the parameter addressed via the inputs *dwCode*, *dwSubcode*, *dwComChannel* and *dwTargetAddress* cyclically with the value of the data input which has been selected via *dwDataTyp*.
	TRUE↘FALSE	Deactivate cyclic writing again.
dnData DINT	Parameter value to be written • The data input and thus the data type of the code to be written is selected via the *dwDataTyp* input.	
dwData DWORD		
nData INT		
wData WORD		
byData BYTE		
bData BOOL		
dwDataTyp DWORD	Selection of the data input / declaration of the data type	
	0	dnData data input / DINT data type
	1	dwData data input/ DWORD data type
	2	nData data input / INT data type
	3	wData data input / WORD data type
	4	byData data input/ BYTE data type
	5	bData data input/ BOOL data type
dwCode DWORD	• If *dwComChannel* = "1" or *bUseIndex* = FALSE: Code (0 ... 16000) • If *dwComChannel* = "2" or "3" and *bUseIndex* = TRUE: CANopen index (0x0 ... 0xFFFF)	
dwSubcode DWORD	Subcode (0 ... 255)	
dwComChannel DWORD	Interface • Up to and including controller software version V07, only the selection "1" (own device) is supported.	
	1	Own device
	2	CAN on-board
	3	CAN module
dwTargetAddress DWORD	This input does not have any function.	
dwTimeOut DWORD	Time-out (0 ... 10000 [ms]) • Time in which the write request must have been processed. • If the input is not assigned or if "0 s" is selected, time-out monitoring is deactivated.	

Identifier/data type		Information/possible settings
dwCycleTime DWORD		Cycle time (0 ... 100000 [ms]) • Interval for the cyclic writing of a parameter. • If an input is not assigned or if "0 ms" is selected, cyclic writing is deactivated.
dwTxCobId DWORD From library V02.05.xx.xx		SDO client transmit identifier (0x0 ... 0x7FF) towards the remote CAN node • Identifier to be used for the communication with the remote node if *dwComChannel* = "2" or "3". • The identifier must correspond to an SDO server channel RX identifier (not to the basic SDO server channel 0). • If *dwComChannel* = "1", this input does not have any function.
dwRxCobId DWORD From library V02.05.xx.xx		SDO client receive identifier (0x0 ... 0x7FF) from the remote CAN node • Identifier to be used for the communication with the remote node if *dwComChannel* = "2" or "3". • The identifier must correspond to an SDO server channel TX identifier (not to the basic SDO server channel 0). • If *dwComChannel* = "1", this input does not have any function.
bUseIndex BOOL From library V02.05.xx.xx		Selection of the addressing of a parameter in the remote CAN node. • Selection only relevant if *dwComChannel* = "2" or "3".
	FALSE	Value at *dwCode* is addressing a code (0 ... 16000).
	TRUE	Value at *dwCode* is addressing a CANopen index (0x0 ... 0xFFFF).

Outputs

Identifier/data type		Value/meaning
dnState DINT		Status (bit-coded) • Bits that are not listed have not been assigned with a status (always "0").
	bits0	Write request has been sent to the operating system and the FB is waiting for a response from the device addressed (signal *bBusy*).
	bits1	Write request has been executed correctly (signal *bDone*).
	Bit 15	Error (group signal for bit 16 ...31).
	bit16	Configuration error: Invalid code.
	bits17	Configuration error: Invalid subcode.
	Bit 19	Configuration error: Invalid target address.
	Bit 20	Time-out error: The addressed device did not respond within the time-out time, the write request has been deleted.
	Bit 21	Error: Invalid data type.
	Bit 22	Error: Limit value has been exceeded.
	Bit 24	Error: Access is not permitted.
	bits25	Error: No element of selection list.
	Bit 26	Error: Parameter writing is not permitted.
	bits27	Error: Parameter writing is only permitted when the controller is inhibited.
	Bit 28	Error: Parameter writing is only permitted when the application has stopped.
	bit29	Error: Invalid identifier.
bBusy BOOL		Status output "Write request transmitted"
	TRUE	The write request has been sent to the operating system and the FB is waiting for a response from the device addressed.
	TRUE↘FALSE	The write request has been completed.

Identifier/data type	Value/meaning	
bDone BOOL	Status output "Write request executed correctly" • The output remains set until *bExecute* is reset to FALSE (however, at least for one task cycle).	
	TRUE	The write request has been executed correctly.
bError BOOL	Status output "Error"	
	TRUE	An error has occurred during processing. • For details, please see the status output *dnState*.

Note!

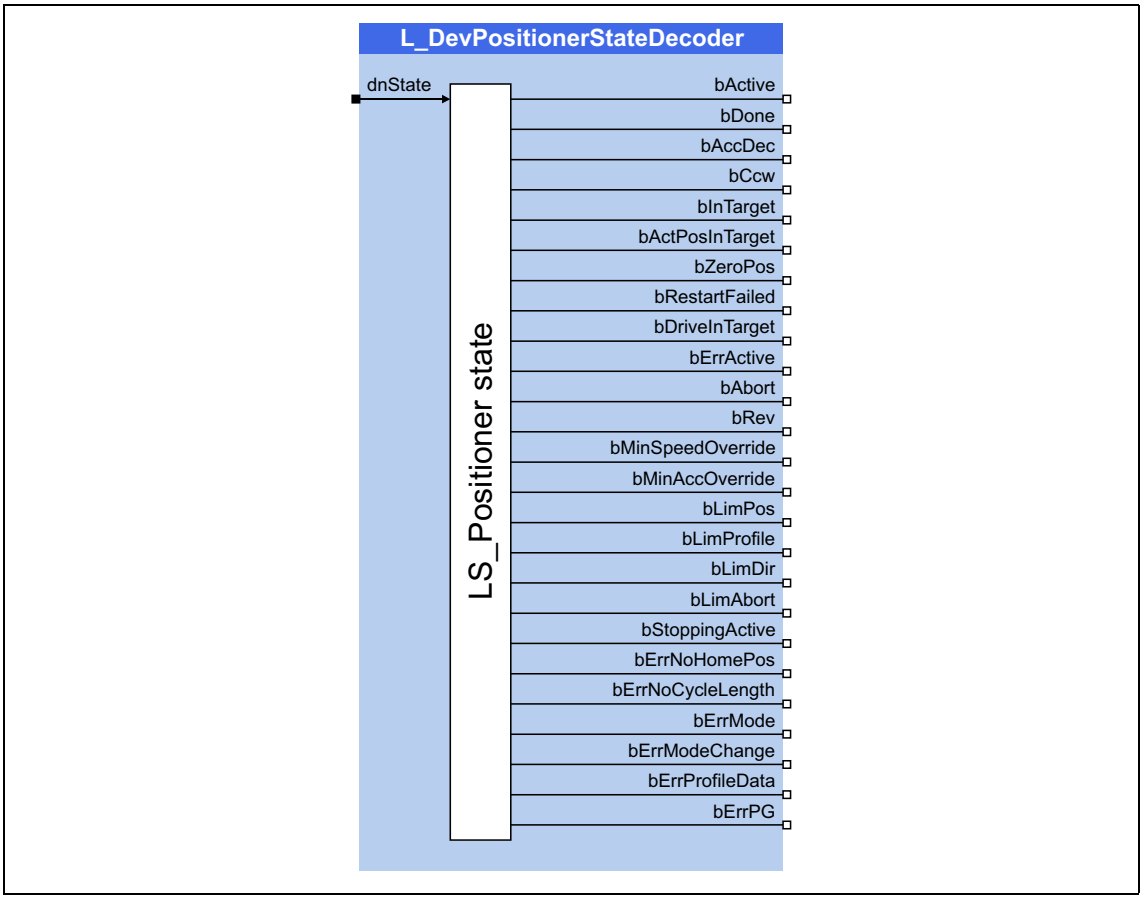
The cycle time specified via the input *dwCycleTime* is only valid for the use of the FB in a 1-ms task! For a longer task cycle the cycle time is extended accordingly:

$$\text{Cycle time} = \frac{\text{dwCycleTime [ms]} \cdot \text{Task cycle [ms]}}{\text{1 [ms]}}$$

When the FB is used in the unsolicited task, the cycle time set is not effective. In this case, use a preceding FB L_TbOscillator instead to activate the write request cyclically:

- Connect the output *bOut* of the FB L_TbOscillator to the input *bExecute*.
- Set the desired cycle time via the parameters of the FB L_TbOscillator.

Tip!



The description of FB L_DevParReadFix provides an application example.

5.73 L_DevPositionerStateDecoder - positioning status signals

Function library:	LenzeDevice9400	**FB available from library V02.00.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB decodes the *dnState* status output signal of the SB **LS_Positioner** into individual boolean status signals for further use in the function block interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the basic function "Positioning". • Connect this input with the output of the same name of the SB **LS_Positioner**.

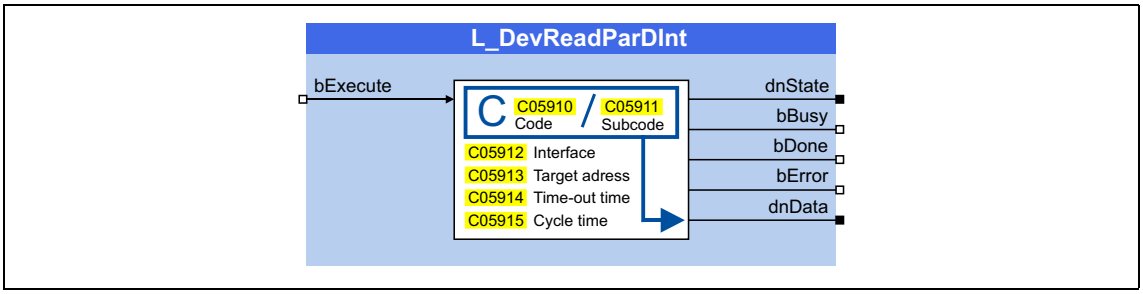
Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
1	bActive	Positioning is active.
2	bDone	Positioning is completed (all profiles have been processed).
3	bAccDec	Acceleration/deceleration phase is active.
4	bActPosInTarget	Actual position in the target • The actual position value of the drive has reached the target position of the profile to be traversed last within the tolerance window set in C02670.
5	bCcw	Counter-clockwise rotation is active.
6	bInTarget	Set position reached (in case of sequence profiles the drive continues to travel).
10	bZeroPos	Zero crossing in the "Modulo" positioning mode.
11	bRestartFailed	Positioning cannot be continued. • At the SB **LS_Positioner**, *POS_bRestart* is selected **AND** • *POS_bAbort* is set simultaneously **OR** • positioning is completed **OR** • a new positioning has been started simultaneously.
12	bDriveInTarget**	Drive in the target (actual position and set position in the target).
15	bErrActive	Error in basic function active (group signal).
16	bAbort	Positioning is aborted.
17	bRev	Reversing phase is active.
18	bMinSpeedOverride	Speed override ≤1 %
19	bMinAccOverride	Acceleration or deceleration override ≤1 %
20	bLimPos	Position is limited by the basic function "Limiter" (SB **LS_Limiter**).
21	bLimProfile	Profile data is limited by the basic function "Limiter" (SB **LS_Limiter**).
22	bLimDir	Direction is inhibited by the basic function "Limiter" (SB **LS_Limiter**).
23	bLimAbort	Abort by basic function "Limiter" (SB **LS_Limiter**).
24	bErrNoHomePos	Home position is not known.
25	bStoppingActive	Stopping is active. • Basic function is enabled for the first time but no positioning requested/active.
26	bErrNoCycleLength	Cycle is not known.
27	bErrMode	Invalid positioning mode.
28	bErrModeChange	Invalid change of positioning mode.
29	bErrProfileData	The profile data is not plausible or faulty: • No valid profile data structure is available (no signal connected to FB). • Parameters for acceleration/deceleration and/or speed = 0 • Override for acceleration/deceleration and/or speed = 0 • Set position > displayable value range • Position > cycle (in Modulo measuring systems)
30	bErrPG	Error during profile generation. • An internal error has occurred while calculating in the profile generator (group signal).

* With regard to the *dnState* input signal. ** As of library V02.04.xx.xx and controller software version V5.0

5.74 L_DevReadParDInt - reading parameters of the DINT type



Function library:	LenzeDevice9400	**FB is available from library V02.00.xx.xx onwards! FB may only be used for firmware from V1.50 onwards!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB reads parameters of data type "DINT" and outputs the read value via the output *dnData* for the application.

- Only internal parameters (codes) of the controller can be read.
- In contrast to the L_DevParReadFix FB, the parameter of this FB to be read is addressed via parameters and not via FB inputs.
- The FB supports both one-time and cyclic reading in a parameterisable time interval.
- To read a parameter with another data type than "DINT", use the FB L_DevParReadFix. (📖 265)

Note!

The following applies to the 9400 ServoPLC: The FB may not be called with the same instance in several tasks.

Inputs

Identifier/data type		Information/possible settings	
bExecute	BOOL	Activate a read request.	
		FALSE↗TRUE	If cycle time (C05915) = "0 s": Read parameter value once which has been addressed via C05910 ...C05913.
			If cycle time (C05915) > "0 s": Read parameter value cyclically which has been addressed via C05910 ...C05913.
		TRUE↘FALSE	Deactivate cyclic reading again.

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded) • Bits that are not listed have not been assigned with a status (always "0").	
	Bit 0	Read request has been sent to the operating system and the FB is waiting for a response from the device addressed (signal *bBusy*).
	Bit 1	Read request has been executed correctly (signal *bDone*).
	Bit 15	Error (group signal for bit 16 ...31).
	Bit 16	Configuration error: Invalid code.
	Bit 17	Configuration error: Invalid subcode.
	Bit 19	Configuration error: Invalid target address.
	Bit 20	Time-out error: The addressed device did not respond within the time-out time, the read request has been deleted.
	Bit 22	Error: Limit value has been exceeded.
	Bit 23	Error: Parameter reading is not permitted.
	Bit 24	Error: Access is not permitted.
	Bit 25	Error: No element of selection list.
bBusy BOOL	Status output "Read request transmitted"	
	TRUE	The read request has been sent to the operating system and the FB is waiting for a response from the device addressed.
	TRUE↘FALSE	The read request has been completed.
bDone BOOL	Status output "Read request executed correctly" • The output remains set until *bExecute* is reset to FALSE (however, at least for one task cycle).	
	TRUE	The read request has been executed correctly and the read parameter value is available at the output *dnData*.
bError BOOL	Status output "Error"	
	TRUE	An error has occurred during processing. • For details, please see the status output *dnState*.
dnData DINT	Parameter value read	

Parameters

Parameter	Possible settings			Info
C05910	0		12000	Code • Initialisation: 2
C05911	0		255	Subcode • Initialisation: 0
C05912				Interface • Currently, only the Lenze setting "Own device" is supported.
	1	Own device		
	2	CAN on-board		
	3	Module in MXI1		
	4	Module in MXI2		
C05913	0		128	Target address • Selection of parameter channel for target device. • Setting is only required if an external parameter is to be read (C05912 > "1").

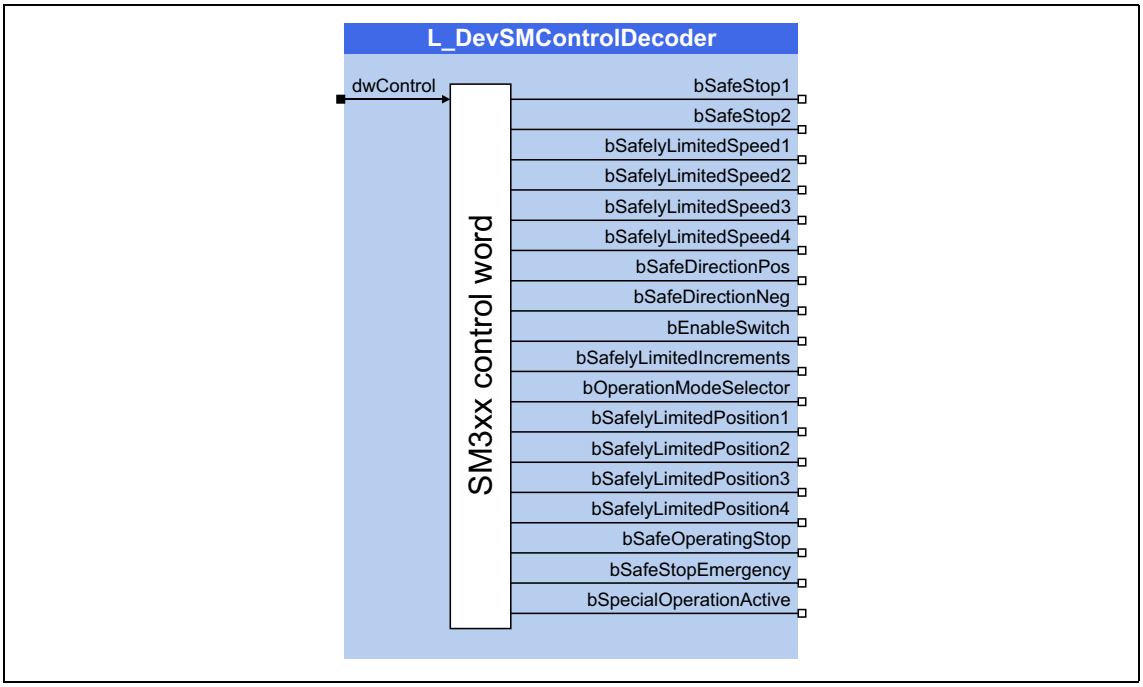
Parameter	Possible settings			Info
C05914	0.000	s	10.000	Time-out time • Time in which the read request must have been processed. • Initialisation: 0.000 s
C05915	0.000	s	100.000	Cycle time • Interval for the cyclic reading of a parameter. • Initialisation: 0.000 s (cyclic reading is deactivated)

Note!

The cycle time set in C05915 applies only to the use of the FB in a 1-ms task! For a longer task cycle the cycle time is prolonged accordingly:

$$\text{Cycle time} = \frac{\text{C5915 [s]} \cdot \text{Task cycle [ms]}}{\text{1 [ms]}}$$

If the FB is used in the unsolicited task, the cycle time set is not effective. In this case use an upstream FB L_TbOscillator instead, in order to cyclically trigger the read request:



- Connect the output *bOut* of FB L_TbOscillator with the input *bExecute*.
- Set the desired cycle time via the parameters of the FB L_TbOscillator.

5.75 L_DevSMControlDecoder - control signals from the safety module

Function library:	LenzeDevice9400	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

The SM3xx safety module uses the bit-coded control signal *SM_dwControl* of the SB **LS_SafetyModuleInterface** to transmit information about requested or active safety functions to the application. The FB decodes the control signal into individual boolean control signals for further use in the FB interconnection.

- The corresponding actions (e.g. braking, braking to standstill, holding of the standstill position) must be executed by the application, e.g. via the basic function "Limiter".
- Several safety functions can be requested/be active at the same time.
- The safety functions that are supported depend on the safety module used.
- The FB functionality corresponds to a "DWORD→BOOL" converter, but the boolean outputs of the FB are called according to their meaning.

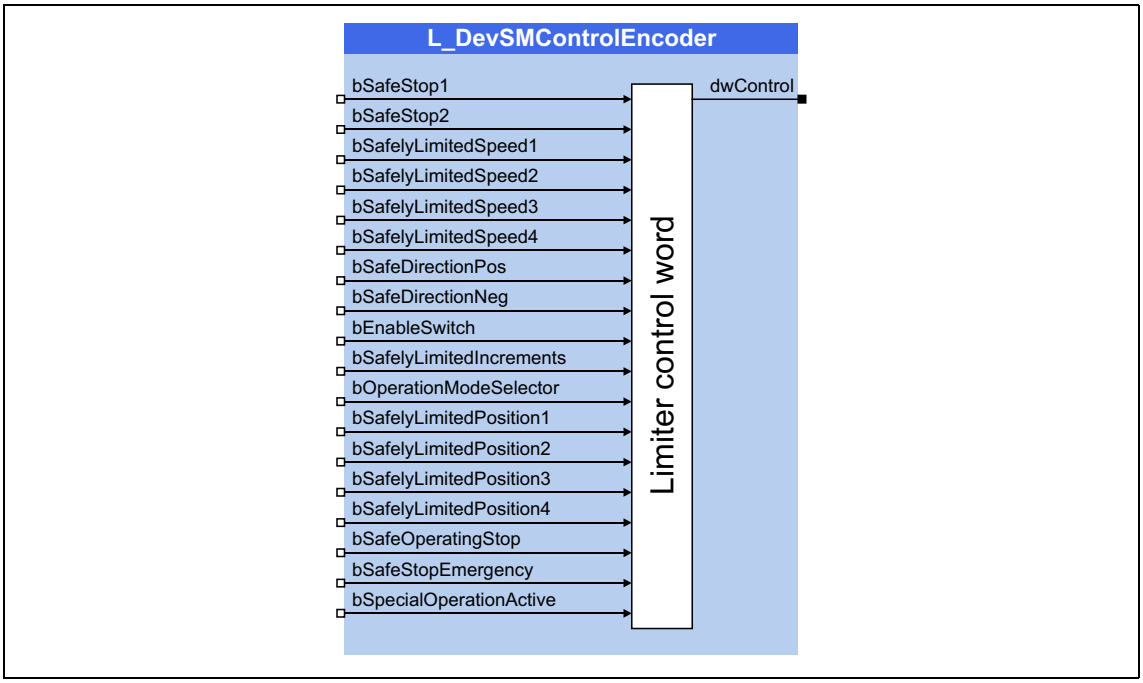
Inputs

Identifier/data type	Information/possible settings
dwControl DWORD	Input for the bit-coded control signal from the safety module. • Connect this input with the output *SM_dwControl* of the SB **LS_SafetyModuleInterface**.

Outputs

Bit*	Identifier	Requested/active safety functions with TRUE
1	bSafeStop1	Safe stop 1 (SS1)
2	bSafeStop2	Safe stop 2 (SS2)
* Relating to the input signal *dwControl*.		

Bit*	Identifier	Requested/active safety functions with TRUE
3	bSafelyLimitedSpeed1	Safely limited speed 1 (SLS1)
4	bSafelyLimitedSpeed2	Safely limited speed 2 (SLS2)
5	bSafelyLimitedSpeed3	Safely limited speed 3 (SLS3)
6	bSafelyLimitedSpeed4	Safely limited speed 4 (SLS4)
7	bSafeDirectionPos	Safe positive direction of rotation (SDIp)
8	bSafeDirectionNeg	Safe negative direction of rotation (SDIn)
9	bSafeEnablingSwitch	Safe enable switch (ES)
10	bSafelyLimitedIncrements	Safely limited increments (SLI)
11	bOperationModeSelector	Safe operation mode selector (OMS)
12	bSafelyLimitedPosition1	Safely limited position 1 (SLP1)
13	bSafelyLimitedPosition2	Safely limited position 2 (SLP2)
14	bSafelyLimitedPosition3	Safely limited position 3 (SLP3)
15	bSafelyLimitedPosition4	Safely limited position 4 (SLP4)
16	bSafeOperatingStop	Safe operating stop (SOS)
23	bSafeStopEmergency	Emergency stop (SSE)
29	bSpecialOperationActive	Special operation is active



* Relating to the input signal *dwControl*.

5.76 L_DevSMControlEncoder - control word for limiter

Function library:	LenzeDevice9400	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB generates the bit-coded control signal *dwControl* from individual boolean control signals for the SB **LS_Limiter** and thus allows control of the basic function "Limiter" if no SM3xx safety module is available.

- The FB functionality corresponds to a "BOOL→DWORD" converter, but the boolean inputs of the FB are called according to their meaning.

Inputs

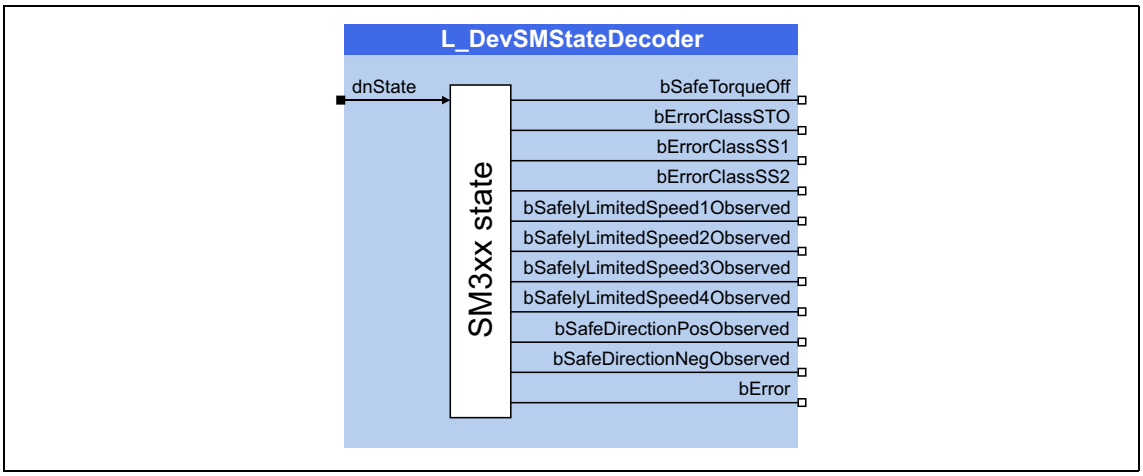
Bit*	Identifier	Requested/active safety functions with TRUE
1	bSafeStop1	Safe stop 1 (SS1)
2	bSafeStop2	Safe stop 2 (SS2)
3	bSafelyLimitedSpeed1	Safely limited speed 1 (SLS1)
4	bSafelyLimitedSpeed2	Safely limited speed 2 (SLS2)
5	bSafelyLimitedSpeed3	Safely limited speed 3 (SLS3)
6	bSafelyLimitedSpeed4	Safely limited speed 4 (SLS4)
7	bSafeDirectionPos	Safe positive direction of rotation (SDIp)
8	bSafeDirectionNeg	Safe negative direction of rotation (SDIn)
9	bSafeEnablingSwitch	Safe enable switch (ES)
10	bSafelyLimitedIncrements	Safely limited increments (SLI)
11	bOperationModeSelector	Safe operation mode selector (OMS)
12	bSafelyLimitedPosition1	Safely limited position 1 (SLP1)
13	bSafelyLimitedPosition2	Safely limited position 2 (SLP2)

* Relating to the output signal *dwControl*.

Bit*	Identifier	Requested/active safety functions with TRUE
14	bSafelyLimitedPosition3	Safely limited position 3 (SLP3)
15	bSafelyLimitedPosition4	Safely limited position 4 (SLP4)
16	bSafeOperatingStop	Safe operating stop (SOS)
23	bSafeStopEmergency	Emergency stop (SSE)
29	bSpecialOperationActive	Special operation is active

* Relating to the output signal *dwControl*.

Outputs



Identifier/data type	Information/possible settings
dwControl DWORD	Bit-coded control signal for the basic function "Limiter". • Connect this output with the input *LIM_dwControl* of the SB **LS_Limiter**.

5.77 L_DevSMStateDecoder - status signals from the safety module

Function library:	LenzeDevice9400	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

The SM3xx safety module uses the bit-coded status signal *SM_dnState* of the SB **LS_SafetyModuleInterface** to transmit the status of the safety functions to the application. The FB decodes the status signal into individual boolean status signals for further use in the FB interconnection.

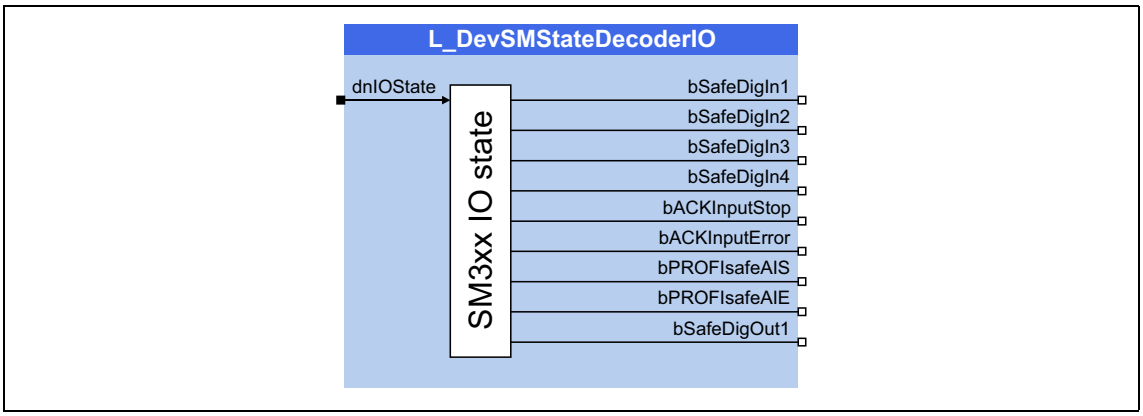
- The FB functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal from the safety module. • Connect this input with the output *SM_dnState* of the SB **LS_SafetyModuleInterface**.

Outputs

Bit*	Identifier	Meaning in case of TRUE
0	bSafeTorqueOff	Safe torque off (STO) is active as normal stop.
3	bErrorClassSTO	Safe torque off (STO) is active as error stop.
4	bErrorClassSS1	Safe stop 1 (SS1) is active as error stop.
5	bErrorClassSS2	Safe stop 2 (SS2) is active as error stop.
8	bSafelyLimitedSpeed1Observed	Safely limited speed 1 (SLS1) is activated and observed.
9	bSafelyLimitedSpeed2Observed	Safely limited speed 2 (SLS2) is activated and observed.
10	bSafelyLimitedSpeed3Observed	Safely limited speed 3 (SLS3) is activated and observed.
11	bSafelyLimitedSpeed4Observed	Safely limited speed 4 (SLS4) is activated and observed.
12	bSafeDirectionPosObserved	Safe positive direction of rotation (SDIp) is activated and observed.
13	bSafeDirectionNegObserved	Safe negative direction of rotation (SDIn) is activated and observed.
14	bError	SM301 safety module is in an error state (Trouble or Warning).



* Relating to the input signal *dnState*.

5.78 L_DevSMStateDecoderIO - status signals from the safety module

Function library:	LenzeDevice9400	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

The SM3xx safety module uses the bit-coded status signal *SM_dnIOState* of the SB **LS_SafetyModuleInterface** to transmit the status of the safe inputs and the safe output to the application. The FB decodes the status signal into individual boolean status signals for further use in the FB interconnection.

- The FB functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

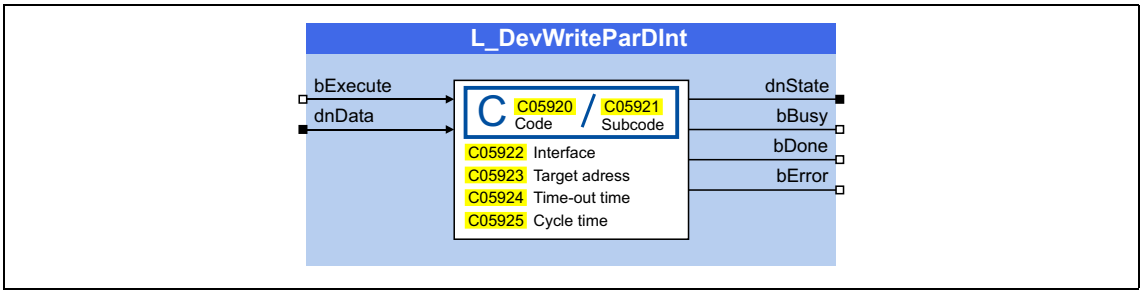
Identifier/data type	Information/possible settings
dnIOState DINT	Input for the bit-coded I/O status signal from the safety module. • Connect this input with the output *SM_dnIOState* of the SB **LS_SafetyModuleInterface**.

Outputs

Bit*	Identifier	Meaning in case of TRUE
0	bSafeDigIn1	Sensor input 1 in ON state.
1	bSafeDigIn2	Sensor input 2 in ON state.
2	bSafeDigIn3	Sensor input 3 in ON state.
3	bSafeDigIn4	Sensor input 4 in ON state.
5	bACKInputStop	Restart acknowledgement AIS via terminal (with TRUE↘FALSE).
6	bACKInputError	Error acknowledgement AIE via terminal (with TRUE↘FALSE).
8	bPROFIsafeAIS	Restart acknowledgement AIS via safety bus.
9	bPROFIsafeAIE	Error acknowledgement AIE via safety bus.
12	bSafeDigOut1	Safe output 1 (feedback output) in ON state.

* Relating to the input signal *dnIOState*.

5.79 L_DevWriteParDInt - writing to parameters of the DINT type



Function library:	LenzeDevice9400	**FB is available from library V02.00.xx.xx onwards!** **FB may only be used for firmware from V1.50 onwards!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB writes a parameter of data type "DINT" with the value assigned to the input *dnData*.

- Only internal parameters (codes) of the controller can be written.
- In contrast to the L_DevParWriteFix FB, the parameter of this FB to be written is addressed via parameters and not via FB inputs.
- The FB supports both one-time and cyclic writing in a parameterisable time interval.
- To write a different data type as "DINT" to a parameter, the FB L_DevParWriteFix is to be used instead. (📖 271)

Note!

The following applies to the 9400 ServoPLC: The FB may not be called with the same instance in several tasks.

Inputs

Identifier/data type		Information/possible settings	
bExecute	BOOL	Activate a write request.	
		FALSE↗TRUE	If cycle time (C05925) = "0 s": Write the parameter addressed via C05920 ...C05923 once with the value assigned to the *dnData* input.
			If cycle time (C05925) > "0 s": Write the parameter addressed via C05920 ...C05923 cyclically with the value assigned to the *dnData* input.
		TRUE↘FALSE	Deactivate cyclic writing again.

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded) • Bits that are not listed have not been assigned with a status (always "0").	
	Bit 0	Write request has been sent to the operating system and the FB is waiting for a response from the device addressed (signal *bBusy*).
	Bit 1	Write request has been executed correctly (signal *bDone*).
	Bit 15	Error (group signal for bit 16 ...31).
	Bit 16	Configuration error: Invalid code.
	Bit 17	Configuration error: Invalid subcode.
	Bit 19	Configuration error: Invalid target address.
	Bit 20	Time-out error: The addressed device did not respond within the time-out time, the write request has been deleted.
	Bit 21	Error: Invalid data type. • Use the table of attributes to check the data type of the parameter you want to write. If it is not a DINT data type, use the FB L_DevParWriteFix instead for writing the parameter.
	Bit 22	Error: Limit value has been exceeded.
	Bit 24	Error: Access is not permitted.
	Bit 25	Error: No element of selection list.
	Bit 26	Error: Parameter writing is not permitted.
	Bit 27	Error: Parameter writing is only permitted when the controller is inhibited.
	Bit 28	Error: Parameter writing is only permitted when the application has stopped.
bBusy BOOL	Status output "Write request transmitted"	
	TRUE	The write request has been sent to the operating system and the FB is waiting for a response from the device addressed.
	TRUE↘FALSE	The write request has been completed.
bDone BOOL	Status output "Write request executed correctly" • The output remains set until *bExecute* is reset to FALSE (however, at least for one task cycle).	
	TRUE	The write request has been executed correctly.
bError BOOL	Status output "Error"	
	TRUE	An error has occurred during processing. • For details, please see the status output *dnState*.

Parameters

Parameter	Possible settings			Info
C05920	0		12000	Code • Initialisation: 2
C05921	0		255	Subcode • Initialisation: 0
C05922				Interface • Currently only the Lenze setting "Own device" is supported.
	1	Own device		
	2	CAN on-board		
	3	Module in MXI1		
	4	Module in MXI2		

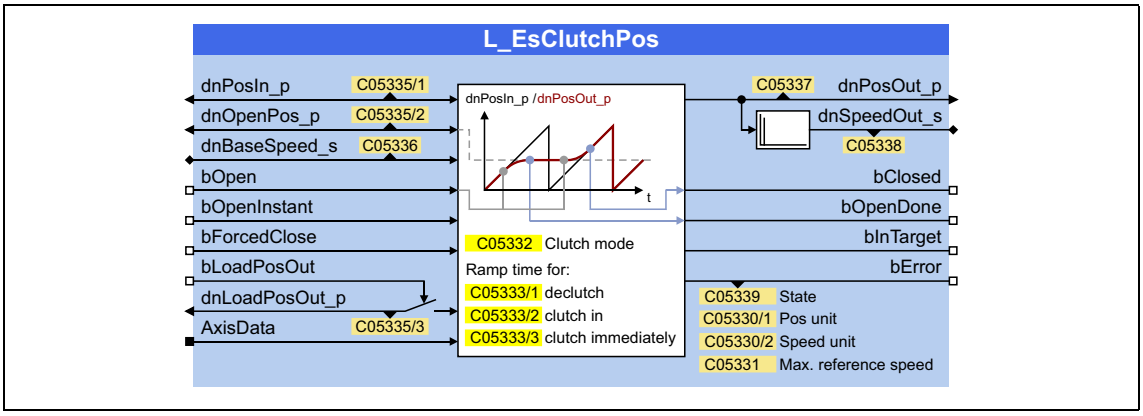
Parameter	Possible settings			Info
C05923	0		128	Target address • Selection of parameter channel for target device. • Setting is only required if an external parameter is to be written (C05922 > "1").
C05924	0.000	s	10.000	Time-out time • Time in which the write request must have been processed. • Initialisation: 0.000 s
C05925	0.000	s	100.000	Cycle time • Interval for the cyclic writing of a parameter. • Initialisation: 0.000 s (cyclic writing is deactivated)

Note!

The cycle time set in C05925 applies only to the use of the FB in a 1-ms task! For a longer task cycle the cycle time is prolonged accordingly:

$$\text{Cycle time} = \frac{\text{C5925 [s]} \cdot \text{Task cycle [ms]}}{\text{1 [ms]}}$$

If the FB is used in the unsolicited task, the cycle time set is not effective. In this case use an upstream FB L_TbOscillator instead, in order to cyclically trigger the write request:



- Connect the output *bOut* of the FB L_TbOscillator with the input *bExecute*.
- Set the desired cycle time via the parameters of the FB L_TbOscillator.

5.80 L_EsClutchPos - clutch (time-controlled)

Function library:	LenzeElectricalShaft	**FB is available as of library V01.01!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB serves to implement a time-controlled clutching and declutching of the master position for all traversing ranges (Modulo/limited/unlimited) via a fifth-order polynomial.

- The FB supports the following clutch modes:
  - Declutching until standstill
  - Declutching to a basic speed
- More functions:
  - Positive opening operation of the clutch (for emergency situations)
  - "Hard clutch-in"
  - "Hard declutch"
- For path-controlled clutching and declutching, use the L_CamClutchPos FB instead. (📖 135)

Inputs

Identifier/data type	Information/possible settings	
dnPosIn_p DINT	Input position in [increments] • Selection of an external master position. • C05335/3 indicates the input position in the real unit of the machine.	
dnOpenPos_p DINT	Standstill position after the declutch process in [increments] • C05335/2 indicates the standstill position in the real unit of the machine.	
dnBaseSpeed_s DINT	Basic speed as speed in [rpm] • For clutch mode C05332 = "1: Clutch-in to basic speed". • C05336 indicates the basic speed in the real unit of the machine.	
bOpen BOOL	Control of the clutch function • The behaviour depends on the clutch-in mode set in C05332.	
	TRUE	"Open clutch" request (declutch process). • The declutch position results indirectly from the declutch time set in C05333/1. • When the declutch process is terminated, the *bOpenDone* output is set to TRUE.
		Clutch-in mode "Declutching until standstill": • The *dnPosOut_p* output position disengages from the *dnPosIn_p* master position within the declutch time set in C05333/1 and decelerated to the *dnOpenPos_p* standstill position. • When the *dnPosOut_p* output position has reached the standstill position, the *bInTarget* output is set to TRUE.
		Clutch-in mode "Declutching to basic speed": • The *dnPosOut_p* output position disengages from the *dnPosIn_p* master position within the declutch time set in C05333/1 and decelerated to the basic speed defined in the *dnBaseSpeed_s* input.
	FALSE	"Close clutch" request (clutch-in process). • The clutch-in process can only be started after the declutch process has been totally completed. An early abort of the declutch process is not possible. • The *dnPosOut_p* output position is synchronised from the standstill position (or basic speed) to *dnPosIn_p* master position again within the clutch-in time set in C05333/1 and follows it. • If the input and output position are synchronous again, the output *bClosed* is set to TRUE.
bOpenInstant BOOL	Positive opening operation of the clutch (for emergency situations) • This input has a higher priority than the input *bOpen*.	
	FALSE↗TRUE	The *dnPosOut_p* output position is separated immediately from the *dnPosIn_p* 3 master position and brought to standstill within the deceleration time set in C05333/3. • It is not possible to abort the positive opening operation early. • If the *dnPosOut_p* output position is at standstill, the output *bOpenDone* is set to TRUE. • Afterwards a clutch-in process by a FALSE-TRUE edge at the input *bOpen* can only be effected again after the input *bOpenInstant* has been reset to FALSE.
bForcedClose BOOL	Reset declutch process. • This function allows for a "hard clutch-in" and can be used for certain interruption mechanisms or for starting up the machine. • The reset of the declutch process should be only effected during controller inhibit or a decoupled setpoint path. • This input has the highest priority.	
	TRUE	The *dnPosOut_p* output position is set immediately to the *dnPosIn_p* master position. • The clutch is now clutched-in. • The output *bClosed* is set to TRUE.

Identifier/data type	Information/possible settings	
bLoadPosOut BOOL	Reset clutch-in process. • The function enables a "hard declutching". • This input has the second highest priority after *bForcedClose*.	
	TRUE	The *dnPosOut_p* output position is immediately set to the position defined via the *dnLoadPosOut_p* input. • The clutch is now declutched. • The *bOpenDone* output is set to TRUE.
dnLoadPosOut_p DINT	Position in [increments] to which the *dnPosOut_p* output position is set by setting *bLoadPosOut* to TRUE. • C05335/3 indicates the position in the real unit of the machine.	
AxisData	Machine parameters • If the FB is to relate to the measuring system of the drive axis, connect this input to the output *DI_AxisData* of the **LS_DriveInterface** SB for accepting the machine parameters of the drive/motor. • If the FB within a cam application is to relate to the measuring system of the master selection (master), connect this input to the output *XAxisData* of the L_CamProfiler FB instead. (📖 162) • If this input is left unconnected, the position values are processed with the following resolution: 1 encoder revolution ≡ 2^{16} increments	

Outputs

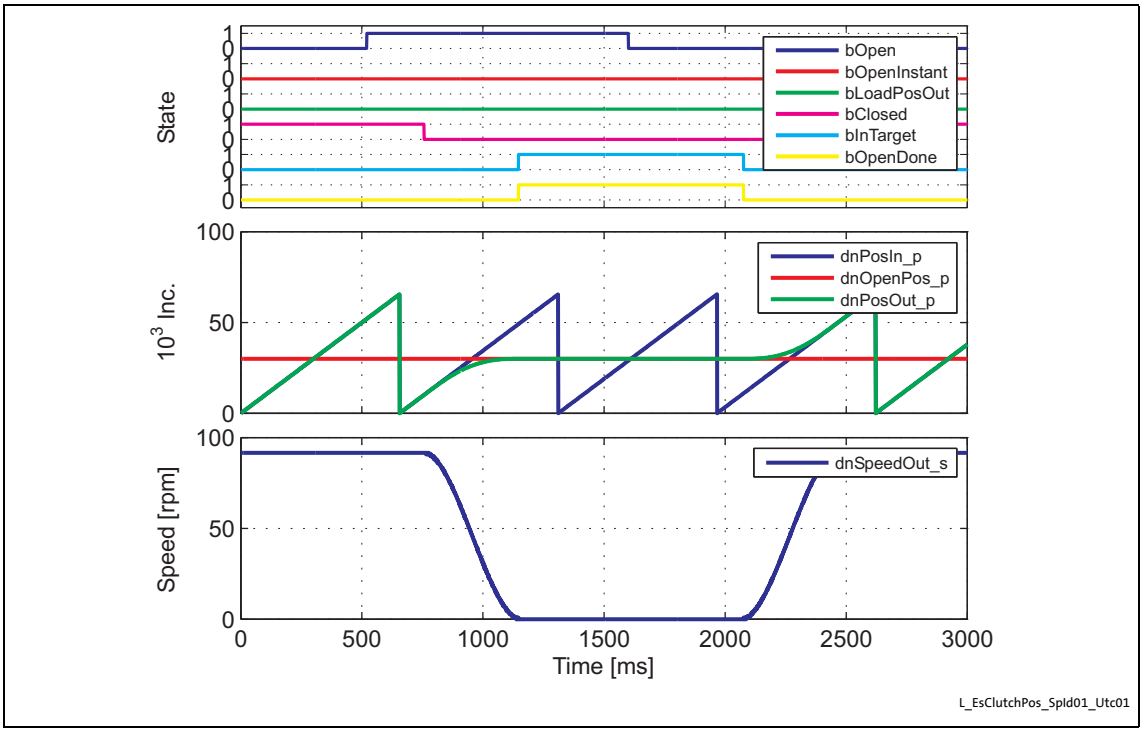
Identifier/data type	Value/meaning	
dnPosOut_p DINT	Output position in [increments] • C05337 indicates the output position in the real unit of the machine.	
dnSpeedOut_s DINT	Output speed given as speed in [rpm] • C05338 indicates the output speed in the real unit of the machine.	
bClosed BOOL	Status signal to the clutch status	
	FALSE	The clutch is open, or an active clutch-in/declutch process is active. • The output position is at standstill or within an acceleration/deceleration phase.
	TRUE	The clutch is closed. • Output position *dnPosOut_p* and input position *dnPosIn_p* are synchronous.
bOpenDone BOOL	Status signal "Declutch process completed"	
	TRUE	The declutch process activated via *bOpen* or *bOpenInstant* has been totally completed; a clutch-in process can be effected again.
bInTarget BOOL	Status signal "Standstill position reached"	
	TRUE	The standstill position *dnOpenPos_p* after a declutch process activated via *bOpen* has been reached.
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C05339.

Parameter

Parameter	Possible settings			Information
C05330/1	String of digits			Position unit • Read only
C05330/2	String of digits			Speed unit • Read only
C05331	0.0000	Unit/t	214748.3647	Reference speed • Read only

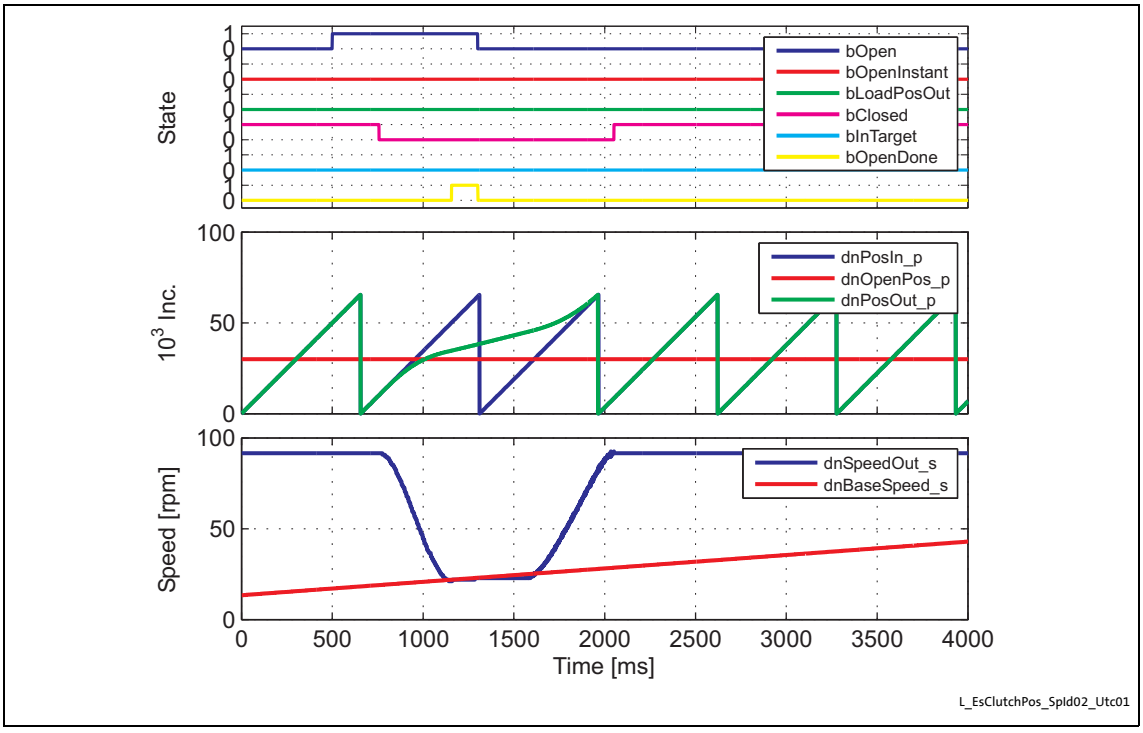
Parameter	Possible settings			Information
C05332				Clutch mode
	0	Declutching until standstill (*dnOpenPos_p*).		
	1	Declutching to basic speed (*dnBaseSpeed_s*).		Lenze setting
C05333/1	0.001	s	10.000	Relative declutch time • With regard to the *dnOpenPos_p* standstill position or the *dnBaseSpeed_s* basic speed. • Initialisation: 1.000 s
C05333/2	0.001	s	10.000	Relative clutch-in time • Relating to the position from which the output position *dnPosOut_p* and input position *dnPosIn_p* are synchronous again. • Initialisation: 1.000 s
C05333/3	0.001	s	10.000	Deceleration time for positive opening operation • Relating to the reference speed. • Initialisation: 1.000 s
C05335/1	-214748.3647	Unit	214748.3647	Input position • Display of the *dnPosIn_p* input signal in the real unit of the machine.
C05335/2	-214748.3647	Unit	214748.3647	Standstill position • Position after declutch process • Display of the *dnOpenPos_p* input signal in the real unit of the machine.
C05335/3	-214748.3647	Unit	214748.3647	Position for "Hard declutching" • Position to which the *dnPosOut_p* output position is set immediately by setting *bLoadPosOut* to TRUE. • Display of the *dnLoadPosOut_p* input signal in the real unit of the machine.
C05336	-214748.3647	Unit/t	214748.3647	Basic speed • Display of the *dnBaseSpeed_s* input signal in the real unit of the machine.
C05337	-214748.3647	Unit	214748.3647	Output position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05338	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.

Parameter	Possible settings		Information
C05339	Status messages:		Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits8	Clutch closed	
	bits9	Declutch position reached	
	bits14	Internal position overflow during declutch process	
	Bit15	Internal position overflow during clutch-in process	
	Error messages:		
	bit16	Position is beyond the cycle	
	bits23	Invalid axis data structure	
	bits31	General error	



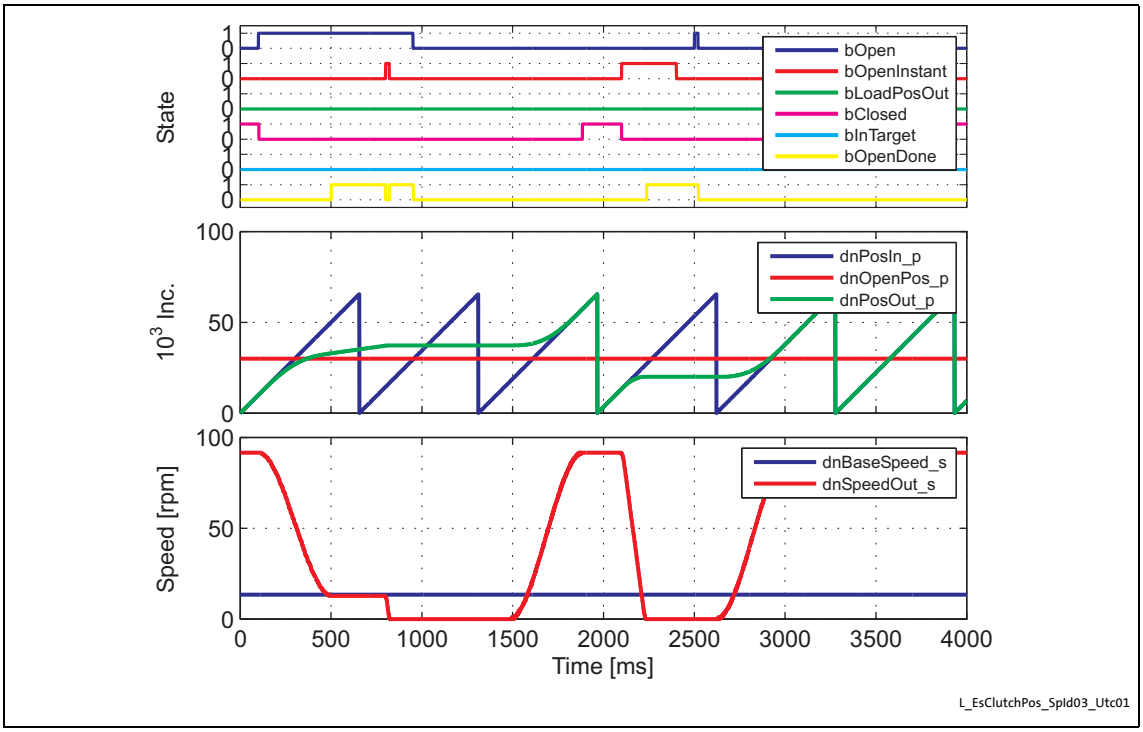
Note!

A clutch-in or declutch process may last up to 10 seconds, depending on the parameterised resolution of an encoder revolution in the machine parameters copied to the FB (*AxisData*).



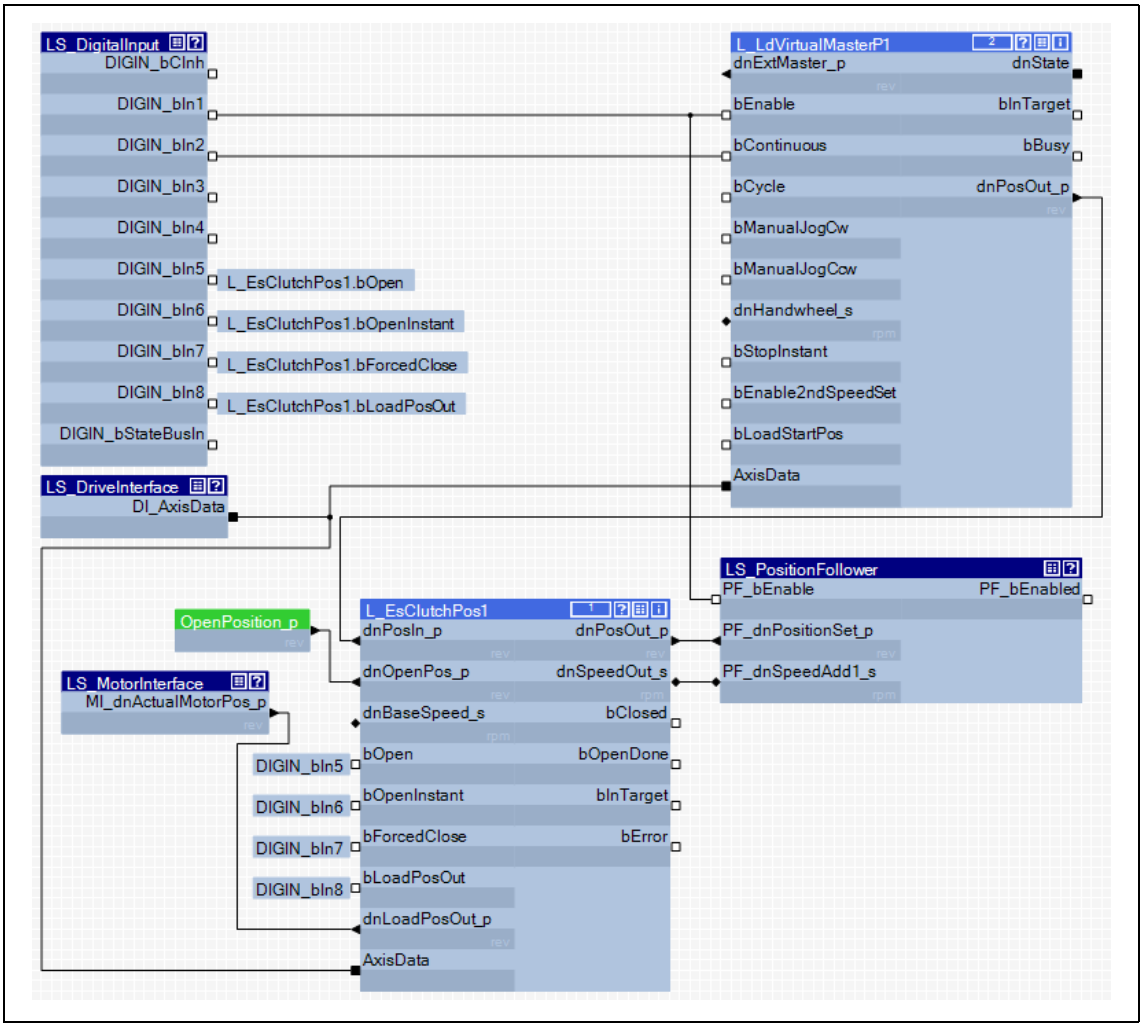
Example: If the maximum resolution of 24 bit/encoder revolution is set, the clutch-in path may be too long after only 2 s at maximum speed (internal position gets lost).

- In this case, clutching-in is executed via an emergency time ramp. This changes the course of speed and position during the clutch-in and declutch process.
- During the declutch process, you cannot stop at the standstill position *dnOpenPos_p* anymore! The time ramp, however, is maintained and the standstill position is within the cycle.
- An internal position overflow during the clutch-in/declutch process is displayed in C05339 via bit 14 and bit 15.



5.80.1 Signal characteristics

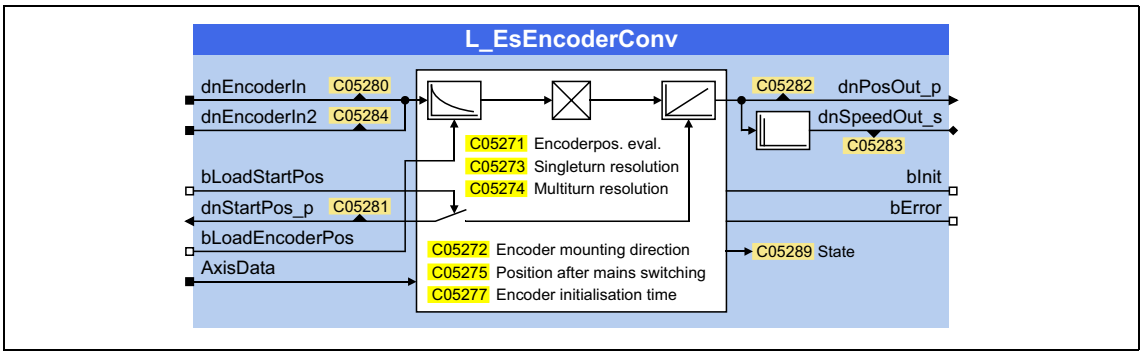
[5-37] Clutch-in mode "0: Declutching until standstill"



[5-38] Clutch-in mode "1: Declutching to basic speed"

[5-39] Positive opening operation of the clutch (*bOpenInstant* = TRUE)

5.80.2 Interconnection example



[5-40] Interconnection example

5.81 L_EsEncoderConv - encoder signal conditioning

Function library:	LenzeElectricalShaft
Runtime software licence:	☐ Motion Control HighLevel ☑ Motion Control TopLevel

This FB converts an actual position that is imported via a bus system, like for example system bus (CAN), Profibus, or ETHERNET Powerlink, by an external encoder, by means of the machine parameters transferred and the encoder resolution parameterised into a position in [increments] and provides it for further processing within the function block interconnection at the output *dnPosOut_p* .

- Via the input *bLoadStartPos* the position output can be set to the starting position pending at the input *dnStartPos_p*.
- The position that is output can be initialised/adjusted to the input value of an absolute value encoder via the *bLoadEncoderPos* input.
- In addition to the position, the resulting speed is shown at the output *dnSpeedOut_s*.
- The FB can process absolute value encoders and incremental encoders (single and multiturn encoders).

Inputs

Identifier/data type	Information/possible settings
dnEncoderIn DINT	External encoder signal (encoder counter) • As soon as the input value at the bus is changed, a valid encoder signal is recognised. • Display parameter: C05280
dnEncoderIn2 DINT From library V01.03.xx.xx	2nd external encoder signal • This input is only evaluated if "1: 64 bit encoder signal" has been selected in C05271. • Display parameter: C05284 ▸ 64 bit encoder signal evaluation (📖 302)
bLoadStartPos BOOL	Load integrator with starting position and reset error output. TRUE: Load the integrator with the value applied to input *dnStartPos_p* and reset *bError* to FALSE.
dnStartPos_p DINT	Starting position in [inc] with which the integrator is loaded by setting *bLoadStartPos* to TRUE. • C05281 indicates the starting position in the real unit of the machine.

Identifier/data type	Information/possible settings	
bLoadEncoderPos BOOL From library V01.03.xx.xx	Load integrator with absolute encoder position • Application: Initialisation of output positions for absolute value encoders	
	TRUE	Load integrator with encoder positions at the *dnEncoderIn* / *dnEncoderIn2* inputs • The resolution of an encoder revolution set in the machine parameters (AxisData) will be considered here. • Input signal changes still result in the generation of a speed value at the output.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters contained within the cam data can be read out via L_CamGetAxisData FB. In this case the FB output *AxisData* must be connected to this input. (📖 155) • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) • If this input is released, the following scaling applies: 1 motor revolution ≡ 2^{16}	

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Master position output in [inc] • Overflow is possible (display via *bError*) • C05282 indicates the master position in the real unit of the machine.	
dnSpeedOut_s DINT	Master speed output in [rpm] • C05283 indicates the master speed in the real unit of the machine.	
bInit BOOL	Status signal "Encoder initialisation phase active"	
	TRUE	The initialisation time for the encoder set in C05277 has not elapsed yet, the FB does not yet carry out internal calculations.
bError BOOL	"Error" status • Status signal can be reset via *bLoadStartPos*.	
	TRUE	An error has occurred (group signal). • For details see display parameter C05289.

Parameter

Parameter	Possible settings		Information
C05270/1	String of digits		Position unit • Read only
C05270/2	String of digits		Speed unit • Read only
C05271 From library V01.03.xx.xx			Encoder position evaluation
	0	32 bit encoder signal • The 32 bit input position is transmitted via the *dnEncoderIn* input. • The resolution of the signal results from C05273 and C05274.	Lenze setting
	1	64 bit encoder signal • The 64 bit input position is transmitted via the *dnEnoderIn* and *dnEncoderIn2* input. • The resolution of the signal results from C05274.	▸ 64 bit encoder signal evaluation (📖 302)

Parameter	Possible settings			Information
C05272				Encoder mounting position
	0	On the right		Lenze setting
	1	On the left		
C05273	1		2147483647	Singleturn resolution • Setting of the number of increments. • Initialisation: 2048
C05274	1		2147483647	Multiturn resolution • Number of revolutions. • Initialisation: 1 (= singleturn)
C05275				Position after main switching
	0	Delete		Lenze setting
	1	Reconstruct		
C05277	0.010	s	60.000	Encoder initialisation time • Time after which the encoder supplies signals after switch-on. • Initialisation: 1.000 s
C05280	-2147483647	Steps	2147483647	Encoder input • Display of the *bEncoderI_n* input signal.
C05281	-214748.3647	Unit	214748.3647	Starting position • Display of the *dnStartPos_p* input signal in the real unit of the machine.
C05282	-214748.3647	Unit	214748.3647	Master position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05283	-214748.3647	Unit/t	214748.3647	Master speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C05284 From library V01.03.xx.xx	-2147483647	Rev	2147483647	2nd encoder input • Display of the *dnEncoderIn2* input signal.
C05289	Status messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bit 10	Zero crossing active		
	Error messages:			
	bit 16	Position is beyond the cycle		
	bit 17	Initial speed too high		
	bit 19	Encoder resolution too high		
	bit 21	Position skip ≥ half a cycle		
	bit 23	Invalid axis data structure		
	bit 25	Encoder input signal invalid		
	bit 31	General error		

5.81.1 Typical application

Via the FB a singleturn or multiturn absolute value bus encoder (CAN, Profibus) can be adapted to the application.

- Example: Master value encoder via system bus (CAN) for detecting the speed of the material path.
- The encoder information conditioned can be optionally used as absolute position or as master speed.
- Via the inputs and parameters the position output can be set to a position defined (set reference) which is reconstructed after mains switching.

5.81.2 Encoder settings

Encoder resolution

By means of the settings in C05273 (singleturn resolution) and C05274 (multiturn resolution) the FB recognises whether a singleturn or multiturn encoder is used.

- For an encoder of the "singleturn" type, for instance only the number of increments of the encoder has to be set in C05273, and C05274 remains on the Lenze setting "1".
- If a "multiturn" encoder is used, in addition to the number of increments the number of revolutions has to be set in C05274.

Note!

The product of a singleturn and multiturn resolution set must not exceed the numerical value of 2^{31}-1!

Please also see: ▸ 64 bit encoder signal evaluation (📖 302)

Encoder initialisation time

The FB can consider an encoder initialisation time after which the encoder for the first time supplies signals via the bus after switch-on.

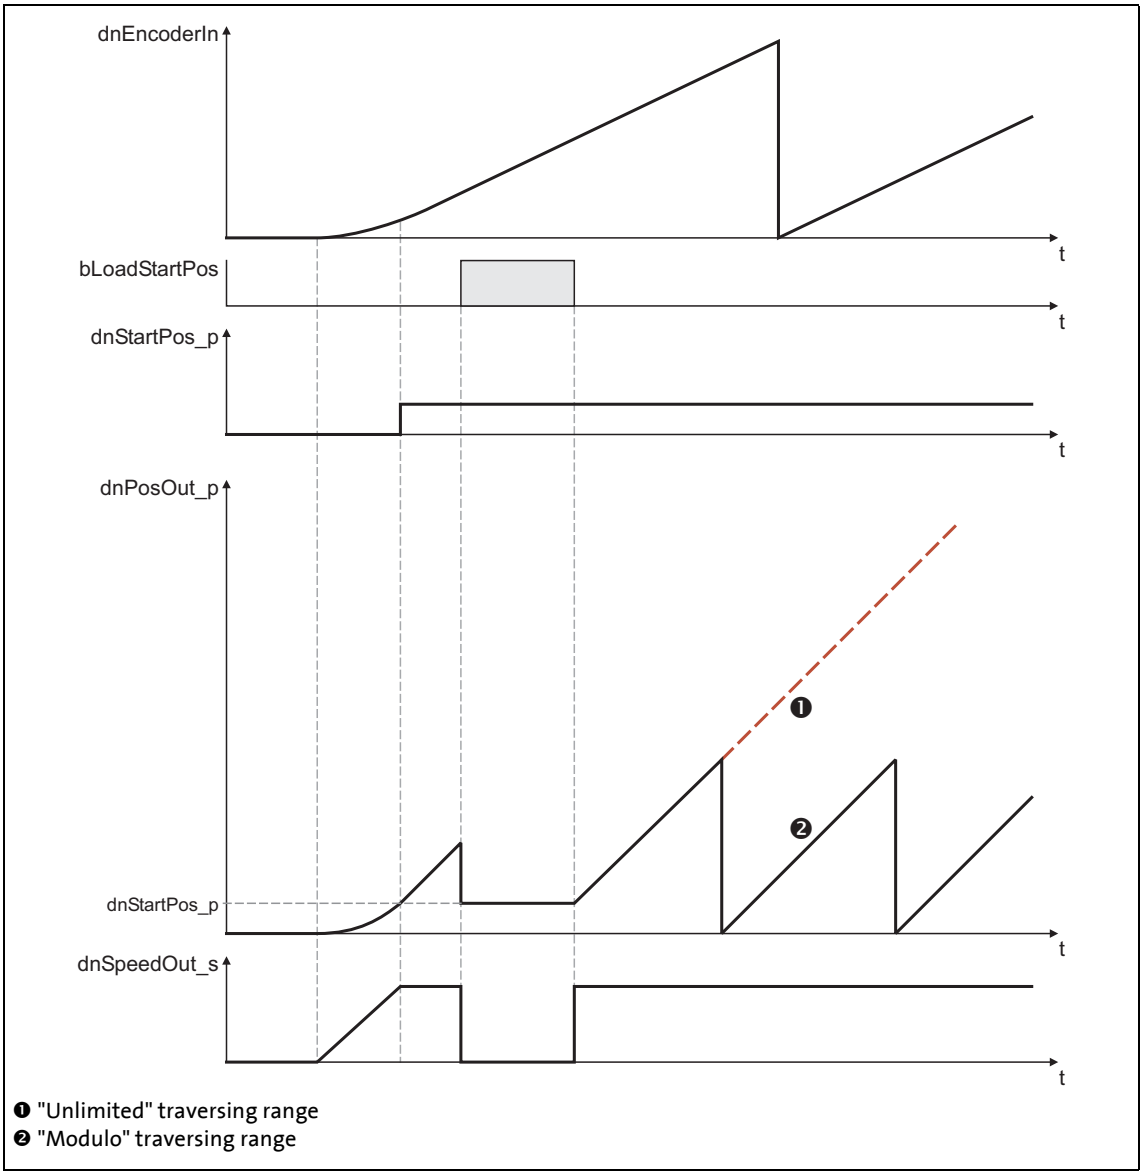
- This initialisation time is to be set in C05277.
- Until this initialisation time has elapsed, the output *bInit* is set to TRUE, and the FB does not carry out internal calculations yet.

Behaviour after mains switching

In C05275 it can be selected whether the position is to be deleted after mains switching (initialised with "0"), or if the last value is to be reconstructed, which is only reasonable if an absolute value encoder is used.

5.81.3 64 bit encoder signal evaluation

This function extension will be available from library V01.03.xx.xx!



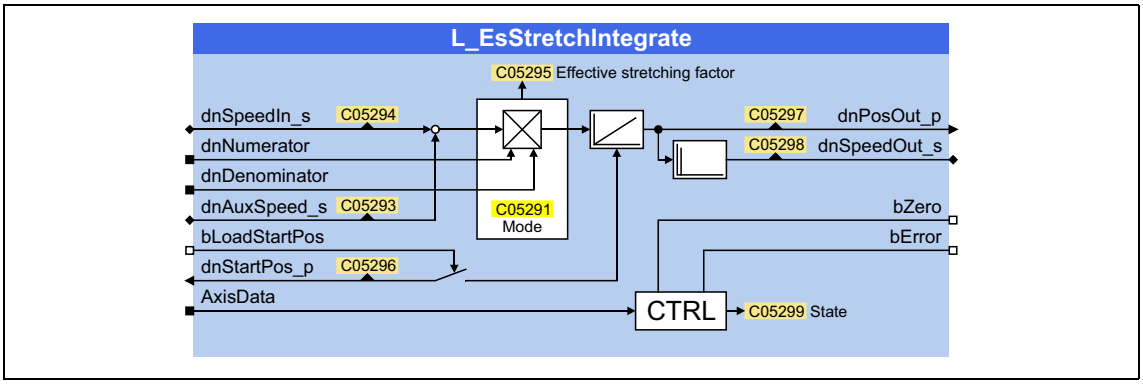
If "1: 64 bit encoder signal" has been selected in C05271, the *dnEncoderIn*2 input is evaluated in addition to the *dnEncoderIn* input for the second encoder signal:

- The position (number of increments) is transmitted within a revolution via the *dnEncoderIn* input. The position has a fixed resolution of 32 bits.
- The current number of encoder revolutions is transmitted via the *dnEncoderIn2* input.
- The (multiturn) resolution for the *dnEncoderIn2* input is set in C05274.
- C05273 (singleturn resolution) is inactive in this mode (is not evaluated).

How to convert encoder information / an encoder position from encoder input X8 into a _p position of the internal measuring system:

1. Connect the *ENC_dnEncoderOut1* output of the **LS_EncoderX8** system block to the *dnEncoderIn* input.
2. Connect the *ENC_dnEncoderOut2* output of the **LS_EncoderX8** system block to the *dnEncoderIn2* input.
3. Select "1: 64 bit encoder signal" in C05271 to ensure that the second input, *dnEncoderIn2*, is also evaluated.
4. Set the resolution of the multiturn encoder in C05274 (maximum number of revolutions).

5.81.4 Signal characteristics



[5-41] Signal characteristics

5.82 L_EsStretchIntegrate - synchronously stretching/compressing the master value

Function library:	LenzeElectricalShaft
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to stretch and compress a master value in the "Modulo" or "Unlimited" traversing range. For this purpose, the FB integrates the input speed to a position and stretches or compresses it.

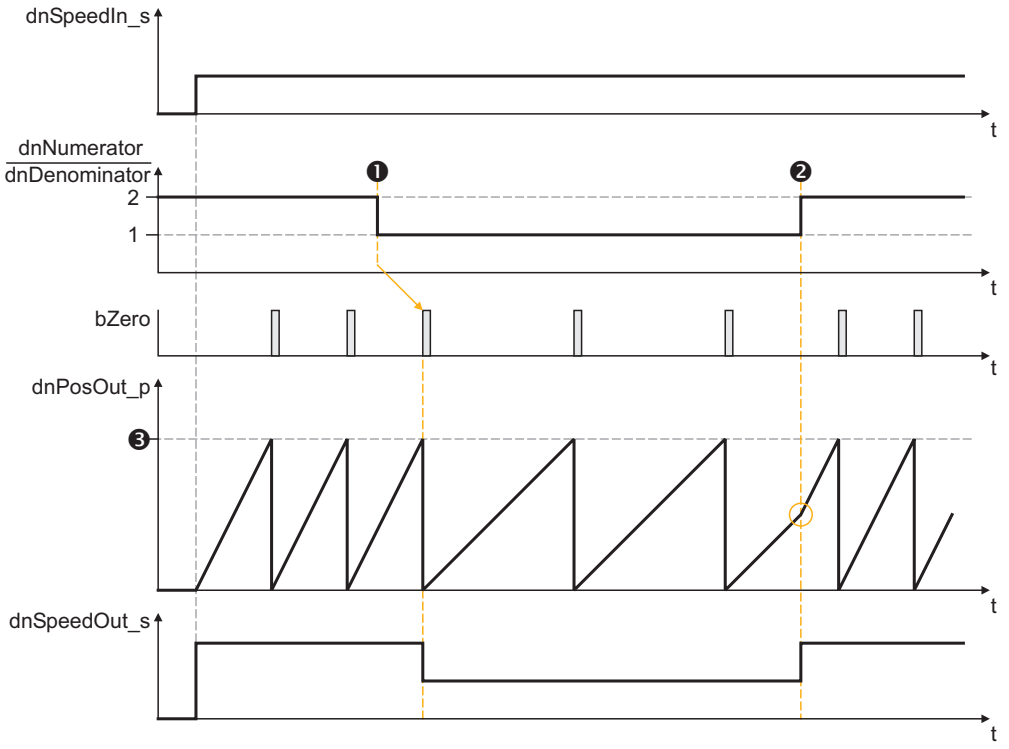
- Via the inputs *dnNumerator* and *dnDenominator* a free stretch factor can be defined for the speed ratio.
- In C05291 only the synchronous stretching/compression is preset as a mode, i. e. a new stretch factor is only accepted in the cycle transition of the position (modulo systems only).
- Via the input *bLoadStartPos* the position output can be set to the starting position pending at the input *dnStartPos_p*.
- In addition to the position, the resulting speed is shown at the output *dnSpeedOut_s*.

Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864 • Display parameter: C05294
dnNumerator DINT	Stretch factor (numerator) • $\pm 2^{31}$-1 • If an invalid value is selected, the ratio will be set to "0".
dnDenominator DINT	Stretch factor (denominator) • 0 ... 2^{31}-1 • A negative stretch factor can only be defined via *dnNumerator*. • In the case of an input value < 0, processing is continued internally with 1. • If an invalid value is selected, the ratio will be set to "0".
dnAuxSpeed_s DINT From library V01.01.xx.xx	Additional (compensation) speed in [rpm] • For example from mark correction. • 15000 rpm ≡ 2^{26} ≡ 67108864 • Display parameter: C05293
bLoadStartPos BOOL	Load the integrator with starting position TRUE: Load the integrator with the value at the *dnStartPos_p* input.

Identifier/data type	Information/possible settings
dnStartPos_p DINT	Starting position in [inc] with which the integrator is loaded by setting *bLoadStartPos* to TRUE. • C05295 indicates the starting position in the real unit of the machine.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters contained within the cam data can be read out via L_CamGetAxisData FB. In this case the FB output *AxisData* must be connected to this input. (📖 155) • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs



Identifier/data type	Value/meaning	
dnPosOut_p DINT	Master position output in [inc] • Overflow is possible (display via *bLimit*) • C05297 indicates the master position in the real unit of the machine.	
dnSpeedOut_s DINT	Master speed output in [rpm] • C05298 indicates the master speed in the real unit of the machine.	
bZero BOOL	Status signal "Zero position/zero crossing"	
	FALSE	Master value is at any position in the master value cycle (register)
	TRUE	**Permanently:** Master value is at zero position. **For one cycle:** Zero crossing of the master value.
		At the same time the status bit 10 ("Zero crossing active") is set in C05299.
bError BOOL	"Error" status • The status signal can be reset to FALSE via *bLoadStartPos* if the error was caused by a too great starting position at *dnStartPos_p* (see bit 16 in C05299).	
	TRUE	An error has occurred (group signal). • For details see display parameter C05299. • *bError* can be reset to FALSE via *bLoadStartPos* if the error was caused by a too great starting position at *dnStartPos_p* (see bit 16 in C05299).

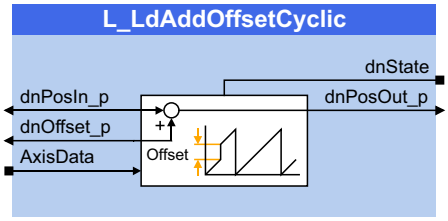
Parameter

Parameter	Possible settings			Information
C05290/1	String of digits			Position unit • Read only
C05290/2	String of digits			Speed unit • Read only
C05291				Stretching/compression mode
	0	Synchronised • Acceptance of a new stretch factor only in the zero crossing.		Lenze setting
	1	Not synchronised • Immediate acceptance of a new stretch factor.		
C05293 From library V01.01.xx.xx	-2147483647	Unit/t	2147483647	Additional compensating speed • Display of the *dnAuxSpeed_s* input signal.

Parameter	Possible settings			Information
C05294	-2147483647	Unit/t	2147483647	Input speed • Display of the *dnSpeedIn_s* input signal.
C05295	-214748.3647		214748.3647	Effective stretch factor
C05296	-214748.3647	Unit	214748.3647	Starting position • Display of the *dnStartPos_p* input signal in the real unit of the machine.
C05297	-214748.3647	Unit	214748.3647	Master position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05298	-214748.3647	Unit/t	214748.3647	Master speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C05299	Status messages:			Status (bit coded) • Bits that are not itemised are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 16 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 16 ... 30) are set.
	bits10	Zero crossing active		
	Error messages:			
	bit16	Position is beyond the cycle		
	bits17	Initial speed too high		
	bits21	Position jump is too big		
	bits23	Invalid axis data structure		
	bits31	General error		

5.82.1 Signal characteristics

❶ Synchronised stretching/compression (C05291 = "1: synchronised")
❷ Immediate acceptance of a new stretch factor (C05291 = "0: not synchronised")
❸Cycle



[5-42] Signal characteristics

5.83 L_LdAddOffsetCyclic - offset addition

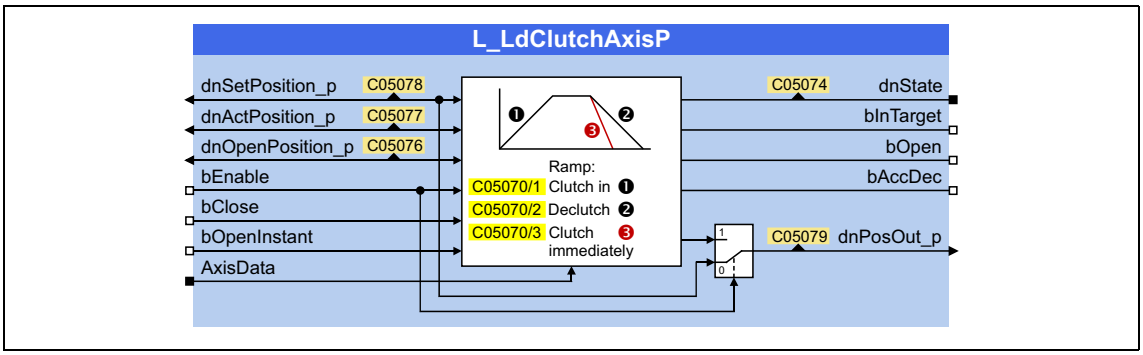
Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to add any offset position to a position signal with Modulo cycle.

- The clock pulse is created without remainder processing.

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Clocked position in [inc] • Apply the position signal with Modulo cycle to this input. • The position must match the measuring system and must not exceed twice the cycle length of the modulo system so that the output is still limited to permissible values (= cycle length of the modulo measuring system). Higher values cause a standstill at the FB output.
dnOffset_p DINT	Offset in [inc] • The offset may be a position of any size. This also applies to the "Modulo" traversing range.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)



Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits10	Zero crossing active
	Bit15	Error
	bits18	No cycle available
	bits21	Input error (e.g. impermissible position jump or inverse direction of motion)
	bits23	No valid axis data structure
dnPosOut_p DINT	Position output in [inc]	

5.84 L_LdClutchAxisP - virtual clutch for synchronism

Function library:	LenzeLineDrive	**Do not use FB for new developments!** Replacement by L_EsClutchPos.
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB provides the "Time-controlled virtual clutch" function with position reference for the "Synchronism" application.

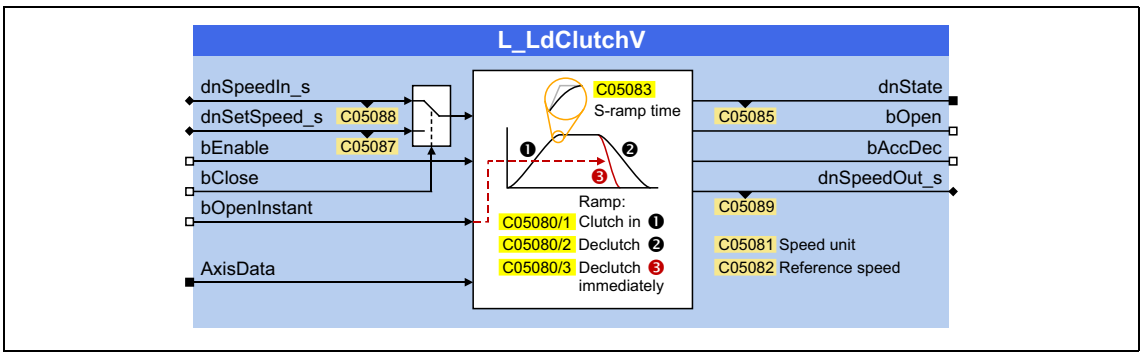
Inputs

Identifier/data type	Information/possible settings	
dnSetPosition_p DINT	Selection of an external master position in [inc] • E.g. by an absolute value encoder or a virtual master. • The external master position must be within the cycle. • C05078 indicates the position of the master shaft in the real unit of the machine.	
dnActPosition_p DINT	Internal master position of the clutch function in [inc] • The internal master position must be within the cycle. • C05077 indicates the master position in the real unit of the machine. • For a master value clutch, connect this input with the output *dnPosOut_p* of this FB.	
dnOpenPosition_p DINT	Selection of the stop position after declutch or selection of the starting position when engaging the master shaft in [inc]. • The stop position/starting position must be within the cycle. • C05076 indicates the stop position in the real unit of the machine.	
bEnable BOOL	Activate the clutch function • This input has the highest priority.	
	FALSE	Clutch function is deactivated. • The input *dnSetPosition_p* connected 1:1 to the output *dnPosOut_p*. No ramps are active.
	TRUE	Clutch function is activated.
bClose BOOL	Control of clutch function	
	FALSE	Open the clutch. • The master position *dnPosOut_p* is positioned via the set ramp to the stop position *dnOpenPosition_p*.
	TRUE	Close the clutch. • The master position *dnPosOut_p* is synchronised via the set ramp and follows the master shaft *dnSetPosition_p* after it has been clutched in.

Identifier/data type	Information/possible settings	
bOpenInstant BOOL	Positive opening operation of the clutch. • This input has the second highest priority (after *bEnable*).	
	FALSE↗TRUE	The master position *dnPosOut_p* is separated from the master shaft and stopped via the set ramp.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit 1	State active
	Bit 2	Procedure completed
	Bit 3	Acceleration/deceleration phase
	Bit 8	Brake/clutch closed
	Bit 9	Waiting for clutch process
	Bit 15	Error
	Bit 16	Starting position is beyond the cycle
	Bit 18	No cycle available
	Bit 19	Maximum speed = "0"
	Bit 21	Input error (e.g. impermissible position jump or inverse direction of motion)
	Bit 23	No valid axis data structure
bInTarget BOOL	Status signal "Position reached"	
	TRUE	Position reached (clutch or declutch process or positive opening operation has been completed).
bOpen BOOL	Status signal "Clutch/declutch process is active"	
	FALSE	Clutch is closed, master position follows the master shaft.
	TRUE	Master position is synchronised to the master shaft after the clutch is closed or the master position is shut down after the clutch is opened. • *dnActPosition_p* and *dnSetPosition_p* are not synchronous!
bAccDec BOOL	Status signal "Ramp function of the clutch is active"	
	FALSE	Ramp function of the clutch is not active. • The clutch is closed or the master position is shut down.
	TRUE	Ramp function of the clutch is active. • The master position is synchronised or shut down. • The TRUE signal is pending immediately if the clutch or declutch process is started via the input *bClose*.
dnPosOut_p DINT	Master position output (current position of the master shaft in the cycle) in [inc] • C05079 indicates the current master position in the real unit of the machine.	



Parameters

Parameter	Possible settings			Info
C05070/1	0.010	s	130.000	Ramp: Clutch in • Acceleration ramp for synchronising to the master shaft. • This specification and the reference speed that exists in the axis data serve to calculate an internal acceleration. This acceleration serves to calculate the clutch-in path. • When a higher clutch-in time is set, the clutch-in path can also be executed via several cycles. • Initialisation: 1.000 s
C05070/2	0.010	s	130.000	Ramp: Declutch • Deceleration ramp for shutdown of the master position. • This specification and the reference speed that exists in the axis data serve to calculate an internal acceleration. This acceleration serves to calculate the declutch path. • When a higher declutch time is set, the declutch path can also be executed via several cycles. • Initialisation: 1.000 s
C05070/3	0.010	s	130.000	Ramp: Positive opening operation • Deceleration ramp for the positive opening operation. • Initialisation: 1.000 s
C05071/1 From library V02.02.xx.xx onwards	Character string			Position unit • Read only
C05071/2 From library V02.02.xx.xx onwards	Character string			Speed unit • Read only
C05072 From library V02.02.xx.xx onwards	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.
C05074	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C05076	-214748.3647	Unit	214748.3647	Set position after declutching • Display of the *dnOpenPosition_p* input signal in the real unit of the machine.
C05077	-214748.3647	Unit	214748.3647	Actual position of the master angle • Display of the *dnActPostion_p* input signal in the real unit of the machine.
C05078	-214748.3647	Unit	214748.3647	Master position at the input • Display of the *dnSetPostion_p* input signal in the real unit of the machine.
C05079	-214748.3647	Unit	214748.3647	Master position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.

5.85 L_LdClutchV - virtual clutch for electronic gearboxes

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB provides the "Virtual clutch" function with speed reference for the "Electronic gearbox" application.

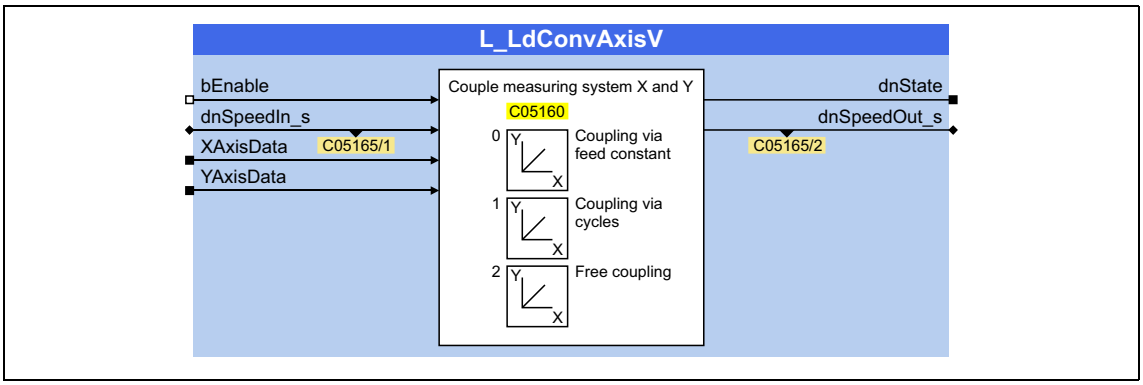
Inputs

Identifier/data type	Information/possible settings	
dnSpeedIn_s DINT	Setpoint speed • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference. • C05088 indicates the setpoint speed in the real unit of the machine.	
dnSetSpeed_s DINT	Basic speed • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference. • The selected speed is output at *dnSpeedOut_s* when the clutch is open. • C05087 indicates the basic speed in the real unit of the machine.	
bEnable BOOL	Activate the clutch function • This input has the highest priority.	
	FALSE	Clutch function is deactivated. • The input *dnSpeedIn_s* is connected through 1:1 to output *dnSpeedOut_s*. No ramps are active.
	TRUE	Clutch function is activated.
bClose BOOL	Control of clutch function	
	FALSE	Open the clutch. • The master speed *dnSpeedOut_s* is led to the basic speed *dnSetSpeed_s* via the set ramp.
	TRUE	Close the clutch. • The master speed *dnSpeedOut_s* is synchronised to the setpoint speed *dnSpeedIn_s* via the set ramp.
bOpenInstant BOOL	Positive opening operation of the clutch. • This input has the second highest priority (after *bEnable*).	
	FALSE↗TRUE	The master speed *dnSpeedOut_s* is separated from the master shaft and stopped via the set ramp.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits1	State active
	bits3	Acceleration/deceleration phase
	bits8	Brake/clutch closed
	Bit15	Error
	bits23	No valid axis data structure
bOpen BOOL	Status signal "Clutch/declutch process is active"	
	FALSE	Clutch is closed, *dnSpeedOut_s* follows *dnSpeedIn_s*.
	TRUE	*dnSpeedOut_s* is asynchronous to *dnSpeedIn_s* and is led via the internal profile generator.
bAccDec BOOL	Status signal "Ramp function of the clutch is active"	
	FALSE	Ramp function of the clutch is not active. • The clutch is closed or the master speed is shut down.
	TRUE	Ramp function of the clutch is active. • The master speed is accelerated or decelerated.
dnSpeedOut_s DINT	Speed output in [rpm] • C05089 indicates the speed in the real unit of the machine.	

Parameter



Parameter	Possible settings			Information
C05080/1	0.010	s	130.000	Ramp: Clutch in • Acceleration ramp for synchronising to *dnSpeedIn_s*. • Initialisation: 1.000 s
C05080/2	0.010	s	130.000	Ramp: Declutch • Deceleration ramp for synchronising to *dnSetSpeed_s*. • Initialisation: 1.000 s
C05080/3	0.010	s	130.000	Ramp: Positive opening operation • Deceleration ramp for the positive opening operation. • Initialisation: 1.000 s
C05081 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C05082 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.
C05083	0.010	s	130.000	S-ramp time • For jerk limitation. • Initialisation: 1.000 s
C05085	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C05087	-214748.3647	Unit	214748.3647	Setpoint speed after declutching • Read only • Calculated from the speed signal *dnSetSpeed_s*.

Parameter	Possible settings			Information
C05088	-214748.3647	Unit	214748.3647	Speed at the input • Read only • Calculated from the speed signal *dnSpeedIn_s*.
C05089	-214748.3647	Unit	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.

5.86 L_LdConvAxisV - speed ratio

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB transforms a speed between two axes.

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate function	
	FALSE	Output speed = "0".
	TRUE	Output speed = transformed input speed.
dnSpeedIn_s DINT	Selection of the master speed • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *XAxisData* are used as speed reference. • C05165/1 indicates the master speed in the real unit of the machine.	
XAxisData	Machine parameters for scaling the master speed (master shaft) • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	
YAxisData	Machine parameters for scaling the setpoint speed (tool) • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**.	

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits14	Internal limitation for calculation
	Bit15	Error
	bits23	No valid axis data structure
dnSpeedOut_s DINT	Setpoint speed output in [rpm] • C05165/2 indicates the setpoint speed in the real unit of the machine.	

Parameter

Parameter	Possible settings				Information
C05160					Coupling measuring systems X and Y
	0	Coupling via feed constants			Lenze setting
	1	Coupling via cycles			
	2	Free coupling			
C05161/1	0		Unit	214748.3647	Cycle X • Read only
C05161/2	0		Unit	214748.3647	Cycle Y • Read only
C05162/1	0.0000			214748.3647	Coupling factor X • Initialisation: 0.0000
C05162/2	0.0000			214748.3647	Coupling factor Y • Initialisation: 0.0000
C05163/1	String of digits				User-defined unit X • Read only
C05163/2	String of digits				User-defined unit Y • Read only
C05165/1	-214748.3647		Unit/t	214748.3647	Speed X at the input • Read only • Calculated from the speed signal *dnSpeedIn_s*.
C05165/2	-214748.3647		Unit/t	214748.3647	Speed Y at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C05169	-2147483647			2147483647	Status • Display of the bit-coded output signal *dnState*.

Function

This FB transforms a speed between two axes, calculating the function of an electronic gearbox. The transformation works with remainder processing.

Operating mode 0 (unit coupling):

- In this operating mode, the FB couples both axes via the set feed constants.
- Via C05162/1 and C05162/2 the ratio of the corresponding units is set, i.e. the number of units of the X axis that corresponds to the number of units of the Y axis.

$$\text{Output value} = \text{Input value} \cdot \frac{\text{Gearbox constant Y}}{\text{Gearbox constant X}} \cdot \frac{\text{Feed constant X}}{\text{Feed constant Y}} \cdot \frac{\text{Coupling factor Y (C05162/2)}}{\text{Coupling factor X (C05162/1)}}$$

[5-43] Formula for operating mode 0

Operating mode 1 (clock equality):

- In this operating mode the FB makes use of the set cycles. The transformation displays one cycle of the X axis exactly in one cycle of the Y axis.

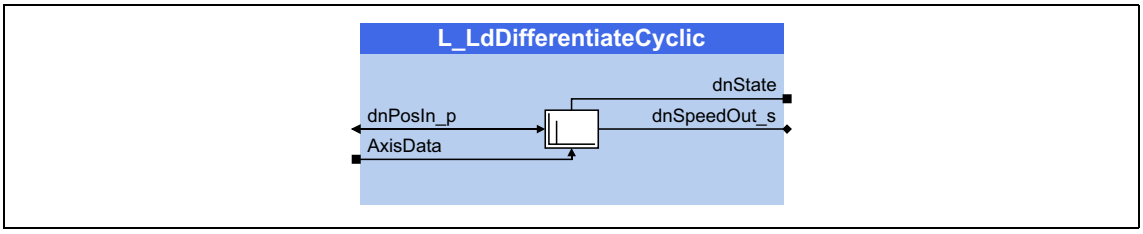
$$\text{Output value} = \text{Input value} \cdot \frac{\text{Gearbox constant Y}}{\text{Gearbox constant X}} \cdot \frac{\text{Feed constant X}}{\text{Feed constant Y}} \cdot \frac{\text{Cycle Y}}{\text{Cycle X}}$$

[5-44] Formula for operating mode 1

Operating mode 2 (free coupling):

- In this operating mode the set feed constants are not used for the transformation.
- Via C05162/1 and C05162/2 the revolution ratio is indicated, i.e. the number of revolutions of the master shaft that corresponds to the number of revolutions of the tool.

$$\text{Output value} = \text{Input value} \cdot \frac{\text{Gearbox constant Y}}{\text{Gearbox constant X}} \cdot \frac{\text{Coupling factor Y (C05162/2)}}{\text{Coupling factor X (C05162/1)}}$$



[5-45] Formula for operating mode 2

5.87 L_LdDifferentiateCyclic - cyclic differentiation

Function library:	LenzeLineDrive	**Do not use FB for new developments!** Replacement by L_SdDifferentiate.
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

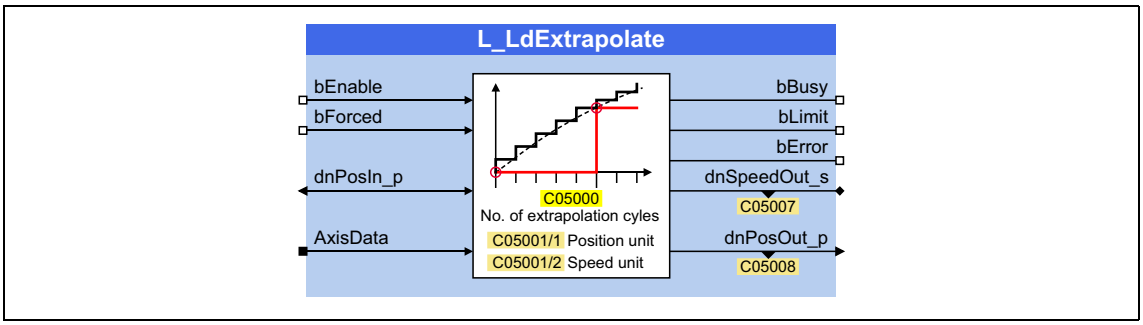
This FB differentiates a position with regard to a speed in consideration of the cycle.

- The cycle and shift factor for the position resolution are read out of the machine parameters (*AxisData*).
- The clock pulse is created with remainder processing.
- The FB is the counterpart of the FB L_LdIntegrateCyclic. (📖 322)

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Clocked position in [inc] • Scaling: 1 encoder revolution ≡ 2^{16} increments (or acc. to *AxisData*)
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits10	Zero crossing active
	bits14	Internal limitation for calculation
	Bit15	Error
	bits18	No cycle available
	bits21	Input error (e.g. impermissible position jump or inverse direction of motion)
	bits23	No valid axis data structure
dnSpeedOut_s DINT	Speed • Scaling: 15000 rpm ≡ 2^{26} ≡ 67108864	

5.88 L_LdExtrapolate - extrapolation

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to extrapolate position information in order to e.g. compensate higher bus transmission cycles or smooth absolute value encoders with low resolution. A forced extrapolation is also possible.

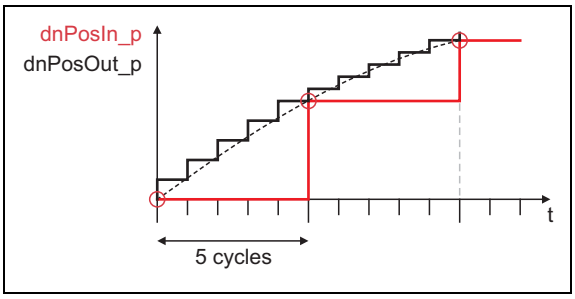
- The LenzeServoDrive library (as of V02.00.xx.xx) provides the FB L_SdInterpolate for interpolation. (📖 483)

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate extrapolation	
	FALSE	The master value at *dnPosIn_p* is connected through 1:1 to the output *dnPosOut_p*.
	TRUE	The master value at *dnPosIn_p* is output to *dnPosOut_p* depending on the input *bForce* and the number of the extrapolation cycles set in C05000.
bForced BOOL	Forced extrapolation	
	FALSE	Extrapolation is only executed if the input value in the task cycle does not change, for instance, since the fieldbus cycle is longer and does not provide new position values in the task cycle.
	TRUE	Extrapolation is executed irrespective of master value changes.
dnPosIn_p DINT	Position of the external, and, as the case may be, insufficiently resolved master shaft in [inc].	
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
bBusy BOOL	Status signal "Extrapolation is executed"	
	TRUE	Extrapolation is executed.
bLimit BOOL	Status signal "Extrapolation limit reached"	
	TRUE	Extrapolation limit (C05000) reached.
bError BOOL	"Error" status signal	
	TRUE	Master position *dnPosIn_p* has exceeded the cycle defined in the machine parameters (*AxisData*).
dnSpeedOut_s DINT	Master speed output (in the cycle) in [rpm] • C05007 indicates the master speed in the real unit of the machine.	
dnPosOut_p DINT	Master position output (in the cycle) in [inc] • C05008 indicates the master position in the real unit of the machine.	



Parameter

Parameter	Possible settings			Information
C05000	1		127	Number of extrapolation cycles • Initialisation: 1
C05001/1 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C05001/2 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C05007	-214748.3647	Unit/t	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C05008	-214748.3647	Unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05009				Extrapolation cycles > selection • Read only
	0	No (OK)		
	1	Yes (error)		

5.88.1 Function

Compensation of bus transmission cycles > Sampling rate

If position information (e.g. the vertical shaft position) is exchanged between master and slave drives via a bus system with a transmission cycle higher than the sampling rate or between tasks with different cycle times, the setpoints cannot be processed in the control cycle of the drives. As a result, the position does not change linearly but stepwise at constant speed, which causes torque impulses.

[5-46] Example: Signal characteristic with five extrapolation cycles

- This FB serves to smooth the stepping by extrapolation.
- The number of the extrapolation cycles to be set in C05000 are defined according to the following formula:

$$C05000 = \frac{\text{Bus cycle [ms]}}{\text{Task cycle [ms]}}$$

Note!

Ensure that an integer value results for the number of extrapolation cycles so that the position information increases linearly and a speed calculation can be carried out correctly. In the case of integer conditions, an alternating speed characteristic results.

- If a smaller value is set than calculated according to the formula mentioned above, the extrapolation limit is reached and this is displayed by the output *bLimit*. In this case, *dnPosIn_p* is directly connected through to *dnPosOut_p*.
- If a higher value is set than calculated according to the formula mentioned above, it has no impact.

- By setting *bEnable* to TRUE, the extrapolation is activated.
- If *bEnable* is set to FALSE, the input signal is only looped through or the difference for speed output is created.

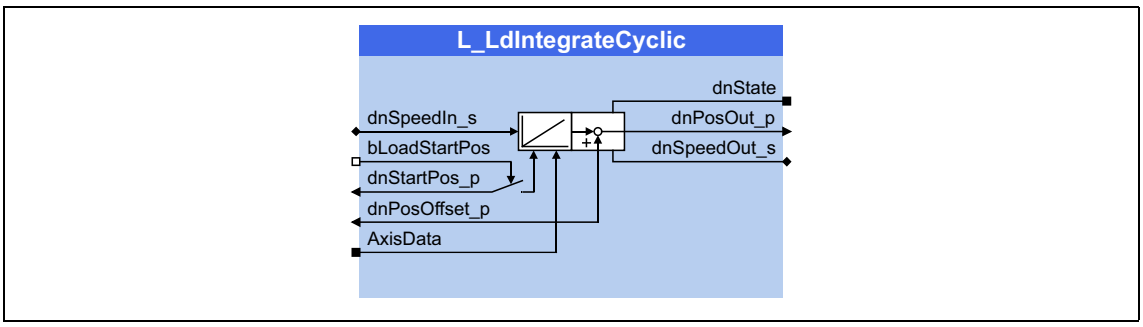
Smoothing of a low-resolution absolute value encoder

If the resolution of the absolute value encoder is so low that a new setpoint is not available for every new task call, this FB serves to "fine-interpolate" between the setpoints for a better smooth running.

- For this purpose enter instead of the bus cycle time the resolution converted at minimum speed into the formula mentioned above for calculating the extrapolation cycles.

Forced extrapolation

Forced extrapolation means that it is extrapolated up to the maximum value in C05000 irrespective whether the input signal has changed or not.



- The forced extrapolation is activated by setting *bForced* to TRUE.

5.89 L_LdIntegrateCyclic - cyclic integration

Function library:	LenzeLineDrive	**Do not use FB for new developments!** Replacement by L_SdIntegrateAxis.
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

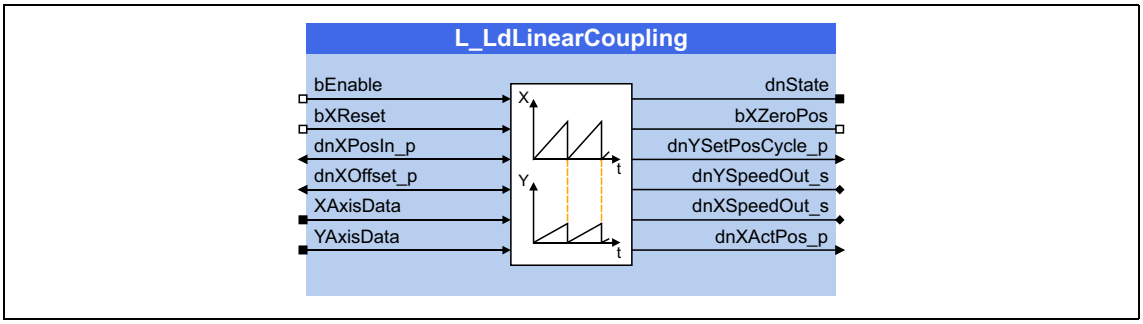
This FB integrates a speed in a position (by analogy with the FB L_SdIntegrate) in consideration of the cycle.

- It is possible to add a position offset to the output position, e.g. for trimming purposes. This function corresponds exactly to the FB L_LdAddOffsetCyclic. (📖 308)
- The cycle and shift factor for the position resolution are read out of the machine parameters (*AxisData*).
- The clock pulse is created with remainder processing.
- The FB is the counterpart of the FB L_LdDifferentiateCyclic. (📖 318)

Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed • 15000 rpm ≡ 2^{26} ≡ 67108864
bLoadStartPos BOOL	Load the integrator with starting position TRUE: Load the integrator with the value at the *dnStartPos_p* input.
dnStartPos_p DINT	Starting position in [inc] with which the integrator is loaded by setting *bLoadStartPos* to TRUE.
dnPosOffset_p DINT	Position offset in [inc]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) • If this input is released, the following scaling applies: 1 motor revolution ≡ 2^{16}

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits10	Zero crossing active
	bits14	Internal limitation for calculation
	Bit15	Error
	bits18	No cycle available
	bits21	Input error (e.g. impermissible position jump or inverse direction of motion)
	bits23	No valid axis data structure
dnPosOut_p DINT	Position output in [inc]	
dnSpeedOut_s DINT	Speed output in [rpm] • Under consideration of the selected position offset.	

5.90 L_LdLinearCoupling - master value connection

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel
