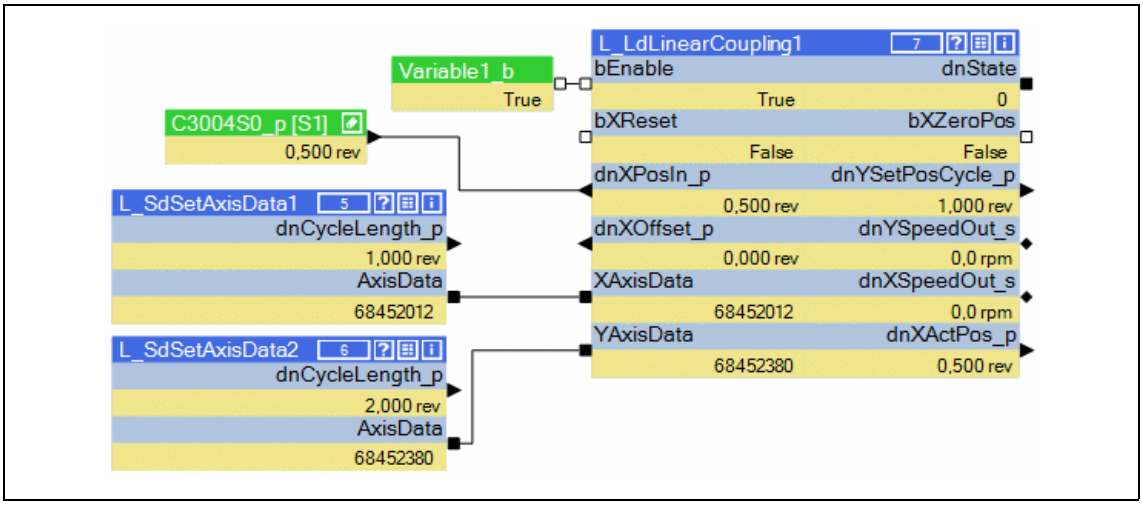
This FB serves as master value connection for the "Synchronism" application.

- The *dnYSetPosCycle_p* position value (Y cycle of the Y axis) is synchronous to the *dnXPosIn_p* master value (cycle of the X axis), i.e. if the master value overflows, a new cycle also starts for the *dnYSetPosCycle_p* output.
- The FB makes use of the set cycles of *XAxisData* and *YAxisData*. The transformation displays one cycle of the X axis exactly with residual values in one cycle of the Y axis.
- Internal calculation:
  dnYSetPosCycle = *dnXPosIn_p* * (cycle Y / cycle X)

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate function	
	FALSE	Function has been deactivated. • The *dnXSpeedOut_s* and *dnXActPos_p* outputs continue to follow the *dnXPosIn_p* and *dnXOffset_p* input positions. • A value of "0" is output at the *dnYSpeedOut_s* output. • The *dnYSetPosCycle_p* output is maintained on the last value. **Caution:** Consequently, a position step change on the master value end will not be displayed at the *dnYSpeedOut_s* and *dnYSetPosCycle_p* outputs!
	TRUE	Function is activated.
bXReset BOOL	Reset the master value selection *dnXPosIn_p* internally	
	FALSE	Output corresponds to *dnXPosIn_p* + *dnXOffset_p*.
	TRUE	Master value selection *dnXPosIn_p* is internally set to and held at "0". Output corresponds to *dnXOffset_p*.
dnXPosIn_p DINT	Master value selection in [inc] • C05186 indicates the master position in the real unit of the machine.	
dnXOffset_p DINT	Phase offset selection for the master value in [inc] • The phase offset is applied immediately. • C05187 indicates the phase offset in the real unit of the machine.	
XAxisData	Machine parameters for scaling the master value • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	
YAxisData	Machine parameters for scaling the setpoint • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**.	

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits10	Zero crossing active
	bits14	Internal limitation for calculation
	Bit15	Error
	bit16	Starting position is beyond the cycle
	bits18	No cycle available
	bits22	No cycle available for Y axis
	bits23	No valid axis data structure
bXZeroPos BOOL	Status signal "Zero position/zero crossing" • The input signal *dnXActPos_p* is the reference.	
	FALSE	Master value is at any position in the master value cycle (register)
	TRUE	**Permanently:** Master value is at the zero position of the master value integrator. **For one cycle:** Zero crossing of the master value integrator.
dnYSetPosCycle_p DINT	Setpoint position output in [inc] • Output of the position setpoint in the setpoint cycle as a function of the master value (master value cycle). • The return of master value cycle and setpoint cycle depends on the corresponding cycles set. Thus, the return is firmly linked to the master value cycle. • If the FB is deactivated (*bEnable* = FALSE), the output is maintained on the last set-point position. • C05189 indicates the setpoint position in the real unit of the machine.	
dnYSpeedOut_s DINT	Setpoint speed output in [rpm] • If the FB is deactivated (*bEnable* = FALSE), a value of "0" is output. • C05184 indicates the setpoint speed in the real unit of the machine.	
dnXSpeedOut_s DINT	Master speed output in [rpm] • If the FB is deactivated (*bEnable* = FALSE), the resulting master speed is output as before. • C05183 indicates the master speed in the real unit of the machine.	
dnXActPos_p DINT	Master position output in [inc] • Results from MODULO(*dnXOffset_p* + *dnXPosIn_p*) • If the FB is deactivated (*bEnable* = FALSE), the resulting master position is output as before. • C05188 indicates the master position in the real unit of the machine.	

Parameter

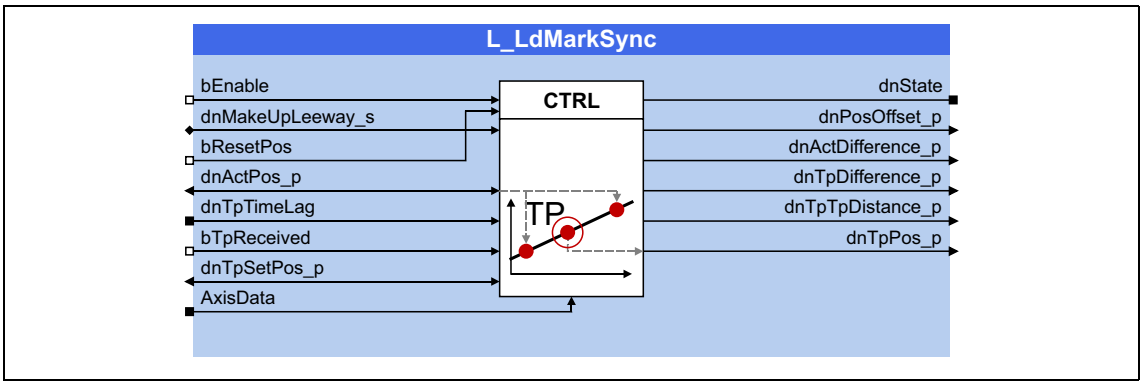
Parameter	Possible settings			Information
C05180/1 As of library V02.02.xx.xx	String of digits			X position unit • Read only
C05180/2 As of library V02.02.xx.xx	String of digits			X speed unit • Read only
C05180/3 As of library V02.02.xx.xx	String of digits			Y position unit • Read only
C05180/4 As of library V02.02.xx.xx	String of digits			Y speed unit • Read only
C05181	-214748.3647		214748.3647	Status • Display of the bit-coded output signal *dnState*.

Parameter	Possible settings			Information
C05183	-214748.3647	Unit/t	214748.3647	Speed X at the output • Read only • Calculated from the speed signal *dnXSpeedOut_s*.
C05184	-214748.3647	Unit/t	214748.3647	Speed Y at the output • Read only • Calculated from the speed signal *dnYSpeedOut_s*.
C05186	-214748.3647	Unit	214748.3647	Position X at the input • Display of the *dnXPosIn_p* input signal in the real unit of the machine.
C05187	-214748.3647	Unit	214748.3647	Trimming X • Display of the *dnXOffset_p* input signal in the real unit of the machine.
C05188	-214748.3647	Unit	214748.3647	Position X at the output • Display of the output signal *dnXActPos_p* in the real unit of the machine.
C05189	-214748.3647	Unit	214748.3647	Position Y at the output • Display of the output signal *dnYSetPosCycle_p* in the real unit of the machine.

5.90.1 Interconnection example

[5-47] Interconnection example

5.91 L_LdMarkSync - mark synchronisation



Function library:	LenzeLineDrive	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

When mark synchronisation is performed, this FB calculates the position at which a mark signal (touch probe signal) occurred. Furthermore, the remaining distance to the setpoint position of the mark is observed and output.

- High-precision detection of the actual TP position for which a mark signal occurred.
- Application only in conjunction with modulo measuring systems.
- Comparison with a TP setpoint position at which the mark ideally occurs.
- Calculation of the TP deviation (= deviation between the actual TP position and the TP setpoint position).
- Feedback of the correcting signal and monitoring of the outstanding TP deviation.
- Distance measurement between two mark signals.

Note!

The generation of the correcting motion is not part of the L_LdMarkSync FB. For this purpose, use e.g. the L_LdPosCtrlLin FB (time-controlled correction) or the L_CamSyncIn FB (path-controlled correction).

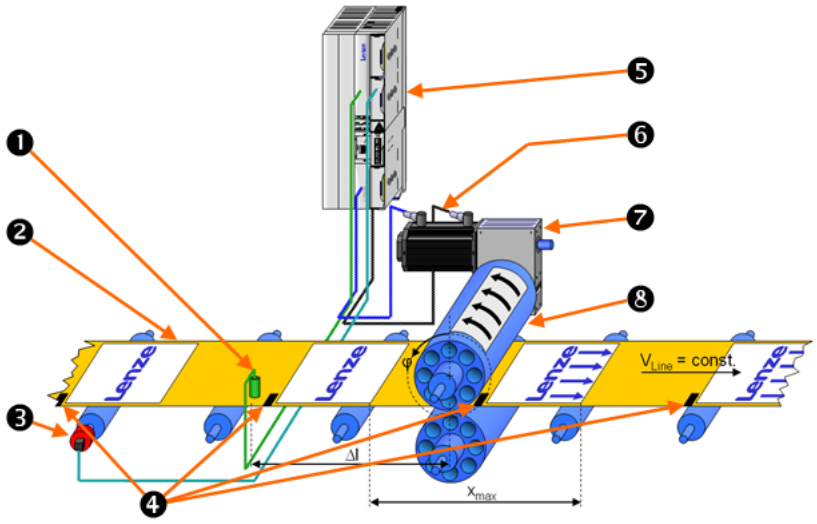
Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate FB	
	FALSE	FB is deactivated: Touch probe signals are not evaluated. A value of "0" is output at the *dnActDifference_p*, *dnTpDifference_p*, *dnTpTpDistance_p* and *dnTpPos_p* outputs. The value at the *dnPosOffset_p* output remains unchanged.
	TRUE	FB is activated: After a touch probe signal has occurred, the outputs display the described quantities. The monitoring of the remaining TP deviation (the *dnActDifference_p* output signal) is switched on.

Identifier/data type	Information/possible settings	
dnMakeUpLeeway_s DINT	Selection (addition) of the compensating speed as a speed signal • Scaling: $2^{26} \equiv 15000$ [rpm] • The *dnActDifference_p* output is set using this speed. The following applies from library V02.04.xx.xx: • The signal at this input is internally processed only as a sum so that the remaining TP distance (the *dnActDifference_p* output signal) can in fact be reduced with the defined *dnMakeUpLeeway_s* speed but never be increased. • If the remaining TP deviation *dnActDifference_p* has been compensated to zero completely, the signal does not have any effect anymore at this input.	
bResetPos BOOL	Reset internal offset integrator	
	FALSE	The internal offset integrator (the *dnPosOffset_p* output = sum of the compensated TP correction distances so far) is set via the performed TP correcting motions.
	TRUE	The internal offset integrator (the *dnPosOffset_p* output) is set to zero.
dnActPos_p DINT	Input for the acceptance of the current position of the system in [increments] for which a touch probe position is to be determined: • If the master value is corrected (x touch probe), the master position can be connected, e.g. the position output of the master value integrator. • If the drive axis is corrected (y touch probe), the actual position value, *FDB_dnActualPos_p*, can be connected. • Please observe that the modulo measuring system connected to the *AxisData* input must go with the position value specified here.	
dnTpTimeLag DINT	Input for accepting the touch probe time stamp • Connect this input with the output *dnTouchProbeTimeLag* of the corresponding touch probe system block. • The time stamp displays the time that has passed between the touch probe event and the calling of the ApplicationTask. • Scaling: $2^{20} \equiv 1048576 \equiv 1$ [ms]	
bTpReceived BOOL	Input for taking over the status "Touch probe detected" • Connect this input with the output *dnTouchProbeReceived* of the corresponding touch probe system block.	
	FALSE↗TRUE	Touch probe detected. • The actual position at the time when the touch probe is detected is calculated and output at the *dnTpPos_p* output. • The TP difference between the TP setpoint position, *dnTpSetPos_p*, and the actual position, *dnTpPos_p*, is output at the *dnTpDifference_p* output. • The remaining TP difference, *dnActDifference_p*, is set to the TP difference, *dnTpDifference_p*. • If a touch probe has already been detected in the last cycle, the position difference between the current and the previous touch probe is output at the *dnTpTpDistance_p* output.

Identifier/data type	Information/possible settings
dnTpSetPos_p DINT	Touch probe setpoint position in [inc] • At this input, specify the position at which the touch probe ideally occurs. • If the touch probe is detected at its (ideal) TP setpoint position, a correcting motion is not required (TP difference *dnTpDifference_p* = 0).
AxisData	Specification of the measuring system which is used to evaluate the touch probe event. The following sources can be used for this input: • If the master position is corrected (x touch probe), an arbitrary measuring system can be defined via the L_SdSetAxisData FB. In this case, its *AxisData* output must be connected to this input. • If an axis position is corrected (y touch probe), the *DI_AxisData* output of the **LS_DriveInterface** SB must be connected to this input. • Some of the cam technology function blocks (e.g. the L_CamProfiler FB) output the measuring systems defined via »Cam Designer«. In this case, the corresponding measuring system output must be connected to this input. **Note:** The connected measuring system must be a modulo measuring system.

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status	
	Bit15	Group error (see bit 16 ... 31)
	bits18	The specified modulo measuring system (the *AxisData* input) does not have a valid cycle (cycle = 0).
	bits20	The TP setpoint position at the *dnTpSetPos_p* input is outside of the permissible cycle of the modulo measuring system (the *AxisData* input).
	bits23	Error in the measuring system: The pointer at the *AxisData* input does not refer to a valid axis data structure.
dnPosOffset_p DINT	Aggregated position offset in [increments] (Aggregation of all correcting motions performed so far) • This output outputs an unlimited correction position. • If the TP is corrected at the axis side (y touch probe), the output can directly be connected to the *FDB_dnPosOffset_p* input of the **LS_Feedback** SB when the axis needs to be corrected.	
dnActDifference_p DINT	Remaining position difference in [increments] • If a touch probe is detected via the *bTpReceived* input, this output is set to the detected TP deviation, *dnTpDifference_p*. • Then, the remaining TP deviation is compensated to zero via the *dnMakeUpLeeway_s* input if a correcting motion is reported (correction distance monitoring). • The shorter distance to the TP setpoint position is always output. (Caution: The function block requires a modulo measuring system to work correctly!)	
dnTpDifference_p DINT	Last TP deviation in [inc] (TP deviation between the TP setpoint position, *dnTpSetPos_p*, and the actual position, *dnTpPos_p*, at which the touch probe has been detected.) • If a touch probe is detected via the *bTpReceived* input, the dnActDifference_p output is set to this value additionally. • The shorter distance to the TP setpoint position is always output. (Caution: The function block requires a modulo measuring system to work correctly!)	

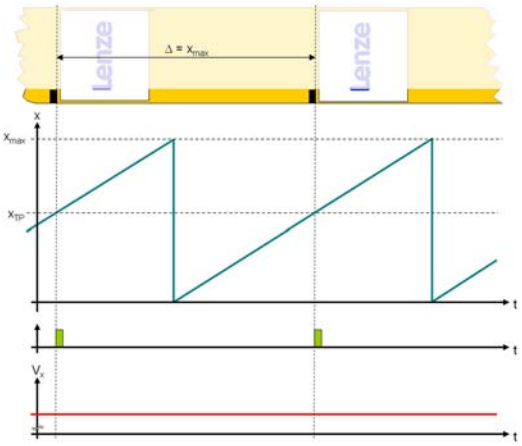
Identifier/data type	Value/meaning
dnTpTpDistance_p DINT	Distance between the two touch probes last detected in [increments] • May e.g. serve to determine the print register (distance between two print marks). • Please make sure that the touch probe sensor is positioned in such a way that no cycle without touch probe detection is possible between two detected touch probes. In this case, the output would indicate a distance which is one cycle too short. This can be prevented by positioning the touch probe sensor in the middle of the cycle.
dnTpPos_p DINT	Detected TP position in [inc] (Actual TP position at which the current touch probe has been detected.) • The distance to the TP setpoint position is calculated using the actual TP position that is output here: *dnTpDifference_p = dnTpSetPos_p - dnTpPos_p*

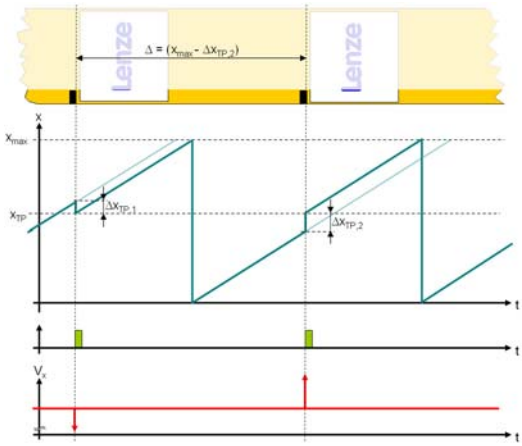
5.91.1 Typical application

Many synchronous operations require a slave drive (tool) to move in synchronism with a master signal/master drive. This motion can be corrected using additional sensor technology.

In the following example, a print register has already been defined by print marks on the web. High-precision detection of these print marks in the controller is possible via fast digital inputs (touch probe inputs).

❶ Print-mark sensor
❷ Web including print register 0 ... x_{max} (print image: "Lenze")
❸ Master value encoder
❹ Print marks
❺ 9400 controller (slave drive = printing roller)
❻ Printing roller drive motor including feedback system
❼ Gearbox (slave drive)
❽ Printing roller including block (print image: "Arrows")





[5-48] Example: Printing roller drive including print-mark correction

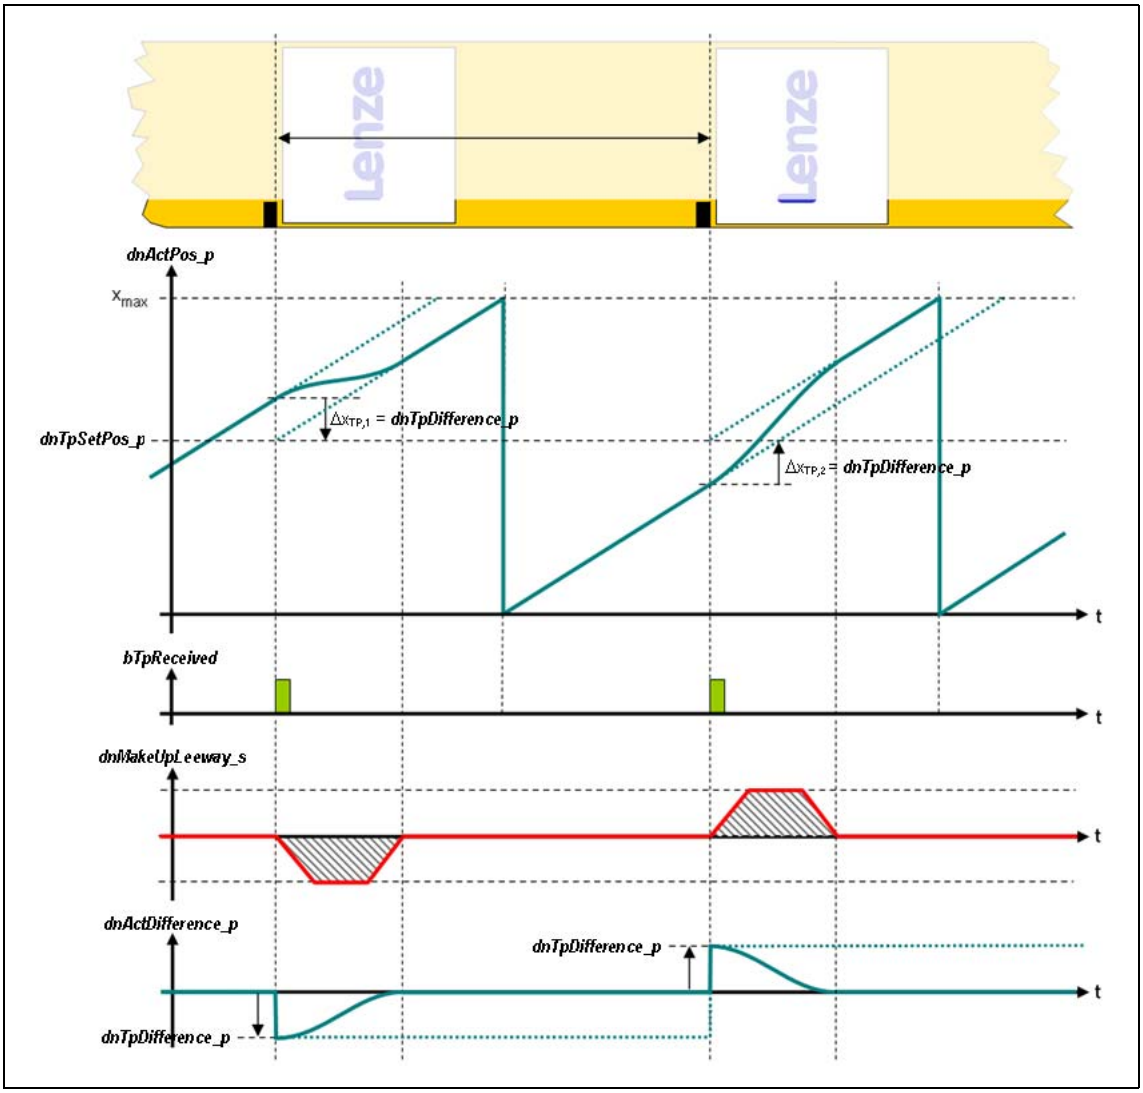
Synchronisation to print marks

The "Arrows" print image is to be printed properly on to the "Lenze" print image on the web. For this purpose and in addition to the material speed signal (master value encoder), the printing roller drive receives a pulse from the print-mark sensor which is connected to one of the digital inputs of the controller.

If the distance Δl between the print-mark sensor and the twelve o'clock position ("kiss point") of the printing roller is known, the printing roller drive is able to correct the motion of the printing roller so that the "Arrows" print image is printed exactly at the required position on the web when the print-mark pulse is detected.

Since the production process in the example is periodical, one print-mark pulse appears per cycle. Ideally, the pulse always appears at a certain set position x_{TP} in the modulo cycle 0 ... x_{max}. If the print mark pulse is detected at another position than at its set position x_{TP}, there is a deviation Δx_{TP} between setpoint and actual position of the print mark pulse.

Signal characteristic 1: Print-mark pulses always appear exactly periodically with a distance of x_{max}.	**Signal characteristic 2:** Print-mark pulses appear approximately periodically (difference Δx_{TP} to x_{max}).
	
The touch probe signal is always detected at position $x = x_{TP}$ in the modulo cycle 0 ... x_{max}. In this case, position value x need not be corrected and shows an ideal saw-tooth profile if speed V_x is constant.	If the touch probe signals appear irregularly, the continuous modulo position x has not reached setpoint position x_{TP} yet, or is already past it. However, since the touch probe signal is always assigned to a defined setpoint position x_{TP}, position value x needs to be corrected accordingly: In the simplest case, position value x can be set to setpoint position x_{TP} if touch probe signal "hard" is detected. Thus, speed V_x shows corresponding discontinuities (delta pulses) at the times when the touch probe signals are detected.

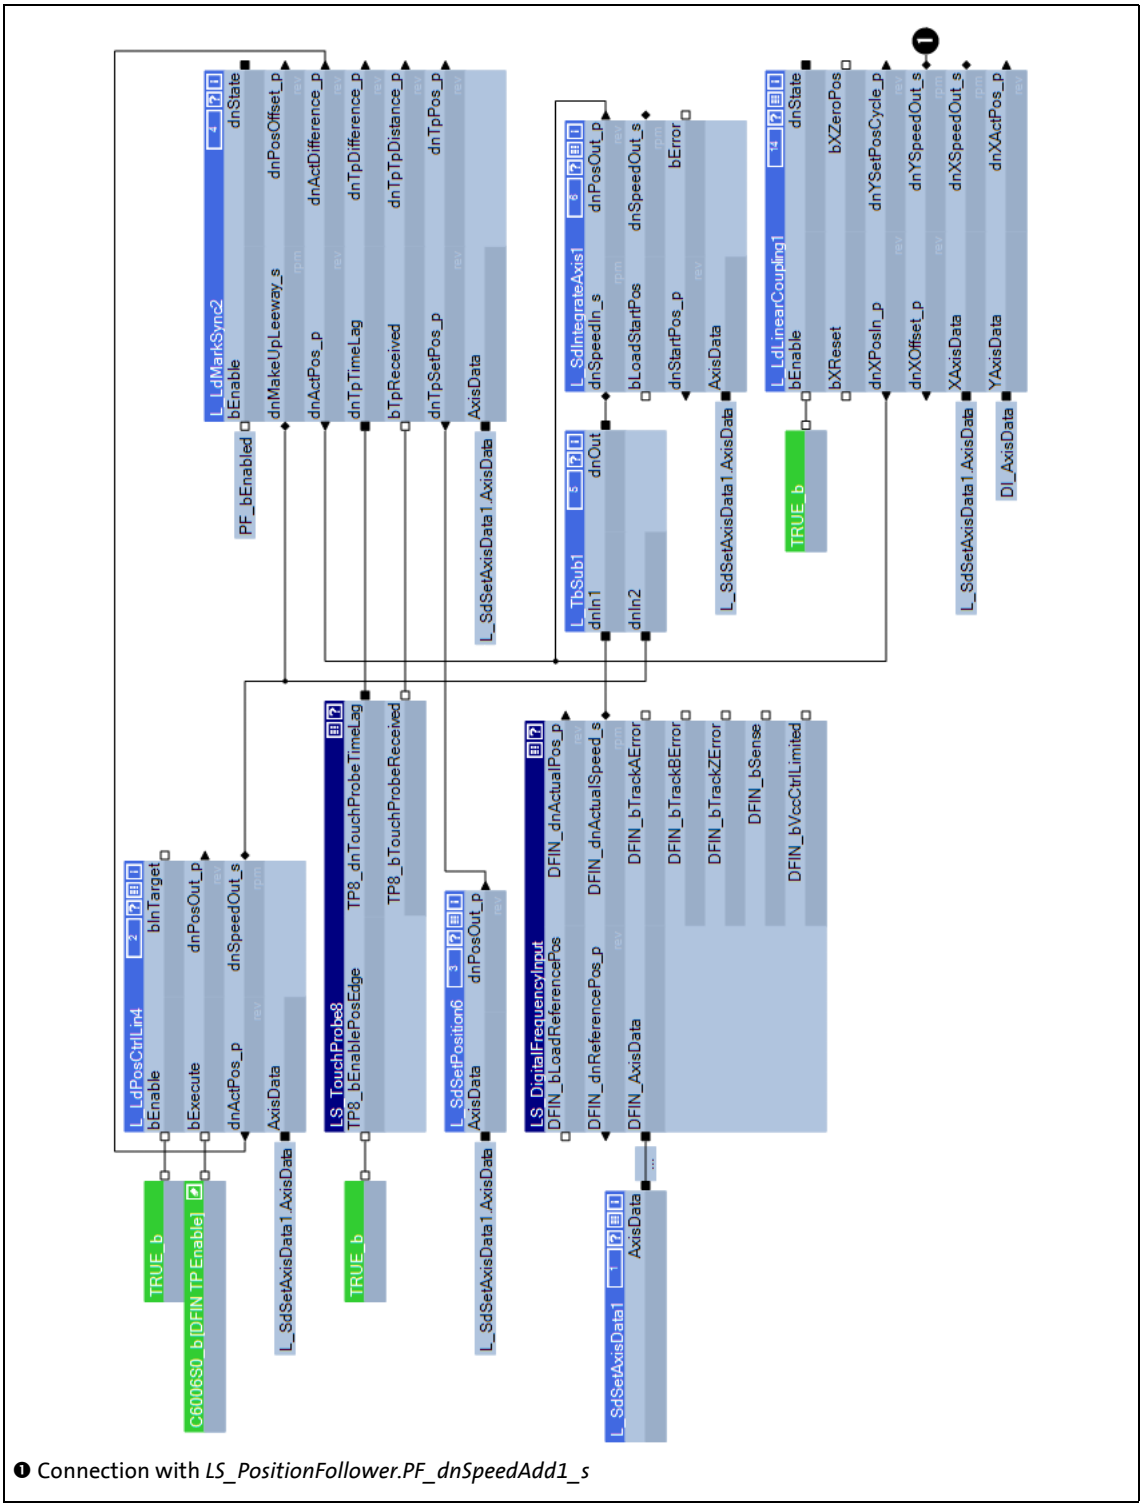


Tip!

Controlled compensation can be used to achieve "smooth" mark synchronisation to avoid delta pulses when correcting print marks.

▸ Interconnection example (📖 333)

5.91.2 Signal characteristics



The following signal characteristics result during the current print-mark correction:

[5-49] Signal characteristics

5.91.3 Interconnection example

Interconnection example of a controlled compensation of print-mark deviation Δx_{TP} via a time-controlled positioning profile:

❶ Connection with *LS_PositionFollower.PF_dnSpeedAdd1_s*

[5-50] Model connection

Function block	Function
L_LdPosCtrlLin4	Time-controlled profile generation • Using the detected deviation (print-mark correction path), the L_LdPosCtrlLin FB generates a time-controlled speed setpoint. • The speed setpoint is provided at the *L_LdPosCtrlLin4.dnSpeedOut_s* output.
LS_TouchProbe8	Detection of the print-mark signal
L_SdSetPosition6	Selection of the set position of the print-mark sensor • The FB L_SdSetPosition converts the set position defined in the application unit [unit] into an incremental value. • The reference measuring system is the master measuring system which is defined via the FB L_SdSetAxisData.
L_LdMarkSync2	Detection of the correction distance Δx_{TP} • The FB L_LdMarkSync detects the correction distance Δx_{TP} based on the current x position and the set position of the print mark signal x_{TP} if a print mark pulse is detected via the SB **LS_TouchProbe8**. • The correction distance Δx_{TP} is provided at the *L_LdMarkSync2.dnActDifference_p* output.
L_SdSetAxisData1	Definition of the master measuring system • Using the L_SdSetAxisData FB, machine parameters of a higher-level drive can be displayed.
LS_DigitalFrequencyInput	Detection of the digital frequency and output as speed signal
L_TbSub1	Injection of the correction speed • The L_TbSub FB performs a subtraction without limitation.
L_SdIntegrateAxis1	Integration of the resulting speed signal to a master position (x position) • The L_SdIntegrateAxis FB integrates a speed into a position.
L_LdLinearCoupling1	Synchronous function • The FB L_LdLinearCoupling establishes the coupling between master and axis measuring system.

Operating mode

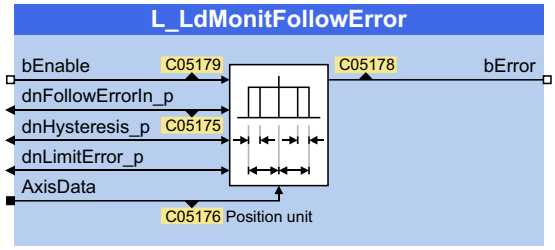
The core function of the interconnection is contained in the FB L_LdMarkSync2: On the basis of the current x position (integrator output *L_SdIntegrateAxis1.dnPosOut_p*) and the set position of the print-mark signal x_{TP} (output *L_SdSetPosition6.dnPosOut_p*) the FB detects the correction distance Δx_{TP} when a print mark pulse is detected.

In the example, the print-mark sensor is connected to the digital input DI8, touch probe is therefore detected via the **LS_TouchProbe8** system block.

The correction distance Δx_{TP} is led from the signal output *L_LdMarkSync2.dnActDifference_p* to the profile generator L_LdPosCtrlLin4 which generates a correction profile $V_{x,comp}$.

The correction speed $V_{x,comp}$ is superimposed on the real master speed (system variable *DFIN_dnActualSpeed_s*) via the FB L_TbSub1 and then integrated in the integrator block L_SdIntegrateAxis1 modulo to a master position 0 ... x_{max}.

Note!



Touch probe corrections cannot be applied to absolute master positions, as for instance if selected via MotionBus.

A touch probe correction on the master value side requires a master speed as master value selection (e.g. via digital frequency coupling).

5.92 L_LdMonitFollowError - following error monitoring

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to implement a following error monitoring.

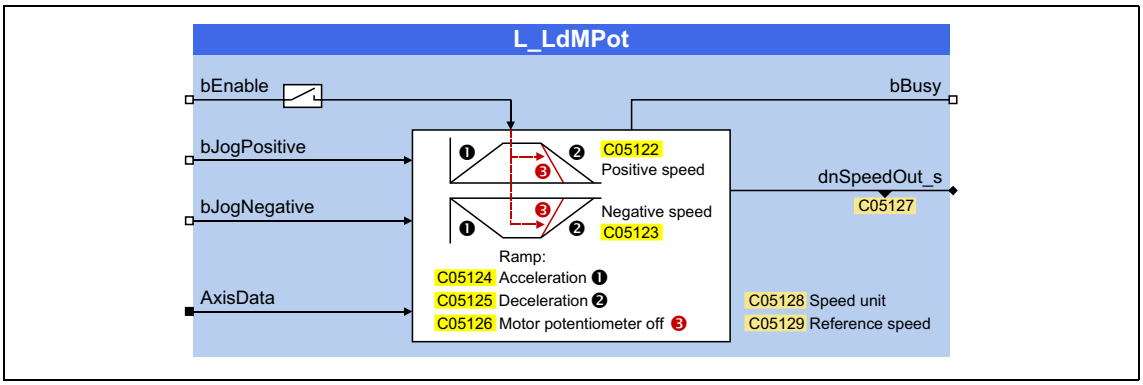
Inputs

Identifier/data type	Information/possible settings
bEnable BOOL	Activate monitoring function TRUE: Monitoring function is activated.
dnFollowErrorIn_p DINT	Following error in [inc] • C05175 indicates the following error in the real unit of the machine.
dnHysteresis_p DINT	Hysteresis for switching threshold in [inc]
dnLimitError_p DINT	Switching threshold for positive and negative following error in [inc]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning
bError BOOL	Status signal "following error" TRUE: Following error of a higher switching threshold.

Parameter



Parameter	Possible settings			Information
C05175	-214748.3647	Unit	214748.3647	Following error at the input • Display of the *dnFollowErrorIn_p* input signal in the real unit of the machine.
C05176 As of library V02.02.xx.xx	String of digits			Position unit • Read only

Parameter	Possible settings		Information
C05178			Following error outside the tolerance • Read only
	FALSE	Following error of a lower switching threshold	
	TRUE	Following error of a higher switching threshold	
C05179			Following error monitoring • Read only
	FALSE	Deactivated	
	TRUE	Activated	

5.93 L_LdMPot - master value adjustment

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to execute a master value adjustment.

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate master value adjustment	
	FALSE	Master value adjustment is/will be deactivated. • Output *dnSpeedOut_s* is braked to standstill via the disable ramp, if required.
	TRUE	Master value adjustment is activated.
bJogPositive BOOL	Adjustment in positive traversing direction	
	FALSE	Output *dnSpeedOut_s* is braked to standstill via the deceleration ramp.
	TRUE	Output *dnSpeedOut_s* is led to positive speed (C05122) via the start-up ramp.
bJogNegative BOOL	Adjustment in negative traversing direction	
	FALSE	Output *dnSpeedOut_s* is braked to standstill via the deceleration ramp.
	TRUE	Output *dnSpeedOut_s* is led to negative speed (C05123) via the start-up ramp.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
bBusy BOOL	Status signal "Master value adjustment is active"	
	FALSE	Master value adjustment is deactivated. • Output *dnSpeedOut_s* = "0".
	TRUE	Master value adjustment is activated. • Output *dnSpeedOut_s* ≠ "0".
dnSpeedOut_s DINT	Master speed output in [rpm] • C05127 indicates the master speed in the real unit of the machine.	

Parameter

Parameter	Possible settings			Information
C05122	-214000.0000	Unit/t	214000.0000	Positive speed • Initialisation: 1.0000 unit/t
C05123	-214000.0000	Unit/t	214000.0000	Negative speed • Initialisation: 1.0000 unit/t
C05124	0.001	s	130.000	Ramp: Acceleration • Initialisation: 1.000 s
C05125	0.001	s	130.000	Ramp: Deceleration • Initialisation: 1.000 s
C05126	0.001	s	130.000	Ramp: Motor potentiometer off • Initialisation: 1.000 s
C05127	-214748.3647	Unit	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C05128 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C05129 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.

5.93.1 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed values defined via C05122 and C05123 are converted from the real unit to the internal unit.

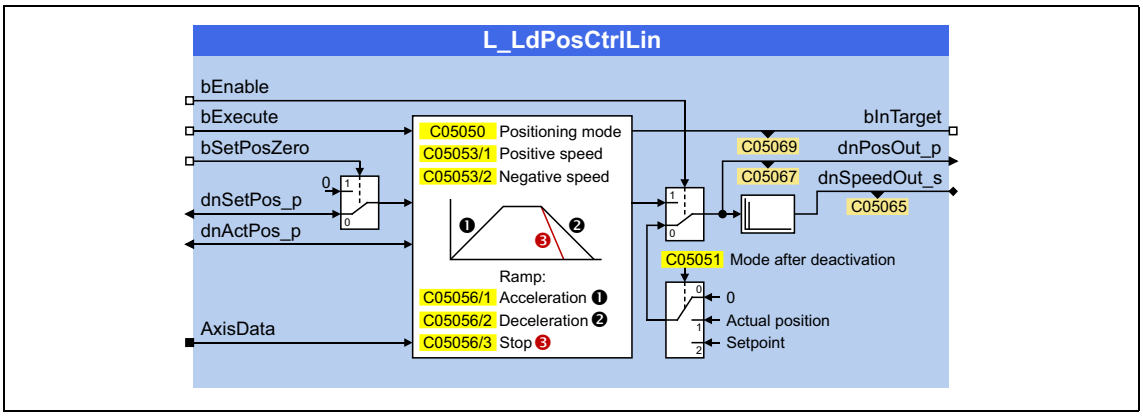
The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:

Error number		Error message in the logbook	Response
61669382	0x3AD0006	L_LdMPot:int.speed overflow (LS_DriveInterface)	Error
61669510	0x3AD0086	L_LdMPot:int.speed overflow (L_SdSetAxisData)	Error

5.94 L_LdPosCtrlLin - Master value adjustment via position

Function library:	LenzeLineDrive	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB permits the time-controlled profile generation with linear acceleration/deceleration ramps. The following positioning functions, for instance, can be implemented via this FB:



- Online trimming of offset positions on the master and drive end
- Positioning of the drive to the position of the electrical shaft
- Position override function: Separate the drive from the curve position and put it in a safe position

Note!

The FB always operates in the absolute measuring system independent of the setting in the *AxisData* machine parameters. Thus, the *dnPosOut_p* position output is not limited to a cycle length in case of a Modulo system.

Only the position value at the *dnPosOut_p* position output should be used in the application.

The *dnSpeedOut_s* speed output must not be integrated because the integrated position cannot be displayed completely using the *dnPosOut_p* output for internal technical reasons!

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate FB	
	FALSE	FB deactivated: • The *dnPosOut_p* output position and the *dnSpeedOut_s* output speed behave according to the deactivation mode set in C05051. • The *bInTarget* status signal is reset. **Caution:** Depending on the set deactivation mode, sudden changes may occur at the position and speed output when the FB (*bEnable* = TRUE↘FALSE) is deactivated! In this case, make sure that no drive motion is derived from these output signals!
	TRUE	FB activated: • The *dnPosOut_p* output position and the *dnSpeedOut_s* output speed display the required position profile according to the profile parameters and control signals set.
bExecute BOOL	Execute positioning according to the positioning mode set	
	FALSE	Abort of positioning (profile generator inactive): • When a running positioning mode is aborted, the speed is led to zero via the stop ramp set in C05056/3.
	FALSE↗TRUE	Executing the positioning: • Positioning is executed depending on the set profile parameters (ramp times, maximum speeds, positioning modes). • If the positioning mode 1 or 2 is set in C05050, a renewed FALSE↗TRUE edge is required at this control input for the start of each positioning profile.
bSetPosZero BOOL	Change over to internal zero position	
	FALSE	The *dnSetPos_p* input signal is used as position target for the traversing profile.
	TRUE	Zero is used as position target for the traversing profile.
dnSetPos_p DINT	Selection of the target position in [increments]: • Absolute position target (for absolute positioning modes 0 and 1) or traversing distance (for relative positioning mode 2).	
dnActPos_p DINT	Feedback of the current position in [increments] • The FB **L_LdPosCtrlLin** generates positioning profiles on the basis of setpoints only. Thus, only connect setpoint-based position signals to this input. • In the simplest case, directly return the *dnPosOut_p* position output to the *dnActPos_p* input. • Never connect this input to real position signals (e.g. *FDB_dnActualPos_p*).	
AxisData	Machine parameters • If the FB is to relate to the measuring system of the drive axis, connect this input to the output *DI_AxisData* of the **LS_DriveInterface** SB for accepting the machine parameters of the drive/motor. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) • For a cam application, this FB can receive the *XAxisData/YAxisData* X/Y axis data structure of the L_CamProfiler FB. (📖 162)	

Outputs

Identifier/data type	Value/meaning	
bInTarget BOOL	Status signal "target position reached" • Display parameter: C05069 • The status signal is reset when the *bEnable* input is reset to FALSE. **Interconnection note:** Do not apply an inverted status signal to the enable input *PF_bEnable* of the SB **LS_PositionFollower**, since a residual path is not travelled anymore after the enable is cancelled (the setpoints *PF_dnPositionSet_p* and *PF_dnSpeedAdd1_s* are rejected in the same cycle).	
	FALSE	The traversing profile is still being executed or has been aborted, the current position *dnActPos_p* and the target position *dnSetPos_p* differ from each other.
	TRUE	The traversing profile has been completed, the current position *dnActPos_p* has reached the target position *dnSetPos_p*.
dnPosOut_p DINT	Output position in [increments] • Set position in traversing profile • In the case of simple positioning tasks (e.g. time-controlled offset adjustment), directly return this position output to the *dnActPos_p* input. • C05067 indicates the output position in the real unit of the machine. **Caution:** Depending on the deactivation mode set in C05051, sudden changes may occur at the position and speed out when the FB (*bEnable* = TRUE↘FALSE) is deactivated! In this case, make sure that no drive motion is derived from these output signals!	
dnSpeedOut_s DINT	Output speed given as speed in [rpm] • Setpoint speed in traversing profile • This signal directly results from the differentiation of the output position *dnPosOut_p*. • C05065 indicates the output speed in the real unit of the machine.	

Parameters

Parameter	Possible settings		Info
C05050			Positioning mode
	0	Absolute positioning without limit stop • When positioning is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position with the set profile parameters. • The traverse path results from the difference between the current position *dnActPos_p* and the target position *dnSetPos_p*. • A new positioning profile is started as soon as the target position changes. An edge change at the *bExecute* control input is not required.	Lenze setting
	1	Absolute positioning with limit stop: • When positioning is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position with the set profile parameters. • The traverse path results from the difference between the current position *dnActPos_p* and the target position *dnSetPos_p*. • After the set position has been reached (*bInTarget* = TRUE), a new positioning process requires a new FALSE↗TRUE edge at the *bExecute* control input.	
	2	Relative positioning with limit stop: • When positioning is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position with the set profile parameters. • The traverse path is directly determined via the *dnSetPos_p* input. • After the set position has been reached (*bInTarget* = TRUE), a new positioning process requires a new FALSE↗TRUE edge at the *bExecute* control input.	

Parameter	Possible settings			Info
C05051				Mode after deactivation
	0	Positioning function deactivated: • The position output *dnPosOut_p* is set to zero. • The *bInTarget* status signal is reset to FALSE.		Lenze setting
	1	Positioning function changes in standby status: • The *dnPosOut_p* positioning output is kept on the current position *dnActPos_p*. • The *bInTarget* status signal is reset to FALSE.		
	2	Positioning function changes in standby status: • If *bSetPosZero* = FALSE: The *dnPosOut_p* position output is kept on the set position *dnSetPos_p*. • If *bSetPosZero* = TRUE: The *dnPosOut_p* position output is kept to zero. • The *bInTarget* status signal is reset to FALSE.		
C05052/1 From library V02.02.xx.xx onwards	Character string			Position unit • Read only
C05052/2 From library V02.02.xx.xx onwards	Character string			Speed unit • Read only

C05053/2	0.0000	Unit/t	214748.3647	Negative speed • Initialisation: 0.02 unit/t
C05054 From library V02.02.xx.xx onwards	-214748.3647	Unit/t	214748.3647	Reference speed • Read only (determined from the machine parameters applied to the *AxisData* input) • For input orientation for speed entries.
C05056/1	0.010	s	130.000	Ramp: Acceleration • Initialisation: 1.000 s • Reference: • For acceleration in the positive direction: positive speed (C05053/1) • For acceleration in the negative direction: negative speed (C05053/2)
C05056/2	0.010	s	130.000	Ramp: Deceleration • Initialisation: 1.000 s • Reference: • For deceleration in the positive direction: positive speed (C05053/1) • For deceleration in the negative direction: negative speed (C05053/2)

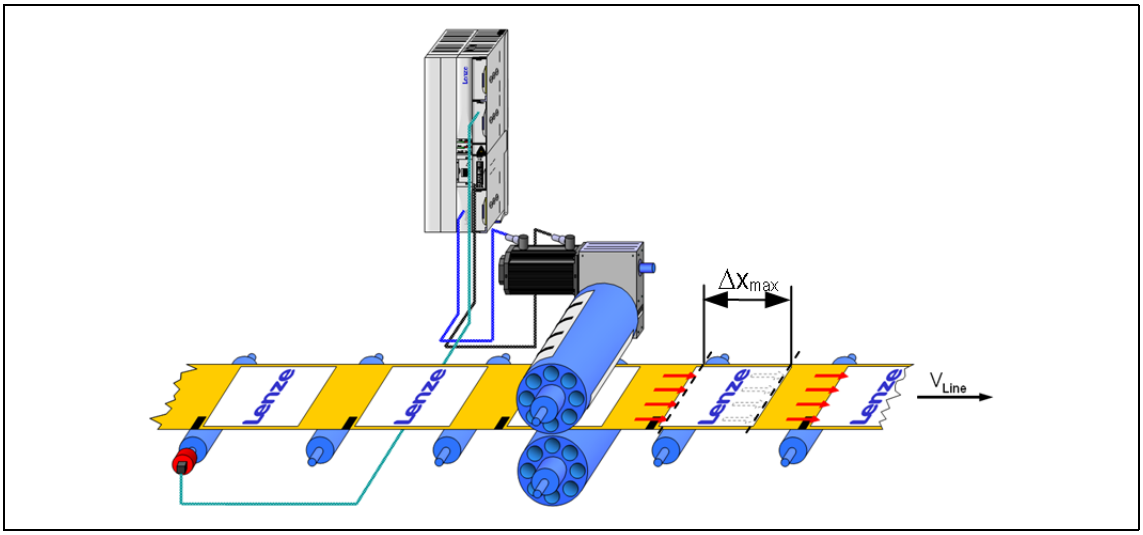
Parameter	Possible settings			Info
C05056/3	0.010	s	130.000	Ramp: Stop • Initialisation: 1.000 s • Reference: • For deceleration in the positive direction: positive speed (C05053/1) • For deceleration in the negative direction: negative speed (C05053/2)
C05065	-2147483647	Unit/t	2147483647	Speed at the output • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C05067	-214748.3647	Unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05069				Set position reached • Display of the *bInTarget* output signal.
	0	Set position not yet reached.		
	1	Set position reached.		

5.94.1 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed values defined via C05053/1...2 are converted from the real unit to the internal unit.

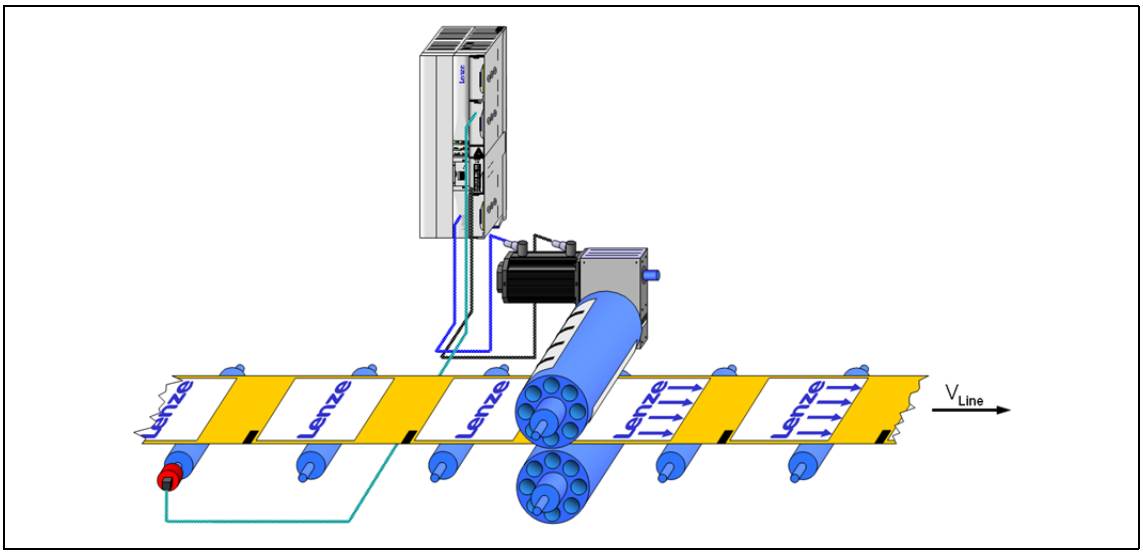
The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:



Error number		Error message in the logbook	Response
61669383	0x3AD0007	L_LdPosCtrlLin:int.speed overflow (LS_DriveInterface)	Error
61669511	0x3AD0087	L_LdPosCtrlLin:int.speed overflow (L_SdSetAxisData)	Error

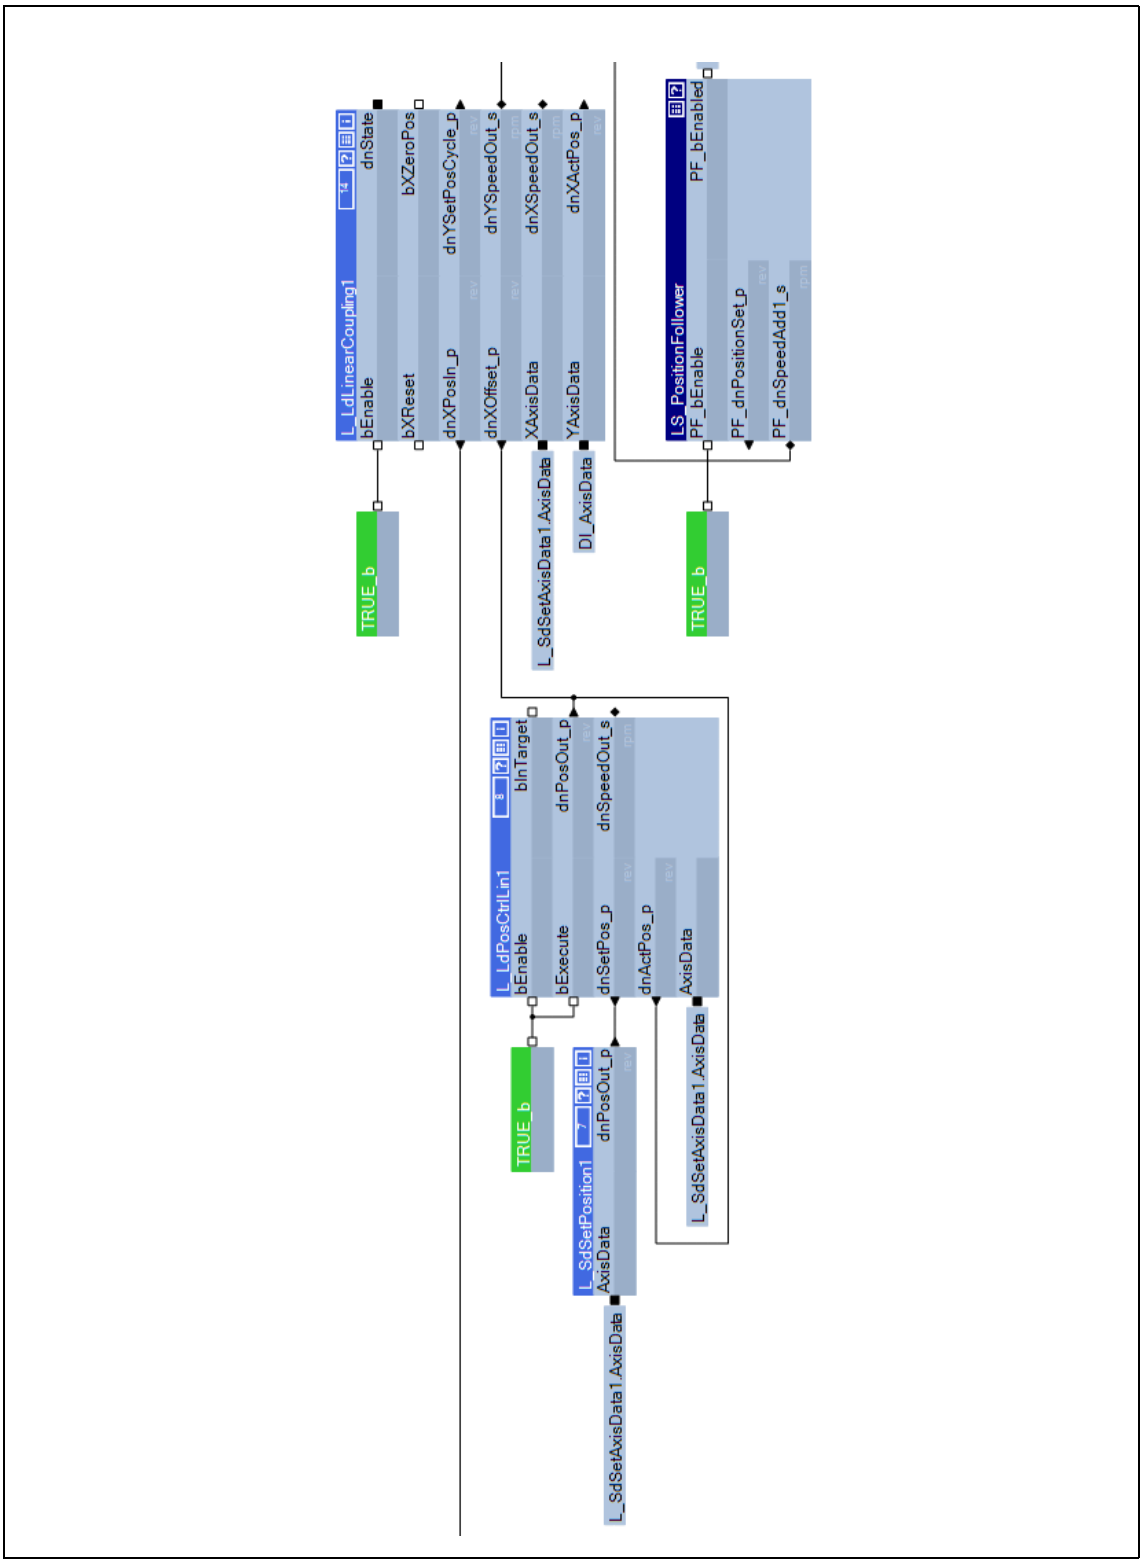
5.94.2 Interconnection examples

5.94.2.1 Printing roller trimming via x offset



In many cases, an angular trimming of the slave drive to the master position is required. Usually, this angular trimming is executed via an x offset. This x offset virtually trims the master value and thus aligns the following axis correctly to the process.

- The following illustration (without x offset) shows the "arrows" print image shifted by Δx_{max} compared to the wanted position.

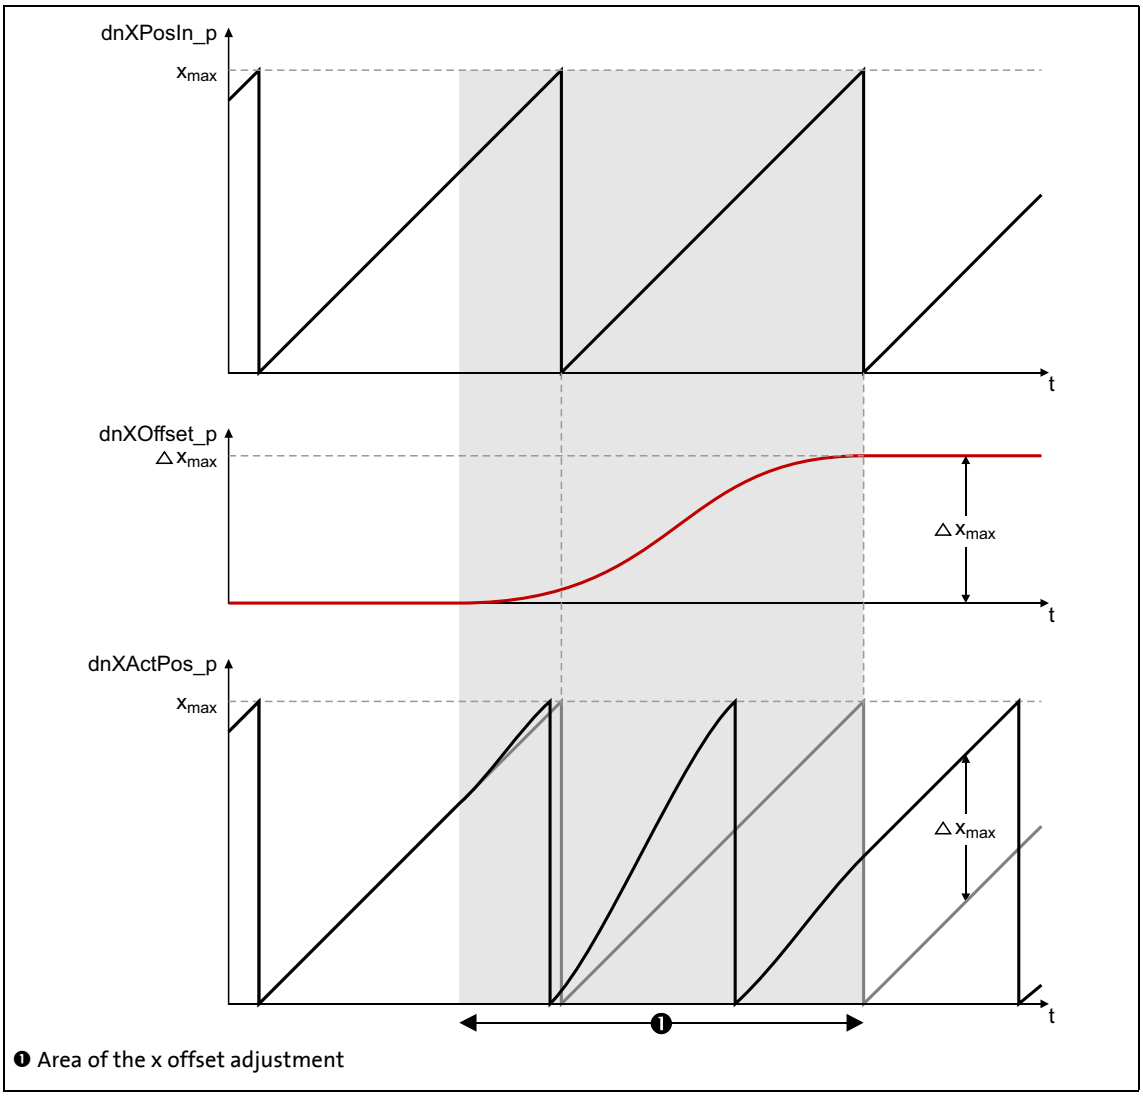


[5-51] Printing roller without angular trimming via x offset

- When x offset is used, the "arrows" print image is on the correct position:

[5-52] Printing roller with angular trimming via x offset

The FB **LdPosCtrlLin** serves to constantly adjust the x offset position. For this purpose the FB must be interconnected as follows in connection with the L_LdLinearCoupling synchronous function:



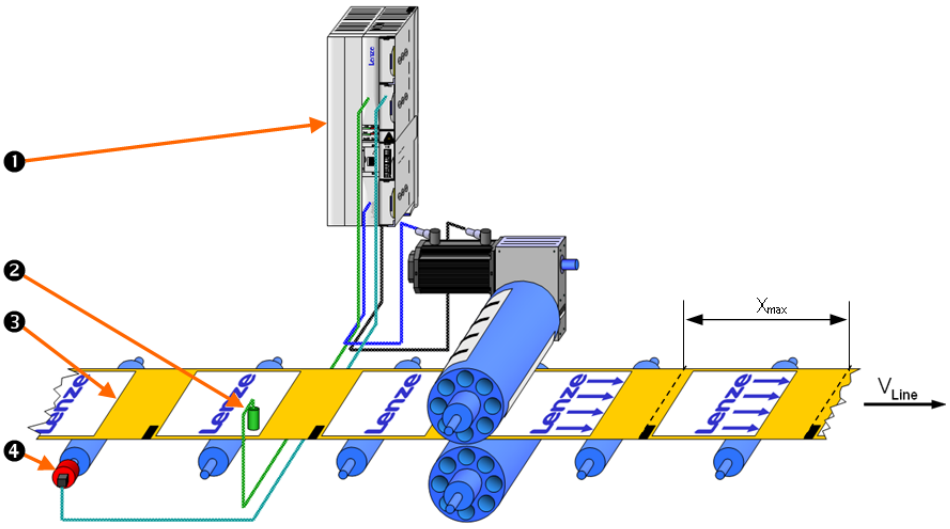
[5-53] Model connection

Function block	Function
L_SdSetPosition1	Selection of an x offset value • The FB L_SdSetPosition converts the position value defined in the application unit [unit] into an incremental value. • The reference measuring system is the master measuring system which is defined via the FB L_SdSetAxisData (not displayed).
L_LdPosCtrlLin1	Continuous adjustment of the x offset position • As described, the FB **L_LdPosCtrlLin** serves to constantly adjust the x offset position at the *dnPosOut_p* output. • The master measuring system serves as reference measuring system. • Important: The *dnPosOut_p* output position must be returned to the *dnActPos_p* input.
L_LdLinearCoupling1	Synchronous function • The FB L_LdLinearCoupling establishes the coupling between master and axis measuring system. • Moreover, this FB provides the option to consider an x offset in the master value.

Tip!

The cycle-related offsetting in the master measuring system (Modulo measuring system) is executed as in the FB L_LdAddOffsetCyclic.

The following signal characteristics exemplifies the x offset adjustment from zero to an offset value x_{max}:



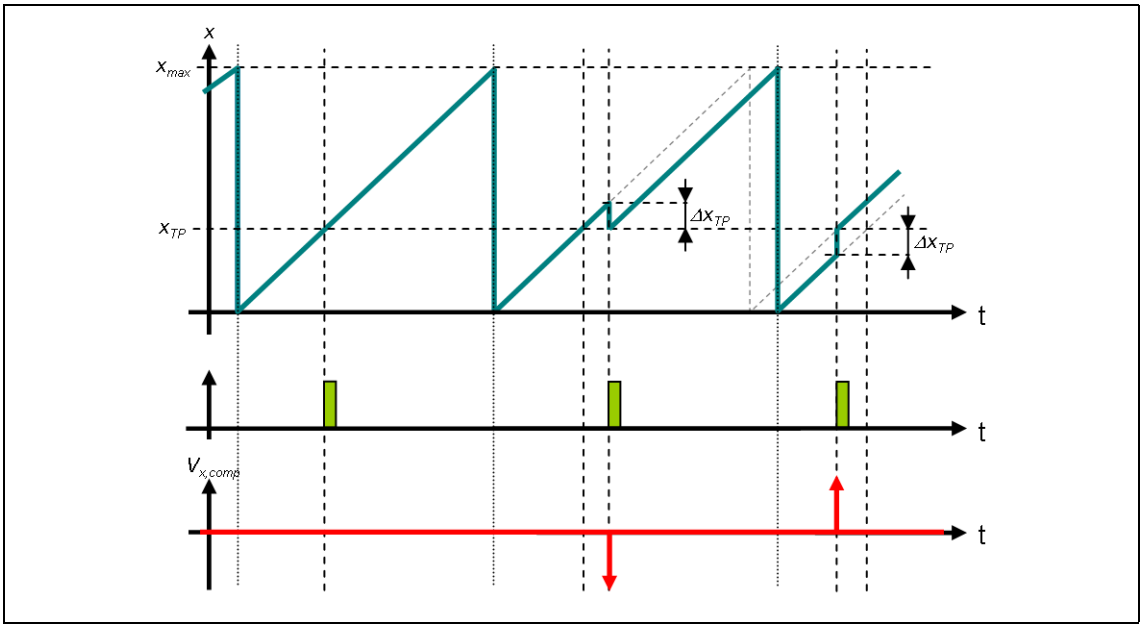
❶ Area of the x offset adjustment

[5-54] Signal characteristics - x offset adjustment

5.94.2.2 Time-based compensation of mark correction

In many production processes, a print register is already defined on the web, e.g. via print marks. These mark signals can be detected with high precision via fast digital inputs (touch probe inputs) in the controller:

❶ Slave drive
❷ Print-mark sensor
❸ Web
❹ Master value encoder
X_{max} = x-cycle of the register

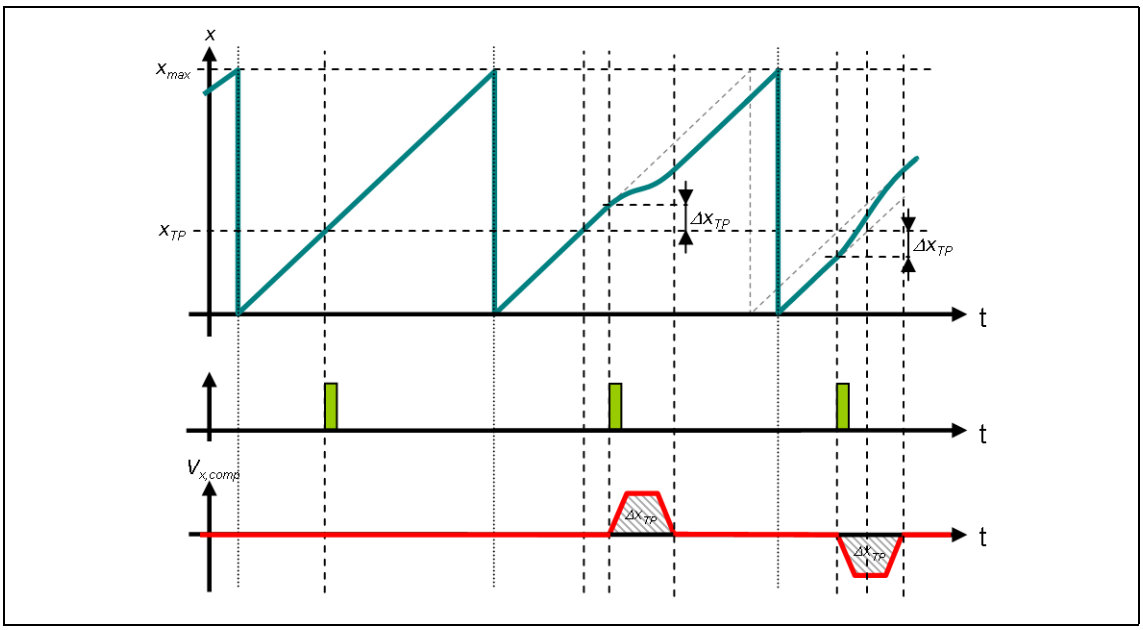


[5-55] Example : Material path with register

Since the production process is periodical, a print mark pulse appears per cycle. Ideally, the pulse always appears at a certain set position x_{TP} in the master cycle 0 ... x_{max}. If the print mark pulse is detected at another position than at its set position x_{TP}, there is a deviation Δx_{TP} between setpoint and actual position of the print mark pulse.

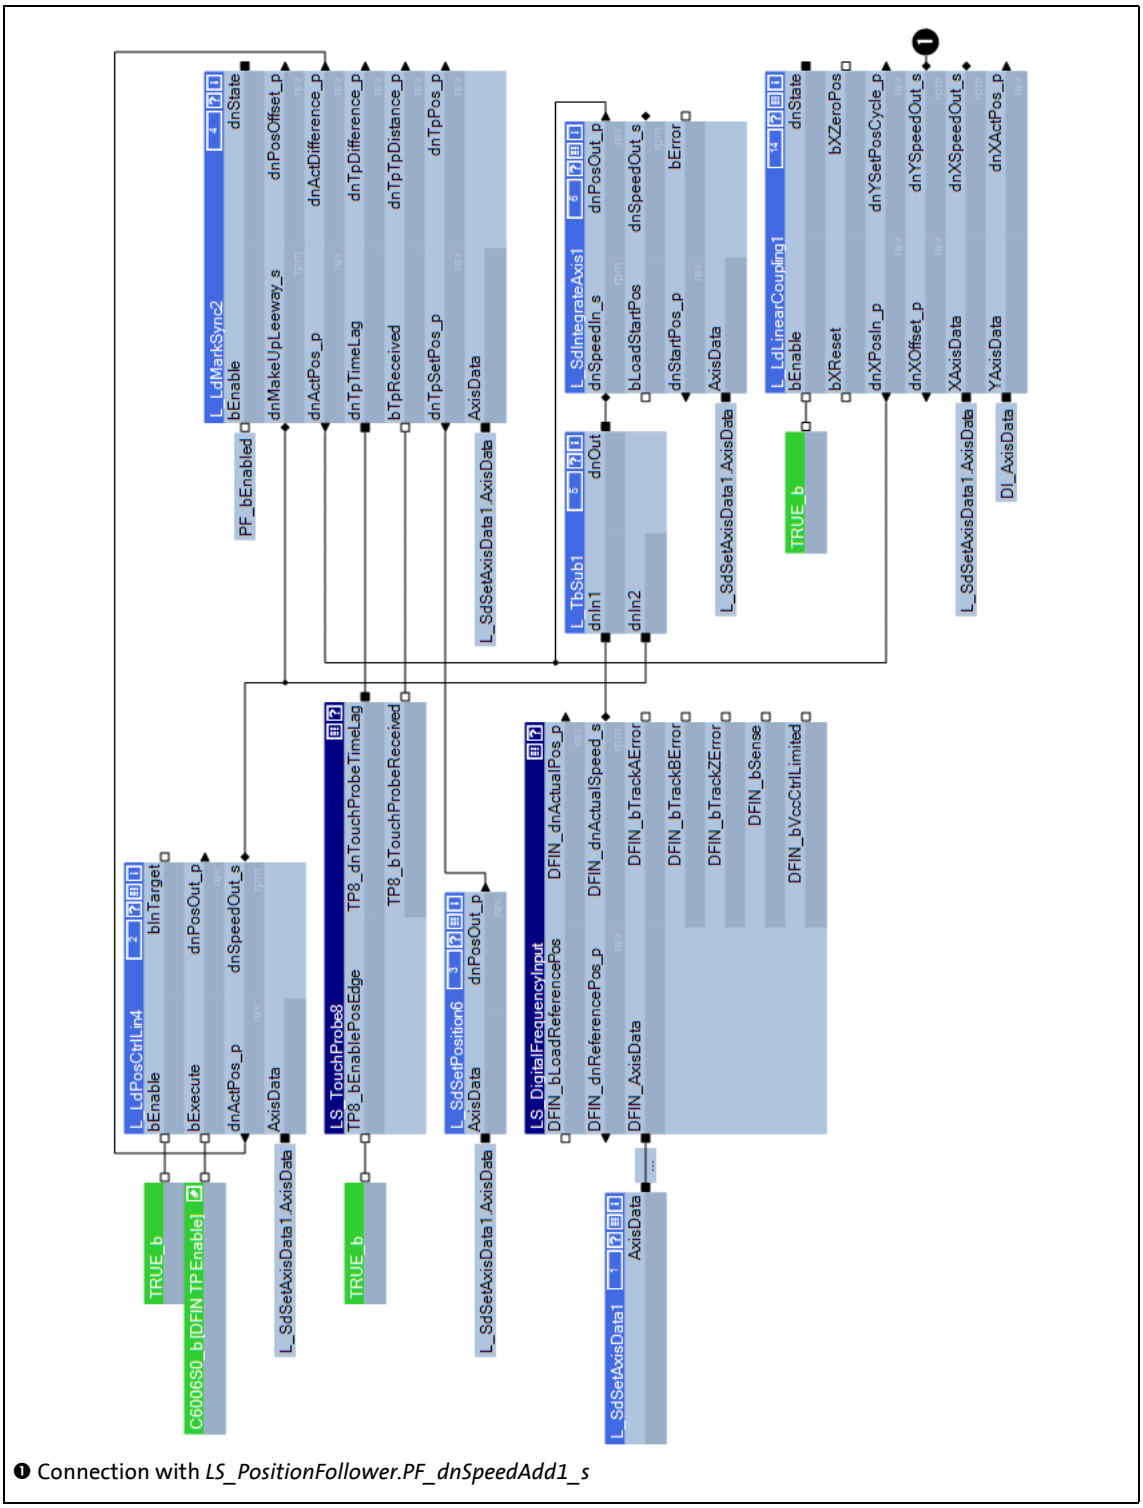
Options for compensating the print mark deviation:

A. Immediate compensation of Δx_{TP}



- During the compensation speed $V_{x,comp}$ delta pulses occur, since the x value is set to its set position x_{TP} when the print mark pulse occurs.

[5-56] Immediate compensation of the print mark deviation Δx_{TP}



B. Compensation of Δx_{TP} via a higher-level compensation profile

- During the compensation speed $V_{x,comp}$, neither delta pulses nor jumps occur since the deviation from the set position of the print mark pulse Δx_{TP} is compensated via a profile generator:

[5-57] Compensation of the print mark deviation Δx_{TP} via a higher-level compensation profile

Interconnection example of a controlled compensation of print-mark deviation Δx_{TP} via a time-controlled positioning profile:

❶ Connection with *LS_PositionFollower.PF_dnSpeedAdd1_s*

[5-58] Model connection

Function block	Function
L_LdPosCtrlLin4	Time-controlled profile generation • Using the detected deviation (print-mark correction path), the L_LdPosCtrlLin FB generates a time-controlled speed setpoint. • The speed setpoint is provided at the *L_LdPosCtrlLin4.dnSpeedOut_s* output.
LS_TouchProbe8	Detection of the print-mark signal
L_SdSetPosition6	Selection of the set position of the print-mark sensor • The FB L_SdSetPosition converts the set position defined in the application unit [unit] into an incremental value. • The reference measuring system is the master measuring system which is defined via the FB L_SdSetAxisData.
L_LdMarkSync2	Detection of the correction distance Δx_{TP} • The FB L_LdMarkSync detects the correction distance Δx_{TP} based on the current x position and the set position of the print mark signal x_{TP} if a print mark pulse is detected via the SB **LS_TouchProbe8**. • The correction distance Δx_{TP} is provided at the *L_LdMarkSync2.dnActDifference_p* output.
L_SdSetAxisData1	Definition of the master measuring system • Using the L_SdSetAxisData FB, machine parameters of a higher-level drive can be displayed.
LS_DigitalFrequencyInput	Detection of the digital frequency and output as speed signal
L_TbSub1	Injection of the correction speed • The L_TbSub FB performs a subtraction without limitation.
L_SdIntegrateAxis1	Integration of the resulting speed signal to a master position (x position) • The L_SdIntegrateAxis FB integrates a speed into a position.
L_LdLinearCoupling1	Synchronous function • The FB L_LdLinearCoupling establishes the coupling between master and axis measuring system.

Operating mode

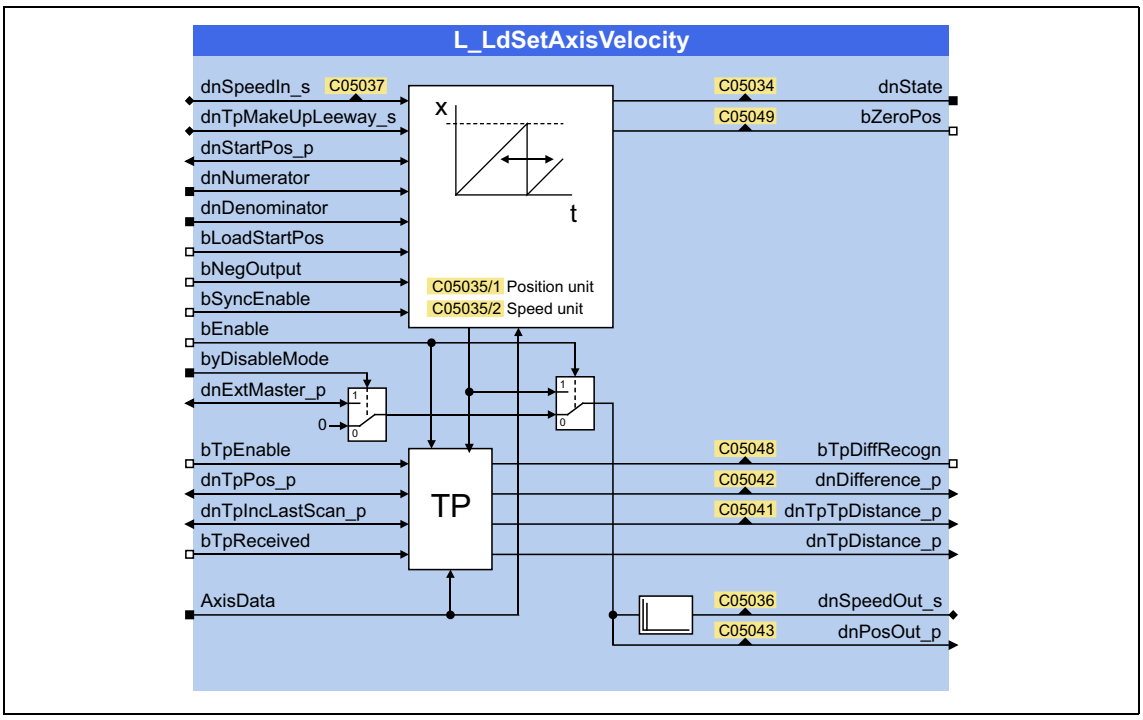
The core function of the interconnection is contained in the FB L_LdMarkSync2: On the basis of the current x position (integrator output *L_SdIntegrateAxis1.dnPosOut_p*) and the set position of the print-mark signal x_{TP} (output *L_SdSetPosition6.dnPosOut_p*) the FB detects the correction distance Δx_{TP} when a print mark pulse is detected.

In the example, the print-mark sensor is connected to the digital input DI8, touch probe is therefore detected via the **LS_TouchProbe8** system block.

The correction distance Δx_{TP} is led from the signal output *L_LdMarkSync2.dnActDifference_p* to the profile generator L_LdPosCtrlLin4 which generates a correction profile $V_{x,comp}$.

The correction speed $V_{x,comp}$ is superimposed on the real master speed (system variable *DFIN_dnActualSpeed_s*) via the FB L_TbSub1 and then integrated in the integrator block L_SdIntegrateAxis1 modulo to a master position 0 ... x_{max}.

Note!



Touch probe corrections cannot be applied to absolute master positions, as for instance if selected via MotionBus.

A touch probe correction on the master value side requires a master speed as master value selection (e.g. via digital frequency coupling).

5.95 L_LdSetAxisVelocity - master value processing

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to extend/compress the X axis and execute a synchronisation via touch probe. The master speed is integrated to the position within the cycle.

Inputs

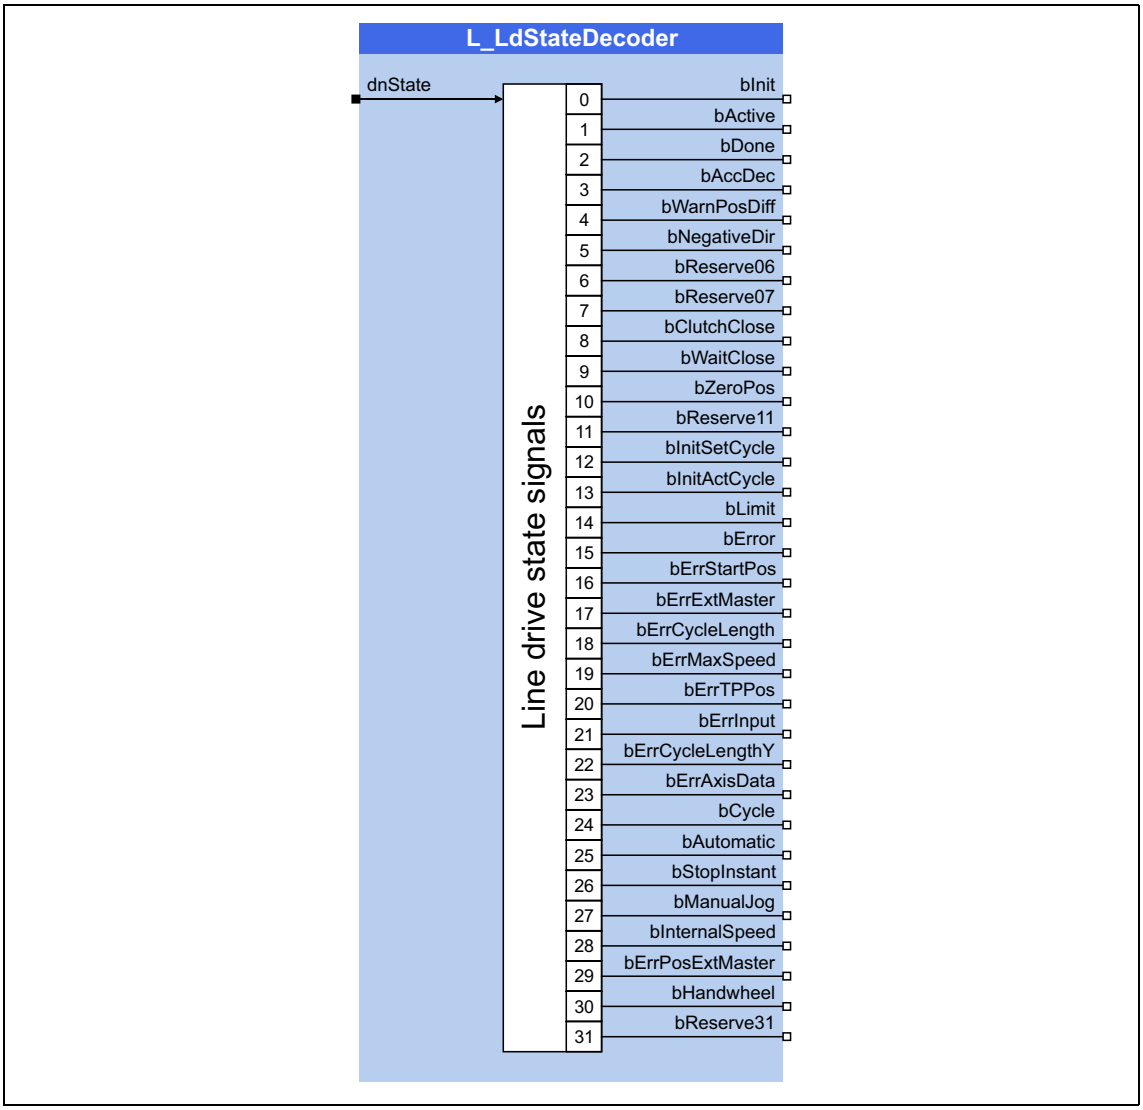
Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Selection of the master speed, e.g. from an encoder. • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference.
dnTpMakeUpLeeway_s DINT	Selection (addition) of the TP correction speed to the master value • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference.
dnStartPos_p DINT	Starting position of the master value integrator in [inc] • The selected master position is accepted with a FALSE↗TRUE edge at *bLoadStartPos*. • The value must be inside the range of the scaled master value cycle (register).
dnNumerator DINT	Factor (numerator) for extending and compressing the master axis • A change during operation is displayed as a stretch factor (electronic gearbox).
dnDenominator DINT	Factor (denominator) for extending and compressing the master axis • A change during operation is displayed as a stretch factor (electronic gearbox).
bLoadStartPos BOOL	Load starting position FALSE↗TRUE: Load starting position *dnStartPos_p* in the master value integrator.

Identifier/data type	Information/possible settings	
bNegOutput BOOL	Invert master speed • Direct sign reversal of the master speed. • The inversion of the master value gets active before the master value scaling and the stretch factor.	
	FALSE	CW rotation, the master value is not reversed.
	TRUE	CCW rotation, the master value is reversed.
bSyncEnable BOOL	Activate synchronised stretching/compression	
	FALSE	Changes in the stretch factor are effective immediately.
	TRUE	Changes in the stretch factor are only accepted during zero crossing.
bEnable BOOL	Activate FB	
	FALSE	Function block is deactivated, for behaviour see *byDisableMode*.
	TRUE	Function block activated.
	TRUE↘FALSE	Master shaft *dnPosOut_p* travels via the ramp for permanent operation with master speed to the external master position *dnExtMaster_p*.
byDisableMode BYTE	Behaviour in case of deactivated function block (*bEnable* = FALSE)	
	0	Speed output is not active, position remains.
	1	Position at *dnExtMaster_p* is accepted, speed output is active.
dnExtMaster_p DINT	Selection of an external master position in [inc], e.g. through an absolute value encoder. • Master value scaling is not considered. • The master position must be inside the cycle.	
bTpEnable BOOL	Activate touch probe evaluation	
	TRUE	Touch probe evaluation activated.
dnTpPos_p DINT	Assigned position of the touch probe sensor in the master value cycle in [inc] • Value is internally limited to 0 ... 2 x cycle.	
dnTpIncLastScan_p DINT	Number of increments counted since touch probe. • Connect this input with the output *dnTPCaptureValue1* of the touch probe system block used.	
bTpReceived BOOL	Control signal for touch probe correction • Connect this input with the output *bTouchProbeReceived* of the touch probe system block used.	
	FALSE↗TRUE	Touch probe detected.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status	
	bits4	Position change per cycle too big
	bits10	Zero crossing active
	bits14	Internal limitation for calculation
	Bit15	Error
	bit16	Starting position is beyond the cycle
	bits17	Error in the master signal (position or speed)
	bits18	No cycle available
	Bit 19	Maximum speed = "0"
	bits20	Position of the touch probe sensor is beyond the cycle
	bits21	Input error (e.g. impermissible position jump or inverse direction of motion)
	bits23	No valid axis data structure
bZeroPos BOOL	Status signal "Zero position/zero crossing"	
	FALSE	Master value is at any position in the master value cycle (register).
	TRUE	**Permanently:** Master value is at the zero position of the master value integrator. **For one cycle:** Zero crossing of the master value integrator.
bTpDiffRecogn BOOL	Status signal "Touch probe correction is active"	
	FALSE	Touch probe correction is not active or already executed in the current cycle.
	TRUE	Touch probe correction is active or not yet completed via the ramp function.
dnDifference_p DINT	Difference between *dnTpPos_p* and the position measured after detecting a touch probe in [inc].	
dnTpTpDistance_p DINT	Distance between the last two touch probes in [inc] • For instance to measure the real master value register.	
dnTpDistance_p DINT	Distance between the detected touch probe and the zero point of the integrator in [inc]	
dnSpeedOut_s DINT	Master speed output in [rpm] • C05036 indicates the master speed in the real unit of the machine.	
dnPosOut_p DINT	Master position output (position value of the master value integrator) in [inc] • C05043 indicates the master position in the real unit of the machine.	

Parameter



Parameter	Possible settings			Information
C05034	-214748.3647		214748.3647	Status • Display of the bit-coded output signal *dnState*.
C05035/1 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C05035/2 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C05036	-214748.3647	Unit/t	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C05037 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Speed at the input • Read only • Calculated from the speed signal *dnSpeedIn_s*.
C05041	-214748.3647	Unit	214748.3647	Measured cycle • Display of the output signal *dnTpTpDistance_p* in the real unit of the machine.
C05042	-214748.3647	Unit	214748.3647	Measured TP deviation • Display of the output signal *dnDifference_p* in the real unit of the machine.
C05043	-214748.3647	Unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05048				TP: Deviation detected • Display of the output signal *bTpDiffRecogn*.
	0	No deviation detected		
	1	Deviation detected		
C05049				Cycle start • Display of the output signal *bZeroPos*.
	0	No cycle start		
	1	Cycle start		

5.96 L_LdStateDecoder - LineDrive status signals

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of an FB from the function library "LenzeLineDrive.lib" into individual boolean status signals for further use in the FB interconnection.

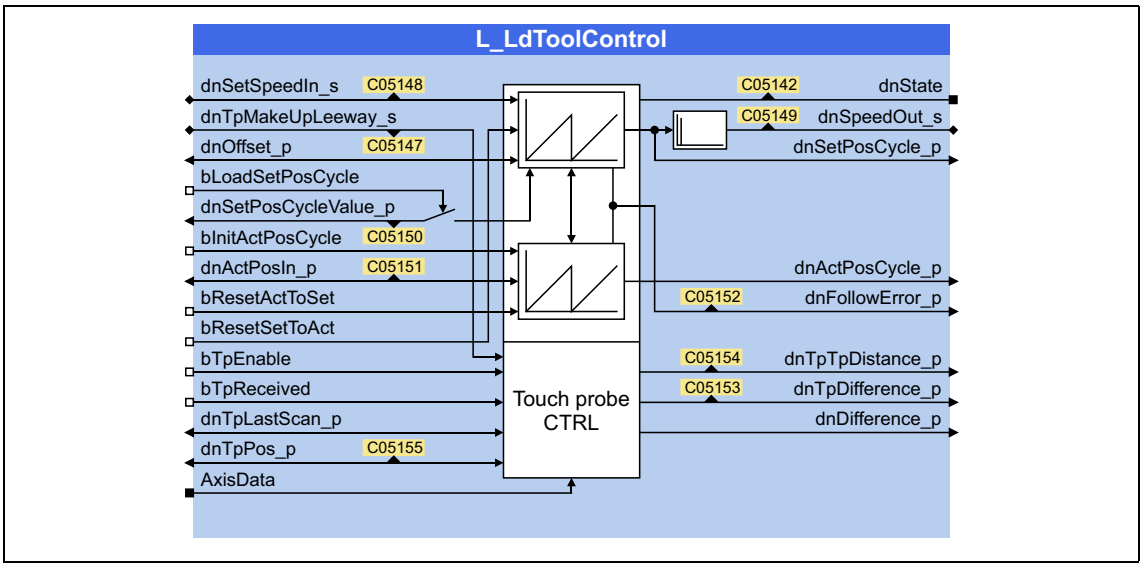
- The functionality corresponds to a converter "DINT→BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of an FB from the function library "LenzeLineDrive.lib". • Connect this input with the output of the same name of the corresponding FB.

Outputs

The boolean outputs have the following meaning when the value is TRUE:



Bit*	Identifier	Meaning in case of TRUE
Status messages:		
0	bInit	Function is being initialised.
1	bActive	Function is active.
2	bDone	Function is completed.
3	bAccDec	Acceleration/deceleration phase is active.
4	bWarnPosDiff	Position change per cycle too big.
5	bNegativeDir	Counter-clockwise rotation
6	bReserve06	-
7	bReserve07	-
8	bClutchClose	Brake/clutch closed.
9	bWaitClose	Waiting for engagement process.
10	bZeroPos	Zero crossing is active.
11	bReserve11	-
12	bInitSetCycle	Initialisation of actual cycle.
13	bInitActCycle	Initialisation of setpoint cycle.
14	bLimit	Internal limitation for calculation.
24	bCycle	Single cycle
25	bAutomatic	Automatic mode
26	bStopInstant	Stopping is active.
27	bManualJog	Manual jog
28	bInternalSpeed	Internal setpoint speed is active.
30	bHandwheel	Electronic handwheel is active.
31	bReserve31	-
Error messages:		
15	bError	Error
16	bErrStartPos	Starting position is beyond the cycle.
17	bErrExtMaster	Error in the master signal (position or speed).
18	bErrCycleLength	No cycle available.
19	bErrMaxSpeed	Maximum speed = "0".
20	bErrTPPos	Position of the touch probe sensor is beyond the cycle.
21	bErrInput	Input error (e.g. impermissible position jump or inverse direction of motion).
22	bErrCycleLengthY	No cycle available for Y axis.
23	bErrAxisData	No valid axis data structure.
29	bErrPosExtMaster	The FB L_LdVirtualMasterV cannot approach the external target position because it is varying. Only fixed positions may be approached.

* Relating to the input signal *dnState*.

5.97 L_LdToolControl - setpoint conditioning

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to execute a setpoint conditioning.

Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Selection of the speed setpoint for the machine axis (tool) • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference. • C05148 indicates the setpoint speed in the real unit of the machine.
dnTpMakeUpLeeway_s DINT	Speed for touch probe correction • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference. • C05147 indicates the correction speed in the real unit of the machine.
dnOffset_p DINT	Relative offset in [inc] • Is added to the speed setpoint *dnSpeedIn_s*.
bLoadSetPosCycle BOOL	Load selection for the master value adjustment TRUE: Load value at *dnSetPosCycleValue_p* into the SET integrator.
dnSetPosCycleValue_p DINT	Selection for the master value adjustment in [inc] • Load value for the SET integrator (setpoint position for the machine axis).
bInitActPosCycle BOOL	Initialise ACT integrator with the actual position TRUE: Load the actual position *dnActPosIn_p* into the ACT integrator.
dnActPosIn_p DINT	Actual position (from SB **LS_Feedback**) in [inc]
bResetActToSet BOOL	Delete following error TRUE: Transmits the value of the SET integrator to the ACT integrator. • The output value *dnSetPosCycle_p* is set to the output value *dnActPosCycle_p*.

Identifier/data type	Information/possible settings	
bResetSetToAct BOOL	Delete following error	
	TRUE	Transmits the value of the ACT integrator to the SET integrator. • The output value *dnActPosCycle_p* is set to the output value *dnSetPosCycle_p*.
bTpEnable BOOL	Activate touch probe evaluation	
	TRUE	Touch probe evaluation activated.
bTpReceived BOOL	Control signal for touch probe correction • Connect this input with the output *bTouchProbeReceived* of the touch probe system block used.	
	FALSE↗TRUE	Touch probe detected.
dnTpLastScan_p DINT	Number of increments counted since touch probe. • Connect this input with the output *dnTPCaptureValue1* of the touch probe system block used.	
dnTpPos_p DINT	Assigned position of the touch probe sensor in the setpoint cycle in [inc] • Value is internally limited to 0 ... 2 x cycle. • C05155 indicates the position in the real unit of the machine.	
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits4	Position change per cycle too big
	bits10	Zero crossing active
	bits12	Initialisation of actual clock
	bits13	Initialisation of setpoint clock
	Bit15	Error
	bits18	No cycle available
	Bit 19	Maximum speed = "0"
	bits20	Position of the touch probe sensor is beyond the cycle
	bits21	Input error (e.g. impermissible position jump or inverse direction of motion)
	bits23	No valid axis data structure
dnSpeedOut_s DINT	Speed setpoint for the position follower (SB **LS_PositionFollower**) for position control	
dnSetPosCycle_p DINT	Setpoint position in the cycle (with clock reference) in [inc] • Referring to zero point. • C05150 indicates the setpoint position in the real unit of the machine.	
dnActCycle_p DINT	Actual position in the cycle (with clock reference) in [inc] • Referring to zero point. • C05151 indicates the actual position in the real unit of the machine.	
dnFollowError_p DINT	Current following error in [inc] • C05152 indicates the following error in the real unit of the machine.	
dnTpTpDistance_p DINT	Distance between the last two touch probes in [inc] • For instance to measure the real actual register. • C05154 indicates the distance in the real unit of the machine.	

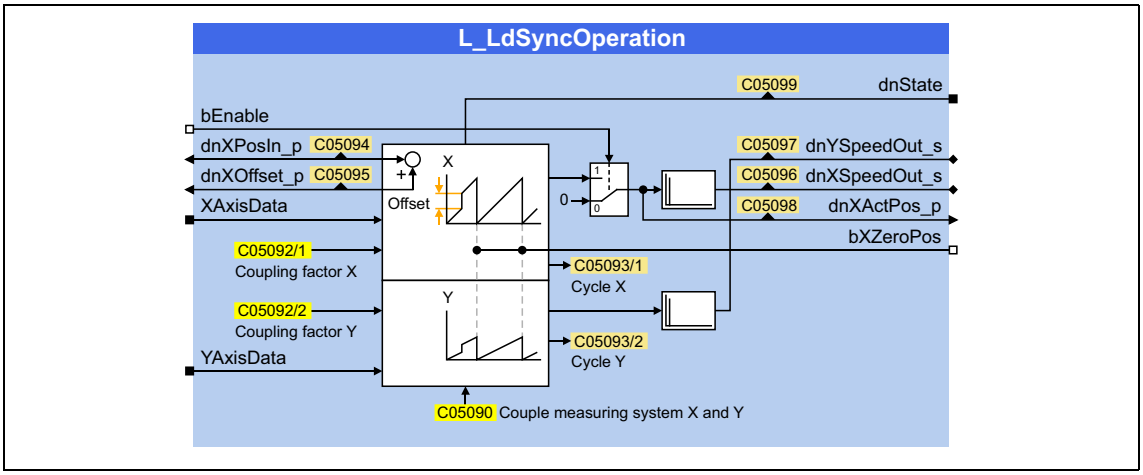
Identifier/data type	Value/meaning
dnTpDifference_p DINT	Difference between *dnTpPos_p* and the position measured after detecting a touch probe in [inc].
dnDifference_p DINT	Current difference between *dnTpPos_p* and the position measured after detecting a touch probe in [inc]. • C05153 indicates the deviation in the real unit of the machine.

Parameter

Parameter	Possible settings			Information
C05142	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C05143/1 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C05143/2 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C05144 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.
C05147	-2147483647	Unit/t	2147483647	Correction speed at the input • Read only • Calculated from the speed signal *dnTpMakeUpLeeway_s*.
C05148	-2147483647	Unit/t	2147483647	Speed at the input • Read only • Calculated from the speed signal *dnSetSpeedIn_s*.
C05149	-2147483647	Unit/t	2147483647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C05150	-214748.3647	Unit	214748.3647	Set position at the output • Display of the output signal *dnSetPosCycle_p* in the real unit of the machine.
C05151	-214748.3647	Unit	214748.3647	Actual position at the output • Display of the output signal *dnActPosCycle_p* in the real unit of the machine.
C05152	-214748.3647	Unit	214748.3647	Following error • Display of the output signal *dnFollowError_p* in the real unit of the machine.
C05153	-214748.3647	Unit	214748.3647	Measured TP deviation • Display of the output signal *dnDifference_p* in the real unit of the machine.
C05154	-214748.3647	Unit	214748.3647	Measured cycle • Display of the output signal *dnTpTpDistance_p* in the real unit of the machine.
C05155	-214748.3647	Unit	214748.3647	TP set position at the input • Display of the *dnTpPos_p* input signal in the real unit of the machine.

5.98 L_LdSyncOperation - master value connection

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel



This FB implements synchronism between a master drive and a slave drive:

- Drift-free synchronism between master drive and slave drive (modulo measuring systems) with different types of couplings.
- Additional in-cycle compensation of angular trimming in the master measuring system (x offset).

Tip!

There are two other FB for synchronous operations:

- The L_LdConvAxisV FB generates the speed setpoint for the following axis from the master speed instead of the master position, as this FB does.
- Like this FB, the L_LdLinearCoupling FB accepts an x position as the master value, but generates a setpoint position for the following axis in addition to the setpoint speed.

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate function	
	FALSE	Function has been deactivated. • The *dnXSpeedOut_s* and *dnXActPos_p* outputs continue to follow the *dnXPosIn_p* and *dnXOffset_p* input positions. • A value of "0" is output at the *dnYSpeedOut_s* output. **Caution:** Thus, a position step change at the master value end will not be displayed at *dnYSpeedOut_s*!
	TRUE	Function is activated. • According to the coupling mode parameterised in C05090, the output signals follow the *input positions, dnXPosIn_p* and *dnXOffset_p*.

Identifier/data type	Information/possible settings
dnXPosIn_p DINT	Selection of the master position in [inc] • The master position must not exceed the permissible modulo value range of the master measuring system (the *XAxisData* input). • If the position changes considerably at this input, it may become impossible to display the values at the *dnXSpeedOut_s* and/or *dnYSpeedOut_s* outputs. In this case, the position reference between master drive and slave drive would get lost! • C05094 indicates the master position in the real unit of the machine.
dnXOffset_p DINT	Selection of the master value adjustment (x offset) in [increments] • It is permissible for the trimming value to be outside of the modulo value range of the master measuring system, but it must not be outside of the DINT value range minus the master cycle (DINT value range = $\pm 2^{31}$-1 [increments] ≡ ±32768 [rev]). • The resulting master value (the *dnXActPos_p* output) will be included in the modulo cycle of the master measuring system. • C05094 displays the effective x offset in the real unit of the master measuring system. • Sudden changes in the offset position cause sudden responses of the drive motion! Provide for smooth offset adjustment (e.g. via the L_LdPosCtrlLin FB).
XAxisData	Selection of the measuring system of the master drive for scaling the master value The following sources can be used for this input: • Any master measuring system can be defined via the L_SdSetAxisData FB. In this case, its *AxisData* output must be connected to this input. • Some of the cam technology function blocks (e.g. the L_CamProfiler FB) output the measuring systems defined via »Cam Designer«. In this case, the corresponding measuring system output must be connected to the *XAxisData* input. **Note:** In most cases, master measuring systems are of the "modulo" type. However, both limited and unlimited measuring systems are also possible. If the FB is operated in the "Coupling via cycles" operating mode (C05090 = 1), it is mandatory for the measuring system to be a modulo measuring system.
YAxisData	Selection of the measuring system of the slave drive for scaling the setpoint • This input typically receives drive measuring system data (the *DI_AxisData* output of the **LS_DriveInterface** SB). **Note:** Basically, all measuring system types (limited, unlimited, modulo) are permissible. If the FB is operated in the "Coupling via cycles" operating mode (C05090 = 1), it is mandatory for the measuring system to be a modulo measuring system.

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits10	Zero crossing active (corresponds to the *bXZeroPos* output signal)
	bits14	Internal limitation for calculation: The *dnYSpeedOut_s* and/or *dnYSpeedOut_s* speed outputs are not able to follow the change in the resulting *dnActXPos_p* master position. The reference to the master cycle gets lost.
	Bit15	Group error (see bit 16 ... 31)
	bit16	The master position at the *dnXPosIn_p* input is outside of the permissible modulo value range of the master measuring system (see *XAxisData* input).
	bits18	The master measuring system and/or the slave measuring system (the *XAxisData* and *YAxisData* inputs) are not modulo measuring systems, or the modulo cycle in one of the measuring systems is zero.
	bits21	Incorrect input value: • Error when selecting the offset position: The *dnXOffset_p* input exceeds the permissible DINT value range minus the master cycle. (DINT value range = $\pm 2^{31}$-1 [increments] ≡ ±32768 [rev]) • Gearbox denominator = "0"
	bits23	Error in the measuring system: • The pointers at the *XAxisData* and/or *YAxisData* inputs do not refer to a valid axis data structure. • If coupling is performed via cycles (C05090 = 1), modulo measuring systems must be specified at the *XAxisData* and/or *YAxisData* inputs.
dnYSpeedOut_s DINT	Output of the setpoint speed (y speed) as a speed signal • Scaling: 2^{26} ≡ 15000 [rpm] • The signal can be used for direct coupling to the **LS_PositionFollower** system block (the *PF_dnSpeedAdd1_s* input). • Shifts in the resulting master position (e.g. when switching-off the FB via *bEnable* = TRUE↘FALSE) will not be displayed via this signal. The position reference to the *dnXActPos_p* master cycle may get lost! • If the FB is deactivated (*bEnable* = FALSE), a value of "0" is output. • Using the measuring system data at the YAxisData input, the setpoint speed is indicated in the real unit of the machine in C05097.	
dnXSpeedOut_s DINT	Output of the resulting master speed as a speed signal (The resulting change in the *dnXPosIn_p* master position and the *dnXOffset_p* master value adjustment is displayed.) • Scaling: 2^{26} ≡ 15000 [rpm] • This signal can be used for the coupling of further slave drives. • Angular trimming via the *dnXOffset_p* input will be accounted for in this signal. • The signal directly results from the differentiation of the resulting *dnXActPos_p* master position. Considerable position step changes at *dnXActPos_p* lead to a limitation of this output. In this case, the signal does not display the position step change at *dnXActPos_p*. • If the FB is deactivated (*bEnable* = FALSE), the resulting master speed is output as before. • Using the measuring system data at the *XAxisData* input, the resulting master speed is displayed in the real unit of the master measuring system in C05096.	
dnXActPos_p DINT	Output of the resulting master position in [increments] • If *bEnable* = TRUE, the *dnXPosIn_p* master position offset against the *dnXOffset_p* offset value will be output. The output signal is limited to the modulo value range of the master measuring system (*XAxisData*). • If the FB is deactivated (*bEnable* = FALSE), the resulting master position is output as before. • Using the measuring system data at the *XAxisData* input, the resulting master position is displayed in the real unit of the master measuring system in C05098.	

Identifier/data type	Value/meaning	
bXZeroPos BOOL	Status signal: "Cycle zero crossing in the modulo cycle of the master measuring system"	
	FALSE	Cycle zero crossing did not occur: The resulting *dnXActPos_p* master position is non-zero, the resulting master value is in the x modulo cycle.
	TRUE	Cycle zero crossing occurred: • The *bXZeroPos* output is statically set to TRUE if the resulting *dnXActPos_p* master position is zero. • The *bXZeroPos* output is set to TRUE for one task cycle if the resulting *dnXActPos_p* master position performs a step change to the following x modulo cycle (*dnXSpeedOut_s* > 0: $x_{max} \rightarrow 0$) or to the previous x modulo cycle (*dnXSpeedOut_s* < 0: $0 \rightarrow x_{max}$).

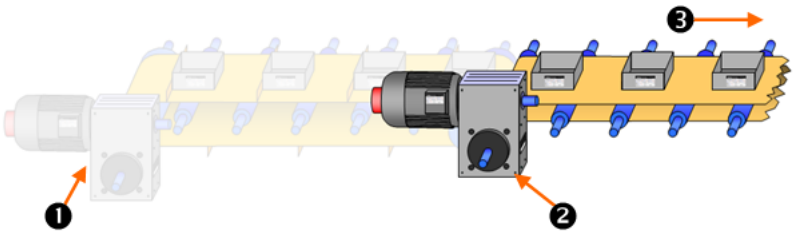
Parameter

Parameter	Possible settings			Information
C05090				Coupling measuring systems X and Y
	0	Coupling via feed constants		One of the units of the master measuring system is mapped to one of the units of the slave measuring system (Lenze setting).
	1	Coupling via cycles		One of the cycles of the master measuring system is mapped to one of the cycles of the slave measuring system.
	2	Free coupling		Synchronism depends on the ratio between the gearbox factors of the master drive/slave drive and on the coupling factors, C05092/1 and C05092/2.
C05091/1	String of digits			User-defined unit X • Display of the unit of the master measuring system.
C05091/2	String of digits			User-defined unit Y • Display of the unit of the slave measuring system.
C05092/1	0.0000		214748.3647	Coupling factor x (master measuring system) • The value entered here is included in the resulting synchronism factor as the denominator term. • Initialisation: 0.0000
C05092/2	0.0000		214748.3647	Coupling factor y (slave measuring system) • The value entered here is included in the resulting synchronism factor as the numerator term. • Initialisation: 0.0000
C05093/1	0	Unit	2147483647	Cycle X • Display of the cycle of the master measuring system
C05093/2	0	Unit	2147483647	Cycle Y • Display of the cycle of the slave measuring system

Parameter	Possible settings			Information
C05094	-214748.3647	Unit	214748.3647	Position x at the input (master position) • Display of the *dnXPosIn_p* input signal in the real unit of the machine.
C05095	-214748.3647	Unit	214748.3647	Trimming X • Display of the *dnXOffset_p* input signal in the real unit of the machine.
C05096	-214748.3647	Unit/t	214748.3647	Speed X at the output • Display of the resulting master speed • Calculated from the speed signal *dnXSpeedOut_s*.
C05097	-214748.3647	Unit/t	214748.3647	Speed Y at the output • Display of the resulting setpoint speed • Calculated from the speed signal *dnYSpeedOut_s*.
C05098	-214748.3647	Unit	214748.3647	Position X at the output (resulting master position) • Display of the output signal *dnXActPos_p* in the real unit of the machine.
C05099	-214748.3647		214748.3647	Status • Display of the bit-coded output signal *dnState*.

5.98.1 Operating mode 0: Coupling via feed constants

In this operating mode, the FB couples the axes of the master drive and the slave drive via the set feed constants. The cycles of the master measuring system and the slave measuring system do not have any effect.



- Via C05092/1 and C05092/2 the ratio of the corresponding units is set, i.e. how many units of the master axis (x axis) correspond to how many units of the slave axis (y axis).
- The speed ratio between the slave drive and the master drive is calculated according to following formula:

$$\frac{\text{dnYSpeedOut_s}}{\text{dnXSpeedOut_s}} = \frac{\text{Gearbox constant Y}}{\text{Gearbox constant X}} \cdot \frac{\text{Feed constant X}}{\text{Feed constant Y}} \cdot \frac{\text{Coupling factor Y (C05092/2)}}{\text{Coupling factor X (C05092/1)}}$$

[5-59] Formula for operating mode 0

- The conversion according to the formula above is remainder considered and hence drift-free (consideration of remainders when performing divisions).

Application example: Synchronous conveying belts

❶ Master drive (conveying belt 1)
❷ Slave drive (conveying belt 2)
❸ Traversing speed

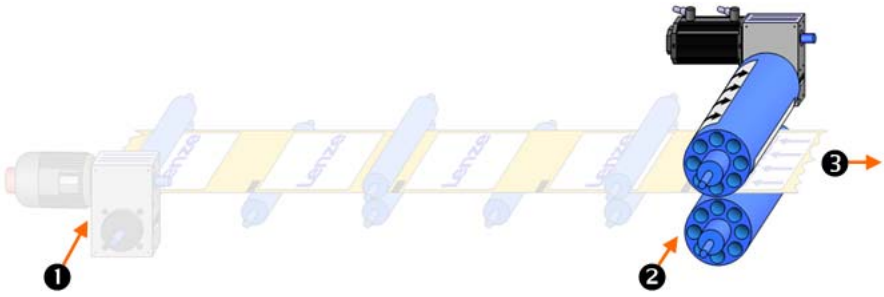
Master drive (conveying belt 1)		Slave drive (conveying belt 2)	
Gearbox constant X	1120 : 207	Gearbox constant Y	5 : 2
Feed constant X	200.0000 [mm]	Feed constant Y	90.0000 [mm]

According to the formula above, the speed ratio between the master drive and the slave drive is calculated as follows:

$$\frac{\text{dnYSpeedOut_s}}{\text{dnXSpeedOut_s}} = \frac{\frac{5}{2}}{\frac{1120}{207}} \cdot \frac{200.0000\ [\text{mm}]}{90.0000\ [\text{mm}]} \cdot \frac{1}{1} = 1.0268...$$

5.98.2 Operating mode 1: Coupling via cycles

In this operating mode, the FB couples the axes of the master drive and the slave drive via the set feed constants and the cycles. One of the cycles of the master drive is mapped on one of the cycles of the slave drive.



- In this type of coupling, both master measuring system and slave measuring system must be modulo measuring systems.
- The C05092/1 and C05092/2 coupling factors do not have any effect in this operating mode.
- The speed ratio between the slave drive and the master drive is calculated according to following formula:

$$\frac{\text{dnYSpeedOut_s}}{\text{dnXSpeedOut_s}} = \frac{\text{Gearbox constant Y}}{\text{Gearbox constant X}} \cdot \frac{\text{Feed constant X}}{\text{Feed constant Y}} \cdot \frac{\text{Cycle Y}}{\text{Cycle X}}$$

[5-60] Formula for operating mode 1

- The conversion according to the formula above is remainder considered and hence drift-free (consideration of remainders when performing divisions).

Application example: Printing roller

❶ Master drive (material feed)
❷ Slave drive (printing roller)
❸ Traversing speed

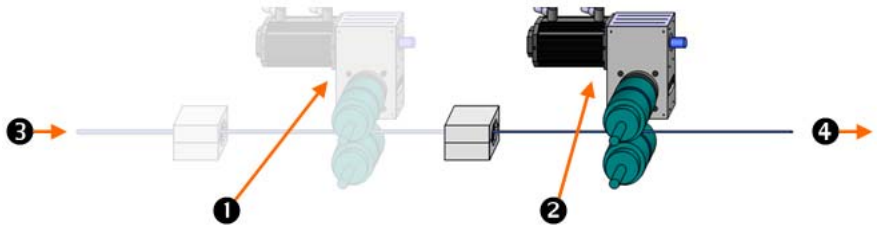
Master drive (material feed)		Slave drive (printing roller)	
Gearbox constant X	32 : 5	Gearbox constant Y	45 : 2
Feed constant X	160.0000 [mm]	Feed constant Y	360.0000 [°] (≡ 628.3185 [mm])
Cycle X	628.3185 [mm] (π * 200 [mm])	Cycle Y	360.0000 [°]

According to the formula above, the speed ratio between the master drive and the slave drive is calculated as follows:

$$\frac{\text{dnYSpeedOut_s}}{\text{dnXSpeedOut_s}} = \frac{\frac{45}{2}}{\frac{32}{5}} \cdot \frac{160.0000\ [\text{mm}]}{360.0000\ [°]} \cdot \frac{360.0000\ [°]}{628.3185\ [\text{mm}]} = 0.8952...$$

5.98.3 Operating mode 2: Free coupling

In this operating mode, the FB couples the axes of the master drive and the slave drive only via the gearbox factors of the master drive/slave drive and the coupling factors parameterised in C05092/1 and C05092/2.



- Neither the feed constants nor the cycles of the master measuring system/slave measuring system have any effect on the synchronism ratio.
- Via C05092/1 and C05092/2 the revolution ratio is indicated, i.e. how many revolutions of the master shaft (x axis) correspond to how many revolutions of the following axis (x axis).
- The speed ratio between the slave drive and the master drive is calculated according to following formula:

$$\frac{\text{dnYSpeedOut_s}}{\text{dnXSpeedOut_s}} = \frac{\text{Gearbox constant Y}}{\text{Gearbox constant X}} \cdot \frac{\text{Coupling factor Y (C05092/2)}}{\text{Coupling factor X (C05092/1)}}$$

[5-61] Formula for operating mode 2

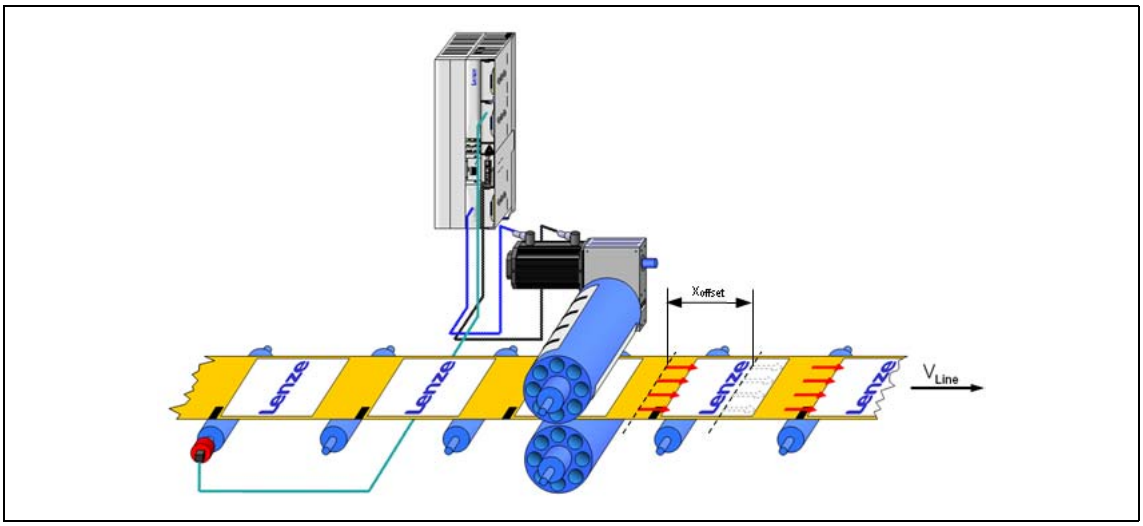
- The conversion according to the formula above is remainder considered and hence drift-free (consideration of remainders when performing divisions).

Application example: Wire drawing system with specification of the synchronism ratio K_y

❶ Master drive (wire drawing station 1)
❷ Slave drive (wire drawing station 2)
❸ Traversing speed
❹ K_y * traversing speed

Master drive (wire drawing station 1)		Slave drive (wire drawing station 2)	
Gearbox constant X	17 : 3	Gearbox constant Y	13 : 2
Feed constant X	160.0000 [mm]	Feed constant Y	160.0000 [mm]
Coupling factor X (C05092/1)	100 [%]	Coupling factor Y (C05092/2)	110 [%]

The speed ratio between the master drive and the slave drive is calculated according to the formula above, the synchronism ratio K_y being considered as the C05092/1 and C05092/1 coupling factors:

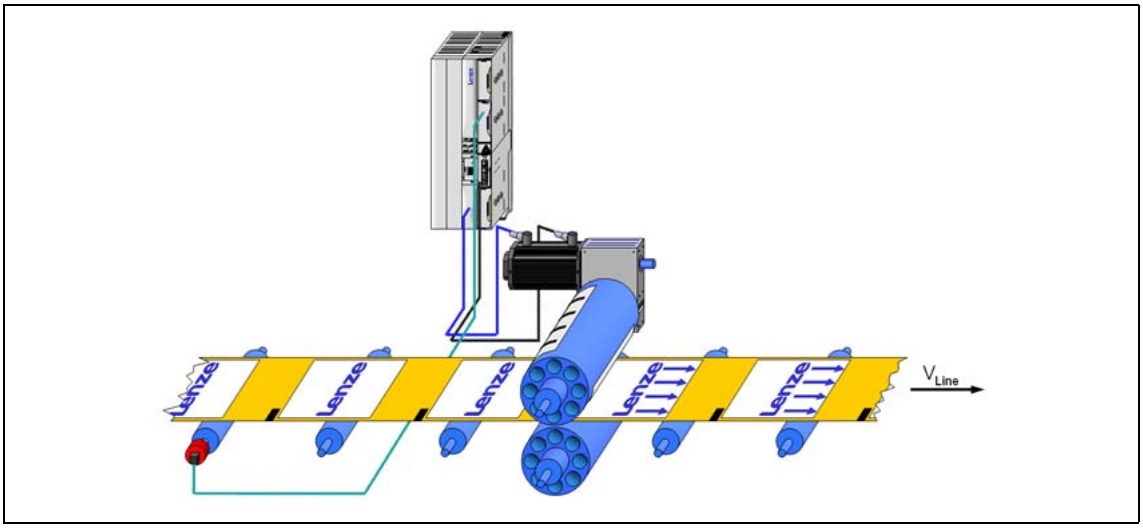


$$\frac{\text{dnYSpeedOut_s}}{\text{dnXSpeedOut_s}} = \frac{\frac{13}{2}}{\frac{17}{3}} \cdot \frac{110\ [\%]}{100\ [\%]} = 1.2618...$$

5.98.4 Angular trimming via x offset

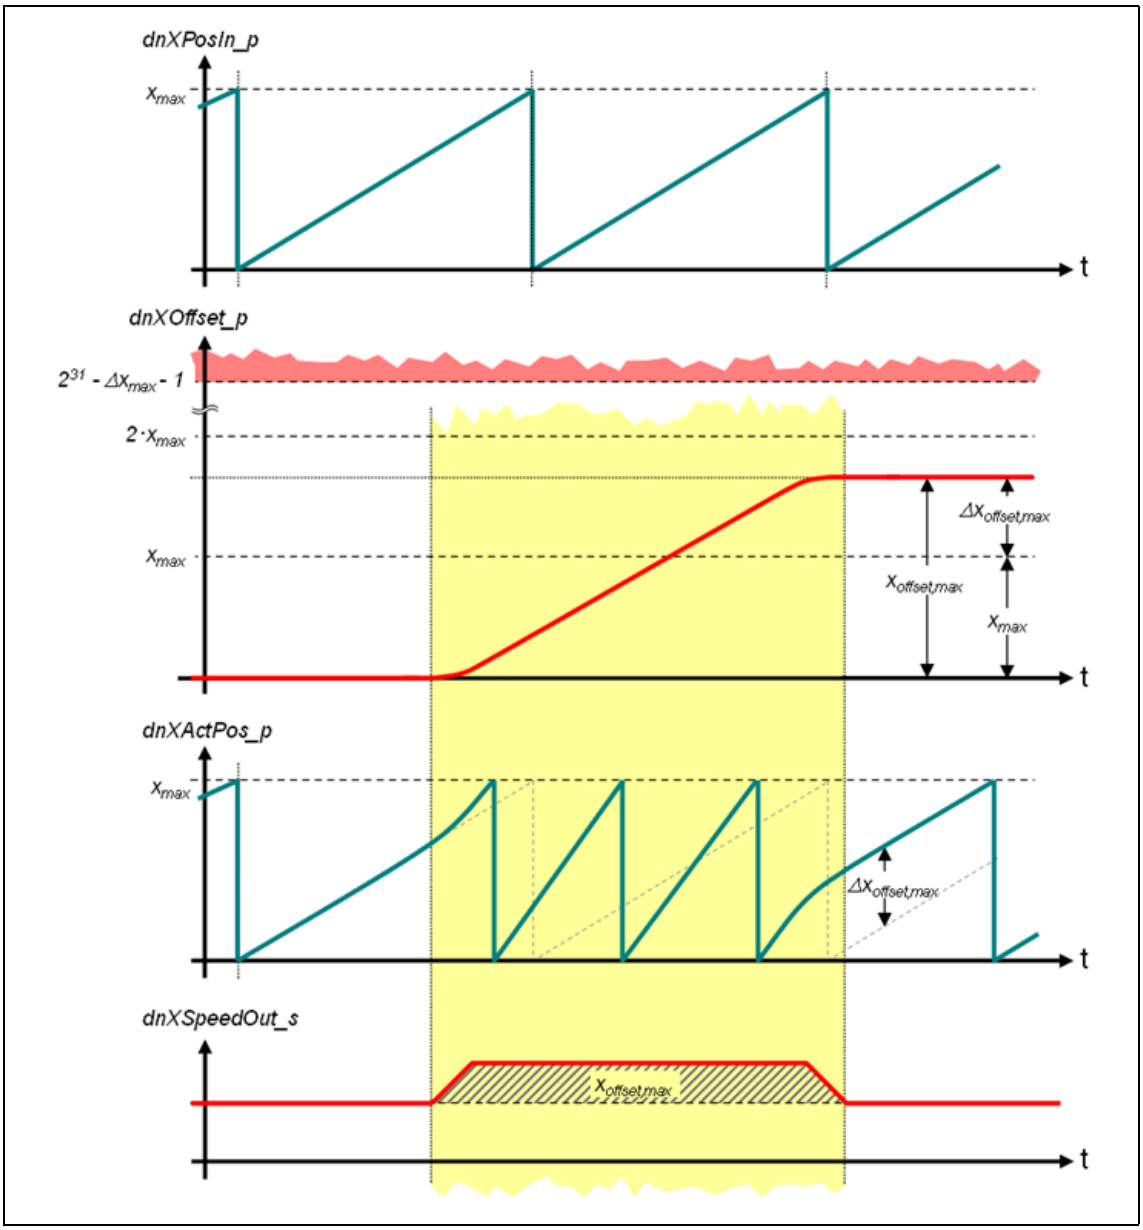
In many production processes, several processing steps in a row are required for a product to be manufactured. Every machining process must be brought into line with the previous one to ensure the desired product quality. This is called angular trimming and normally achieved via a so-called x offset. The x offset leads to a virtual trimming of the master value and hence to a correct alignment of the following axis to the process.

Example 1: No angular trimming (without x offset)



The "Arrows" print image is shifted by x_{offset} compared to the desired position:

[5-62] Example 1



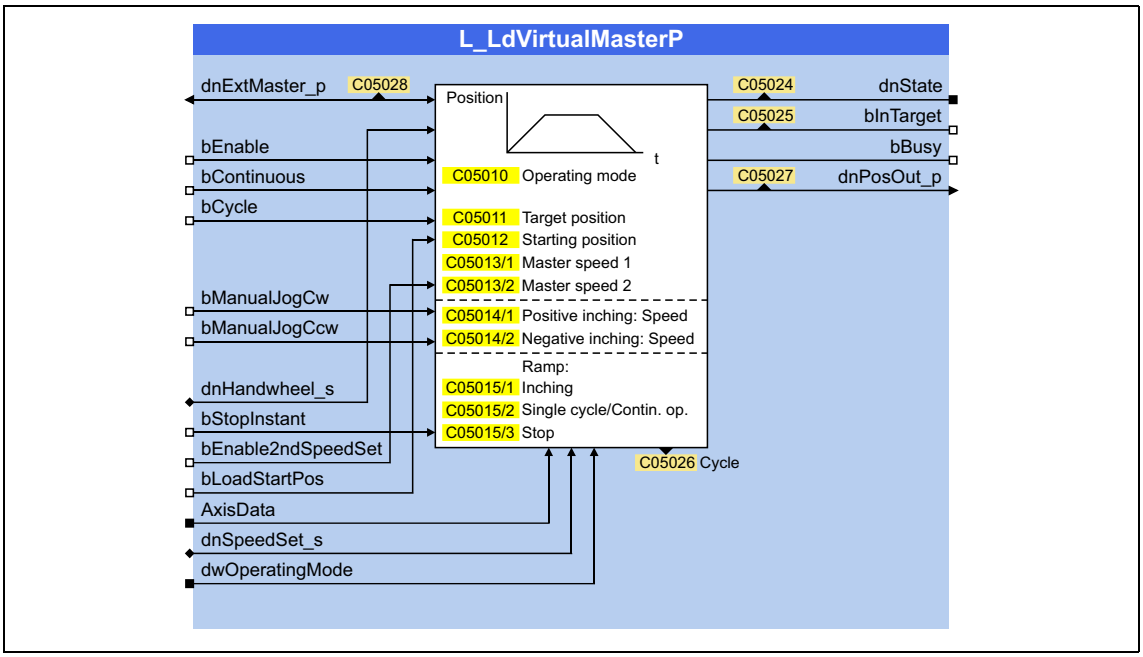
Example 2: Angular trimming via x offset

The "Arrows" print image is on the desired position:

[5-63] Example 2

The *dnXOffset_p* x offset is additively superimposed on the *dnXPosIn_p* master position and then projected again on the modulo cycle of the master measuring system. The resulting master position is output at the *dnXActPos_p* output.

[5-64] Example: Superimposing an offset on the master position



Tip!

- The *dnXOffset_p* offset value does not necessarily have to be limited to the modulo value range of the master cycle. However, it must not exceed the permissible DINT value range minus the master cycle.
  (DINT value range = $\pm 2^{31}$-1 [increments] ≡ ±32768 [rev])
- The x offset is offset in the **L_LdSyncOperation** FB in the same way as in the L_LdAddOffsetCyclic FB.

5.99 L_LdVirtualMasterP - virtual master for synchronism

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB provides the "Virtual master" function for the "Synchronism" application.

Inputs

Identifier/data type	Information/possible settings	
dnExtMaster_p DINT	Selection of an external master position in [inc] • E.g. through an absolute value encoder. • The master position must be inside the cycle. • C05028 indicates the external master position in the real unit of the machine.	
bEnable BOOL	Activate master function • This input has the highest priority.	
	FALSE	The input *dnExtMaster_p* connected 1:1 to the output *dnPosOut_p*. No ramps are active.
	TRUE	Ramps are activated.
	TRUE↘FALSE	Master shaft *dnPosOut_p* travels via the ramp for permanent operation with master speed to the external master position *dnExtMaster_p*. • Only a fixed master position can be approached. • If the master position changes, bit 29 of the status signal *dnState* will be set.
bContinuous BOOL	Control - continuous operation/production process • Only possible when: • C05010 = "0: Continuous operation" or • C05010 = "3: Enable speed and mode by process data" and *dwOperatingMode* = "0" (continuous operation). In this case, the speed is selected via the *dnSpeedSet_s* input.	
	TRUE	Continuous operation is started, master shaft *dnPosOut_p* travels continuously.
	TRUE↘FALSE	Continuous operation is stopped, master shaft *dnPosOut_p* travels to the stop position set in C05011.

Identifier/data type	Information/possible settings	
bCycle BOOL	Control - single cycle • Only possible when: • C05010 = "1: Inching" or • C05010 = "3: Enable speed and mode by process data" and *dwOperatingMode* = "1" (inching). In this case, the speed is selected via the *dnSpeedSet_s* input.	
	FALSE↗TRUE	Cyclic operation of the master shaft *dnPosOut_p* is started. • The master shaft travels to the stop position set in C05011. • A renewed cycle must be started with a renewed FALSE↗TRUE edge.
bManualJogCw BOOL	Inching - CW rotation • Only possible when: • C05010 = "1: Inching" or • C05010 = "3: Enable speed and mode by process data" and dwOperatingMode = "1" (inching). **Note:** The speeds specified in C05014/1 and C05014/2 are always valid for inching, independent of the preselected mode via code or input.	
	TRUE	Inching (manual jog) in positive direction.
bManualJogCcw BOOL	Inching - CCW rotation • Only possible when: • C05010 = "1: Inching" or • C05010 = "3: Enable speed and mode by process data" and dwOperatingMode = "1" (inching). **Note:** The speeds specified in C05014/1 and C05014/2 are always valid for inching, independent of the preselected mode via code or input.	
	TRUE	Inching (manual jog) in negative direction.
dnHandwheel_s DINT	Master speed for the handwheel function of the master shaft • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference.	
bStopInstant BOOL	Stop master shaft • This input has the second highest priority (after *bEnable*).	
	FALSE↗TRUE	The master shaft *dnPosOut_p* is immediately braked to standstill via the set stop ramp.
bEnable2ndSpeedSet BOOL	Change over to second master speed	
	FALSE	Master speed 1 (C05013/1) is active.
	TRUE	Master speed 2 (C05013/2) is active.
bLoadStartPos BOOL	Set master shaft to starting position	
	FALSE↗TRUE	Master shaft *dnPosOut_p* is set to the starting position set in C05012.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) **Note:** This FB only works with modulo measuring systems!	
dnSpeedSet_s DINT From library V02.07.xx.xx	Selection of master speed 1 via process date • This input is only active if the operating mode "3: Speed and mode via input" has been selected in C05010. **Note:** The master speed 2 is always selected via C05013/2.	

Identifier/data type	Information/possible settings	
dwOperatingMode DWORD From library V02.07.xx.xx	Selection of the operating mode via process date • This input is only active if the operating mode "3: Speed and mode via input" has been selected in C05010.	
	0	Continuous operation
	1	Inching
	2	Handwheel function

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit 1	State active
	Bit 2	Procedure completed
	Bit 3	Acceleration/deceleration phase
	Bit 5	Counter-clockwise rotation
	Bit 10	Zero crossing active
	Bit 15	Error
	bit16	Starting position is beyond the cycle
	bits17	Error in the master signal (position or speed)
	Bit 18	No cycle available
	Bit 19	Maximum speed = "0"
	bits23	No valid axis data structure
	Bit 24	Single cycle
	bits25	Automatic mode
	Bit 26	Stopping is active
	Bit 27	Manual jog
	Bit 28	Internal setpoint speed is active
	Bit 29	Position difference - external master
	bits30	Electronic handwheel is active
bInTarget BOOL	Status signal "Master shaft has reached stop position"	
	TRUE	Master shaft *dnPosOut_p* has reached the stop position set in C05011.
bBusy BOOL	Status signal "master shaft is positioned"	
	TRUE	Master shaft *dnPosOut_p* is positioned.
dnPosOut_p DINT	Master position output (current position of the master shaft in the cycle) in [inc] • C05027 indicates the master position in the real unit of the machine.	

Parameter

Parameter	Possible settings		Info
C05010			VMaster: Operating mode
	0	Continuous operation	Lenze setting
	1	Inching	
	2	Handwheel function	
	3	Selection of speed and mode via input	Master speed 1 and the operating mode are selected via the corresponding inputs of the FB.

Parameter	Possible settings			Info
C05011	0.0000	Unit	214000.0000	Target position • The target position must be inside the cycle. • Initialisation: 0.0000 unit
C05012	0.0000	Unit	214000.0000	Starting position • The starting position must be inside the cycle. • Initialisation: 0.0000 unit
C05013/1	-214000.0000	Unit/t	214000.0000	Master speed 1 • Initialisation: 1.0000 unit/t
C05013/2	-214000.0000	Unit/t	214000.0000	Master speed 2 • Initialisation: 1.0000 unit/t
C05014/1	0.0000	Unit/t	214000.0000	Positive inching: Speed • Initialisation: 1.0000 unit/t
C05014/2	0.0000	Unit/t	214000.0000	Negative inching: Speed • Initialisation: 1.0000 unit/t
C05015/1	0.010	s	130.000	Ramp: Inching • Initialisation: 1.000 s
C05015/2	0.010	s	130.000	Ramp: Continuous operation/single cycle • Initialisation: 1.000 s
C05015/3	0.010	s	130.000	Ramp: Stop • Initialisation: 1.000 s
C05016/1 From library V02.02.xx.xx onwards	Character string			Position unit • Read only
C05016/2 From library V02.02.xx.xx onwards	Character string			Speed unit • Read only
C05017 From library V02.02.xx.xx onwards	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.
C05024	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C05025				Master position in the target • Like output *bInTarget* • Read only
	0	No		
	1	Yes		
C05026	-214748.3647	Unit	214748.3647	Cycle • Read only
C05027	-214748.3647	Unit	214748.3647	Master position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C05028	-214748.3647	Unit	214748.3647	External master position at the input • Display of the *dnExtMaster_p* input signal in the real unit of the machine.

5.99.1 Functions

Handwheel function

- Ensures an easy control of a machine run. The clutched drives are interconnected in a system.
- Incremental encoders via DFIN or multiple encoder input. An input must be selected.
- No ramp functions are active.
- Function is enabled via the control (PLC) by selecting the "handwheel function" operating mode (C05010 ="2") and setting *bEnable* to TRUE.

Manual jog (inching)

- Operation per HMI or keys via control (PLC). The locking is done in the PLC.
- Ramp functions are active.
- Parameters are defined once or changed via HMI.

Single cycle

- Operation per HMI or keys via control (PLC)
- Function starts with a FALSE↗TRUE edge at the *bCycle* input.
- Ramp functions are active.
- The data for production speed are used as parameters.
- The cycle starts at the current position and stops at the stop position (C05011).

Continuous operation

- Operation per HMI or keys via control (PLC)
- Function starts with a FALSE↗TRUE edge at the *bContinuous* input. The function remains active as long as the TRUE level is applied.
- Ramp functions are active.
- The data for production speed are used as parameters.
- The cycle starts at the current position and stops at the stop position (C05011).

Synchronise virtual master to the external master

- The virtual master is synchronised to an external position selection. Thus, the downstream system can be separated from the external master any time.
- Application: Modular machines: The external position is delivered by
  - MotionBus (Slave)
  - DFIN/multiple encoder input/FB **L_LdSetXAxisVelocity** (relative synchronism)
  - Fieldbus as real encoder (must be limited to the cycle set).
- The function is activated by setting *bEnable* to TRUE.

Profile generator/stopping at stop position:

- The process can be executed via several machine cycles (example: printing machines). The setting of the operating time is decisive.

Load starting position:

- The starting position set in C05012 is accepted by setting *bLoadStartPos* to TRUE.
- For this, the enable input *bEnable* must be set to TRUE.

Stop master shaft

- The master shaft is braked to standstill within the operating time set in C05015/3 setting *bStopInstant* to TRUE.
- For this, the enable input *bEnable* must be set to TRUE.
- This function has the highest priority.

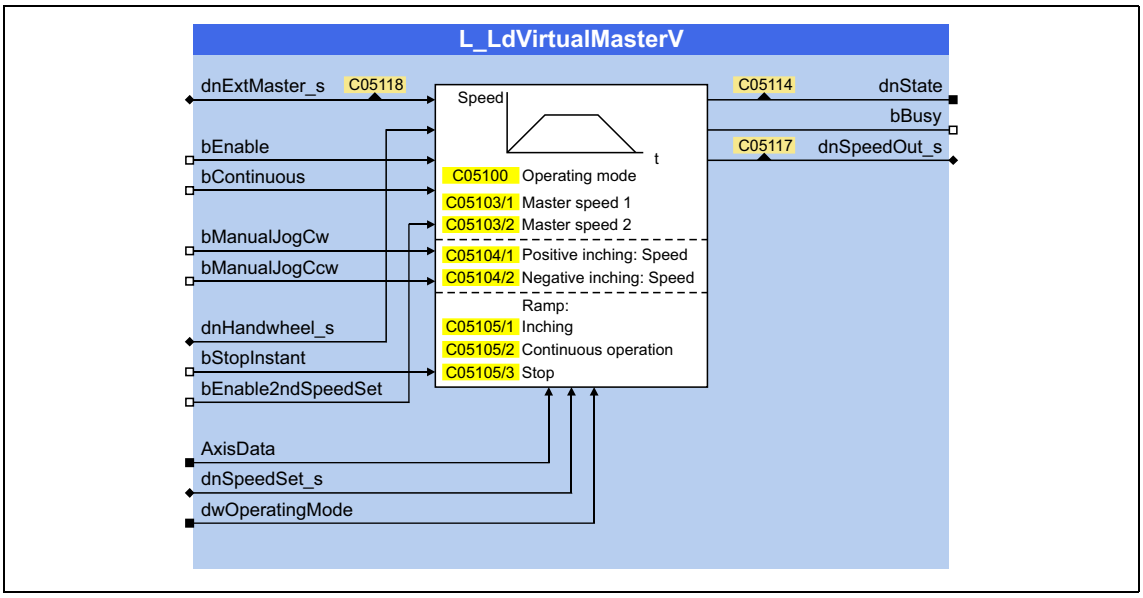
Change over to second master speed

- By setting *bEnable2ndSpeedSet* to TRUE, the master speed 1 (C05013/1) is changed to master speed 2 (C05013/2).
- Ramp functions are active.

5.99.2 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed and position values defined via parameters are converted from the real unit to the internal unit.



The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:

Error number		Error message in the logbook	Response
61669515	0x3AD008B	L_LdVirtualMasterP:int.speed overflow (LS_DriveInterface)	Error
61669387	0x3AD000B	L_LdVirtualMasterP:int.speed overflow (L_SdSetAxisData)	Error

5.100 L_LdVirtualMasterV - virtual master for electronic gearboxes

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB provides the "Virtual master" function for the "Electronic gearbox" application.

Inputs

Identifier/data type	Information/possible settings	
dnExtMaster_s DINT	Selection of an external master speed, e.g. from an encoder. • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference. • C05118 indicates the external master speed in the real unit of the machine.	
bEnable BOOL	Activate master function • This input has the highest priority.	
	FALSE	The input *dnExtMaster_s* is connected through 1:1 to output *dnSpeedOut_s*. No ramps are active.
	TRUE	Master shaft *dnSpeedOut_s* is braked to standstill via the ramp function or follows the function selected.
	TRUE↘FALSE	Master shaft *dnSpeedOut_s* travels via the ramp for continuous operation with master speed *dnExtMaster_s*.
bContinuous BOOL	Control - continuous operation/production process • Only possible for the "continuous operation" mode set in C05100.	
	TRUE	Continuous operation is started, master shaft *dnSpeedOut_s* travels with setpoint speed.
	TRUE↘FALSE	Continuous operation is stopped, master shaft *dnSpeedOut_s* is braked to standstill via ramp for continuous operation.
bManualJogCw BOOL	Inching - CW rotation • Only possible for the "inching" mode set in C05100.	
	TRUE	Inching (manual jog) in positive direction.
bManualJogCcw BOOL	Inching - CCW rotation • Only possible for the "inching" mode set in C05100.	
	TRUE	Inching (manual jog) in negative direction.

Identifier/data type	Information/possible settings	
dnHandwheel_s DINT	Master speed for the handwheel function of the master shaft. • At this input, the FB expects a speed in [rpm]. The machine parameters at the input *AxisData* are used as speed reference.	
bStopInstant BOOL	Stop master shaft • This input has the second highest priority (after *bEnable*).	
	FALSE↗TRUE	The master shaft *dnSpeedOut_s* is immediately braked to standstill via the set stop ramp.
bEnable2ndSpeedSet BOOL	Change over to second master speed	
	FALSE	Master speed 1 (C05103/1) is active.
	TRUE	Master speed 2 (C05103/2) is active.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	
dnSpeedSet_s DINT As of library V02.07.xx.xx	Selection of master speed 1 via process date • This input is only active if the operating mode "3: Speed and mode via input" has been selected in C05100.	
dwOperatingMode DWORD As of library V02.07.xx.xx	Selection of the operating mode via process date • This input is only active if the operating mode "3: Speed and mode via input" has been selected in C05100.	
	0	Continuous operation
	1	Inching
	2	Handwheel function

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits1	State active
	bits3	Acceleration/deceleration phase
	bits5	Counter-clockwise rotation
	Bit15	Error
	bits17	Error in the master signal (position or speed)
	Bit 19	Maximum speed = "0"
	bits23	No valid axis data structure
	bits25	Automatic mode
	bits26	Stopping is active
	bits27	Manual jog
	bits28	Internal setpoint speed is active
	bits30	Electronic handwheel is active
bBusy BOOL	Status signal "Master shaft travels"	
	TRUE	Master shaft *dnSpeedOut_s* travels
dnSpeedOut_s DINT	Master speed output in [rpm] • C05117 indicates the master speed in the real unit of the machine.	

Parameter

Parameter	Possible settings			Information
C05100				VMaster: Operating mode
	0	Continuous operation		Lenze setting
	1	Inching		
	2	Handwheel function		
	3	Selection of speed and mode via input		Master speed 1 and the operating mode are selected via the corresponding inputs of the FB.
C05101 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C05102 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.
C05103/1	-214000.0000	Unit/t	214000.0000	Master speed 1 • Initialisation: 1.0000 unit/t
C05103/2	-214000.0000	Unit/t	214000.0000	Master speed 2 • Initialisation: 1.0000 unit/t
C05104/1	0.0000	Unit/t	214000.0000	Positive inching: Speed • Initialisation: 1.0000 unit/t
C05104/2	0.0000	Unit/t	214000.0000	Negative inching: Speed • Initialisation: 1.0000 unit/t
C05105/1	0.010	s	130.000	Ramp: Inching • Initialisation: 1.000 s
C05105/2	0.010	s	130.000	Ramp: Continuous operation/single cycle • Initialisation: 1.000 s
C05105/3	0.010	s	130.000	Ramp: Stop • Initialisation: 1.000 s
C05114	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C05117	-214748.3647	Unit	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C05118	-214748.3647	Unit	214748.3647	External speed at the input • Read only • Calculated from the speed signal *dnExtMaster_s*.

5.100.1 Functions

Handwheel function

- Ensures an easy control of a machine run. The clutched drives are interconnected in a system.
- Incremental encoders via DFIN or multiple encoder input. An input must be selected.
- No ramp functions are active.
- Function is enabled via the control (PLC) by selecting the "handwheel function" operating mode (C05100 ="2") and setting *bEnable* to TRUE.

Manual jog (inching)

- Operation per HMI or keys via control (PLC). The locking is done in the PLC.
- Ramp functions are active.
- Parameters are defined once or changed via HMI.

Continuous operation

- Operation per HMI or keys via control (PLC)
- Function starts with a FALSE↗TRUE edge at the *bContinuous* input. The function remains active as long as the TRUE level is applied.
- Ramp functions are active.
- The data for production speed are used as parameters.

Synchronise virtual master to the external master

- The virtual master is synchronised to an external speed selection. Thus, the downstream system can be separated from the external master any time.
- Application: Modular machines: The external speed is delivered by
  - MotionBus (Slave) as position selection
  - DFIN/multiple encoder input/FB **L_LdSetXAxisVelocity** (relative synchronism)
  - Fieldbus as real encoder as position selection (must be limited to the cycle set).
- The function is activated by setting *bEnable* to TRUE.

Stop master shaft

- The master shaft is braked to standstill within the operating time set in C05111 setting *bStopInstant* to TRUE.
- For this, the enable input *bEnable* must be set to TRUE.
- This function has the highest priority.

Change over to second master speed

- By setting *bEnable2ndSpeedSet* to TRUE, the master speed 1 (C05103/1) is changed to master speed 2 (C05103/2).
- Ramp functions are active.
- The function can be used e.g. for applications with reduced machine speed.

Second master speed for manual jog

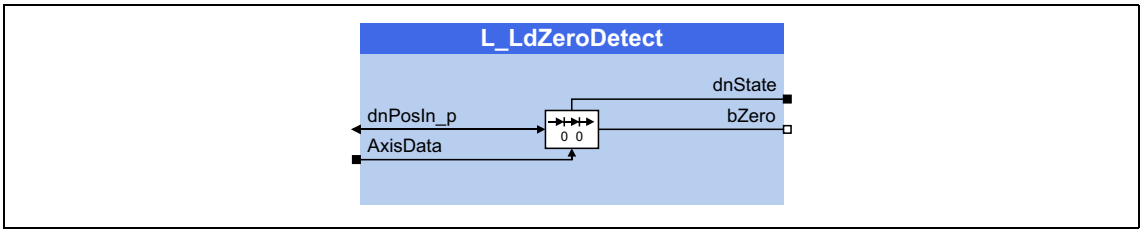
- A change-over to master speed 2 via input *bEnable2ndSpeedSet* has also an effect on the "Manual jog" function:
  - Master speed 2 supersedes the manual speeds set in C05104/1 and C05104/2.
  - The direction of rotation is defined by the inputs *bManualJogCw* (positive) or *bManualJogCcw* (negative).

5.100.2 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed and position values defined via parameters are converted from the real unit to the internal unit.

The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:



Error number		Error message in the logbook	Response
61669388	0x3AD000C	L_LdVirtualMasterV:int.speed overflow (LS_DriveInterface)	Error
61669516	0x3AD008C	L_LdVirtualMasterV:int.speed overflow (L_SdSetAxisData)	Error

5.101 L_LdZeroDetect - zero crossing detection

Function library:	LenzeLineDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

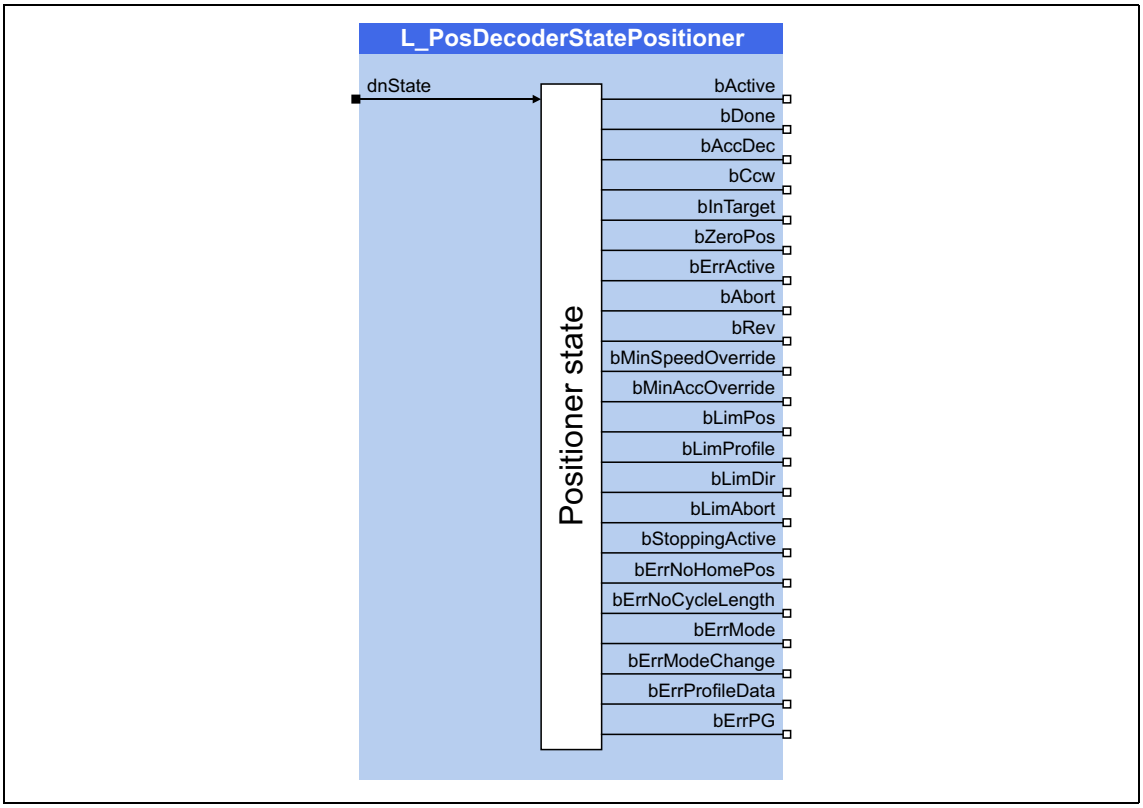
This FB observes a clocked position and detects zero crossings.

- The cycle and shift factor for the position resolution are read out of the machine parameters (*AxisData*).

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Clocked position in [inc]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits10	Zero crossing active
	Bit15	Error
	bits18	No cycle available
	bits21	Input error (e.g. impermissible position jump or inverse direction of motion)
	bits23	No valid axis data structure
bZero BOOL	Status signal "Zero crossing"	
	TRUE	Zero crossing detected or position = "0"

5.102 L_PosDecoderStatePositioner - positioning status signals

Function library:	LenzePositioning	**Do not use FB for new developments!** Replacement by L_DevPositionerStateDecoder.
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of SB **LS_Positioner** into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

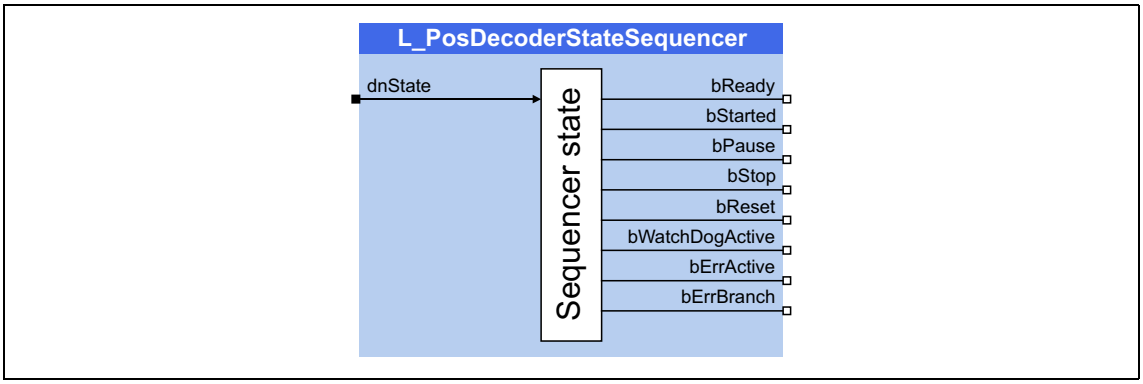
Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit-coded status signal of the basic function "Positioning". • Connect this input with the output of the same name of the SB **LS_Positioner**.

Outputs

The boolean outputs have the following meaning when the value is TRUE:

Bit*	Identifier	Meaning in case of TRUE
Status messages:		
1	bActive	Positioning is active.
2	bDone	Positioning is completed (all profiles have been processed).
3	bAccDec	Acceleration/deceleration phase is active.
5	bCcw	Counter-clockwise rotation is active.
6	bInTarget	Set position reached (in case of sequence profiles the drive continues to travel).
10	bZeroPos	Zero crossing
16	bAbort	Positioning is aborted.
17	bRev	Reversing phase is active.
18	bMinSpeedOverride	Speed override ≤1 %
19	bMinAccOverride	Acceleration override ≤1 %
20	bLimPos	Position is limited by the basic function "Limiter" (SB **LS_Limiter**).
21	bLimProfile	Profile data is limited by the basic function "Limiter" (SB **LS_Limiter**).
22	bLimDir	Direction is inhibited by the basic function "Limiter" (SB **LS_Limiter**).
23	bLimAbort	Abort by basic function "Limiter" (SB **LS_Limiter**).
25	bStoppingActive	Stopping is active.
Error messages:		
15	bErrActive	Error is active.
24	bErrNoHomePos	Home position is not known.
26	bErrNoCycleLength	Cycle is not known.
27	bErrMode	Invalid positioning mode.
28	bErrModeChange	Invalid change of positioning mode.
29	bErrProfileData	Profile data is not plausible or faulty.
30	bErrPG	Error during profile generation.



* Relating to the input signal *dnState*.

5.103 L_PosDecoderStateSequencer - status signals of the sequence control

Function library:	LenzePositioning	**Do not use FB for new developments!** Replacement by L_PosSequencerStateDecoder.
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB decodes the status output signal *dnState* of FB LS_PosSequencer into individual boolean status signals for further use in the FB interconnection.

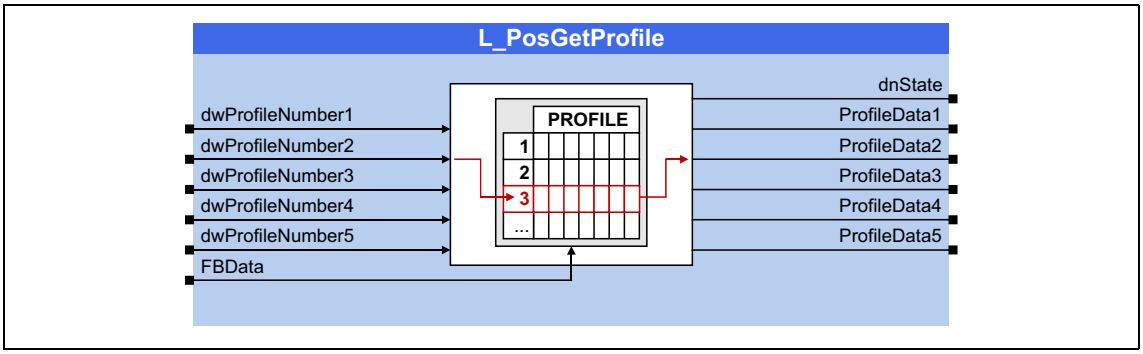
- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit coded status signal of the sequence control. • Connect this input with the output of the same name of the FB L_PosSequencer. (📖 430)

Outputs

The boolean outputs have the following meaning when the value is TRUE:



Bit*	Identifier	Meaning in case of TRUE
Status messages:		
16	bReady	Positioning program ready to start/program end reached.
17	bStarted	Positioning program is running.
18	bPause	Positioning program is started, pause is active.
19	bStop	Positioning program is stopped.
20	bReset	Positioning program is reset.
Error messages:		
22	bWatchDogActive	"Watchdog" monitoring function for positioning has been activated.
15	bErrActive	Error is active.
25	bErrBranch	Wrong value at branch input.

* Relating to the input signal *dnState*.

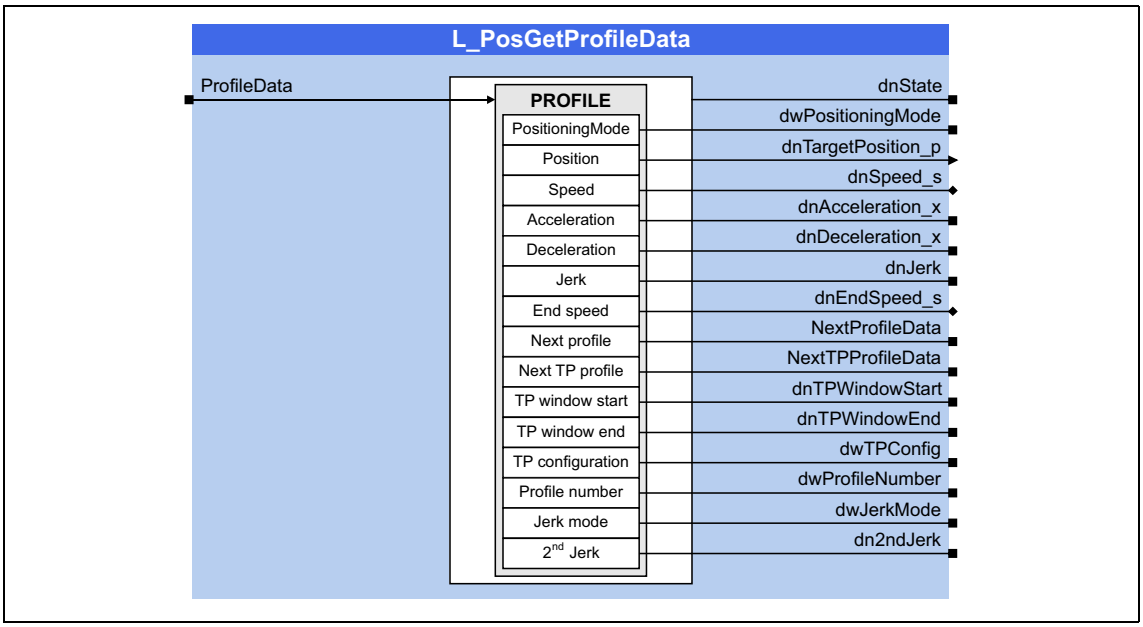
5.104 L_PosGetProfile - profile data tables

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

Together with an FB instance of type L_PosPositionerTable or L_PosProfileTable this FB provides five profile data sets that can be selected.

Inputs

Identifier/data type	Information/possible settings	
dwProfileNumber**1...5** DWORD	Number of the profile whose profile data is to be output at *ProfileData1* ... *ProfileData5*.	
	In connection with an FB instance of type **L_PosPositionerTable**:	
	1 ... 75	Profiles 1 ... 75
	In connection with an FB instance of type **L_PosProfileTable**:	
	1 ... 4	Profile 1 ... 4
FBData	Interface for the transmission of the FB instance data. • Connect this input with the output of the same name of the FB instance of type **L_PosPositionerTable** or **L_PosProfileTable**.	



Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit15	Error is active (collective message).
	bit16	*dwProfileNumber1* is not within the valid range.
	bits17	*dwProfileNumber2* is not within the valid range.
	bits18	*dwProfileNumber3* is not within the valid range.
	Bit 19	*dwProfileNumber4* is not within the valid range.
	bits20	*dwProfileNumber5* is not within the valid range.
	bits27	Error: Invalid FB instance data.
ProfileData**1...5**	Profile data of the profile selected via *dwProfileNumber1...5*.	

5.105 L_PosGetProfileData - profile data output

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

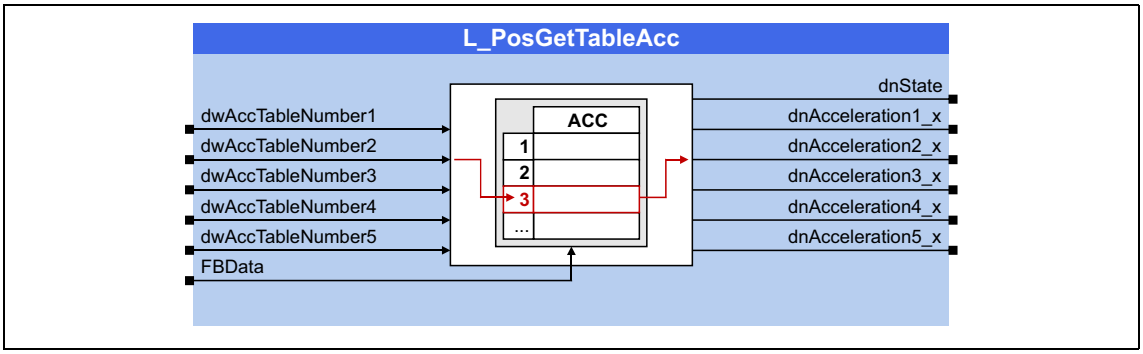
This FB outputs the profile data of a profile data set.

Inputs

Identifier/data type	Information/possible settings
ProfileData	Interface for the transmission of the profile data set.

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit15	Error is active (collective message).
	bits29	Error: Invalid profile data.
dwPositioningMode DWORD	Positioning mode	
	1	Absolute
	2	Absolute TP
	5	Relative
	6	Relative TP
	7	Speed
	8	Speed TP
	11	Absolute CW
	12	Absolute CW TP
	13	Absolute CCW
	14	Absolute CCW TP
	15	Absolute shortest way
	16	Absolute shortest way TP
dnTargetPosition_p DINT	Target position in [inc]	
dnSpeed_s DINT	Traversing velocity as speed • Scaling: $2^{26} \equiv 15000$ [rpm]	
dnAcceleration_x DINT	Acceleration as speed variation/time • Scaling: $2^{22} \equiv 15000000$ [rpm/s]	
dnDeceleration_x DINT	Deceleration as speed variation/time • Scaling: $2^{22} \equiv 15000000$ [rpm/s]	
dnJerk DINT	S-ramp time in [ms]	
dnEndSpeed_s DINT	Final velocity as speed • Scaling: $2^{26} \equiv 15000$ [rpm]	
NextProfileData	Profile data of the standard sequence profile • For profile linkage.	
NextTPProfileData	Profile data of the TP sequence profile • For touch probe residual path positioning.	
dnTPWindowStart DINT	TP window starting position	
dnTPWindowEnd DINT	TP window end position	



Identifier/data type	Value/meaning		
dwTPConfig DWORD	Touch-probe configuration (bit coded) • For the touch probe channels to be used, the corresponding bit must be set to "1":		
	bits0	TP channel 1, rising edge	Digital input 1
	bits1	TP channel 1, falling edge	
	bit 2	TP channel 2, rising edge	Digital input 2
	bits3	TP channel 2, falling edge	
	bits4	TP channel 3, rising edge	Digital input 3
	bits5	TP channel 3, falling edge	
	bits6	TP channel 4, rising edge	Digital input 4
	bits7	TP channel 4, falling edge	
	bits8	TP channel 5, rising edge	Digital input 5
	bits9	TP channel 5, falling edge	
	bits10	TP channel 6, rising edge	Digital input 6
	bits11	TP channel 6, falling edge	
	bits12	TP channel 7, rising edge	Digital input 7
	bits13	TP channel 7, falling edge	
	bits14	TP channel 8, rising edge	Digital input 8
	Bit15	TP channel 8, falling edge	
	bit16	TP channel 9	Motor encoder zero pulse
	bits18	TP channel 10	Load encoder zero pulse
	bits20	TP channel 11	DFIN zero pulse
	bits22	TP channel 12	DFOUT zero pulse
dwProfileNumber DWORD	Profile number of the profile data set		
dwJerkMode DWORD As of library V02.05.xx.xx	S-ramp mode • Will be supported as of controller software version V5.0. With a software version < V5.0, this output is always set to zero.		
	0	Second S-ramp time is not active. • The *dnJerk* S-ramp time is used for the acceleration and deceleration phase.	
	1	Second S-ramp time is active for deceleration. • The *dnJerk* S-ramp time is only used for the acceleration phase. • For the deceleration phase, however, the second *dn2ndJerk* S-ramp time is used.	
dn2ndJerk DINT As of library V02.05.xx.xx	Second S-ramp time in [ms] • Will be supported as of controller software version V5.0. With a software version < V5.0, this output is always set to zero. • The second S-ramp time is only used for S-ramp mode "1" for the deceleration phase.		

5.106 L_PosGetTableAcc - acceleration table

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

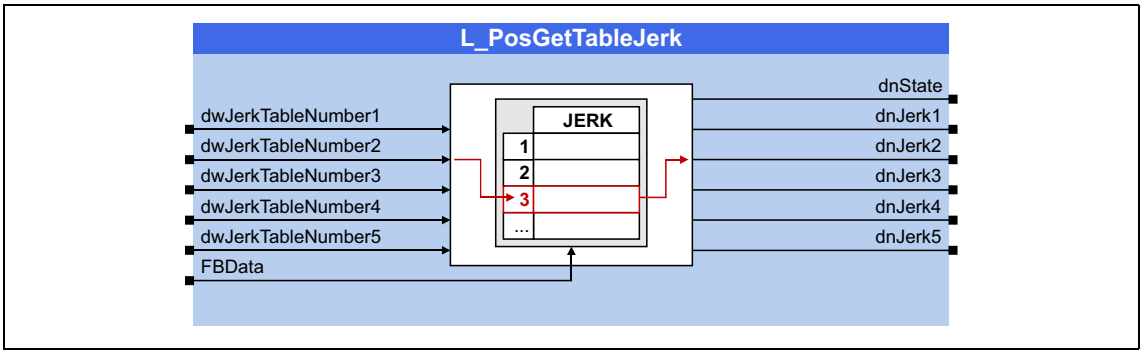
Together with an FB instance of type L_PosPositionerTable this FB provides five acceleration values from the VTACC variable table.

In connection with an FB instance of type L_PosProfileTable it is possible to output the acceleration and deceleration values that are directly defined in the profiles.

Inputs

Identifier/data type	Information/possible settings	
dwAccTableNumber**1...5** DWORD	Number of the table position or profile whose acceleration value is to be output at *dnAcceleration1_x ... dnAcceleration5_x*.	
	In connection with an FB instance of type **L_PosPositionerTable**:	
	1 ... 50	Table position 1 ... 50 of the VTACC table
	In connection with an FB instance of type **L_PosProfileTable**:	
	1	Acceleration of profile 1
	2	Acceleration of profile 2
	3	Acceleration of profile 3
	4	Acceleration of profile 4
	5	Deceleration of profile 1
	6	Deceleration of profile 2
	7	Deceleration of profile 3
	8	Deceleration of profile 4
FBData	Interface for the transmission of the FB instance data. • Connect this input with the output of the same name of the FB instance of type **L_PosPositionerTable** or **L_PosProfileTable**.	

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit15	Error is active (collective message).
	bit16	*dwAccTableNumber1* is not within the valid range.
	bits17	*dwAccTableNumber2* is not within the valid range.
	bits18	*dwAccTableNumber3* is not within the valid range.
	Bit 19	*dwAccTableNumber4* is not within the valid range.
	bits20	*dwAccTableNumber5* is not within the valid range.
	bits27	Error: Invalid FB instance data.
dnAcceleration**1...5**_x DINT	Acceleration value parameterised at table position or in profile number *dwAccTableNumber1...5*. • Output as speed variation/time • Scaling: $2^{22} \equiv 15000000$ [rpm/s]	

5.107 L_PosGetTableJerk - S-ramp time table

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

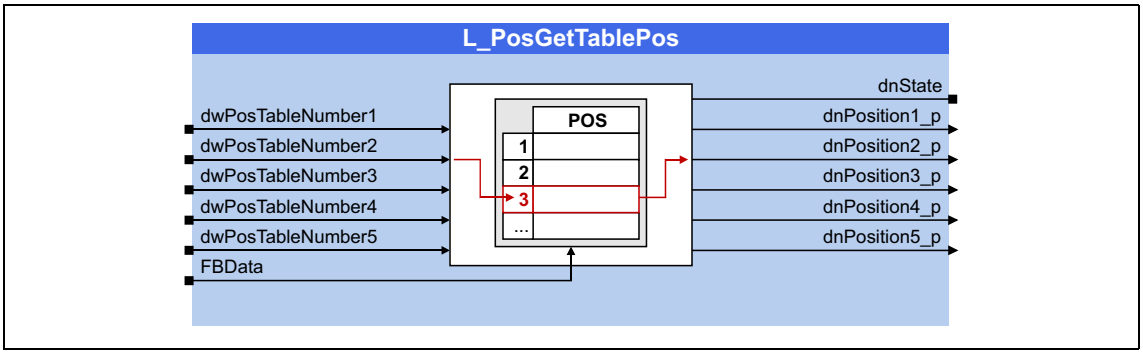
Together with an FB instance of type L_PosPositionerTable this FB provides five S-ramp times from the VTJERK variable table.

In connection with an FB instance of type L_PosProfileTable it is possible to output the S-ramp times that are directly defined in the profiles.

Inputs

Identifier/data type	Information/possible settings	
dwJerkTableNumber**1...5** DWORD	Number of the table position or profile, the speed value of which is to be output at *dnJerk1* ... *dnJerk5*.	
	In connection with an FB instance of type **L_PosPositionerTable**:	
	1 ... 50	Table position 1 ... 50 of the VTJERK table
	In connection with an FB instance of type **L_PosProfileTable**:	
	1 ... 4	Profile 1 ... 4
FBData	Interface for the transmission of the FB instance data. • Connect this input with the output of the same name of the FB instance of type **L_PosPositionerTable** or **L_PosProfileTable**.	

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit15	Error is active (collective message).
	bit16	*dwJerkTableNumber1* is not within the valid range.
	bits17	*dwJerkTableNumber2* is not within the valid range.
	bits18	*dwJerkTableNumber3* is not within the valid range.
	Bit 19	*dwJerkTableNumber4* is not within the valid range.
	bits20	*dwJerkTableNumber5* is not within the valid range.
	bits27	Error: Invalid FB instance data.
dnJerk**1...5**_s DINT	S-ramp time in [ms] parameterised at table position or in profile number *dwJerkTableNumber1...5*.	

5.108 L_PosGetTablePos - position table

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

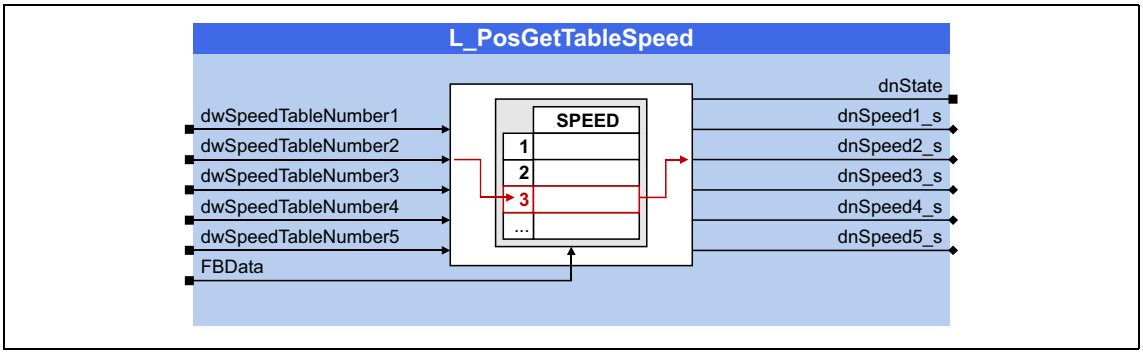
Together with an FB instance of type L_PosPositionerTable this FB provides five position values from the VTPOS variable table.

In connection with an FB instance of type L_PosProfileTable it is possible to output the positions that are directly defined in the profiles.

Inputs

Identifier/data type	Information/possible settings	
dwPosTableNumber**1...5** DWORD	Number of the table position or profile, the position value of which is to be output at *dnPosition1_p ... dnPosition5_p*.	
	In connection with an FB instance of type **L_PosPositionerTable**:	
	1 ... 50	Table position 1 ... 75 of the VTPOS table
	In connection with an FB instance of type **L_PosProfileTable**:	
	1 ... 4	Profile 1 ... 4
FBData	Interface for the transmission of the FB instance data. • Connect this input with the output of the same name of the FB instance of type **L_PosPositionerTable** or **L_PosProfileTable**.	

Outputs



Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit15	Error is active (collective message).
	bit16	*dwPosTableNumber1* is not within the valid range.
	bits17	*dwPosTableNumber2* is not within the valid range.
	bits18	*dwPosTableNumber3* is not within the valid range.
	Bit 19	*dwPosTableNumber4* is not within the valid range.
	bits20	*dwPosTableNumber5* is not within the valid range.
	bits27	Error: Invalid FB instance data.
dnPosition**1...5**_p DINT	Position in [inc] parameterised at table position or in profile number *dwPosTableNumber1...5*.	

5.109 L_PosGetTableSpeed - speed table

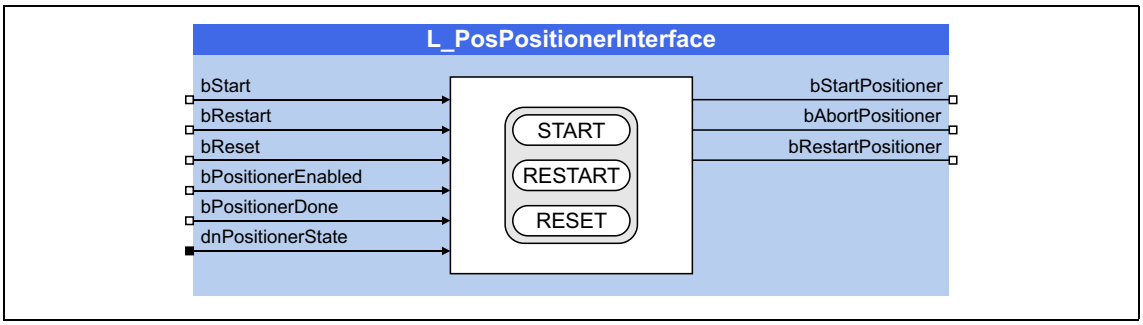
Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

Together with an FB instance of type L_PosPositionerTable this FB provides five speed values from the VTSPEED variable table.

In connection with an FB instance of type L_PosProfileTable it is possible to output the speed values that are directly defined in the profiles.

Inputs

Identifier/data type	Information/possible settings	
dwSpeedTableNumber**1...5** DWORD	Number of the table position or profile, the speed value of which is to be output at *dnSpeed1_s ... dnSpeed5_s*.	
	In connection with an FB instance of type **L_PosPositionerTable**:	
	1 ... 50	Table position 1 ... 50 of the VTSPEED table
	In connection with an FB instance of type **L_PosProfileTable**:	
	1 ... 4	Profile 1 ... 4
FBData	Interface for the transmission of the FB instance data. • Connect this input with the output of the same name of the FB instance of type **L_PosPositionerTable** or **L_PosProfileTable**.	



Outputs

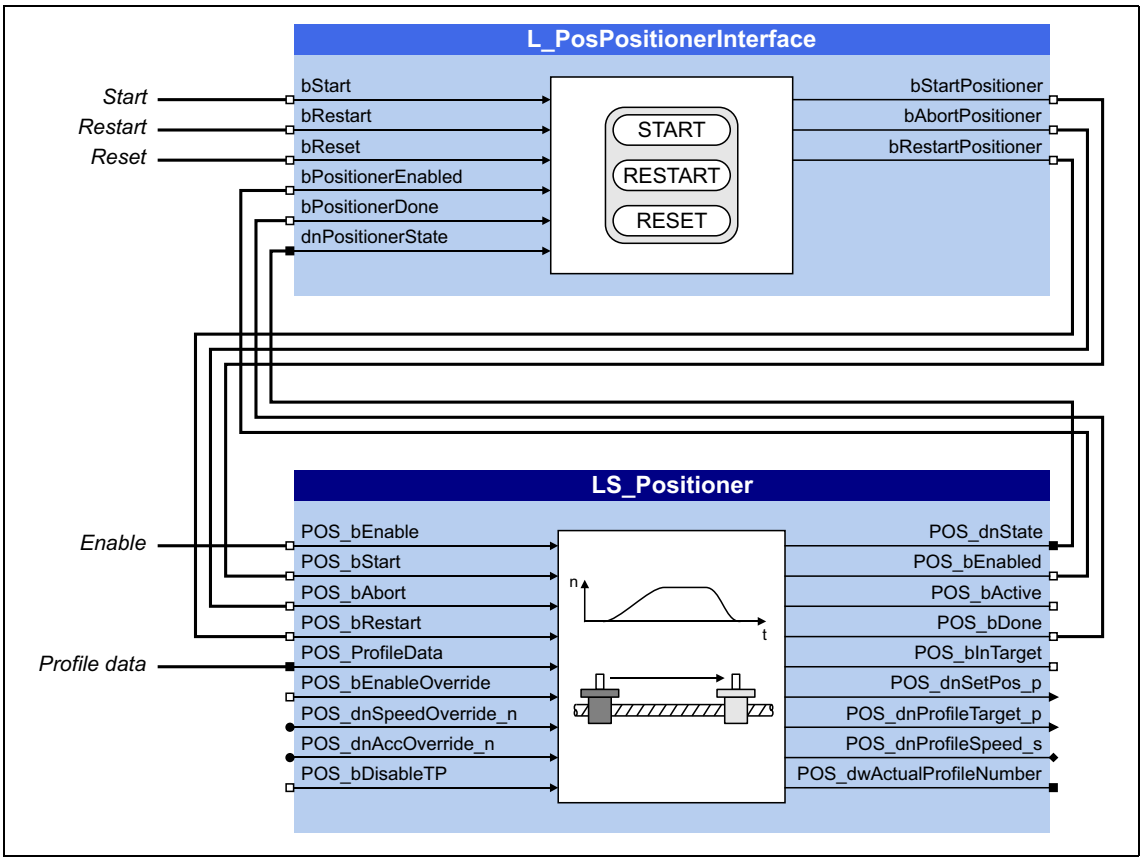
Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	Bit15	Error is active (collective message).
	bit16	*dwSpeedTableNumber1* is not within the valid range.
	bits17	*dwSpeedTableNumber2* is not within the valid range.
	bits18	*dwSpeedTableNumber3* is not within the valid range.
	Bit 19	*dwSpeedTableNumber4* is not within the valid range.
	bits20	*dwSpeedTableNumber5* is not within the valid range.
	bits27	Error: Invalid FB instance data.
dnSpeed**1...5**_s DINT	Velocity parameterised on table position or in profile number *dwSpeedTableNumber1...5* is output as speed. • Scaling: $2^{26} \equiv 15000$ [rpm]	

5.110 L_PosPositionerInterface - positioning interface

Function library:	LenzePositioning	**FB is available as of library V02.00.xx.xx! FB may only be used for firmware as of V1.50!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB provides an interface for the basic function "Positioning" for a higher-level control and allows to control the SB **LS_Positioner** via level-controlled signals.

Inputs



Identifier/data type	Information/possible settings	
bStart BOOL	Start/continue positioning	
	TRUE	Start/continue positioning.
	FALSE	Cancel positioning.
bRestart BOOL	Profile restart	
	FALSE↗TRUE	Read profile data once again considering the distance already traversed.
bReset BOOL	Profile reset	
	FALSE↗TRUE	Read profile data once again without considering the distance already traversed.
bPositionerEnabled BOOL	Interface to basic function "Positioning" • Connect this input with the output *POS_bEnabled* of the SB **LS_Positioner**.	
bPositionerDone BOOL	Interface to basic function "Positioning" • Connect this input with the output *POS_bDone* of the SB **LS_Positioner**.	
dnPositionerState DINT From library V02.07.xx.xx	Interface to basic function "Positioning" • Connect this input to the *POS_dnState* output of the **LS_Positioner** SB. • If this input is interconnected, the positioning process is restarted every time an error is detected or a restart of the **LS_Positioner** SB is impossible when the next edge at *bStart* is reached.	

Outputs

Identifier/data type	Value/meaning
bStartPositioner BOOL	Interface to basic function "Positioning" • Connect this output with the input *POS_bStart* of the SB **LS_Positioner**.
bAbortPositioner BOOL	Interface to basic function "Positioning" • Connect this output with the input *POS_bAbort* of the SB **LS_Positioner**.
bRestartPositioner BOOL	Interface to basic function "Positioning" • Connect this output with the input *POS_bRestart* of the SB **LS_Positioner**.

5.110.1 Interconnection

Connections required between the FB **L_PosPositionerInterface** and the SB **LS_Positioner**:

[5-65] Interconnection

Note!

If the *dnPositionerState* input is interconnected and positioning cannot be continued, the next positive edge at *bStart* will trigger a restart of the positioning process.

- If this behaviour is not required, do not interconnect the *dnPositionerState* input. In this case, a manual reset via the *bReset* input is necessary.

5.110.2 Applications

Application		FB control	Notes
Start positioning		*bStart* = TRUE	
Cancel/interrupt positioning		*bStart* = FALSE	
Continue positioning		*bStart* = FALSE↗TRUE	Profile data will be read again; the distance already traversed will be considered.
Update profile data during positioning (*bStart* = TRUE)		*bRestart* = FALSE↗TRUE	Profile data will be read again; the distance already traversed will be considered.
Restart positioning			
	after completion of positioning (*POS_bDone* = TRUE)	*bStart* = FALSE (≥ 1 cycle) *bStart* = TRUE **or** *bStart* = TRUE *bReset* = FALSE↗TRUE	
	after cancellation of positioning (*bStart* = FALSE)	*bReset* = FALSE↗TRUE *bStart* = FALSE↗TRUE	
	during positioning (*bStart* = TRUE)	*bReset* = FALSE↗TRUE	
Reset the status "Positioning completed" after end of positioning		*bStart* = FALSE	Status output *POS_bDone* will be reset to FALSE.

Continuing an interrupted positioning process

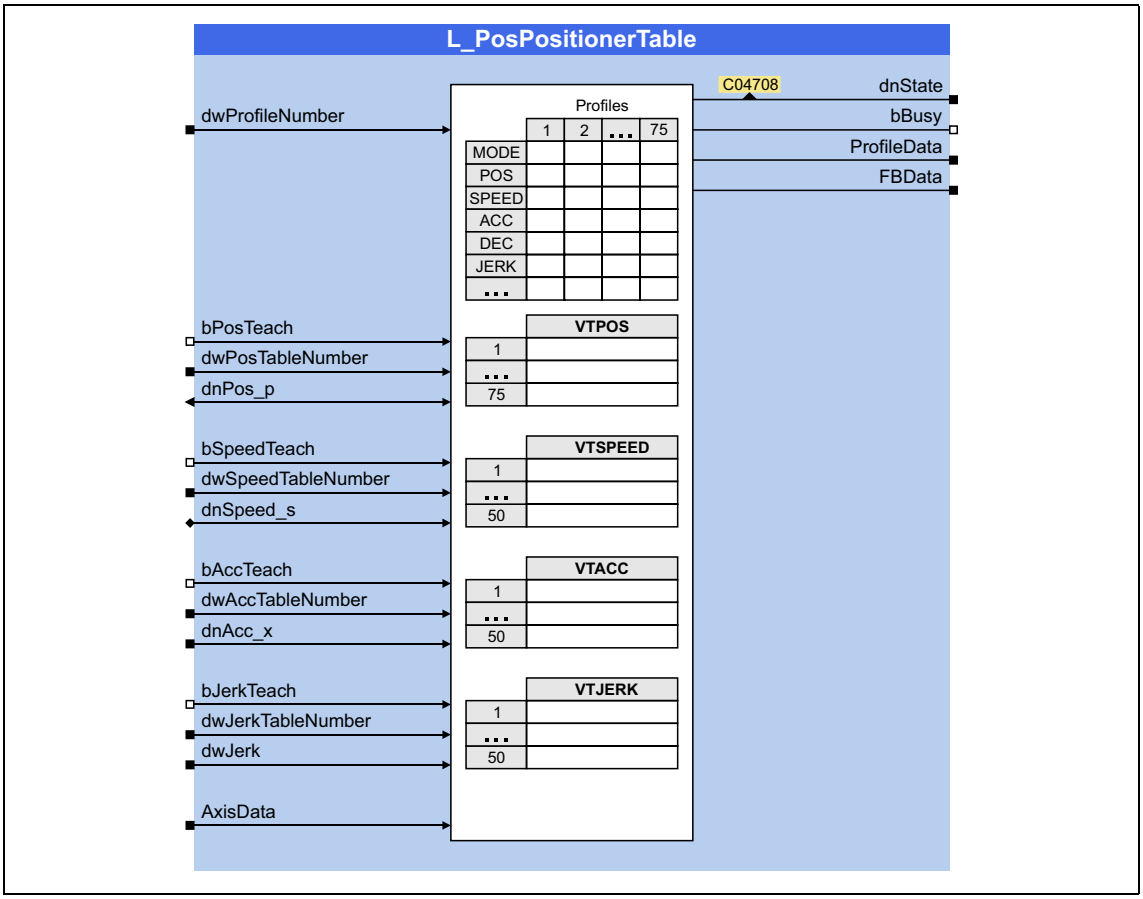
If the basic function "Positioning" is deactivated during the active positioning process (e. g. by quick stop or controller inhibit), the interrupted positioning is tried to be continued if the basic function "Positioning" is activated again, as far as the input *bStart* is set to TRUE.

- Distances of a relative positioning, that have already been covered, are taken into consideration.
- The positioning is not continued if incorrect profile data are available after the interruption, or if the **LS_Positioner** SB reports another error.
- If it is not possible to continue a positioning process, this is displayed via bit 11 of the status output *POS_dnState* at the **LS_Positioner** SB.

For controllers with software version lower than V3.0 the following applies:

- A positioning process can not be continued if another function state except for "Quick stop active", "Drive is stopped", or "Drive in standstill", has been active in the meantime. In this case the FB has to be reset with a FALSE-TRUE edge at the input *bReset*.

For controllers as of software version V3.0 the following applies:



- A positioning process can not be continued if the machine parameters have been altered in the meantime, or if another referencing has taken place.

5.111 L_PosPositionerTable - profile data record management

Function library:	LenzePositioning	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB is used to store and manage (traversing) profiles and to teach positions, speeds, accelerations/decelerations and S-ramp times.

- A profile describes a motion request which can be implemented into a rotary motion by the SB **LS_Positioner**.
- A profile is described via the following profile parameters: mode (type of positioning), position, speed, acceleration, deceleration, S-ramp time, final speed, standard sequence profile, TP sequence profile, TP window starting and end position.
  - For easier handling, the profile parameters position, speed, acceleration/deceleration and S-ramp time are kept in separate tables.
  - Thus, a positioning program for e.g. repeating speeds can always use the same table position. If this speed is to be changed, an adjustment of a table position can have an effect on several profiles.
- Another important task of this FB is the conversion of the table values according to the scaling/machine parameters selected in the SB **LS_DriveInterface**.

Inputs

Identifier/data type	Information/possible settings	
dwProfileNumber DWORD	Profile selection • Number of the profile the profile parameters of which are to be transferred to the SB **LS_Positioner** via the output *ProfileData*. • If a sequence profile is defined in the selected profile, this profile is only the first profile of an arbitrary linkage of profiles.	
	1...75	Profile number
bPosTeach BOOL	"Teach" position	
	TRUE	The position assigned to the input *dnPos_p* is stored at the VTPOS table position selected via the input *dwPosTableNumber*.
	TRUE↘FALSE	The value of the last cycle is maintained in the table.
dwPosTableNumber DWORD	Selection of the table position of the position to be "taught"	
	0	No selection (selection in case the input is not assigned)
	1...75	Table position 1 ... 75 of the VTPOS table
dnPos_p DINT	Position to be "taught" in [inc]	
bSpeedTeach BOOL	"Teach" speed	
	TRUE	The speed assigned to the input *dnSpeed_s* is stored at the VTSPEED table position selected via the input *dwSpeedTableNumber*.
	TRUE↘FALSE	The value of the last cycle is maintained in the table.
dwSpeedTableNumber DWORD	Selection of the table position for the speed to be "taught"	
	0	No selection (selection in case the input is not assigned)
	1...50	Table position 1 ... 50 of the VTSPEED table
dnSpeed_s DINT	Speed to be "taught" • At this input, the FB expects a speed. The machine parameters at the input *AxisData* are used as speed reference. • Scaling: $2^{26} \equiv 15000$ [rpm]	
bAccTeach BOOL	"Teach" acceleration/deceleration	
	TRUE	The acceleration/deceleration assigned to the input *dnAcc_s* is stored at the VTACC table position selected via the input *dwAccTableNumber*.
	TRUE↘FALSE	The value of the last cycle is maintained in the table.
dwAccTableNumber DWORD	Selection of the table position for the acceleration/deceleration speed to be "taught"	
	0	No selection (selection in case the input is not assigned)
	1...50	Table position 1 ... 50 of the VTACC table
dnAcc_x DINT	Acceleration/deceleration to be "taught" • At this input, the FB expects a speed variation/time. The machine parameters at the input *AxisData* are used as acceleration reference. • Scaling: $2^{22} \equiv 15000000$ [rpm/s]	
bJerkTeach BOOL	"Teach" S-ramp time	
	TRUE	The S-ramp time assigned to the input *dwJerk* is stored at the VTJERK table position selected via the input *dwJerkTableNumber*.
	TRUE↘FALSE	The value of the last cycle is maintained in the table.
dwJerkTableNumber DWORD	Selection of the table position for the S-ramp time to be "taught"	
	0	No selection (selection in case the input is not assigned)
	1...50	Table position 1 ... 50 of the VTJERK table

Identifier/data type	Information/possible settings
dwJerk DWORD	S-ramp time to be "taught" in [ms]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits15	Error is active.
	bits16	Calculation is active.
	bits17	Position taught.
	bits18	Speed taught.
	bits19	Acceleration taught.
	bits20	S-ramp time taught.
	bits28	Error: Invalid machine parameters (*AxisData*).
	bits29	Error: Invalid profile number (*dwProfileNumber*).
	bits30	Error: Invalid teach profile number.
bBusy BOOL	Status signal "Conversion of the profile parameter is active"	
	FALSE	Profile parameters are ready.
	TRUE	Conversion is active, no access possible to the profile parameters at the moment.
ProfileData	Interface to basic function "Positioning" • Data structure with the profile parameters of the profile selected via the input *dwProfileNumber*. • Connect this output with the input of the same name of the SB **LS_Positioner**.	
FBData	FB interface for internal profiles/table data (L_PosGetProfile, L_PosGetTableAcc, L_PosGetTableJerk, L_PosGetTablePos, L_PosGetTableSpeed) • Data structure with the internal instance data.	

Parameter

Parameter	Possible settings		Information
C04700/1			"Teach" position • For execution via parameter channel.
	0↗1	The position assigned to the input *dnPos_p* is stored at the VTPOS table position selected via the input *dwPosTableNumber*.	
C04700/2			"Teach" speed • For execution via parameter channel.
	0↗1	The speed assigned to the input *dnSpeed_s* is stored at the VTSPEED table position selected via the input *dwSpeedTableNumber*.	

Parameter	Possible settings			Information
C04700/3				Teach acceleration • For execution via parameter channel.
	0↗1	The acceleration/deceleration assigned to the input *dnAcc_s* is stored at the VTACC table position selected via the input *dwAccTableNumber*.		
C04700/4				"Teach" S-ramp time • For execution via parameter channel.
	0↗1	The S-ramp time assigned to the input *dwJerk* is stored at the VTJERK table position selected via the input *dwJerkTableNumber*.		
C04701/1...75	-214748.3647	Unit	214748.3647	VTPOS: variable positions • For the selection of the target positions and the TP window starting or end positions for the profiles.
C04702/1...50	-214748.3647	Unit/s	214748.3647	VTSPEED: variable speeds • For the selection of the traversing and final speeds for the profiles.
C04703/1...50	0.0000	unit/s^2	214748.3647	VTACC: variable accelerations • For the selection of the accelerations and decelerations for the profiles.
C04704/1...50	0.000	s	2147483.647	VTJERK: variable S-ramp times • For the selection of the S-ramp times for the profiles.
C04705/1				DIS:bPosTeach • Display of the *bPosTeach* input signal.
	0	FALSE		
	1	TRUE		
C04705/2				DIS:bSpeedTeach • Display of the *bSpeedTeach* input signal.
	0	FALSE		
	1	TRUE		
C04705/3				DIS:bAccTeach • Display of the *bAccTeach* input signal.
	0	FALSE		
	1	TRUE		
C04705/4				DIS:bJerkTeach • Display of the *bJerkTeach* input signal.
	0	FALSE		
	1	TRUE		
C04706/1	0		100	DIS:VTPosNum • Display of the *dwPosTableNumber* input signal.
C04706/2	0		100	DIS:VTSpeedNum • Display of the *dwSpeedTableNumber* input signal.
C04706/3	0		100	DIS:VTAccNum • Display of the *dwAccTableNumber* input signal.
C04706/4	0		100	DIS:VTJerkNum • Display of the *dwJerkTableNumber* input signal.
C04706/5	0		100	DIS:ProfileNum • Display of the *dwProfileNumber* input signal.

Parameter	Possible settings			Information
C04707/1	-214748.3647	Unit	214748.3647	DIS:dnTeachPos • Display of the *dnPos_p* input signal in the real unit of the machine.
C04707/2	-214748.3647	Unit/s	214748.3647	DIS:dnTeachSpeed • Display of the *dnSpeed_s* input signal in the real unit of the machine.
C04707/1	-214748.3647	unit/s^2	214748.3647	DIS:dnTeachAcc • Display of the *dnAcc_x* input signal in the real unit of the machine.
C04707/1	-214748.3647	s	214748.3647	DIS:dnTeachJerk • Display of the *dwJerk* input signal in the real unit of the machine.

	2	VTJERK position 2 (C04704/2)	
	...	...	
	50	VTJERK position 50 (C04704/50)	

5.111.1 Variable tables

To simplify parameter handling, the four most important physical sizes for profile parameters are stored in separate "variable tables".

	VTPos Positions	**VTSpeed** Speeds	**VTAcc** Acceleration/ deceleration	**VTJerk** S-ramp times
Unit	Unit	Unit/s	unit/s^2	s
Data format	DINT with four decimal positions			
Memory locations	75	50	50	50
Code	C04701/1...75	C04702/1...50	C04703/1...50	C04704/1...50
For profile parameters	Target position TP window starting position TP window end position	Speed Final speed	Acceleration Delay	S-ramp time

A value is assigned to a profile parameter by a reference to a table position of the assigned variable table. So not the value, but the table position which contains the value to be used is entered in the profile parameter.

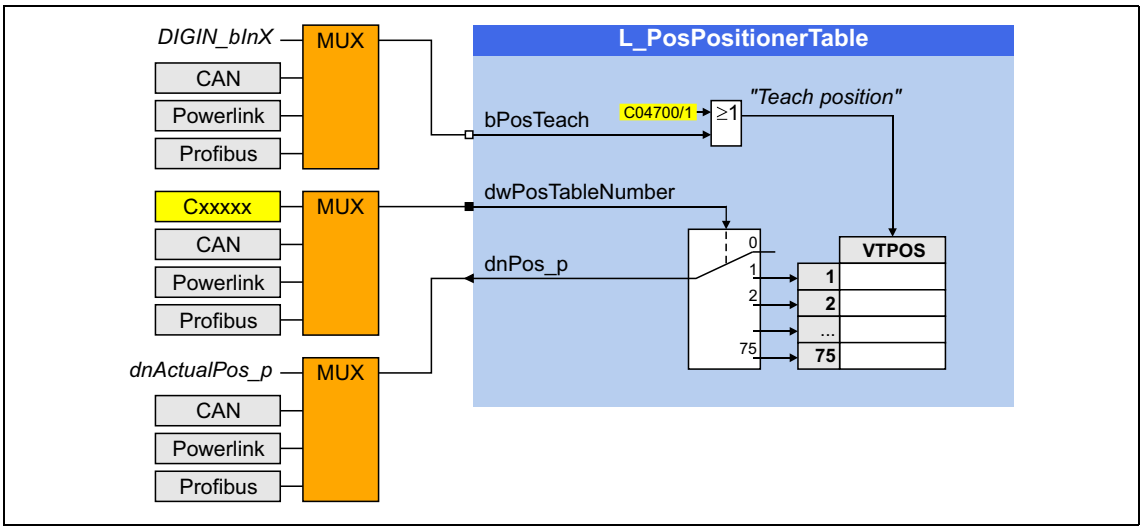
[5-66] Principle: References to variable tables (here: References to VTSPEED)

- In the case of several references to the same table position, a change of the value in this table position affects several profiles at the same time. Thus, recurring profile parameters only need to be changed on one position.
- If e.g. in the case of a profile chaining, several profiles are to be executed with the same speed, the corresponding profile parameters "speed" can all refer to the same table position.

Conversion of the values into internal values

The values of the variable tables VTPOS, VTSPEED, VTACC and VTJERK are always entered in the application unit [unit].

- Since the SB **LS_Positioner** needs the profile parameters in the internal measuring system, the FB **L_PosPositionerTable** also stores the values of the variable tables in this measuring system.
- The values must only be reconverted by the FB if the machine parameters transmitted by the drive interface via the input *AxisData* have changed.
  - In this case the output *bBusy* is set to TRUE during the conversion and an access to the profile parameters is not possible.



Note!

The values to be "taught" are exceptions. They must be selected in the internal measuring system.

5.111.2 "Teach" function

In addition to the direct value entry via parameters, the values can also be stored in the variable tables by means of the "teach" function.

The "teaching" of a value can be activated via an FB input or by describing a parameter (e.g. by master control):

[5-67] Principle of the "teach" function (here: "teaching" of positions)

Note!

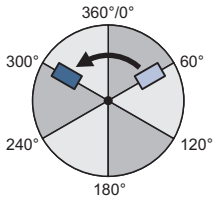
If a position, speed, or acceleration are read out of the variable tables (e.g. with the FBs L_PosGetTablePos, L_PosGetTableSpeed or L_PosGetTableAcc) and this value is taught again into the FB, the value displayed may deviate in application units.

The deviation in the display can be explained by the conversion of the value from application units into internal units and back again to application units, but has no negative effect on the drive behaviour.

5.111.3 Positioning modes

Depending on the traversing range/application, you can select between different positioning modes which are described in the below table.

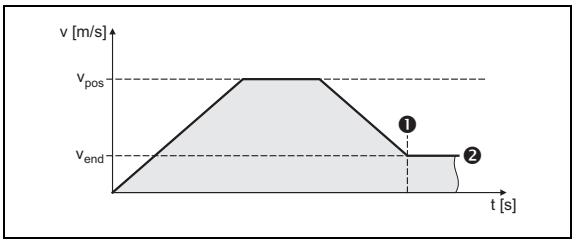
Note!



For absolute positioning, the home position must be known!

- If an absolute positioning process (positioning modes 1 ... 2 and 11 ... 16) is started although the home position is not known, an error message occurs.
  - In this case a programming error has occurred and the program flow must be reset.
  - If the error only occurs in a sequence profile, the last valid deceleration is used to decelerate the drive to standstill.

The modulo positioning modes may involve reversing processes!



- If a modulo positioning process (positioning modes 11 ... 16) is started at an initial speed other than zero, the target position may be overtravelled and a reversing process may follow, depending on the selected deceleration / S-ramp time parameters. This would also cause e.g. counter-clockwise rotation in the "Absolute CW (modulo)" positioning mode.

Positioning mode		Supported traversing range		
		Unlimited	Limited	Modulo
1	**Absolute** The axis travels to an absolute position. • Reference for the absolute position is zero position. • The home position must be known. • The traversing range is limited: • to 214748.3647 [unit] • by the internal display area ($\pm 2^{31}$ increments)	●	●	
2	**Absolute TP** Like mode 1, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 412)	●	●	
5	**Relative** The axis is traversed by a distance. • Reference for the distance is the target position of the profile executed before. • The feed per positioning is limited: • to 214748.3647 [unit] • by the internal display area ($\pm 2^{31}$ increments)	●	●	●
6	**Relative TP** Like mode 5, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 412)	●	●	●
7	**Speed** Continuous constant travel. • This mode does not approach a defined position, but follows the profile. • Acceleration and deceleration are based on profile values. • The traversing direction is defined by the sign of the traversing speed. • Stopped through break signal.	●	●	
8	**Speed TP** Like mode 7, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 412)	●	●	

Positioning mode		Supported traversing range		
		Unlimited	Limited	Modulo
11	**Absolute CW (modulo)** The axis travels in CW direction to an absolute position. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.			●
12	**Absolute CW TP (modulo)** Like mode 11, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 412)			●
13	**Absolute CCW (modulo)** The axis travels in CCW direction to an absolute position. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.			●
14	**Absolute CCW TP (modulo)** Like mode 13, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 412)			●
15	**Absolute ShortestWay (modulo)** The axis travels to an absolute position in best time. • Reference for the absolute position is zero position. • The rotary table positioning is basically an absolute positioning with target positions between 0 and 360 angular degree [°]. In this mode the zero point can also be overtravelled if this is the shortest way to the target position:  			●
16	**Absolute ShortestWay TP (modulo)** Like mode 15, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 412)			●

5.111.4 Positioning with final speed

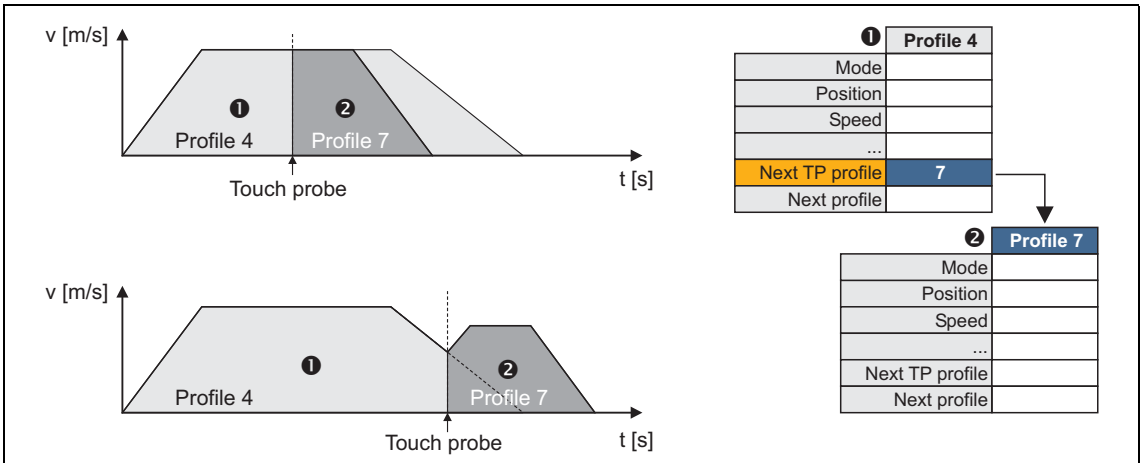
If a positioning process with a final speed other than zero is carried out, a velocity changeover / overchange can be realised, i.e. a second positioning process is started immediately once the target position is reached, and the drive does not come to a standstill at the first target position.

❶ Target position
❷ Final speed (in our example: other than zero)

[5-68] The principle of velocity changeover / overchange

- Normally, the drive has reached the final speed when the target position is reached.
- The profile is run through which is defined via "Profile data sequence profile without TP".
- The final speed must not exceed the maximum profile speed.
  - The speed is internally limited to the profile speed.
  - This is the maximum value for the final speed if the profile speed is reduced via override. (This behaviour may add to the cases described in the note below.)
  - The speed limitation is not affected by subsequent increases in the override value.

Note!



Positioning processes with final speeds other than zero do not permit reversing. In this case, the positioning process is aborted and an error is issued.

In the case of positioning processes with final speeds and if S-shaped ramps are used, a plausibility check as to whether the final speed can be reached is carried out when the profile is started. If the final speed cannot be reached, the positioning process is aborted and an error is issued. This is often the case if the positioning process has been paused and is then to be continued.

5.111.5 Touch probe positioning

With touch probe positioning, the profile is first processed according to the set profile parameters. If a touch probe is detected during profile processing, the profile automatically changes to the profile specified under the profile parameter "TP sequence profile".

- Here the current actual position is stored at the time of the touch probe activation (by a touch probe sensor).
- In the following relative positioning process, the "residual path" to this stored position is travelled according to the increments.

❶ "Starting profile"
❷ "Residual path profile" that is defined in the profile parameter "TP sequence profile" of the starting profile.

[5-69] Examples for a "residual path positioning" after a touch probe is detected

- The profile parameters "TP window starting position" and "TP window end position" the range in which touch probes are to be detected can be restricted.
  - If both profile parameters = "0", touch probe detection will be active for the whole profile/the whole traversing range.
- If no touch probe is detected and after the profile is executed, the positioning is continued with the profile defined in the profile parameter "Sequence profile without TP" (profile chaining).

Note!

If a profile is travelled with high speed and touch probe positioning is started, the residual path of which is smaller than the result from current speed and set deceleration ramp, the target position is "overtravelled".

- Normally a reversing movement occurs, i.e. the drive returns.
- If, for instance, a CCW rotation of the drive is forbidden by the safety module, the target cannot be approached since in this case the reversing movement is not permissible.

Further constellations are possible in connection with profile chaining in which an approach of the target position is impossible.

Touch probe configuration

The touch probe channel for positioning with touch probe detection can be selected in the »Engineer« via the parameter dialog of the FB **L_PositionerTable**.

- Go to the parameter dialog of the FB **L_PositionerTable** and press the **Setting up touch probe** button to open the *Setting up touch probe* dialog box and select the desired setting for the corresponding profile.
- The setting selected in this parameterisation dialog has a direct effect on the setting of C04721/1...75 ("touch probe configuration") and vice versa.
- For a direct setting of C04721/1...75 (e.g. via keypad) the following table lists the corresponding decimal values for all possible configurations.

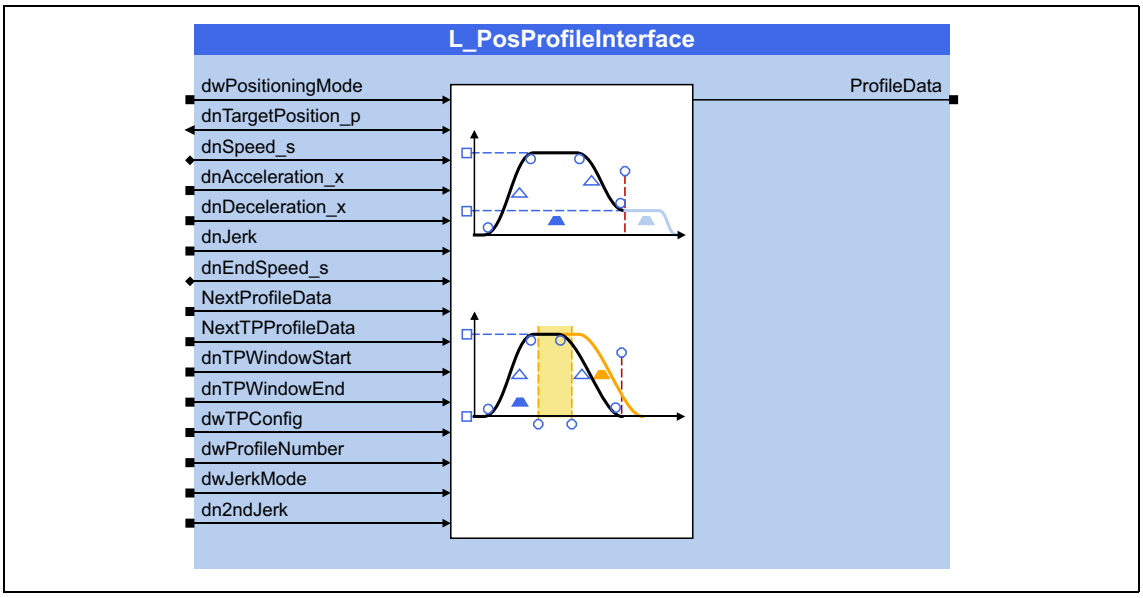
Selection Touch probe channel	Touch probe response		
	Positive edge	Negative edge	Both edges
DIGIN 1	1	2	3
DIGIN 2	4	8	12
DIGIN 3	16	32	48
DIGIN 4	64	128	192
DIGIN 5	256	512	768
DIGIN 6	1024	2048	3072
DIGIN 7	4096	8192	12288
DIGIN 8	16384	32768	49152
Motor encoder zero pulse	65536		
Load encoder zero pulse	262144		
DFIN zero pulse	1048576		
DFOUT zero pulse	4194304		

- Example: For the selection of the touch probe channel "DIGIN 8" and the response to only one positive edge, the decimal value "16384" must be set in C04721.

5.111.6 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed, acceleration, and position values defined via parameters are converted from the real unit to the internal unit.



The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:

Error number		Error message in the logbook	Response
61736961	0x3AE0801	L_PosPositionerTable:int.pos. overflow (LS_DriveInterface)	Error
61737217	0x3AE0901	L_PosPositionerTable:int.pos. overflow (L_SdSetAxisData)	Error
61735937	0x3AE0401	L_PosPositionerTable:int.speed overflow (LS_DriveInterface)	Error
61736193	0x3AE0501	L_PosPositionerTable:int.speed overflow (L_SdSetAxisData)	Error
61735425	0x3AE0201	L_PosPositionerTable:int.accel. overflow (LS_DriveInterface)	Error
61735681	0x3AE0301	L_PosPositionerTable:int.accel. overflow (L_SdSetAxisData)	Error

5.112 L_PosProfileInterface - profile data interface

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB provides a profile data record for the SB **LS_Positioner**.

Inputs

Identifier/data type	Information/possible settings	
dwPositioningMode DWORD	Positioning mode • For absolute positioning, the home position must be known! • Not all positioning modes are available in every traversing range! ▸ Positioning modes (📖 416)	
	1	Absolute
	2	Absolute TP
	5	Relative
	6	Relative TP
	7	Speed
	8	Speed TP
	11	Absolute CW (modulo)
	12	Absolute CW TP (modulo)
	13	Absolute CCW (modulo)
	14	Absolute CCW TP (modulo)
	15	Absolute ShortestWay (modulo)
	16	Absolute ShortestWay TP (modulo)
dnTargetPosition_p DINT	Target position in [inc]	
dnSpeed_s DINT	Speed • Entry as speed • Scaling: $2^{26} \equiv 15000$ [rpm]	

Identifier/data type	Information/possible settings		
dnAcceleration_x DINT	Acceleration • Entry as speed variation/time • Scaling: $2^{22} \equiv 15000000$ [rpm/s]		
dnDeceleration_x DINT	Delay • Entry as speed variation/time • Scaling: $2^{22} \equiv 15000000$ [rpm/s]		
dnJerk DINT	S-ramp time in [ms]		
dnEndSpeed_s DINT	Final speed • Entry as speed • Scaling: $2^{26} \equiv 15000$ [rpm]		
NextProfileData ProfileData	Profile data of the sequence profile without TP (for profile chaining) • This input can be connected e.g. with the output *ProfileData* of another instance of the FB **L_PosProfileInterface**.		
NextTPProfileData ProfileData	Profile data of the sequence profile with TP (for touch probe residual path positioning) • This input can be connected e.g. with the output *ProfileData* of another instance of the FB **L_PosProfileInterface**.		
dnTPWindowStart DINT	Area start for touch probe detection		
dnTPWindowEnd DINT	Area end for touch probe detection		
dwTPConfig DWORD	Touch-probe configuration (bit coded) • The touch probe channels to be used are selected by setting the corresponding bits to "1":		
	bits0	TP channel 1, rising edge	Digital input 1
	bits1	TP channel 1, falling edge	
	bits2	TP channel 2, rising edge	Digital input 2
	bits3	TP channel 2, falling edge	
	bits4	TP channel 3, rising edge	Digital input 3
	bits5	TP channel 3, falling edge	
	bits6	TP channel 4, rising edge	Digital input 4
	bits7	TP channel 4, falling edge	
	bits8	TP channel 5, rising edge	Digital input 5
	bits9	TP channel 5, falling edge	
	bits10	TP channel 6, rising edge	Digital input 6
	bits11	TP channel 6, falling edge	
	bits12	TP channel 7, rising edge	Digital input 7
	bits13	TP channel 7, falling edge	
	bits14	TP channel 8, rising edge	Digital input 8
	bits15	TP channel 8, falling edge	
	bit16	TP channel 9	Motor encoder zero pulse
	bits18	TP channel 10	Load encoder zero pulse
	bits20	TP channel 11	DFIN zero pulse
	bits22	TP channel 12	DFOUT zero pulse
dwProfileNumber DINT	Number assigned to the profile. • This number is displayed at the SB **LS_Positioner**.		

Identifier/data type	Information/possible settings	
dwJerkMode DWORD From library V02.05.xx.xx	S-ramp mode • Will be supported as of controller software version V5.0. With software versions < V5.0, this input has no function.	
	0	Second S-ramp time is not active. • The *dnJerk* S-ramp time is used for the acceleration and deceleration phase.
	1	Second S-ramp time is active for deceleration. • The *dnJerk* S-ramp time is only used for the acceleration phase. • For the deceleration phase, however, the second *dn2ndJerk* S-ramp time is used.
dn2ndJerk DINT From library V02.05.xx.xx	Second S-ramp time in [ms] • Will be supported as of controller software version V5.0. With software versions < V5.0, this input has no function. • The second S-ramp time is only used for S-ramp mode "1" for the deceleration phase.	

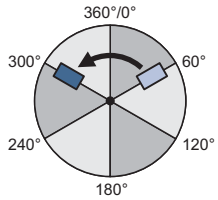
Outputs

Identifier/data type	Value/meaning
ProfileData	Profile data for the SB **LS_Positioner**

5.112.1 Positioning modes

Depending on the traversing range/application, you can select between different positioning modes which are described in the below table.

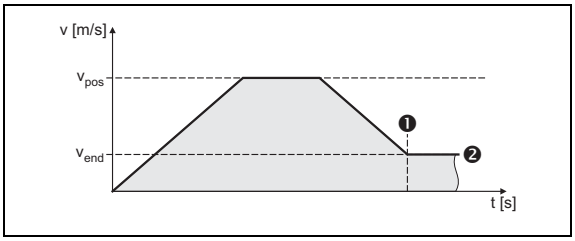
Note!



For absolute positioning, the home position must be known!

- If an absolute positioning process (positioning modes 1 ... 2 and 11 ... 16) is started although the home position is not known, an error message occurs.
  - In this case a programming error has occurred and the program flow must be reset.
  - If the error only occurs in a sequence profile, the last valid deceleration is used to decelerate the drive to standstill.

The modulo positioning modes may involve reversing processes!



- If a modulo positioning process (positioning modes 11 ... 16) is started at an initial speed other than zero, the target position may be overtravelled and a reversing process may follow, depending on the selected deceleration / S-ramp time parameters. This would also cause e.g. counter-clockwise rotation in the "Absolute CW (modulo)" positioning mode.

Positioning mode		Supported traversing range		
		Unlimited	Limited	Modulo
1	**Absolute** The axis travels to an absolute position. • Reference for the absolute position is zero position. • The home position must be known. • The traversing range is limited: • to 214748.3647 [unit] • by the internal display area ($\pm 2^{31}$ increments)	●	●	
2	**Absolute TP** Like mode 1, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 419)	●	●	
5	**Relative** The axis is traversed by a distance. • Reference for the distance is the target position of the profile executed before. • The feed per positioning is limited: • to 214748.3647 [unit] • by the internal display area ($\pm 2^{31}$ increments)	●	●	●
6	**Relative TP** Like mode 5, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 419)	●	●	●
7	**Speed** Continuous constant travel. • This mode does not approach a defined position, but follows the profile. • Acceleration and deceleration are based on profile values. • The traversing direction is defined by the sign of the traversing speed. • Stopped through break signal.	●	●	
8	**Speed TP** Like mode 7, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 419)	●	●	
11	**Absolute CW (modulo)** The axis travels in CW direction to an absolute position. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.			●
12	**Absolute CW TP (modulo)** Like mode 11, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 419)			●
13	**Absolute CCW (modulo)** The axis travels in CCW direction to an absolute position. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.			●
14	**Absolute CCW TP (modulo)** Like mode 13, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 419)			●

Positioning mode		Supported traversing range		
		Unlimited	Limited	Modulo
15	**Absolute ShortestWay (modulo)** The axis travels to an absolute position in best time. • Reference for the absolute position is zero position. • The rotary table positioning is basically an absolute positioning with target positions between 0 and 360 angular degree [°]. In this mode the zero point can also be overtravelled if this is the shortest way to the target position:  			●
16	**Absolute ShortestWay TP (modulo)** Like mode 15, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 419)			●

5.112.2 Positioning with final speed

If a positioning process with a final speed other than zero is carried out, a velocity changeover / overchange can be realised, i.e. a second positioning process is started immediately once the target position is reached, and the drive does not come to a standstill at the first target position.

❶ Target position
❷ Final speed (in our example: other than zero)

[5-70] The principle of velocity changeover / overchange

- Normally, the drive has reached the final speed when the target position is reached.
- The profile is run through which is defined via "Profile data sequence profile without TP".
- The final speed must not exceed the maximum profile speed.
  - The speed is internally limited to the profile speed.
  - This is the maximum value for the final speed if the profile speed is reduced via override. (This behaviour may add to the cases described in the note below.)
  - The speed limitation is not affected by subsequent increases in the override value.

Note!

Positioning processes with final speeds other than zero do not permit reversing. In this case, the positioning process is aborted and an error is issued.

In the case of positioning processes with final speeds and if S-shaped ramps are used, a plausibility check as to whether the final speed can be reached is carried out when the profile is started. If the final speed cannot be reached, the positioning process is aborted and an error is issued. This is often the case if the positioning process has been paused and is then to be continued.

5.112.3 Touch probe positioning

With touch probe positioning, the profile is first processed according to the set profile parameters. If a touch probe is detected during profile processing, the profile automatically changes to the "sequence profile with TP", which has been defined via the *NextTPProfileData* input.

- If no touch probe is detected, positioning is continued with the sequence profile which has been defined via the *NextProfileData* input (profile linkage).
- In order to define the sequence profiles, both inputs *NextTPProfileData* and *NextProfileData* can be connected, for instance, with the *ProfileData* output of another instance of the FB **L_PosProfileInterface**.

Note!

If a profile is travelled with high speed and touch probe positioning is started, the residual path of which is smaller than the result from current speed and set deceleration ramp, the target position is "overtravelled".

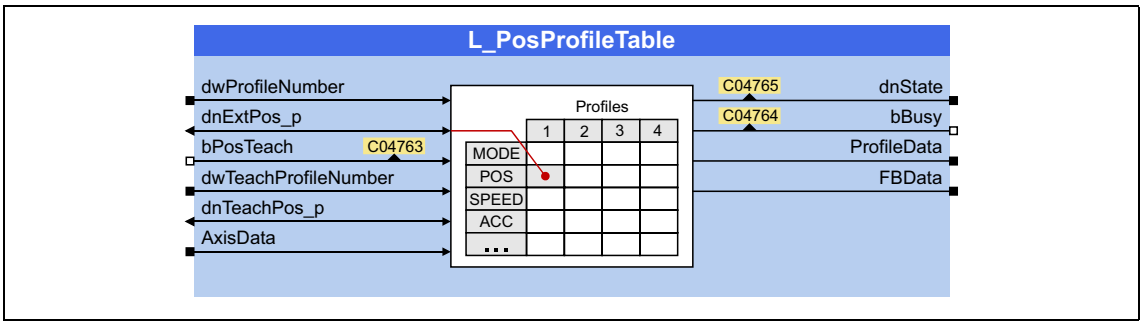
- Normally a reversing movement occurs, i.e. the drive returns.
- If, for instance, a CCW rotation of the drive is forbidden by the safety module, the target cannot be approached since in this case the reversing movement is not permissible.

Further constellations are possible in connection with profile chaining in which an approach of the target position is impossible.

5.112.4 Touch probe configuration

The touch probe channel to be used for positioning with touch probe detection is selected bit-coded via the *dwTPConfig* input. The following table contains all possible configurations with the corresponding decimal values:

Selection Touch probe channel	Touch probe response		
	Positive edge	Negative edge	Both edges
DIGIN 1	1	2	3
DIGIN 2	4	8	12
DIGIN 3	16	32	48
DIGIN 4	64	128	192
DIGIN 5	256	512	768
DIGIN 6	1024	2048	3072
DIGIN 7	4096	8192	12288
DIGIN 8	16384	32768	49152
Motor encoder zero pulse	65536		
Load encoder zero pulse	262144		
DFIN zero pulse	1048576		
DFOUT zero pulse	4194304		



- Example: For the selection of the touch probe channel "DIGIN 8" and the response to only one positive edge, the decimal value "16384" must be set at the *dwTPConfig* input.

5.113 L_PosProfileTable - profile data record management (simple)

Function library:	LenzePositioning
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is used to store and manage up to four traversing profiles and to "teach" target positions.

- A profile describes a motion request which can be implemented into a rotary motion by the SB **LS_Positioner**.
- A profile is described via the following profile parameters: Mode (type of positioning), position, speed, acceleration, deceleration, S-ramp time, TP sequence profile and TP selection.
- Unlike the FB L_PosPositionerTable, this FB does not use any variable tables, but profile parameter data is directly entered under the assigned codes.
- Furthermore, the position assigned to the input *dnExtPos_p* will be used as target position if profile number 1 is selected.
- Another important task of this FB is the conversion of the table values according to the scaling selected in the SB **LS_DriveInterface**.

Inputs

Identifier/data type	Information/possible settings	
dwProfileNumber DWORD	Profile selection • Number of the profile the profile parameters of which are to be transferred to the SB **LS_Positioner** via the output *ProfileData*.	
	1...4	Profile number
dnExtPos_p DINT	External target position in [inc] for profile number 1	
bPosTeach BOOL	"Teach" position	
	TRUE	The position assigned to the input *dnTeachPos_p* is stored in the profile selected via the input *dwTeachProfileNumber*.
	TRUE↘FALSE	The value of the last cycle is maintained in the table.
dwTeachProfileNumber DWORD	Selection of the profile for the position to be "taught"	
	0	No selection (selection in case the input is not assigned)
	1	Profile 1 • The position selected via the input *dnExtPos_p* will be used as target position for profile number 1.
	2...4	Profiles 2 ... 4

Identifier/data type	Information/possible settings
dnTeachPos_p DINT	Position to be "taught" in [inc]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits15	Error is active.
	bits16	Calculation is active.
	bits17	Position taught.
	bits28	Error: Invalid machine parameters (*AxisData*).
	bits29	Error: Invalid profile number (*dwProfileNumber*).
	bits30	Error: Invalid teach profile number.
bBusy BOOL	Status signal "Conversion of the profile parameter is active"	
	FALSE	Profile parameters are ready.
	TRUE	Conversion is active, no access possible to the profile parameters at the moment.
ProfileData	Interface to basic function "Positioning" • Data structure with the profile parameters of the profile selected via the input *dwProfileNumber*. • Connect this output with the input of the same name of the SB **LS_Positioner**.	
FBData	FB interface for internal profiles/table data (L_PosGetProfile, L_PosGetTableAcc, L_PosGetTableJerk, L_PosGetTablePos, L_PosGetTableSpeed) • Data structure with the internal instance data.	

Parameter

Parameter	Possible settings			Information
C04750/1...4 (Subcode 1 ... 4 ≡ profile no. 1 ... 4)				Positioning mode • For absolute positioning, the home position must be known. • Not all positioning modes are available in every traversing range! ▸ Positioning modes (📖 426)
	1	Absolute		
	2	Absolute TP		
	5	Relative		
	6	Relative TP		
	7	Speed

	bits11	TP channel 6, falling edge		
	bits12	TP channel 7, rising edge		Digital input 7
	bits13	TP channel 7, falling edge		
	bits14	TP channel 8, rising edge		Digital input 8
	bits15	TP channel 8, falling edge		
	bit16	TP channel 9		Motor encoder zero pulse
	bits18	TP channel 10		Load encoder zero pulse
	bits20	TP channel 11		DFIN zero pulse
	bits22	TP channel 12		DFOUT zero pulse
C04758				"Teach" position • For execution via parameter channel.
	0↗1	The position assigned to the input *dnTeachPos_p* is stored in the profile selected via the input *dwTeachProfileNumber*.		
C04759/1	String of digits			Position unit • Read only
C04759/2	String of digits			Speed unit • Read only
C04759/3	String of digits			Acceleration unit • Read only

Parameter	Possible settings			Information
C04760/1	-214748.3647	Unit	214748.3647	External target position • Display of the *dnExtPos_p* input signal in the real unit of the machine.
C04760/2	-214748.3647	Unit	214748.3647	Teach position • Display of the *dnTeachPos_p* input signal in the real unit of the machine.
C04761/1	0		4	Selected profile • Display of the *dwProfileNumber* input signal.
C04761/2	0		4	Selected teach profile • Display of the *dwTeachProfileNumber* input signal.
C04763				DIS:bPosTeach • Display of the *bPosTeach* input signal.
	0	FALSE		
	1	TRUE		
C04764				DIS:bBusy • Display of the output signal *bBusy*.
	0	Profile parameters are ready.		
	1	Conversion is active, no access possible to the profile parameters at the moment.		
C04765	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C04767/1...4 (Subcode 1 ... 4 ≡ profile no. 1 ... 4) From library V02.05.xx.xx				S-ramp mode • Will be supported as of controller software version V5.0. With software versions < V5.0, this parameter has no function.
	0	Second S-ramp time is not active. • The S-ramp time parameterised in C04755/1...4 is used for the acceleration and deceleration phase.		
	1	Second S-ramp time is active for deceleration. • The S-ramp time parameterised in C04755/1...4 is only used for the acceleration phase. • For the deceleration phase, however, the second S-ramp time parameterised in C04768/1...4 is used.		
C04768/1...4 (Subcode 1 ... 4 ≡ profile no. 1 ... 4) From library V02.05.xx.xx	0.000		s	2147483.647	Second S-ramp time • Will be supported as of controller software version V5.0. With software versions < V5.0, this parameter has no function. • The second S-ramp time is only used for S-ramp mode "1" for the deceleration phase.

5.113.1 Profile data table

Profile parameter data is directly entered under the assigned codes.

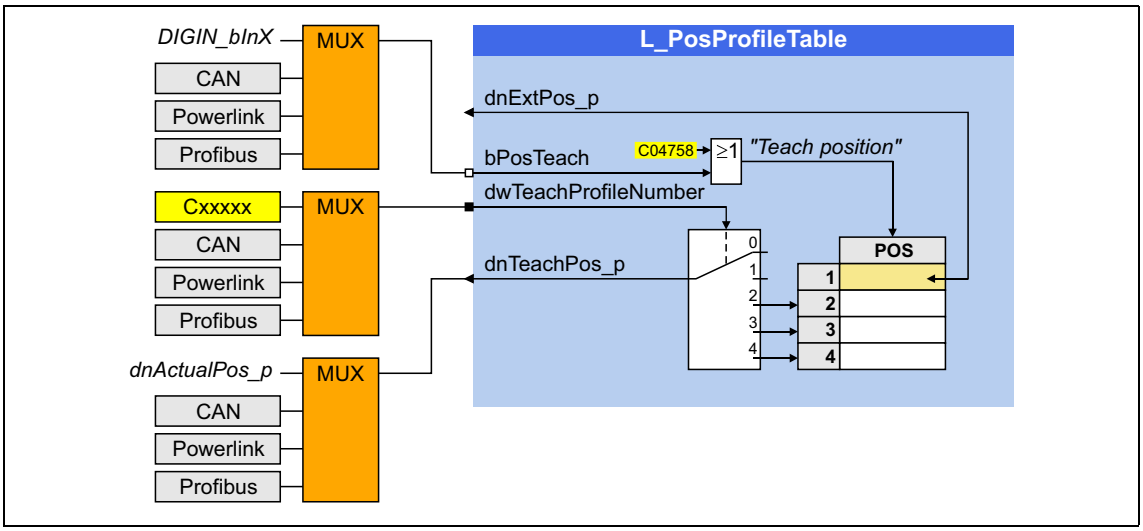
- Exception: The position assigned to the input *dnExtPos_p* will be used as target position if profile number 1 is selected.

Profile parameters	Unit	Profile no. 1	Profile no. 2	Profile no. 3	Profile no. 4
Positioning mode	-	C04750/1	C04750/2	C04750/3	C04750/4
Position	Unit	*dnExtPos_p*	C04751/2	C04751/3	C04751/4
Speed	Unit/t	C04752/1	C04752/2	C04752/3	C04752/4
Acceleration	Unit/t^2	C04753/1	C04753/2	C04753/3	C04753/4
Delay	Unit/t^2	C04754/1	C04754/2	C04754/3	C04754/4
S-ramp time	s	C04755/1	C04755/2	C04755/3	C04755/4
TP sequence profile	-	C04756/1	C04756/2	C04756/3	C04756/4
TP selection	-	C04757/1	C04757/2	C04757/3	C04757/4

Conversion of the values into internal values

The profile parameters are always entered in the application unit [unit].

- Since the SB **LS_Positioner** needs the profile parameters in the internal measuring system, the FB **L_PosProfileTable** also stores the values in this measuring system.
- The values must only be reconverted by the FB if the machine parameters transmitted by the drive interface via the input *AxisData* have changed.
  - In this case the output *bBusy* is set to TRUE during the conversion and an access to the profile parameters is not possible.



Note!

The values to be "taught" are exceptions. They must be selected in the internal measuring system.

5.113.2 "Teach" function

In addition to the direct value entry via parameters, the target position for a profile can also be stored by means of the "teach" function.

The "teaching" of a value can be activated via an FB input or by describing a parameter (e.g. by master control):

[5-71] "Teach" function principle

Note!

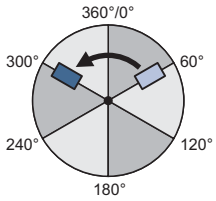
If a position is read out of the FB (e.g. with the FB L_PosGetTablePos) and this value is taught again to the FB, the value displayed may deviate in application units.

The deviation in the display can be explained by the conversion of the value from application units into internal units and back again to application units, but has no negative effect on the drive behaviour.

5.113.3 Positioning modes

Depending on the traversing range/application, you can select between different positioning modes which are described in the below table.

Note!

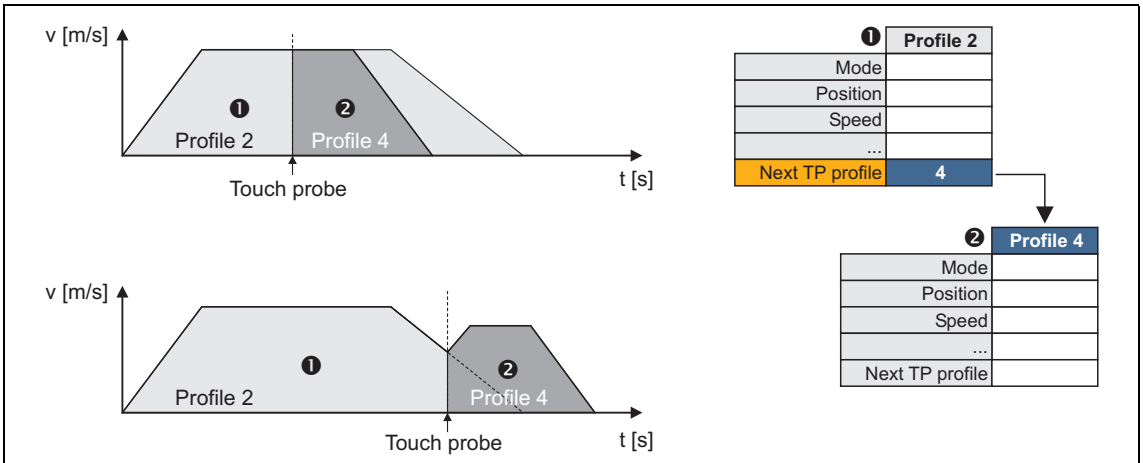


For absolute positioning, the home position must be known!

- If an absolute positioning process (positioning modes 1 ... 2 and 11 ... 16) is started although the home position is not known, an error message occurs.
  - In this case a programming error has occurred and the program flow must be reset.
  - If the error only occurs in a sequence profile, the last valid deceleration is used to decelerate the drive to standstill.

The modulo positioning modes may involve reversing processes!

- If a modulo positioning process (positioning modes 11 ... 16) is started at an initial speed other than zero, the target position may be overtravelled and a reversing process may follow, depending on the selected deceleration / S-ramp time parameters. This would also cause e.g. counter-clockwise rotation in the "Absolute CW (modulo)" positioning mode.



Positioning mode		Supported traversing range		
		Unlimited	Limited	Modulo
1	**Absolute** The axis travels to an absolute position. • Reference for the absolute position is zero position. • The home position must be known. • The traversing range is limited: • to 214748.3647 [unit] • by the internal display area ($\pm 2^{31}$ increments)	●	●	
2	**Absolute TP** Like mode 1, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 428)	●	●	
5	**Relative** The axis is traversed by a distance. • Reference for the distance is the target position of the profile executed before. • The feed per positioning is limited: • to 214748.3647 [unit] • by the internal display area ($\pm 2^{31}$ increments)	●	●	●
6	**Relative TP** Like mode 5, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 428)	●	●	●
7	**Speed** Continuous constant travel. • This mode does not approach a defined position, but follows the profile. • Acceleration and deceleration are based on profile values. • The traversing direction is defined by the sign of the traversing speed. • Stopped through break signal.	●	●	
8	**Speed TP** Like mode 7, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 428)	●	●	

Positioning mode		Supported traversing range		
		Unlimited	Limited	Modulo
11	**Absolute CW (modulo)** The axis travels in CW direction to an absolute position. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.			●
12	**Absolute CW TP (modulo)** Like mode 11, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 428)			●
13	**Absolute CCW (modulo)** The axis travels in CCW direction to an absolute position. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.			●
14	**Absolute CCW TP (modulo)** Like mode 13, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 428)			●
15	**Absolute ShortestWay (modulo)** The axis travels to an absolute position in best time. • Reference for the absolute position is zero position. • The rotary table positioning is basically an absolute positioning with target positions between 0 and 360 angular degree [°]. In this mode the zero point can also be overtravelled if this is the shortest way to the target position:  			●
16	**Absolute ShortestWay TP (modulo)** Like mode 15, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 428)			●

5.113.4 Touch probe positioning

With touch probe positioning, the profile is first processed according to the set profile parameters. If a touch probe is detected during profile processing, the profile automatically changes to the profile specified under the profile parameter "TP sequence profile".

- Here the current actual position is stored at the time of the touch probe activation (by a touch probe sensor).
- In the following relative positioning process, the "residual path" to this stored position is travelled according to the increments.

❶ "Starting profile"
❷ "Residual path profile" that is defined in the profile parameter "TP sequence profile" of the starting profile.

[5-72] Examples for a "residual path positioning" after a touch probe is detected

- If no touch probe is detected, positioning stops after profile processing without profile linkage.

Note!

If a profile is travelled with high speed and touch probe positioning is started, the residual path of which is smaller than the result from current speed and set deceleration ramp, the target position is "overtravelled".

- Normally a reversing movement occurs, i.e. the drive returns.
- If, for instance, a CCW rotation of the drive is forbidden by the safety module, the target cannot be approached since in this case the reversing movement is not permissible.

Further constellations are possible in connection with profile chaining in which an approach of the target position is impossible.

5.113.5 Monitoring for counter overflow

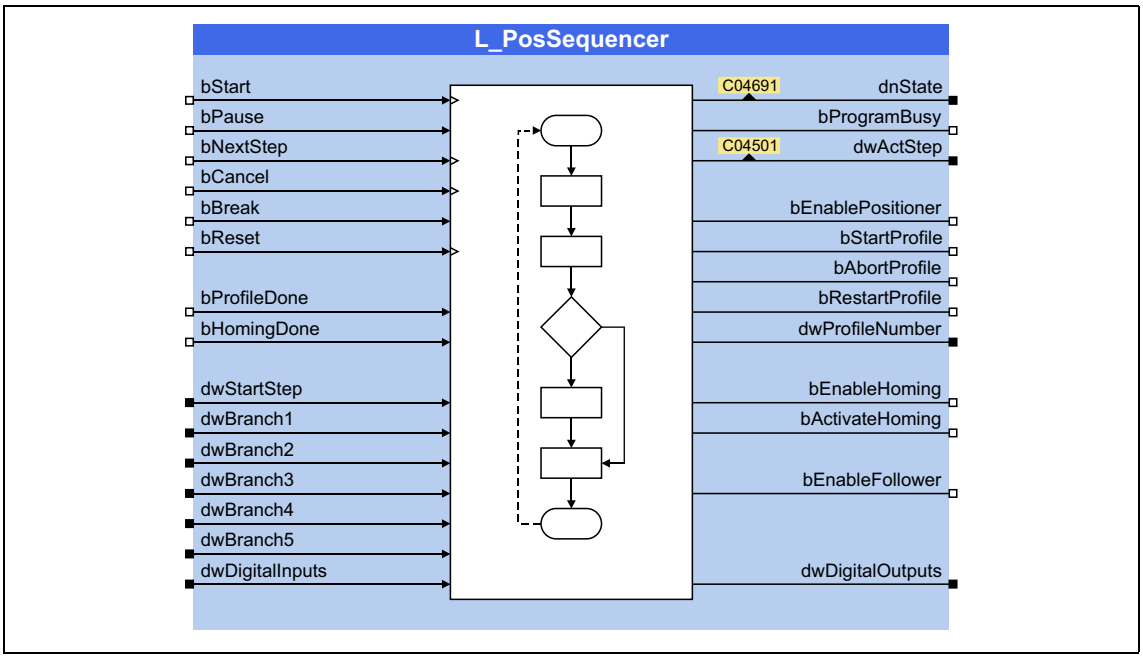
This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed, acceleration, and position values defined via parameters are converted from the real unit to the internal unit.

The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:

Error number		Error message in the logbook	Response
61736966	0x3AE0806	L_PosProfileTable:int.pos. overflow (LS_DriveInterface)	Error
61737222	0x3AE0906	L_PosProfileTable:int.pos. overflow (L_SdSetAxisData)	Error
61735942	0x3AE0406	L_PosProfileTable:int.speed overflow (LS_DriveInterface)	Error
61736198	0x3AE0506	L_PosProfileTable:int.speed overflow (L_SdSetAxisData)	Error
61735430	0x3AE0206	L_PosProfileTable:int.accel. overflow (LS_DriveInterface)	Error
61735686	0x3AE0306	L_PosProfileTable:int.accel. overflow (L_SdSetAxisData)	Error

5.114 L_PosSequencer - sequence control



Function library:	LenzePositioning	
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB processes a positioning program based on a sequence table.

- The sequence table is an important part of this FB and is indicated by a code with 100 subcodes. Each subcode contains a reference to a single program segment, also known as "action".
- Different action types are available which serve to implement, for instance, program branching, switching operations, waiting times and counters. The actions themselves are also indicated by codes.
  - The following action types are passive: Branching, variable branching, switching, counter setting, counting, waiting, standby, and program end. When these action types are processed, the deceleration ramp is active and a brake, if available, will be applied.
  - The action types positioning and homing are active since these both action types trigger the execution of the corresponding basic function via control outputs.

Note!

For a complete sequence control, the FB **L_PosSequencer** must be connected to further blocks, like the FB **L_PosPositionerTable** (profile data record management) and the SB **LS_Positioner** (basic function "positioning").

Inputs

Identifier/data type	Information/possible settings	
bStart BOOL	Start/continue positioning program • Display parameter: C04690/2	
	FALSE↗TRUE	The positioning program is started/continued. • Counters and outputs are not automatically reset by this. • A positioning program interrupted by *bBreak* is continued with the sequence step. • The started positioning program is processed until the end, even if *bStart* is reset to FALSE.
bPause BOOL	Interrupt the current step of the positioning program • Display parameter: C04690/3	
	TRUE	• An active positioning is interrupted. • The drive is stopped with the current profile deceleration. • A deceleration override is taken into account. • The sequence of an active timing element is stopped. • A "Standby" action is not interrupted, i.e. the output *bEnableFollower* remains TRUE.
	FALSE	• The interrupted positioning is completed. • The distance of the profile already covered is considered here. • Positioning processes with final speeds are not continued if the final speed cannot be reached anymore. • The deceleration of the stopped timing element is continued with the residual time.
bNextStep* BOOL From library V02.00.xx.xx	Cancel current step and go to next step	
	FALSE↗TRUE	The current positioning program step is cancelled immediately and the positioning program is continued with the next step listed in the sequence table.
bCancel BOOL	Cancel the current step and jump to the step defined in C04504 • Display parameter: C04690/6	
	FALSE↗TRUE	The current step of the positioning program is cancelled immediately and the positioning program is continued with the step defined in C04504.
bBreak BOOL	Interrupt positioning program • This input is intended for a linkage with drive-relevant status signals (e.g. for controller inhibit or quick stop). • If the interruption is cancelled again by a reset to FALSE, a new FALSE/TRUE edge is required at *bStart* so that the positioning program can be continued with the sequence step. • Display parameter: C04690/4	
	FALSE	Condition for the program start via *bStart*.
	TRUE	The active positioning program is interrupted. • If positioning is active, the drive is braked to standstill with the deceleration time for stop. • The system block **LS_Positioner** is deactivated. • The system block **LS_Homing** is deactivated. • The setpoint followers are deactivated. • The digital output signals keep their state.

Identifier/data type	Information/possible settings	
bReset BOOL	Reset positioning program. • Also possible when the positioning program is interrupted. • Display parameter: C04690/5	
	FALSE↗TRUE	The positioning program is reset. • If positioning is active, the drive is braked to standstill with the deceleration time for stop without considering an acceleration override. • The program flow is aborted ("program end"). • The digital output signals, counters and timing elements are reset. • In case a stand-by operation is active, it is aborted.
bProfileDone BOOL	Interface to basic function "Positioning" • Input for status signal "Profile has been executed". • Connect this input with the status output of the same name of the SB **LS_Positioner**. • Display parameter: C04690/7	
bHomingDone BOOL	Interface to basic function "Homing" • Input for status signal "Homing completed". • Connect this input with the status output of the same name of the SB **LS_Homing**. • Display parameter: C04690/1	
dwStartStep DWORD	Step of the sequence table with which the positioning program is to start. • Display parameter: C04692/6	
	0	Positioning program starts with step 1 of the sequence table.
	1 ... 100	Starting step
	Other	Positioning program does not start.
	Not assigned	Positioning program starts with step 1 of the sequence table.
dwBranch1 DWORD	Input signal for action 1 of type "Variable branch" • Display parameter: C04692/1 • If the positioning program contains the action 1 of type "Variable branch", a branch is carried out depending on the value applied to this input.	
	0	Branch to the next step.
	1	Branch to the step defined in C04540/1.
	2	Branch to the step defined in C04541/1.
	...	...
	20	Branch to the step defined in C04559/1.
	> 20	Branch to the next step.
dwBranch2 DWORD	Input signal for action 2 of type "Variable branch" • Display parameter: C04692/2 • If the positioning program contains the action 2 of type "Variable branch", a branch is carried out depending on the value applied to this input.	
	0	Branch to the next step.
	1	Branch to the step defined in C04540/2.
	2	Branch to the step defined in C04541/2.
	...	...
	20	Branch to the step defined in C04559/2.
	> 20	Branch to the next step.

Identifier/data type		Information/possible settings	
dwBranch3	DWORD	Input signal for action 3 of type "Variable branch" • Display parameter: C04692/3 • If the positioning program contains the action 3 of type "Variable branch", a branch is carried out depending on the value applied to this input.	
		0	Branch to the next step.
		1	Branch to the step defined in C04540/3.
		2	Branch to the step defined in C04541/3.
		...	...
		20	Branch to the step defined in C04559/3.
		> 20	Branch to the next step.
dwBranch4	DWORD	Input signal for action 4 of type "Variable branch" • Display parameter: C04692/4 • If the positioning program contains the action 4 of type "Variable branch", a branch is carried out depending on the value applied to this input.	
		0	Branch to the next step.
		1	Branch to the step defined in C04540/4.
		2	Branch to the step defined in C04541/4.
		...	...
		20	Branch to the step defined in C04559/4.
		> 20	Branch to the next step.
dwBranch5	DWORD	Input signal for action 5 of type "Variable branch" • Display parameter: C04692/5 • If the positioning program contains the action 5 of type "Variable branch", a branch is carried out depending on the value applied to this input.	
		0	Branch to the next step.
		1	Branch to the step defined in C04540/5.
		2	Branch to the step defined in C04541/5.
		...	...
		20	Branch to the step defined in C04559/5.
		> 20	Branch to the next step.
dwDigitalInputs	DWORD	Sequencer inputs 1 ... 32 (bit coded) • The action types "Positioning", Branching", "Waiting" and "Stand-by" have the parameter "Input for...". If this is non-zero, it describes the number of the sequencer input where the positioning program awaits the level defined before it executes the action. • For the transmission of individual control signals a BOOL-to-DWORD converter can be connected to this input. • Display parameter: C04693/1	
		bits0	Sequencer input 1
		bits1	Sequencer input 2
		...	...
		bits31	Sequencer input 32

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded) • Display parameter: C04691	
	bits15	Error is active.
	bits16	Positioning program ready to start/program end reached.
	bits17	Positioning program is running.
	bits18	Positioning program is started, pause is active.
	bits19	Positioning program is stopped.
	bits20	Positioning program is reset.
	bits21	Positioning program is completed.
	bits22	"Watchdog" monitoring function for positioning has been activated.
	bits25	Wrong value at branch input.
bProgramBusy BOOL	Status signal "Positioning program is running" • Display parameter: C04690/15	
	FALSE	Positioning program has not been started or stopped.
	TRUE	Positioning program is running.
dwActStep DWORD	Current step which is processed by the positioning program. • Display parameter: C04501	
	0	Positioning program has not been started.
	1 ... 100	Current step
bEnablePositioner BOOL	Interface to basic function "Positioning" • Control signal for enabling the basic function. • Connect this output with the input *bEnable* of the SB **LS_Positioner**. • Display parameter: C04690/10	
bStartProfile BOOL	Interface to basic function "Positioning" • Control signal for starting the positioning. • Connect this output with the input *bStart* of the SB **LS_Positioner**. • Display parameter: C04690/11	
bAbortProfile BOOL	Interface to basic function "Positioning" • Control signal for aborting the positioning. • Connect this output with the input *bAbort* of the SB **LS_Positioner**. • Display parameter: C04690/12	
bRestartProfile BOOL	Interface to basic function "Positioning" • Control signal for restarting the positioning. • Connect this output with the input *bRestart* of the SB **LS_Positioner**. • Display parameter: C04690/13	
dwProfileNumber DINT	Interface to profile data record management • Transmission of the profile number for selecting the next profile . • Connect this output with the input of the same name of the FB **L_PosPositionerTable**. • Display parameter: C04692/8	
bEnableHoming BOOL	Interface to basic function "Homing" • Control signal for enabling the basic function. • Connect this output with the input *bEnable* of the SB **LS_Homing**. • Display parameter: C04690/8	
bActivateHoming BOOL	Interface to basic function "Homing" • Control signal for starting homing. • This control signal is set to TRUE one cycle later than the *bEnableHoming* control signal. • Connect this output with the input of the same name of the SB **LS_Homing**. • Display parameter: C04690/9	

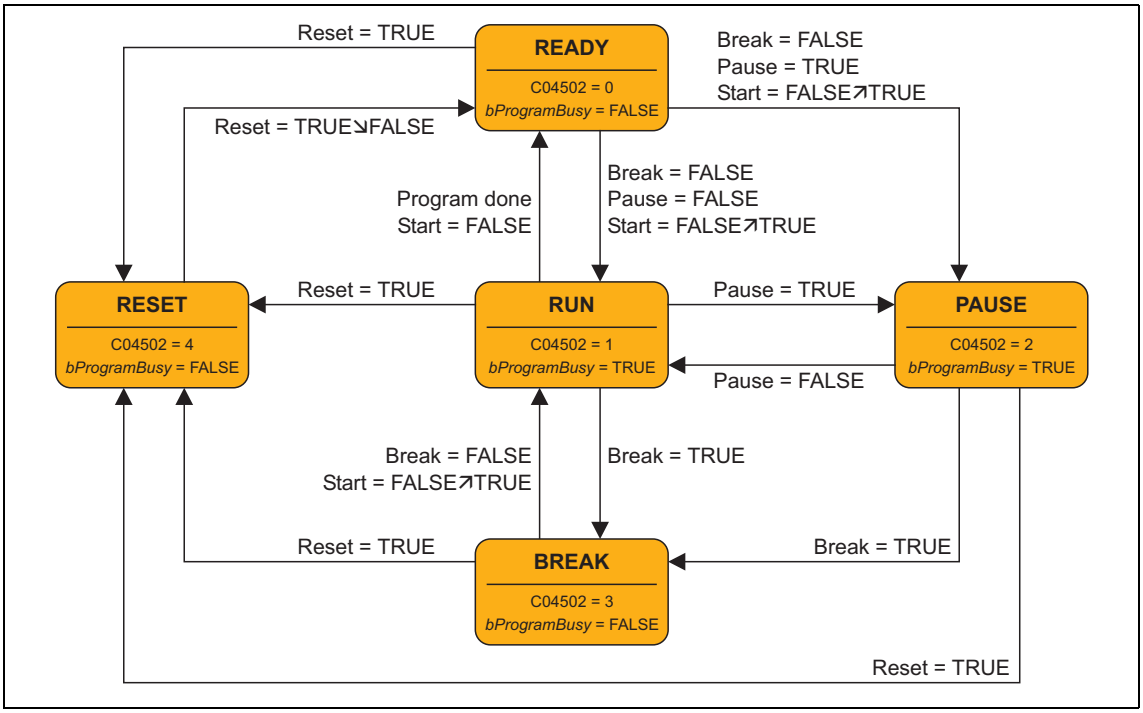
Identifier/data type	Value/meaning	
bEnableFollower BOOL	Enable signal for setpoint follower • This output is intended for the enable of a setpoint follower during a stand-by program step. • Connect this output, if required, with the input *bEnable* of the corresponding set-point follower (SB **LS_SpeedFollower**, SB **LS_TorqueFollower** or SB **LS_PositionFollower**). • Display parameter: C04690/10	
	FALSE	No enable since the basic function "Positioning" is active.
	TRUE	Enable is possible since stand-by program step is active.
dwDigitalOutputs DWORD	Sequencer outputs 1 ... 32 (bit coded) • The sequencer outputs can be set to "0" or "1" by means of the "Switching" action type during the runtime of the positioning program. • For the transmission of individual control signals a DWORD-to-BOOL converter can be connected to this input. • Display parameter: C04693/2	
	bits0	Sequencer output 1
	bits1	Sequencer output 2
	...	...
	bits31	Sequencer output 32

General parameters

> **Note!**
>
> The parameters of the different actions for the sequence tables are described in the corresponding action subchapters.

Parameter	Possible settings			Information
C04500/1...100				Sequence table • The calls for the actions required for the positioning program are stored under the subcodes. • This is how the basic sequence (except for the branches) is described.
	0	Program end		
	xxyyy	Action call • xx ≡ action type • yyy ≡ action number		
C04501	1		100	Current program step • Read only
C04502				Status of sequence control • Read only
	0	READY: Positioning program is ready to start/program end has been reached.		
	1	RUN: Positioning program is running.		
	2	PAUSE: Current step is interrupted, pause is active.		
	3	BREAK: Positioning program is interrupted.		
	4	RESET: Positioning program has been reset.		
C04503				Sequence control • Bit-coded code for controlling the sequencer by a PC or master control via parameter channel. • By setting a bit to "1" the corresponding function is activated.
	bits0	Start		
	bits1	Pause		
	bit 2	BREAK		
	bits3	Cancel		
	bits4	Reset		
	bits5	NextStep		
C04504				Program step at abort • This step is processed when the input *bCancel* is set to TRUE.
	0	**Sequence step**		
	1...100	Step 1 ... 100		
	101	Program end		
C04505	Text			Current comment • Read only

5.114.1 Priorities of the control signals

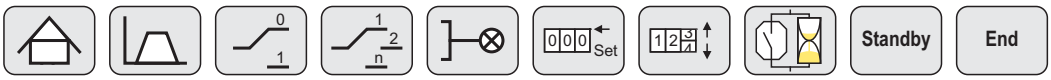


The boolean control signals are evaluated in the following sequence:

1. *bReset* 2. *bBreak* 3. *bPause* 4. *bStart* 5. *bCancel*

5.114.2 States of the sequencer

The internal state machine of the sequencer distinguishes the following five states:



Status	Display C04502	Information
Ready	0	Positioning program ready to start/program end reached. • If the "Break" function is not activated, the positioning program can be started by e.g. a FALSE/TRUE edge at *bStart*.
RUN	1	Positioning program is running. • The sequence table is processed.
PAUSE	2	Positioning program is started, pause has been activated. • An active positioning is interrupted. • The drive is stopped with the current profile deceleration. • An acceleration override is not considered. • The sequence of an active timing element is stopped. • After the pause is cancelled, the positioning program and a positioning activated before or a stopped timing element are continued at the same position.
BREAK	3	Positioning program is interrupted. • If positioning is active, the drive is braked to standstill with the deceleration time for stop. • The system block **LS_Positioner** is deactivated. • The digital output signals keep their state. • After the interruption is cancelled, a new start signal is required to continue the positioning program with the sequence step.
Reset	4	Positioning program is reset. • If positioning is active, the drive is braked to standstill with the deceleration time for stop without considering an acceleration override. • The program flow is aborted ("program end"). • The digital output signals, counters and timing elements are reset. • In case a stand-by operation is active, it is aborted.

[5-73] Internal state machine of the sequencer

5.114.3 Action types available for creating the positioning program

The program flow of the multi-purpose positioning is selected according to a sequence table which can contain up to 100 references to "actions".

- An action comprises a clear functionality which is described with a few parameters.
- Different action types are available which serve to implement, for instance, program branching, switching operations, waiting times and counters.
- Each action type provides a certain number of actions which can be parameterised individually.
- One action can be called from several positions in the sequence table.
- After an action has been processed, the action in the next step of the sequence table is automatically processed unless it is jumped to another step in the sequence table due to a branch.
- One action can be maximally processed per computing cycle.
- The sequence table and the actions are displayed by parameters (codes with subcodes).
- Action calls are entered into the sequence table using a decimal number which contains the action type A and the action number B.

Overview

Action	Action type A	Action number B	Number of available actions	Parameter range (first instance)
Program end	0	000	1	-
Positioning	1	001 ... 050	50	C04510 ... C04516
Switching	2	001 ... 025	25	C04520 ... C04523
Branching	3	001 ... 025	25	C04530 ... C04532
Variable branching	4	001 ... 005	5	C04540 ... C04559
Homing	5	000	1	-
Waiting	7	001 ... 025	25	C04570 ... C04573
Counter setting	8	001 ... 010	10	C04580 ... C04582
Counting	9	001 ... 025	25	C04590 ... C04593
Stand-by	10	001 ... 005	5	C04600 ... C04602

Detailed information of the action types can be found in the following subchapters.

5.114.3.1 Action type "Program end"

To define the program end in the sequence table, the action of type "Program end" is available.

Action call (entry in the sequence table)

0 (Leading zeros can be left out).

- If the input *bStart* is reset to FALSE while the positioning program is running, processing is only continued until the program end has been reached.
- In the Lenze setting all entries of the sequence table are set to "0" and thus to "program end".

5.114.3.2 Action type "Positioning"

To execute a profile, 50 actions of "Positioning" type are available.

Action call (entry in the sequence table)

1	x	x	x

with action number xxx = 001 ... 050

Waiting function

The execution of the set profile with activated waiting function is only started if the bit 1 ... 32 of the input signal *dwDigitalInputs* selected for the waiting function adopts the selected signal state ("0" or "1").

"Watchdog" monitoring function

You can select an individual "watchdog time" for every "positioning" action.

- If positioning takes longer than the selected watchdog time, there will be a branch to the next watchdog step.
- If the watchdog time is set to 0 s, the monitoring function is deactivated (Lenze setting).

Parameter

The available actions 1 ... 50 are indicated via the subcodes 1 ... 50.

Parameter	Possible settings		Information
C04510/1...50	Text		Comment on positioning step • Option for description of the function for keypad/HMI.
C04511/1...50			Input for waiting function • With the default setting "0" the waiting function is skipped and the profile execution is started immediately.
	0	**Waiting function is deactivated.**	
	1	Sequencer input 1 (Bit 0 of *dwDigitalInputs*)	
	2	Sequencer input 2 (Bit 1 of *dwDigitalInputs*)	
	...	...	
	32	Sequencer input 32 (Bit 31 of *dwDigitalInputs*)	
C04512/1...50			Signal state for waiting function • Only when the input for the waiting function has adopted this state, the profile is executed.
	0	Profile start when bit state is "0"	
	1	**Profile start when bit state is "1"**	
C04513/1...50			Profile number • A sequence profile can be set in the corresponding profile parameter.
	0	**No profile execution.**	
	1...100	Execute profile no. 1 ... 100.	
C04514/1...50			Sequence step • Step inside the sequence table which will be processed after the profile has been executed.
	0	**Sequence step**	
	1...100	Step 1 ... 100	
C04515/1...50			Watchdog time • Monitoring time within which positioning must be completed. Otherwise, there will be a branch to the next watchdog step defined under C04516.
	0	**Monitoring function is deactivated.**	
	> 0	Monitoring time in [s]	
C04516/1...50			Watchdog sequence step • Executed when the watchdog time is exceeded.
	0	**Sequence step**	
	1...100	Step 1 ... 100	

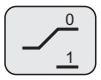
5.114.3.3 Action type "Switching"

In order to switch digital output signals 25 actions of type "Switching" are available.

- Each action can set two selectable bits of the output signal *dwDigitalOutputs* to "0" or "1" independently of each other.

Action call (entry in the sequence table)

2	x	x	x



with action number xxx = 001 ... 025

Parameter

The available actions 1 ... 25 are indicated via the subcodes 1 ... 25.

Parameter	Possible settings		Information
C04520/1...25			Output for A switching
	0	**Switching is deactivated.**	
	1	Sequencer output 1 (Bit 0 of *dwDigitalOutputs*)	
	2	Sequencer output 2 (Bit 1 of *dwDigitalOutputs*)	
	...	...	
	32	Sequencer output 32 (Bit 31 of *dwDigitalOutputs*)	
C04521/1...25			Signal state for A switching
	0	Set bit to "0".	
	1	**Set bit to "1".**	
C04522/1...25			Output for B switching
	0	**Switching is deactivated.**	
	1	Sequencer output 1 (Bit 0 of *dwDigitalOutputs*)	
	2	Sequencer output 2 (Bit 1 of *dwDigitalOutputs*)	
	...	...	
	32	Sequencer output 32 (Bit 31 of *dwDigitalOutputs*)	
C04523/1...25			Signal state for B switching
	0	Set bit to "0".	
	1	**Set bit to "1".**	

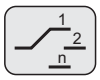
5.114.3.4 Action type "Branching"

25 actions of type "Branching" are available for conditional and unconditional branches (jumps).

- A branch to the indicated step is executed when the comparison is deactivated or the selected bit 1 ... 32 of the input signal *dwDigitalInputs* has the selected signal state at the time of processing ("0" or "1"). If not, the sequence step is processed in the sequence table.

Action call (entry in the sequence table)

3	x	x	x



with action number xxx = 001 ... 025

Parameter

The available actions 1 ... 25 are indicated via the subcodes 1 ... 25.

Parameter	Possible settings		Information
C04530/1...25			Input for comparison
	0	**Unconditional branch** (The sequence step set in C04532/1...25 is processed).	
	1	Sequencer input 1 (Bit 0 of *dwDigitalInputs*)	
	2	Sequencer input 2 (Bit 1 of *dwDigitalInputs*)	
	...	...	
	32	Sequencer input 32 (Bit 31 of *dwDigitalInputs*)	
C04531/1...25			Comparison value • State which is compared with the bit to be evaluated of the input signal *dwDigitalInputs*.
	0	Comparison with "0"	
	1	**Comparison with "1"**	
C04532/1...25			Sequence step in case of equality • If the bit to be evaluated of the input signal *dwDigitalInputs* equals the comparison value, a branch to the step set here is executed. • In case of inequality or "0" setting, the next step in the sequence table is processed.
	0	**Sequence step**	
	1...100	Step 1 ... 100	

5.114.3.5 Action type "Variable branching"

For variable branches (jumps) 5 actions of type "Variable branching" are available.

- The branch to one of 20 possible steps is executed depending on the input signal *dwBranch1...5* at the time of processing.
- The input signals *dwBranch1...5* are firmly assigned to the five available actions
  - Input signal *dwBranch1* determines the branch for action 1,
  - Input signal *dwBranch2* determines the branch for action 2, etc.
- Example: When the input signal *dwBranch2* has the value "15" at the time of processing the action no. 2, it is branched to the step which is entered in the parameter "Sequence step at branch 15" for action no. 2 (C04554/2).

Action call (entry in the sequence table)

4	x	x	x

with action number xxx = 001 ... 005

Parameter

The available actions 1 ... 5 are indicated via the subcodes 1 ... 5.

Parameter	Possible settings		Information
C04540/1...5			Sequence step at branch value 1 • Step which is executed next when input *dwBranch1...5* = "1".
	0	**Branching is deactivated.** (The next step in the sequence table is processed.)	
	1...100	Step 1 ... 100	
C04541/1...5	See possible settings for C04540.		Sequence step at branch value 2
C04542/1...5			Sequence step at branch value 3
C04543/1...5			Sequence step at branch value 4
C04544/1...5			Sequence step at branch value 5
C04545/1...5			Sequence step at branch value 6
C04546/1...5			Sequence step at branch value 7
C04547/1...5			Sequence step at branch value 8
C04548/1...5			Sequence step at branch value 9
C04549/1...5			Sequence step at branch value 10
C04550/1...5			Sequence step at branch value 11
C04551/1...5			Sequence step at branch value 12
C04552/1...5			Sequence step at branch value 13
C04553/1...5			Sequence step at branch value 14

5.114.3.6 Action type "Homing"

In order to execute a homing function, the action of type "Homing" is available.

Action call (entry in the sequence table)

5	0	0	0

Note!

The "Homing" action has no own parameters.

The settings for homing are carried out via the parameters of the basic function "Homing".

Required connections

This functionality requires the following connections between the FB and the basic function "Homing":

- Output *bEnableHoming* → input *HM_bEnable* of the SB **LS_Homing**.
- Output *bActivateHoming* → input *HM_bActivateHoming* of the SB **LS_Homing**.
- Output *HM_bDone* of the SB **LS_Homing** → input *bHomingDone*.

Sequence

1. If the action is called, the SB **LS_Homing** is enabled via the *bEnableHoming* output.
2. One cycle later, the output *bActivateHoming* for activating homing is set to TRUE.
3. After the feedback via input *bHomingDone* that homing has been executed, the enable of the SB **LS_Homing** is deactivated again.
4. The program flow is continued.

5.114.3.7 Action type "Waiting"

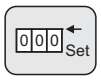
25 actions of type "Waiting" are available for the insertion into the program flow.

- The sequence step is only processed after the waiting time has expired or when the selected bit 1 ... 32 of the input signal *dwDigitalInputs* has the selected signal state ("1" or "2") at the time of processing.

Waiting time C04571	Input C04572	Function
0 (deactivated)	0 (deactivated)	Sequence step is processed immediately (default setting).
> 0 [s]	0 (deactivated)	After the waiting time has expired, the sequence step will be processed.
> 0 [s]	1 ... 32	The sequence step will be processed when the input for the waiting time has the set state, but no later than after the set waiting time has elapsed.
0 (deactivated)	1 ... 32	If the input for the waiting function has the set state, the sequence step will be processed.

Action call (entry in the sequence table)

7	x	x	x



with action number xxx = 001 ... 025

Parameter

The available actions 1 ... 25 are indicated via the subcodes 1 ... 25.

Parameter	Possible settings		Information
C04570/1...25	Text		Comment on waiting step • Option for description of the function for keypad/HMI.
C04571/1...25	**0**	**Waiting time is deactivated.**	Waiting time
	> 0	Waiting time in [s]	
C04572/1...25			Input for waiting function
	0	**Input is deactivated.**	
	1	Sequencer input 1 (Bit 0 of *dwDigitalInputs*)	
	2	Sequencer input 2 (Bit 1 of *dwDigitalInputs*)	
	...	...	
	32	Sequencer input 32 (Bit 31 of *dwDigitalInputs*)	
C04573/1...50			Signal state for waiting function • Only when the input for the waiting function has adopted this state, the sequence step will be processed.
	0	Sequence step when bit state is "0"	
	1	**Sequence step when bit state is "1"**	

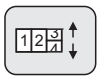
5.114.3.8 Action type "Counter setting"

10 actions of type "Counter setting" are available for setting one of the 10 available counters to a certain starting value.

- The 10 actions of type "Counter setting" are not permanently assigned to the 10 counters.
- You can use, for instance, an action of type "Counter setting" to set a counter to a value and later you can set the same counter with another action of type "Counter setting" to another value.

Action call (entry in the sequence table)

8	x	x	x



with action number xxx = 001 ... 010

Parameter

The available actions 1 ... 10 are indicated via the subcodes 1 ... 10.

Parameter	Possible settings			Information
C04580/1...10				Counter selection
	0	"Counter setting" is deactivated.		
	1	**Counter 1**		
	...	...		
	10	Counter 10		
C04581/1...10	-2147483647		2147483647	New counter content
C04582/1...10	-2147483647		2147483647	Current counter content • Read only

5.114.3.9 Action type "Counting"

25 actions of type "Counting" are available for counting processes.

- With each action processing the counter content of the respective counter is increased or reduced by the set step value (count upwards or downwards).
- When the comparison condition for comparing the counter content with an adjustable comparison value is fulfilled, a branch to any step is possible.
- 10 actions of type "Counter setting" are available for setting a counter to a starting value.

Action call (entry in the sequence table)

9	x	x	x

with action number xxx = 001 ... 025

Parameter

The available actions 1 ... 25 are indicated via the subcodes 1 ... 25.

Parameter	Possible settings			Information
C04590/1...25				Counter selection
	0	Counting is deactivated. (Sequence step is processed.)		
	1	**Counter 1**		
	...	...		
	10	Counter 10		
C04591/1...25	-2147483647		2147483647	Step value • Value by which the counter is increased or reduced. • Initialisation: 1
C04592/1...25	-2147483647		2147483647	Comparison value • Value with which the counter is compared.
C04593/1...25				Sequence step • When the set comparison condition is met, a branch to the step set here is executed. • If the condition is not fulfilled or with "0" setting, the next step in the sequence table is processed.
	0	**Sequence step**		
	1...100	Step 1 ... 100		
C04594/1...25				Comparison condition
	1	**Counter content = comparison value**		
	2	Counter content > comparison value		
	3	Counter content ≥ comparison value		
	4	Counter content < comparison value		
	5	Counter content ≤ comparison value		

5.114.3.10 Action type "Stand-by"

5 actions of type "Stand-by" are available for the temporary activation of a setpoint follower.

- For this purpose the output *bEnableFollower* must be connected to the enable input *bEnable* of the corresponding setpoint follower (SB **LS_SpeedFollower**, SB **LS_TorqueFollower** or SB **LS_PositionFollower**).
- The enable signal at the output *bEnableFollower* is applied until the condition for exiting the stand-by is met.

Action call (entry in the sequence table)

1	0	x	x	x

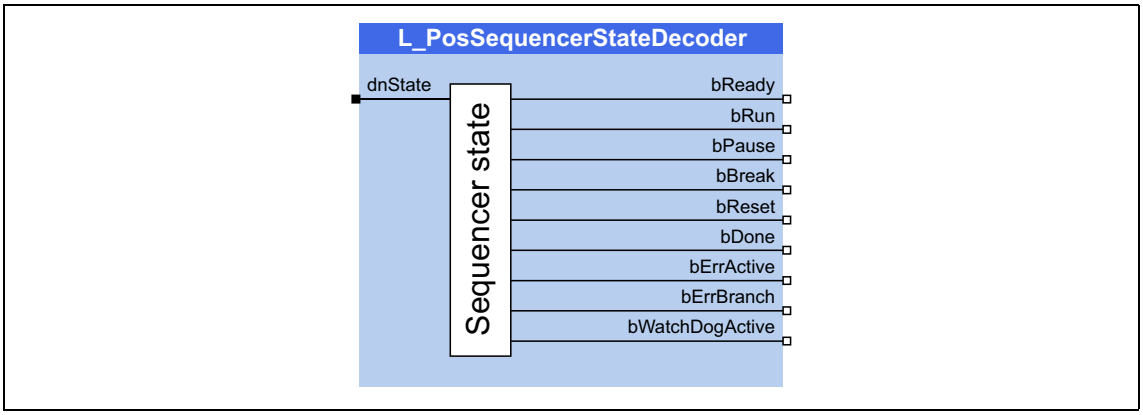
with action number xxx = 001 ... 005

Parameter

The available actions 1 ... 5 are indicated via the subcodes 1 ... 5.

Parameter	Possible settings		Information
C04600/1...5	Text		Comment on "Stand-by" step • Option for description of the function for keypad/HMI.
C04601/1...5			Input for "Stand-by" end
	1	Sequencer input 1 (Bit 0 of *dwDigitalInputs*)	
	2	Sequencer input 2 (Bit 1 of *dwDigitalInputs*)	
	...	...	
	32	Sequencer input 32 (Bit 31 of *dwDigitalInputs*)	
C04602/1...5			Signal state for "Stand-by" end • Only when the input for the end of "Stand-by" has reached this state, this stand-by step is exited and the sequence step is processed.
	0	Sequence step when bit state is "0"	
	1	**Sequence step when bit state is "1"**	

5.114.4 Example: Sequence table



Parameter	Entry	≡ Action type/action no.		Meaning
C04500/1	5000		-	Execute homing
C04500/2	3001		1	Process action 1 of type "Branching" (3)
C04500/3	9005		5	Process action 5 of type "Counting" (9)
C04500/4	1001		1	Process action 1 of type "Positioning" (1)
C04500/5	7003		3	Process action 3 of type "Waiting" (7)
C04500/6	1002		2	Process action 2 of type "Positioning" (1)
C04500/7	3002		2	Process action 2 of type "Branching" (3)
C04500/8	9005		5	Process action 5 of type "Counting" (9)
C04500/9	3004		4	Process action 4 of type "Branching" (3)
C04500/...	yyxxx	yy	xxx	Process action *xxx* of type *yy*
C04500/24	1012		12	Process action 12 of type "Positioning" (1)
C04500/25	0		-	Program end
C04500/26	0		-	Program end
C04500/...	...	...	...	...
C04500/100	0		-	Program end

5.115 L_PosSequencerStateDecoder - status signals of the sequence control

Function library:	LenzePositioning	**FB is available as of library V02.00!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

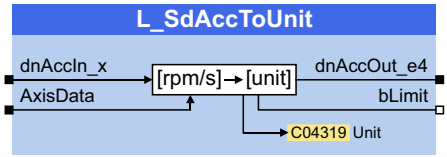
This FB decodes the status output signal *dnState* of FB LS_PosSequencer into individual boolean status signals for further use in the FB interconnection.

- The functionality corresponds to a converter "DINT➞BOOL", but the boolean outputs of this FB have the same names according to their meaning.

Inputs

Identifier/data type	Information/possible settings
dnState DINT	Input for the bit coded status signal of the sequence control. • Connect this input with the output of the same name of the FB L_PosSequencer. (📖 430)

Outputs



Bit*	Identifier	Meaning in case of TRUE
Status messages:		
16	bReady	Positioning program ready to start/program end reached.
17	bRun	Positioning program is running.
18	bPause	Positioning program is started, pause is active.
19	bBreak	Positioning program is stopped.
20	bReset	Positioning program is reset.
21	bDone	Positioning program is completed.
Error messages:		
15	bErrActive	Error is active.
22	bWatchDogActive	"Watchdog" monitoring function for positioning has been activated.
25	bErrBranch	Wrong value at branch input.

* Relating to the input signal *dnState*.

5.116 L_SdAccToUnit - acceleration conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts an acceleration value defined in the internal unit [rpm/s] into an acceleration value in the real unit of the machine.

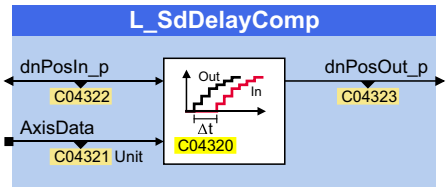
Inputs

Identifier/data type	Information/possible settings
dnAccIn_x DINT	Acceleration as speed variation/time in [rpm/s] • 15000000 rpm/s ≡ 2^{22} ≡ 4194304
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnAccOut_e4 DINT	Acceleration in [unit/s^2] • Output in "e4" format (fixed point with four decimal positions)	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited to the value range that can be displayed.

Parameter



Parameter	Possible settings	Information
C04319	String from *AxisData*	Acceleration unit • Read only

5.117 L_SdDelayComp - dead time compensation

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB extrapolates a signal by a set time. In this way, the FB can compensate for the dead times of incoming signals resulting from the bus transfer.

- The FB considers a modulo measuring system and the cycle of the selected machine parameters.

Inputs

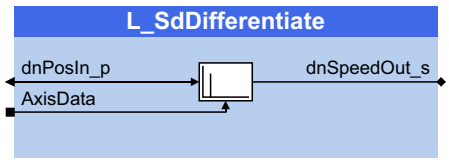
Identifier/data type	Information/possible settings
dnPosIn_p DINT	Position in [inc]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning
dnPosOut_p DINT	Compensated position in [inc]

Parameter

Parameter	Possible settings			Information
C04320	-100.000	ms	100.000	Rate time • Initialisation: 0.000 ms
C04321 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C04322 As of library V02.02.xx.xx	-214000.0000	Unit	214000.0000	Position at the input • Display of the *dnPosIn_p* input signal in the real unit of the machine.
C04323 As of library V02.02.xx.xx	-214000.0000	Unit	214000.0000	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.



5.118 L_SdDifferentiate - differentiation

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB creates a speed signal from a position value.

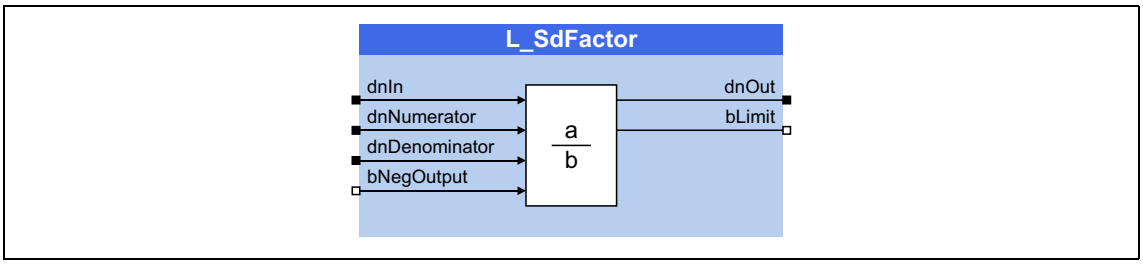
Note!

As of library V02.00.xx.xx the FB is also suitable for clocked (modulo) positions!

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Position in [inc] • Scaling: 1 encoder revolution ≡ 2^{16} increments (or acc. to *AxisData*)
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs



Identifier/data type	Value/meaning
dnSpeedOut_s DINT	Speed output in [rpm] • Scaling: 15000 rpm ≡ 2^{26} ≡ 67108864

5.119 L_SdFactor - stretch factor

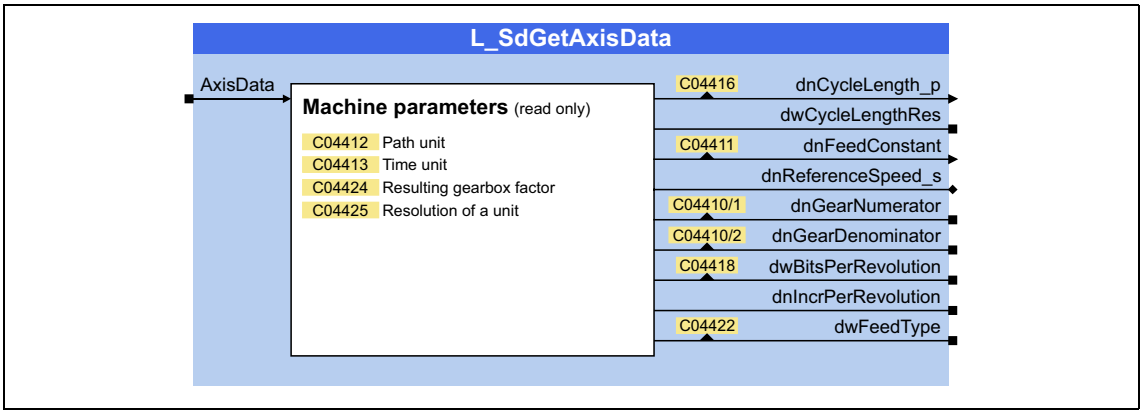
Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB provides the "stretch factor" function for the application "Electronic gearbox".

- The calculation is made with remainder handling.

Inputs

Identifier/data type	Information/possible settings	
dnIn DINT	Input signal	
dnNumerator DINT	Stretch factor (numerator) • 0 ... 2^{31}-1 • If an invalid value is selected, the gain will be set to "0".	
dnDenominator DINT	Stretch factor (denominator) • 1 ... 2^{31}-1 • If an invalid value is selected, the gain will be set to "0".	
bNegOutput BOOL	Reverse output signal	
	FALSE	Inversion is deactivated.
	TRUE	The output signal is inverted to the input signal if valid values are pending at the inputs *dnNumerator* and *dnDenominator*.



Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited, the drive does not follow the setpoint.

5.120 L_SdGetAxisData - Reading out machine parameters from axis data

Function library:	LenzeServoDrive	**FB is available as of library V02.07.xx.xx!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB reads out selected machine parameters from the copied axis data and makes them available to other FB which require them for internal calculations (e.g. master value integrators, FB for stretching/compression, and other FB for the edition of cam data).

Inputs

Identifier/data type	Information/possible settings
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

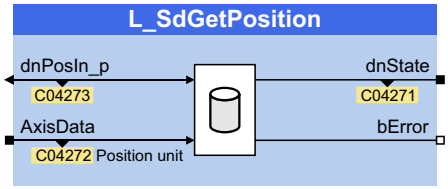
Outputs

Identifier/data type	Value/meaning
dnCycleLength_p DINT	Cycle in [increments] • C04416 indicates the cycle in the real unit of the machine.
dwCycleLengthRes DWORD	Remainder of the cycle
dnFeedConstant DINT	Feed constant in [increments] • C04411 indicates the feed constant in the real unit of the machine.
dnReferenceSpeed_s DINT	Reference speed as a speed signal • Scaling: $2^{26} \equiv 15000$ [rpm] • C04420 indicates the reference speed in the real unit of the machine.
dnGearNumerator DINT	Gearbox factor (numerator) • The gearbox factor related to the current position control (C02570) and to the position encoder selection (C00490) is output. • Display parameter: C04410/1 • C04424 indicates the resulting gearbox factor.
dnGearDenominator DINT	Gearbox factor (denominator) • The gearbox factor related to the current position control (C02570) and to the position encoder selection (C00490) is output. • Display parameter: C04410/2 • C04424 indicates the resulting gearbox factor.

Identifier/data type	Value/meaning	
dwBitsPerRevolution DWORD	Resolution of an encoder revolution • Display parameter: C04418	
	10	Bit / encoder revolution
	...	...
	24	Bit / encoder revolution
dwIncrPerRevolution DWORD	Resolution of a revolution in [increments]	
dwFeedType DWORD	Traversing range • Display parameter: C04422	
	0	Unlimited
	1	Limited
	2	Modulo

Parameter

Note!



Observe that the index of the codes listed in the following only applies to the first instance!

Parameter	Possible settings			Information
C04410/1	1		2147483647	Gearbox factor (numerator) • Read only
C04410/2	1		2147483647	Gearbox factor (denominator) • Read only
C04411	0.0001	Unit/incr.	214748.3647	Feed constant • Read only
C04412	String of digits with max. 16 characters			Unit • Read only
C04413	String of digits with max. 8 characters			Time unit • Read only
C04414	String of digits with max. 16 characters			Axis name • Read only
C04416	0.0000	Unit	214748.3647	Cycle • Read only
C04418	10	Bit	24	Resolution of an encoder revolution • Read only
C04420	-214748.3647	Unit/t	214748.3647	Reference speed • Read only
C04422				Traversing range • Read only
	0	Unlimited		
	1	Limited		
	2	Modulo		
C04424	-2147483.647		2147483.647	Resulting gearbox factor • Read only
C04425	-214748.3647	Incr./unit	214748.3647	Resolution of a unit • Read only

5.121 L_SdGetPosition - position conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

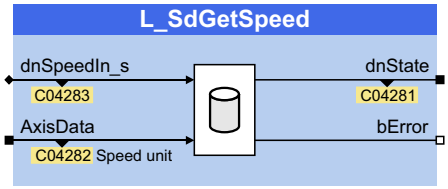
This FB uses the transmitted machine parameters and converts a position in [inc] into a position in the real unit of the machine. The converted position is displayed in C04273.

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Position in [inc] • Scaling: 1 encoder revolution ≡ 2^{16} increments (or acc. to *AxisData*)
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status	
	0	Ok - no error
	-1	No machine parameters are applied to the input *AxisData*.
	-12	Counter overflow of ±214748.3647 in the display parameter C04273.
bError BOOL	"Error" status signal	
	TRUE	The conversion was incorrect.



Parameter

Parameter	Possible settings			Information
C04271	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C04272 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C04273	-214748.3647	Unit	214748.3647	Position value • Display of the *dnPosIn_p* input signal in the real unit of the machine.

5.122 L_SdGetSpeed - speed conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a speed into a velocity. The converted value is displayed in C04283.

Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed in [rpm] • Scaling: 15000 rpm ≡ 2^{26} ≡ 67108864
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

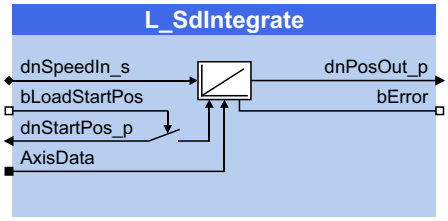
Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status	
	0	Ok - no error
	-1	No machine parameters are applied to the input *AxisData*.
	-12	Counter overflow of ±214748.3647 in the display parameter C04283.
bError BOOL	"Error" status signal	
	TRUE	The conversion was incorrect.

Parameter

Parameter	Possible settings			Information
C04281	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C04282 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C04283	-214748.3647	Unit/t	214748.3647	Speed value • Read only • Calculated from the speed signal *dnSpeedIn_s*.

5.123 L_SdIntegrate - integration of speed to position



Function library:	LenzeServoDrive	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB integrates a speed to a position.

- The calculation is made with remainder handling.
- The *bLoadStartPos* input serves to load the starting position pending at the *dnStartPos_p* input into the integrator.

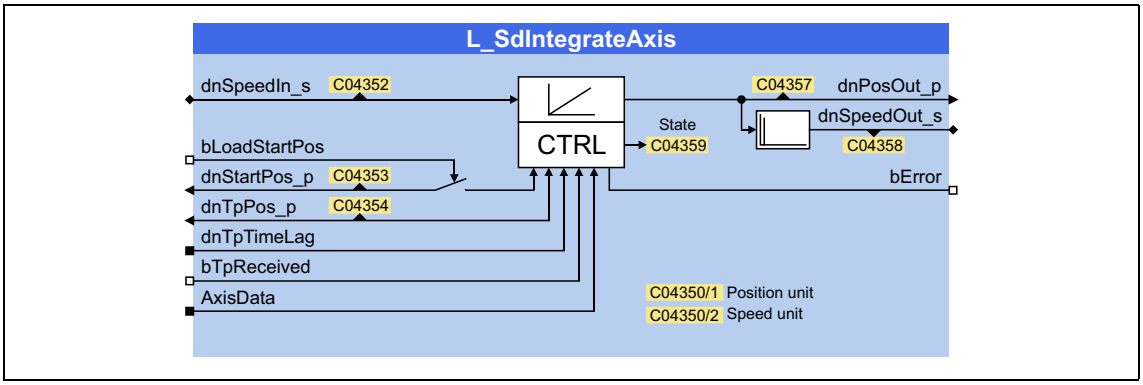
Note!

The FB is not suitable for modulo measuring systems!
(No clocked (Modulo) positions are provided.)

Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864
bLoadStartPos BOOL	Load integrator with starting position and reset overflow signal. TRUE: Load the integrator with the value applied to input *dnStartPos_p* and reset *bError* to FALSE.
dnStartPos_p DINT	Starting position in [inc] with which the integrator is loaded by setting *bLoadStartPos* to TRUE.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) • If this input is released, the following scaling applies: 1 motor revolution ≡ 2^{16}

Outputs



Identifier/data type	Value/meaning
dnPosOut_p DINT	Position in [inc] • Overflow is possible (display via *bError*)
bError BOOL	Status signal "Overflow occurs" • Status signal can be reset via *bLoadStartPos*. TRUE: Overflow has occurred.

5.124 L_SdIntegrateAxis - speed to position integration (with TP correction)

Function library:	LenzeServoDrive	**FB is available as of library V02.03.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB integrates a speed to a position.

- In contrast to the FB L_SdIntegrate, in the case of this FB a correction of the position output via touch probe can additionally be effected, i. e. the integrator considers the time from the detection of a touch probe to the next task cycle.
- The *bLoadStartPos* input serves to load the starting position pending at the *dnStartPos_p* input into the integrator.
- A touch-probe-exact (mark-controlled) start of the integrator can be carried out.
- In addition to the position, the resulting speed is shown at the output *dnSpeedOut_s*.
- The FB can be used for all measuring systems (modulo/limited/unlimited).

Inputs

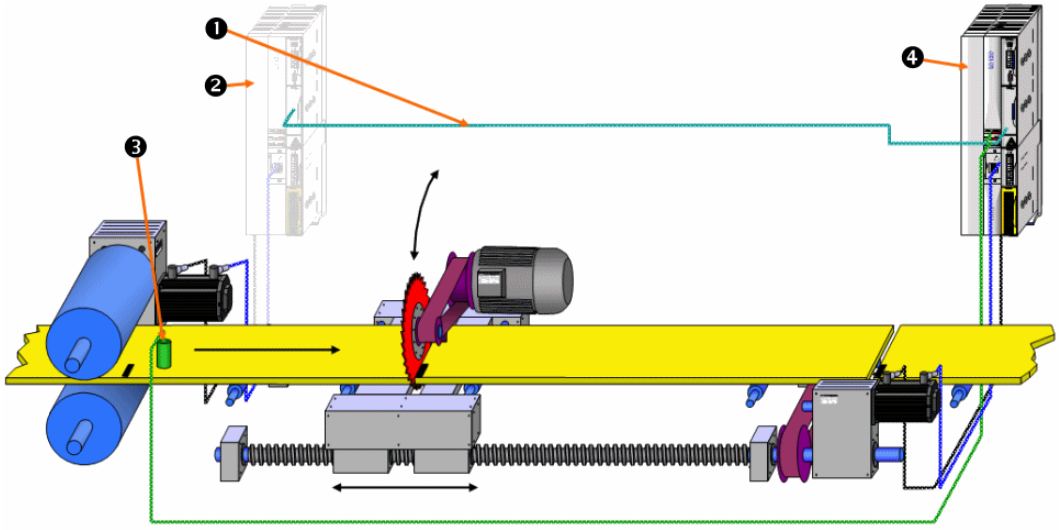
Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864 • Display parameter: C04352
bLoadStartPos BOOL	Load integrator with starting position and reset error output. TRUE: Load the integrator with the value applied to input *dnStartPos_p* and reset *bError* to FALSE.
dnStartPos_p DINT	Starting position in [inc] with which the integrator is loaded by setting *bLoadStartPos* to TRUE. • C04353 indicates the starting position in the real unit of the machine.
dnTpPos_p DINT	Position of the touch probe sensor in [increments]. • C04354 indicates the position in the real unit of the machine.
dnTpTimeLag DINT	Input for accepting the touch probe time stamp • Connect this input with the output *dnTouchProbeTimeLag* of the corresponding touch probe system block.

Identifier/data type	Information/possible settings
bTpReceived BOOL	Input for taking over the status "Touch probe detected" • Connect this input with the output *dnTouchProbeReceived* of the corresponding touch probe system block. • As long as the input *bLoadStartPos* is set to TRUE, this input has no effect.
	FALSE↗TRUE: Touch probe detected.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) • If this input is released, the following scaling applies: 1 motor revolution ≡ 2^{16}

Outputs

Identifier/data type	Value/meaning
dnPosOut_p DINT	Position output in [inc] • Overflow is possible (display via *bError*) • C04357 indicates the position in the real unit of the machine.
dnSpeedOut_s DINT	Speed output in [rpm] • C04358 indicates the speed in the real unit of the machine.
bError BOOL	"Error" status • Status signal can be reset via *bLoadStartPos*.
	TRUE: An error has occurred (group signal). • For details see display parameter C05289.

Parameter



Parameter	Possible settings			Information
C04350/1	String of digits			Position unit • Read only
C04350/2	String of digits			Speed unit • Read only
C04352	-214748.3647	Unit/t	214748.3647	Speed input • Display of the *dnSpeedIn_s* input signal in the real unit of the machine.
C04353	-214748.3647	Unit	214748.3647	Starting position • Display of the *dnStartPos_p* input signal in the real unit of the machine.
C04354	-214748.3647	Unit	214748.3647	TP position • Display of the *dnTpPos_p* input signal in the real unit of the machine.
C04357	-214748.3647	Unit	214748.3647	Output position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C04358	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.

Parameter	Possible settings		Information
C04359	Bit coded:		Status • Bits that are not itemised are reserved for future extensions.
	bits10	Zero crossing active	
	bit16	Position is beyond the cycle	
	bits17	Initial speed too high	
	bits23	Invalid axis data structure	
	bits31	General error	

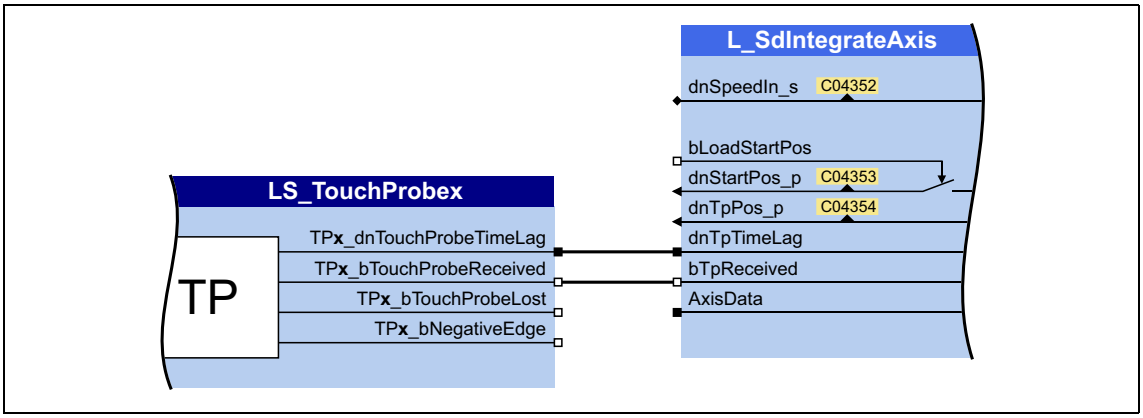
5.124.1 Typical application

Mark-controlled start of a following axis

The following illustration shows the "flying saw" application. If no mark has been detected, the slave drive remains in its waiting position. Even if the material is fed, no material motion is shown via the position output of the FB, as no mark signal has been detected. Only if a mark has been detected via the touch probe sensor, the internal integrator starts and maps the material feed.

❶ Digital frequency connection
❷ Master drive (material feed)
❸ Touch probe sensor for mark-controlled start
❹ Slave drive (flying saw)

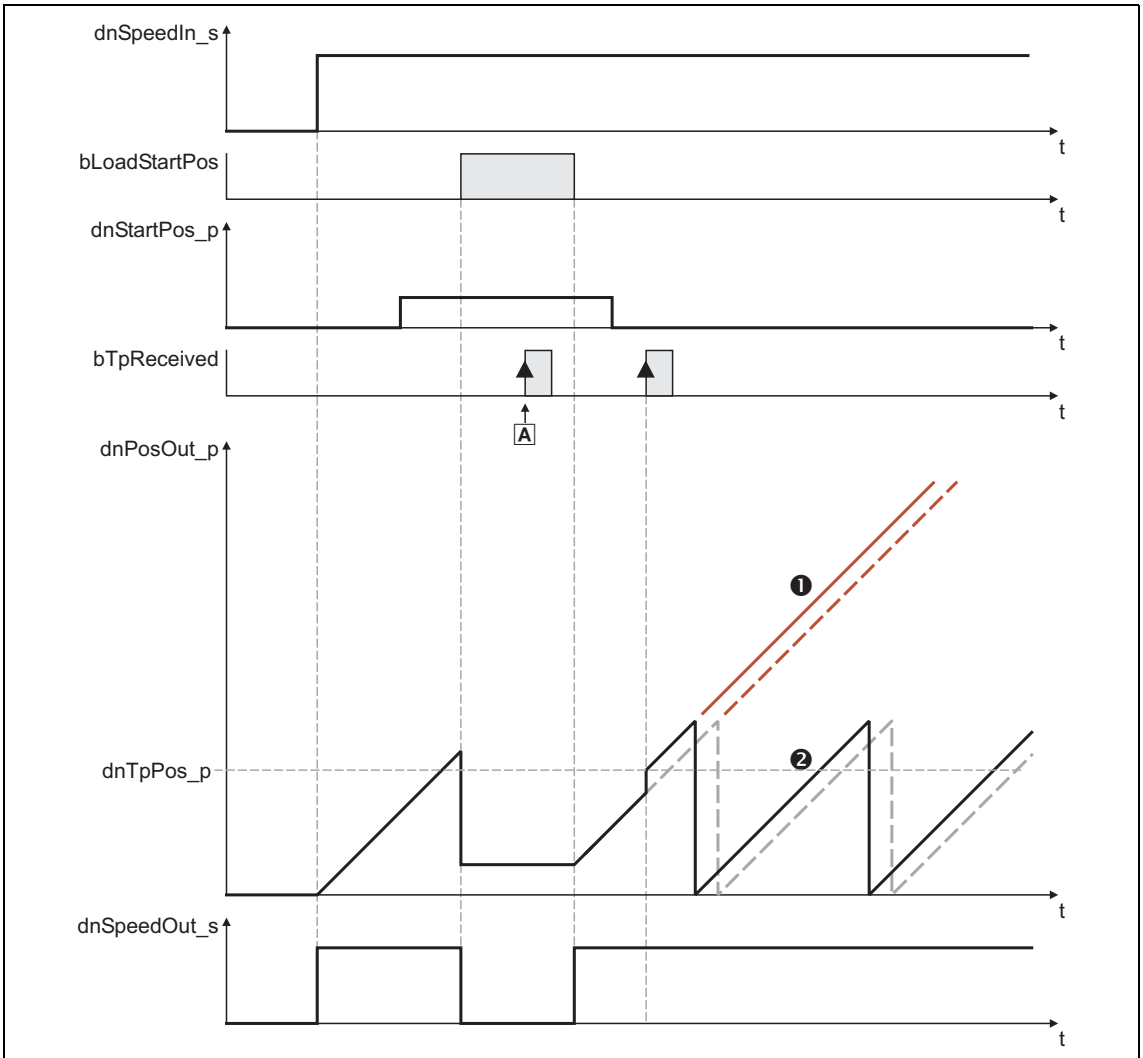
[5-74] Example: flying saw



Measuring integrator for master position

In many cases integrators are not only required for motion control, but simply for generating comparison measuring systems (e. g. master cycle generation without direct influence on the drive motion).

The FB makes it possible to set the positions once, or even cyclically in a "hard" manner, via touch probe signals, which is desired in such cases.

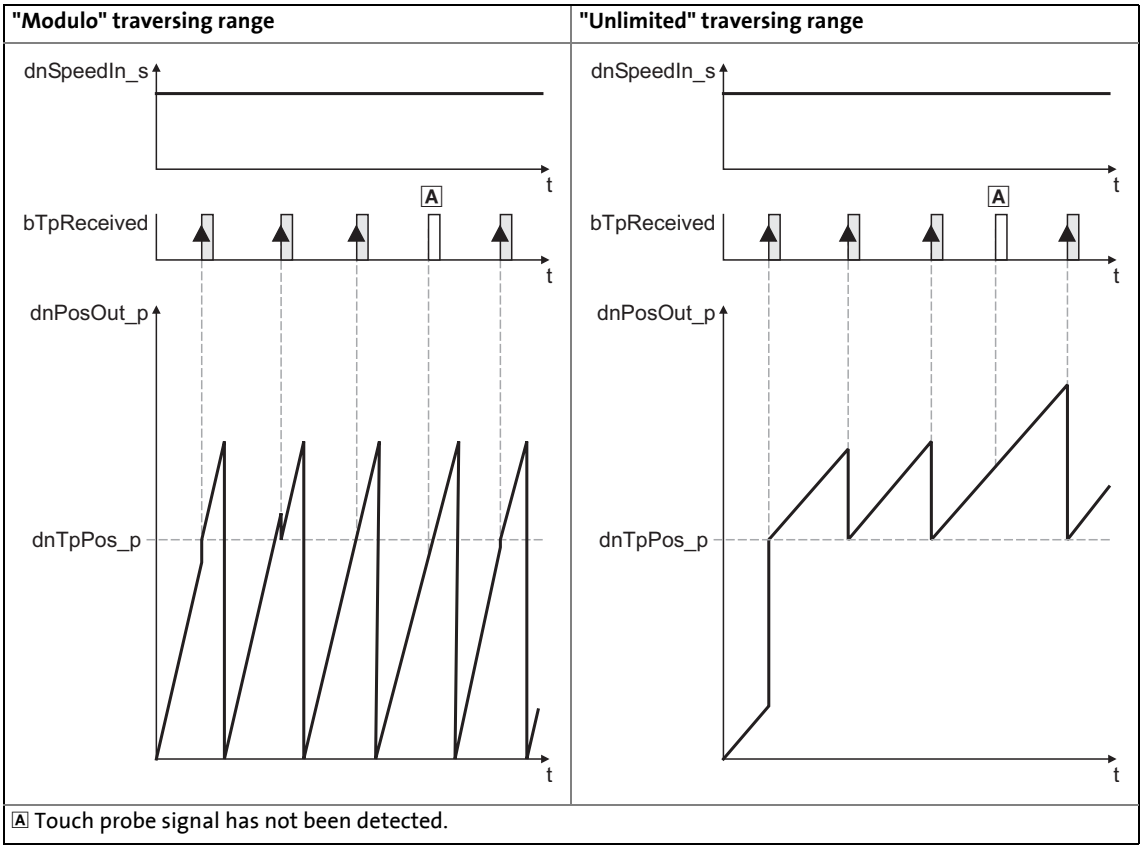


5.124.2 Interconnection of the touch probe inputs

For the position correction via touch probe the FB requires the touch probe time stamp and the "Touch probe detected" status signal from the **LS_TouchProbe** system block for the touch probe channel used:

[5-75] Example: Interconnection of the touch probe inputs of the L_SdIntegrateAxis FB

5.124.3 Signal characteristics



❶ "Unlimited" traversing range
❷ "Modulo" traversing range
A Touch probe signal has no effect, as *bLoadStartPos* is set to TRUE.

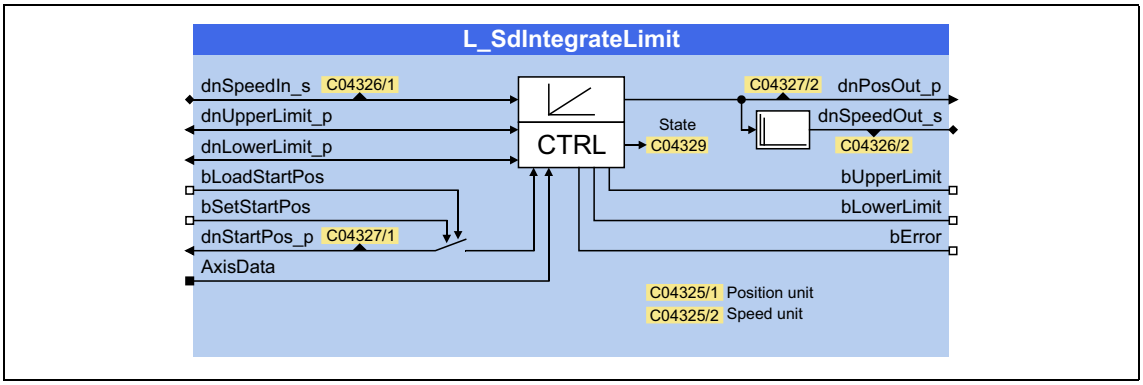
[5-76] Signal characteristics

Touch probe correction

In contrast to the FB L_SdIntegrate, in the case of this FB it is possible to correct the position output additionally via touch probe.

[5-77] Signal characteristics of touch probe correction

5.125 L_SdIntegrateLimit - integration of speed to position



Function library:	LenzeServoDrive	**FB available from library V02.09.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB integrates a speed to a position.

- The cycle (return) can be defined via inputs *dnUpperLimit_p* and *dnLowerLimit_p*.
- The starting position applied at the *dnStartPos_p* input can be loaded into the integrator in a level-triggered manner via the *bLoadStartPos* input or in an edge-triggered manner via the *bSetStartPos* input.

Note!

During modulo operation, a cycle defined in the machine parameters that are applied (*AxisData*) will not be taken into account!

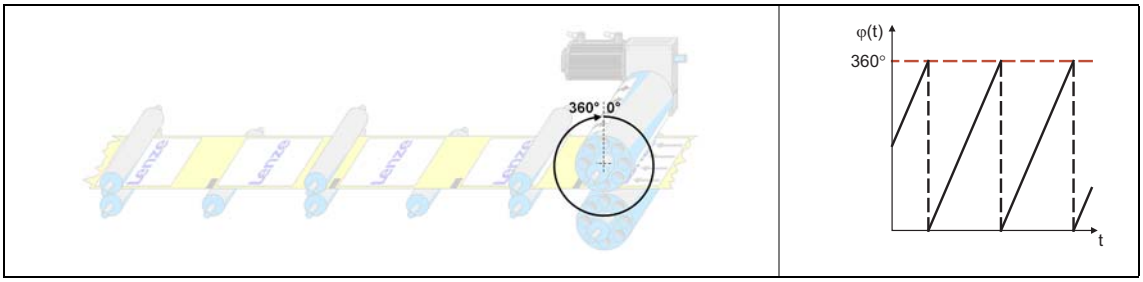
Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864 • Display parameter: C04326/1
dnUpperLimit_p DINT	Upper limit in [increments] for the position signal return
dnLowerLimit_p DINT	Lower limit in [increments] for the position signal return
bLoadStartPos BOOL	Load the integrator with starting position (level-triggered) TRUE: Load the integrator with the value at the *dnStartPos_p* input.
bSetStartPos BOOL	Load the integrator with starting position (edge-triggered) FALSE↗TRUE: Load the integrator with the value at the *dnStartPos_p* input. The speed is continued to be integrated immediately.
dnStartPos_p DINT	Starting position in [increments] used to load the integrator by setting *bLoadStartPos* to TRUE or by a FALSE-TRUE edge at *bSetStartPos*.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Position in [inc] • Overflow at *dnUpperLimit_p* and *dnLowerLimit_p*.	
dnSpeedOut_s DINT	Speed output in [rpm] • C04326/2 indicates the speed in the real unit of the machine. • If *bLoadStartPos* = TRUE, "0" is provided.	
bUpperLimit BOOL	Status signal "Return from upper value is executed"	
	TRUE	The integrator has exceeded the value at *dnUpperLimit_p*. The integration process is continued at *dnLowerLimit_p* without any loss of increments.
bLowerLimit BOOL	Status signal "Return from lower value is executed"	
	TRUE	The integrator has exceeded the value at *dnLowerLimit_p*. The integration process is continued at *dnUpperLimit_p* without any loss of increments.
bError BOOL	"Error" status	
	TRUE	An error has occurred (group signal). • For details see display parameter C04329.

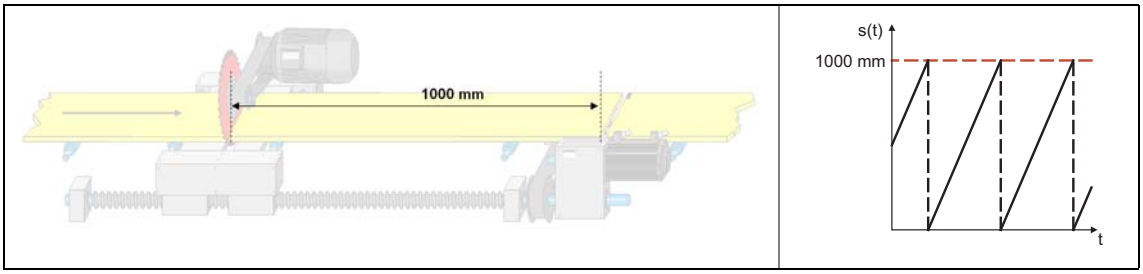
Parameters



Parameter	Possible settings			Info
C04325/1	Character string			Position unit • Read only
C04325/2	Character string			Speed unit • Read only
C04326/1	-214748.3647	Unit/t	214748.3647	Speed input • Display of the *dnSpeedIn_s* input signal in the real unit of the machine.
C04326/2	-214748.3647	Unit/t	214748.3647	Output speed • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C04327/1	-214748.3647	Unit	214748.3647	Starting position • Display of the *dnStartPos_p* input signal in the real unit of the machine.
C04327/2	-214748.3647	Unit	214748.3647	Output position • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C04329	Status messages:			Status (bit-coded) • Bits that are not listed are reserved for future extensions. • The *bError* error output will only be set to TRUE if an error message (bit 15 ... 31) is issued. • Bit 31 is the default setting if one or more other error bits (bit 15 ... 30) are set.
	Bit 6	Upper limit reached/exceeded		
	Bit 7	Lower limit reached/exceeded		
	Bit 10	Zero crossing active		
	Error messages:			
	bit16	Position is beyond the cycle		
	bits17	Initial speed too high		
	Bit 23	Invalid axis data structure		
	bits31	General error		

5.125.1 Basics

Many machine structures and processes produce measuring systems which display a periodic feed motion (so-called modulo measuring systems). These measuring systems thus represent a position range of 0 ... s_{max}.

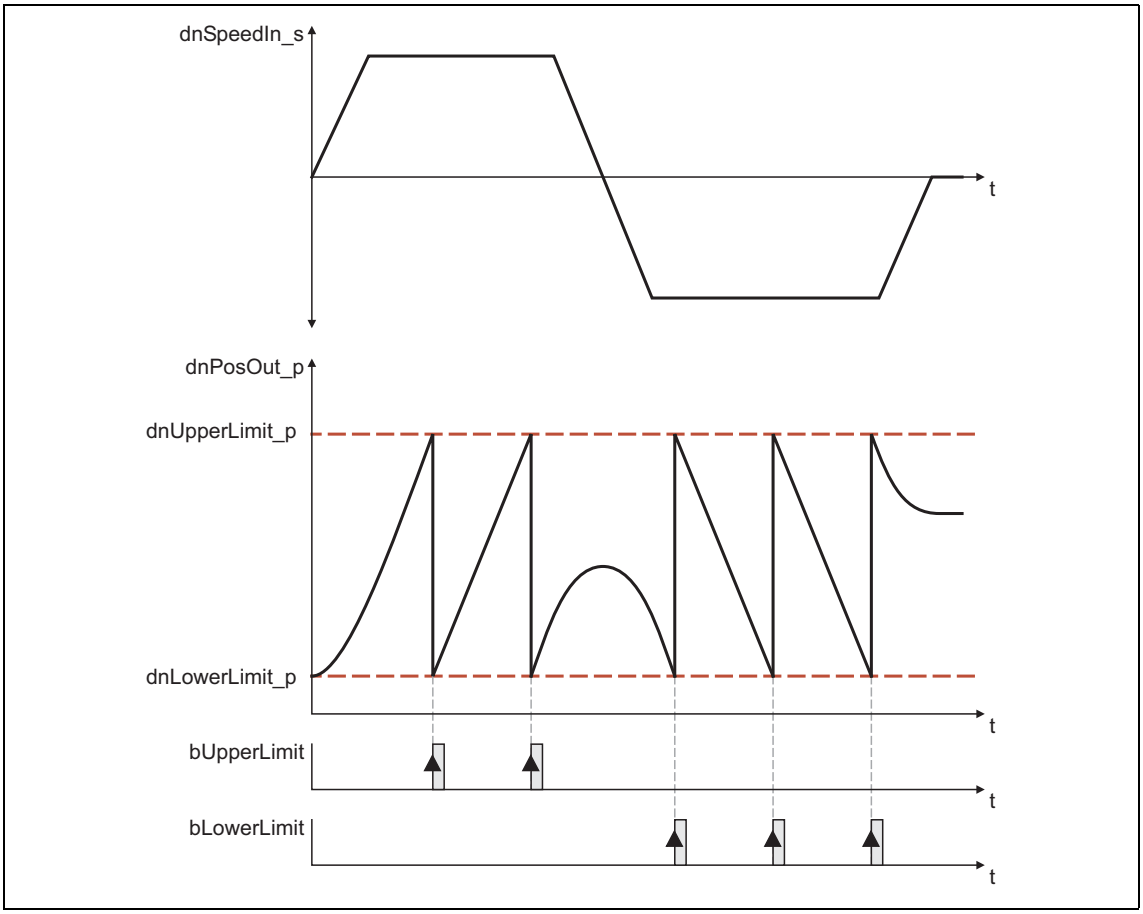


The following cases can be further distinguished:

- Case 1: Modulo measuring systems with a **reference to the mechanical system**
  - The modulo cycle results solely from the machine structure.

[5-78] Example of a reference to the mechanical system

- Case 2: Modulo measuring systems with a **process reference**
  - The modulo cycle is a process parameter (e.g. here product length = 1000 mm) and thus is variable.



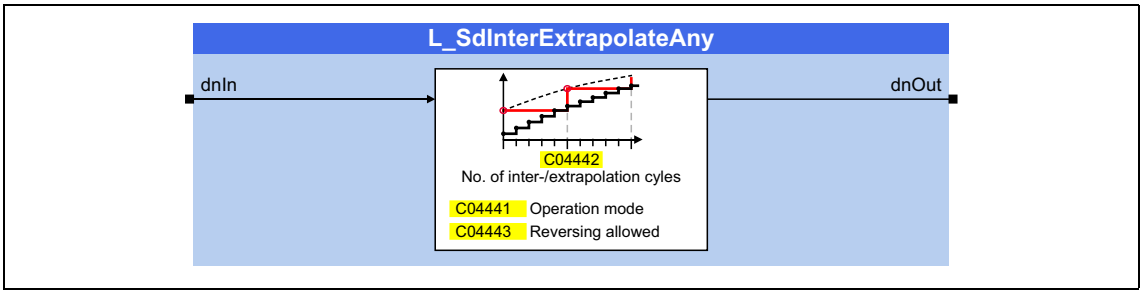
[5-79] Example of a process reference

Selection help

For both cases integrator function blocks are provided, calculating a modulo position from an input speed:

- Case 1: L_LdIntegrateCyclic, L_SdIntegrateAxis, L_EsStretchIntegrate
- Case 2: **L_SdIntegrateLimit**

5.125.2 Signal characteristics



[5-80] Signal characteristics

5.126 L_SdInterExtrapolateAny - signal interpolation

Function library:	LenzeServoDrive	**FB available from library V02.09.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB serves to interpolate or extrapolate setpoints which have a greater resolution than the task cycle.

- The L_SdInterExtrapolatePosition FB serves to interpolate or extrapolate position information. (📖 474)

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input value (setpoint)

Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output value (in the cycle)

Parameter

Parameter	Possible settings			Information
C04441				Operation mode
	0	Linear interpolation		Lenze setting
	1	Quadratic interpolation		
	2	Linear extrapolation		
	3	Quadratic extrapolation		
C04442	1		127	Number of interpolation/extrapolation steps • Task cycles per communication cycle • Initialisation: 1
C04443				Permit reversing during quadratic extrapolation
	0	Reversing not permitted		Lenze setting
	1	Reversing permitted		

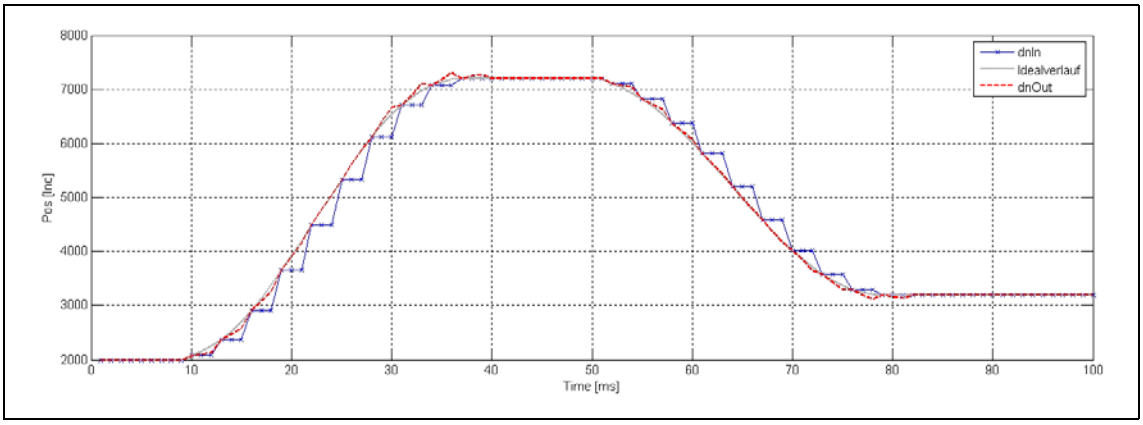
5.126.1 Extrapolation function

The FB fills in missing process data by extrapolation. These process data may be missing because of stochastic errors (e.g. EMC interferences) or the bus cycle being greater than the task cycle of the application.

- Select a linear or a quadratic extrapolation in C04441.
- Set the number of extrapolation steps in C04442:

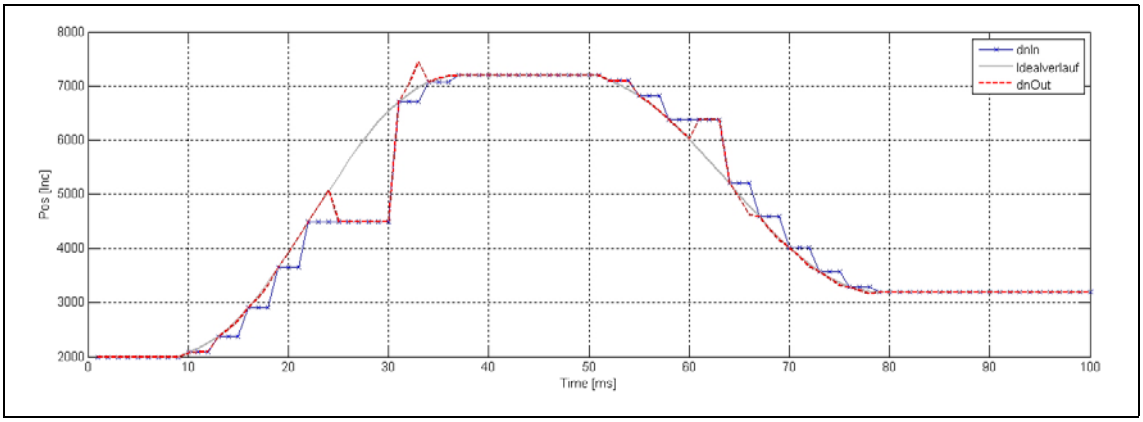
$$C04442 = \frac{\text{Bus cycle [ms]}}{\text{Task cycle [ms]}}$$

5.126.2 Interpolation function



The FB fills in missing process data by interpolation. These process data are missing because the bus cycle is greater than the task cycle of the application.

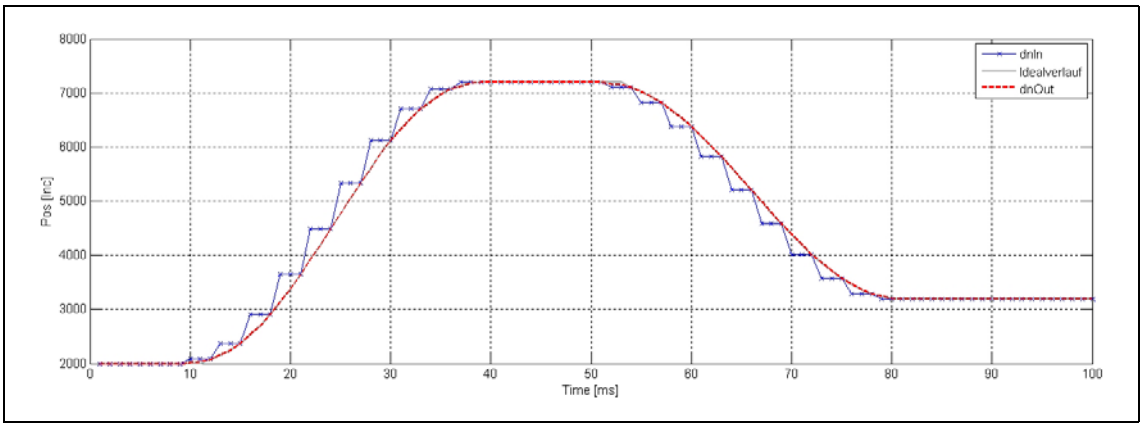
- Select a linear or a quadratic interpolation in C04441.
- Set the number of interpolation steps in C04442:



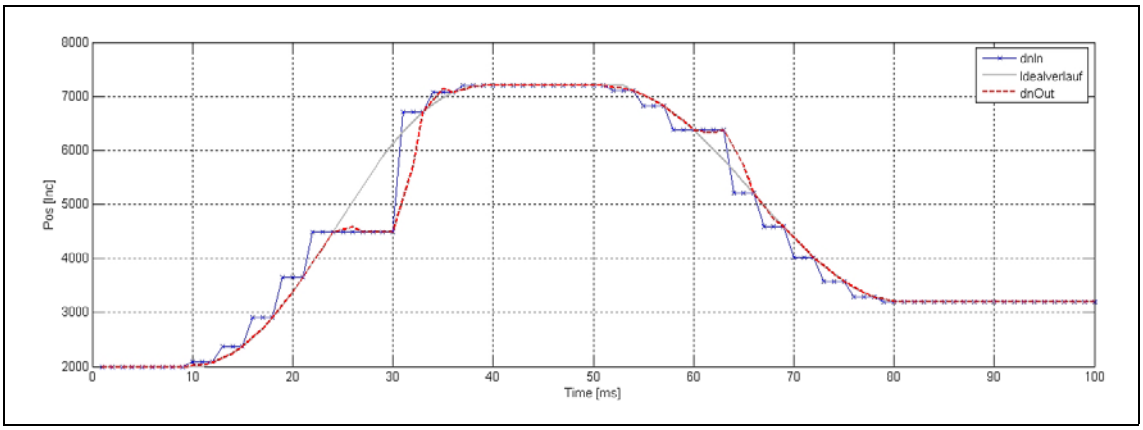
$$C04442 = \frac{\text{Bus cycle [ms]}}{\text{Task cycle [ms]}}$$

5.126.3 Signal characteristics

Extrapolation



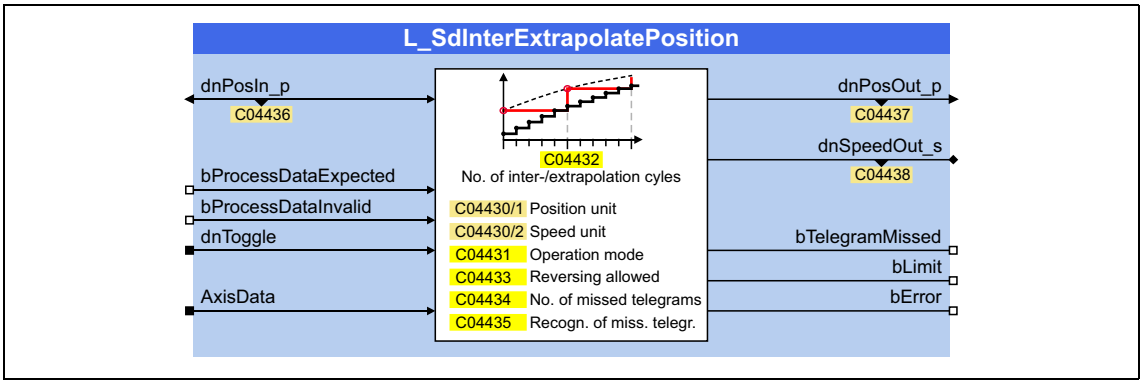
[5-81] Quadratic extrapolation



[5-82] Quadratic extrapolation with telegram failure

Interpolation

[5-83] Quadratic interpolation



[5-84] Quadratic interpolation with telegram failure

5.127 L_SdInterExtrapolatePosition - signal interpolation

Function library:	LenzeServoDrive	**FB available from library V02.09.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB serves to interpolate or extrapolate position information with a greater resolution than the task cycle. Furthermore, the FB provides measures for filling in the gaps in the case of telegram failures.

- The L_SdInterExtrapolateAny FB serves to interpolate or extrapolate other data types. (📖 471)

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Input position (setpoint) in [increments]
bProcessDataExpected BOOL	SyncInput interface for telegram failure detection • This input is only evaluated if C04435 = "2". • If this input is set to TRUE (e.g. via the **LS_SyncInput** SB), the FB expects a new position value at the *dnPosIn_p* input at that time.
	FALSE: A new process datum at *dnPosIn_p* is not expected.
	TRUE: A new process datum at *dnPosIn_p* is expected.
bProcessDataInvalid BOOL	SyncInput interface for telegram failure detection • This input is only evaluated if C04435 = "2". • The signal is only valid in conjunction with *bProcessDataExpected*. • If this input is set to TRUE (e.g. via the **LS_SyncInput** SB), the FB invalidates the new position value at the *dnPosIn_p* input.
	FALSE: The process datum at *dnPosIn_p* is valid.
	TRUE: The process datum at *dnPosIn_p* is invalid.
dnToggle DINT	Toggle input for telegram failure detection • This input is only evaluated if C04435 = "1". • The input is supposed to receive a 32-bit value which had been received from the master control and which changes with every communication cycle. If the *dnToggle* input value remains unchanged, this behaviour will be evaluated as telegram failure.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Output position (in the cycle) in [increments]	
dnSpeedOut_s DINT	Output speed (in the cycle) provided as speed in [min^{-1}] • 15000 rpm ≡ 2^{26} ≡ 67108864	
bTelegramMissed BOOL	Status signal "Telegram failure detected"	
	TRUE	Telegram failure has been detected.
bLimit BOOL	Status signal "Number of accepted telegram failures reached"	
	TRUE	The number of accepted telegram failures set in C04434 has been reached.
bError BOOL	"Error" status	
	TRUE	An error has occurred.

Parameter

Parameter	Possible settings			Information
C04430/1	String of digits			Position unit • Read only
C04430/2	String of digits			Speed unit • Read only
C04431				Operation mode
	0	Linear interpolation		Lenze setting
	1	Quadratic interpolation		
	2	Linear extrapolation		
	3	Quadratic extrapolation		
C04432	1		127	Number of interpolation/extrapolation steps • Task cycles per communication cycle • Initialisation: 1
C04433				Permit reversing during quadratic extrapolation
	0	Reversing not permitted		Lenze setting
	1	Reversing permitted		
C04434	0		50	Number of accepted telegram failures • at the same time number of communication cycles used for further interpolation/extrapolation. • Initialisation: 0
C04435				Selection: Telegram failure detection
	0	Inactive (Two identical input position values in a row are not evaluated as telegram failure.)		Lenze setting
	1	Toggle input		
	2	SyncInput interface		
C04436	-214748.3647	Unit	214748.3647	Position at the input • Display of the *dnPosIn_p* input signal in the real unit of the machine.

Parameter	Possible settings			Information
C04437	-214748.3647	Unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C04438	-214748.3647	Unit/t	214748.3647	Speed at the output • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.

5.127.1 Extrapolation function

The FB fills in missing position data by extrapolation. These position data may be missing because of stochastic errors (e.g. EMC interferences) or the bus cycle being greater than the task cycle of the application.

- Select a linear or a quadratic extrapolation in C04431.
- Set the number of extrapolation steps in C04432:

$$C04432 = \frac{\text{Bus cycle [ms]}}{\text{Task cycle [ms]}}$$

Note!

A great number of interpolation/extrapolation steps may cause the extrapolated output signal to reverse, e.g. if the input signal with a rough resolution is brought to a standstill.

- Select in C04433 if reversing is permitted or not. In the Lenze setting of C04433, reversing is not permitted.

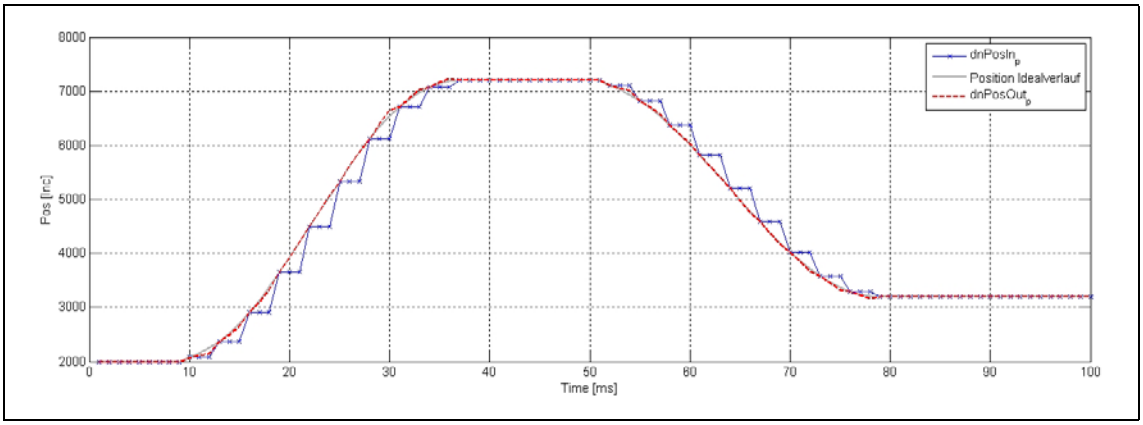
5.127.2 Interpolation function

The FB fills in missing position data by interpolation. These process data are missing because the bus cycle is greater than the task cycle of the application.

- Select a linear or a quadratic interpolation in C04431.
- Set the number of interpolation steps in C04432:

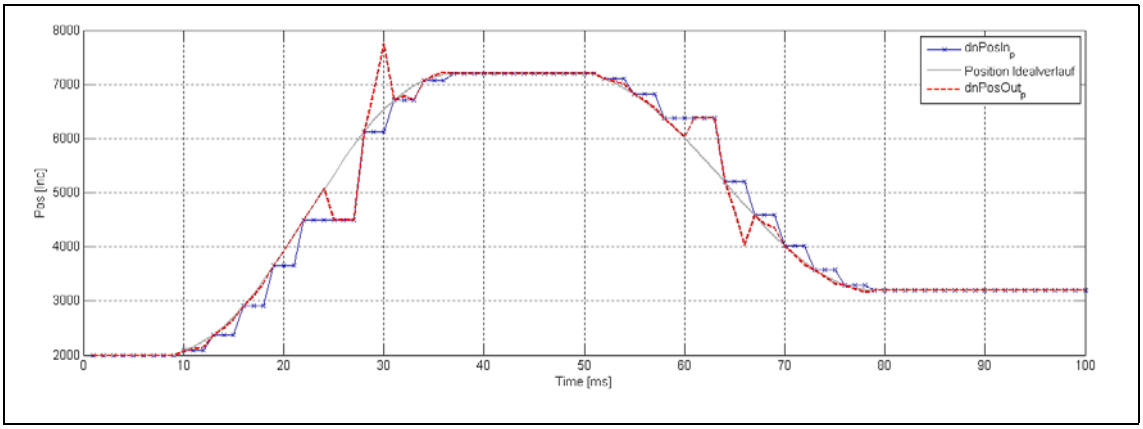
$$C04432 = \frac{\text{Bus cycle [ms]}}{\text{Task cycle [ms]}}$$

5.127.3 Telegram failure detection



An optional telegram failure detection can be activated in C04435, either via toggle input or SyncInput interface (SB **LS_SyncInput**).

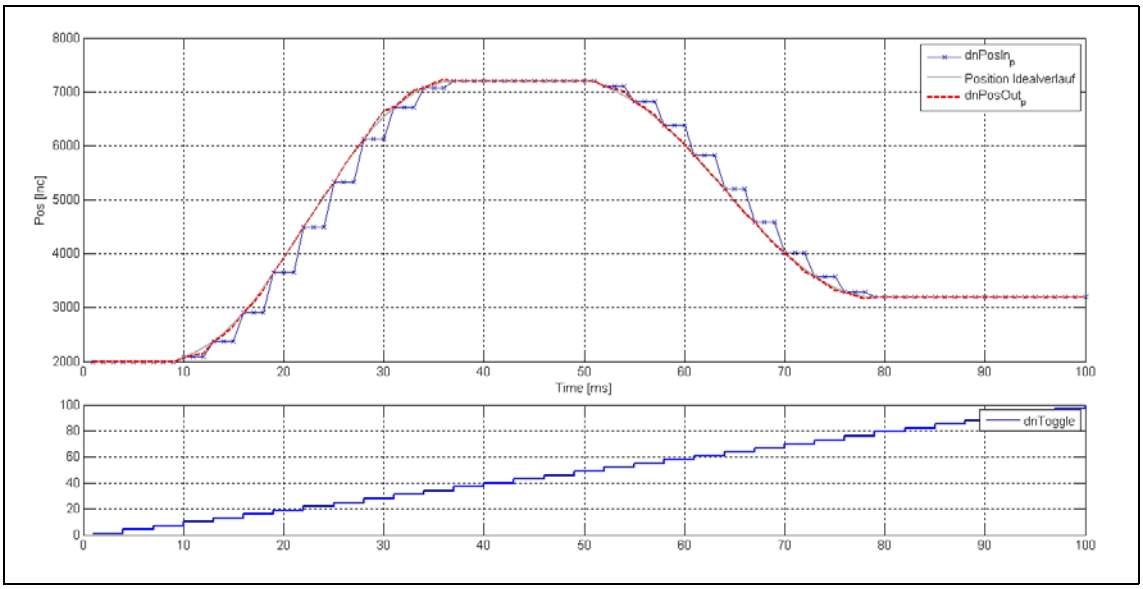
- Telegram failure detection serves to fill in missing process data values.
- The maximum number of accepted telegram failures before interpolation/extrapolation is stopped can be set in C04434.



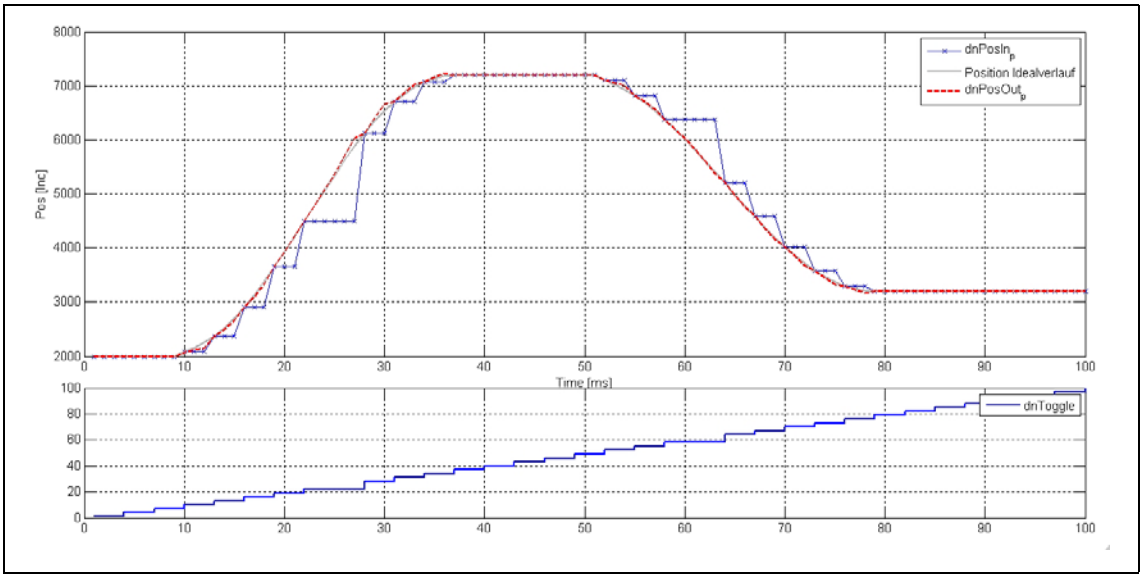
5.127.4 Signal characteristics

Extrapolation without telegram failure detection

Selection: Telegram failure detection (C04435) = "0: Deactivated"



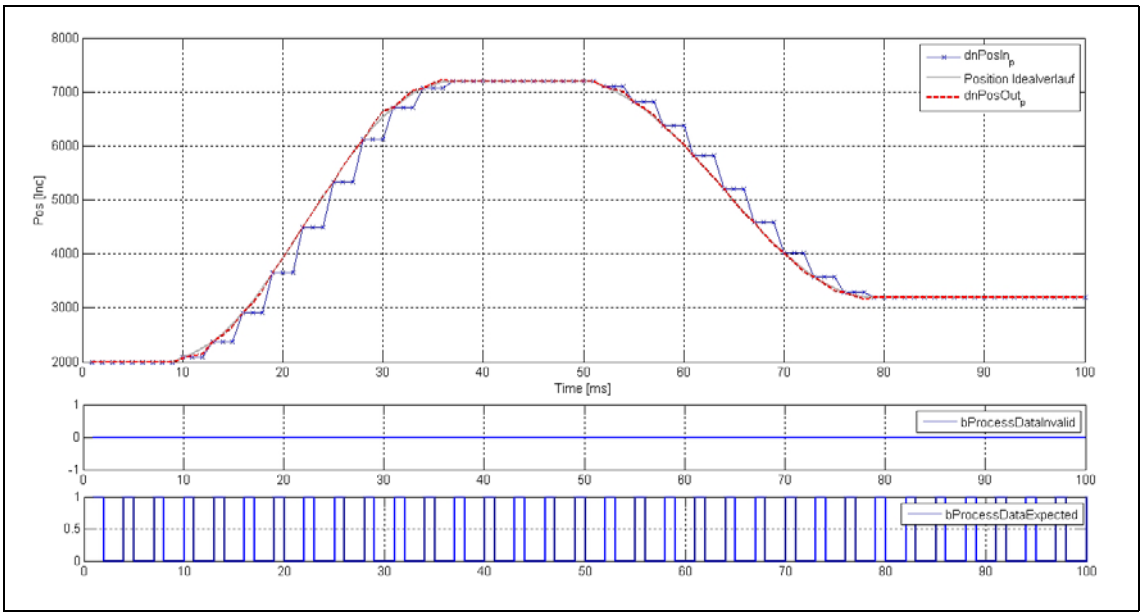
[5-85] Input values OK



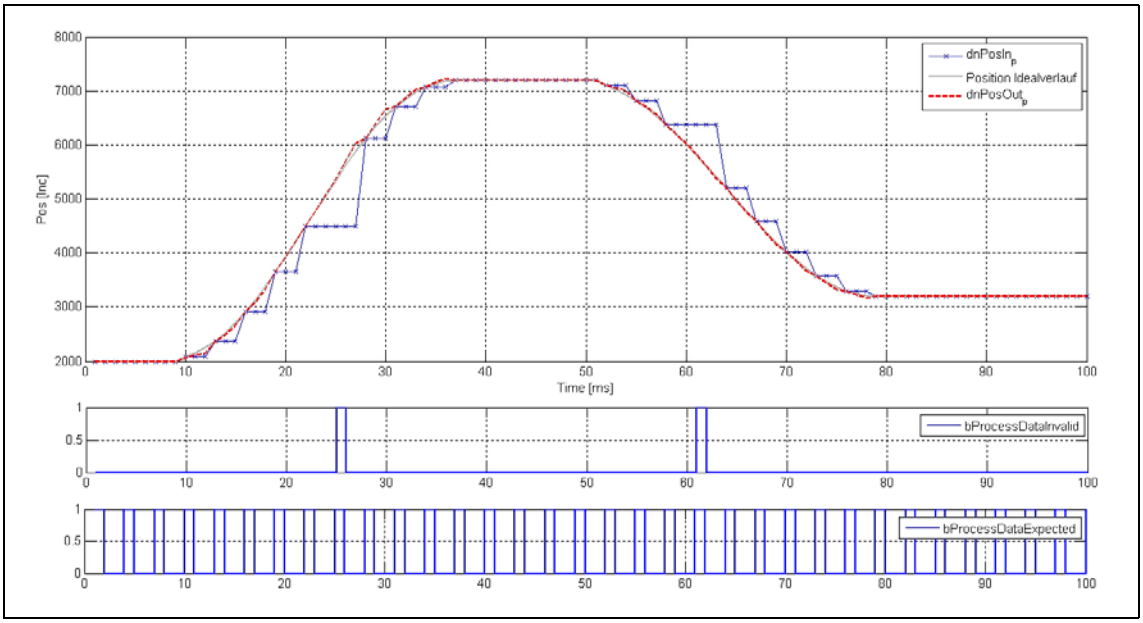
[5-86] Input values not OK, number of accepted telegram failures = 0

Extrapolation with telegram failure detection via toggle input

Selection: Telegram failure detection (C04435) = "1: Toggle input"



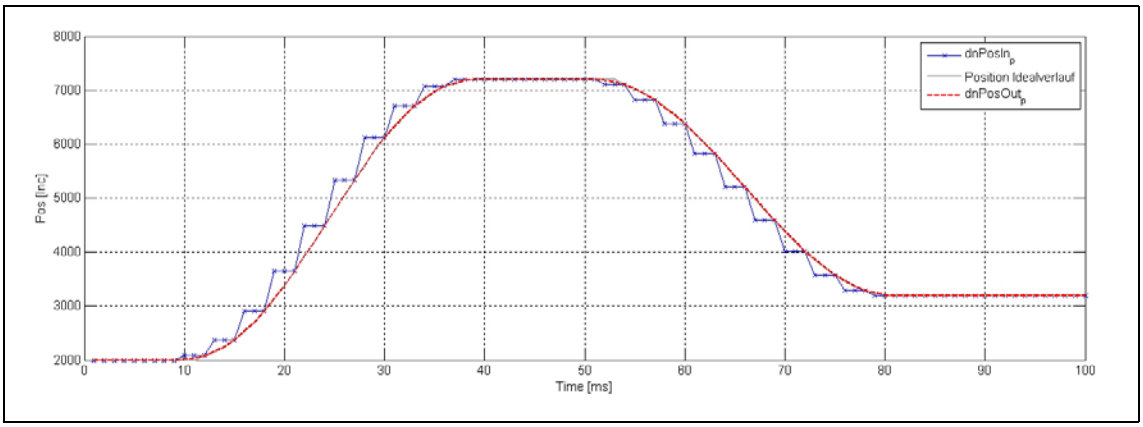
[5-87] Input values OK



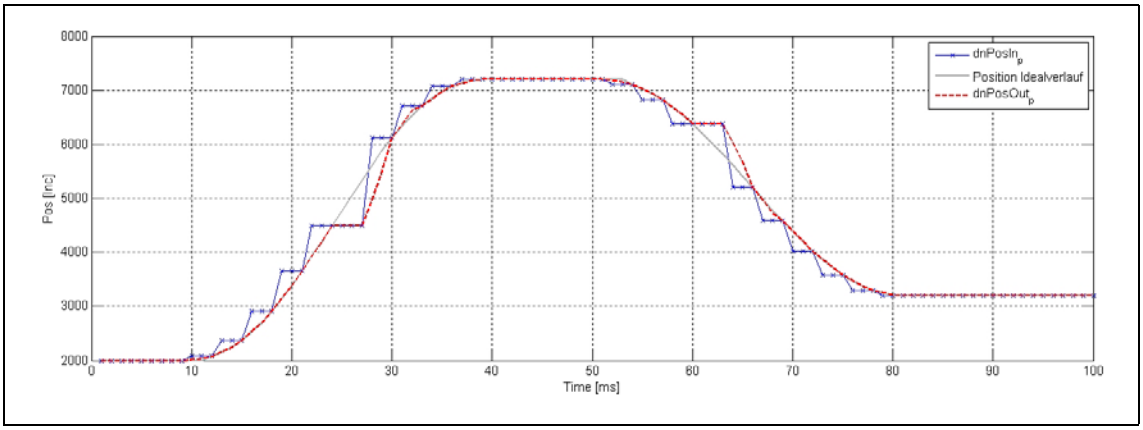
[5-88] Input values not OK, number of accepted telegram failures = 1

Extrapolation with telegram failure detection via SyncInput interface

Selection: Telegram failure detection (C04435) = "2: SyncInput interface"



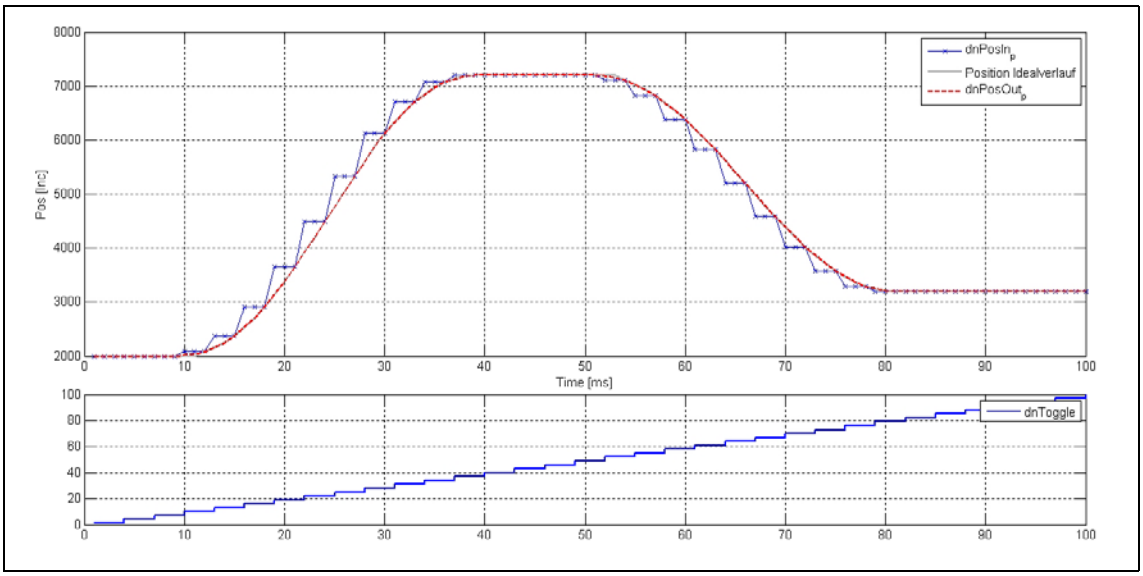
[5-89] Input values OK



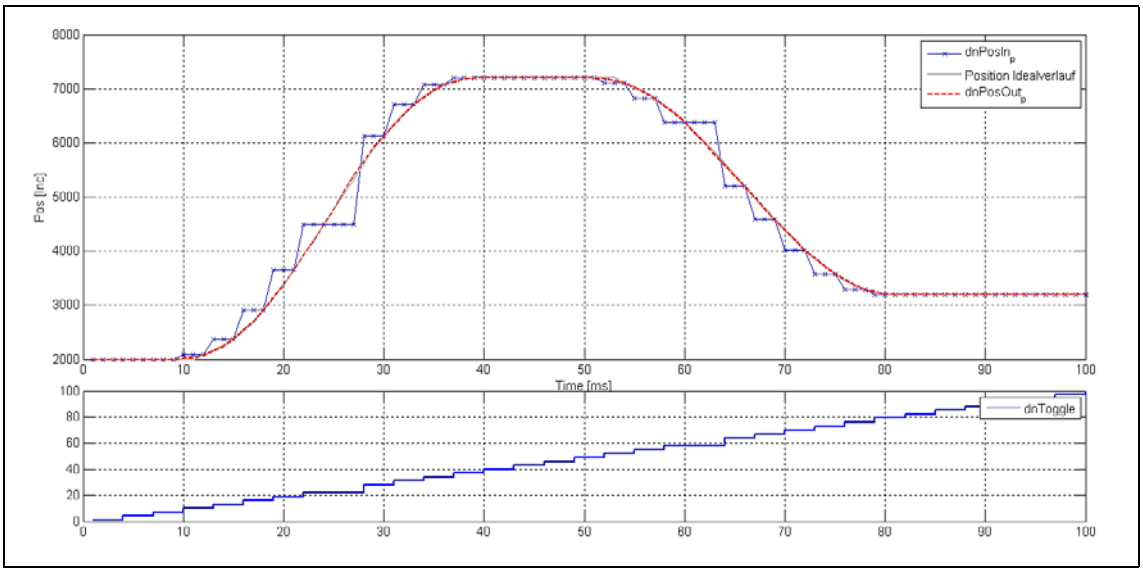
[5-90] Input values not OK, number of accepted telegram failures = 1

Interpolation without telegram failure detection

Selection: Telegram failure detection (C04435) = "0: Deactivated"



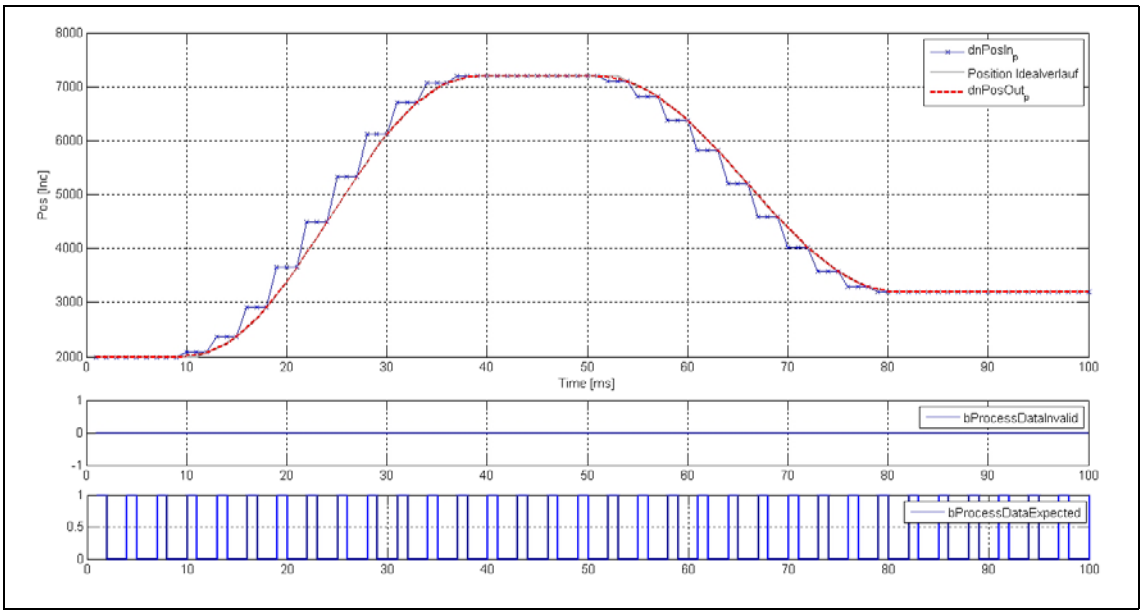
[5-91] Input values OK



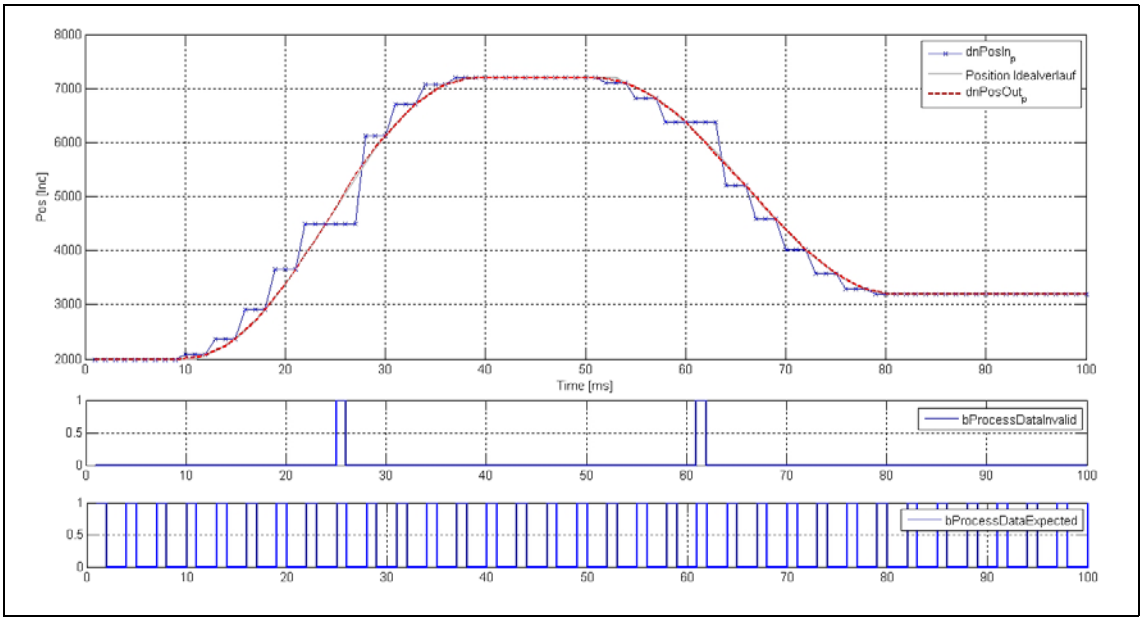
[5-92] Input values not OK, number of accepted telegram failures = 0

Interpolation with telegram failure detection via toggle input

Selection: Telegram failure detection (C04435) = "1: Toggle input"



[5-93] Input values OK

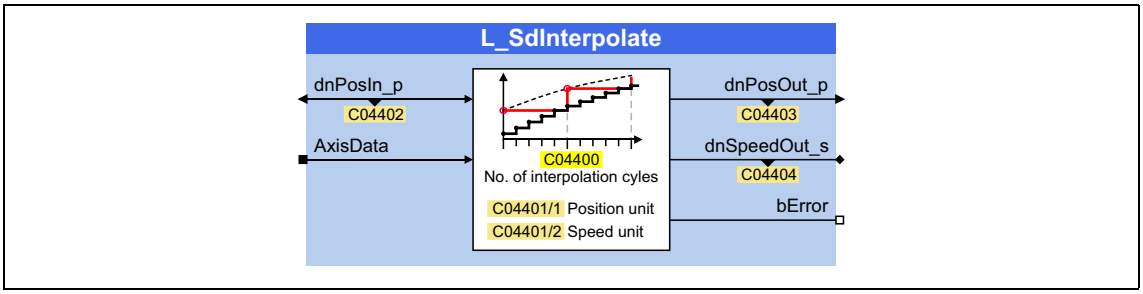


[5-94] Input values not OK, number of accepted telegram failures = 1

Interpolation with telegram failure detection via SyncInput interface

Selection: Telegram failure detection (C04435) = "2: SyncInput interface"

[5-95] Input values OK



[5-96] Input values not OK, number of accepted telegram failures = 1

5.128 L_SdInterpolate - signal interpolation

Function library:	LenzeServoDrive	**FB available from library V02.00.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB is used to interpolate position information, e.g. to compensate for long bus transfer cycles or smooth low-resolution absolute-value encoders.

- The FB L_LdExtrapolate is available for extrapolation. (📖 319)

Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Position of the external, and, as the case may be, insufficiently resolved master shaft in [increments].
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Master position output (in the cycle) in [inc]	
dnSpeedOut_s DINT	Master speed output (in the cycle) in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
bError BOOL	"Error" status signal	
	TRUE	Master position *dnPosIn_p* has exceeded the cycle defined in the machine parameters (*AxisData*).

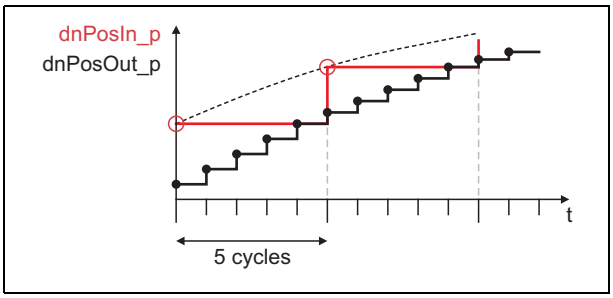
Parameter

Parameter	Possible settings			Information
C04400	1		16	Number of the interpolation cycles • Initialisation: 1
C04401/1 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C04401/2 As of library V02.02.xx.xx	String of digits			Speed unit • Read only

Parameter	Possible settings			Information
C04402 As of library V02.02.xx.xx	-214748.3647	Unit	214748.3647	Position at the input • Display of the *dnPosIn_p* input signal in the real unit of the machine.
C04403 As of library V02.02.xx.xx	-214748.3647	Unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C04404 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Speed at the output • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.

5.128.1 Function

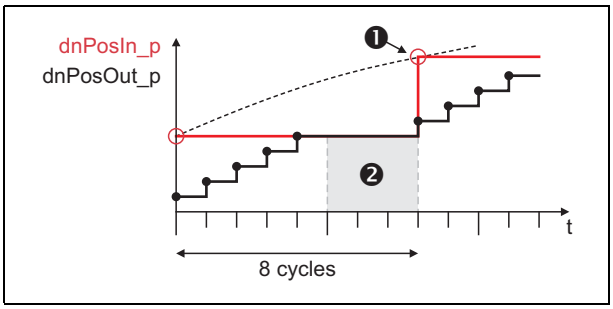
The number of interpolation cycles to be set under C04400 is calculated by means of the following formula:



$$C04400 = \frac{\text{Bus cycle [ms]}}{\text{Task cycle [ms]}}$$

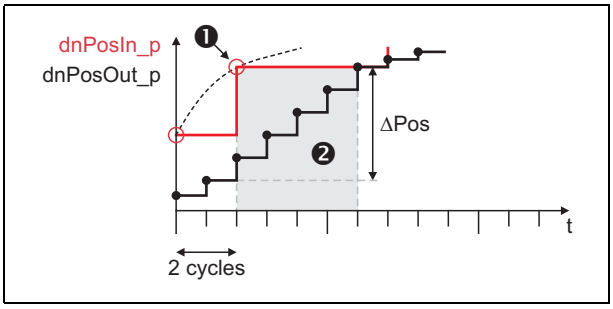
Example

If the 9400 HighLine controller (task cycle = 1 ms) receives a position value in a 5-ms cycle from a higher-level control at *dnPosIn_p*, set "5" under C04400.



Applications

In the following examples, the number of interpolation cycles selected under C04400 is set to "5".



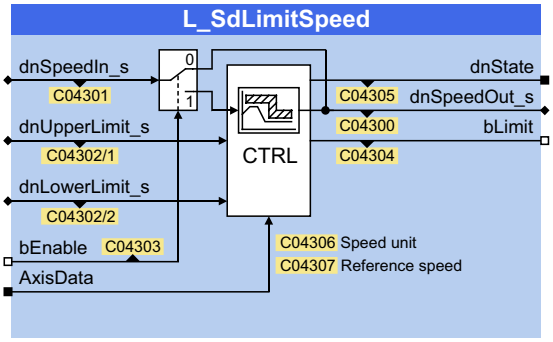
[5-97] Case 1: Cycle time of the input signal = number of interpolation cycles

- In every cycle, the interpolated position value is output at *dnPosOut_p*.

[5-98] Case 2: Cycle time of the input signal > number of interpolation cycles

- If a new value is only received after completion of the five interpolation cycles (❶), the output constantly outputs the input value after completion of the five interpolation cycles (❷).

[5-99] Case 3: Cycle time of the input signal < number of interpolation cycles



- If a new value is received before completion of the five interpolation cycles (❶), the new interpolation values are calculated by means of the difference between actual and setpoint position (❷).

5.129 L_SdLimitSpeed - speed limitation

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is used to lead a speed setpoint to defined limit ranges.

- The overflow buffer has a sample rate of 8 revolutions/ms.

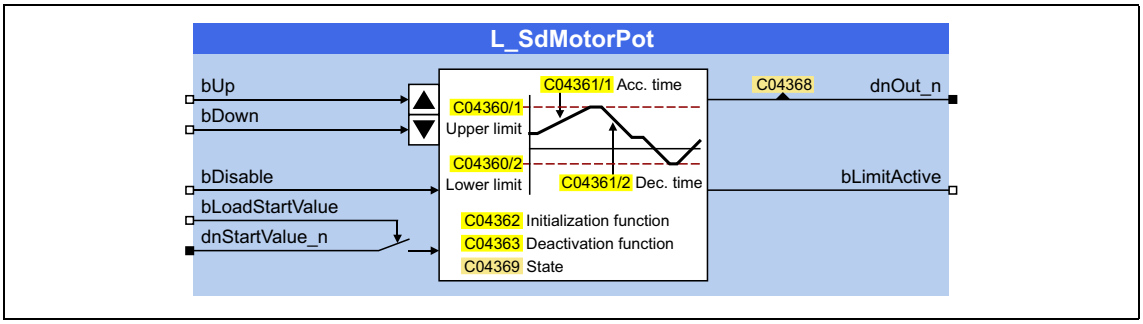
Inputs

Identifier/data type	Information/possible settings	
dnSpeedIn_s DINT	Speed input signal in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
dnUpperLimit_s DINT	Upper speed limit in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
dnLowerLimit_s DINT	Lower speed limit in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
bEnable BOOL	Activate speed limitation	
	FALSE	Speed limitation is deactivated. • The input signal *dnSpeedIn_s* is output unchanged to the output *dnSpeedOut_s*. • The overflow buffer is cleared.
	TRUE	Speed limitation is activated. • The input signal *dnSpeedIn_s* is output to the output *dnSpeedOut_s* considering the defined speed ranges.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded)	
	bits0	Ok - no error
	Bit15	Fault (group signal)
	bit16	Speed output signal is limited to the upper speed limit.
	bits17	Speed output signal is limited to the lower speed limit.
	bits18	No speed limits defined, the speed limitation is not active.
	Bit 19	Speed limits are invalid.
	bits20	Overflow of the overflow buffer
dnSpeedOut_s DINT	Speed output signal in [rpm]	
bLimit BOOL	Status signal "Speed limitation is active"	
	TRUE	The speed output signal is limited.

Parameter



Parameter	Possible settings			Information
C04300	-214748.3647	Unit/t	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C04301	-214748.3647	Unit/t	214748.3647	Speed at the input • Read only • Calculated from the speed signal *dnSpeedIn_s*.
C04302/1 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Upper speed limit • Read only • Is calculated from the *dnUpperLimit_s* speed signal.
C04302/2 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Lower speed limit • Read only • Is calculated from the *dnLowerLimit_s* speed signal.
C04303				Limitation enabled • Display of the *bEnable* input signal.
	0	Speed limitation is deactivated.		
	1	Speed limitation is activated.		
C04304				Limitation active • Display of the output signal *bLimit*.
	0	Speed output signal is not limited.		
	1	Speed output signal is limited.		
C04305	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C04306 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C04307 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.

5.130 L_SdMotorPot - motor potentiometer

Function library:	LenzeServoDrive	**FB is available as of library V02.04.xx.xx!**
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel
Required retain memory:	212 bytes	

This FB replaces a hardware motor potentiometer and can be used as an alternative setpoint source controlled via two inputs.

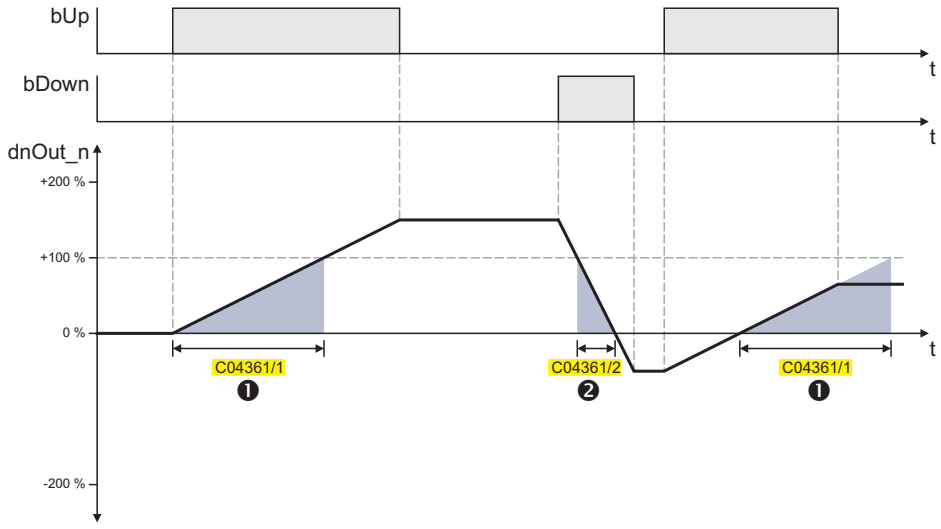
- The signal output is effected via a ramp function generator with linear ramps.
- The acceleration and deceleration time and the upper and lower limit value can be parameterised independently of each other.
- The behaviour after mains switching can be parameterised; in the Lenze setting the last output value before the mains are switched off is re-established.
- The behaviour in the case of deactivation of the motor potentiometer function can also be parameterised.

Inputs

Identifier/data type	Information/possible settings	
bUp BOOL	Increase output value	
	TRUE	With the acceleration time set in C04361/1, *dnOut_n* is increased until the upper limit value has been reached (C04360/1). • If the input *bDown* is set to TRUE at the same time, *dnOut_n* is not changed.
bDown BOOL	Decrease output value	
	TRUE	With the deceleration time set in C04361/2, *dnOut_n* is decreased until the lower limit value has been reached (C04360/2). • If the input *bUp* is set to TRUE at the same time, *dnOut_n* is not changed.
bDisable BOOL	Deactivate motor potentiometer function • This input has the second highest priority after *bLoadStartValue*. • The behaviour of the output value *dnOut_n* in the case of deactivation can be selected in C04362; in the Lenze setting the last output value is maintained.	
	TRUE	Motor potentiometer function is deactivated.
bLoadStartValue BOOL	Load motor potentiometer with starting value • This input has the highest priority.	
	TRUE	*dnOut_n* is set to the starting value *dnStartValue_n*. • If the starting value is beyond the limit values parameterised, the output value *dnOut_n* is limited to the corresponding limit value.
dnStartValue_n DINT	Starting value in [%]	

Outputs

Identifier/data type	Value/meaning	
dnOut_n DINT	Output value in [%] • Display parameter: C04368	
bLimitActive BOOL	Status signal "Output value is limited"	
	TRUE	The output value *dnOut_n* lies on a limit value or lies beyond the limit values and is directed to the nearest limit value.



Parameter

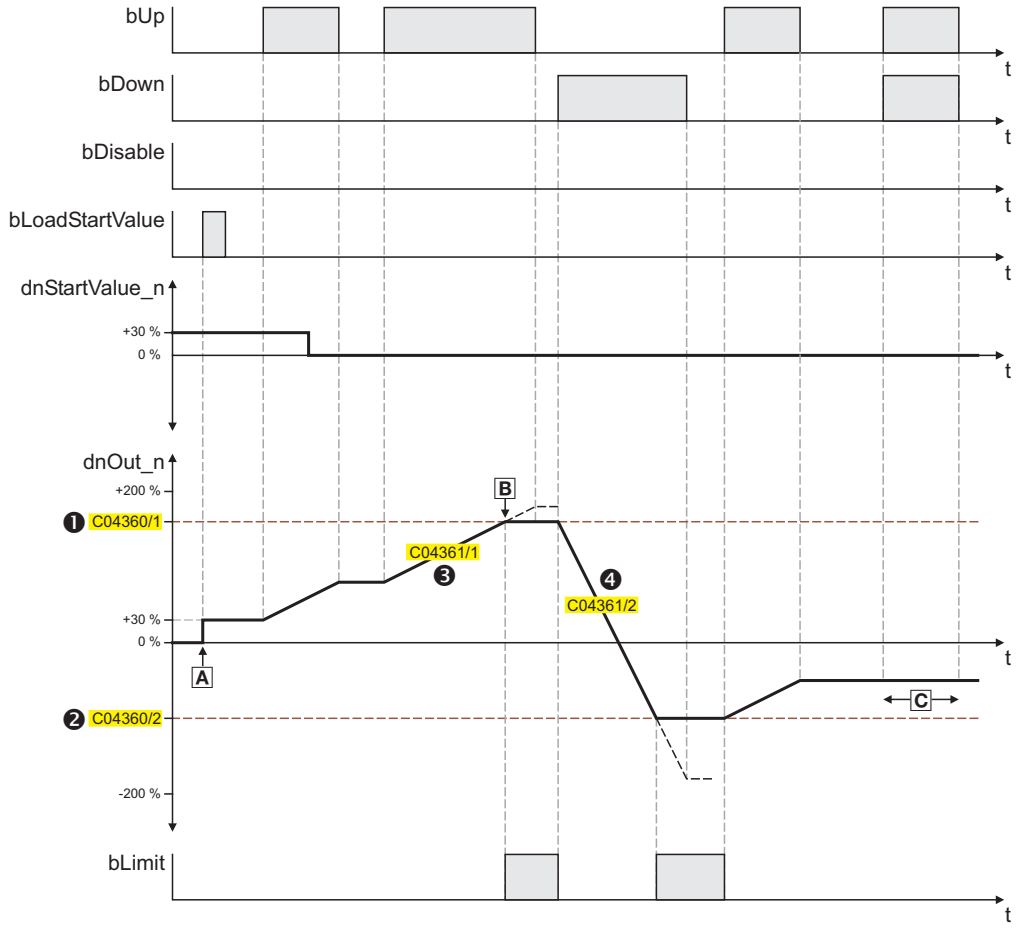
Parameter	Possible settings			Information
C04360/1	-200.00	%	200.00	Upper limit value • Initialisation: 200.00 %
C04360/2	-200.00	%	200.00	Lower limit value • Initialisation: -200.00 %
C04361/1	0.001	s	999.999	Acceleration time • Relating to a change of the output value by 100 %. • Initialisation: 10 s
C04361/2	0.001	s	999.999	Deceleration time • Relating to a change of the output value by 100 %. • Initialisation: 10 s
C04362	The output value *dnOut_n*			Deactivation function • Behaviour of *dnOut_n* if *bDisable* is set to TRUE.
	0	...maintains its last value.		Lenze setting
	1	...is increased to 0 % with the deceleration time or increased with the acceleration time.		
	2	...is increased to the lower limit value with the deceleration time.		
	3	...is increased to the upper limit value with the acceleration time.		
	11	...is set to 0 % immediately.		**Important for the emergency stop function**
	12	...is set to the lower limit value immediately.		
	13	...is set to the upper limit value immediately.		
C04363	The output value *dnOut_n*			Initialisation function • Behaviour of *dnOut_n* after mains connection.
	0	...is set to its last value before mains switch-off.		Lenze setting
	1	...is set to 0 %.		
	2	...is set to the lower limit value.		
	3	...is set to the upper limit value.		
C04368	-200.00	%	200.00	Output setpoint • Display of the *dnOut_n* output value.

Parameter	Possible settings		Information
C04369	Bit coded:		Status • Bits that are not itemised are reserved for future extensions.
	bits5	Starting value loaded is limited	
	bits6	Upper limit value reached	
	bits7	Lower limit value reached	
	bits19	Lower limit value > upper limit value	
	bits31	General error	

5.130.1 Acceleration and deceleration time

The acceleration and deceleration time can be parameterised independently of each other in C04361/1 and C04361/2 and relate to a change in the output value *dnOut_n* by 100 %:

❶ C04361/1: acceleration time
❷ C04361/2: deceleration time



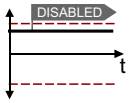
[5-100] Definition of the acceleration and deceleration time

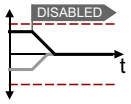
5.130.2 Control signals

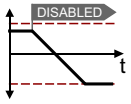
bUp	bDown	bDisable	bLoadStartValue	Function
FALSE	FALSE	FALSE	FALSE	*dnOut_n* remains unchanged.
TRUE	FALSE	FALSE	FALSE	**Increase output value** With the acceleration time set in C04361/1, *dnOut_n* is increased until the upper limit value has been reached (C04360/1).
FALSE	**TRUE**	FALSE	FALSE	**Decrease output value** With the deceleration time set in C04361/2, *dnOut_n* is decreased until the lower limit value has been reached (C04360/2).
TRUE	TRUE	FALSE	FALSE	*dnOut_n* remains unchanged.

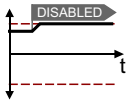
bUp	bDown	bDisable	bLoadStartValue	Function
-	-	**TRUE**	FALSE	**Deactivate motor potentiometer function** *dnOut_n* behaves according to the deactivation function set in C04362.
-	-	-	**TRUE**	**Load starting value** *dnOut_n* is set to the value pending at input *dnStartValue_n*. • If the starting value is beyond the limit values parameterised, the output value *dnOut_n* is set to the corresponding limit value.

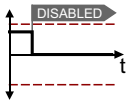
5.130.3 Signal characteristics

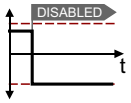


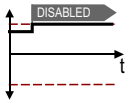










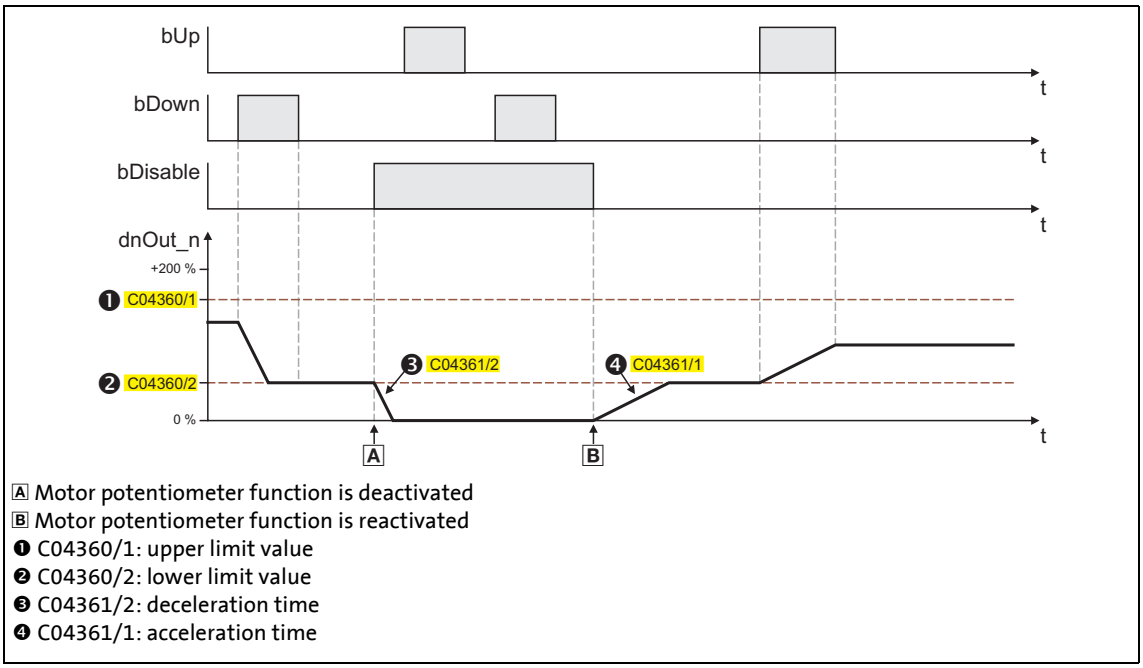


A Starting value is loaded
B Output value is limited
C Output value remains unchanged, as *bUp* and *bDown* are set to TRUE at the same time.
❶ C04360/1: upper limit value
❷ C04360/2: lower limit value
❸ C04361/1: acceleration time
❹ C04361/2: deceleration time

[5-101] Signal characteristics

5.130.4 Deactivation function

If the control input *bDisable* is set to TRUE, the control inputs *bUp* and *bDown* are deactivated and the output value *dnOut_n* is changed according to the deactivation function set in C04362:



C04362		Deactivation function
0		*dnOut_n* maintains its last value.
1		*dnOut_n*is increased to 0 % with the deceleration time or increased with the acceleration time.
2		*dnOut_n* is decreased to the lower limit value (C04360/2) with the deceleration time (C04361/2).
3		*dnOut_n* is increased to the upper limit value (C04360/1) with the acceleration time (C04361/1).
11		*dnOut_n* is set to 0 % immediately.
12		*dnOut_n* is set to the lower limit value (C04360/2) immediately.
13		*dnOut_n* is set to the upper limit value (C04360/1) immediately.

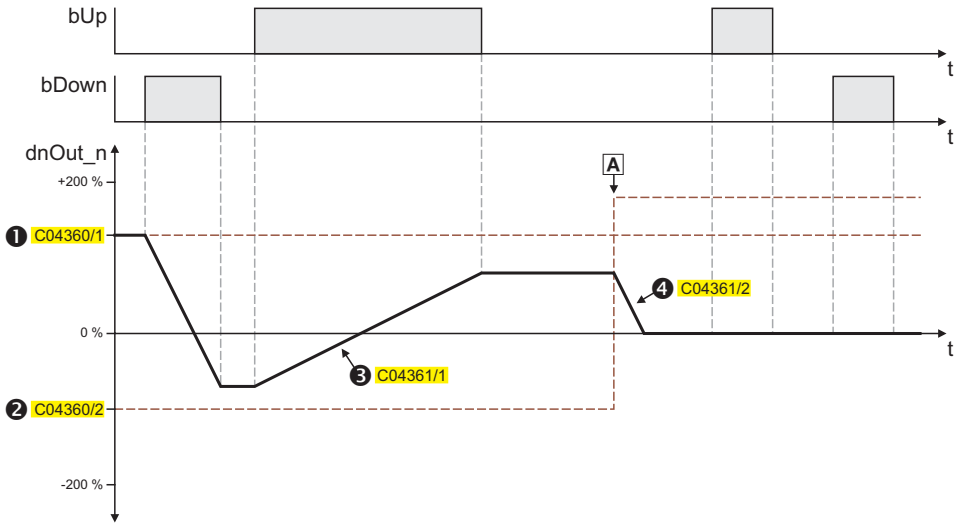
Note!

If the motor potentiometer function is reactivated and *dnOut_n* is beyond the limit values parameterised, *dnOut_n* is lead to the nearest limit value under consideration of the acceleration/deceleration time.

This process is independent of the control signals *bUp* and *bDown*.

Example: Leading the output value to 0 % at deactivation

A Motor potentiometer function is deactivated
B Motor potentiometer function is reactivated
❶ C04360/1: upper limit value
❷ C04360/2: lower limit value
❸ C04361/2: deceleration time
❹ C04361/1: acceleration time



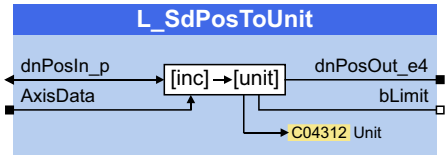
[5-102] Example: signal characteristics at deactivation function C04362 = 1

A. By setting the control input *bDisable* to TRUE, the motor potentiometer function is deactivated.
   - When the deactivation function C04362 = 1 is set, *dnOut_n* is decreased to 0 % under consideration of the deceleration time.

B. By resetting the control input *bDisable* to FALSE, the motor potentiometer function is reactivated.
   - As the lower limit value in the example is set greater 0 % and hence *dnOut_n* is beyond the limit values, *dnOut_n* is first lead back to the lower limit value by means of the acceleration time.

5.130.5 Behaviour for incorrect parameterisation of the limit values

If the upper limit value is parameterised smaller than the lower limit value, a bit coded error message is output via the display code C04369. As a response to this incorrect parameterisation, the control inputs *bUp* and *bDown* are deactivated and the output value *dnOut_n* is lead to 0 % with the deceleration/acceleration time set.



A Incorrect parameterisation (lower limit value > upper limit value)
❶ C04360/1: upper limit value
❷ C04360/2: lower limit value
❸ C04361/1: acceleration time
❹ C04361/2: deceleration time

[5-103] Example: signal characteristics for incorrect parameterisation of the limit values

5.131 L_SdPosToUnit - position conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a position defined in the internal unit [inc] into a position in the real unit of the machine.

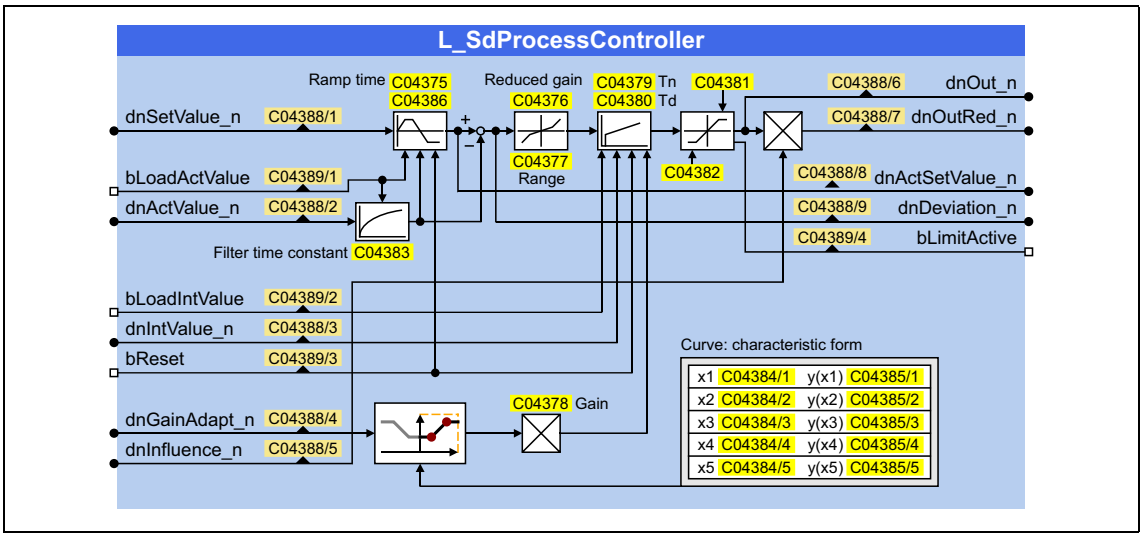
Inputs

Identifier/data type	Information/possible settings
dnPosIn_p DINT	Position in [inc]
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnPosOut_e4 DINT	Position in [unit] • Output in "e4" format (fixed point with four decimal positions)	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited to the displayable value range or the *dnPosIn_p* input position is located beyond the software limit positions of the connected machine parameters (*AxisData*).

Parameter



Parameter	Possible settings	Info
C04312	String from *AxisData*	Position unit • Read only

5.132 L_SdProcessController - PID controller with limitation

Function library:	LenzeServoDrive	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This function block provides a comprehensive PID controller with setpoint and actual value processing as well as characteristic function.

- The function block basically consists of an interconnection of the following function blocks:
  - L_TbPT1Filter (📖 615)
  - L_SdRampGenerator (📖 504)
  - L_TbCurve (📖 565)
  - L_TbPIController (📖 613)
  - L_TbDifferentiate (📖 582)
- The value output to the output *dnOut_n* is internally limited to the limit range parameterised in C04381 and C04382 (default setting ±200 %).
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings	
dnSetValue_n DINT	Scaled process setpoint • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/1	
bLoadActValue BOOL	Initialise ramp function generator and PT1 filter • Display parameter: C04389/1	
	FALSE	The ramp function generator runs with the acceleration/deceleration time set in C04375 from the actual value loaded via *dnActValue_n* to the setpoint applied to *dnSetValue_n*. • In the Lenze setting, the acceleration/deceleration time (C04375) is set to zero.
	TRUE	The *dnActValue_n* actual value is loaded into the ramp function generator and PT1 filter. The current system deviation is zero.
dnActValue_n DINT	Scaled actual process value for the ramp function generator and PT1 filter • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/2	

Identifier/data type	Information/possible settings	
bLoadIntValue BOOL	Loading of the integrator • Display parameter: C04389/2	
	TRUE	Set the integral action component of the PID controller to the value applied to the input *dnIntValue_n*.
dnIntValue_n DINT	Scaled value on which the integral action component of the PID controller is adjusted by setting *bLoadIntValue* to TRUE. • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/3	
bReset BOOL	Reset PID controller to zero • Display parameter: C04389/3	
	FALSE	PID controller is activated.
	TRUE	PID controller is reset to zero.
dnAdaptGain_n DINT	Scaled value for adapting the controller gain • The *dnAdaptGain_n* input value is first evaluated via a parameterisable characteristic function and then adapted to the controller gain (C04378). • In the characteristic default setting (y = 100 %), *dnAdaptGain_n* is ineffective. The controller gain is directly effective (C04378). • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/4	
dnInfluence_n DINT	Scaled value for evaluating the *dnOut_n* output signal • The evaluated *dnOut_n* output signal is output at *dnOutRed_n*. • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/5	

Outputs

Identifier/data type	Value/meaning	
dnOut_n DINT	Output signal • Is internally limited to the limit range parameterised in C04381 and C04382 (default setting ±200 %). • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/6	
dnOutRed_n DINT	Output signal evaluated via *dnInfluence_n* input signal • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/7	
dnActSetValue_n DINT	Current setpoint of the ramp function generator • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/8	
dnDeviation_n DINT	System deviation • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 • Display parameter: C04388/9	
bLimitActive BOOL	Status signal "Limitation active" • Display parameter: C04389/4	
	TRUE	The output signal is limited.

Parameter

Parameter	Possible settings			Information
C04375	0.000	s	1000.000	Acceleration/deceleration ramp function generator • Initialisation: 0.000 s • Alternatively, it is possible from library V02.09.xx.xx to set a separate deceleration time in C04386. In the Lenze setting, the setting in C04386 is used as the deceleration time as usual.
C04376	0.00	%	100.00	Gain of the system deviation in the area of reduced sensitivity • Initialisation: 0.00 %
C04377	0.00	%	100.00	Area of system deviation with reduced gain/sensitivity • Initialisation: 0.00 %
C04378	0.0000		214748.3647	Controller gain • Setting 0.0000 resets the PID controller. • Initialisation: 1.0000
C04379	0.001	s	1000.000	Controller reset time • Setting 1000.000 s deactivates the I component. • Initialisation: 1.000 s
C04380	0.000	s	1000.000	Controller rate time • Setting 0.000 s deactivates the D component. • Initialisation: 0.000 s
C04381	0.00	%	200.00	Positive output limit value • Initialisation: 200.00 %
C04382	-200.00	%	0.00	Negative output limit value • Initialisation: -200.00 %
C04383	0.001	s	60.000	Filter time constant - actual value • With the setting 0.001 s the filter is not active. • Initialisation: 0.001 s
C04384/1...5	0.00	%	200.00	X values of the characteristic function • Subcodes 1 ... 5 correspond to the point values X1 ... X5. • Initialisation: X1, X3 ... X5 = 0.00 % X2 = 100.00 %
C04385/1...5	0.00	%	200.00	Y values of the characteristic function • Subcodes 1 ... 5 correspond to the point values Y1 ... Y5. • Initialisation: X1, X2 = 100.00 % X3 ... X5 = 0.00 %

Parameter	Possible settings			Information
C04386 From library V02.09.xx.xx	0.000	s	1000.001	Ramp function generator deceleration time • Only effective if ≠ 1000.001 s • Given a Lenze setting of 1000.001 s, the setting in C04375 is used as the deceleration time as usual. • Initialisation: 1000.001 s
C04388/1	-200.00	%	200.00	Process setpoint • Display of the *dnSetValue_n* input signal.
C04388/2	-200.00	%	200.00	Actual process value • Display of the *dnActValue_n* input signal.
C04388/3	-200.00	%	200.00	Load value - PID controller I component • Display of the *dnIntValue_n* input signal.
C04388/4	-200.00	%	200.00	Adaptation - controller gain • Display of the *dnAdaptGain_n* input signal.
C04388/5	-200.00	%	200.00	Evaluation of output signal • Display of the *dnInfluence_n* input signal.
C04388/6	-200.00	%	200.00	Setpoint at the output • Display of the *dnOut_n* output signal.
C04388/7	-200.00	%	200.00	Evaluated setpoint at the output • Display of the *dnOutRed_n* output signal.
C04388/8	-200.00	%	200.00	Current setpoint of ramp function generator • Display of the *dnActSetValue_n* output signal.
C04388/9	-200.00	%	200.00	System deviation • Display of the *dnDeviation_n* output signal.
C04389/1				Initialise ramp function generator and PT1 filter • Display of the *bLoadActValue* input signal.
	0	FALSE		
	1	TRUE		
C04389/2				Loading of the integrator • Display of the *bLoadIntValue* input signal.
	0	FALSE		
	1	TRUE		
C04389/3				Reset PID controller to zero • Display of the *bReset* input signal.
	0	FALSE		
	1	TRUE		
C04389/4				Limitation active • Display of the *bLimitActive* output signal.
	0	FALSE		
	1	TRUE		

5.132.1 Controller characteristic

The PID controller dynamics is parameterised according to the V_p gain, the T_n reset time, and the T_d rate time.

- In the Lenze setting, the function block operates as a PI controller and the D component is deactivated.

Gain (P component)

The controller gain is set in C04378.

- Setting "0.0000" resets the controller.
- The controller gain can be adapted via the *dnGainAdapt_n* input and a parameterisable characteristic function. ▸ Adaptation of the controller gain via characteristic function (📖 501)

Reset time (I component)

The reset time is set in C04379.

- Setting "1000.000 s" deactivates the I component.
- By setting the *bLoadIntValue* input to TRUE, the I component of the controller can be set to the value applied to the *dnIntValue_n* input.

Rate time (D component)

The rate time is set in C04380.

- Setting "0.000 s" deactivates the D component (Lenze setting). The PID controller thus becomes a PI controller or P controller if the I component is deactivated as well.

5.132.2 Adaptation of the controller gain via characteristic function

The controller gain can be adapted via the *dnGainAdapt_n* input and a parameterisable characteristic function.

- In the characteristic default setting (y = 100 %), *dnAdaptGain_n* is ineffective. The controller gain is directly effective (C04378).

$$P = C04378$$

- Only with the characteristic setting x1 = 0, y1 = 0, x2 = 100 % and y2 = 100 %, *dnAdaptGain_n* directly acts on the controller gain:

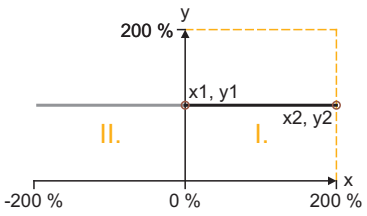
$$P = dnGainAdapt_n \cdot C04378$$

- By changing the characteristic, the influence of *dnAdaptGain_n* on the controller gain can be evaluated in percent:

$$P = f(dnGainAdapt_n) \cdot C04378$$

Selection of the characteristic

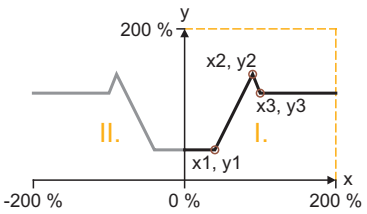
The characteristic can consist of up to five points which are defined by the subcodes of C04384 and C04385.



- Between the points a linear interpolation takes place.
- The characteristic is selected for the I. quadrant and mirrored at the Y axis.
- The same subcodes of C04384 and C04385 correspond to a pair of variates/point (x_n, y_n).

	1	2	2	2	5
Y	C04384/**1**	C04384/**2**	C04384/**3**	C04384/**4**	C04384/**5**
x	C04385/**1**	C04385/**2**	C04385/**3**	C04385/**4**	C04385/**5**

- The first pair of variates (C04384/1 and C04385/1) is always valid.
- The X values of the characteristic must be entered in ascending order (X1 < X2 < ... < X5).
- If the ascending chain of x values is interrupted, this corresponds to the end of the characteristic (see the following examples).
- Based on the last valid pair of variates, an extrapolation is executed to the end of the x value range (±200 %) on both sides.



Characteristic examples

	1	2	3	4	5
x	0 %	100 %	0 %	0 %	0 %
Y	100 %	100 %	0 %	0 %	0 %

[5-1] Example 1 (Lenze setting)

	1	2	3	4	5
x	40 %	90 %	100 %	0 %	0 %
Y	40 %	140 %	115 %	0 %	0 %

[5-2] Example 2

5.132.3 System deviation in the area of reduced sensitivity

A reduced controller dynamics with low system deviations causes a positive influence on the damping behaviour of the control loop.

- C04377 serves to set a tolerance window, in which the system deviation is transferred to the controller with a slight gain.
- C04376 serves to set the required gain reduction in the defined tolerance window in percent.

5.132.4 Controller influence

The *dnInfluence_n* input serves to evaluate the *dnOut_n* controller output in percent. The evaluated output signal is provided at *dnOutRed_n*.

5.132.5 Ramp function generator

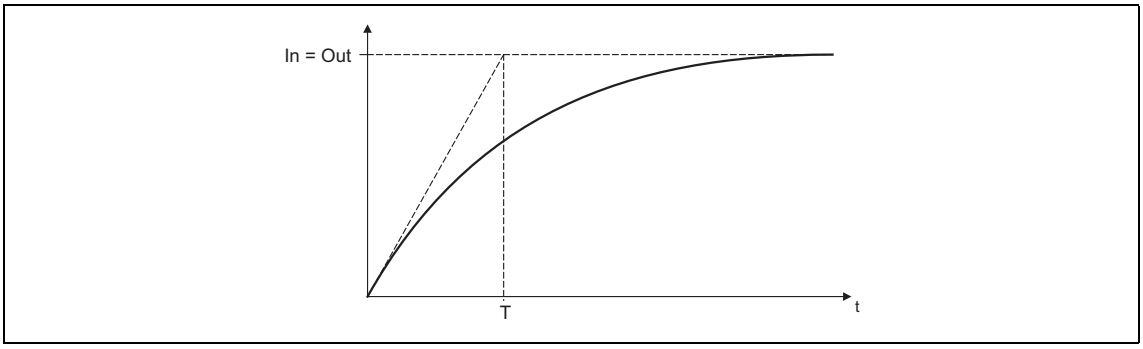
The *dnSetValue_n* input setpoint can be lead via a ramp function generator with linear ramps to prevent setpoint step-changes at the input.

The following applies up to and including library V02.08.xx.xx:

- The acceleration/deceleration times are set via C04375.

The following applies from library V02.09.xx.xx:

- The acceleration and deceleration times are set in C04375 and C04386.
  - If C04386 = "1000.001 s" (Lenze setting), the setting in C04375 is used for both the acceleration and the deceleration time, which corresponds to the behaviour so far (symmetrical acceleration/deceleration times).
  - If C04386 <> "1000.001 s", the setting in C04375 is used as the acceleration time and a separate setting in C04386 is used as the deceleration time.
- The acceleration time describes the time necessary to reach 100 %.
- The setting is done according to the formula:



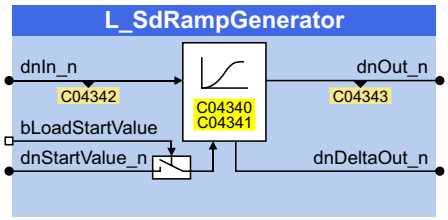
$$\frac{1\ \text{s} \cdot 100\ \%}{\text{C04375}\ [\text{s}]}$$

- In the Lenze setting, the ramp function generator is deactivated (C04375 = 0.000 s).
- By setting the *bLoadActValue* input to TRUE, the ramp function generator can be initialised with the value applied to the *dnActValue_n* input. This causes the system deviation to be zero.

5.132.6 Low pass in actual value path

The *dnActValue_n* actual value loaded by setting *bLoadActValue* to TRUE can be lead via a PT1 filter.

- The rate time is set in C04383.
- In the Lenze setting, the filter is deactivated (C04383 = 0.001 s).



[5-104] PT1 filter function

5.133 L_SdRampGenerator - ramp function generator - S-ramp

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is a ramp function generator with S-shaped ramps for limiting the increase of analog signals over time. The S-shape of the ramps results from a trapezoidal acceleration.

- The ramp function generator has a setting function for directly loading the value into the internal ramp generator.
- The acceleration/deceleration times are set via C04340.
- An S-ramp time for a jerk-free acceleration can be set in C04341.
- At the output *dnDeltaOut_n* the gradient dy/dt of the output signals *dnOut_n* is shown. This signal can for instance be used for torque feedforward control after a gain via the L_TbGainLim FB.
- An advanced version, the L_SdRampGeneratorAny FB, is available from library V02.09.xx.xx. This FB can be used to also process speeds (_s) and to set separate acceleration and deceleration times.

Inputs

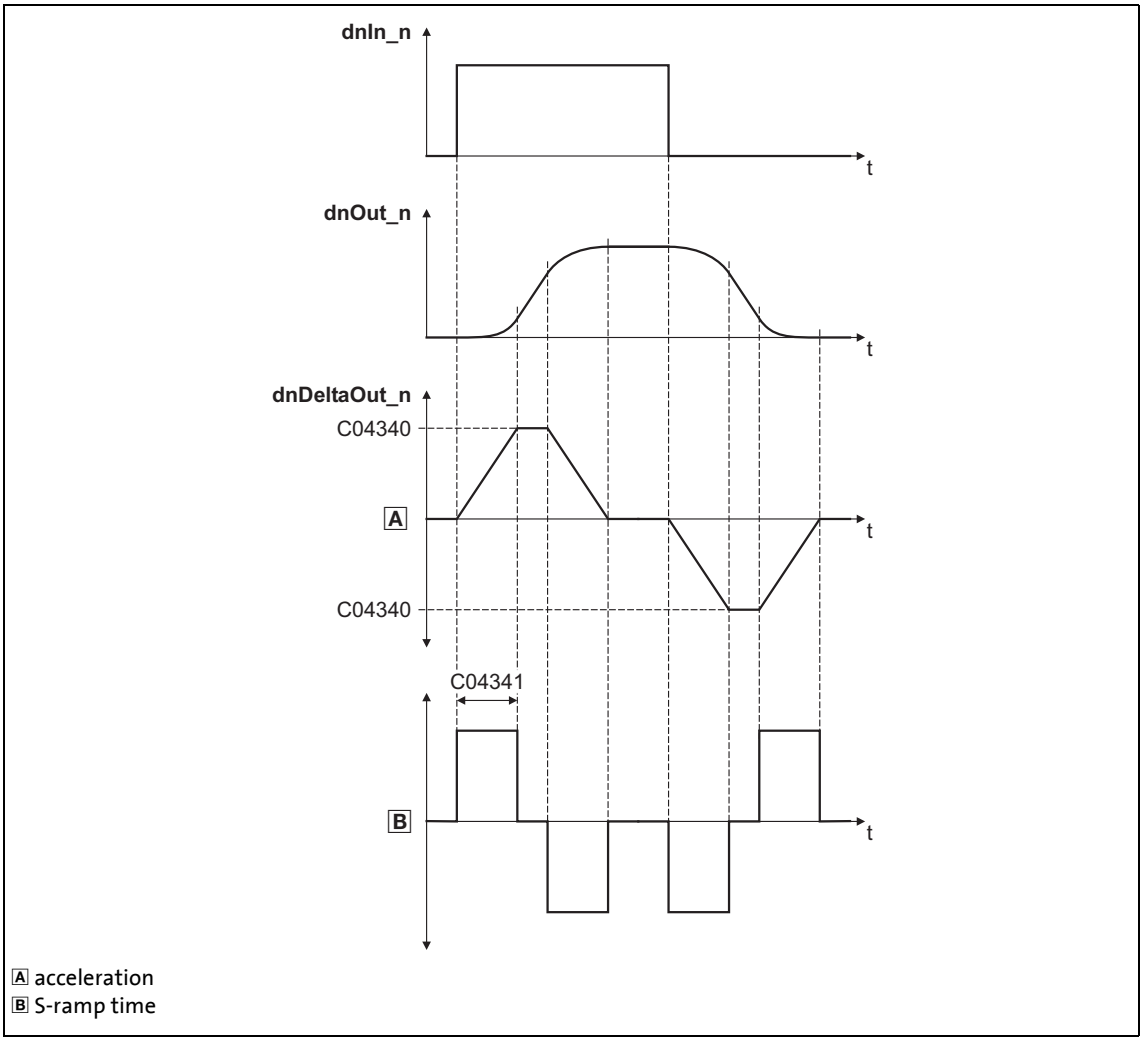
Identifier/data type	Information/possible settings	
dnIn_n DINT	Scaled input signal	
bLoadStartValue BOOL	Initialising ramp function generator	
	FALSE	The ramp function generator runs with the Ti times set from the value loaded via *dnStartValue_n* to the value at *dnIn_n*.
	TRUE	At the output *dnOut_n* *dnStartValue_n* is output, *dnDeltaOut_n* remains on 0 %.
dnStartValue_n DINT	Scaled starting value for the ramp function generator • Acceptance when *bLoadStartValue* = TRUE	

Outputs

Identifier/data type	Value/meaning
dnOut_n DINT	Scaled output signal • Internally limited to ±200 %
dnDeltaOut_n DINT	Scaled acceleration of the ramp function generator • Time reference: 62.5 µs, i. e. 0.01 % correspond to a change of 160 % in the output signal within 1 s. • Internally limited to ±200 %

Parameter

Parameter	Possible settings			Information
C04340	0.001	s	1000.000	Acceleration / deceleration time • Initialisation: 1.000 s
C04341	0.001	s	10.000	S-ramp time • Initialisation: 0.100 s
C04342 As of library V02.02.xx.xx	-200.000	%	200.000	Setpoint at the input • Display of the *dnIn_n* input signal.
C04343 As of library V02.02.xx.xx	-200.000	%	200.000	Setpoint at the output • Display of the *dnOut_n* output signal.



5.133.1 Loading the ramp function generator

By setting *bLoadStartValue* to TRUE the ramp function generator is loaded with the signal at *dnStartValue_n*.

- This value is accepted immediately and output to *nOut_n*. No s-shape ramp-up or ramp-down takes place.
- As long as *bLoadStartValue* = TRUE , the ramp function generator is inhibited.

5.133.2 Acceleration and jerk

The maximum acceleration and the jerk can be adjusted separately.

A acceleration
B S-ramp time

[5-105] Line diagram

Acceleration / deceleration time

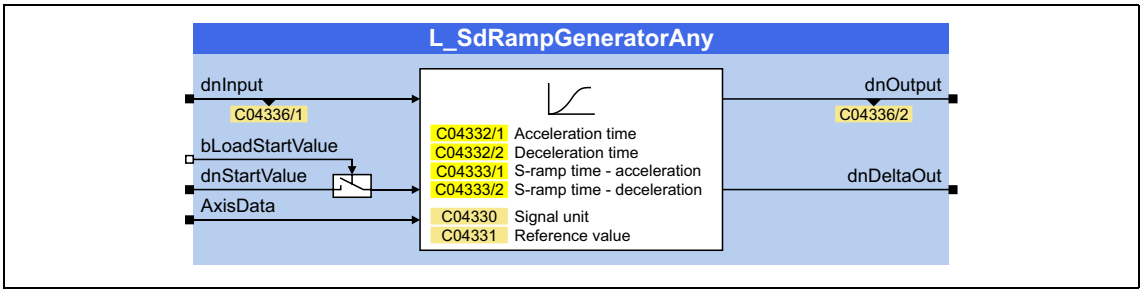
The acceleration and deceleration time are set in C04340.

- The acceleration time describes the time necessary to reach 100 %.
- The setting is done according to the formula:

$$\frac{1\ \text{s} \cdot 100\ \%}{\text{C04340}\ [\text{s}]}$$

S-ramp time

An S-ramp time for a jerk-free acceleration of the drive can be set in C04341.



- The jerk is entered in [s] until the ramp function generator operates with the maximum acceleration.

5.134 L_SdRampGeneratorAny - ramp function generator - S-ramp

Function library:	LenzeServoDrive	**FB available from library V02.09.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB is a ramp function generator with S-shaped ramps for limiting the increase of analog signals over time. The S-shape of the ramps results from a trapezoidal acceleration.

- This FB is an advanced version of the L_SdRampGenerator FB:
  - Depending on the interconnection of AxisData, setpoints can be defined as scaled signals (_n) or speeds (_s).
  - Separate acceleration and deceleration times can be set via C04332/1 and C04332/2.
  - Separate S-ramp times for acceleration and deceleration to achieve jerk-free acceleration can be set in C04333/1 and C04333/2.
- The ramp function generator has a setting function for directly loading the value into the internal ramp generator.
- At the *dnDeltaOut* output, gradient dy/dt of the *dnOutput* output signal is provided. This signal can e.g. be used for torque feedforward control after being amplified via the L_TbGainLim FB.

Inputs

Identifier/data type	Information/possible settings
dnInput DINT	Input signal (scaled signal or speed) • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 (without *AxisData*) 15000 min^{-1} ≡ 2^{26} ≡ 67108864 (with *AxisData*)
bLoadStartValue BOOL	Initialising ramp function generator
	FALSE: The ramp function generator runs with the Ti times set from the value loaded via *dnStartValue* to the value at *dnInput*.
	TRUE: At the *dnOutput* output, *dnStartValue* is provided. *dnDeltaOut* remains at 0 % or 0 min^{-1}, respectively.
dnStartValue DINT	Starting value for the ramp function generator (scaled signal or speed) • Acceptance when *bLoadStartValue* = TRUE • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 (without *AxisData*) 15000 min^{-1} ≡ 2^{26} ≡ 67108864 (with *AxisData*)
AxisData	Machine parameters • If this input is not interconnected, the FB uses scaled signals. • If the FB receives machine parameters via this input, the FB uses speed signals instead. • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning
dnOutput DINT	Output signal • Scaling: 100 % ≡ 2^{30} ≡ 1073741824 (without *AxisData*) 15000 min^{-1} ≡ 2^{26} ≡ 67108864 (with *AxisData*)
dnDeltaOut DINT	Ramp function generator acceleration • Time reference: 62.5 µs

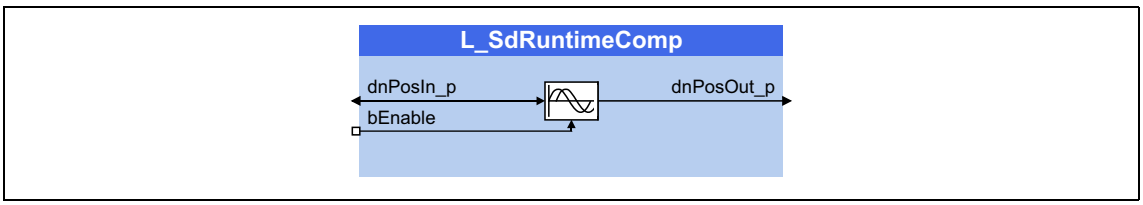
Parameter

Parameter	Possible settings			Information
C04330	String of digits			Display of the signal unit • "%" (without *AxisData*) or display of the application unit from *AxisData*.
C04331	0.0000		100.0000	Display of the reference value • 100.0000 (without *AxisData*) or reference speed from *AxisData*.
C04332/1	0.000	s	100.000	Acceleration time • The acceleration time refers to the time when the reference value is reached. • Setting as per the following formula: 1 s * reference / acceleration time [s] • Initialisation: 1.000 s
C04332/2	0.000	s	100.000	Deceleration time • Setting as per the following formula: 1 s * reference / deceleration time [s] • Initialisation: 1.000 s
C04333/1	0.000	s	10.000	S-ramp time - acceleration • The jerk is entered in [s] until the ramp function generator operates with the maximum acceleration. • Initialisation: 0.100 s
C04333/2	0.000	s	10.000	S-ramp time - deceleration • The jerk is defined as the time in [s] for the ramp function generator to reach max. deceleration. • Initialisation: 0.100 s
C04336/1	-214748.3647		214748.3647	Setpoint at the input • Read only
C04336/2	-214748.3647		214748.3647	Setpoint at the output • Read only

For a detailed functional description, see the L_SdRampGenerator FB.

5.135 L_SdRuntimeComp - runtime compensation

Function library:	LenzeServoDrive	**Do not use FB for new developments!** Replacement by L_SdDelayComp.
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel



This FB is used for the runtime compensation of position signals that are, for instance, transmitted by means of a bus system.

- The output signal leads the input signal by the last position difference.
- The resulting rate time equals the task runtime of the program in which the FB is used.

Note!

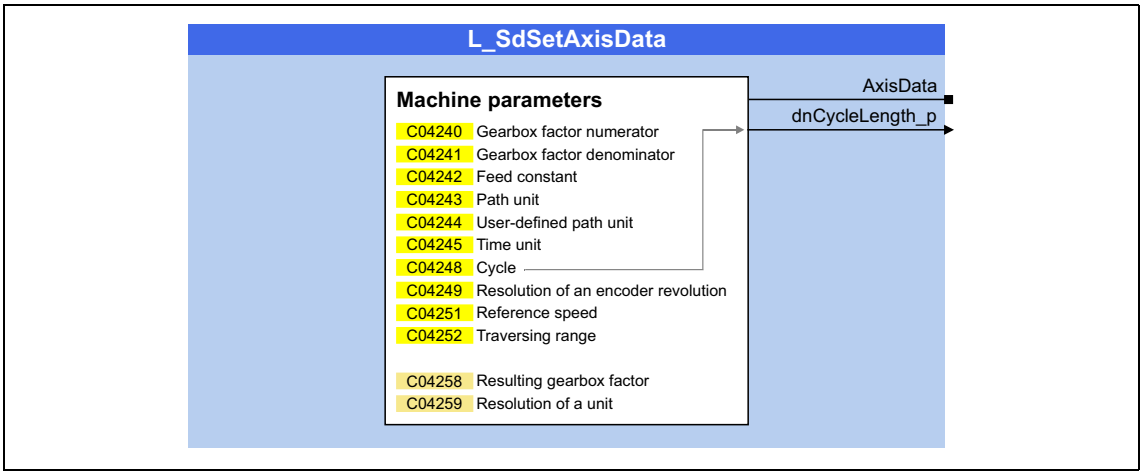
The FB is not suitable for clocked (modulo) positions!

The FB L_SdDelayComp can be used for dead time compensation. (📖 453)

Inputs

Identifier/data type	Information/possible settings	
dnPosIn_p DINT	Position in [inc]	
bEnable BOOL	Activate compensation	
	TRUE	Compensation is activated.

Outputs



Identifier/data type	Value/meaning
dnPosOut_p DINT	Compensated position in [inc] • Leads the input signal *dnPosIn_p* by the last position difference.

5.136 L_SdSetAxisData - machine parameters

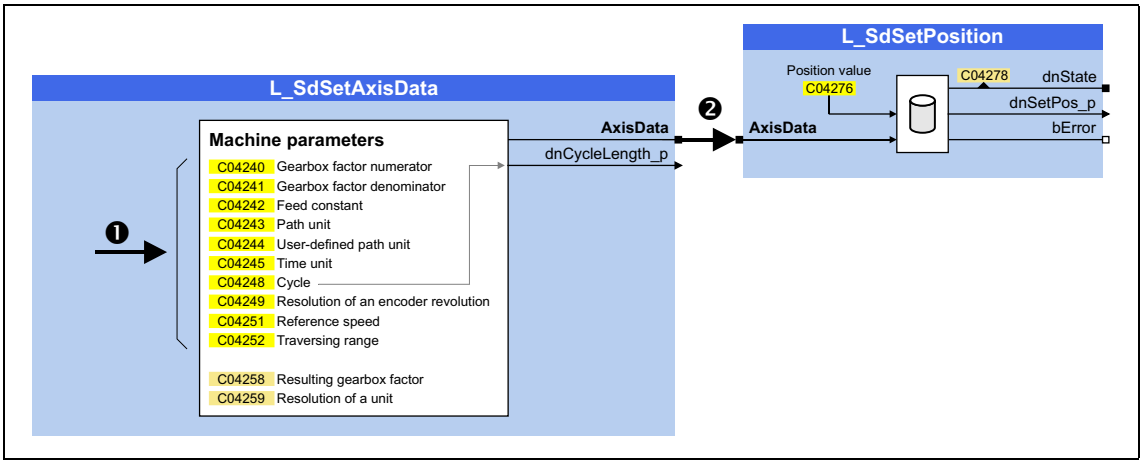
Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to indicate the machine parameters of a master drive. The FB processes the machine parameters which you define with the physical units of the machine via parameters for the internal representation.

- The FB outputs a pointer to the data structure with the prepared machine parameters at the output *AxisData*.
- To transmit the machine parameters to another FB, which requires these data for internal calculations, the output *AxisData* must simply be connected to the input of the same name of the corresponding FB.

Outputs

Identifier/data type	Value/meaning
AxisData	Machine parameters • Pointer to a data structure the elements of which contain the machine parameters in the internal measuring system. • Via this "interface" the machine parameters can be provided for other FBs which require these data for internal calculations.
dnCycleLength_p DINT As of library V02.05.xx.xx	Cycle in [increments] • C04248 indicates the cycle in the real unit of the machine.



Parameter

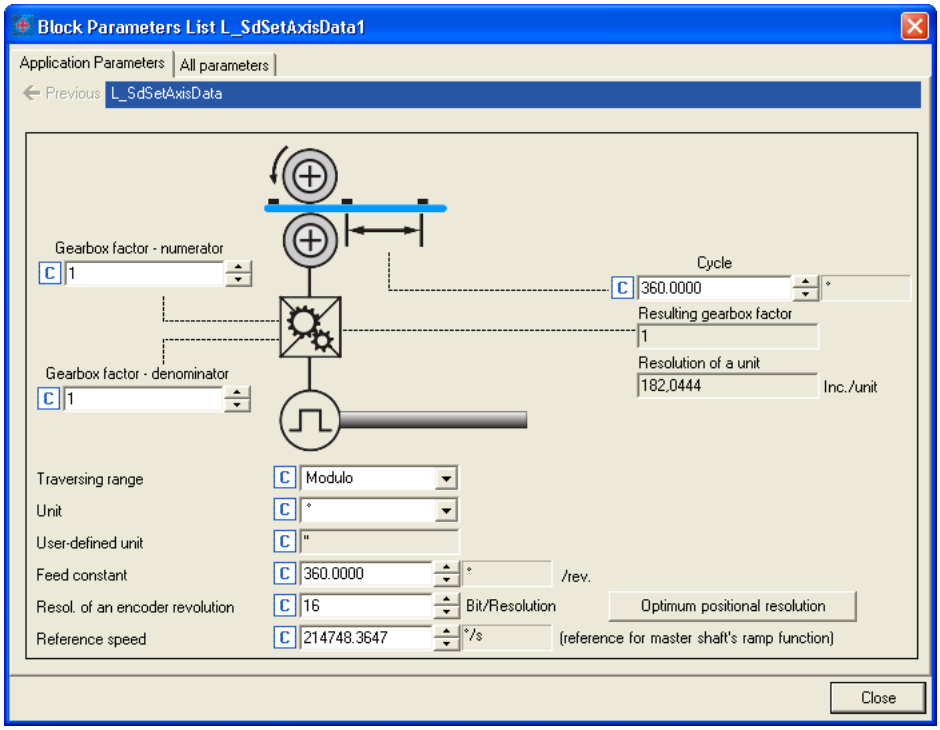
Note!

Observe that the index of the codes listed in the following only applies to the first instance!

Parameter	Possible settings			Information
C04240	1		2147483647	Gearbox factor numerator • Initialisation: 1
C04241	1		2147483647	Gearbox factor denominator • Initialisation: 1
C04242	0.0001	unit/inc	214748.3647	Feed constant • Initialisation: 360 unit/inc
C04243				Path unit
	0	User-defined		Selection in C04244
	1	inc		
	2	µM		
	3	mm		
	4	M		
	5	inch		
	6	yard		
	7	°		Lenze setting
C04244	String of digits with max. 8 characters			User-defined path unit
C04245				Time unit • The time base unit is default set to "s" and cannot be changed!
	0	User-defined		
	1	ms		
	2	s		
	3	min		
	4	H		
C04246 As of library V02.07.xx.xx	String of digits with max. 16 characters			Axis name • Read only
C04248	0.0000	Unit	214748.3647	Cycle • Initialisation: 360 unit
C04249	10	Bit	24	Resolution of an encoder revolution • Initialisation: 16 bits
C04251	-214748.3647	Unit/t	214748.3647	Reference speed • Initialisation: 214748.3647 unit/t
C04252 As of library V02.00.xx.xx				Traversing range
	0	Unlimited		
	1	Limited		
	2	Modulo		Lenze setting
C04258	-2147483.647		2147483.647	Resulting gearbox factor • Read only
C04259	-214748.3647	Incr./unit	214748.3647	Resolution of a unit • Read only

5.136.1 Typical application

[5-106] Typical application



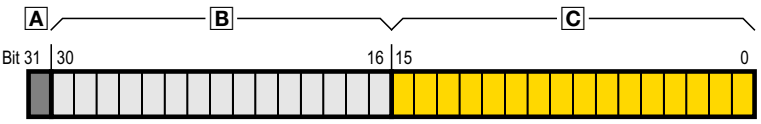
1. The machine data are specified with the physical units of the machine via the corresponding parameters. ❶
2. The FB converts the machine parameters into the internal representation and provides the data at the output *AxisData* as a data structure for transfer to other FBs. ❷
   - For library V01.xx the following applies: Always a modulo measuring system is output.
   - As of library V02.00 the following applies: The traversing range can be selected via C04252.

5.136.2 Selection and input of machine parameters

The following table lists absolutely necessary machine parameters:

Machine parameters	Setting	Unit	Information
Gearbox ratio - numerator	C04240	-	Input according to the gearbox nameplate.
Gearbox ratio - denominator	C04241	-	
Feed constant (F_c)	C04242	Unit	Enter the number in [unit] (e.g. [mm]), which is to be fed when the gearbox output revolves once.
Reference speed (v_{max})	C04251	Unit/t	This limit applies to the entire machine.
	Caution: The limit must be set in a way that it can be reached with max. motor speed: $V_{max} \leq n_{max} \cdot \frac{\text{Feed constant}}{60} \cdot \frac{\text{gearbox (denominator)}}{\text{gearbox (numerator)}}$ $\text{dwVmax} \leq \text{C00011} \cdot \frac{\text{C04242}}{60} \cdot \frac{\text{C04240}}{\text{C04241}}$		

The machine parameters can be easily entered via the parameterisation dialog of the FB **L_SdSetAxisData**.

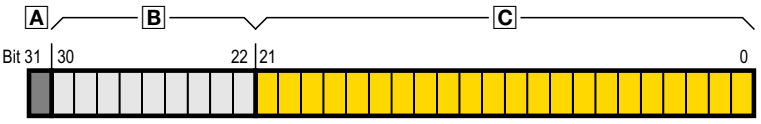


Tip!

The way how to detect the optimum resolution of the position values is described in the subchapter "Detecting the optimum resolution". (📖 516)

5.136.3 Resolution of an encoder revolution

C04249 serves to set the resolution - tailored to the application.



- The preset resolution of 16 bits/revolution is sufficient for standard applications.

A Sign bit
B Number of revolutions: 15 bits ≡ ±32767 revolutions
C Resolution of an encoder revolution: 16 bits ≡ 65536 increments/revolution

[5-107] Example: Standard resolution (16 bits/revolution)

- For higher-order applications, a higher resolution of the position values may lead to considerably improved control properties and positioning accuracies.
  - Finer resolution of the position targets ➞ improved positioning accuracy
  - Finer quantisation of the setpoints and actual values ➞ higher control quality
  - Higher loop gain can be adjusted ➞ less following errors
- However, a higher resolution results in a restricted number of encoder revolutions and only smaller traversing paths can be displayed.

A Sign bit
B Number of revolutions: 9 bits ≡ ±512 revolutions
C Resolution of an encoder revolution: 22 bits ≡ 4194304 increments/revolution

[5-108] Example: Higher resolution (22 bits/revolution) with restricted traversing range

Tip!

The way how to detect the optimum resolution of the position values is described in the following subchapter "Detecting the optimum resolution". (📖 516)

Note!

The position values (e.g. setpoints, actual values, parameters, ...) in the signal flow always use the set resolution, irrespective of the resolution the encoder supplies directly.

Resolution of the drive/motor

The machine parameters for the drive/motor are set via the drive interface (SB **LS_DriveInterface**).

Multi-axis systems

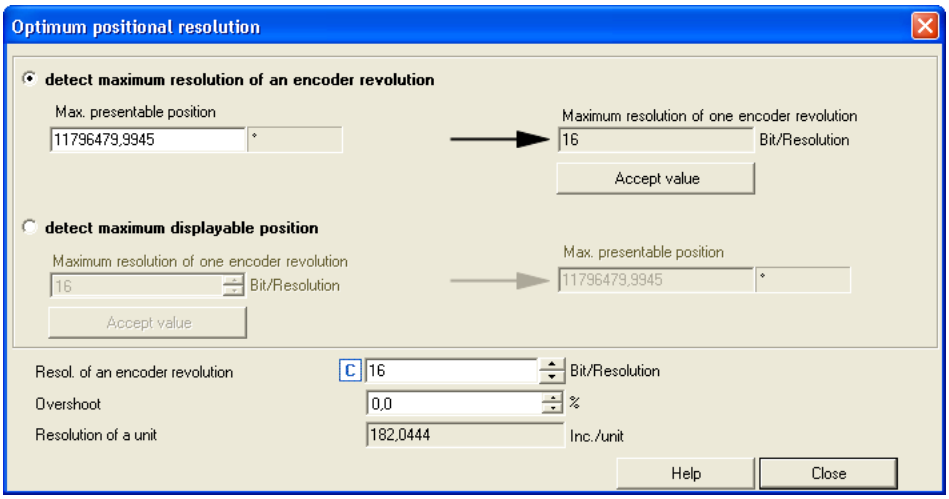
When being connected via the electrical shaft, the drive is at least provided with two measuring systems (master and slave).

- Each measuring system has an own resolution setting.
- The machine parameters (gearbox factors, feed constant, encoder resolution, and cycle) for the master measuring system or master value must be identical for all drives in the interconnection.

Technology applications "Electronic gearbox" and "Synchronism"

For both technology applications, the machine parameters of the master measuring system are defined on the *Application parameters* tab in the "Master value scaling" dialog level.

Electronic cam



For electronic cams, the machine parameters of the master measuring system are defined on the *Measuring systems* tab of the electrical shaft.

5.136.3.1 Detecting the optimum resolution

How to detect the optimum resolution:

In the parameterisation dialog of the FB **L_SdSetAxisData**:

1. Set gearbox factors.
2. Set real unit of the machine.
3. Set feed constant.
4. Click **Optimum positional resolution**.
   - The *Optimum positional resolution* dialog box is displayed:

5. Enter the greatest position to be entered into a parameter during operation into the **Max. presentable position** input field.
   - If required, set an overshoot in the **Overshoot** input field for considering possibly occurring following errors (overshooting of the actual values).

   After this, the maximum resolution for the entered position is displayed in the **Maximum resolution for encoder revolution** field.
6. Press **Accept value** to accept the resolution displayed in C04249.
7. Press **Close** to close the dialog box again.

Tip!

In order to display the max. presentable position for a predefined resolution, activate the second option **detect maximum displayable position**. Afterwards you can set the resolution for which the max. presentable position is to be displayed in the **Maximum resolution for encoder revolution** input field.

5.136.4 Example

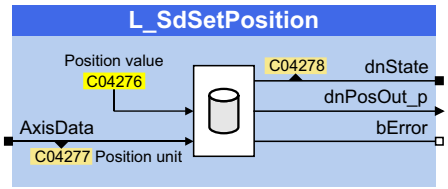
The machine parameters of a master value encoder are to be displayed in the application for the purpose of master value processing.

❶ Machine parameters of the master value encoder
❷ Machine parameters of the drive/motor

[5-109] Schematic diagram of real master (master value encoder)

Settings

Machine parameters	Setting	Input	Information
Gearbox ratio - numerator	C04240	10	Enter gearbox ratio i_1 = 3.333 for the master value encoder as a quotient (numerator and denominator).
Gearbox ratio - denominator	C04241	3	
Feed constant	C04242	471.2389	Fc = d_1 * π = 150 mm * π = 471.2389 mm
Path unit	C04243	3	Unit = [mm]
Cycle	C04248	600	l_1 = 600 mm
Reference speed	C04251	1000	v_{max} = 1000 mm/s



Tip!

The machine parameters for the drive/motor are set via the drive interface (SB **LS_DriveInterface**).

5.137 L_SdSetPosition - position conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a position which has been selected via C04276 in the real machine units into a position in [inc] and outputs it at *dnSetPosOut_p* for further processing within the FB interconnection.

Inputs

Identifier/data type	Information/possible settings
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510) • If this input is released, the following scaling applies: 1 motor revolution ≡ 2^{16}

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status	
	0	Ok - no error
	-12	Counter overflow of ±214748.3647 with position value (C04276). ▸ Monitoring for counter overflow (📖 519)
dnPosOut_p DINT	Position in [inc] • Scaling: 1 encoder revolution ≡ 2^{16} increments (or acc. to *AxisData*)	
bError BOOL	"Error" status signal	
	TRUE	The conversion was incorrect.

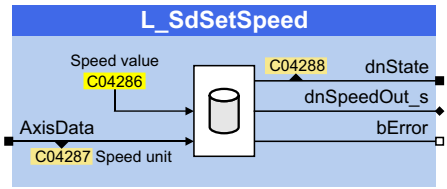
Parameter

Parameter	Possible settings			Information
C04276	-214000.0000	Unit	214000.0000	Position value • Initialisation: 0 unit
C04277 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C04278	-2147483647		2147483647	Status • Read only

5.137.1 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the position value defined via C04276 is converted from the real unit to the internal unit.



The FB reports an internal counter overflow due to a changed measuring system by the value "-12" at the *dnState* status output and activates a corresponding error message:

Error number		Error message in the logbook	Response
61603844	0x3AC0004	L_SdSetPosition:int.pos. overflow (LS_DriveInterface)	Error
61737217	0x3AE0901	L_SdSetPosition:int.pos. overflow (L_SdSetAxisData)	Error

5.138 L_SdSetSpeed - speed conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a velocity which has been selected via C04286 in the real machine units into a speed and outputs it at *dn'SpeedOut_s* for further processing in the FB interconnection.

Inputs

Identifier/data type	Information/possible settings
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status	
	0	Ok - no error
	-12	Counter overflow of ±214748.3647 with speed value (C04286). ▸ Monitoring for counter overflow (📖 521)
dnSpeedOut_s DINT	Speed output in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
bError BOOL	"Error" status signal	
	TRUE	The conversion was incorrect.

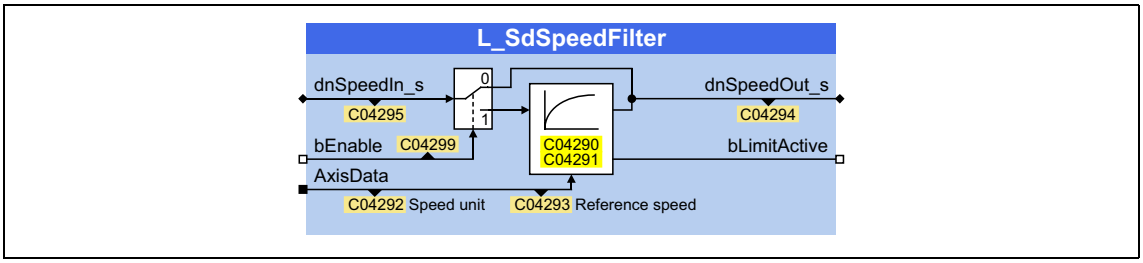
Parameter

Parameter	Possible settings			Information
C04286	-214748.3647	Unit/t	214748.3647	Speed value • Initialisation: 0 unit/t
C04287 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C04288	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.

5.138.1 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed value defined via C04286 is converted from the real unit to the internal unit.



The FB reports an internal counter overflow due to a changed measuring system by the value "-12" at the *dnState* status output and activates a corresponding error message:

Error number		Error message in the logbook	Response
61603845	0x3AC0005	L_SdSetSpeed:int.speed overflow (LS_DriveInterface)	Error
61603973	0x3AC0085	L_SdSetSpeed:int.speed overflow (L_SdSetAxisData)	Error

5.139 L_SdSpeedFilter - speed signal delay

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is used to filter or delay a speed signal according to the PT1 principle. The resulting position loss is compensated by an internal overflow buffer.

Inputs

Identifier/data type	Information/possible settings	
dnSpeedIn_s DINT	Speed selection in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
bEnable BOOL	Activate filter function	
	FALSE	Filter is deactivated. • Use these settings during the acceleration and deceleration phases to prevent a drifting of the position.
	TRUE	Filter is activated.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)	

Outputs

Identifier/data type	Value/meaning	
dnSpeedOut_s DINT	Filtered speed in [rpm]	
bLimitActive BOOL	Status signal "Overflow/underflow"	
	TRUE	An overflow/underflow has occurred.

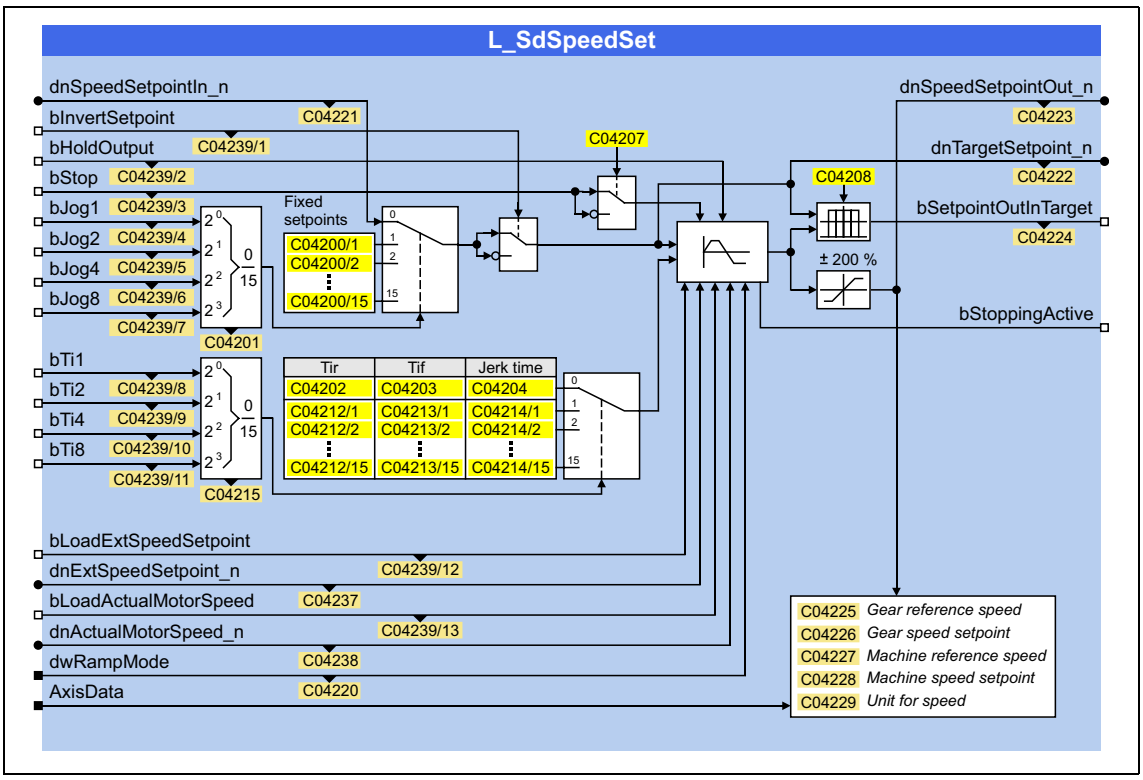
Parameter

Parameter	Possible settings			Information
C04290	0.0000	Unit/s	214000.0000	Compensating speed • For compensating the phase differences. • Initialisation: 0.0010 unit/s
C04291	0.000	s	60.000	Filter time constant • Initialisation: 0.003 s
C04292 As of library V02.02.xx.xx	String of digits			Speed unit • Read only
C04293 As of library V02.02.xx.xx	-214748.3647	Unit/t	214748.3647	Reference speed • Read only • For input orientation for speed entries.
C04294	-214748.3647	Unit/t	214748.3647	Speed at the output • Read only • Calculated from the speed signal *dnSpeedOut_s*.
C04295	-214748.3647	Unit/t	214748.3647	Speed at the input • Read only • Calculated from the speed signal *dnSpeedIn_s*.
C04299				Filter is enabled • Read only
	0	Filter is not active		
	1	Filter is active		

5.139.1 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the speed value defined via C04290 is converted from the real unit to the internal unit.



The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:

Error number		Error message in the logbook	Response
61603852	0x3AC000C	L_SdSpeedFilter:int.speed overflow (LS_DriveInterface)	Error
61603980	0x3AC008C	L_SdSpeedFilter:int.speed overflow (L_SdSetAxisData)	Error

5.140 L_SdSpeedSet - setpoint ramp generator

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB contains a ramp generator with comprehensive parameterisation and control options for conditioning a setpoint signal.

Inputs

Identifier/data type	Information/possible settings
dnSpeedSetpointIn_n DINT	Input setpoint in [%] • Relating to the reference speed (C00011)
bInvertSetpoint BOOL	Reversing the speed setpoint
	TRUE: Speed setpoint is inverted.
bHoldOutput BOOL	Holding (freezing) the output value
	TRUE: The current value of the ramp generator is held.
bStop BOOL	Activating "Ramp-down" to standstill • This input has priority over the input *bHoldOutput*.
	TRUE: The current value of the ramp generator is led to "0" via the Ti time set.
bJog1 ... bJog8 BOOL	Binary coded selection of the setpoint. • When all inputs are set to FALSE, the setpoint *dnSpeedSetpointIn_n* is selected, otherwise the corresponding fixed setpoint (C04200/1...15).
bTI1 ... bTI8 BOOL	Binary coded selection of the acceleration, deceleration and S-ramp time. • The times are set in the subcodes of C04212, C04213 and C04214. • The conversion is controlled via *dwRampMode* and *bStop*.

Identifier/data type	Information/possible settings	
bLoadExtSpeedSetpoint BOOL	Loading of the ramp generator with the motor-based speed setpoint *dnExtSpeedSetpoint_n*.	
	TRUE	The input signal *dnExtSpeedSetpoint_n* is loaded into the ramp generator.
dnExtSpeedSetpoint_n DINT	Motor-based speed setpoint in [%] • Is loaded into the ramp generator by setting *bLoadExtSpeedSetpoint* to TRUE.	
bLoadActualMotorSpeed BOOL	Loading of the ramp generator with the motor-based actual speed *dnActualMotorSpeed_n*.	
	TRUE	The input signal *dnActualMotorSpeed_n* is loaded into the ramp generator.
dnActualMotorSpeed_n DINT	Motor-based actual speed value in [%] • Is loaded into the ramp generator by setting *bLoadActualMotorSpeed* to TRUE.	
dwRampMode DWORD	Type of profile generation • Can also be set via C04220.	
	0	Profile generation with linear ramps. • Relating to the reference speed (C00011)
	1	Profile generation with jerk limitation (S ramps).
	10	Profile generation with linear ramps. • Relating to the reference speed (C00011) • In case of edge change at the *bStop* input with regard to the current setpoint (constant time). • The setpoint applied to the input *dnExtSpeedSetpoint_n* is adopted as starting value.
AxisData	Machine parameters • For calculation and display of reference values on the load side (output shaft speed, machine speed) the reference speed (C00011), the gearbox factor and the feed constant are required. • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**.	

Outputs

Identifier/data type	Value/meaning	
dnSpeedSetpointOut_n DINT	Output setpoint • Relating to the reference speed (C00011)	
bStoppingActive BOOL	Status signal "Ramp-down is active" • Ramp-down can be activated via the input *bStop*.	
	TRUE	The ramp generator leads the current output value to "0" (standstill).
	TRUE↘FALSE	The output value equals "0" (standstill).
dnTargetSetpoint_n DINT	Current target setpoint (at the input of the ramp generator) • Relating to the reference speed (C00011)	
bSetpointOutInTarget BOOL	Status signal "Default value reached"	
	TRUE	The output of the ramp generator has reached the default value (in consideration of the window set).

Parameter

Parameter	Possible settings			Information
C04200/1...15	-200.00	%	200.00	Fixed setpoint 1 ... 15 • Initialisation: 0.00 %
C04201	0		15	Active setpoint • Read only

Parameter	Possible settings			Information
C04202	0.000	s	1000.000	Basic acceleration time • Initialisation: 1.000 s
C04203	0.000	s	1000.000	Basic deceleration time • Initialisation: 1.000 s
C04204	0.000	s	10.000	Basic S-ramp time • Initialisation: 0.100 s
C04207				Polarity *bStop* input
	0	**HIGH active**		
	1	LOW active		
C04208	0.00	%	100.00	Tolerance setpoint reached • Initialisation: 1.00 %
C04212/1...15	0.000	s	1000.000	Acceleration time 1 ... 15 • Initialisation: 0.000 s
C04213/1...15	0.000	s	1000.000	Deceleration time 1 ... 15 • Initialisation: 0.000 s
C04214/1...15	0.000	s	1000.000	S-ramp time 1 ... 15 • Initialisation: 0.000 s
C04215	0		15	Active ramp parameters • Read only
C04220				Profile mode • Read only
	0	Profile generation with linear ramps • Relating to the reference speed (C00011)		
	1	Profile generation with jerk limitation (S ramps)		
	10	Profile generation with linear ramps • Relating to the reference speed (C00011) • In case of edge change at the *bStop* input with regard to the current setpoint (constant time). • The setpoint applied to the input *dnExtSpeedSetpoint_n* is adopted as starting value.		
C04221	-200.00	%	200.00	Setpoint at the input • Display of the *dnSpeedSetpointIn_n* input signal.
C04222	-200.00	%	200.00	Target setpoint • Display of the *dnTargetSetpoint_n* output signal
C04223	-200.00	%	200.00	Setpoint at the output • Display of the *dnSpeedSetpointOut_n*output signal.
C04224				Status "Target setpoint reached" • Display of the *bSetpointOutInTarget* output signal.
	0	Target setpoint not yet reached		
	1	Target setpoint reached		
C04225	0.000	rpm	50000.000	Load reference speed • Read only
C04226	0.000	rpm	50000.000	Setpoint speed - load • Read only
C04227	0.0000	Unit/t	214000.0000	Reference speed • Read only

Parameter	Possible settings			Information
C04228	-214000.0000	Unit/t	214000.0000	Setpoint speed • Read only
C04229	String from *AxisData*			Speed unit • Read only
C04237	-200.00	%	200.00	External setpoint • Display of the *dnExtSpeedSetpoint_n* input signal.
C04238	-200.00	%	200.00	Current motor speed • Display of the *dnActualMotorSpeed_n* input signal.
C04239/1				Reverse setpoint • Display of the *bInvertSetpoint* input signal.
	0	Setpoint not inverted		
	1	Setpoint inverted		
C04239/2				Hold setpoint output • Display of the *bHoldOutput* input signal.
	0	Setpoint output enabled		
	1	Hold setpoint output		
C04239/3				Stop • Display of the *bStop* input signal.
	0	Stop not active		
	1	Stop requested		
C04239/4...7				Jog input 1 ... 8 • Display of the *bJog1* ... *bJog8* input signals.
	0	Jog input not active		
	1	Jog input active		
C04239/8...11				Ti input 1 ... 8 • Display of the *bTi1* ... *bTi8* input signals.
	0	Ti input not active		
	1	Ti input active		
C04239/12				Load external setpoint • Display of the *bLoadExtSpeedSetpoint* input signal.
	0	Loading not active		
	1	Load external setpoint		
C04239/13				Load motor speed • Display of the *bLoadActualMotorSpeed* input signal.
	0	Loading not active		
	1	Load motor speed		

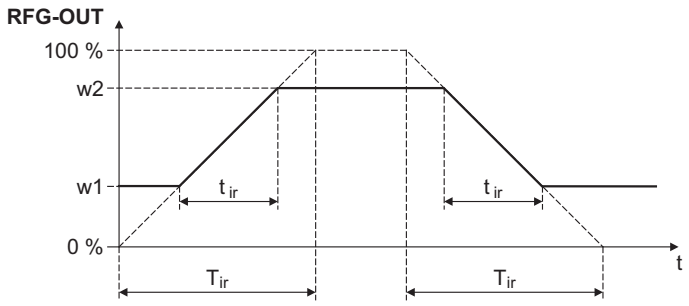
5.140.1 Setpoint path

- The signals in the setpoint path are limited to ±200.00 % of the motor Motor reference speed (C00011).
- The signal at *dnSpeedSetpointIn_n* is first led via the function "Selection of fixed setpoints".
- A selected fixed setpoint switches the input *dnSpeedSetpointIn_n* inactive and the subsequent signal conditioning uses the selected fixed setpoint.
- By setting the input *bInvertSetpoint* to TRUE the input signal of the ramp generator can be inverted.

5.140.2 Fixed setpoints

In addition to the direct setpoint selection via the input *dnSpeedSetpointIn_n* fixed setpoints can be preset in C04200/1...15.

- These fixed setpoints can be called binary coded any time via the selection inputs *bJog1* ... *bJog8*, so 15 options are available.



Selected inputs				Used Setpoint
bJog8	bJog4	bJog2	bJog1	
FALSE	FALSE	FALSE	FALSE	*dnSpeedSetpointIn_n*
FALSE	FALSE	FALSE	TRUE	C04200/1
FALSE	FALSE	TRUE	FALSE	C04200/2
FALSE	FALSE	TRUE	TRUE	C04200/3
FALSE	TRUE	FALSE	FALSE	C04200/4
FALSE	TRUE	FALSE	TRUE	C04200/5
FALSE	TRUE	TRUE	FALSE	C04200/6
FALSE	TRUE	TRUE	TRUE	C04200/7
TRUE	FALSE	FALSE	FALSE	C04200/8
TRUE	FALSE	FALSE	TRUE	C04200/9
TRUE	FALSE	TRUE	FALSE	C04200/10
TRUE	FALSE	TRUE	TRUE	C04200/11
TRUE	TRUE	FALSE	FALSE	C04200/12
TRUE	TRUE	FALSE	TRUE	C04200/13
TRUE	TRUE	TRUE	FALSE	C04200/14
TRUE	TRUE	TRUE	TRUE	C04200/15

- The number of selected inputs to be assigned depends on the number of required fixed setpoints.

Number of the fixed setpoints required	Number of the selection inputs to be assigned (bJog1 ... bJog8)
1	at least 1
1 ... 3	at least 2
4 ... 7	at least 3
8 ... 15	4

5.140.3 Ramp generator

Afterwards, the setpoint is led via a ramp generator with S-ramp characteristic. The ramp generator transfers setpoint step-changes at the input to a ramp.

w1, w2 = change of the setpoint as a function of t_{ir} or t_{if}
RFG-OUT = output of the ramp generator

[5-110] Acceleration and deceleration times

- t_{ir} and t_{if} are the desired times for changing between w1 and w2.
- S-ramps are possible if an S-ramp time is selected.
- The t_{ir}/t_{if} values are converted into the required Ti times according to the following formula:

$T_{ir} = t_{ir} \cdot \frac{100\,\%}{w2 - w1}$	$T_{if} = t_{if} \cdot \frac{100\,\%}{w2 - w1}$

5.140.4 Setting and selection of the Ti times

16 different Tir, Tif and S-ramp times can be selected via parameters for the ramp generator.

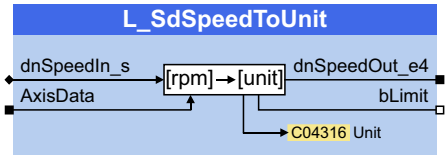
- The selection is carried out binary coded via the selection inputs *bTI1* ... *bTI8*:

Selected inputs				Selection		
bTI8	bTI4	bTI2	bTI1	Tir	Tif	S-ramp time
FALSE	FALSE	FALSE	FALSE	C04202	C04203	C04204
FALSE	FALSE	FALSE	TRUE	C04212/1	C04213/1	C04214/1
FALSE	FALSE	TRUE	FALSE	C04212/2	C04213/2	C04214/2
FALSE	FALSE	TRUE	TRUE	C04212/3	C04213/3	C04214/3
FALSE	TRUE	FALSE	FALSE	C04212/4	C04213/4	C04214/4
FALSE	TRUE	FALSE	TRUE	C04212/5	C04213/5	C04214/5
FALSE	TRUE	TRUE	FALSE	C04212/6	C04213/6	C04214/6
FALSE	TRUE	TRUE	TRUE	C04212/7	C04213/7	C04214/7
TRUE	FALSE	FALSE	FALSE	C04212/8	C04213/8	C04214/8
TRUE	FALSE	FALSE	TRUE	C04212/9	C04213/9	C04214/9
TRUE	FALSE	TRUE	FALSE	C04212/10	C04213/10	C04214/10
TRUE	FALSE	TRUE	TRUE	C04212/11	C04213/11	C04214/11
TRUE	TRUE	FALSE	FALSE	C04212/12	C04213/12	C04214/12
TRUE	TRUE	FALSE	TRUE	C04212/13	C04213/13	C04214/13
TRUE	TRUE	TRUE	FALSE	C04212/14	C04213/14	C04214/14
TRUE	TRUE	TRUE	TRUE	C04212/15	C04213/15	C04214/15

5.140.5 Display of the machine-based variables

For a better assessment of the created setpoints/parameterised fixed values (% value) the machine-based reference values are calculated and displayed:

Parameter	Information
C04225	Load reference speed
C04226	Setpoint speed - load
C04227	Machine reference speed
C04228	Machine setpoint speed



The current setpoint is also calculated and displayed correspondingly.

Parameter	Information
C04221	Setpoint at the input
C04222	Target setpoint
C04223	Setpoint at the output

5.141 L_SdSpeedToUnit - speed conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB uses the transmitted machine parameters and converts a speed value defined in the internal unit [rpm] into a speed value in the real unit of the machine.

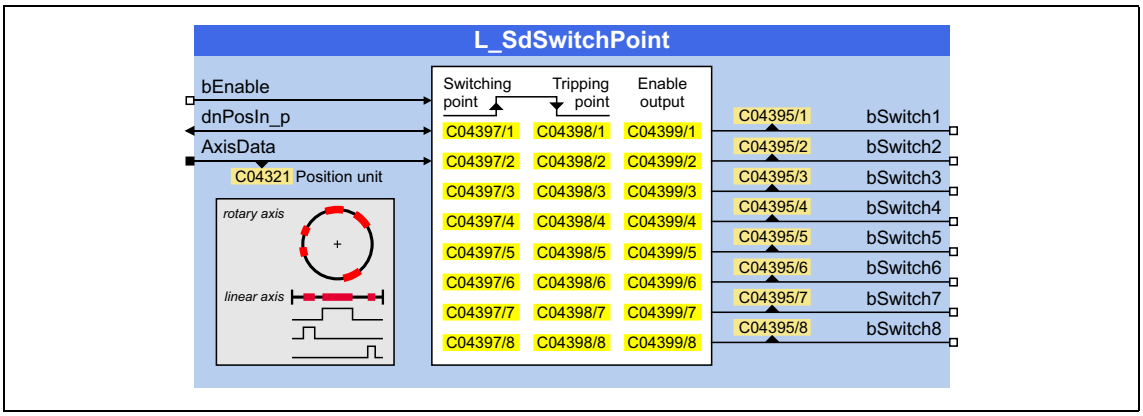
Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_s DINT	Speed given in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnSpeedOut_e4 DINT	Speed in [unit/s] • Output in "e4" format (fixed point with four decimal positions)	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited to the value range that can be displayed.

Parameter



Parameter	Possible settings	Information
C04316	String from *AxisData*	Speed unit • Read only

5.142 L_SdSwitchPoint - position switch points

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to implement up to 8 simple position switch points (cams). When the current drive position is inside a range defined via parameters, the output assigned to this "switching area" is set to TRUE.

- The output setting does not depend on whether the switching range is approached by the positive or negative side.
- In the modulo measuring system (rotary table) the switching ranges can also be defined beyond the 0° position (e.g. switching on at 350° and off at 10° in CW rotation).

Inputs

Identifier/data type	Information/possible settings
bEnable BOOL	Enable FB TRUE: Position switch points are activated.
dnPosIn_p DINT	Input for accepting the current position • Connect this input with the position signal to be accepted. Depending on the application, this can be a setpoint or an actual position.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
bSwitch1 BOOL	Position switch point 1	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/1 and C04398/1.
bSwitch2 BOOL	Position switch point 2	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/2 and C04398/2.
bSwitch3 BOOL	Position switch point 3	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/3 and C04398/3.
bSwitch4 BOOL	Position switch point 4	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/4 and C04398/4.
bSwitch5 BOOL	Position switch point 5	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/5 and C04398/5.
bSwitch6 BOOL	Position switch point 6	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/6 and C04398/6.
bSwitch7 BOOL	Position switch point 7	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/7 and C04398/7.
bSwitch8 BOOL	Position switch point 8	
	TRUE	The current position (*dnPosIn_p*) is inside the switching range defined via C04397/8 and C04398/8.

Parameter

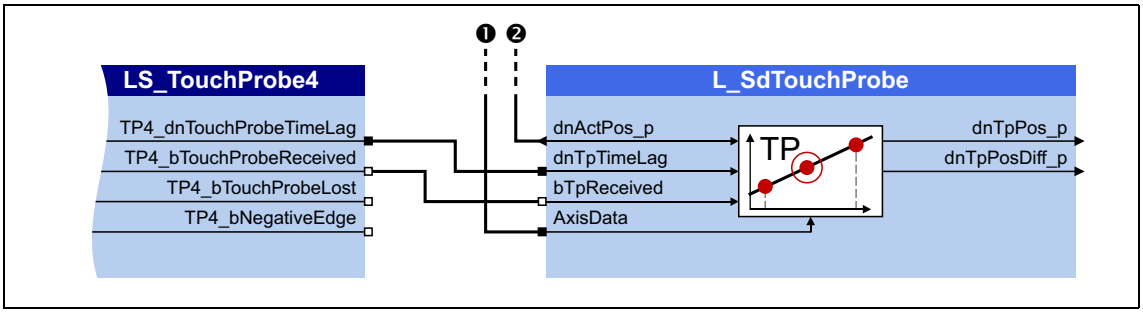
Parameter	Possible settings			Information
C04395/1...8				Status of switching range 1 ... 8 • Read only
	0	Switch off		
	1	Switch on		
C04396 As of library V02.02.xx.xx	String of digits			Position unit • Read only
C04397/1...8	-214748.3647	Unit	214748.3647	Switch-on position - switching range 1 ... 8
C04398/1...8	-214748.3647	Unit	214748.3647	Switch-off position - switching range 1 ... 8
C04399/1...8				Enable - switching range 1 ... 8
	0	Switching range not enabled		
	1	Switching range enabled		

5.142.1 Monitoring for counter overflow

This function extension will be available from library V2.02!

If the machine parameters transferred to the FB via the *AxisData* input are changed afterwards (e.g. the gearbox factors), this may cause a counter overflow when the position values defined via C04397/1...8 and C04398/1...8 converted from the real unit to the internal unit.

The FB causes a corresponding error message in case of an internal counter overflow due to a changed measuring system:



Error number		Error message in the logbook	Response
61603846	0x3AC0006	L_SdSwitchPoint:int.pos. overflow (LS_DriveInterface)	Error
61603974	0x3AC0086	L_SdSwitchPoint:int.pos. overflow (L_SdSetAxisData)	Error

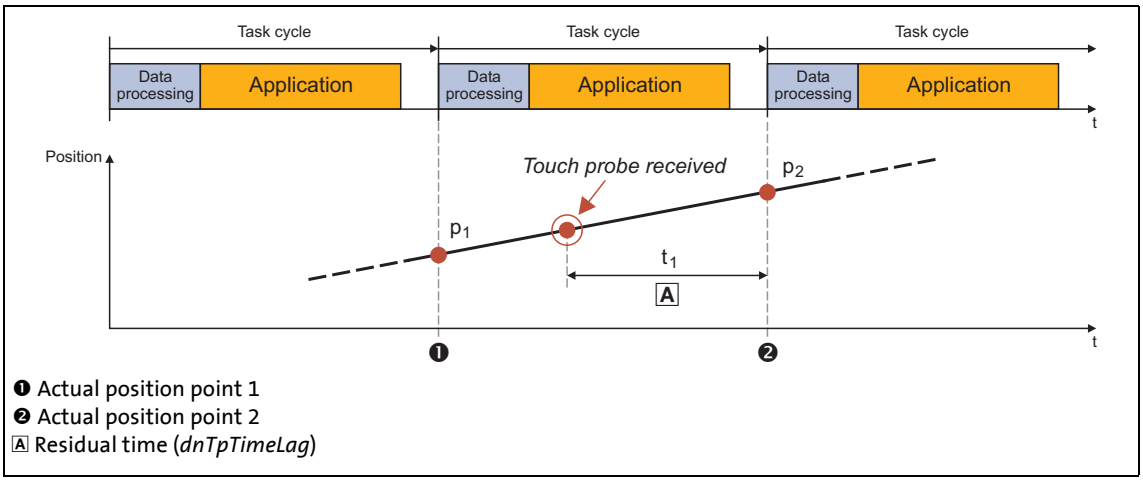
5.143 L_SdTouchProbe - touch probe evaluation

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB takes over the interpolation of the input signal based on the time stamp handed over by a touch probe system block and outputs the interpolated value and the difference compared with the last input signal.

- The FB considers a modulo measuring system and the cycle of the selected machine parameters.

Inputs



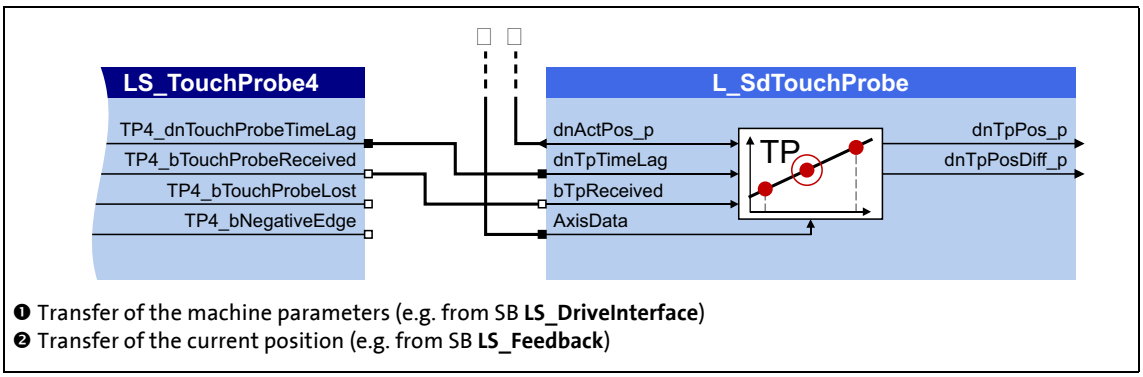
Identifier/data type	Information/possible settings
dnActPos_p DINT	Input for accepting the current position in [inc] • Connect this input with the signal to be interpolated, e.g. the master value of a line drive.
dnTpTimeLag DINT	Input for accepting the time stamp • Connect this input with the output *dnTouchProbeTimeLag* of the corresponding touch probe system block.
bTpReceived BOOL	Input for taking over the status "Touch probe detected" • Connect this input with the output *dnTouchProbeReceived* of the corresponding touch probe system block.
	FALSE↗TRUE | Touch probe detected.
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning
dnTpPos_p DINT	Interpolated TP position in [inc]
dnTpPosDiff_p DINT	Position difference in [increments] • Position difference between the last time the TP position was latched and the starting time of the task.

5.143.1 Actual value interpolation (principle)

If a touch probe is detected, the (residual) time to the following task cycle is determined and a time stamp is created from it. Based on this time stamp the FB **L_SdTouchProbe** can execute a linear interpolation between both actual position points. The result is the exact actual position at the time of the physical touch probe event.

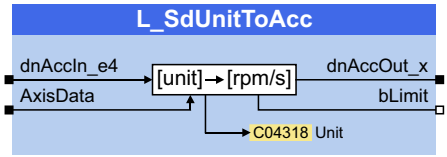


❶ Actual position point 1
❷ Actual position point 2
A Residual time (*dnTpTimeLag*)

[5-111] Actual value determination through linear interpolation (principle)

5.143.2 Example

Connections required for a touch probe detection via the digital input DI4:



❶ Transfer of the machine parameters (e.g. from SB **LS_DriveInterface**)
❷ Transfer of the current position (e.g. from SB **LS_Feedback**)

[5-112] Transfer of the FB L_SdTouchProbe

5.144 L_SdUnitToAcc - acceleration conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

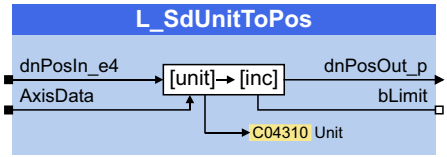
This FB uses the transmitted machine parameters and converts an acceleration value defined in the real unit of the machine into an internal acceleration value.

Inputs

Identifier/data type	Information/possible settings
dnAccIn_e4 DINT	Acceleration in [unit/s^2] • Selection in "e4" format (fixed point with four decimal positions)
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnAccOut_x DINT	Acceleration as speed variation/time in [rpm/s] • 15000000 rpm/s ≡ 2^{22} ≡ 4194304	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited to the value range that can be displayed.



Parameter

Parameter	Possible settings	Information
C04318	String from *AxisData*	Acceleration unit • Read only

5.145 L_SdUnitToPos - position conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

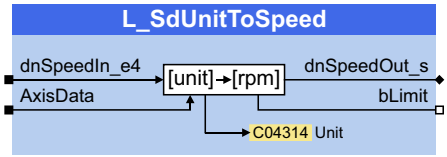
This FB uses the transmitted machine parameters and converts a position defined in the real unit of the machine into an internal position.

Inputs

Identifier/data type	Information/possible settings
dnPosIn_e4 DINT	Position in [unit] • Selection in "e4" format (fixed point with four decimal positions)
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnPosOut_p DINT	Position in [inc]	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited to the value range that can be displayed.



Parameter

Parameter	Possible settings	Information
C04310	String from *AxisData*	Position unit • Read only

5.146 L_SdUnitToSpeed - speed conversion

Function library:	LenzeServoDrive
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

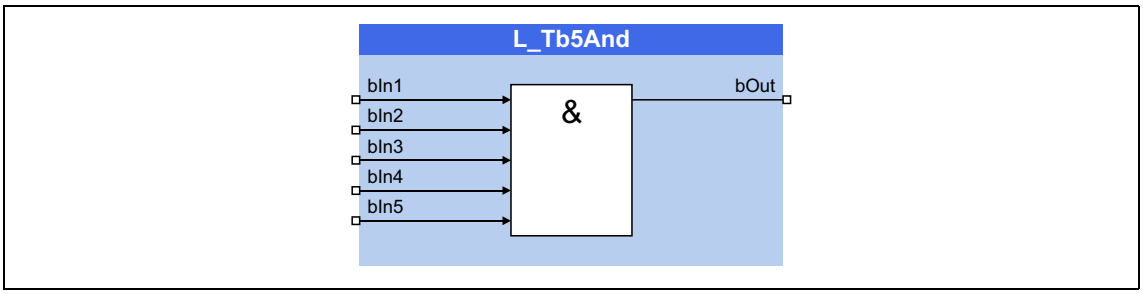
This FB uses the transmitted machine parameters and converts a speed defined in the real unit of the machine into an internal speed.

Inputs

Identifier/data type	Information/possible settings
dnSpeedIn_e4 DINT	Speed in [unit/s] • Selection in "e4" format (fixed point with four decimal positions)
AxisData	Machine parameters • For accepting the machine parameters of the drive/motor, connect this input with the output *DI_AxisData* of the SB **LS_DriveInterface**. • The machine parameters of a master drive can be displayed with the FB L_SdSetAxisData. In this case, the FB output *AxisData* must be connected to this input. (📖 510)

Outputs

Identifier/data type	Value/meaning	
dnSpeedOut_s DINT	Speed given in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864	
bLimit BOOL	Status "Output signal is limited"	
	TRUE	The output signal is limited to the value range that can be displayed.



Parameter

Parameter	Possible settings	Information
C04314	String from *AxisData*	Speed unit • Read only

5.147 L_Tb5And - AND with 5 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

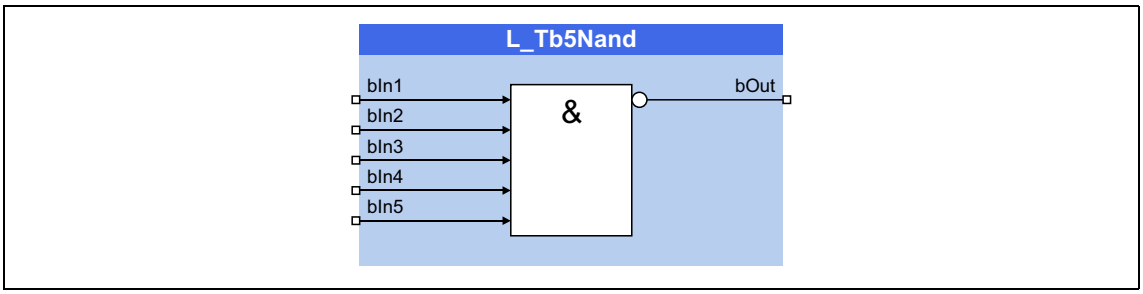
This FB carries out a logic AND operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2
bIn3 BOOL	Input 3
bIn4 BOOL	Input 4
bIn5 BOOL	Input 5

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the AND operation



Tip!

If you want to combine less than five signals, set the unused inputs to TRUE or assign several inputs to the same signal.

5.148 L_Tb5Nand - NAND with 5 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

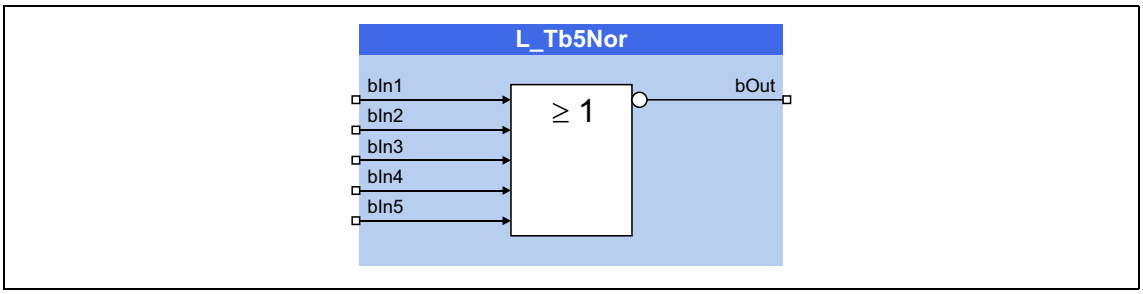
This FB carries out a logic NAND operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2
bIn3 BOOL	Input 3
bIn4 BOOL	Input 4
bIn5 BOOL	Input 5

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the NAND operation



Tip!

If you want to combine less than five signals, set the unused inputs to TRUE or assign several inputs to the same signal.

5.149 L_Tb5Nor - NOR with 5 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

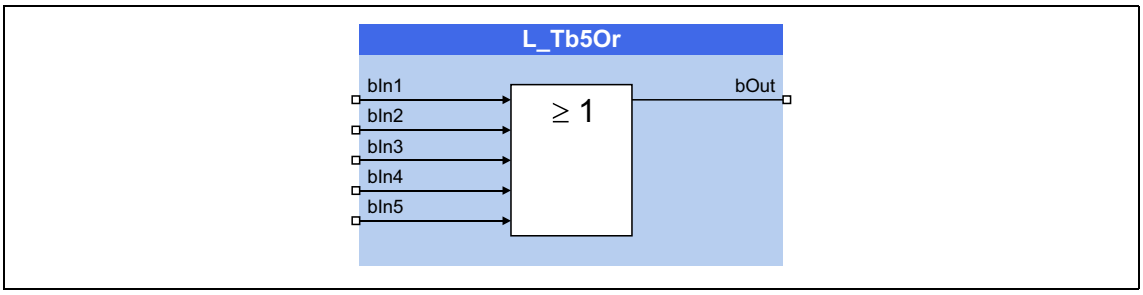
This FB carries out a logic NOR operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2
bIn3 BOOL	Input 3
bIn4 BOOL	Input 4
bIn5 BOOL	Input 5

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the NOR operation



Tip!

If you want to combine less than five signals, set the unused inputs to FALSE.

5.150 L_Tb5Or - OR with 5 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

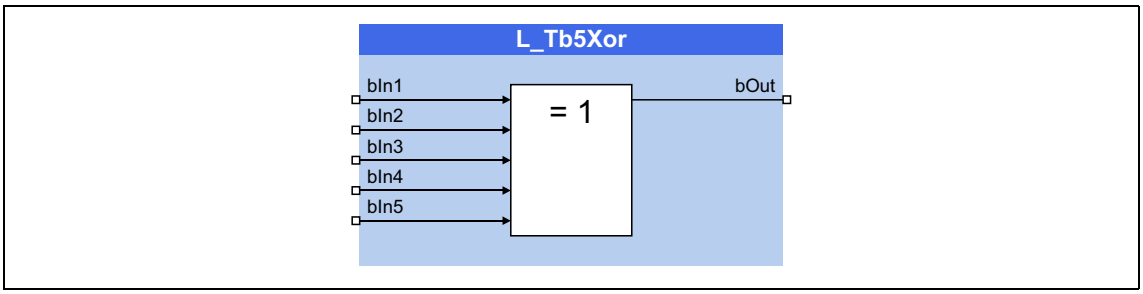
This FB carries out a logic OR operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2
bIn3 BOOL	Input 3
bIn4 BOOL	Input 4
bIn5 BOOL	Input 5

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the OR operation



Tip!

If you want to combine less than five signals, set the unused inputs to FALSE.

5.151 L_Tb5Xor - XOR with 5 inputs

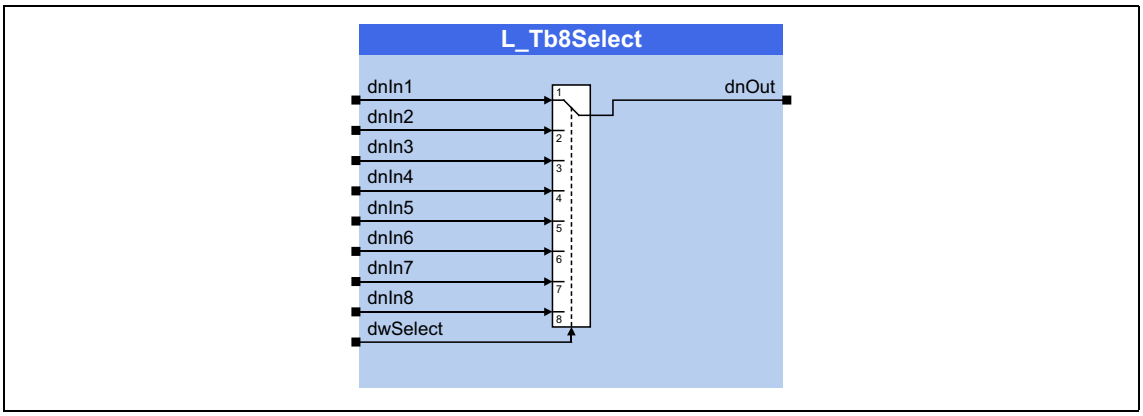
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a logic EXCLUSIVE OR operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2
bIn3 BOOL	Input 3
bIn4 BOOL	Input 4
bIn5 BOOL	Input 5

Outputs



Identifier/data type	Value/meaning
bOut BOOL	Result of the exclusive OR operation

5.152 L_Tb8Select - 1-out-of-8 selector (for data type "DINT")

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

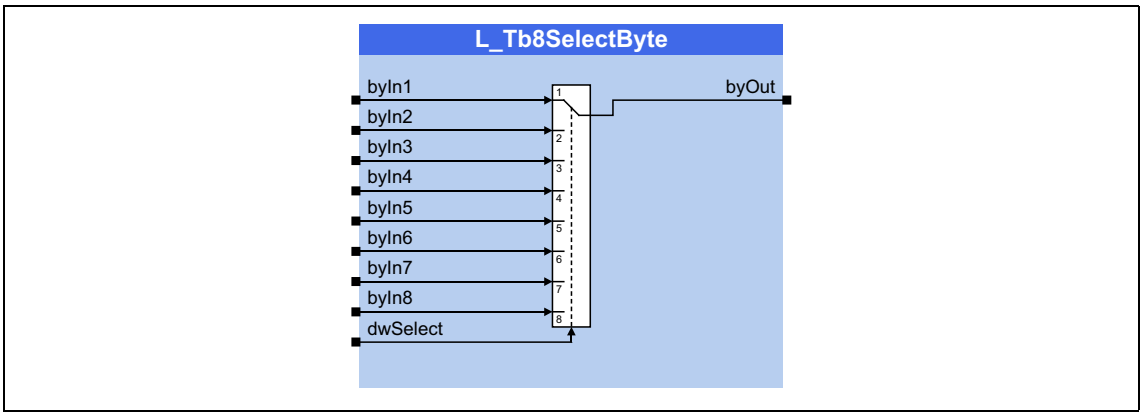
This FB connects one of eight input signals of "DINT" type through to the output.

- The input is selected via the input *dwSelect*.

Inputs

Identifier/data type	Information/possible settings	
dnIn1 ... dnIn8 DINT	Input signal 1 ... 8	
dwSelect DWORD	Selection of the input signal for the output to *dnOut*	
	0	0
	1	*dnIn1*
	2	*dnIn2*
	3	*dnIn3*
	4	*dnIn4*
	5	*dnIn5*
	6	*dnIn6*
	7	*dnIn7*
	8	*dnIn8*
	> 8	0

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Output signal

5.153 L_Tb8SelectByte - 1-out-of-8 selector (for data type "BYTE")

Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

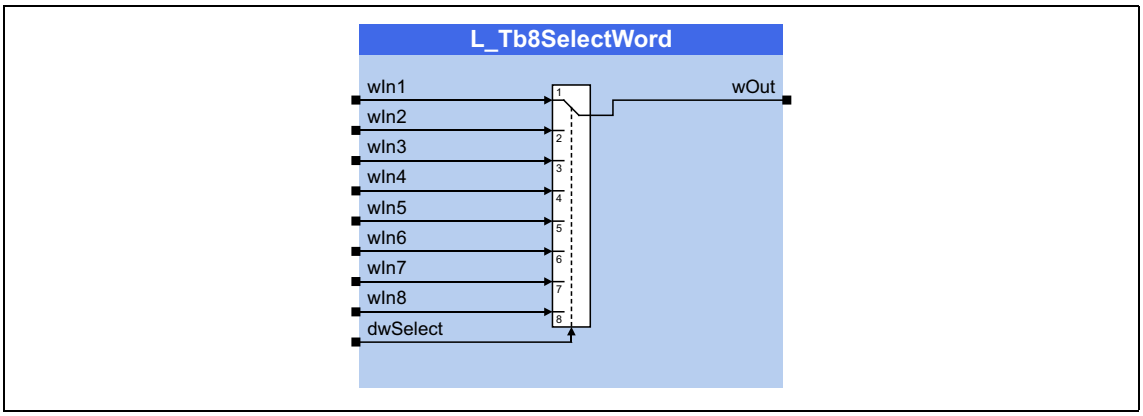
This FB connects one of eight input signals of "BYTE" type through to the output.

- The input is selected via the input *dwSelect*.

Inputs

Identifier/data type	Information/possible settings	
byIn1 ... byIn8 BYTE	Input signal 1 ... 8	
dwSelect DWORD	Selection of the input signal for the output to *byOut*	
	0	0
	1	*byIn1*
	2	*byIn2*
	3	*byIn3*
	4	*byIn4*
	5	*byIn5*
	6	*byIn6*
	7	*byIn7*
	8	*byIn8*
	> 8	0

Outputs



Identifier/data type	Value/meaning
byOut BYTE	Output signal

5.154 L_Tb8SelectWord - 1-out-of-8 selector (for data type "WORD")

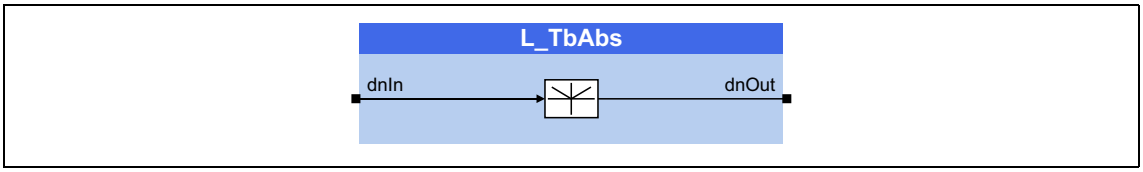
Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB connects one of eight input signals of "WORD" type through to the output.

- The input is selected via the input *dwSelect*.

Inputs

Identifier/data type	Information/possible settings	
wIn1 ... wIn8 WORD	Input signal 1 ... 8	
dwSelect DWORD	Selection of the input signal for the output to *wOut*	
	0	0
	1	*wIn1*
	2	*wIn2*
	3	*wIn3*
	4	*wIn4*
	5	*wIn5*
	6	*wIn6*
	7	*wIn7*
	8	*wIn8*
	> 8	0



Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal

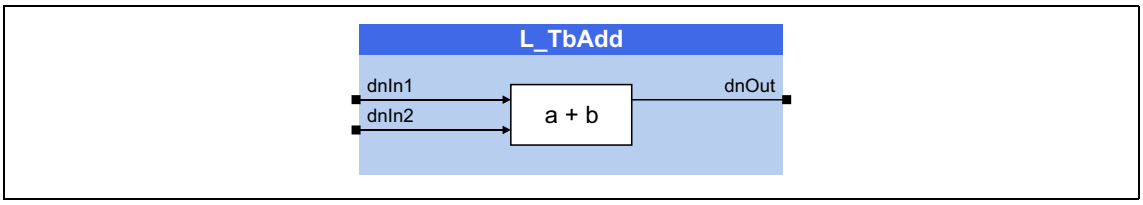
5.155 L_TbAbs - absolute value

Function library:	LenzeToolbox	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This function block converts a bipolar signal into a unipolar signal, i.e. the absolute value of the input signal is generated.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal



Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal

5.156 L_TbAdd - addition

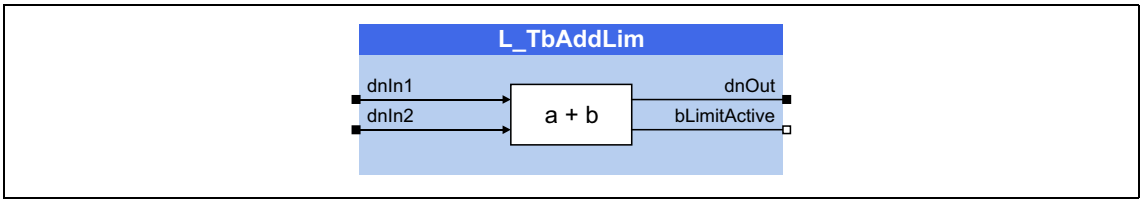
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out an addition without limitation.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	1st summand
dnIn2 DINT	2nd summand

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Cumulative value (result of the addition) • No internal limitation, thus an overflow is possible: • If the result > 2^{31}-1: *dnOut* = *dnIn1* + *dnIn2* - 2^{32} • If the result < 2^{31}: *dnOut* = *dnIn1* + *dnIn2* + 2^{32}

5.157 L_TbAddLim - addition with limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

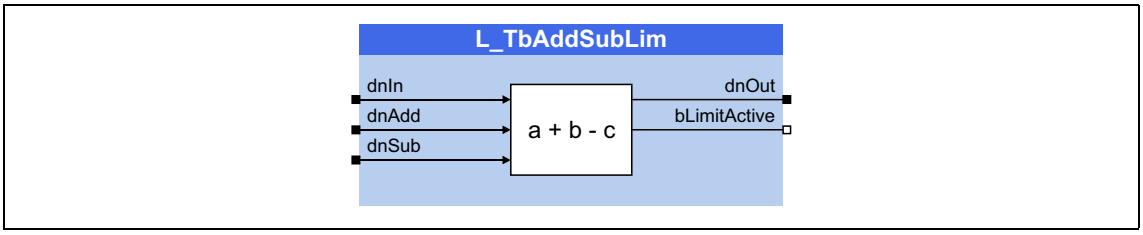
This FB carries out an addition with limitation.

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	1st summand
dnIn2 DINT	2nd summand

Outputs



Identifier/data type	Value/meaning	
dnOut DINT	Cumulative value (result of the addition) • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

5.158 L_TbAddSubLim - addition and subtraction with limitation

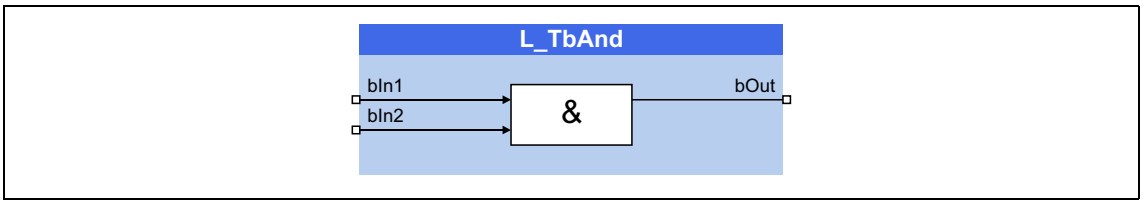
Function library:	LenzeToolbox	**FB is available as of library V02.04.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB carries out an addition with subsequent subtraction and limitation.

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input value
dnAdd DINT	Value that is added to the input value.
dnSub DINT	Value that is subtracted from the input value.



Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Result of the calculation • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

5.159 L_TbAnd - AND with 2 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a logic AND operation of binary signals.

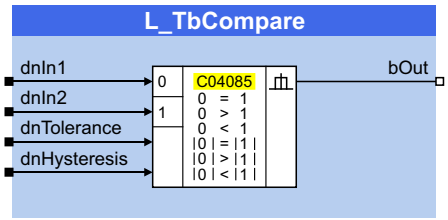
Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the AND operation

Function



bIn2	bIn1	bOut
FALSE	FALSE	FALSE
FALSE	TRUE	FALSE
TRUE	FALSE	FALSE
TRUE	TRUE	TRUE

5.160 L_TbCompare - comparison

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This function block compares two signals of the "DINT" data type and can be used e.g. for implementing a trigger.

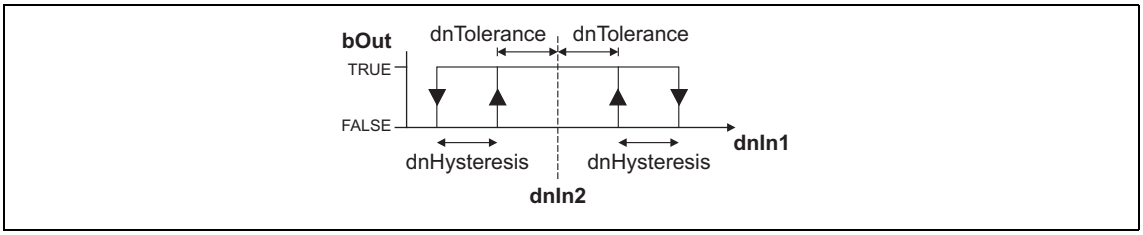
- The comparison function is selected via C04085.
- In contrast to the FB L_TbCompare_n, the window and hysteresis of this FB can be adjusted via inputs instead of parameters.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	Input signal 1
dnIn2 DINT	Input signal 2
dnTolerance DINT	Window for comparison operation • Value is internally limited to ≥0.
dnHysteresis DINT	Hysteresis for comparison operation • Value is internally limited to ≥0.

Outputs

Identifier/data type	Value/meaning	
bOut BOOL	Status signal "Comparison statement is true"	
	TRUE	The statement of the selected comparison mode is true.

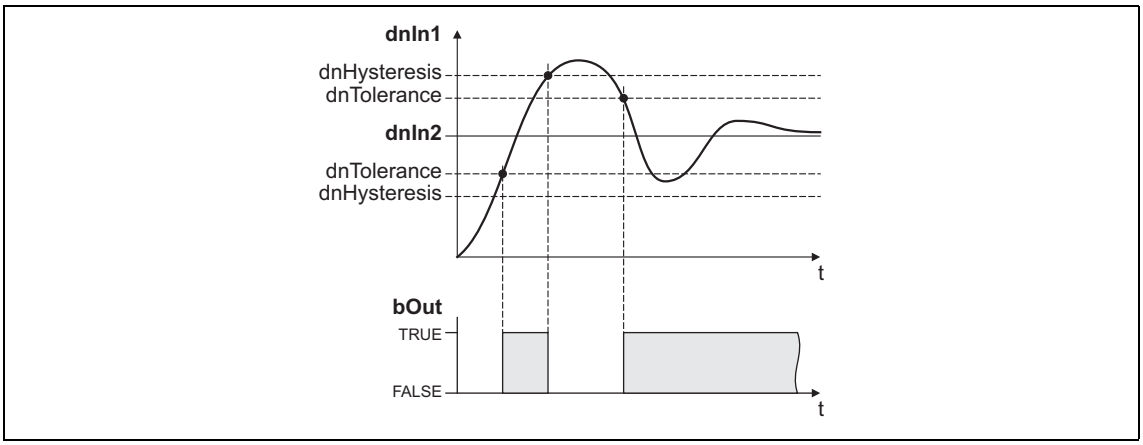


Parameter

Parameter	Possible settings		Information
C04085			Comparison operation
	0	**dnIn1 = dnIn2**	Lenze setting
	1	dnIn1 > dnIn2	
	2	dnIn1 < dnIn2	
	3	|dnIn1| = |dnIn2|	
	4	|dnIn1| > |dnIn2|	
	5	|dnIn1| < |dnIn2|	

5.160.1 Function 1: dnIn1 = dnIn2

Selection: C04085 = "0"

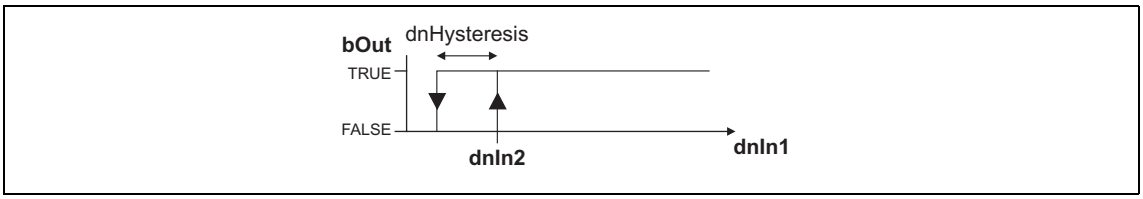


- This function compares two signals with regard to equality. They can, for instance, provide the comparison "actual speed equals setpoint speed " ($n_{act} = n_{set}$).
- Use the input *dnTolerance* to select the window within which the equality is to apply:
- Use the input *dnHysteresis* to select a hysteresis if the input signals are not stable and the output oscillates.

[5-113] Function 1: Switching performance

Tip!

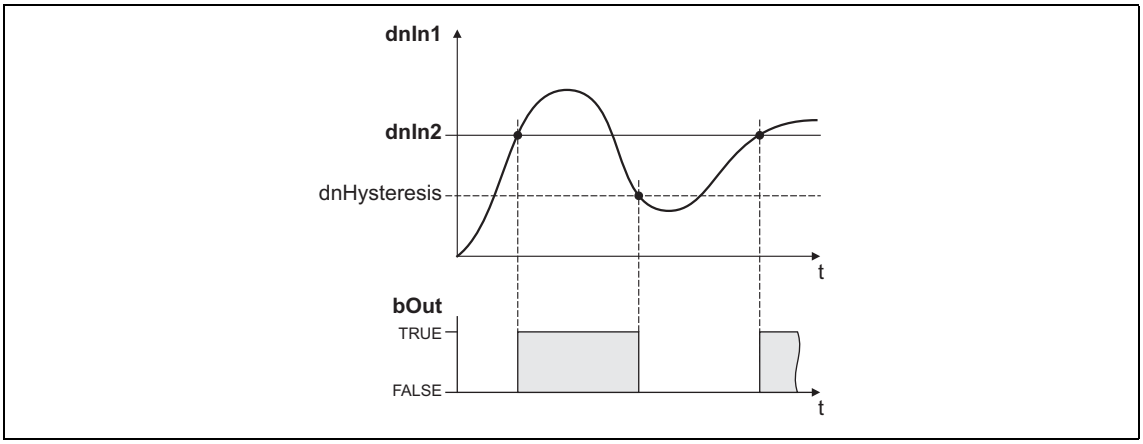
With this function, the FB must be used in a fast task to achieve optimum sampling of the signals.



[5-114] Function 1: Example

5.160.2 Function 2: dnIn1 > dnIn2

Selection: C04085 = "1"

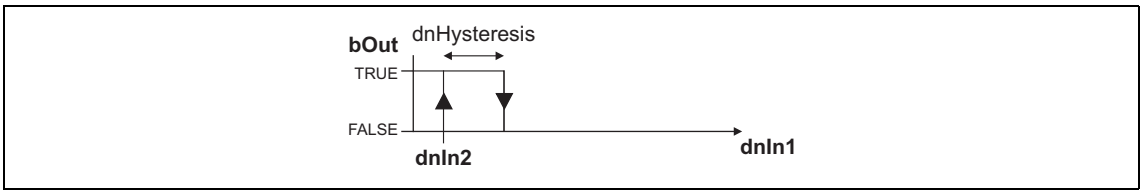


- This function serves, for instance, to implement the comparison "actual speed is higher than a limit value" ($n_{act} > n_x$) for one direction of rotation.

[5-115] Function 2: Switching performance

Functional sequence

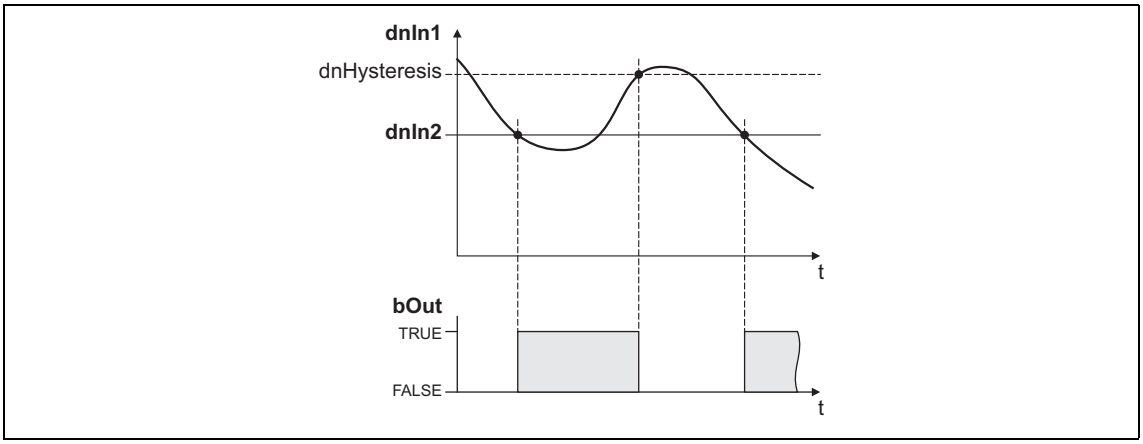
1. If the value at d*nIn1* exceeds the value at *dnIn2*, *bOut* changes from FALSE to TRUE.
2. Only if the signal at *dnIn1* falls below the value at *dnIn2 - dnHysteresis* again, *bOut* changes from TRUE to FALSE.



[5-116] Function 2: Example

5.160.3 Function 3: dnIn1 < dnIn2

Selection: C04085 = "2"



- This function serves, for instance, to implement the comparison "actual speed is lower than a limit value" (n_{act} n_x) for one direction of rotation.

[5-117] Function 3: Switching performance

Functional sequence

1. If the value at *dnIn1* falls below the value at *dnIn2*, *bOut_b* changes from FALSE to TRUE.
2. Only if the signal at *dnIn1* exceeds the value at *dnIn2 - dnHysteresis* again, *bOut_b* changes from TRUE to FALSE.

[5-118] Function 3: Example

5.160.4 Function 4: |dnIn1| = |dnIn2|

Selection: C04085 = "3"

- This function serves, for instance, to implement the comparison "$n_{act} = 0$".
- This function behaves like function 1. However, the amount is generated by the input signals before signal processing (without sign).
  ▸ Function 1: dnIn1 = dnIn2 (📖 554)

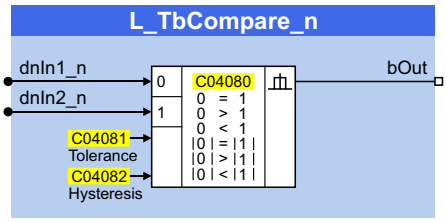
5.160.5 Function 5: |dnIn1| > |dnIn2|

Selection: C04085 = "4"

- This function serves, for instance, to implement the comparison "$|n_{act}| > |n_x|$" independent of the direction of rotation.
- This function behaves like function 2. However, the amount is generated by the input signals before signal processing (without sign).
  ▸ Function 2: dnIn1 > dnIn2 (📖 555)

5.160.6 Function 6: |dnIn1| < |dnIn2|

Selection: C04085 = "5"



- This function serves to implement the comparison "$|n_{act}| < |n_x|$" independent of the direction of rotation.
- This function behaves like function 3. However, the amount is generated by the input signals before signal processing (without sign).
  ▸ Function 3: dnIn1 < dnIn2 (📖 556)

5.161 L_TbCompare_n - scaled comparison

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This function block compares two scaled signals and can be used e.g. for implementing a trigger.

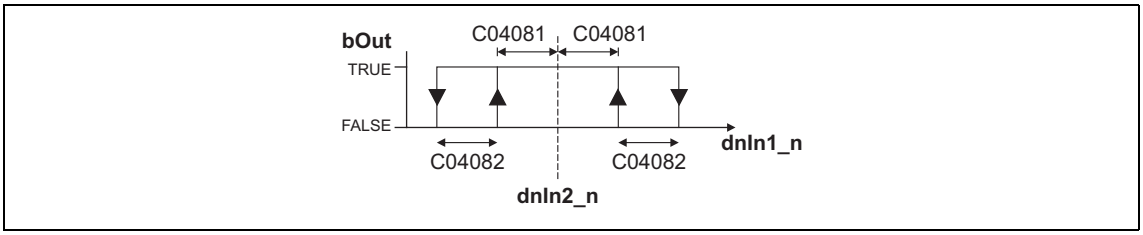
- The comparison function is selected via C04080.
- In contrast to the FB L_TbCompare, the window and hysteresis of this FB can be adjusted via parameters instead of inputs.

Inputs

Identifier/data type	Information/possible settings
dnIn1_n DINT	Input signal 1 • Scaling: 100 % ≡ 2^{30} ≡ 1073741824
dnIn2_n DINT	Input signal 2 • Scaling: 100 % ≡ 2^{30} ≡ 1073741824

Outputs

Identifier/data type	Value/meaning	
bOut BOOL	Status signal "Comparison statement is true"	
	TRUE	The statement of the selected comparison mode is true.

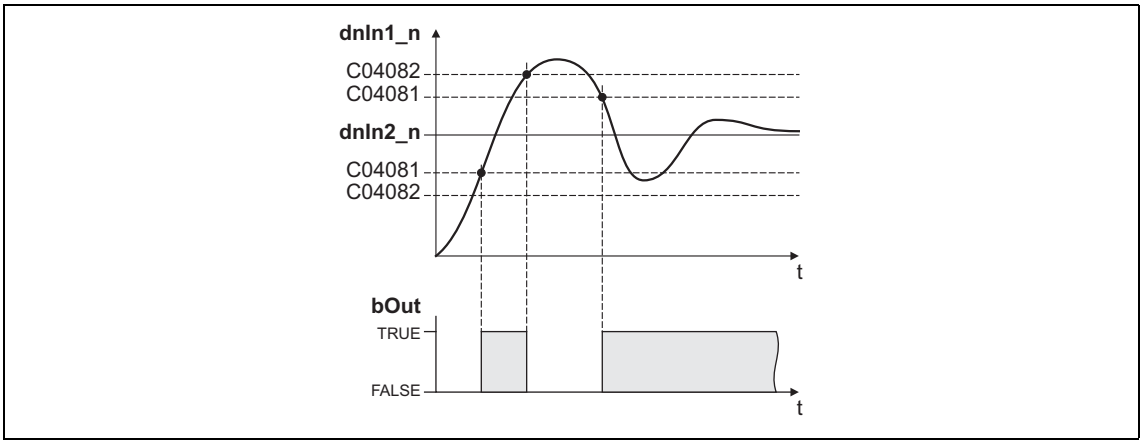


Parameter

Parameter	Possible settings			Information
C04080				Comparison operation
	0	**dnIn1_n = dnIn2_n**		Lenze setting
	1	dnIn1_n > dnIn2_n		
	2	dnIn1_n < dnIn2_n		
	3	|dnIn1_n| = |dnIn2_n|		
	4	|dnIn1_n| > |dnIn2_n|		
	5	|dnIn1_n| < |dnIn2_n|		
C04081	0.00	%	100.00	Tolerance • Initialisation: 1.00 %
C04082	0.00	%	100.00	Hysteresis • Initialisation: 1.00 %

5.161.1 Function 1: dnIn1_n = dnIn2_n

Selection: C04080 = "0"

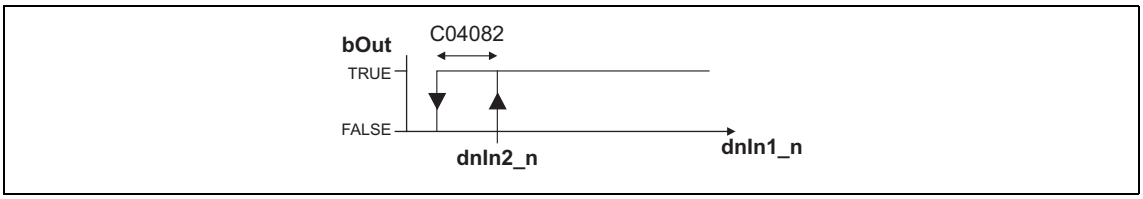


- This function compares two signals with regard to equality. They can, for instance, provide the comparison "actual speed equals setpoint speed " ($n_{act} = n_{set}$).
- Use C04081 to select the window within which the equality is to apply.
- Use C04082 to select a hysteresis if the input signals are not stable and the output oscillates.

[5-119] Function 1: Switching performance

Tip!

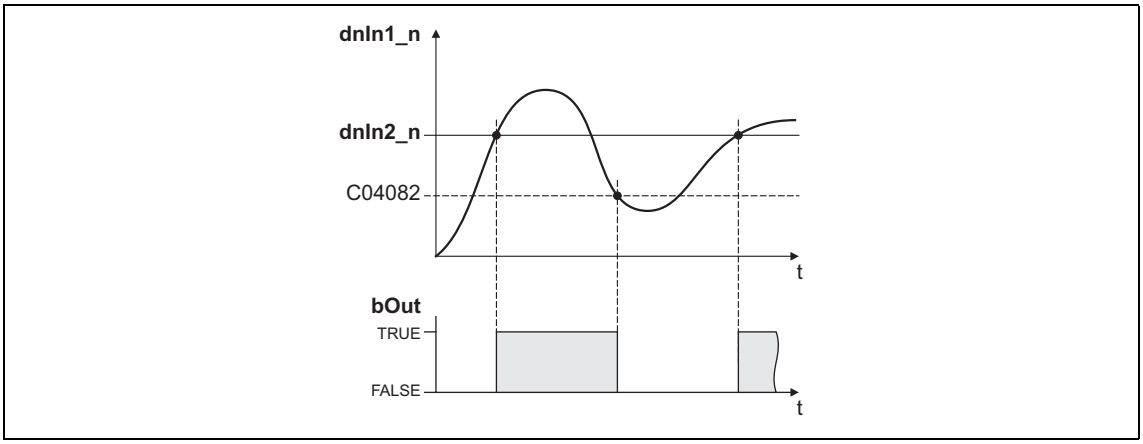
With this function, the FB must be used in a fast task to achieve optimum sampling of the signals.



[5-120] Function 1: Example

5.161.2 Function 2: dnIn1_n > dnIn2_n

Selection: C04080 = "1"

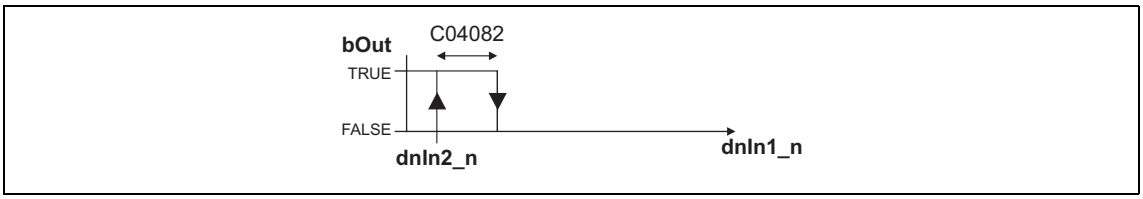


- This function serves, for instance, to implement the comparison "actual speed is higher than a limit value" ($n_{act} > n_x$) for one direction of rotation.

[5-121] Function 2: Switching performance

Functional sequence

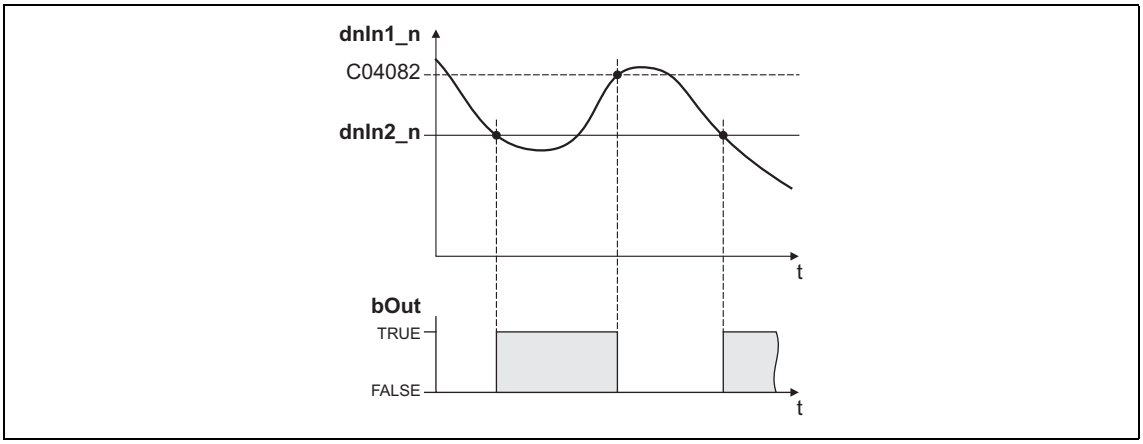
1. If the value at d*nIn1_n* exceeds the value at *dnIn2_n*, *bOut* changes from FALSE to TRUE.
2. Only if the signal at *dnIn1_n* falls below the value at *dnIn2_n* - C04082 again, *bOut* changes from TRUE to FALSE.



[5-122] Function 2: Example

5.161.3 Function 3: dnIn1_n < dnIn2_n

Selection: C04080 = "2"



- This function serves, for instance, to implement the comparison "actual speed is lower than a limit value" (n_{act} n_x) for one direction of rotation.

[5-123] Function 3: Switching performance

Functional sequence

1. If the value at *dnIn1_n* falls below the value at *dnIn2_n*, *bOut_b* changes from FALSE to TRUE.
2. Only if the signal at *dnIn1_n* exceeds the value at *dnIn2_n* - C04082 again, *bOut_b* changes from TRUE to FALSE.

[5-124] Function 3: Example

5.161.4 Function 4: |dnIn1_n| = |dnIn2_n|

Selection: C04080 = "3"

- This function serves, for instance, to implement the comparison "$n_{act} = 0$".
- This function behaves like function 1. However, the amount is generated by the input signals before signal processing (without sign).
  ▸ Function 1: dnIn1_n = dnIn2_n (📖 559)

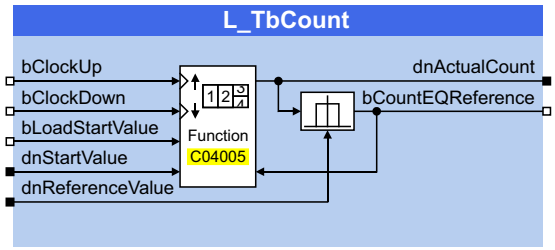
5.161.5 Function 5: |dnIn1_n| > |dnIn2_n|

Selection: C04080 = "4"

- This function serves, for instance, to implement the comparison "$|n_{act}| > |n_x|$" independent of the direction of rotation.
- This function behaves like function 2. However, the amount is generated by the input signals before signal processing (without sign).
  ▸ Function 2: dnIn1_n > dnIn2_n (📖 560)

5.161.6 Function 6: |dnIn1_n| < |dnIn2_n|

Selection: C04080 = "5"



- This function serves to implement the comparison "$|n_{act}| < |n_x|$" independent of the direction of rotation.
- This function behaves like function 3. However, the amount is generated by the input signals before signal processing (without sign).
  ▸ Function 3: dnIn1_n < dnIn2_n (📖 561)

5.162 L_TbCount - up/downcounter

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is a digital up/downcounter with adjustable limitation.

- Under C04005 you can select if the counter is to be stopped or reset automatically when reaching the limitation.

Inputs

Identifier/data type	Information/possible settings	
bClockUp BOOL	Upcounter	
	FALSE↗TRUE	Increase counter by "1".
bClockDown BOOL	Downcounter	
	FALSE↗TRUE	Reduce counter by "1".
bLoadStartValue BOOL	Accept starting value • This input has the highest priority.	
	TRUE	The starting value specified via *dnStartValue* is loaded into the counter.
dnStartValue DINT	Starting value	
dnReferenceValue DINT	Comparison value	

Outputs

Identifier/data type	Value/meaning	
dnActualCount DINT	Current counter content	
bCountEQReference BOOL	Result of the comparison of current counter content and comparison value	
	TRUE	$\|dnActualCount\| \geq \|dnReferenceValue\|$

Parameter

Parameter	Possible settings		Information
C04005			Reset function
	0	After reaching the reference value the counter is automatically reset to the starting value.	Lenze setting
	1	The reached reference value is maintained until a reset via *bLoadStartValue* is executed.	

5.162.1 Function 1: Automatic counter reset

Selection: C04005 = "0"

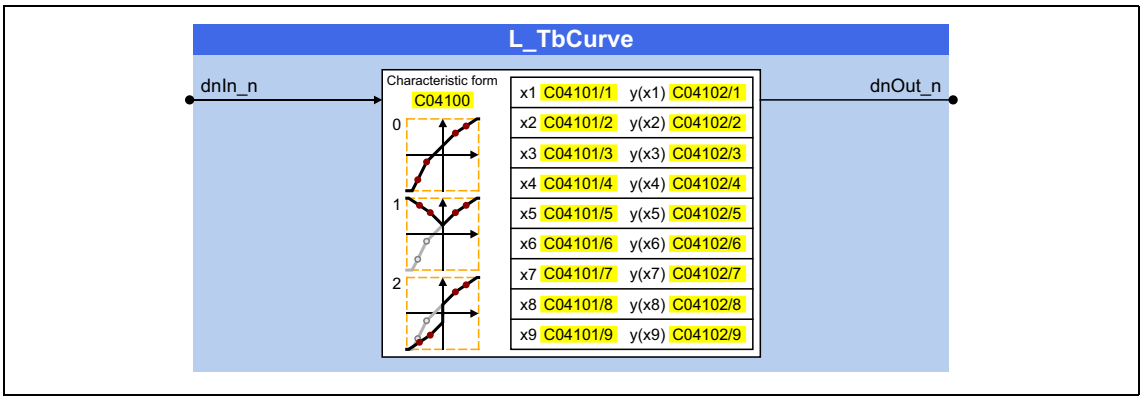
Functional sequence

1. If the amount of the current counter content ≥ the amount of the comparison value, the output *bCountEQReference* is set to TRUE (|*dnActualCount*| ≥ |*dnReferenceValue*|).
2. In the next cycle the counter is reset to the starting value *dnStartValue* and the output *bCountEQReference* is reset to FALSE.

5.162.2 Function 2: Counter stop at upper limit

Selection: C04005 = "1"

Functional sequence



1. If the amount of the current counter content ≥ the amount of the comparison value, the output *bCountEQReference* is set to TRUE (|*dnActualCount*| ≥ |*dnReferenceValue*|).
2. The counter inputs *bClockUp* and *bClockDown* are deactivated at the same time, i.e. counting upwards or downwards is not possible anymore.
3. By setting *bLoadStartValue* to TRUE the counter is reset to the starting value *dnStartValue* and the counter inputs *bClockUp* and *bClockDown* are evaluated again.

5.163 L_TbCurve - characteristic function

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB represents a characteristic/curve function y = f(x). Here, the input signal corresponds to the x axis and the output signal corresponds to the y axis.

- The characteristic can consist of up to nine points which are defined by parameters.
- Between the points a linear interpolation takes place.
- The characteristic can be entered over the entire value range and can also be created symmetrically to the y axis or zero point by selecting the corresponding characteristic mode in C04100.

Inputs

Identifier/data type	Information/possible settings
dnIn_n DINT	Input signal

Outputs

Identifier/data type	Value/meaning
dnOut_n DINT	Output signal

Parameter

Parameter	Possible settings		Information
C04100			Characteristic mode
	0	Entire range	Lenze setting
	1	Symmetrically to the y axis	
	2	Symmetrically to the zero point	

Parameter	Possible settings			Information
C04101/1...9	-200.00	%	200.00	X values of the characteristic function • Subcodes 1 ... 9 correspond to the point values X1 ... X9. • Initialisation: 0.00 %
C04102/1...9	-200.00	%	200.00	Y values of the characteristic function • Subcodes 1 ... 9 correspond to the point values Y1 ... Y9. • Initialisation: 0.00 %

5.163.1 Selection of the characteristic

The up to nine points of the characteristic are selected via the subcodes of C04101 and C04102.

- The same subcodes of C04101 and C04102 correspond to a pair of variates/point (x_n, y_n).

	1	2	...	9
x	C04101/**1**	C04101/**2**	C04101/...	C04101/**9**
Y	C04102/**1**	C04102/**2**	C04102/...	C04102/**9**

- The first pair of variates (C04101/1 and C04102/1) is always valid.
- The X values of the characteristic must be entered in ascending order (X1 < X2 < ... < X9).
- If the ascending chain of x values is interrupted, this corresponds to the end of the characteristic (in the example X5 < X4):

	1	2	3	4	5	6	7	8	9
x	-140 %	-90 %	70 %	145 %	0 %	0 %	0 %	0 %	0 %
Y	-140 %	-40 %	115 %	160 %	0 %	0 %	0 %	0 %	0 %

- Based on the last valid pair of variates, an extrapolation is executed to the end of the x value range (±200 %) on both sides.
- In the characteristic modes 1 and 2, only the range of the characteristic entered in the quadrants I. and IV. is used.

Special cases

- Jumps/discontinuities can be displayed by parameterising two successive x values the same way. A jump is only valid if a valid pair of variates exists after that, otherwise the extrapolation is executed starting from the last valid pair of variates.

	1	2	3	4	5	6	7	8	9
x	-130 %	-70 %	-70 %	80 %	0 %	0 %	0 %	0 %	0 %
y(x)	-150 %	-75 %	85 %	160 %	0 %	0 %	0 %	0 %	0 %

[5-125] Example: Characteristic in the characteristic mode 0 (entire range) with jump

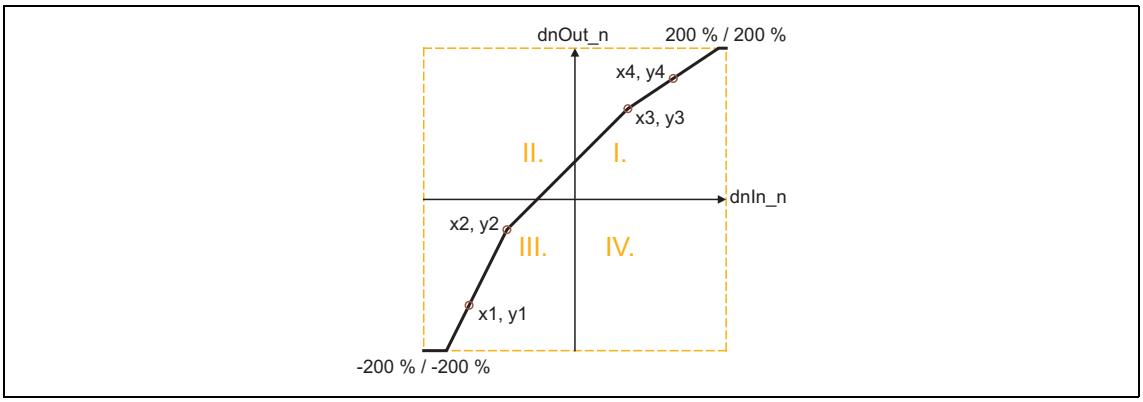
- If only one point X1 is defined in the negative range, X2 exists with the Lenze setting "0 %" as valid point (X2 > X1) and both points form a line:

	1	2	3	4	5	6	7	8	9
x	-130 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %
y(x)	40 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %

[5-126] Example: Characteristic in characteristic mode 0 (entire range) with only one defined point and X1 < 0

- If only one point X1 is defined in the positive range, a line is extrapolated:

	1	2	3	4	5	6	7	8	9
x	120 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %
y(x)	40 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %	0 %



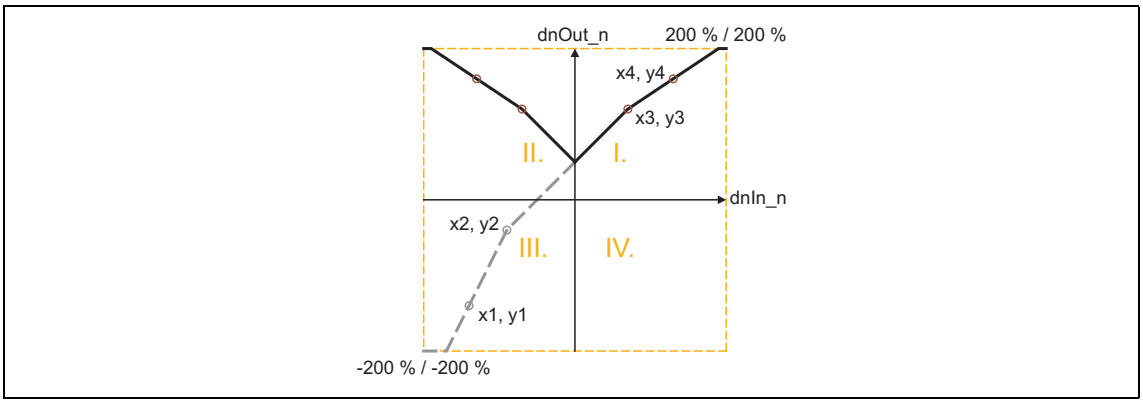
[5-127] Example: Characteristic in characteristic mode 0 (entire range) with only one defined point and X1 < 0

5.163.2 Characteristic mode 0: Entire range

If "Entire range" is selected in C04100, the entire characteristic range (quadrants I ... IV) is valid.

Example

	1	2	3	4	5	6	7	8	9
x	-140 %	-90 %	70 %	130 %	0 %	0 %	0 %	0 %	0 %
y(x)	-140 %	-40 %	120 %	160 %	0 %	0 %	0 %	0 %	0 %



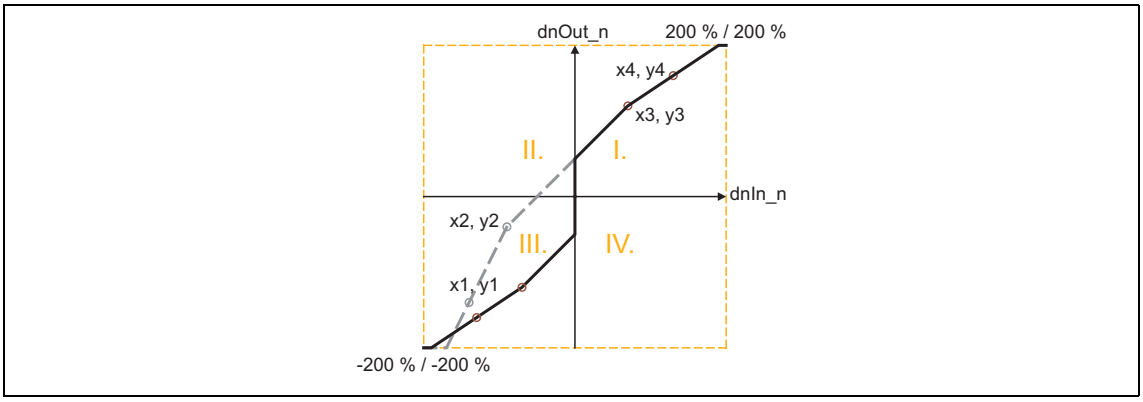
[5-128] Example: Characteristic in characteristic mode 0 (entire range)

5.163.3 Characteristic mode 1: Symmetrically to y axis

If "Symmetrically to y axis" is selected in C04100, the resulting characteristic is mirrored along the y axis in the I. and IV. quadrant.

Example

	1	2	3	4	5	6	7	8	9
x	-140 %	-90 %	70 %	130 %	0 %	0 %	0 %	0 %	0 %
y(x)	-140 %	-40 %	120 %	160 %	0 %	0 %	0 %	0 %	0 %



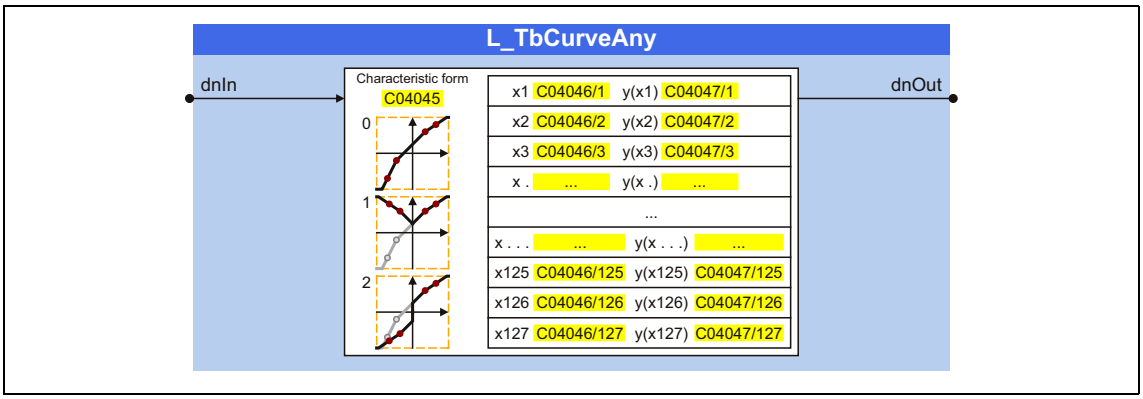
[5-129] Example: Characteristic in characteristic mode 1 (symmetrically to y axis)

5.163.4 Characteristic mode 2: Symmetrically to zero point

If "Symmetrically to zero point" is selected in C04100, the resulting characteristic is mirrored along the zero point in the I. and IV. quadrant.

Example

	1	2	3	4	5	6	7	8	9
x	-140 %	-90 %	70 %	130 %	0 %	0 %	0 %	0 %	0 %
y(x)	-140 %	-40 %	120 %	160 %	0 %	0 %	0 %	0 %	0 %



[5-130] Example: Characteristic in characteristic mode 2 (symmetrically to zero point)

5.164 L_TbCurveAny - Characteristic function

Function library:	LenzeToolbox	**FB is available as of library V02.06.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB represents a characteristic/curve function y = f(x). Here, the input signal corresponds to the x axis and the output signal corresponds to the y axis.

- The characteristic can consist of up to 127 points which are defined by parameters.
- Between the points a linear interpolation takes place.
- The characteristic can be entered over the entire value range and can also be created symmetrically to the y axis or zero point by selecting the corresponding characteristic mode in C04045.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal

Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal

Parameters

Parameter	Possible settings		Info
C04045			Characteristic mode
	0	Entire range	Lenze setting
	1	Symmetrically to the y axis	
	2	Symmetrically to the zero point	

Parameter	Possible settings			Info
C04046/1...127	-2147483648		2147483647	X values of the characteristic function • Subcodes 1 ... 127 correspond to the point values X1 ... X127. • Initialisation: 0
C04047/1...127	-2147483648		2147483647	Y values of the characteristic function • Subcodes 1 ... 127 correspond to the point values Y1 ... Y127. • Initialisation: 0

Tip!

For a better understanding, in the following examples, the converted percentages referring to the limit values 2^{31}-1 and -(2^{31}) are entered instead of the real DINT values.

5.164.1 Selection of the characteristic

The up to 127 points of the characteristic are selected via the subcodes of C04046 and C04047.

- The same subcodes of C04046 and C04047 correspond to a pair of variates/point (x_n, y_n).

	1	2	...	127
x	C04046/**1**	C04046/**2**	C04046/...	C04046/127
Y	C04047/**1**	C04047/**2**	C04047/...	C04047/127

- The first pair of variates (C04046/1 and C04047/1) is always valid.
- The x values of the characteristic must be entered in ascending order (x1 < x2 < ... < x127).
- If the ascending chain of x values is interrupted, this corresponds to the end of the characteristic (in the example X5 < X4):

	1	2	3	4	5	6	...	126	127
x	-140 %	-90 %	70 %	145 %	0	0	0	0	0
y	-140 %	-40 %	115 %	160 %	0	0	0	0	0

- Based on the last valid pair of variates, an extrapolation is executed to the end of the x value range (2^{31})-1 on both sides.
- In the characteristic modes 1 and 2, only the range of the characteristic entered in the quadrants I. and IV. is used.

Special cases

- Jumps/discontinuities can be displayed by parameterising two successive x values the same way. A jump is only valid if a valid pair of variates exists after that, otherwise the extrapolation is executed starting from the last valid pair of variates.

	1	2	3	4	5	6	...	126	127
x	-130 %	-70 %	-70 %	80 %	0	0	0	0	0
y(x)	-150 %	-75 %	85 %	160 %	0	0	0	0	0

[5-131] Example: Characteristic in the characteristic mode 0 (entire range) with jump

- If only one point X1 is defined in the negative range, X2 exists with the Lenze setting "0" as valid point (X2 > X1) and both points form a line:

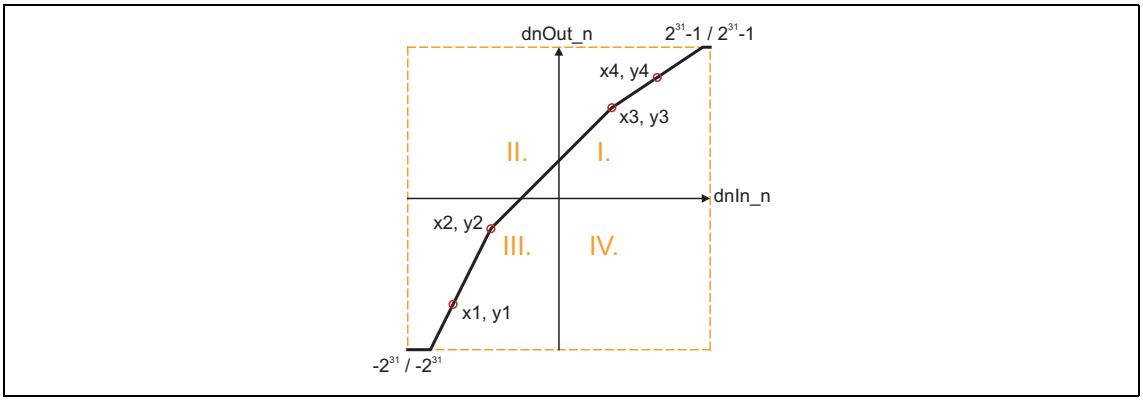
	1	2	3	4	5	6	...	126	127
x	-130 %	0	0	0	0	0	0	0	0
y(x)	40 %	0	0	0	0	0	0	0	0

[5-132] Example: Characteristic in characteristic mode 0 (entire range) with only one defined point and X1 < 0

- If only one point X1 is defined in the positive range, a line is extrapolated:

	1	2	3	4	5	6	...	126	127
x	120 %	0	0	0	0	0	0	0	0
y(x)	40 %	0	0	0	0	0	0	0	0

[5-133] Example: Characteristic in characteristic mode 0 (entire range) with only one defined point and X1 < 0



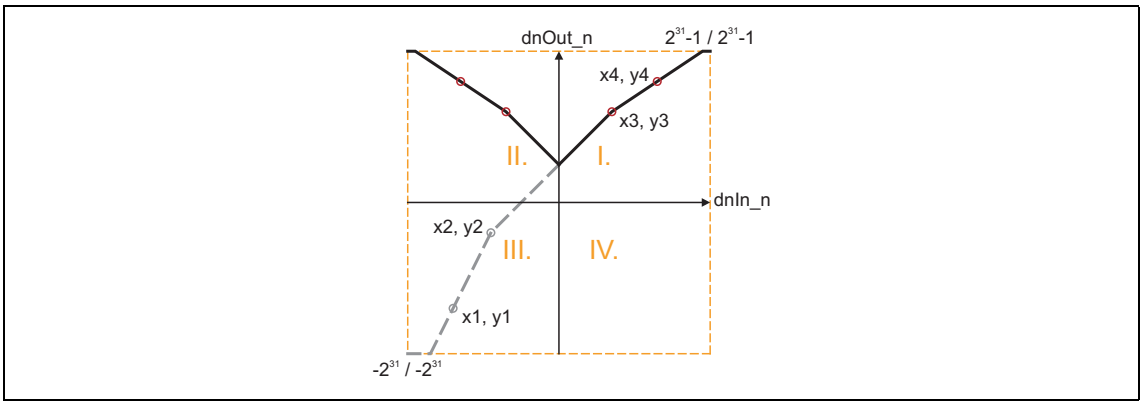
5.164.2 Characteristic mode 0: Entire range

If "Entire range" is selected in C04045, the entire characteristic range (quadrants I ... IV) is valid.

Note: For a better understanding, the corresponding percentages are entered instead of the real DINT values.

Example

	1	2	3	4	5	6	...	126	127
x	-140 %	-90 %	70 %	130 %	0	0	0	0	0
y(x)	-140 %	-40 %	120 %	160 %	0	0	0	0	0



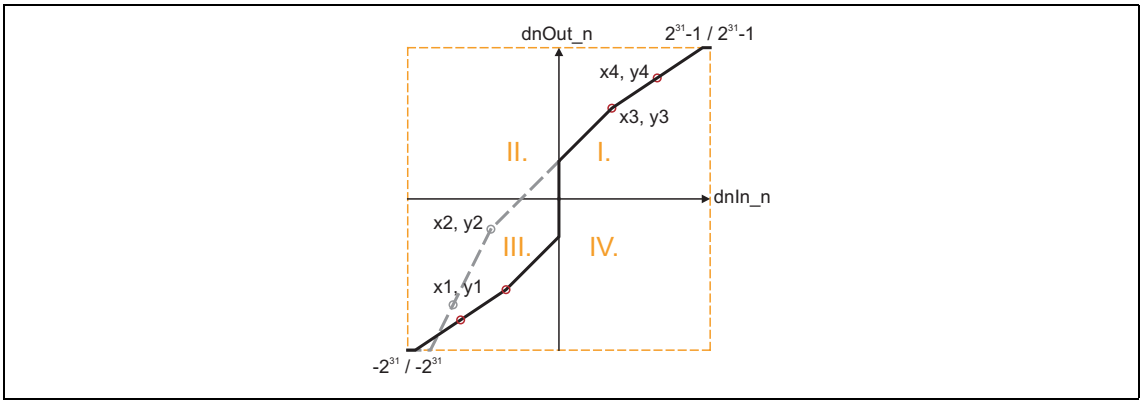
[5-134] Example: Characteristic in characteristic mode 0 (entire range)

5.164.3 Characteristic mode 1: Symmetrically to y axis

If "Symmetrically to y axis" is selected in C04045, the resulting characteristic is mirrored along the y axis in the I. and IV. quadrant.

Example

	1	2	3	4	5	6	...	126	127
x	-140 %	-90 %	70 %	130 %	0	0	0	0	0
y(x)	-140 %	-40 %	120 %	160 %	0	0	0	0	0



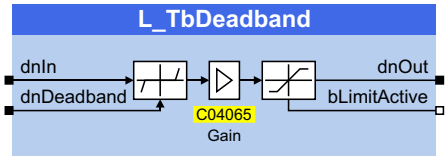
[5-135] Example: Characteristic in characteristic mode 1 (symmetrically to y axis)

5.164.4 Characteristic mode 2: Symmetrically to zero point

If "Symmetrically to zero point" is selected in C04045, the resulting characteristic is mirrored along the zero point in the I. and IV. quadrant.

Example

	1	2	3	4	5	6	...	126	127
x	-140 %	-90 %	70 %	130 %	0	0	0	0	0
y(x)	-140 %	-40 %	120 %	160 %	0	0	0	0	0



[5-136] Example: Characteristic in characteristic mode 2 (symmetrically to zero point)

5.165 L_TbDeadband - dead band with gain

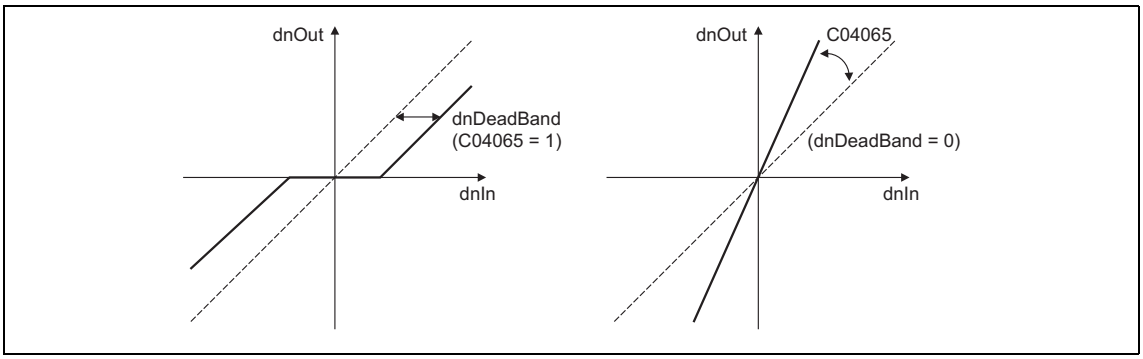
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB produces a symmetrical dead band around zero.

- The attenuation of the input signal caused by the dead band can be compensated by a parameterisable gain.
- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.
- The function corresponds by approximation to the "DB" function of the 9300 servo inverter.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal
dnDeadband DINT	Dead band area for the input signal • Value is internally limited to ≥0.



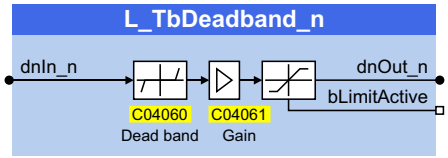
Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal • If |*dnIn*| ≤ *dnDeadband* the output is set to zero. • If |*dnIn*| > *dnDeadband* the difference multiplied by the parameterised gain is output as output signal. • The sign results from the sign of *dnIn* and the sign of the selected gain. • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The output signal *dnOut* is limited.

Parameter

Parameter	Possible settings			Information
C04065	-214748.3647		214748.3647	Gain • Initialisation: 1.0000

Function



[5-137] Dead band and gain

5.166 L_TbDeadband_n - scaled dead band with gain

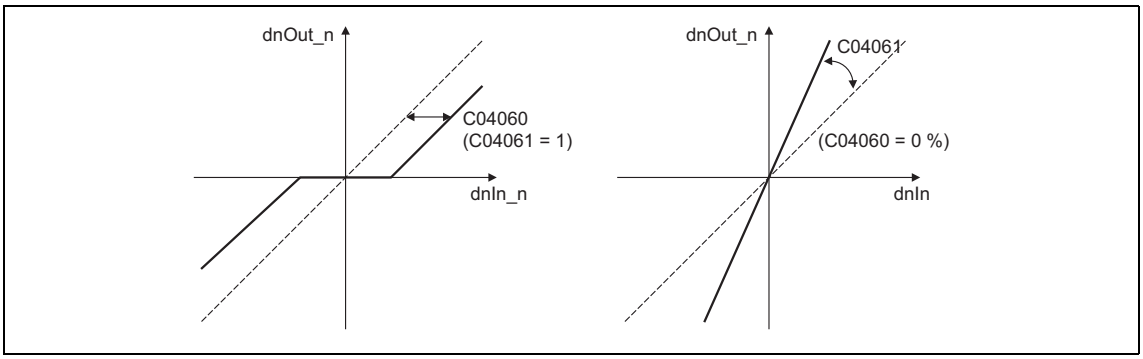
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB produces a symmetrical dead band around zero.

- The attenuation of the input signal caused by the dead band can be compensated by a parameterisable gain.
- The value output to *dnOut* is internally limited to ±200 %.
- The *bLimitActive* output displays if a limitation is active.
- The function corresponds by approximation to the "DB" function of the 9300 servo inverter.

Inputs

Identifier/data type	Information/possible settings
dnIn_n DINT	Input signal



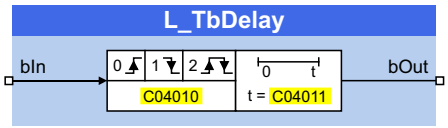
Outputs

Identifier/data type	Value/meaning	
dnOut_n DINT	Output signal • If |*dnIn_n*| ≤ C04060 the output is set to zero. • If |*dnIn_n*| > C04060 the difference multiplied by the parameterised gain is output as output signal. • The sign results from the sign of *dnIn_n* and the sign of the selected gain. • Internally limited to ±200 %	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The output signal *dnOut_n* is limited.

Parameter

Parameter	Possible settings			Information
C04060	0.00	%	100.00	Dead band • Initialisation: 1.00 %
C04061	-214748.3647		214748.3647	Gain • Initialisation: 1.0000

Function



[5-138] Dead band and gain

5.167 L_TbDelay - delay

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB delays binary signals.

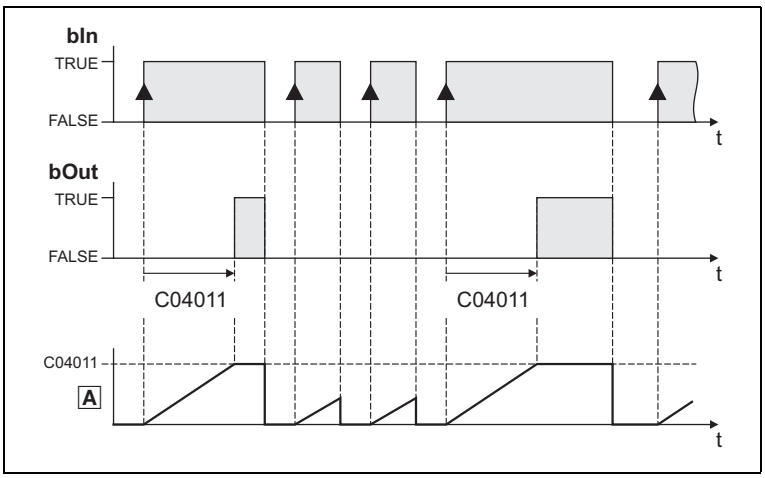
- The edge to be delayed is selected via the parameter C04010.
- The delay time is set via the parameter C04011.
- The function corresponds to the "DIGDEL" function of the 9300 servo inverter.

Inputs

Identifier/data type	Information/possible settings
bin BOOL	Input

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Output with time-delayed input signal



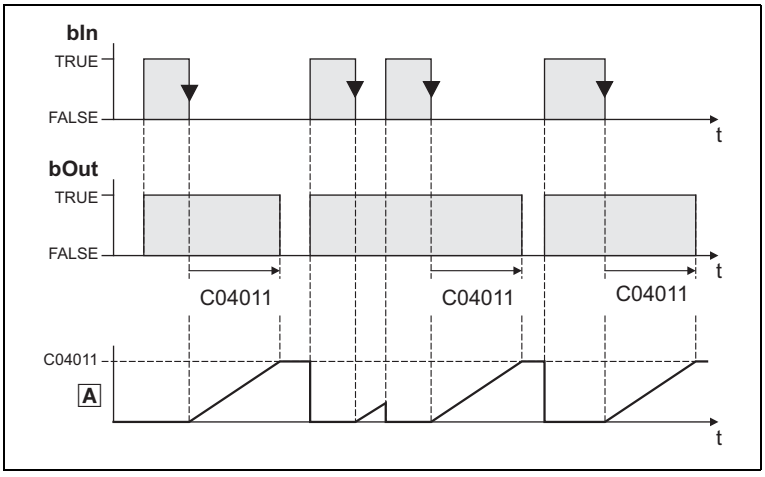
Parameter

Parameter	Possible settings			Information
C04010				Selection of the edge to be delayed
	0	Rising edge		Lenze setting
	1	Falling edge		
	2	Both edges		
C04011	0.000	s	60.000	Delay time • Initialisation: 0.001 s

5.167.1 Function 1: ON-delay

Selection: C04010 = "0" (Lenze setting)

- In this mode, the FB operates like a retriggerable monoflop.



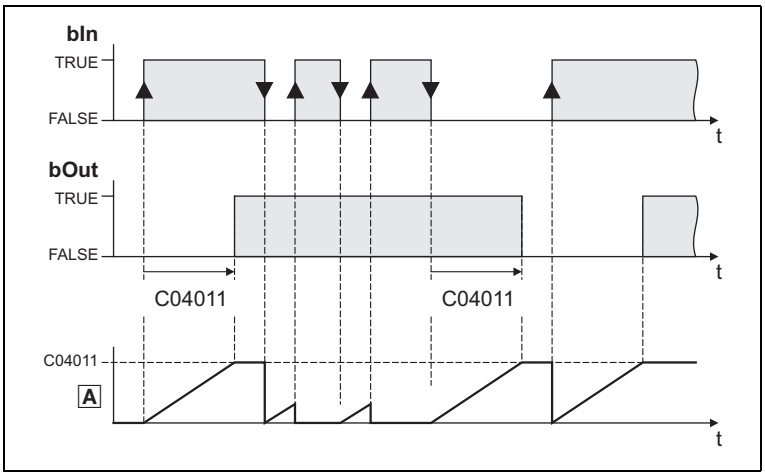
A = internal timing element

Functional sequence

1. A FALSE-TRUE edge at *bIn* starts the internal timing element (A).
2. After the delay time set via C04011 has elapsed, *bOut* is set to TRUE.
3. A TRUE-FALSE edge at b*In* sets *bOut* to FALSE again. Simultaneously, the internal timing element is reset.

5.167.2 Function 2: OFF-delay

Selection: C04010 = "1"



A = internal timing element

Functional sequence

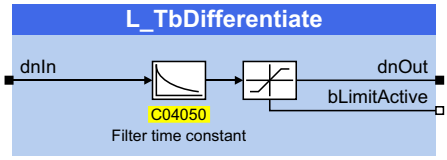
1. A FALSE-TRUE edge at b*In* sets *bOut* to TRUE. Simultaneously, the internal timing element (A) is reset.
2. A TRUE-FALSE edge at b*In* starts the internal timing element.
3. After the delay time set via C04011 has elapsed, *bOut* is reset to FALSE.

5.167.3 Function 3: General delay

Selection: C04010 = "2"

A = internal timing element

Functional sequence



1. Any edge at b*In* resets and starts the internal timing element (A).
2. After the delay time set via C04011 has elapsed, the input signal *bIn* is output to *bOut*.

5.168 L_TbDifferentiate - differentiator with low-pass filter

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB represents a differentiator with low pass.

- The input signal is differentiated and filtered with the filter time constant set via the parameter C04050.
- The *dnOut* output signal has the unit [1/s] as time reference. ▸ Adapting the time reference (📖 584)
- The *dnOut* output signal is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

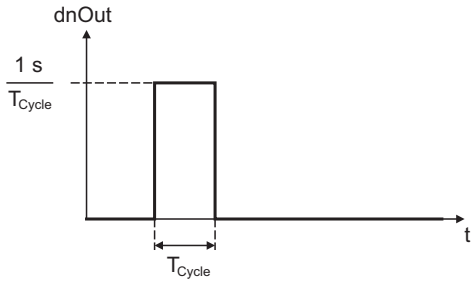
Identifier/data type	Information/possible settings
dnIn DINT	Input signal

Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

Parameter

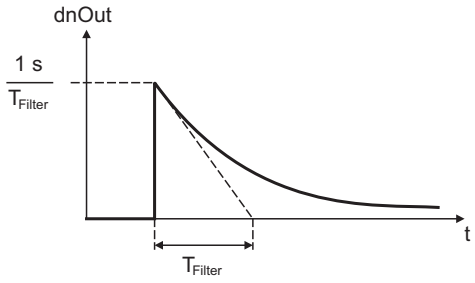
Parameter	Possible settings			Information
C04050	0.001	s	60.000	Filter time constant T_{Filter} • Initialisation: 0.001 s



5.168.1 Function

Considering the signalling technique, the FB consists of the series connection of a time-discrete differentiator and a PT1 filter.

- The filtering of the output signal can be switched off with the setting of the filter time constant T_{Filter} to "0.001 s". In this case, the output signal results directly from:

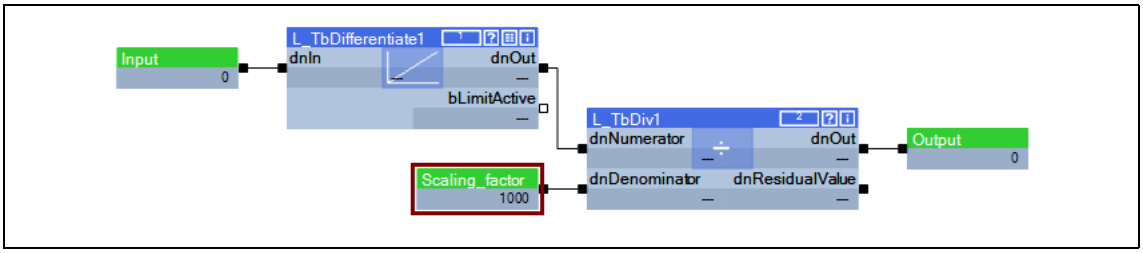


$$dnOut = \Delta dnIn \cdot \frac{1\ s}{\text{Task cycle time}}$$

[5-139] Formula for the output signal when the filter is switched off

[5-140] Step response when filter is switched off

- When the filter is switched on, each change of the input signal is evaluated with 1 s/T_{Filter}. Then the output signal tends to zero with the filter time constant T_{Filter}:



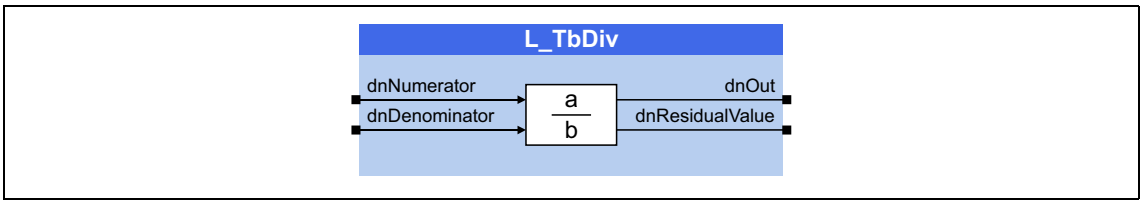
C04050: Filter time constant T_{Filter}

[5-141] Step response when the filter is switched on

5.168.2 Adapting the time reference

The *dnOut* output signal has the unit [1/s] as time reference.

The *dnOut* output signal can be adapted to the required unit by dividing the output signal by a corresponding scaling factor:



[5-142] Model connection for adapting the time reference

Example: Required unit of the signal *Output* = [1/ms] ➞ scaling factor = 1000

5.169 L_TbDiv - division

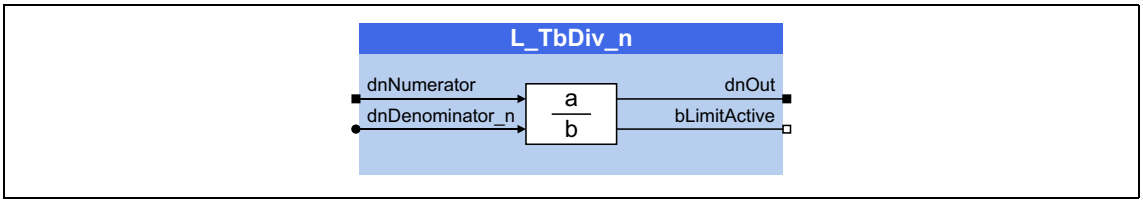
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a division with remainder.

Inputs

Identifier/data type	Information/possible settings
dnNumerator DINT	Dividend (numerator)
dnDenominator DINT	Divisor (denominator)

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Quotient value (integer result of division)
dnResidualValue DINT	Remainder

5.170 L_TbDiv_n - scaled division

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

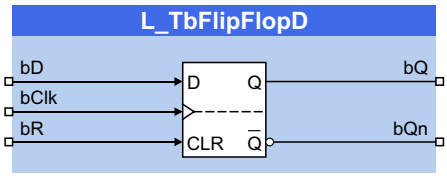
This FB carries out a division. The divisor (denominator) must be specified as a scaled signal [%].

- With a divisor of 100 % the dividend is output unchanged.
- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnNumerator DINT	Dividend (numerator)
dnDenominator_n DINT	Divisor (denominator) • Scaling: 100 % ≡ 2^{30} ≡ 1073741824

Outputs



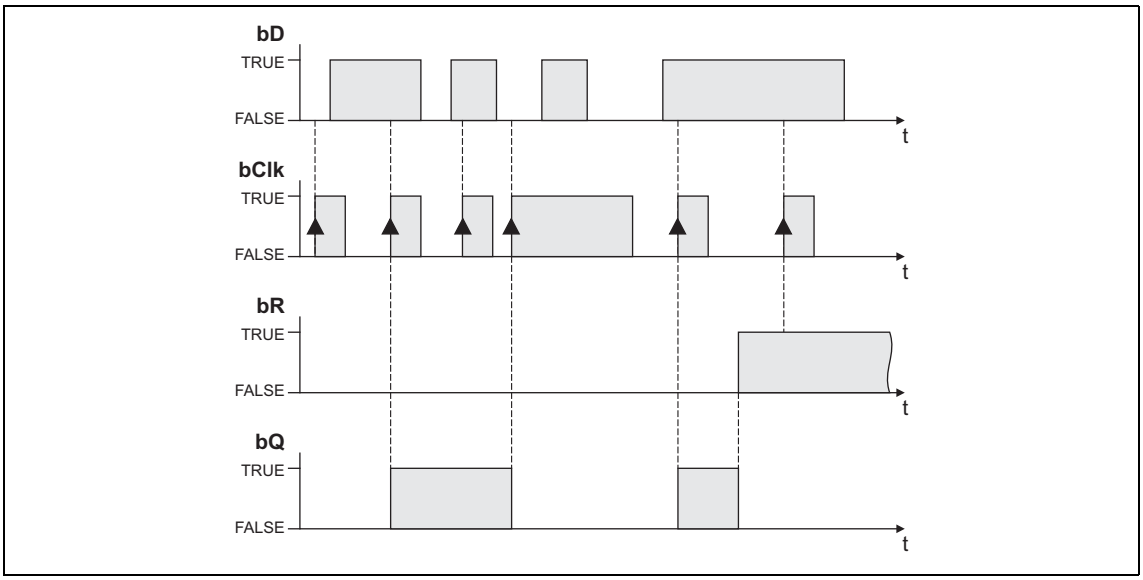
Identifier/data type	Value/meaning	
dnOut DINT	Quotient value (result of the division) • Internal limitation to $\pm 2^{31}$-1 (≡ ±200 %)	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

5.171 L_TbFlipFlopD - D flipflop

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is created as a D flipflop and can be used to evaluate and save digital signal edges.

- With each rising edge at the clock input *bClk* the current status of the input *bD* is saved internally and output to the output *bOut*.
- The flipflop can be reset by a TRUE signal at the reset input *bR* which has the highest priority.



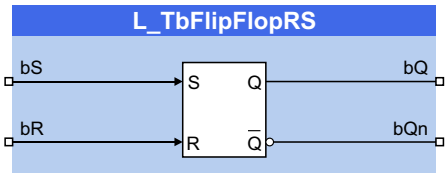
Inputs

Identifier/data type	Information/possible settings	
BD BOOL	Input	
bClk BOOL	Saving of input value	
	FALSE↗TRUE	The input value *bD* is saved internally and output to *bOut* until a new value is saved or the flipflop is reset via *bR*.
bR BOOL	Flipflop reset • This input has the highest priority.	
	TRUE	The output *bOut* is reset to FALSE.

Outputs

Identifier/data type	Value/meaning
bQ BOOL	State of the D flipflop
bQn BOOL	Inverted state of the D flipflop (≡ $\overline{bQ}$)

Function



[5-143] Switching performance of the D flipflop

5.172 L_TbFlipFlopRS - status-controlled RS flipflop

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB is created as an RS flipflop and can be used to evaluate and save digital signals.

- The RS flipflop is set with a TRUE signal at the set input *bS* and reset with a TRUE signal at the reset input *bR*.
- If both inputs are applied with a FALSE signal, the output state is maintained.

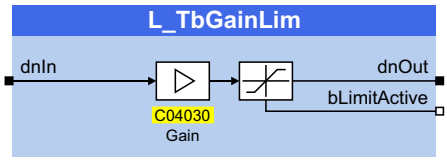
Inputs

Identifier/data type	Information/possible settings	
bS BOOL	Set input	
	TRUE	Set RS flipflop.
bR BOOL	Reset input	
	TRUE	Reset RS flipflop.

Outputs

Identifier/data type	Value/meaning
bQ BOOL	State of the RS flipflop
bQn BOOL	Inverted state of the RS flipflop (≡ $\overline{bQ}$)

Function



bS	bR	bQ	bQn
FALSE	FALSE	unchanged	unchanged
TRUE	FALSE	TRUE	FALSE
FALSE	TRUE	FALSE	TRUE
TRUE	TRUE	FALSE	TRUE

5.173 L_TbGainLim - gain with limitation

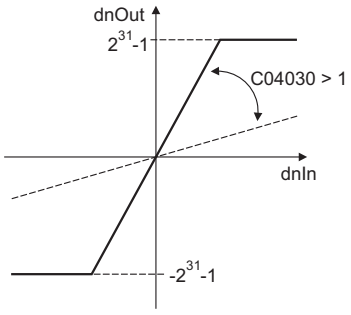
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB amplifies the input signal.

- The gain is set via the parameter C04030.
- The value output to output *dnOut* is internally limited to $\pm 2^{31}-1$.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal



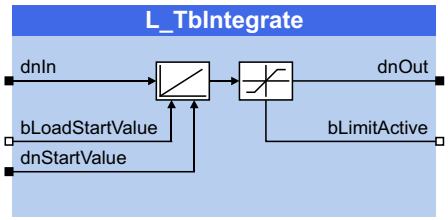
Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal • Internally limited to $\pm 2^{31}-1$	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The output signal *dnOut* is limited.

Parameter

Parameter	Possible settings			Information
C04030	-214748.3647		214748.3647	Gain • Initialisation: 1.0000

Function



[5-144] Gain and limitation

5.174 L_TbIntegrate - integration with limitation

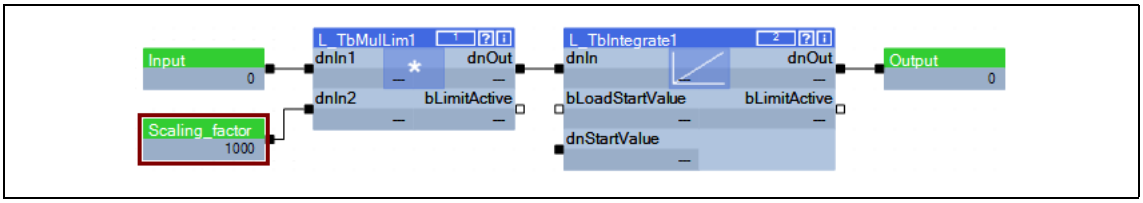
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out an integration with limitation.

- The *dnIn* input signal has the unit [1/s] as time reference. ▸ Adapting the time reference (📖 592)
- The *dnOut* output signal is internally limited to $\pm 2^{31}-1$.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal
bLoadStartValue BOOL	Loading of the integrator TRUE: Load the integrator with the value at the *dnStartValue* input.
dnStartValue DINT	Value with which the integrator is loaded by setting *bLoadStartValue* to TRUE.



Outputs

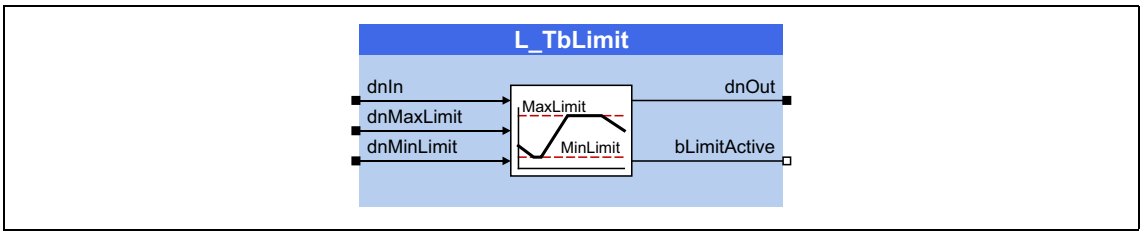
Identifier/data type	Value/meaning
dnOut DINT	Output signal • Internally limited to $\pm 2^{31}-1$
bLimitActive BOOL	Status signal "Limitation active" TRUE: The output signal is limited.

5.174.1 Adapting the time reference

The *dnIn* input signal has the unit [1/s] as time reference.

An input signal can easily be adapted to the expected unit [1/s] by multiplying it by a corresponding scaling factor:

[5-145] Model connection for adapting the time reference



Example: Time reference of the *Input* input signal = [1/ms] ➞ scaling factor = 1000

5.175 L_TbLimit - limitation (for "DINT" data type)

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB limits a signal of "DINT" data type to an adjustable value range.

- The upper and lower limits of the value range are set via the inputs *dnMaxLimit* and *dnMinLimit*.
- The *bLimitActive* output displays if a limitation is active.

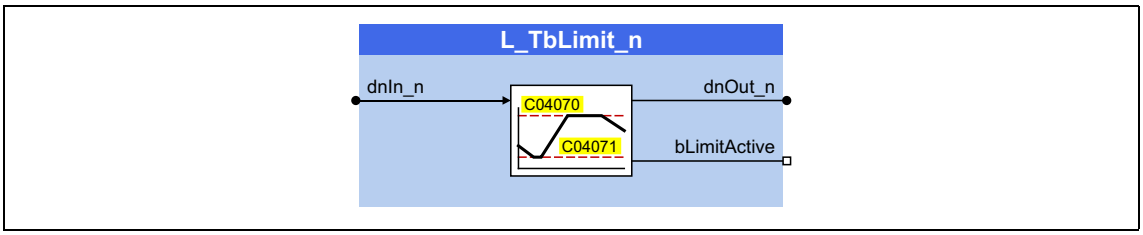
Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal
dnMaxLimit DINT	Upper limitation
dnMinLimit DINT	Lower limitation

Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The output signal *dnOut* is limited.

Tip!



The lower limit must always be set smaller than the upper limit, otherwise the value "0" is output at *dnOut*.

5.176 L_TbLimit_n - scaled limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB limits a scaled signal [%] to an adjustable value range.

- The upper and lower limits of the value range are set via the parameters C04070 and C04071.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn_n DINT	Input signal • Scaling: 100 % ≡ 2^{30} ≡ 1073741824

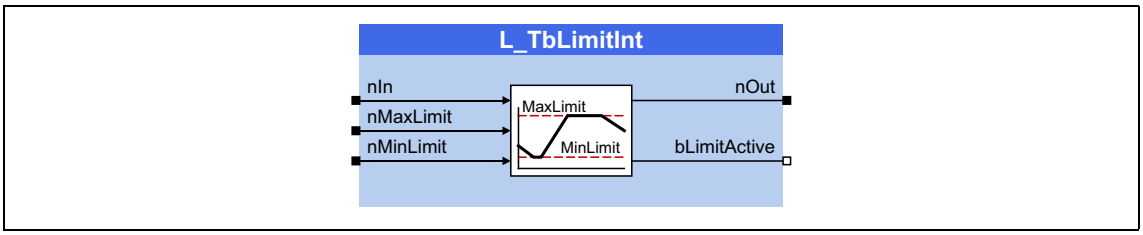
Outputs

Identifier/data type	Value/meaning	
dnOut_n DINT	Output signal • Scaling: 100 % ≡ 2^{30} ≡ 1073741824	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The output signal *dnOut_n* is limited.

Parameter

Parameter	Possible settings			Information
C04070	-200.00	%	200.00	Upper limitation • Initialisation: 100.00 %
C04071	-200.00	%	200.00	Lower limitation • Initialisation: -100.00 %

Tip!



The lower limit must always be set smaller than the upper limit, otherwise the value "0" is output at *dnOut_n*.

5.177 L_TbLimitInt - limitation (for "INT" data type)

Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This FB limits a signal of "INT" data type to an adjustable value range.

- The upper and lower limits of the value range are set via the inputs *nMaxLimit* and *nMinLimit*.
- The *bLimitActive* output displays if a limitation is active.

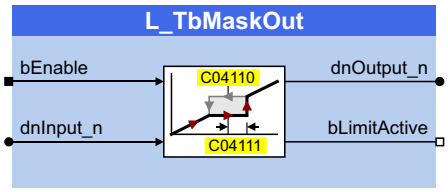
Inputs

Identifier/data type	Information/possible settings
nIn INT	Input signal
nMaxLimit INT	Upper limitation
nMinLimit INT	Lower limitation

Outputs

Identifier/data type	Value/meaning	
nOut INT	Output signal	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The *nOut* output signal is limited.

Tip!



The lower limit must always be set smaller than the upper limit, otherwise the value "0" is output at *nOut*.

5.178 L_TbMaskOut - zone masking

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

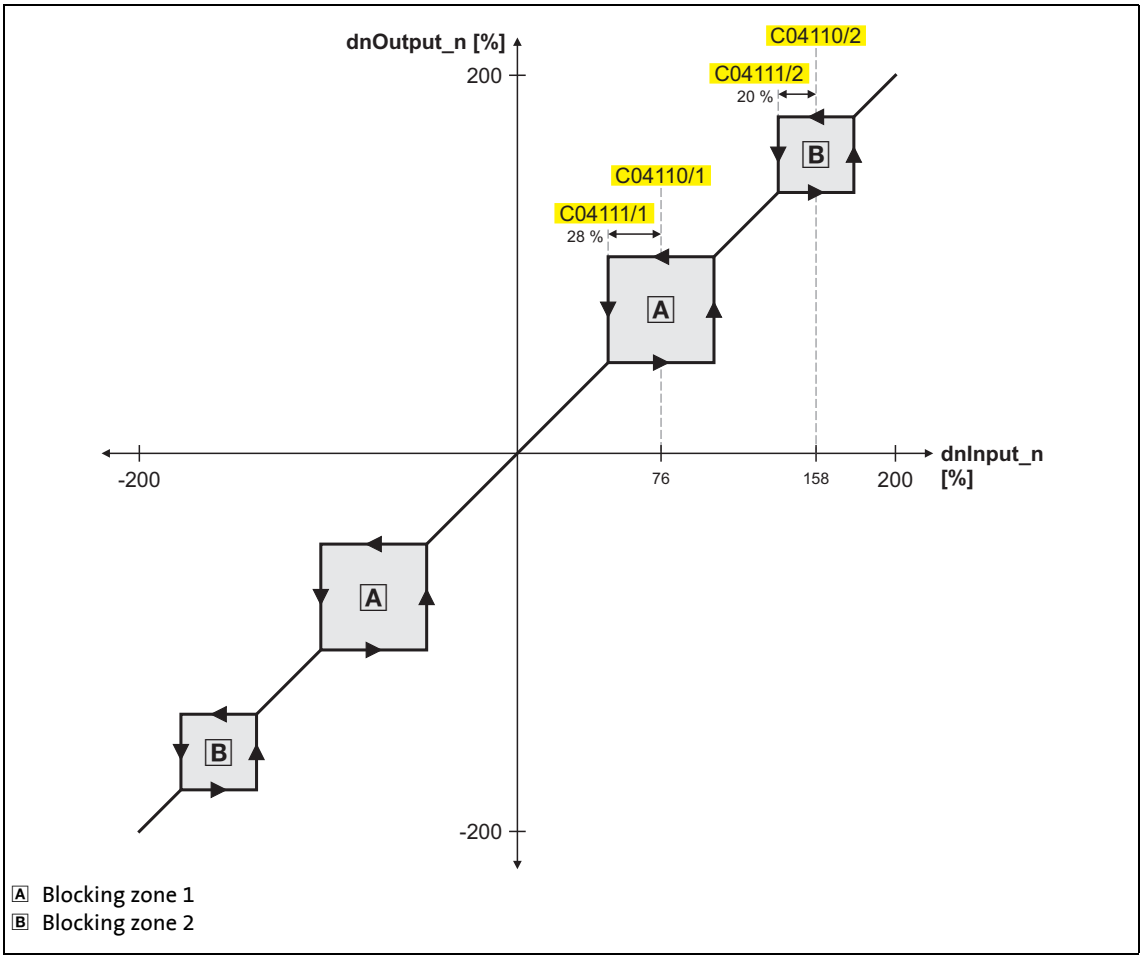
This FB masks up to four parameterisable blocking zones within a continuous signal characteristic.

- The definition of the upper and lower limits of the blocking zones is effected by specifying the mean value and the half width of the respective zone.
- The FB can be generally used (no measuring system reference).

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activate zone masking	
	FALSE	The FB is deactivated. • The input signal is shown 1:1 at the output d*nOutput_n*.
	TRUE	The FB is activated. • A zone masking of the input signal according to the parameterised blocking zones is carried out.
dnInput_n DINT	Scaled input signal in [%]	

Outputs



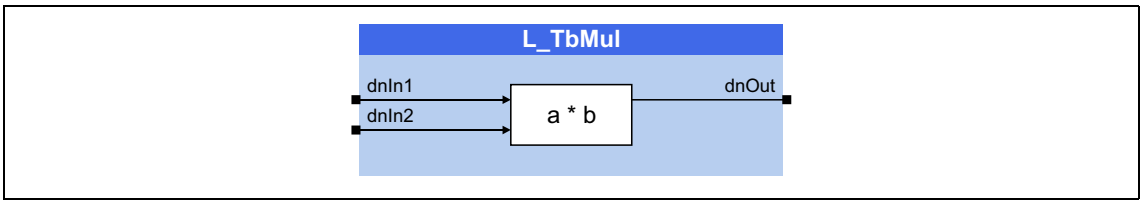
Identifier/data type	Value/meaning	
dnOutput_n DINT	Scaled output signal in [%] • If the FB is activated, the output signal is beyond the blocking zones.	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The input signal is within a blocking zone and is limited to the corresponding boundary value of the zone.

Parameter

Parameter	Possible settings			Information
C04110/1...4	0.00	%	200.00	Mean value of blocking zones 1 ... 4 • Initialisation: 0.00 %
C04111/1...4	0.00	%	100.00	Half width of blocking zones 1 ... 4 • Initialisation: 0.00 %

Function

The parameterised blocking zones act in the same way on negative input signals:



[5-146] Zone masking by means of parameterisable blocking zones

Parameter	Blocking zone 1	Blocking zone 2	Blocking zone 3	Blocking zone 4
Mean value	76 % (C04110/1)	158 % (C04110/2)	0 % (C04110/3)	0 % (C04110/4)
Half width	28 % (C04111/1)	20 % (C04111/2)	0 % (C04111/3)	0 % (C04111/4)

5.179 L_TbMul - multiplication

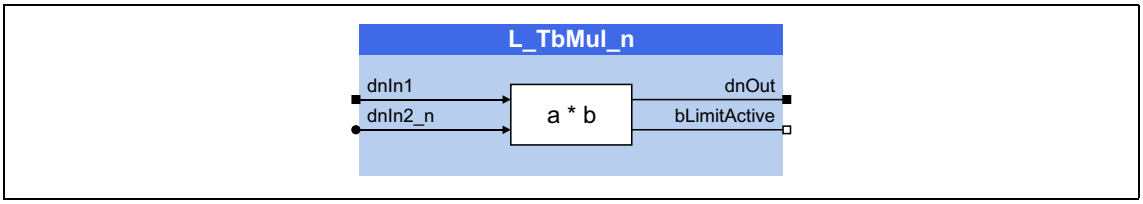
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a multiplication without limitation.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	Multiplier (1st factor)
dnIn2 DINT	Multiplicand (2nd factor)

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Product value (result of the multiplication) with overflow • No internal limitation, thus an overflow is possible.

5.180 L_TbMul_n - scaled multiplication with limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

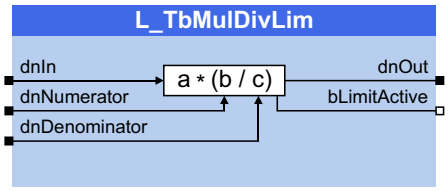
This FB carries out a multiplication. The multiplicand (2. factor) must be specified as a scaled signal [%].

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	Multiplier (1st factor)
dnIn2_n DINT	Multiplicand (2nd factor) • Scaling: 100 % ≡ 2^{30} ≡ 1073741824

Outputs



Identifier/data type	Value/meaning	
dnOut DINT	Product value (result of the multiplication) • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

5.181 L_TbMulDivLim - multiplication and division with limitation

Function library:	LenzeToolbox	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

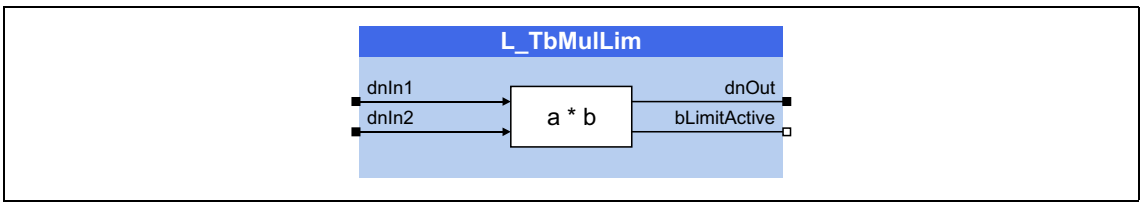
This FB carries out a multiplication with subsequent division and limitation.

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Multiplier (1st factor)
dnNumerator DINT	Multiplicand (2nd factor)
dnDenominator DINT	Divisor

Outputs



Identifier/data type	Value/meaning	
dnOut DINT	Result of the multiplication and division • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

5.182 L_TbMulLim - multiplication with limitation

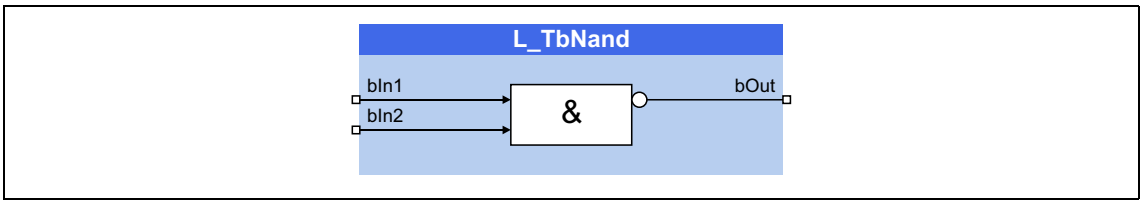
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a multiplication with limitation.

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	Multiplier (1st factor)
dnIn2 DINT	Multiplicand (2nd factor)



Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Product value (result of the multiplication) • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.

5.183 L_TbNand - NAND with 2 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a logic NAND operation of binary signals.

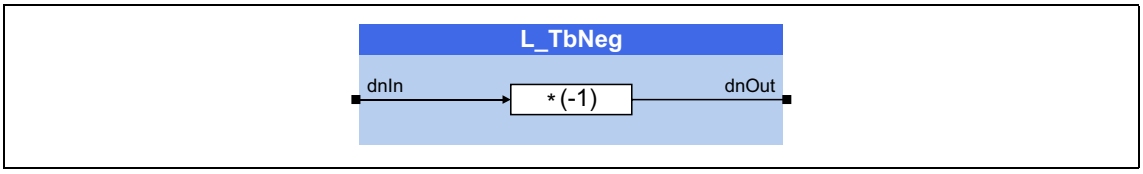
Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the NAND operation

Function



bIn2	bIn1	bOut
FALSE	FALSE	TRUE
FALSE	TRUE	TRUE
TRUE	FALSE	TRUE
TRUE	TRUE	FALSE

5.184 L_TbNeg - negation (for "DINT" data type)

Function library:	LenzeToolbox	
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

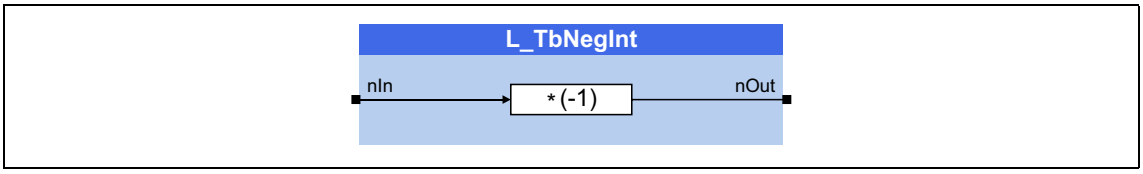
This function block inverts the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The L_TbNegSel FB is available for optional inversion.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Output signal

5.185 L_TbNegInt - negation (for "INT" data type)

Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

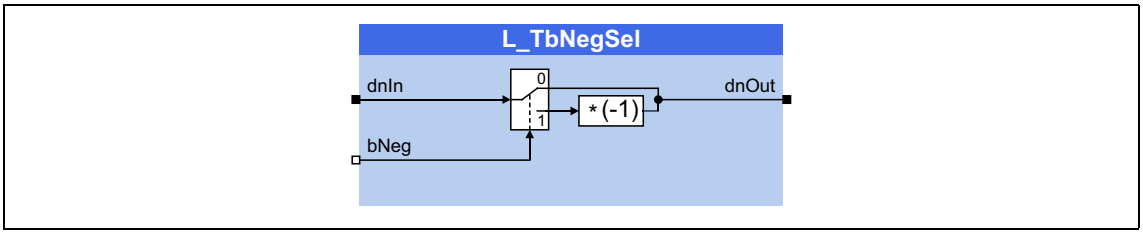
This function block inverts the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.

- The value output to output *nOut* is internally limited to $\pm 2^{15}$-1.
- The FB L_TbNegSelInt is available for optional inversion.

Inputs

Identifier/data type	Information/possible settings
nIn INT	Input signal

Outputs



Identifier/data type	Value/meaning
nOut INT	Output signal

5.186 L_TbNegSel - optional negation (for "DINT" data type)

Function library:	LenzeToolbox	**FB is available as of library V02.02!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

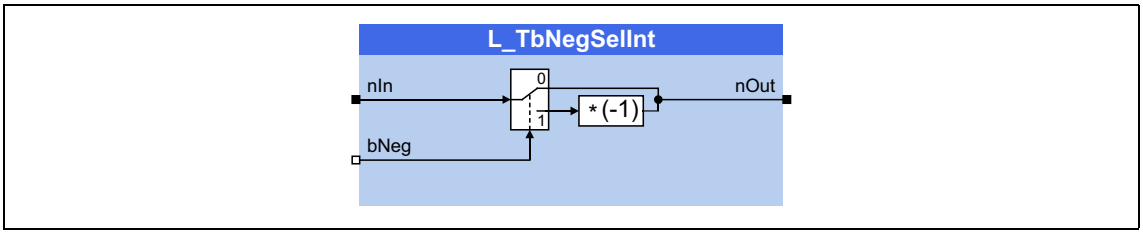
This function block inverts (optionally) the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.

- In contrast to the L_TbNeg FB, this FB is only inverted if the *bNeg* control input is set to TRUE.
- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.

Inputs

Identifier/data type	Information/possible settings	
dnIn DINT	Input signal	
bNeg BOOL	Activate inversion	
	FALSE	*dnOut = dnIn*
	TRUE	*dnOut = -dnIn*

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Output signal

5.187 L_TbNegSelInt - optional negation (for "INT" data type)

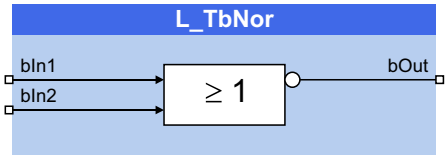
Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This function block inverts (optionally) the sign of the input signal, i.e. the input signal is multiplied by -1 and is then output.

- In contrast to the L_TbNegInt FB, this FB is only inverted if the *bNeg* control input is set to TRUE.
- The value output to output *nOut* is internally limited to $\pm 2^{15}$-1.

Inputs

Identifier/data type	Information/possible settings	
nIn INT	Input signal	
bNeg BOOL	Activate inversion	
	FALSE	*nOut = nIn*
	TRUE	*nOut = -nIn*



Outputs

Identifier/data type	Value/meaning
nOut INT	Output signal

5.188 L_TbNor - NOR with 2 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

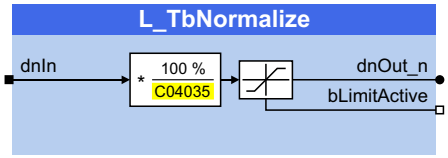
This FB carries out a logic NOR operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the NOR operation



Function

bIn2	bIn1	bOut
FALSE	FALSE	TRUE
FALSE	TRUE	FALSE
TRUE	FALSE	FALSE
TRUE	TRUE	FALSE

5.189 L_TbNormalize - signal scaling with limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB scales any signal to a parameterisable reference variable.

Inputs

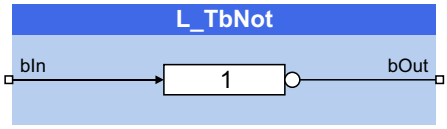
Identifier/data type	Information/possible settings
dnIn DINT	Input signal

Outputs

Identifier/data type	Value/meaning	
dnOut_n DINT	Scaled output signal • Internally limited to ±200 %	
bLimitActive BOOL	Output signal within the limitation	
	TRUE	The output signal *dnOut_n* is limited.

Parameter

Parameter	Possible settings			Information
C04035	-2147483647		2147483647	Reference variable • Setting "0" is not possible. • Initialisation: 1073741824



Function

$$dnOut_n = \frac{dnIn}{C04035} \cdot 100\ \%$$

5.190 L_TbNot - negation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

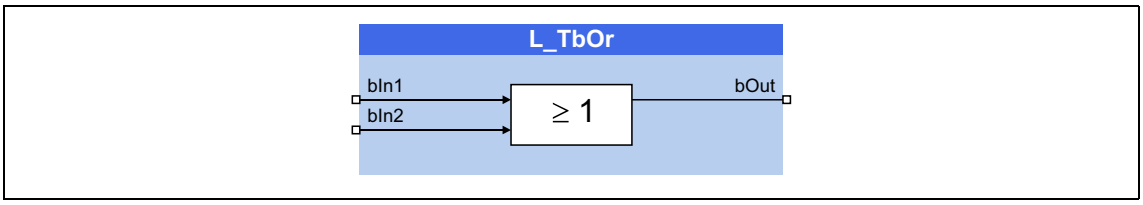
This FB negates a signal from the BOOL data type.

Inputs

Identifier/data type	Information/possible settings
bin BOOL	Input

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the NOT operation



Function

bin	bOut
FALSE	TRUE
TRUE	FALSE

5.191 L_TbOr - OR with 2 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

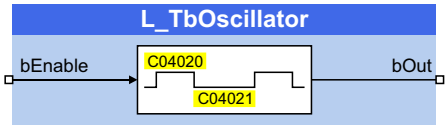
This FB carries out a logic OR operation of binary signals.

Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the OR operation



Function

bIn2	bIn1	bOut
FALSE	FALSE	FALSE
FALSE	TRUE	TRUE
TRUE	FALSE	TRUE
TRUE	TRUE	TRUE

5.192 L_TbOscillator - rectangular signal generator

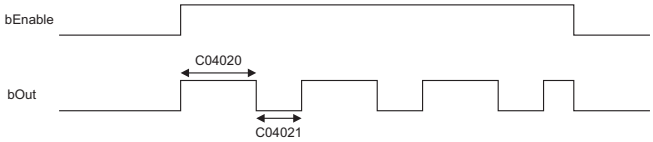
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB can be used to generate a Boolean square wave signal with a variable high/low time.

Inputs

Identifier/data type	Information/possible settings	
bEnable BOOL	Activating the signal generator	
	FALSE	Signal generator deactivated, *bOut* = FALSE.
	TRUE	Signal generator activated.

Outputs



Identifier/data type	Value/meaning
bOut BOOL	Boolean square wave signal

Parameter

Parameter	Possible settings			Information
C04020	0.000	s	60.000	ON time • Initialisation: 0.001 s
C04021	0.000	s	60.000	OFF time • Initialisation: 0.001 s

5.192.1 Function

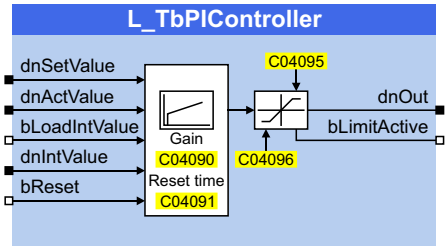
If the FB is activated by setting *bEnable* to TRUE, the set square wave signal is output to *bOut*, starting with the HIGH state:

- If *bEnable* is reset to FALSE, the output *bOut* is also immediately reset to FALSE.

5.192.2 Optimising the accuracy of the output signal

Enter only integer multiples of the task cycle time via C04020 and C04021 for a maximum accuracy of the rectangular signal to be output.

- In case of an asymmetrical entry of the pulse/pause time and non-compliance with the times selected as integer multiples of the task cycle time, the times selected are internally rounded up to integer multiples of the task cycle times.
- With a minimum timing below the task cycle time the permanent level arises according to the following rule: bOut = TRUE if C04020 > C04021.
- The following table lists the possible input signal states and the resulting output signal:



Task running time t	**On time** C04020	**Off time** C04021	**State of ON and OFF time**	**Output signal** bOut
1 ms	3 msec	2 ms	ON time, OFF time ≥ T ON time > OFF time	TRUE: 3 ms, FALSE: 2 ms
3 msec	3 msec	2 ms	ON time ≥ T OFF time < T ON time > OFF time	TRUE
3 msec	2 ms	1 ms	On time, OFF time < T ON time > OFF time	TRUE
3 msec	1 ms	2 ms	On time, OFF time < T ON time < OFF time	FALSE
3 msec	2 ms	2 ms	On time, OFF time < T ON time = OFF time	FALSE
3 msec	2 ms	3 msec	ON time < T OFF time ≥ T ON time < OFF time	FALSE
3 msec	3 msec	5 ms	ON time, OFF time ≥ T ON time < OFF time OFF time ≠ (n * T)	TRUE: 3 ms, FALSE: 6 ms
3 msec	5 ms	3 msec	ON time, OFF time ≥ T ON time > OFF time ON time ≠ (n * T)	TRUE: 6 ms, FALSE: 3 ms
3 msec	5 ms	4 ms	ON time, OFF time ≥ T ON time > OFF time ON time, OFF time ≠ (n * T)	TRUE: 6 ms, FALSE: 3 ms
3 msec	4 ms	5 ms	ON time, OFF time ≥ T ON time < OFF time ON time, OFF time ≠ (n * T)	TRUE: 3 ms, FALSE: 6 ms
3 msec	5 ms	5 ms	ON time, OFF time ≥ T ON time = OFF time ON time, OFF time ≠ (n * T)	TRUE: 6 ms, FALSE: 6 ms

5.193 L_TbPIController - PI controller with limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB provides a simple PI controller with different control functions.

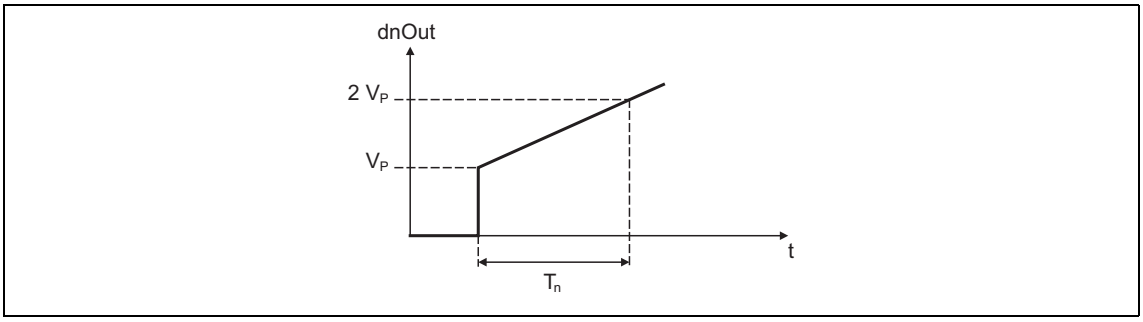
- The value output to the output *dnOut* is internally limited to the limit range parameterised in C04095 and C04096 (default setting ±200 %).
- The *bLimitActive* output displays if a limitation is active.
- The function corresponds by approximation to the "PCTRL" function of the 9300 servo inverter.

Inputs

Identifier/data type	Information/possible settings	
dnSetValue DINT	Setpoint signal	
dnActValue DINT	Actual signal	
bLoadIntValue BOOL	Loading of the integrator	
	TRUE	Set the integral action component of the PI controller to the value applied to the input *dnIntValue*.
dnIntValue DINT	Value on which the integral action component of the PI controller is adjusted by setting *bLoadIntValue* to TRUE.	
bReset BOOL	Reset PI controller to zero.	
	TRUE	PI controller is reset to zero.

Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal • Is internally limited to the limit range parameterised in C04095 and C04096 (default setting ±200 %).	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.



Parameter

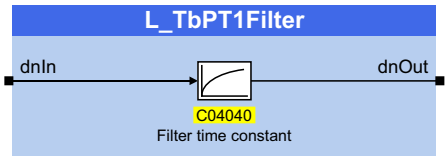
Parameter	Possible settings			Information
C04090	0.0000		214748.3647	Controller gain • Setting 0.0000 resets the PI controller. • Initialisation: 1.0000
C04091	0.001	s	1000.000	Controller reset time • Setting 1000.000 resets the PI controller. • Initialisation: 1.000 s
C04095	0.00	%	200.00	Positive output limit value • Initialisation: 200.00 %
C04096	-200.00	%	0.00	Negative output limit value • Initialisation: -200.00 %

Function

The FB contains the calculation of the system deviation and the PI controller.

- The dynamics of the controller is parameterised according to the gain V_p (C04090) and the reset time T_n (C04091):

[5-147] Step response of the controller



- By setting *bReset* to TRUE the controller is reset (P and I component).
- The I component of the controller can be set via the inputs *bLoadIntValue* and *dnIntValue*.
  - This function is also active when the controller is reset via the input *bReset*, i.e. the integral action component is loaded while a zero is output to the output. This provides the opportunity to reset the controller with a signal and simultaneously initialise the integral action component for the following enable:
- The correcting variable of the controller is automatically limited to the range $\pm 2^{31}$-1 (±200 %).
  - If a small setting range is required, the positive and negative output limit value can be set individually via C04095 and C04096.
  - When the controller reaches the output limitation, the P component has priority over the I component.

5.194 L_TbPT1Filter - delay

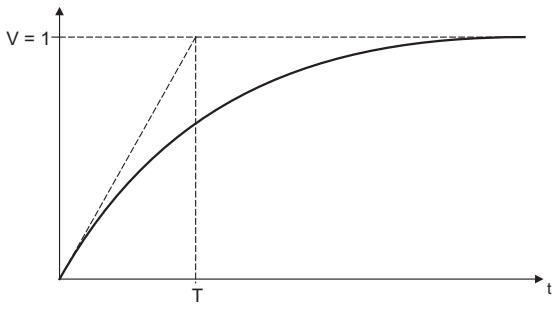
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB filters and delays analog signals.

- The filter time constant T is set via the parameter C04040.
- The gain is fixed at V = 1.
- The function corresponds to the "PT1" function of the 9300 servo inverter.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal



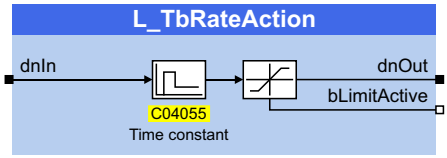
Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal

Parameter

Parameter	Possible settings			Information
C04040	0.001	s	60.000	Filter time constant • With the setting 0.001 s the filter is not active. • Initialisation: 0.001 s

Function



[5-148] Filter time constant T of the first-order delay element

5.195 L_TbRateAction - rate action with limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB contains a rate action function to compensate disturbing low passes.

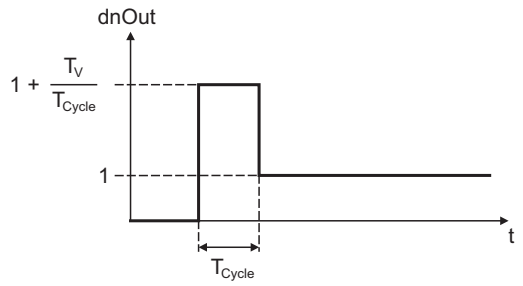
- Therefore the rate time constant must be adjusted to the filter time constant of the low pass via the parameter C04055.
- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.

Inputs

Identifier/data type	Information/possible settings
dnIn DINT	Input signal

Outputs

Identifier/data type	Value/meaning	
dnOut DINT	Output signal • Internally limited to $\pm 2^{31}$-1	
bLimitActive BOOL	Status signal "Limitation active"	
	TRUE	The output signal is limited.



Parameter

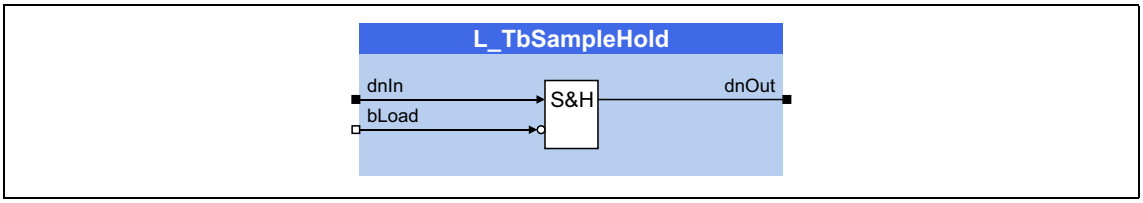
Parameter	Possible settings			Information
C04055	0.000	s	60.000	Rate time constant T_V • Initialisation: 1.000 s

Function

The input signal is differentiated by means of the parameterised rate time constant T_V and added to the input signal.

- The differentiation of the input signal can be switched off by setting the rate time constant T_V lower than the task cycle time. In this case the differential component is zero and the input signal is output unchanged to the output.
- When the rate time constant T_V is higher than the task cycle time, the following step response is the result:

C04055: Rate time constant T_V



[5-149] Step response when the rate time constant > task cycle time

5.196 L_TbSampleHold - sample & hold (for "DINT" data type)

Function library:	LenzeToolbox	
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel
Required retain memory:	32 bytes	

This FB can save a signal from the "DINT" data type.

- The stored value is also available after mains disconnection.

Inputs

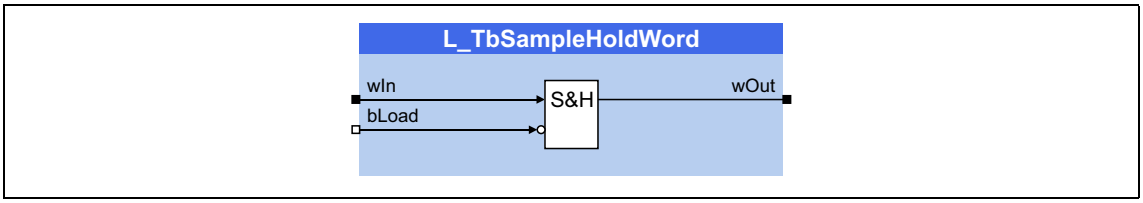
Identifier/data type	Information/possible settings	
dnIn DINT	Input signal	
bLoad BOOL	Saving of input signal	
	FALSE	The value valid last at *dnIn* is stored and output to *dnOut*. A signal change at *dnIn* does not change *dnOut*.
	TRUE	*dnIn* is output at the output *dnOut*.

Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal

Behaviour when switching the mains

The value loaded last is stored permanently when the supply voltage is switched off and reloaded after the mains is switched on again.



- In order that the stored value is not immediately overwritten by the current input signal at *dnIn* after switching on the mains again, *bLoad* must be set to FALSE when the mains is switched on again.

5.197 L_TbSampleHoldWord - sample & hold (for "WORD"data type)

Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel
Required retain memory:	28 bytes	

This FB can save a signal from the "WORD" data type.

- The stored value is also available after mains disconnection.

Inputs

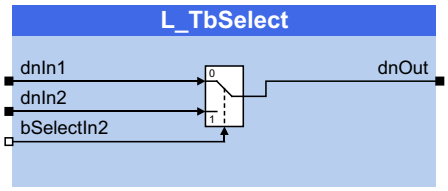
Identifier/data type	Information/possible settings	
wIn WORD	Input signal	
bLoad BOOL	Saving of input signal	
	FALSE	The value valid last at *wIn* is saved and output to *wOut*. A signal change at *wIn* does not change *wOut*.
	TRUE	*wIn* is output at the output *wOut*.

Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal

Behaviour when switching the mains

The value loaded last is stored permanently when the supply voltage is switched off and reloaded after the mains is switched on again.



- In order that the stored value is not immediately overwritten by the current input signal at *wIn* after switching on the mains again, *bLoad* must be set to FALSE when the mains is switched on again.

5.198 L_TbSelect - selector (for "DINT" data type)

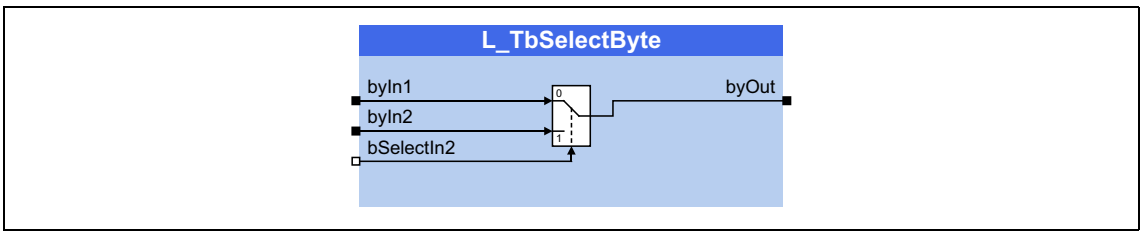
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This function block switches between two signals of "DINT" type. The switch-over is controlled via a boolean input signal.

- So it is, for example, possible to switch between an initial diameter and a calculated diameter during winding.

Inputs

Identifier/data type	Information/possible settings	
dnIn1 DINT	Input signal 1	
dnIn2 DINT	Input signal 2	
bSelectIn2 BOOL	Selection of the input signal for the output to *dnOut*	
	FALSE	*dnIn1*
	TRUE	*dnIn2*



Outputs

Identifier/data type	Value/meaning
dnOut DINT	Output signal

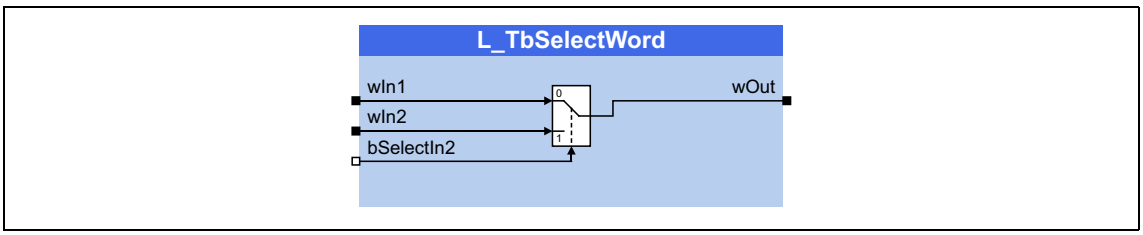
5.199 L_TbSelectByte - selector (for "BYTE" data type)

Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This function block switches between two signals of "BYTE" type. The switch-over is controlled via a boolean input signal.

Inputs

Identifier/data type	Information/possible settings	
byIn1 BYTE	Input signal 1	
byIn2 BYTE	Input signal 2	
bSelectIn2 BOOL	Selection of the input signal for the output to *byOut*	
	FALSE	*byIn1*
	TRUE	*byIn2*



Outputs

Identifier/data type	Value/meaning
byOut BYTE	Output signal

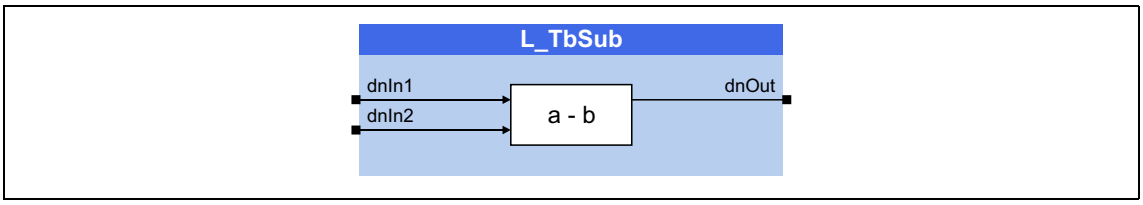
5.200 L_TbSelectWord - selector (for "WORD" data type)

Function library:	LenzeToolbox	**FB is available as of library V02.05.xx.xx!**
Runtime software licence:	☑ Motion Control HighLevel	☑ Motion Control TopLevel

This function block switches between two signals of "WORD" type. The switch-over is controlled via a boolean input signal.

Inputs

Identifier/data type	Information/possible settings	
wIn1 WORD	Input signal 1	
wIn2 WORD	Input signal 2	
bSelectIn2 BOOL	Selection of the input signal for the output to *byOut*	
	FALSE	*wIn1*
	TRUE	*wIn2*



Outputs

Identifier/data type	Value/meaning
wOut WORD	Output signal

5.201 L_TbSub - subtraction

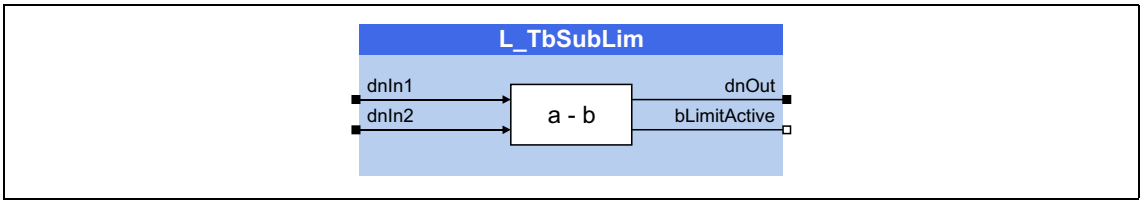
Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a subtraction without limitation.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	Minuend
dnIn2 DINT	Subtrahend

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Differential value (result of the subtraction) • No internal limitation, thus an overflow is possible: • If the result > 2^{31}-1: *dnOut* = *dnIn1* - *dnIn2* - 2^{32} • If the result < 2^{31}: *dnOut* = *dnIn1* - *dnIn2* + 2^{32}

5.202 L_TbSubLim - subtraction with limitation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

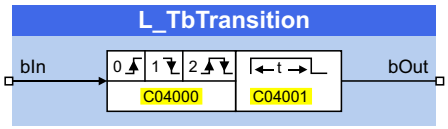
This FB carries out a subtraction with limitation.

- The value output to output *dnOut* is internally limited to $\pm 2^{31}$-1.
- The *bLimitActive* output displays if a limitation is active.

Inputs

Identifier/data type	Information/possible settings
dnIn1 DINT	Minuend
dnIn2 DINT	Subtrahend

Outputs



Identifier/data type	Value/meaning
dnOut DINT	Differential value (result of the subtraction) • Internally limited to $\pm 2^{31}$-1
bLimitActive BOOL	Status signal "Limitation active"
	TRUE: The output signal is limited.

5.203 L_TbTransition - edge evaluation

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to evaluate digital signal edges and converts them into time-defined and retriggerable pulses.

- This function corresponds to the "TRANS" function of the 9300 servo inverter.

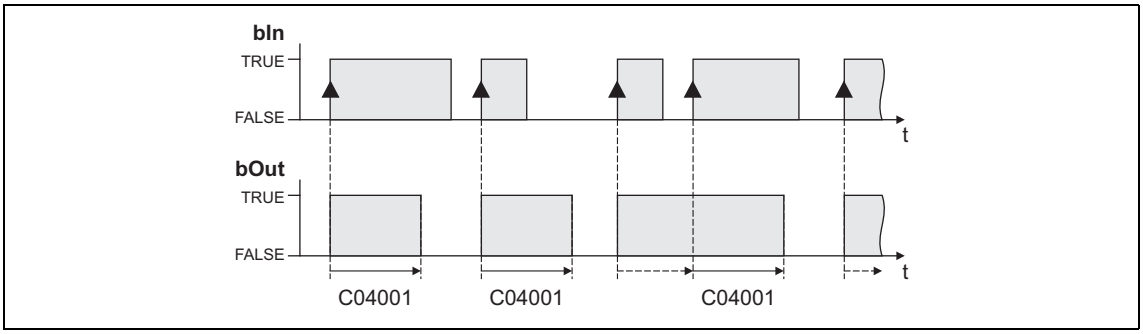
Inputs

Identifier/data type	Information/possible settings
bin BOOL	Input for edge evaluation • Function depends on the selection of the trigger edge in C04000.

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Output (retriggerable)

Parameter



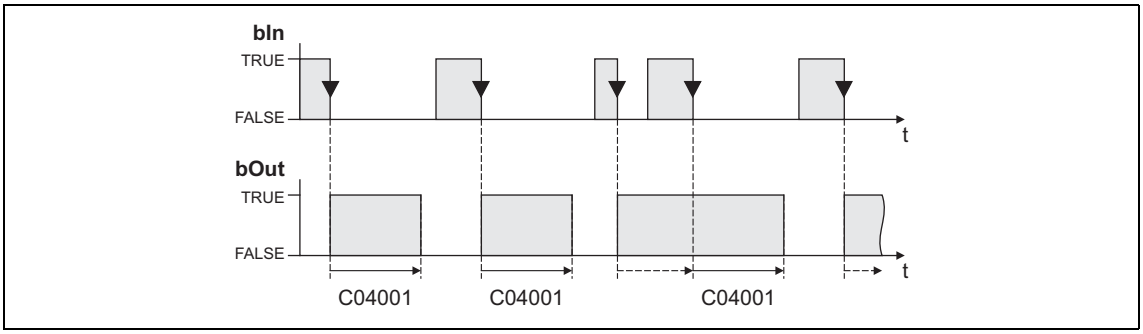
Parameter	Possible settings			Information
C04000				Trigger edge
	0	Rising edge		Lenze setting
	1	Falling edge		
	2	Both edges		
C04001	0.001	s	60.000	Pulse duration • Initialisation: 0.001 s

Note!

When the task interval time is set to >1 ms and the pulse duration set in C04001 is not an integer multiple of the interval time, the pulse duration is automatically extended to the next integer multiple of the interval time.

5.203.1 Function 1: Evaluating rising edges

C04000 = "0"



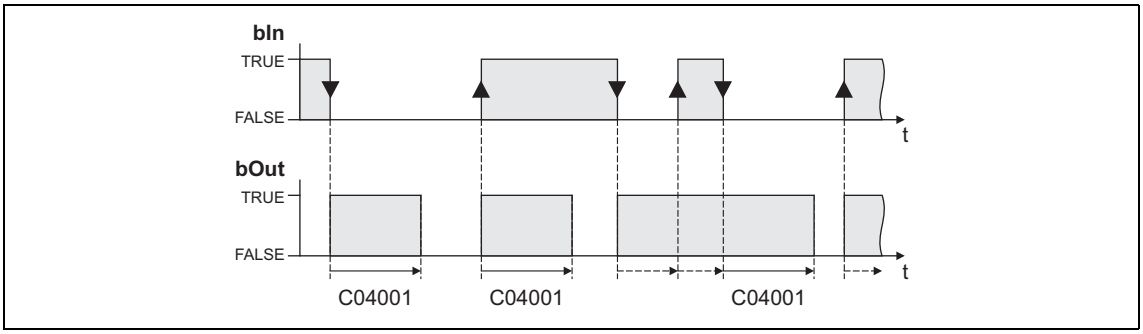
[5-150] Switching performance when evaluating rising edges

Functional sequence

1. A FALSE-TRUE edge at the input *bIn* sets the output *bOut* to TRUE.
2. After the time specified via C04001 the output *bOut* is reset to FALSE provided that no other FALSE/TRUE edge has taken place at the output *bIn* in the meantime.
   - If another FALSE/TRUE edge takes place at the *bIn* input, the time C04001 restarts to elapse, i.e. the output *bOut* is retriggerable.

5.203.2 Function 2: Evaluating falling edges

C04000 = "1"



[5-151] Switching performance when evaluating falling edges

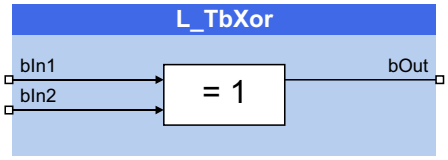
Functional sequence

1. A TRUE-FALSE edge at the input *bIn* sets the output *bOut* to TRUE.
2. After the time specified via C04001 the output *bOut* is reset to FALSE provided that no other TRUE/FALSE edge has taken place at the *bIn* input in the meantime.
   - If another TRUE/FALSE edge takes place at the *bIn* input, the time C04001 restarts to elapse, i.e. the output *bOut* is retriggerable.

5.203.3 Function 3: Evaluating rising and falling edges

C04000 = "2"

[5-152] Switching performance when evaluating rising and falling edges



Functional sequence

1. A signal change (FALSE-TRUE or TRUE-FALSE edge) at the input *bIn* sets the output *bOut* to TRUE.
2. After the time specified via C04001 the output *bOut* is reset to FALSE provided that no other signal change has taken place at the *bIn* input in the meantime.
   - If another signal change takes place at the *bIn* input, the time C04001 restarts to elapse, i.e. the output *bOut* is retriggerable.

5.204 L_TbXor - XOR with 2 inputs

Function library:	LenzeToolbox
Runtime software licence:	☑ Motion Control HighLevel ☑ Motion Control TopLevel

This FB carries out a logic EXCLUSIVE OR operation of binary signals.

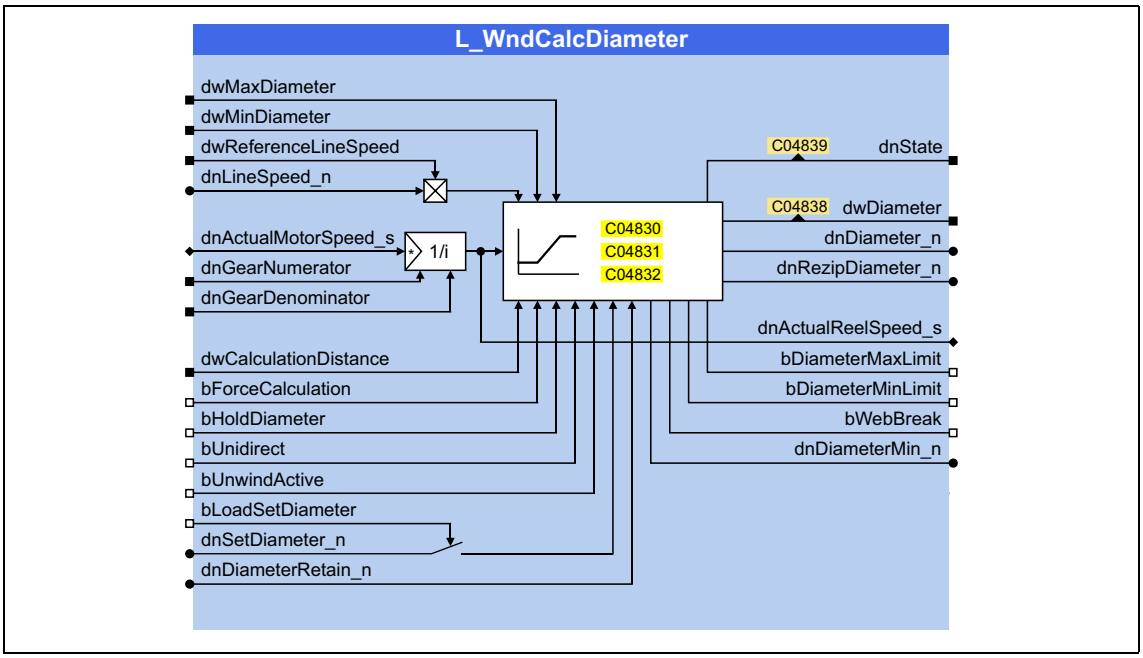
Inputs

Identifier/data type	Information/possible settings
bIn1 BOOL	Input 1
bIn2 BOOL	Input 2

Outputs

Identifier/data type	Value/meaning
bOut BOOL	Result of the exclusive OR operation

Function



bIn2	bIn1	bOut
FALSE	FALSE	FALSE
FALSE	TRUE	TRUE
TRUE	FALSE	TRUE
TRUE	TRUE	FALSE

5.205 L_WndCalcDiameter - diameter calculation

Function library:	LenzeWinder
Runtime software licence:	☐ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to calculate the reel diameter from the line speed and the reel speed.

- The output signal *dwDiameter* has a resolution of 1 µm and can display a maximum of 10 m.

Inputs

Identifier/data type	Information/possible settings
dwMaxDiameter DWORD	Maximum diameter in [µm] • 1000 µm ≡ 1 mm; 1000000 µm ≡ 1 m • Internal limitation to 10 m
dwMinDiameter DWORD	Minimum diameter in [µm] • 1000 µm ≡ 1 mm; 1000000 µm ≡ 1 m • Internal limitation to 10 m
dwReferenceLineSpeed DWORD	Maximum material speed in [cm/min] • 2500 cm/min ≡ 25.00 m/min • Internal limitation to 2000 m/min
dnLineSpeed_n DINT	Material speed setpoint in [%] • 100 % ≡ maximum material speed (*dwReferenceLineSpeed*)
dnActualMotorSpeed_s DINT	Current motor speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864
dnGearNumerator DINT	Gearbox factor (numerator)
dnGearDenominator DINT	Gearbox factor (denominator)
dwCalculationDistance DWORD	Reel shaft distance (number of revolutions) after which a recalculation of the diameter is carried out. • 1000 ≡ one revolution (with three decimal positions) • Internal limitation to 1000000, i. e. the diameter calculation can be maximally averaged by 1000 revolutions.

Identifier/data type		Information/possible settings	
bForceCalculation	BOOL	Forcing of the diameter calculation	
		FALSE↗TRUE	Forcing of the diameter calculation • The next diameter calculation is carried out after the reel shaft distance specified via *dwCalculationDistance* has been elapsed.
bHoldDiameter	BOOL	Hold last diameter value	
		TRUE	The diameter value output last is not overwritten with new values.
bUnidirect	BOOL	Enable of only one direction of change and activation of the web break monitoring	
		TRUE	Only the direction of change defined via *bUnwindActive* is enabled.
bUnwindActive	BOOL	Selection of the direction of change enabled • Only in the case of *bUnidirect* = TRUE	
		FALSE	Clockwise rotation (Cw)
		TRUE	Counter-clockwise rotation (Ccw)
bLoadSetDiameter	BOOL	Acceptance of the preselected initial value • This input has a higher priority than the input *bHoldDiameter*.	
		TRUE	Accept value at *dnSetDiameter_n*.
dnSetDiameter_n	DINT	Selection of an initial value/external diameter signal in [%] • 100 % ≡ maximum diameter (*dwMaxDiameter*) • Value is accepted by setting *bLoadSetDiameter* to TRUE.	
dnDiameterRetain_n	DINT	Input for reading in the current diameter value after mains switching: 1. For this, connect the output *dnDiameter_n* with a retain variable. 2. Then connect the retain variable with this input.	

Outputs

Identifier/data type		Value/meaning	
dnState	DINT	Status (bit coded) • Bits that are not listed have not been assigned with a status (always "0").	
		Status messages:	
		Bit 12	Diameter value was calculated/read from the memory.
		Bit 13	Diameter value was initialised with *dwMinDiameter*.
		Bit 14	Diameter value is/was loaded via *bLoadSetDiameter*/ *dnSetDiameter_n*.
		Bit 15	Diameter value is/was held (*bHoldDiameter*).
		Error messages:	
		Bit 29	Input value *dwMinDiameter* ≥ *dwMaxDiameter*.
		Bit 30	Internal reset of the diameter calculation (integration overflow by *dnLineSpeed_n*).
dwDiameter	DWORD	Current diameter in [µm] • 1000 µm ≡ 1 mm; 1000000 µm ≡ 1 m • Internal limitation to 10 m • Display parameter: C04838	
dnDiameter_n	DINT	Current diameter in [%] • 100 % ≡ maximum diameter (*dwMaxDiameter*)	
dnRecipDiameter_n	DINT	Reciprocal value of the current diameter in [%] • 100 % ≡ minimum diameter (*dwMinDiameter*)	
dnActualReelSpeed_s	DINT	Current reel speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864 • The current reel speed results from the motor speed (*dnActualMotorSpeed_s*) and the gearbox factor (*dnGearNumerator*/*dnGearDenominator*).	

Identifier/data type	Value/meaning	
bDiameterMaxLimit BOOL	Limit value monitoring	
	TRUE	Upper limit value *dwMaxDiameter* reached.
bDiameterMinLimit BOOL	Limit value monitoring	
	TRUE	Lower limit value *dwMinDiameter* reached.
bWebBreak BOOL	Web break monitoring	
	TRUE	Web break after passing through the monitor window set in C04832.
dnDiameterMin_n DINT	Minimum diameter in [%] • 100 % ≡ maximum diameter (*dwMaxDiameter*)	

Parameter

Parameter	Possible settings			Info
C04830	0.000	Rev	1000.000	Calculation interval • Display of the *dwCalculationDistance* input signal.
C04831	0.01	s	3.00	Diameter filter time constant • Initialisation: 0.10 s
C04832	0.00	%	100.00	Window for web break monitoring • Only relevant for *bUnidirect* = TRUE. • Relating to the maximum diameter *dwMaxDiameter*. • Initialisation: 10.00 %
C04838	0	µm	10000000	Current diameter • Display of the output signal *dwDiameter*.
C04839	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.

5.205.1 Setting an initial value

At the input *dnSetDiameter_n* you can specify an initial value or an external diameter signal.

- This value is accepted if *bLoadSetDiameter* is set to TRUE.
- During the acceptance, the diameter calculation is reset and the filter for the diameter calculation is loaded with the initial value specified.

5.205.2 Calculating the diameter

For calculating the reel diameter, the material speed and the current reel speed are cyclically integrated.

- The material speed is specified via *dnLineSpeed_n*.
- The reel speed results from the motor speed (*dnActualMotorSpeed_s*) and the current gearbox factor (*dnGearNumerator*/*dnGearDenominator*).
- The calculation cycle is defined via the input *dwCalculationDistance*.
- At the end of each integration interval a new diameter value results from the division of the integrator values.
- An absolute value generation and smoothing via a first order low pass is effected. The time constant of this filter can be set in C04831. The output *dwDiameter* is not filtered.

Converting the diameter to 1/D

For evaluating the material speed with 1/D (speed-controlled winders), the reciprocal value of the reel diameter is provided via output *dnRezipDiameter_n*.

- This value refers to the limit value *dwMinDiameter*.

5.205.3 Holding the current value

By setting *bHoldDiameter* to TRUE, the last diameter value *dnDiameter_n* that is output is held internally.

- The diameter calculation is reset and the filter for the diameter calculation is loaded with the diameter value that is held internally.

5.205.4 Selecting the direction of change/web break monitoring

By setting *bUnidirect* to TRUE, only one direction of change is enabled for the diameter calculation, and at the same time the web break monitoring is activated.

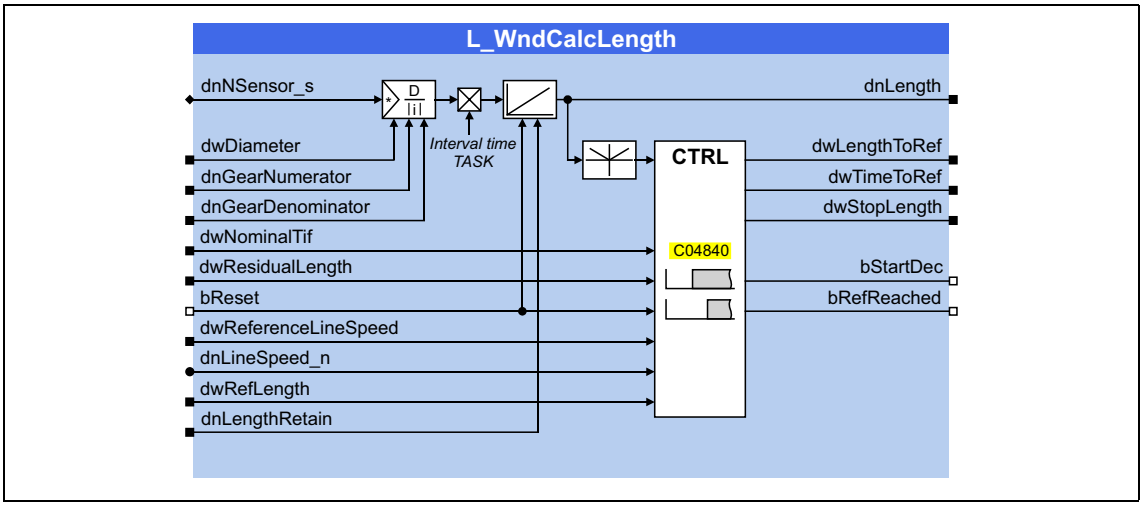
- The permissible direction of change is defined via *bUnwindActive*.
- A newly calculated value is only accepted if it exceeds the value in the permissible direction which is saved last.

After a web break the successively calculated diameter values in the majority of cases go to the opposite direction very quickly.

- In C04832 you can define the maximally permissible deviation in the opposite direction by the exceedance of which the output *bWebBreak* is set to TRUE.
- If *bUnidirect* is set to FALSE, both directions of change are enabled, and the internal memory is always overwritten with the recalculated value. By this, the web break monitoring is switched off.

5.205.5 Limit value monitoring

Via *dwMaxDiameter* and *dwMinDiameter* you define limit values for the diameter values specified by the achievement/exceedance of which the corresponding output (*bDiameterMaxLimit*/ *bDiameterMinLimit*) is set to TRUE.



- The unfiltered diameter value *dwDiameter* and the filtered diameter value *dnDiameter_n* are limited.
- The limit values are entered in [µm].
- The hysteresis for resetting *bDiameterMaxLimit*/*bDiameterMinLimit* is set fixedly to 1 % of *dwMaxDiameter*.
- For the parameterisation of further FBs, the value in *dwMinDiameter* relating to *dwMaxDiameter* on a percentage basis is provided via output *dnDiameterMin_n*.

5.206 L_WndCalcLength - length calculation

Function library:	LenzeWinder
Runtime software licence:	☐ Motion Control HighLevel ☑ Motion Control TopLevel

On the basis of the speed and the diameter of a roll moving along with the material, this FB serves to carry out a continuous length calculation.

- If a gearbox is switched between the roll and the speed sensor, the sensor speed is converted to the speed of the roll according to the gearbox factor.
- The output signal *dnLength* has a resolution of 1 mm and can display a maximum of 2000 km.

Inputs

Identifier/data type	Information/possible settings
dnNSensor_s DINT	Current encoder speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864
dwDiameter DWORD	Diameter of the impeller/roll in [µm] • 1000 µm ≡ 1 mm; 1000000 µm ≡ 1 m • Internal limitation to 10 m
dnGearNumerator DINT	Gearbox factor (numerator) of the gearbox between the impeller/roll and the speed sensor
dnGearDenominator DINT	Gearbox factor (denominator) of the gearbox between the impeller/roll and the speed sensor
dwNominalTif DWORD	Rated deceleration time for braking process in [ms] • Is triggered if the pre-switch-off length has been reached (output *bStartDec* = TRUE). • The reference value can be selected in C04840 (Lenze setting: material speed set-point). • 1000 ms ≡ 1 s • Internal limitation to 10000 s.
dwResidualLength DWORD	Remaining residual length after the winding process in [mm] • 1000 mm ≡ 1 m; 1000000 mm ≡ 1 km • Internal limitation to 1000 km
bReset BOOL	Reset length acquisition TRUE: The length acquisition and the digital output signals *bStartDec* and *bRefReached* are reset.

Identifier/data type	Information/possible settings
dwReferenceLineSpeed DWORD	Maximum material speed in [cm/min] • 2500 cm/min ≡ 25.00 m/min • Internal limitation to 2000 m/min
dnLineSpeed_n DINT	Material speed setpoint in [%] • 100 % ≡ maximum material speed (*dwReferenceLineSpeed*)
dwRefLength DWORD	The length to be winded up during a winding process in [mm] • 1000 mm ≡ 1 m; 1000000 mm ≡ 1 km • Internal limitation to 2000 km
dnLengthRetain DINT	Input for reading in the current length after mains switching: 1. For this, connect the output *dnLength_n* with a retain variable. 2. Then connect the retain variable with this input.

Outputs

Identifier/data type	Value/meaning	
dnLength DINT	Current length in [mm]	
dwLengthToRef DWORD	Residual length until reaching the reference value in [mm] • Internal limitation to 2000 km	
dwTimeToRef DWORD	Residual runtime until reaching the reference value in [s] • The calculation depends on C04840, either on the basis of the material speed setpoint or the maximum material speed. • This value is only calculated at every 2. call of the FB (alternating with *dwStopLength*).	
dwStopLength DWORD	Change in length during the braking phase in [mm] • This value is only calculated at every 2. call of the FB (alternating with *dwTimeToRef*).	
bStartDec BOOL	Control signal for starting the braking process	
	TRUE	Pre-switch-off length reached.
bRefReached BOOL	Control signal for triggering the limit stop	
	TRUE	Reference length *dwRefLength* reached.

Parameters

Parameter	Possible settings		Info
C04840	Reference value =		Stop length of reference value • Reference value for the rated deceleration time *dwNominalTif* • Initialisation: maximum material speed
	0	Maximum material speed (*dwReferenceLineSpeed*)	
	1	Material speed setpoint (*dnLineSpeed_n*)	

5.206.1 Display of the length/residual length/residual runtime reached

Via the output *dnLength* the length reached is displayed as a physical value [mm]. Negative values can also be shown.

Via the output *dwLengthToRef* the residual length until reaching the reference value (*dwRefLength*) is provided.

- Assuming that the maximum material speed *dwReferenceLineSpeed* is run, a corresponding residual runtime *dwTimeToRef* results from the residual length.

5.206.2 Activating the braking process

For the activation of the braking process, the current length is compared to the remaining length after the stop (*dwResidualLength*), including the change in length during the braking phase (*dwStopLength*).

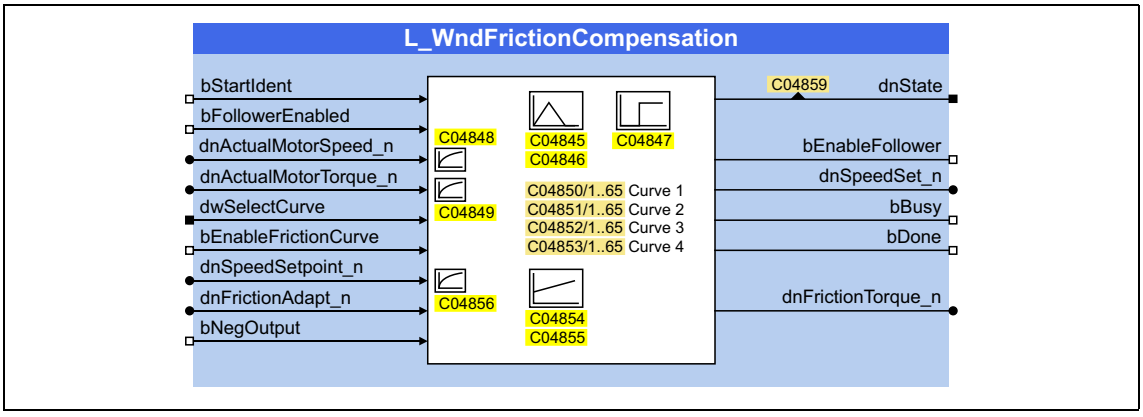
- The change in length during the braking phase is output at *dwStopLength*. It depends on the current material speed which is calculated from *dwReferenceLineSpeed* and *dnLineSpeed_n*, and on the reference deceleration time *dwNominalTif*.
- The signal for activating the braking process is output at *bStartDec*.

5.206.3 Triggering a limit stop

For triggering a limit stop, the current length is compared to the reference length.

- The signal for triggering the limit stop is output at *bRefReached*.

5.206.4 Resetting the calculation & trigger signals



By setting *bReset* to TRUE, you can reset the length calculation and the two digital outputs for the activation of the braking process/limit stop.

5.207 L_WndFrictionCompensation - friction compensation

Function library:	LenzeWinder	
Runtime software licence:	☐ Motion Control HighLevel	☑ Motion Control TopLevel

This FB contains the two functions "friction identification" and "friction compensation".

- With the "friction identification" function the friction characteristic can be identified automatically.
  - For this, the FB accepts the drive control on request and carries out the identification.
  - For saving the automatically identified friction characteristic, four memory locations are provided. The selection of memory locations 1 ... 4 is effected via the input *dwSelectCurve*.
  - The friction characteristic includes 65 values which are equally distributed across the speed range of 0 ... n_{max} (C00011).
- With the "friction compensation" function, a speed-dependent compensation of the friction torque can be carried out on the basis of a linear or a previously automatically determined friction characteristic.
  - If the "friction compensation" function is activated, the input *dwSelectCurve* on the other hand serves to select the friction characteristic to be used.
  - If the input *dwSelectCurve* is = 0 or unassigned, a parameterisable linear characteristic is used for the friction compensation.

Inputs

Identifier/data type	Information/possible settings
bStartIdent BOOL	Start identification of the friction characteristic TRUE | Start identification.
bFollowerEnabled BOOL	Interface for the basic function "Speed follower" • Connect this input with the output *SF_bEnabled* of the SB **LS_SpeedFollower**.
dnActualMotorSpeed_n DINT	Current speed of the motor shaft in [%] • 100 % ≡ motor reference speed (C00011)
dnActualMotorTorque_n DINT	Current actual torque of the motor in [%] • 100 % ≡ motor reference torque (C00057/2)

Identifier/data type	Information/possible settings	
dwSelectCurve DWORD	**Friction identification** (*bStartIdent* = True): Selection of the memory area within which the friction values identified are saved. 4 characteristics can be saved in the FB at the maximum.	
	1 ... 4	Memory area 1 ... 4
	Friction compensation (*bStartIdent* = FALSE, *bEnableFrictionCurve* = TRUE): Selection of the characteristic for the friction compensation.	
	0	Linear friction characteristic (adjustable in C04854 and C04855)
	1 ... 4	Identified friction characteristic (memory area 1 ... 4)
bEnableFrictionCurve BOOL	Activate friction compensation	
	FALSE	Friction torque is reset to "0".
	TRUE	Friction compensation is activated.
dnSpeedSetpoint_n DINT	Speed reference value for characteristic in [%] • 100 % ≡ motor reference speed (C00011)	
dnFrictionAdapt_n DINT	Input for the proportional evaluation of the characteristic in [%] • Internal limitation to 0 ... 200 %	
bNegOutput BOOL	Inversion of the output signal	
	TRUE	Output signal *dnFrictionTorque_n* is displayed in an inverted manner.

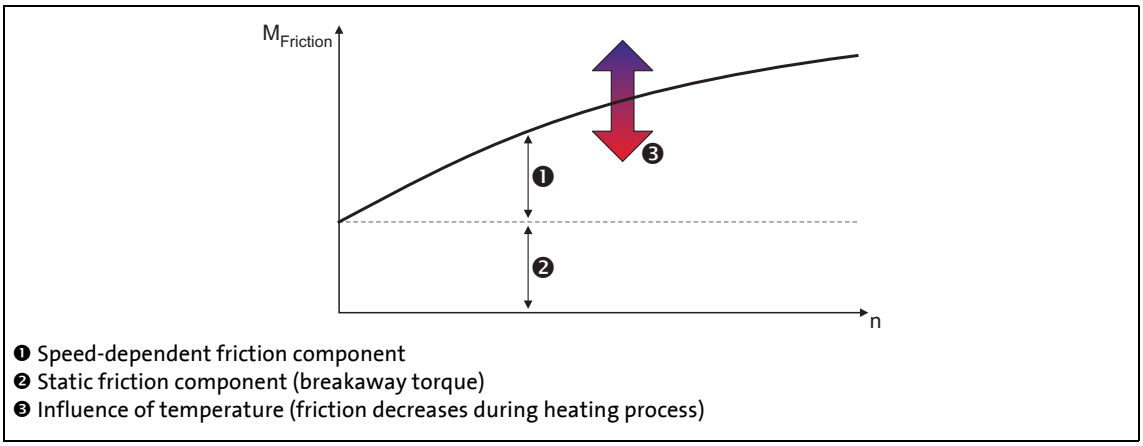
Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded) • Bits that are not listed have not been assigned with a status (always "0").	
	Status messages:	
	Bit 0	Identification started. Waiting for activation of the basic function "Speed follower".
	Bit 1	Waiting for motor standstill.
	Bit 2	Drive is accelerated to the specified speed.
	Bit 3	Drive has reached the specified speed and is braked to standstill.
	Bit 4	The friction torque is calculated.
	Bit 5	Identification completed successfully.
	Error messages:	
	Bit 16	Identification cancelled (*bStartIdent* = FALSE).
	Bit 17	Identification cancelled (*bFollowerEnabled* = FALSE).
	Bit 18	Specified maximum speed not reached.
	Bit 19	Acceleration time for the friction absorption too short.
	Bit 20	Speed reached at the end of acceleration process too low.
bEnableFollower BOOL	Interface for the basic function "Speed follower" • Connect this output to the input *SF_bEnable* of SB **LS_SpeedFollower**.	
dnSpeedSet_n DINT	Interface for the basic function "Speed follower" • Connect this output to the input *SF_dnSpeedSet_n* of SB **LS_SpeedFollower**.	
bBusy BOOL	Status signal "Detection of measured value active"	
	TRUE	Detection of measured value active.
bDone BOOL	Status signal "Identification completed successfully"	
	TRUE	Identification completed successfully.
dnFrictionTorque_n DINT	Current friction torque in [%] • 100 % ≡ motor reference torque (C00057/2)	

Parameters for the identification of the friction characteristic

Parameter	Possible settings			Info
C04845	5.00	%	100.00	Max. motor speed - ident • 100 % ≡ motor reference speed (C00011) • Initialisation: 100.00 %
C04846	1	s	3600	Acceleration/deceleration time - ident • Initialisation: 30 s
C04847	0	ms	1000	Start delay - ident • Initialisation: 500 ms
C04848	0	ms	100	Current speed filter time - ident • Initialisation: 5 ms
C04849	0	ms	1000	Current torque filter time - ident • Initialisation: 5 ms
C04850/1...65	0.00	%	200.00	Friction characteristic 1 • Display of the identified friction values 1 ... 65
C04851/1...65	0.00	%	200.00	Friction characteristic 2 • Display of the identified friction values 1 ... 65
C04852/1...65	0.00	%	200.00	Friction characteristic 3 • Display of the identified friction values 1 ... 65
C04853/1...65	0.00	%	200.00	Friction characteristic 4 • Display of the identified friction values 1 ... 65

Parameters for friction compensation

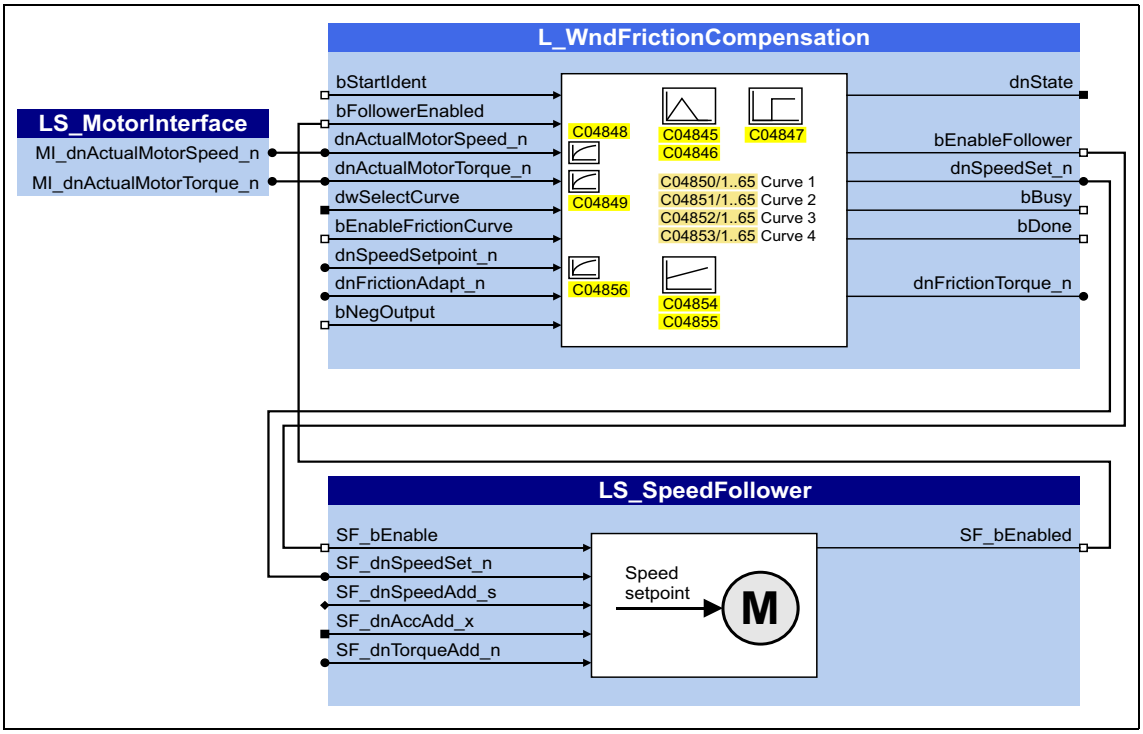


Parameter	Possible settings			Info
C04854	0.00	%	200.00	Starting friction - comp • Initialisation: 0.00 %
C04855	0.00	%	200.00	Final friction - comp • Initialisation: 0.00 %
C04856	0	ms	100	Filter time setpoint speed - comp • Filter time constant for speed reference value *dnSpeedSetpoint_n*. • Initialisation: 0 ms

Status display

Parameter	Possible settings			Info
C04859	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.

5.207.1 Basics: Friction response



Starting with the breakaway torque, the friction generally increases with the speed. However, apart from the speed, also the temperature and torque (e.g. if a gearbox is used) can influence the friction response.

❶ Speed-dependent friction component
❷ Static friction component (breakaway torque)
❸ Influence of temperature (friction decreases during heating process)

[5-153] Friction response

5.207.2 Basic interconnection

[5-154] Basic interconnection with the basic function "Speed follower"

5.207.3 Identifying the friction characteristic automatically

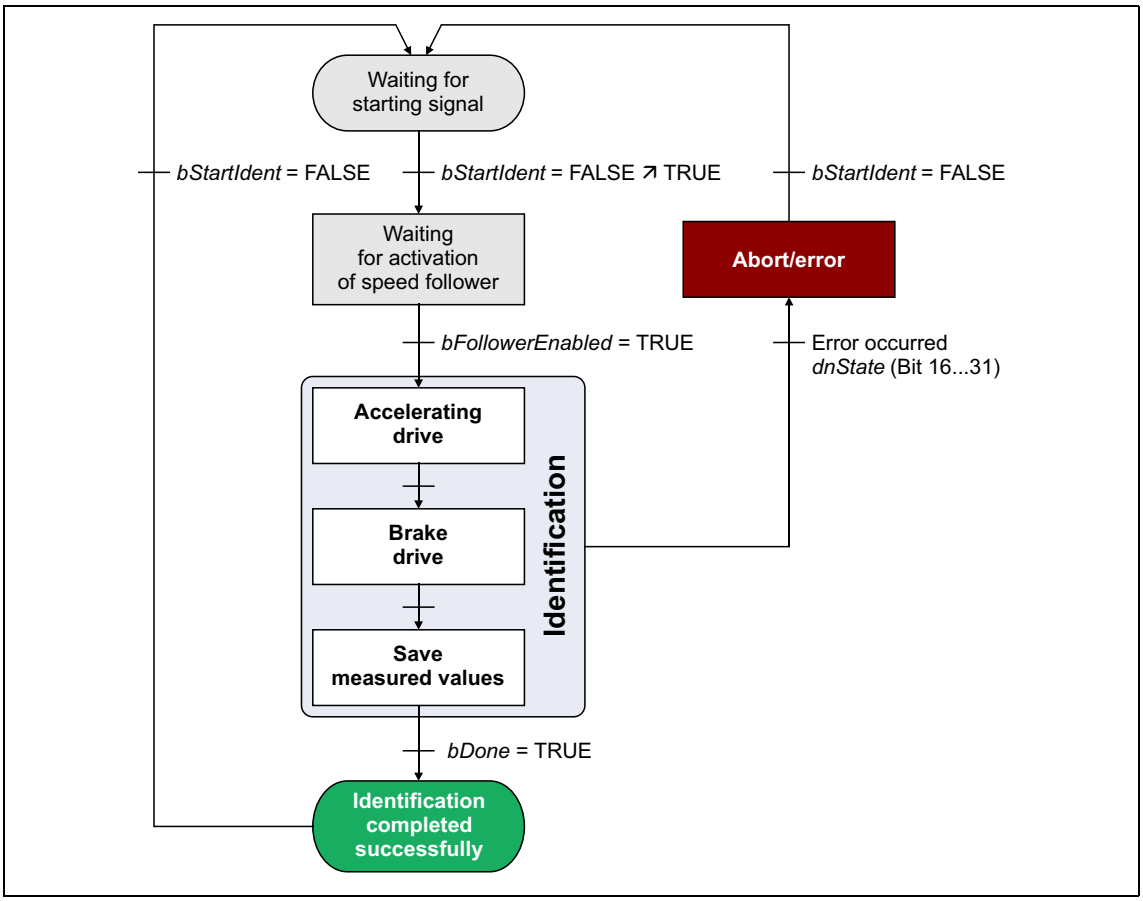
Danger!

For the identification of the friction characteristic, the drive is accelerated to the maximum speed set in C04845 and braked to standstill again with the acceleration/deceleration time set in C04846.

Select the memory location for the characteristic

Define the memory location (1 ... 4) on which the characteristic is to be saved after a successful identification via input *dwSelectCurve*.

Starting the identification



By setting the input *bStartIdent* from FALSE to TRUE, you start the identification.

Identification procedure

1. The basic function "Speed follower" is activated.
   - Output *bBusy* changes to TRUE.
2. If the drive is still coasting it is waited until the motor stops coasting first.
3. With the acceleration/deceleration time set in C04846 , the drive is accelerated to the maximum speed set in C04845.
4. When the drive has reached the maximum speed, it is braked to standstill again with the acceleration/deceleration time set in C04846.
5. The friction characteristic is saved in the memory area selected via the input *dwSelectCurve*.
6. After the identification has been completed successfully, the output *bBusy* is reset to FALSE, and the output *bDone* is set to TRUE.

State machine for the identification

The identification is effected according to the following state machine:

[5-155] State machine for the identification run

Cancelling the identification

If the input *bStartIdent* is reset to FALSE, the active identification is cancelled immediately. Resetting the input *bFollowerEnabled* to FALSE also results in the immediate abort.

- The output *bBusy* is reset to FALSE and the drive is brought to a standstill via quick stop.
- The cause for the abort is shown via status output *dnState*.

Delay of pulse enable

After activation of the function, the identification does not start immediately, but only after the delay time set in C04847 has elapsed. By this, the magnetic flux of the motor can fully build up first (only required for asynchronous machines).

- If required, the presetting is to be increased in the case of machines with great rotor time constants.

Smoothing the actual value signals

If incremental encoders are used, it may be required to filter the actual speed value signal.

- The time constant for the filter can be set in C04848; in the majority of cases the setting "10 ms" is sufficient.
- For smoothing the friction characteristic, it can also be helpful to filter the actual torque value signal; the time constant for this filter can be set in C04849.

5.207.4 Activating the friction compensation

The friction compensation is active if the input *bStartIdent* is set to FALSE, and the input *bEnableFrictionCurve* is set to TRUE.

- The current speed is preselected via the input *dnSpeedSetpoint_n*.
- If the actual speed value exceeds 100 %, the characteristic is extrapolated linearly.

Use of a linear characteristic

If the input *dwSelectCurve* is = 0 or unassigned, a linear characteristic is used for the friction compensation.

- The linear characteristic is specified via parameters C04854 and C04855:
  - C04854 = initial friction torque at speed "0"
  - C04855 = friction torque at maximum speed (C00011)
- The characteristic is limited internally to 0 ... 200 %.

Use of a previously automatically identified friction characteristic

If the input *dwSelectCurve* = 1 ... 4, the friction characteristic saved on the corresponding memory location is used instead of the linear characteristic.

▸ Identifying the friction characteristic automatically (📖 641)

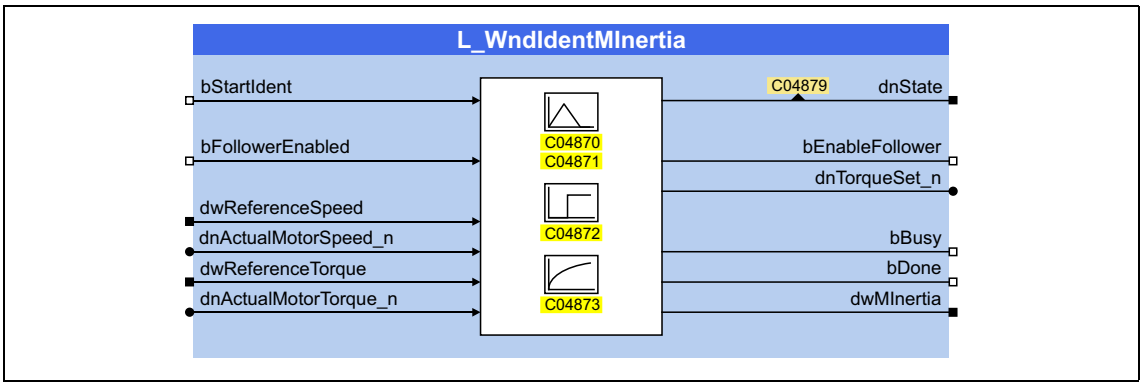
Temperature compensation

Via the input *dnFrictionAdapt_n* a gain for the characteristic on a percentage basis is specified, for instance in order to compensate changes in the friction torque due to temperature changes.

Smoothing the speed reference value

For smoothing the speed reference value *dnSpeedSetpoint_n*, a filter time constant can be set in C04856.

Display of the precontrol signal



The precontrol signal generated is provided at output *dnFrictionTorque_n*. By setting the input *bNegOutput* to TRUE, you can output this signal in an inverted manner (change of direction of rotation).

5.208 L_WndIdentMInertia - identification of the moment of inertia

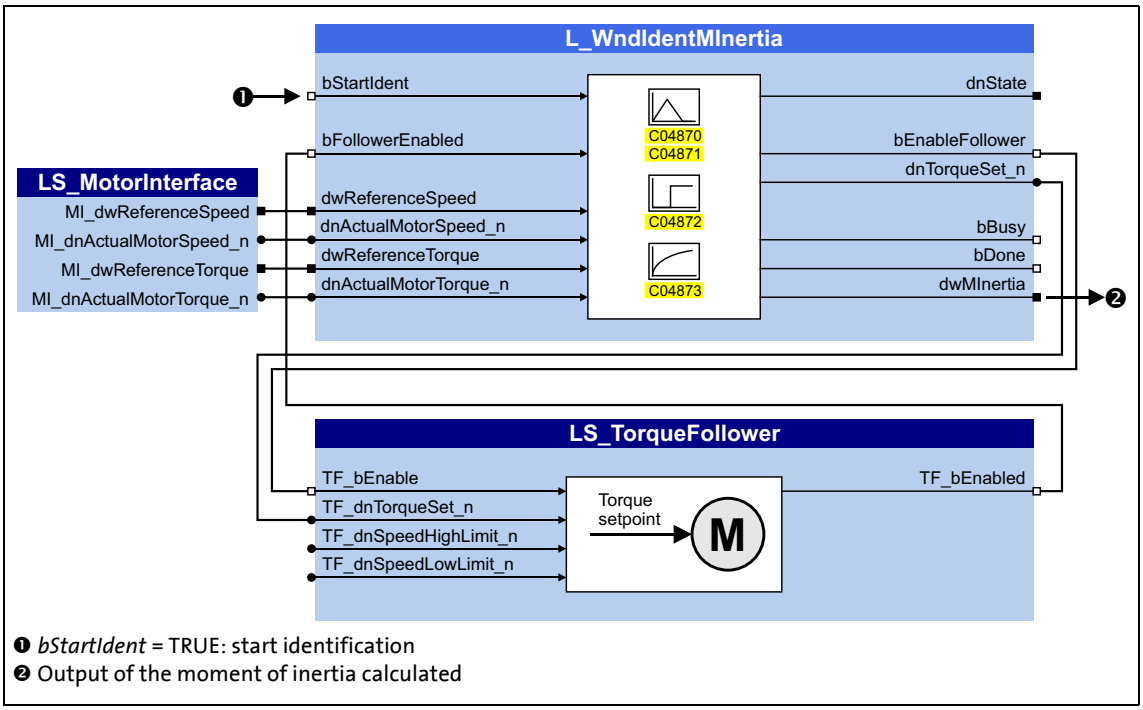
Function library:	LenzeWinder
Runtime software licence:	☐ Motion Control HighLevel ☑ Motion Control TopLevel

By means of this FB, the current moment of inertia can be identified automatically. The FB takes over the drive control on request and carries out the identification.

- Via *dnState* the current status of the identification run is displayed, or the cause that may have lead to an early abort is shown.
- After the identification run has been completed successfully, the moment of inertia is output via *dwMInertia*.

Inputs

Identifier/data type	Information/possible settings
bStartIdent BOOL	Start identification of the moment of inertia TRUE | Start identification.
bFollowerEnabled BOOL	Interface for the basic function "Torque follower" • Connect this input with the output *TF_bEnabled* of the SB **LS_TorqueFollower**.
dwReferenceSpeed DWORD	Motor reference speed in [rpm] • 15000 rpm ≡ 2^{26} ≡ 67108864 • Internal limitation to 50000 rpm • Connect this input to the output *MI_dwReferenceSpeed* of the SB **LS_MotorInterface**.
dnActualMotorSpeed_n DINT	Current speed of the motor shaft in [%] • 100 % ≡ motor reference speed (*dwReferenceSpeed*) • Connect this input to the output *MI_dnActualMotorSpeed_n* of the SB **LS_MotorInterface**.
dwReferenceTorque DWORD	Motor reference torque in [mNm] • 1000 mNm ≡ 1 Nm • Internal limitation to 3000 Nm. • Connect this input to the output *MI_dwReferenceTorque* of the SB **LS_MotorInterface**.
dnActualMotorTorque_n DINT	Current actual torque of the motor in [%] • 100 % ≡ motor reference torque (*dwReferenceTorque*) • Connect this input to the output *MI_dnActualMotorTorque_n* of the SB **LS_MotorInterface**.



Outputs

Identifier/data type	Value/meaning	
dnState DINT	Status (bit coded) • Bits that are not listed have not been assigned with a status (always "0").	
	Status messages:	
	Bit 0	Identification started. Waiting for activation of the basic function "Torque follower".
	Bit 1	Waiting for motor standstill.
	Bit 2	Drive is accelerated to the specified speed.
	Bit 3	Drive has reached the specified speed and is braked to standstill.
	Bit 4	The moment of inertia (*dwMInertia*) is calculated.
	Bit 5	Identification completed successfully.
	Error messages:	
	Bit 16	Identification cancelled (*bStartIdent* = FALSE).
	Bit 17	Identification cancelled (*bFollowerEnabled* = FALSE).
	Bit 18	Specified maximum speed not reached.
	Bit 20	Speed reached at the end of acceleration process too low.
bEnableFollower BOOL	Interface for the basic function "Torque follower" • Connect this output with the input *TF_bEnable* of the SB **LS_TorqueFollower**.	
dnTorqueSet_n DINT	Interface for the basic function "Torque follower" • Connect this output with the input *TF_dnTorqueSet_n* of the SB **LS_TorqueFollower**.	
bBusy BOOL	Status signal "Detection of measured value active"	
	TRUE	Detection of measured value active.
bDone BOOL	Status signal "Identification completed successfully"	
	TRUE	Identification completed successfully.
dwMinertia DWORD	Identified moment of inertia in [0.1 kg cm^2]	

Parameters

5.208.1 Basic interconnection

[5-156] Basic interconnection with the basic function "Speed follower"

5.208.2 Carrying out the identification

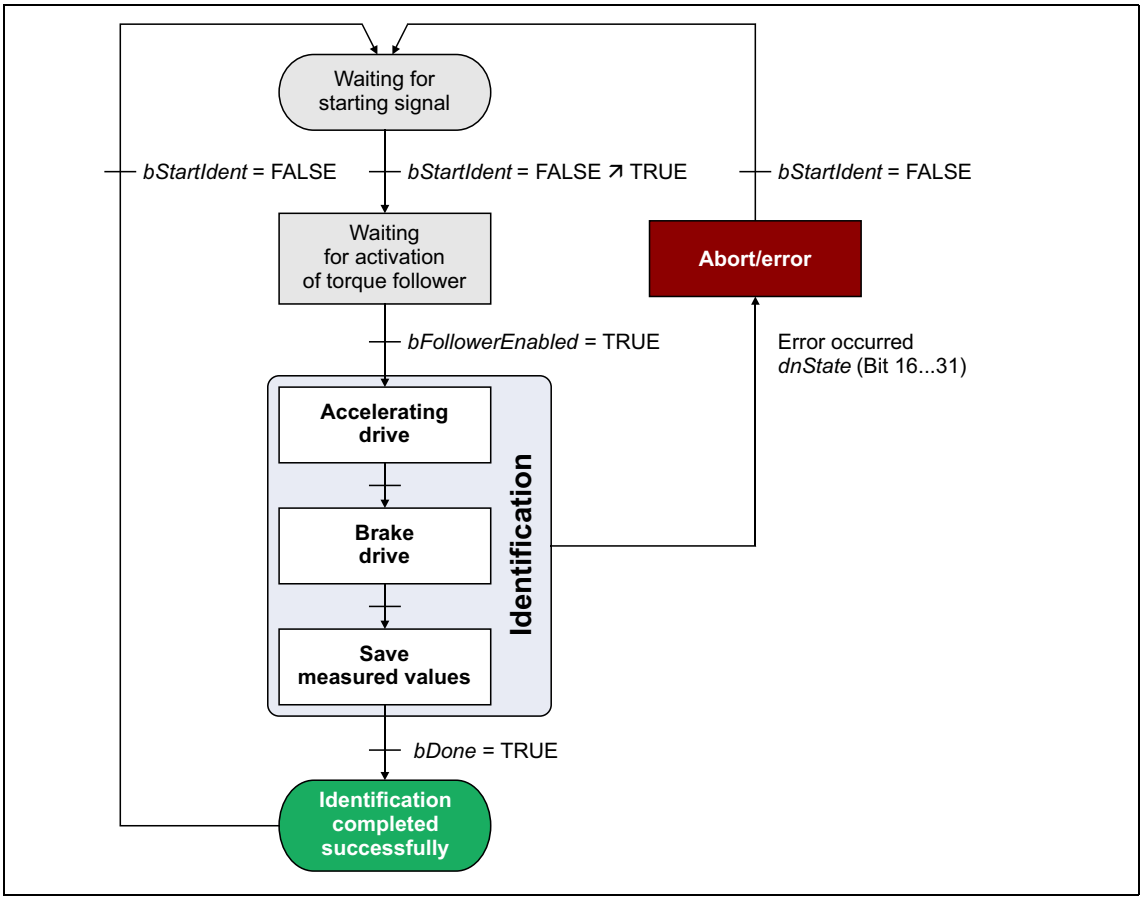
Danger!

For the identification of the current moment of inertia, the drive is accelerated to the maximum speed set in C04870 and is braked to standstill again.

Note!

The rate of change of the speed results from the torque setpoint set in C04871 and the present moment of inertia.

Starting the identification



By setting the input *bStartIdent* from FALSE to TRUE, you start the identification.

Identification procedure

1. The basic function "Torque follower" is activated.
   - Output *bBusy* changes to TRUE.
2. If the drive is still coasting it is waited until the motor stops coasting first.
3. The drive is accelerated to the specified maximum speed (C04870) with the specified torque setpoint (C04871).
4. When the drive has reached the maximum speed, it is braked to standstill again with the inverse torque setpoint.
5. The present moment of inertia is calculated.
   - At the output *dwMInertia* the calculated value is displayed as a physical value in the unit [0.01 kg cm^2].
6. After the identification has been completed successfully, the output *bBusy* is reset to FALSE, and the output *bDone* is set to TRUE.

State machine for the identification

The identification is effected according to the following state machine:

[5-157] State machine for the identification run

Cancelling the identification

If the input *bStartIdent* is reset to FALSE, the active identification is cancelled immediately. Resetting the input *bFollowerEnabled* to FALSE also results in the immediate abort.

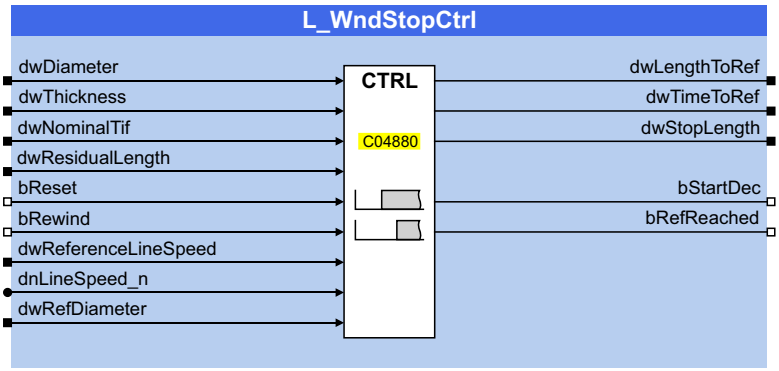
- The output *bBusy* is reset to FALSE and the drive is brought to a standstill via quick stop.
- The cause for the abort is shown via status output *dnState*.

Delay of pulse enable

After activation of the function, the identification does not start immediately, but only after the delay time set in C04872 has elapsed. By this, the magnetic flux of the motor can fully build up first (only required for asynchronous machines).

- If required, the presetting is to be increased in the case of machines with great rotor time constants.

Smoothing the actual speed value signal



If incremental encoders are used, it may be required to filter the actual speed value signal.

- The time constant for the filter can be set in C04873; in the majority of cases the setting "10 ms" is sufficient.

5.209 L_WndStopCtrl - stop controller

Function library:	LenzeWinder
Runtime software licence:	☐ Motion Control HighLevel ☑ Motion Control TopLevel

This FB serves to monitor the residual length to the reference diameter, on the basis of the current diameter and the material thickness. Output signals for an accurately timed braking and a limit stop are provided.

Inputs

Identifier/data type	Information/possible settings	
dwDiameter DWORD	Current reel diameter in [µm] • 1000 µm ≡ 1 mm; 1000000 µm ≡ 1 m • Internal limitation to 10 m	
dwThickness DWORD	Current material thickness in [µm] • 1000 µm ≡ 1 mm • Internal limitation to 30 mm	
dwNominalTif DWORD	Rated deceleration time for braking process in [ms] • Is triggered if the pre-switch-off length has been reached (output *bStartDec* = TRUE). • The reference value can be selected in C04880 (Lenze setting: material speed set-point). • 1000 ms ≡ 1 s • Internal limitation to 10000 s.	
dwResidualLength DWORD	Remaining residual length after the stop in [mm] • 1000 mm ≡ 1 m; 1000000 mm ≡ 1 km • Internal limitation to 1000 km	
bReset BOOL	Reset stop controller	
	TRUE	The stop controller and the digital output signals *bStartDec* and *bRefReached* are reset.
bRewind BOOL	Selection of unwinding/rewinding operation	
	FALSE	Unwinding operation
	TRUE	Rewinding operation
dwReferenceLineSpeed DWORD	Maximum material speed in [cm/min] • 2500 cm/min ≡ 25.00 m/min • Internal limitation to 2000 m/min	

Identifier/data type	Information/possible settings
dnLineSpeed_n DINT	Material speed setpoint in [%] • 100 % ≡ maximum material speed (*dwReferenceLineSpeed*)
dwRefDiameter DWORD	Reference diameter for pre-switch-off and switch-off signal in [µm] • 1000 µm ≡ 1 mm; 1000000 µm ≡ 1 m • Internal limitation to 10 m

Outputs

Identifier/data type	Value/meaning	
dwLengthToRef DWORD	Residual length until reaching the reference value in [mm] • Internal limitation to 2000 km	
dwTimeToRef DWORD	Residual runtime until reaching the reference value in [s] • The calculation depends on C04880, either on the basis of the material speed set-point or the maximum material speed. • This value is only calculated at every 2. call of the FB (alternating with *dwStopLength*).	
dwStopLength DWORD	Change in length during the braking phase in [mm] • This value is only calculated at every 2. call of the FB (alternating with *dwTimeToRef*).	
bStartDec BOOL	Control signal for starting the braking process	
	TRUE	Pre-switch-off length reached.
bRefReached BOOL	Control signal for triggering the limit stop	
	TRUE	Reference length *dwRefLength* reached.

Parameters

Parameter	Possible settings		Info
C04880	Reference value =		Stop length of reference value • Reference value for the rated deceleration time *dwNominalTif* • Initialisation: maximum material speed
	0	Maximum material speed (*dwReferenceLineSpeed*)	
	1	Material speed setpoint (*dnLineSpeed_n*)	

5.209.1 Display of the residual length/residual runtime

Via the output *dwLengthToRef* the residual length until reaching the reference diameter (*dwRefDiameter*) is provided.

- Via *bRewind* you define whether the reference diameter is to be smaller (unwinder) or greater (rewinder) than the current diameter.
- If the reference diameter is reached or exceeded, the residual length is zero.
- Assuming that the maximum material speed *dwReferenceLineSpeed* is run, a corresponding residual runtime *dwTimeToRef* results from the residual length.

5.209.2 Activating the braking process

For the activation of the braking process, the residual length until reaching the reference diameter is compared to the remaining length after the stop (*dwResidualLength*), including the change in length during the braking phase (*dwStopLength*).

- The change in length during the braking phase is output at *dwStopLength*. It depends on the current material speed which is calculated from *dwReferenceLineSpeed* and *dnLineSpeed_n*, and on the reference deceleration time *dwNominalTif*.
- The signal for activating the braking process is output at *bStartDec*.

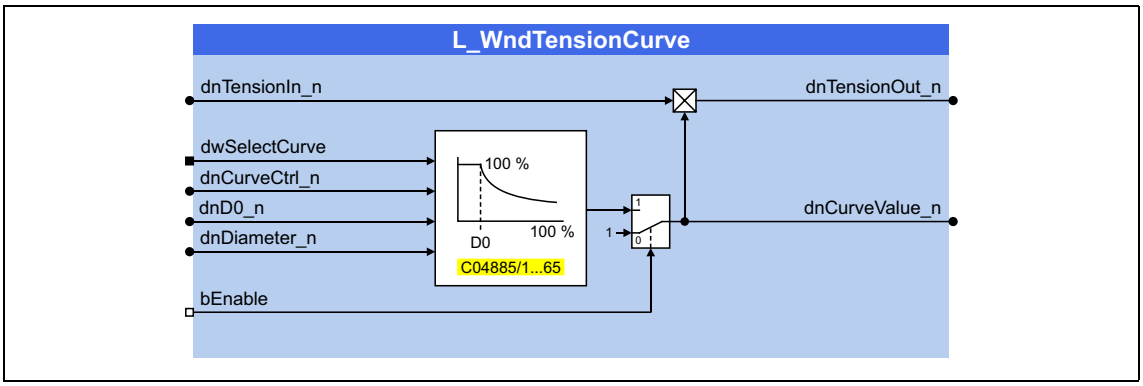
5.209.3 Triggering a limit stop

For the activation of a limit stop, the residual length until reaching the reference diameter is compared to zero (current diameter equals reference diameter).

- The signal for triggering the limit stop is output at *bRefReached*.

5.209.4 Resetting the calculation & trigger signals

By setting *bReset* to TRUE, you can reset the stop controller and the two digital outputs for the activation of the braking process/limit stop.



5.210 L_WndTensionCurve - tensile force characteristic

Function library:	LenzeWinder
Runtime software licence:	☐ Motion Control HighLevel ☑ Motion Control TopLevel

In the case of centre winders, the drive torque is transmitted from the centre across the individual layers to the winding surface. For smooth materials and large diameter areas in the majority of cases it is required to reduce the tensile force in a manner depending on the diameter.

This FB serves to generate a tensile force characteristic depending on the diameter.

- This characteristic is distinguished by an initial area with a constant evaluation (100 %) and a second area within which the tensile force is adapted to the diameter.

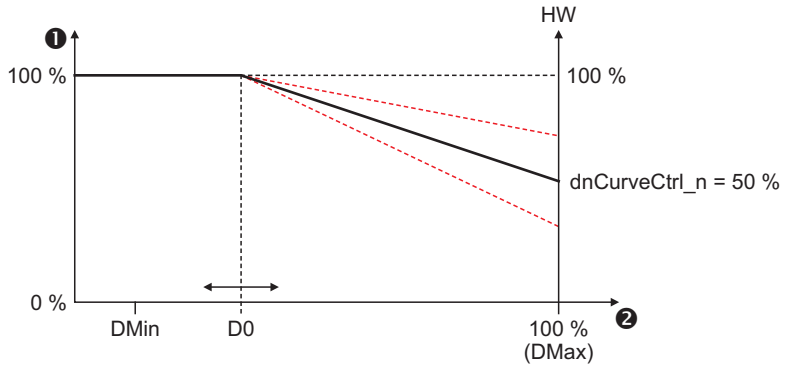
Inputs

Identifier/data type	Information/possible settings	
dnTensionIn_n DINT	Maximum setpoint of the tensile force in [%]	
dwSelectCurve DWORD	Selection of the characteristic	
	0	Linear tensile force characteristic
	1	Linear torque characteristic
	2	Course of the tensile force according to a specified characteristic (C04885/1...65)
dnCurveCtrl_n DINT	Gradient of the characteristic (torque characteristic) in [%] • Internal limitation to -100 ... +200 % • At 100 % there is a constant tensile force characteristic and therefore a torque proportionally increasing with D.	
dnD0_n DINT	Starting point of the characteristic • 100 % ≡ maximum diameter	
dnDiameter_n DINT	Current diameter • 100 % ≡ maximum diameter	
bEnable BOOL	Activate tensile force setpoint	
	FALSE	Tensile force setpoint is not affected.
	TRUE	Tensile force setpoint is multiplied with the characteristic value.

Outputs

Identifier/data type	Value/meaning
dnTensionOut_n DINT	Current tensile force setpoint in [%]
dnCurveValue_n DINT	Current characteristic value in [%]

Parameters



Parameter	Possible settings			Info
C04885/1...65	1	%	200	Table of characteristic values • The 65 values in [%] are distributed equally across the diameter area of *dnD0_n* to the maximum diameter.

5.210.1 Selection of the characteristic

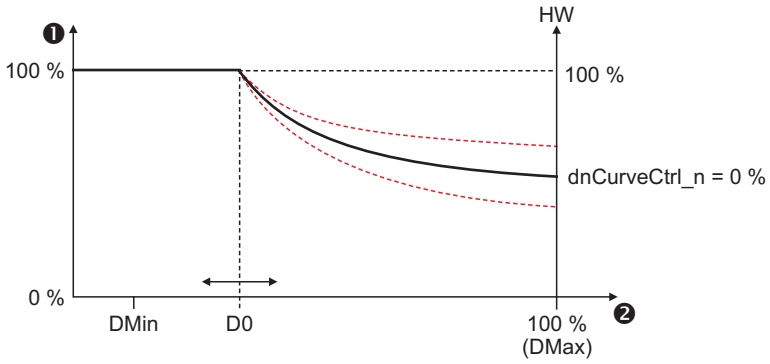
The part of the characteristic that depends on the diameter can be generated for a linear course of the tensile force, a linear course of the torque, or on the basis of a specified characteristic. The corresponding selection is carried out via the input *dwSelectCurve*.

5.210.1.1 Characteristic for a linear course of the tensile force

Characteristic
❶ Tensile force
❷ Diameter

Function for D > D0:

$$100\,\% - \frac{D - D0}{100\,\% - D0} \cdot (100\,\% - HW)$$



D	Current diameter (*dnDiameter_n*)
D0	Starting point for diameter dependency (*dnD0_n*)
HW	Evaluation of tensile force (*dnCurveCtrl_n*)

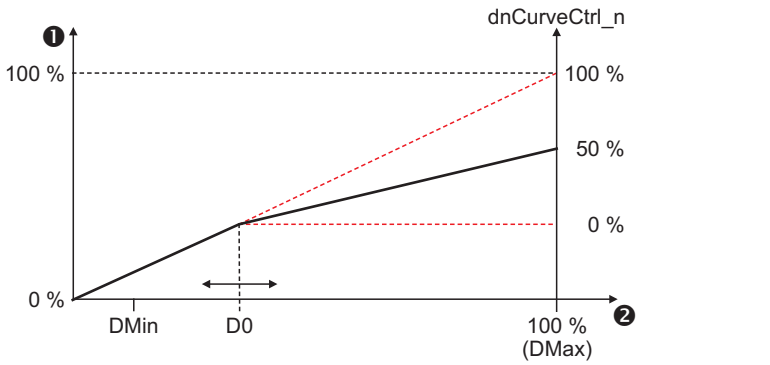
[5-158] Characteristic for a linear course of the tensile force (*dwSelectCurve* = 0)

- Via *dnD0_n* you define the diameter at which the reduction of the tensile force is to start.

5.210.1.2 Characteristic for a linear course of the torque

Characteristic
❶ Tensile force
❷ Diameter

Function for D > D0:



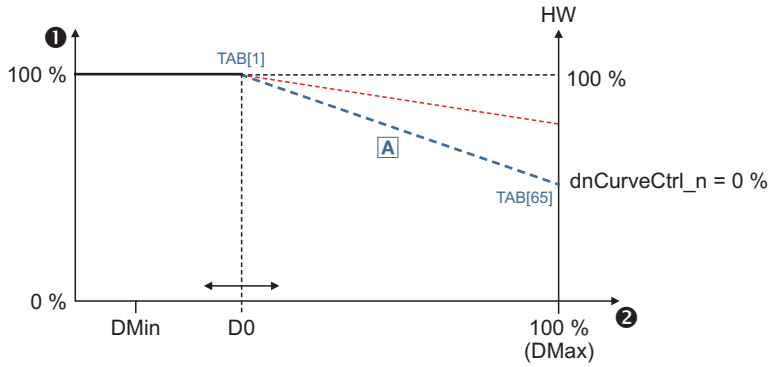
$$HW + \frac{(100\,\% - HW) \cdot D0}{D}$$

D	Current diameter (*dnDiameter_n*)
D0	Starting point for diameter dependency (*dnD0_n*)
HW	Evaluation of tensile force (*dnCurveCtrl_n*)

[5-159] Characteristic for a linear course of the torque (*dwSelectCurve* = 1)

- Via *dnD0_n* you define the diameter at which the reduction of the tensile force is to start.
- Since this characteristic selection focuses on the linear course of the torque, in this case you define the steepness of the torque curve via *dnCurveCtrl_n*:
  - At *dnCurveCtrl_n* = 100 % the tensile force remains unchanged.
  - At *dnCurveCtrl_n* = 0 % the tensile force is reduced to D0/DMax.

Characteristic
❶ Torque
❷ Diameter



D	Current diameter (*dnDiameter_n*)
D0	Starting point for diameter dependency (*dnD0_n*)

5.210.1.3 Course of the tensile force according to a specified characteristic

The characteristic (A) can be parameterised in C04885/x and contains 65 values, equally distributed across the diameter area of D0 ... DMax:

Characteristic
❶ Tensile force
❷ Diameter

Function for D > D0:

$$100\,\% - \frac{(100\,\% - \mathrm{TAB[D\text{-}D0]}) \cdot (100\,\% - \mathrm{HW})}{100\,\%}$$

A	Table function (e.g. straight line)
TAB[D-D0]	Table value [1...65] for D-D0
D0	Starting point for diameter dependency (*dnD0_n*)
HW	Evaluation of tensile force (*dnCurveCtrl_n*)

[5-160] Course of the tensile force according to a specified characteristic (*dwSelectCurve* = 2)

- Via *dnD0_n* you define the start of the table area (D0).
- Via *dnCurveCtrl_n* the gradient of the characteristic can be altered.
  - At *dnCurveCtrl_n* = 0 % the gradient of the characteristic remains unchanged.

6 Table of attributes

The table of attributes contains information required for a communication to the controller via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter will be addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Only required if accessed via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	S	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte bit coded
			BITFIELD_16	2 bytes bit coded
			BITFIELD_32	4 bytes bit coded
			INTEGER_8	1 byte with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes without sign
			VISIBLE_STRING	ASCII string
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 ≡ no decimal positions 10 ≡ 1 decimal position 100 ≡ 2 decimal positions 1000 ≡ 3 decimal positions 10000 ≡ 4 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit required	☑ Writing is only possible if the controller is inhibited

1 About this documentation

This documentation contains information about the technology application "Actuator - speed" for the Servo Drives 9400 series.

Note!

This documentation supplements the mounting instructions supplied with the controller, the hardware manual and the software manual for the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation applies to:

Technology application	Appl. ID	Required runtime software licence
Actuator – speed	100102101	Available in every license stage

The technology application can be used with the following controllers:

Product series	Type designation	From hardware version	From software version
9400 Servo Drives	E94AxHExxxx	PD	1.35

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	04/2007	TD05	First edition
1.1	10/2008	TD05	New subchapter "Parameterisable function blocks"

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window pane	*Italics*	The *Message window*... / The *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Keyboard command	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program listings	Courier	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**Courier bold**	
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse click in this online documentation.
Symbols		
Page reference	(📖 5)	Optically highlighted reference to another page. It is activated with a mouse click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and suggests how to avoid the danger)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of material damage** Indicates a potential danger that may lead to material damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note for trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Brief description

The technology application "actuator – speed" enables the drive to create a speed to be defined. The speed setpoint can be complied with using a speed controller which adopts the motor torque to the prevailing load situation.

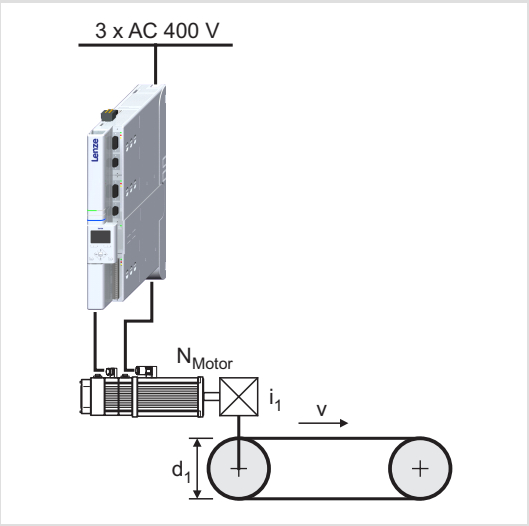
- The speed setpoint of the drive can be specified for both directions. The driven machine parts accordingly moves forwards or backwards. As an alternative to the inversion of the setpoint, the change of the direction of movement can be done via the digital input DI3.
- After the speed-controlled operation is enabled via the digital input DI2 the acceleration/deceleration of the drive to the setpoint is controlled via a ramp generator based on the current setpoint/actual speed.
- The maximum torque of the drive can also be controlled, if required.

Basic drive functions

- A quick stop can be activated via the digital input DI1.
- A manual control is provided for the setting-up operation. It is enabled via the digital input DI6. The digital inputs DI7 and DI8 activate parameterisable setpoints for both directions of rotation.
- The basic function "limiter" enables the travel range to be monitored via limit switches.
- When a brake is available the brake control opens and closes the brake.

Application range

- General servo drive for speed control of:
  - Conveyor drives (connected in one system)
  - Extruders
  - Test benches
  - Vibrators
  - Travelling drives
  - Presses
  - Machine tools
  - Dosing machines
- Actuator for higher-level controllers
  - Positioning drives with external position control
  - Multi-axis systems with external path control



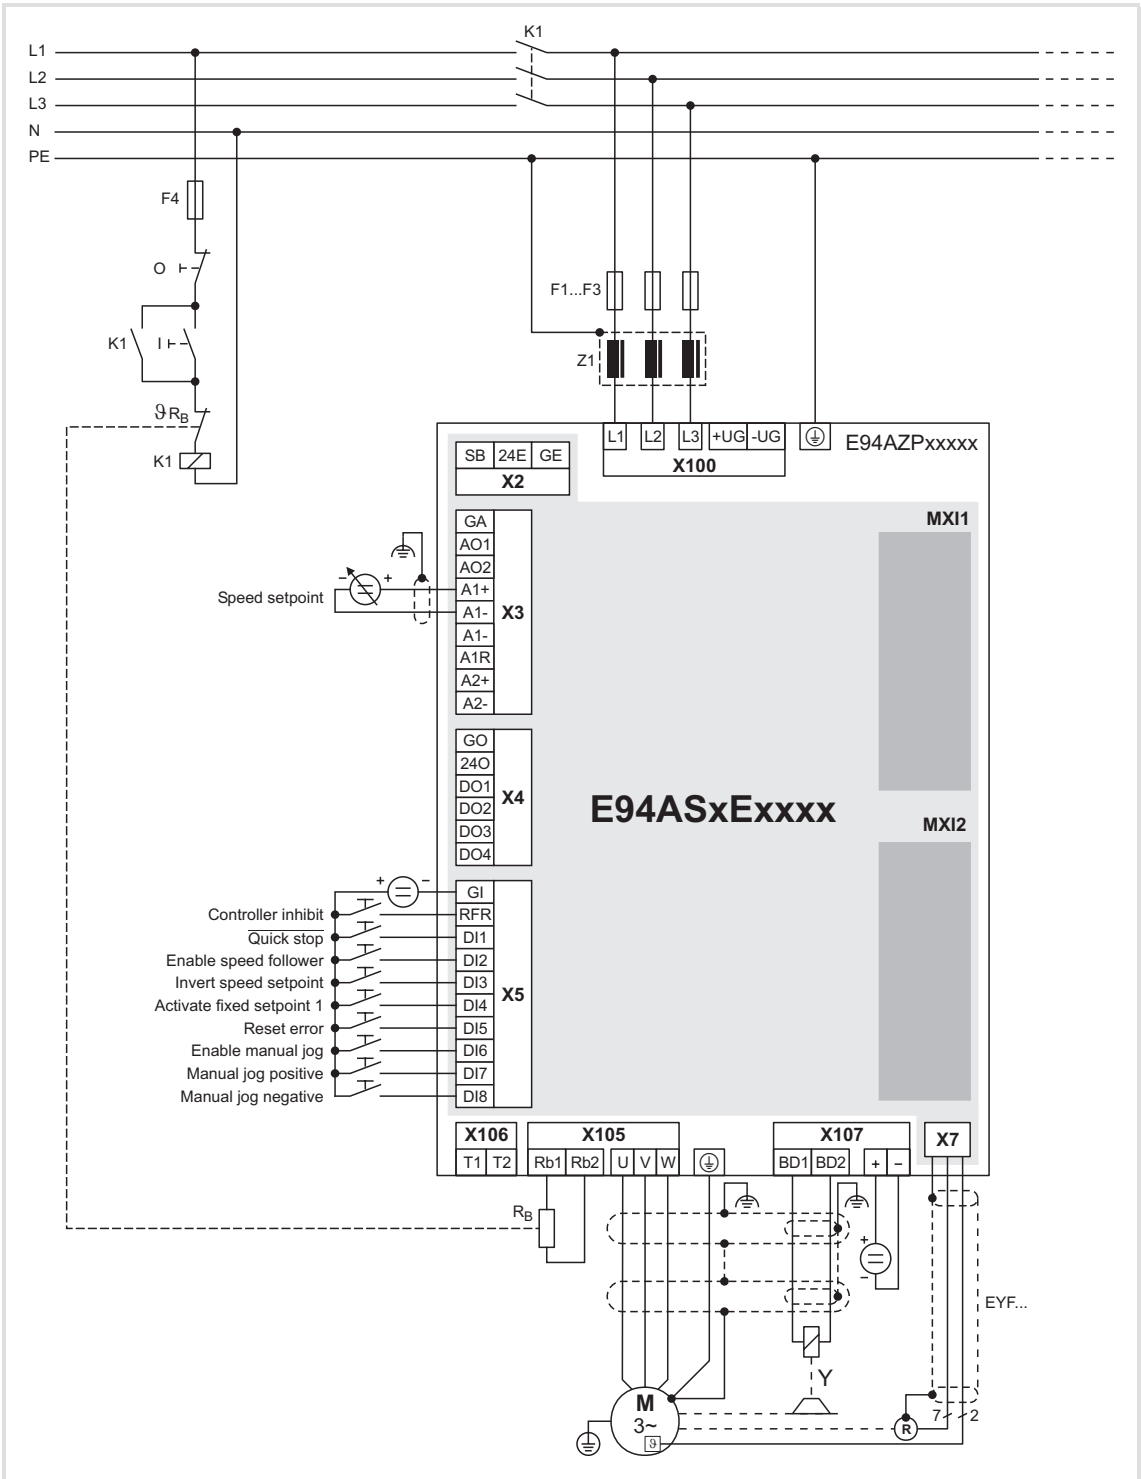
Required license/delivery

- Available in every license stage.
- The technology application is saved at program memory location 2 in the memory module and can be selected from the »Engineer« application catalog.

3 Short setup

3.1 Application example

A conveyor drive is used as an application example for short setup:

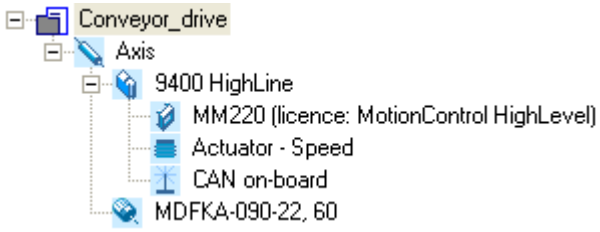


[3-1] Schematic diagram

- N_{motor} = 1680 rpm
- i_1 = 12.612
- d_1 = 200 mm
- v_{max} = 100 m/min

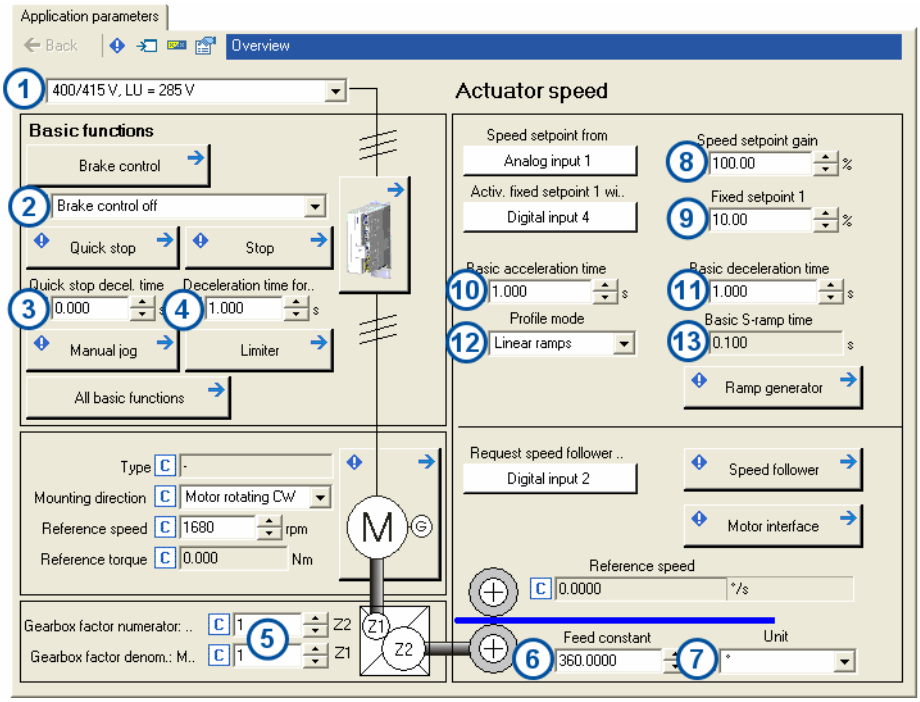
Component	Technical data	
Controller	9400 SingleDrive HighLine with brake module	
Motor	MDFKA-090-22, 60	
	Type:	Asynchronous servo motor
	Connection:	Y
	Power factor:	0.8
	Rated current:	8.5 A
	Rated frequency:	60 Hz
	Rated power:	3.8 kW
	Rated speed:	1680 rpm
	Rated voltage:	390 V
Brake	24 V DC	
Gearbox	GKS06	
	Gearbox factor:	12.612

3.2 Connection diagram



[3-2] Connection diagram

Designation	Component
E94ASxExxxx	9400 Single Drive servo axis module
E94AZPxxxxx	Mounting backplane
k1	Mains contactor
F1 ... F4	Fuses
Z1	Mains filter/RFI filter (option)
⏚	HF-shield termination through large-surface connection to functional earth
EYF...	System cable for resolver feedback
R	Resolver
R_B	Brake resistor
Y	Motor holding brake (at optional motor brake control)



3.3 Step 1: Creating a project

1. Start »Engineer«.
2. Go to *Start-up wizard* and select the option "New project (empty)" and enter a name for the project in a next step.
3. Insert the axis for the conveyor drive.
   – Add the corresponding components (controller, motor, extension module) to the axis.
   – Select the application "Actuator – Speed" for the controller.
   – Example *project view* in the »Engineer«:

3.4 Step 2: Parameterising the application

For parameterising the application in the »Engineer«, use the **Application parameters** tab which will be displayed by default when selecting the controller in the *project view*:

1. Select the mains voltage (C00173).
2. If a brake is used: Activate automatic brake control via brake module (C02580 = "Autom. with brake module").
3. Select the deceleration time for quick stop (C00105), e.g. "0.1 s".
   – If digital input DI1 is set to LOW level, the drive is decelerated to standstill within the quick stop deceleration time independently of the setpoint selection.
4. Select the deceleration time for stop (C02610), e.g. "0.5 s".
   – If the speed follower is inhibited by resetting digital input DI2 to LOW level, the drive is decelerated within the deceleration time for stop.

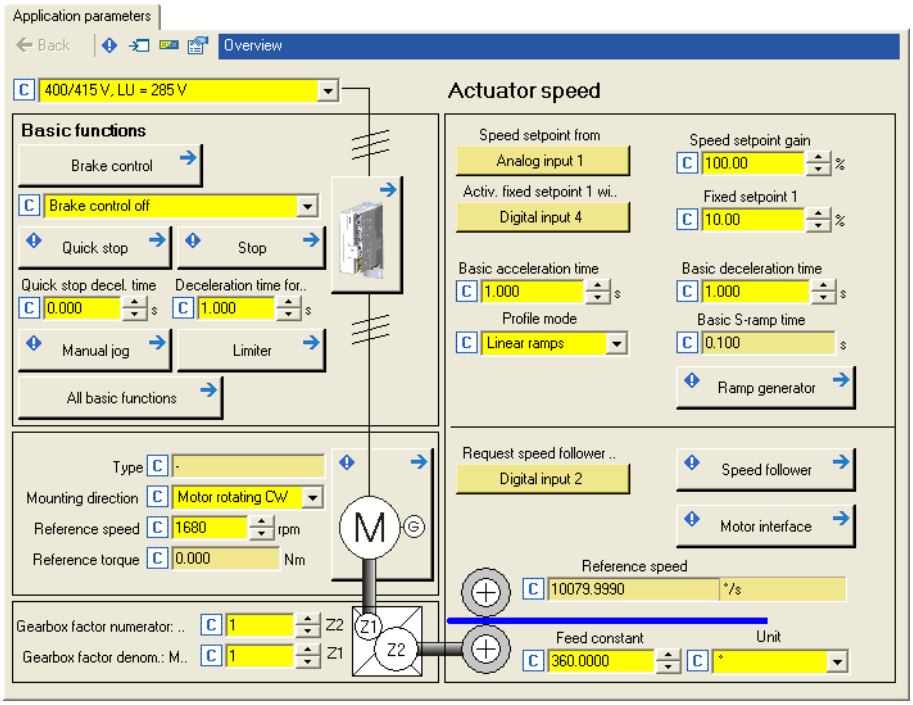
Note!

The manual jog function requires the following gearbox ratio and feed constant settings.

- The manual jog function is parameterised in machine units.
- The selected gearbox ratio and the feed constant are furthermore used to calculate the reference speed of the machine "online".

5. Enter gearbox ratio as a quotient (numerator and denominator): i_1 = 12.612 = 12612/1000
   - Numerator (C02520) = 12612
   - Denominator (C02521) = 1000
6. Set feed constant (C02524).
   - The feed constant corresponds to the motion of the machine at one revolution of the gearbox output shaft.
   - For the conveyor drive: Vk = d_1 * π = 628.32 mm
7. Set the selection "mm" as unit (C02525).
   - This parameter is used to define the real unit of the machine for the selection of physical values (e. g. speeds, accelerations and decelerations).
8. If necessary, adapt the setpoint gain (C03002) for analog input 1.
   - The setpoint is selected via analog input 1 using the following normalisation: 10 V = 100 % internal setpoint = reference speed of motor (C00011)
   - If a lower voltage is available for the setpoint selection, set the setpoint gain as follows: C03002 = 100 % * 10 V / max. input voltage
9. Select fixed setpoint 1 (C03500/1).
   - As an alternative to the analog setpoint, the fixed setpoint can be activated by setting digital input DI4 to HIGH level.
10. Select the acceleration time (C03502) for accelerating the drive, e.g. "0.5 s".
11. Select the deceleration time (C03503) for decelerating the drive, e.g. "0.5 s".
12. For low-jerk acceleration:
    Select "S-shaped ramps" as profile mode for the ramp generator (C03010).
13. When selecting the profile mode "S-shaped ramps", select the S-ramp time (C03504).

3.5 Step 3: Transferring the application to the controller



Note!

The transferred application is always stored in the first application memory location in the memory module of the controller.

The preinstalled technology applications on the following memory locations are still available.

1. Update devices.
   – Set the checkmark in the control field **Recreate all**.
   – Click **Create** to start the compiling process.

2. Go online and transfer the application to the controller.
   – With an online connection, the »Engineer« displays the current controller parameter settings with a yellow background colour:

Note!

The machine reference speed is the speed of the conveyor belt when the motor runs at reference speed (C00011) with 100 % setpoint.

- The indicated value corresponds to a speed of 83.7 m/min.
- For reaching a speed of 100 m/min with 10 V at the setpoint input, the setpoint gain can be increased to 120 % or the reference speed to 2010 rpm.

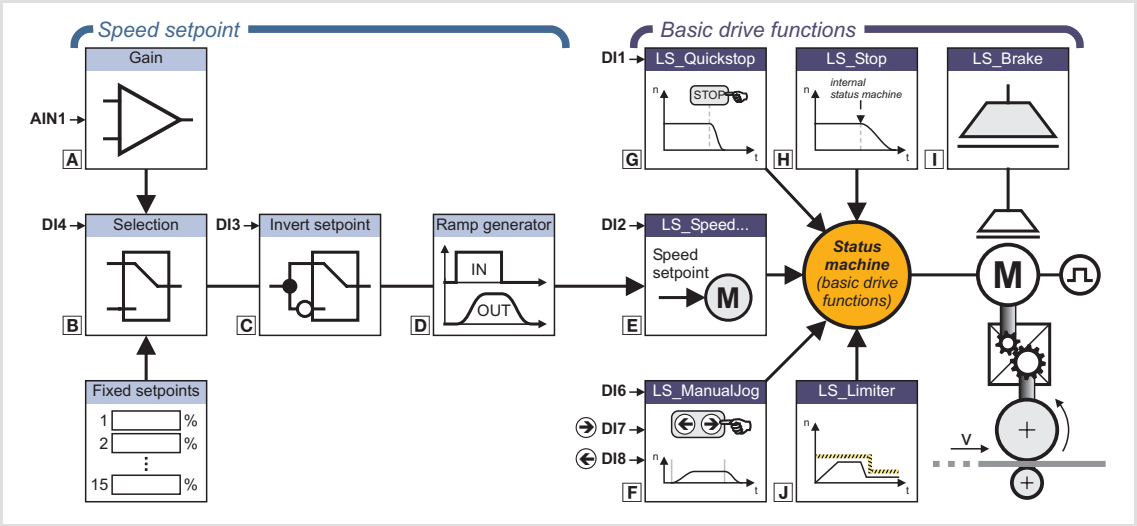
3.6 Step 4: Controlling the application via terminals

Terminal assignment

Terminal		Assignment (Lenze setting)
X3	AI1- AI1+	Speed setpoint • ±10 V ≡ ±100 % reference speed of motor (C00011) ▸ Speed setpoint conditioning (📖 18)
X5	RFR	Controller enable
	DI1	Quick stop • If digital input DI1 is set to LOW level, the drive is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time. ▸ Quick stop (📖 25)
	DI2	Enable speed follower ▸ Speed follower (📖 23)
	DI3	Invert speed setpoint ▸ Setpoint inversion (📖 20)
	DI4	Activate fixed setpoint 1 as speed setpoint • Instead of the selection via the analog input 1 the fixed setpoint 1 is used as speed setpoint. ▸ Change-over to fixed setpoint (📖 19)
	DI5	Reset error • By means of a LOW-HIGH edge an existing error status can be reset if the cause of the fault is removed.
	DI6	Manual jog ▸ Manual jog (📖 24)

DI7	DI8	Function
LOW	LOW	Stop
HIGH	LOW	Manual control in positive direction
LOW	HIGH	Manual control in negative direction
HIGH	HIGH	- (previous state remains active)

Procedure



1. Enable controller: Set digital input RFR to HIGH level.
2. Deactivate quick stop: Set digital input DI1 to HIGH level.
3. Enable speed follower: Set digital input DI2 to HIGH level.
4. Select speed setpoint via analog input 1.

Tip!

As an alternative, you can activate fixed setpoint 1 by setting digital input DI4 to HIGH level.

4 Parameter setting & configuration

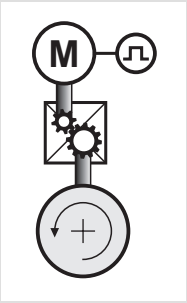
C Setpoint inversion

D Ramp generator

Basic drive functions

E Speed follower

F Manual jog



G Quick stop

H Stop

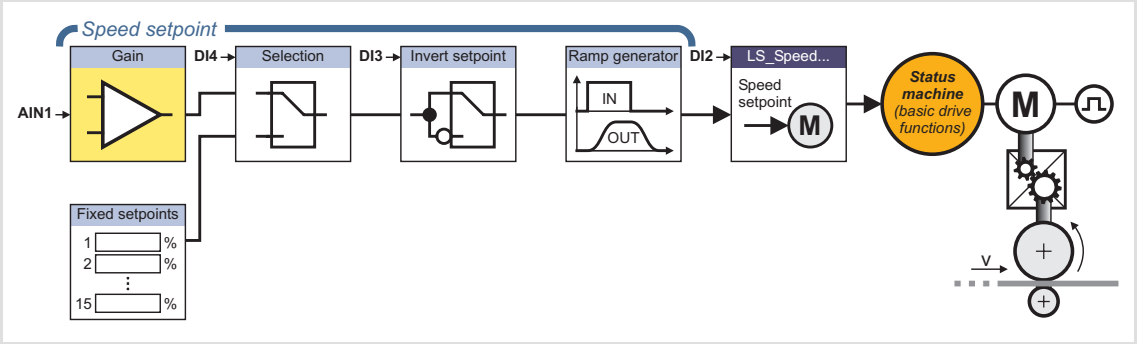
I Brake control (optional)

J Limiter (optional)

4.2 Machine parameters

The machine parameters describe e.g. the motor end of the mechanics used.

The setting of the machine parameters in the »Engineer» is carried out on the **Application parameters** tab in the dialog level *Overview* → *Drive interface* .



Tip!

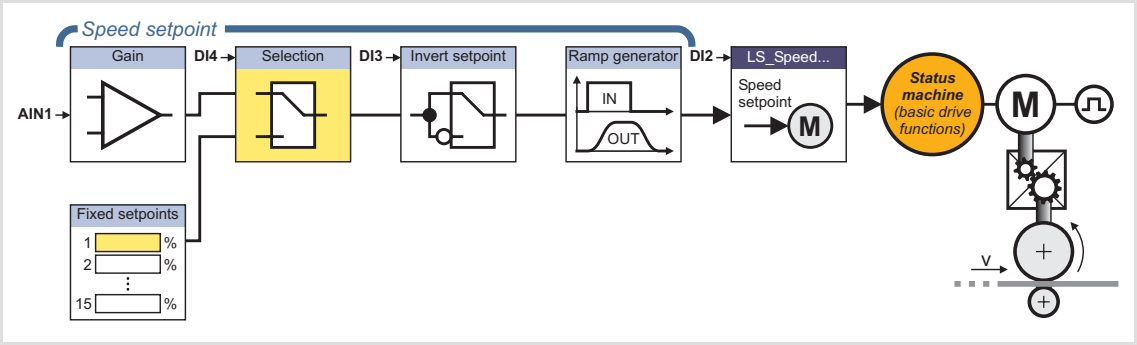
In the »Engineer« the most important machine parameters can be adapted to the machine on the **Application parameters** tab directly in the topmost *Overview* dialog level:

Short overview of machine parameters

Parameter		Lenze setting	
		Value	Unit
C00173	Mains voltage	400/415	V
C00174	Undervoltage (LU) threshold	285	V
C00600	Resp. to DC bus overvoltage	Trouble	
C02520	Gearbox factor numerator: Motor	1	
C02521	Gearbox factor denom: Motor	1	
C02527	Motor mounting direction	Motor rotating CW	
C02570	Position control structure	Phase control	
C02522	Gearbox factor num.: Pos. enc.	1	
C02523	Gearbox factor denom.: Pos. enc.	1	
Description of the mechanics (load, tool)			
C02528	Traversing range	Unlimited	
C02524	Feed constant	360.0000	unit
C02525	Unit	°	
C02526	User-defined unit	°	
C02533	Time unit	s	
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

4.3 Speed setpoint conditioning

[4-2] Speed setpoint conditioning (schematic diagram)



The speed setpoint is defined in the Lenze setting via the analog input 1 and take place in both directions (bipolar) and accordingly the driven machine part moves forward or backward.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03002	Setpoint gain	100.00	%

Setpoint inputs of the function		Signal configuration
Lenze setting	Setpoint input	(Multiplexer parameters)
AIN 1	→ Speed setpoint	C03000

4.3.1 Change-over to fixed setpoint

[4-3] Additional offset for the speed limit value (schematic diagram)

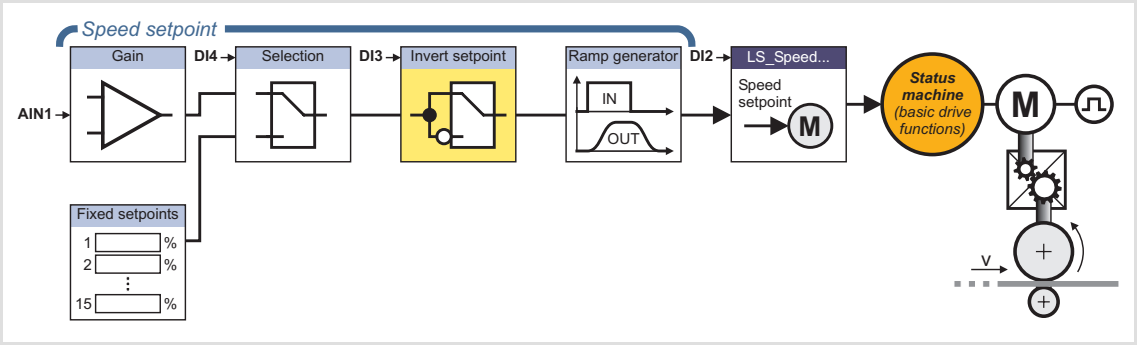
Via the digital input DI4 a change-over to a parameterisable fixed setpoint can take place.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03500/1	Fixed setpoint 1	10.00	%

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 4	→ Activate fixed setpoint 1	C03009/4

Use of further fixed setpoints



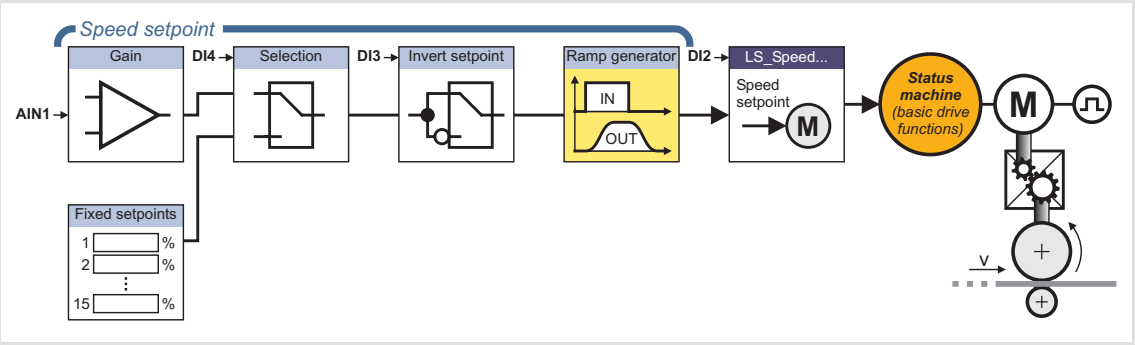
A total of 15 different fixed setpoints can be parameterised. For the selection of the fixed setpoints 2 ... 15 the selection inputs are to be assigned with the corresponding signals. The selection of the fixed setpoints is carried out in a binary coded manner.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Ramp generator* → *All fixed setpoints*

Parameter		Lenze setting	
		Value	Unit
C03500/1	Fixed setpoint 1	10.00	%
C03500/2	Fixed setpoint 2	0.00	%
C03500/...	Fixed setpoint ...	...	...
C03500/15	Fixed setpoint 15	0.00	%

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 4	→ Activate fixed setpoint 1	C03009/4
FALSE	→ Activate fixed setpoint 2 a	C03009/5
FALSE	→ Activate fixed setpoint 4 a	C03009/6
FALSE	→ Activate fixed setpoint 8 a	C03009/7

4.3.2 Setpoint inversion



[4-4] Setpoint inversion (schematic diagram)

Via the digital input DI3 the effective direction of the (bipolar) setpoint can be inverted, if required.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Ramp generator*

Control inputs of the function		Signal configuration
Lenze setting	**Control input**	**(Multiplexer parameters)**
DIGIN 3	→ Invert direction of rotation	C03009/1

4.3.3 Speed ramp generator

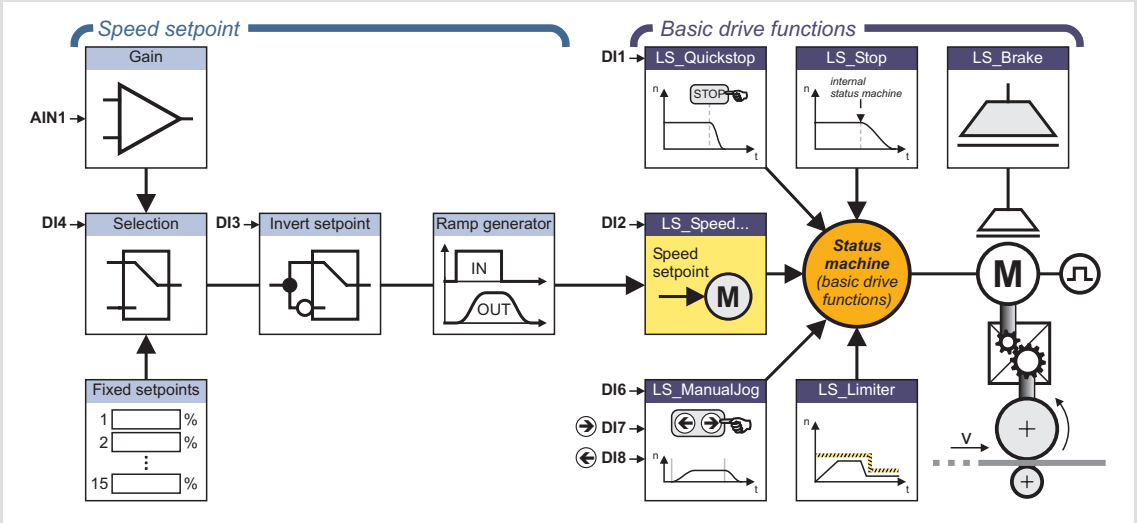
[4-5] Ramp generator (schematic diagram)

In order to avoid setpoint step-changes the speed setpoint passes a ramp generator with a parameterisable acceleration/deceleration and S-ramp time before it is transmitted to the basic drive function "Speed follower".

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03502	Basic acceleration time	1.000	s
C03503	Basic deceleration time	1.000	s
C03504	Basic S-ramp time	0.100	s
C03510	Profile mode	Linear ramps	

Use of further ramp parameter sets



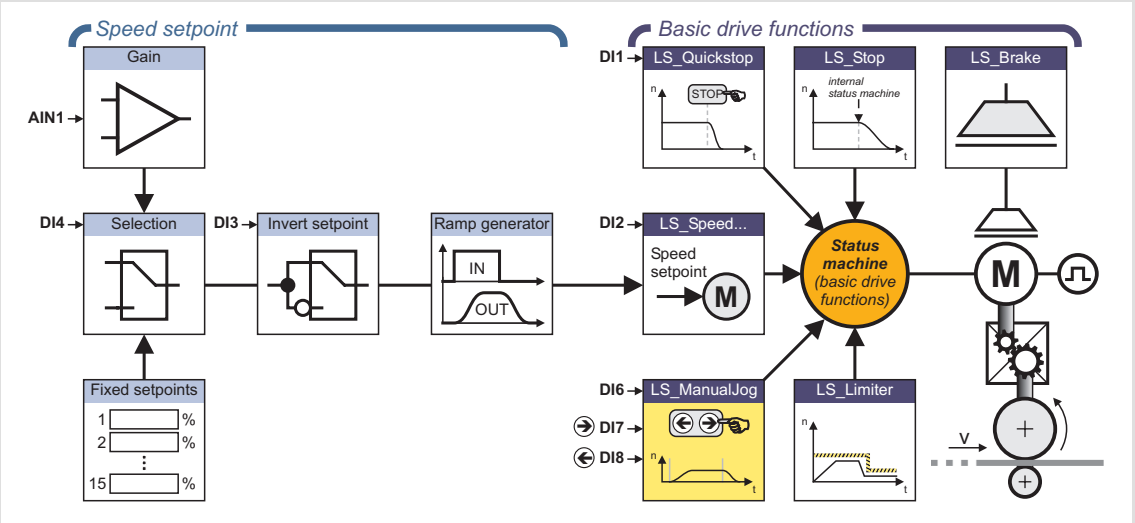
If required, 15 further ramp parameter sets can be parameterised. For the selection of the ramp parameter sets 1 ... 15 the selection inputs are to be assigned with the corresponding signals. The selection of the ramp parameter sets is carried out in a binary coded manner.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Ramp generator* → *All ramp parameters*

Parameter		Lenze setting	
		Value	Unit
C03512/1	Acceleration time 1	0.000	s
C03512/...	Acceleration time ...	...	...
C03512/15	Acceleration time 15	0.000	s
C03513/1	Deceleration time 1	0.000	s
C03513/...	Deceleration time ...	...	...
C03513/15	Deceleration time 15	0.000	s
C03514/1	S-ramp time 1	0.000	s
C03514/...	S-ramp time	...	...
C03514/15	S-ramp time 15	0.000	s

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Activate ramp parameter set 1 a	C03009/8
FALSE	→ Activate ramp parameter set 2	C03009/9
FALSE	→ Activate ramp parameter set 4	C03009/10
FALSE	→ Activate ramp parameter set 8 a	C03009/11

4.4 Speed follower



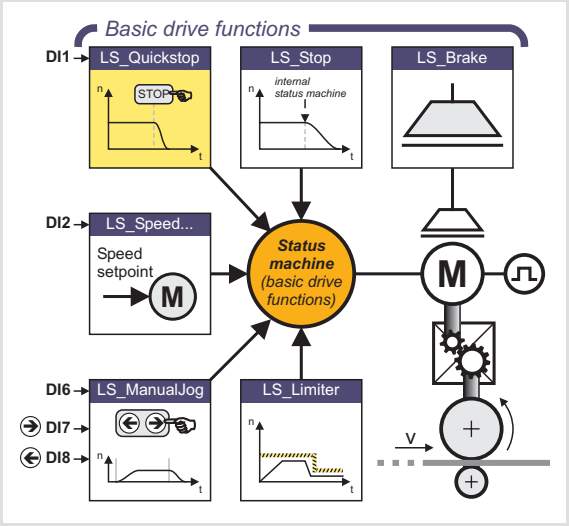
[4-6] Basic function "Speed follower" (schematic diagram)

The speed-controlled operation is requested via the digital input DI2. If no other basic function and error state are active, the speed-controlled operation is enabled.

- The acceleration/deceleration of the drive to the setpoint is controlled via a ramp generator based on the current setpoint/actual speed.
- If the enable of the speed-controlled operation is reset via the digital input DI2, the drive is decelerated to standstill via an independent profile generator of the basic function "Stop".

4.5 Manual jog

[4-7] Basic function "Manual jog" (schematic diagram)



For the setting-up operation the basic function "Manual jog" is available. It is requested via the digital input DI6. If no other basic function and error status are active, enable is carried out and the manual jog via the digital inputs DI7 and DI8 is possible.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Manual jog*

Parameter		Lenze setting	
		Value	Unit
C02620	Manual jog: Speed 1	360.0000	unit/s
C02621	Manual jog: Speed 2	720.0000	unit/s
C02622	Manual jog: Acceleration	360.0000	unit/s^2
C02623	Manual jog: Deceleration	1440.0000	unit/s^2
C02624	Manual jog: S-ramp time	0.100	s

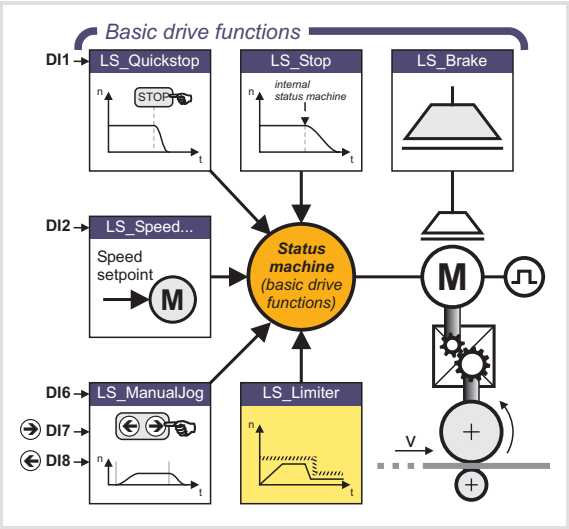
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 6	→ Request manual jog	C03155/1
DIGIN 7	→ Activate positive manual jog	C03155/2
DIGIN 8	→ Activate negative manual jog	C03155/3
FALSE	→ Activate 2. speed	C03155/4

4.6 Quick stop

[4-8] Basic function "Quick stop" (schematic diagram)

The basic function "Quick stop" brakes the drive to standstill within the deceleration time set for the quick stop function after a corresponding request independent of the setpoint selection.

If the quick stop function is deactivated, the drive is led to the selected setpoint again via the acceleration time set in the speed ramp generator.



▶ The quick stop function can be activated as follows in the Lenze setting:
  – By setting the digital input DI1 to LOW level.
  – By a master control via the port *LPortControl1*:
    By setting bit 2 of the bit-coded control word 1.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Quick stop*

Parameter		Lenze setting	
		Value	Unit
C00105	Quick stop deceleration time	0.000	s
C00106	Quick stop S-ramp time	0.00	%
C00107	Reference for quick stop deceleration time	Motor reference speed (C00011)	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 1	→ Activate quick stop 1	C03135/1
Control word 1 bit 02	→ Activate quick stop 2	C03135/2
FALSE	→ Activate quick stop 3	C03135/3

4.7 Limiter

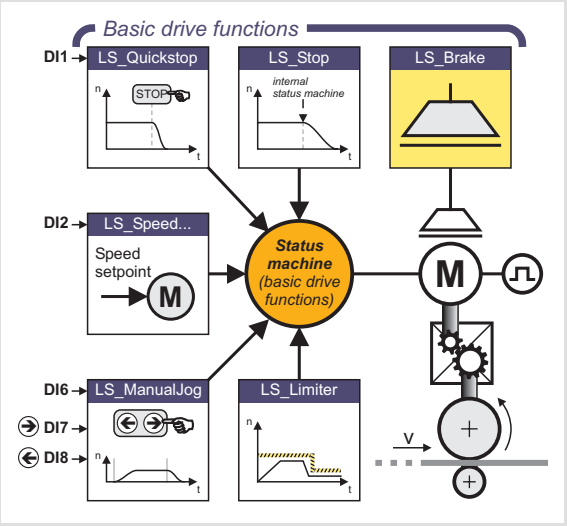
[4-9] Basic function "Limiter" (schematic diagram)

The basic function "Limiter", where applicable, by means of limit switches monitors travel range limits.

In the case of homing, positioning and manual jog the basic function "Limiter" if required provides for the compliance with kinematic limit values.

Note!

The parameterised limit values are not effective for the basic functions "speed follower", "torque follower", and "position follower"!



For the exceeding of the limit values an error response can be set.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Limiter*

Parameter		Lenze setting	
		Value	Unit
Only for homing, positioning and manual jog			
C02702	Limitations are active	Deactivated	
C02703	Max. speed	3600.0000	unit/s
C02705	Max. acceleration	3600.0000	unit/s^2
C02706	Min. S-ramp time	100	ms
C02707	Permissible direction of rotation	Positive and negative	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Positive limit switch	C03150/1
FALSE	→ Negative limit switch	C03150/2

4.8 Brake control

[4-10] Basic function "Brake control" (schematic diagram)

The basic function "Brake control" serves to the wear free control and monitoring of a holding brake.

In the simplest case, an optionally available brake module is used.

Alternatively the holding brake can also be controlled and monitored via the digital inputs/outputs.

Note!

In the Lenze setting the brake control is switched off to reach a safe status after mains connection.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Brake control*

Parameter		Lenze setting	
		Value	Unit
C02580	Operating mode of brake	Brake control off	
C02581	Brake activation threshold	50	rpm
C02582	Brake response to pulse inhibit	Activate brake immediately	
C02583	Status input monitoring	Not active	
C02585	Brake control polarity	Not inverted	
C02586	Starting torque 1	0.00	Nm
C02587	Starting torque 2	0.00	Nm
C02588	Starting torque source	Starting torque 1/2	
C02589	Brake closing time	100	ms
C02590	Brake opening time	100	ms
C02591	Waiting time - status monitoring	100	ms
C02593	Waiting time - brake activation	0.000	s
C02594	Test torque	0.00	Nm
C02595	Permissible angle of rotation	5	°
C02596	Grinding speed	100	rpm
C02597	Accel./decel. time - grinding	1.000	s
C02598	Grinding ON time	0.5	s
C02599	Grinding OFF time	0.5	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Open brake (release)	C03165/1
FALSE	→ Activate starting torque 2	C03165/2
FALSE	→ Keep open brake at standstill	C03165/3
FALSE	→ Brake status signal	C03165/4
FALSE	→ Activate brake test	C03165/5
FALSE	→ Grind brake	C03165/6
0 %	→ Additional torque	C03166

4.9 Signal configuration

4.9.1 Drive and motor interface

If required, the preset signal configuration of the control and setpoint inputs of the drive and motor interface can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Drive interface

Signal (Lenze setting)	Control input	Signal configuration
FALSE	→ Set controller inhibit	C03130/1
DIGIN 5	→ Reset error 1	C03130/2
Control word 1 bit 07	→ Reset error 2	C03130/3
FALSE	→ Reset error 3	C03130/4
FALSE	→ Set error	C03130/5
Control word 1 bit 00	→ Switch on drive	C03130/6

Motor interface

Signal (Lenze setting)	Setpoint input	Signal configuration
100 %	→ Upper torque limit value	C03141/1
-100 %	→ Lower torque limit value	C03141/2
100 %	→ Adaptation of mass inertia	C03141/3

4.9.2 Output ports

If required, the preset signal configuration of the output ports can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Output port "LPortAxisOut1"

The output port **LPortAxisOut1** is intended for the connection with a following axis.

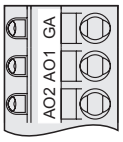
Signal (Lenze setting)	Output port	Signal configuration
Axis status word • Application-specific signals can be supplemented.		
Drive ready	→ Axis status word bit 00	C03120/1
FALSE	→ Axis status word bit 01	C03120/2
Operation enabled	→ Axis status word bit 02	C03120/3
Error is active	→ Axis status word bit 03	C03120/4
FALSE	→ Axis status word bit 04	C03120/5
Quick stop is active	→ Axis status word bit 05	C03120/6
Drive is ready to start	→ Axis status word bit 06	C03120/7
Warning is active	→ Axis status word bit 07	C03120/8
FALSE	→ Axis status word bit 08	C03120/9
FALSE	→ Axis status word bit 09	C03120/10
FALSE	→ Axis status word bit 10	C03120/11
Motor control in limitation	→ Axis status word bit 11	C03120/12
FALSE	→ Axis status word bit 12	C03120/13
FALSE	→ Axis status word bit 13	C03120/14
FALSE	→ Axis status word bit 14	C03120/15
FALSE	→ Axis status word bit 15	C03120/16
Setpoints for horizontal communication		
Filtered torque setpoint	→ Axis-Port Out 1	C03124/1
	Scaling: 16384 ≡ 2^{14} ≡ 100 % motor reference torque (C00057/2)	
Speed setpoint	→ Axis-Port Out 2	C03124/2
	Scaling: 1073741824 ≡ 2^{30} ≡ 100 % motor reference speed (C00011)	

Output port "LPortStatus1"

The output port **LPortStatus1** is intended for the connection with a higher-level control.

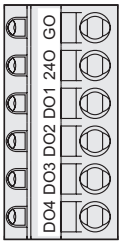
Signal (Lenze setting)	Output port	Signal configuration
Status word 1		
Drive ready	→ Status word 1 bit 00	C03121/1
FALSE	→ Status word 1 bit 01	C03121/2
Operation enabled	→ Status word 1 bit 02	C03121/3
Error is active	→ Status word 1 bit 03	C03121/4
FALSE	→ Status word 1 bit 04	C03121/5
Quick stop is active	→ Status word 1 bit 05	C03121/6
Drive is ready to start	→ Status word 1 bit 06	C03121/7
Warning is active	→ Status word 1 bit 07	C03121/8
FALSE	→ Status word 1 bit 08	C03121/9
FALSE	→ Status word 1 bit 09	C03121/10
FALSE	→ Status word 1 bit 10	C03121/11
Motor control in limitation	→ Status word 1 bit 11	C03121/12
FALSE	→ Status word 1 bit 12	C03121/13
FALSE	→ Status word 1 bit 13	C03121/14
FALSE	→ Status word 1 bit 14	C03121/15
FALSE	→ Status word 1 bit 15	C03121/16

Output port "LPortStatus2"



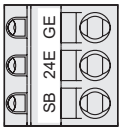
Signal (Lenze setting)	Output port	Signal configuration
Status word 2		
FALSE	→ Status word 2 bit 00	C03122/1
FALSE	→ Status word 2 bit 01	C03122/2
FALSE	→ Status word 2 bit 02	C03122/3
FALSE	→ Status word 2 bit 03	C03122/4
FALSE	→ Status word 2 bit 04	C03122/5
FALSE	→ Status word 2 bit 05	C03122/6
FALSE	→ Status word 2 bit 06	C03122/7
FALSE	→ Status word 2 bit 07	C03122/8
FALSE	→ Status word 2 bit 08	C03122/9
FALSE	→ Status word 2 bit 09	C03122/10
FALSE	→ Status word 2 bit 10	C03122/11
FALSE	→ Status word 2 bit 11	C03122/12
FALSE	→ Status word 2 bit 12	C03122/13
FALSE	→ Status word 2 bit 13	C03122/14
FALSE	→ Status word 2 bit 14	C03122/15
FALSE	→ Status word 2 bit 15	C03122/16

4.10 Actual value and status signals



The following tables contain the Lenze assignment of the analog and digital outputs for the technology application "actuator - speed".

▶ The default signal configuration if required can be easily changed by parameterising the multiplexer parameters assigned.



Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	Speed setpoint • Scaling: ±10 V ≡ motor reference speed (C00011)	C03110/1
	AO2	Filtered torque setpoint • Scaling: ±10 V ≡ Motor reference torque (C00057/2)	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Status "Drive ready" • DC-bus voltage is available and no error has occurred.	C03100/1
	DO2	Status "Speed follower enabled" • The speed follower has been enabled via the digital input DI2.	C03100/2
	DO3	Status "Speed follower in limitation" • The enabled speed follower is in the limitation for more than 100 ms. • The setpoint is limited to the upper or lower speed limit value (C00909/1 or C00909/2) .	C03100/3
	DO4	Status "Error active acknowledgement is required" • A monitoring function with the error response "Error" or "Quick stop by trouble" has been activated and the controller is in the status "Error active" or "Quick stop by trouble active".	C03100/4

State bus

Terminal X2		Signal (Lenze setting)	Signal configuration
	**SB**	Status "Speed follower in limitation" • The enabled speed follower is in the limitation for more than 100 ms. • The setpoint is limited to the upper or lower speed limit value (C00909/1 or C00909/2) . • The state bus is put in the "error" status.	C03100/5

Display elements

User LED	Signal (Lenze setting)	Signal configuration
	Status "Speed follower enabled" • The speed follower has been enabled via the digital input DI2.	C03100/6

4.11 Application error messages

For the output of application-specific error messages, an FB instance *L_DevApplErr1* of the function block **L_DevApplErr** is available.

- Via the 8 boolean inputs up to 8 different application error messages with parameterisable module ID, error ID and error response can be activated by the application.

Error message		Error ID	Error response
1	Speed follower in limitation	8001	Warning locked
2	-	8000	Error
3	-	8000	Error
4	-	8000	Error
5	-	8000	Error
6	-	8000	Error
7	-	8000	Error
8	-	8000	Error

- Parameter setting: Tab **All parameters**

Parameter		Lenze setting
C05900	Module ID	980
C05901/1...8	Error ID 1 ... 8	See table above
C05902/1...8	Error response 1 ... 8	See table above

Reset of error message

In the Lenze setting the digital input DI5 for resetting (acknowledging) an error message is connected to the input *DI_bResetError1* of the drive interface.

4.12 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application and the corresponding parameters in alphabetical order.

4.12.1 L_DevApplErr1

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 33)

Parameter	Possible settings			Information
C05900	980		999	Module ID
C05901/1...8	0		65535	Error ID
C05902/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

4.12.2 L_TbDelay1

Is an instance of	Function
L_TbDelay	Delay of the signal *MI_bSpeedCtrlLimited* for error handling

Parameter	Possible settings				Information
C03550					Selection of the edge to be delayed
	0	Rising edge			Lenze setting
	1	Falling edge			
	2	Both edges			
C03551	0.000		s	60.000	Delay time • Initialisation: 0.100 s

4.12.3 SpeedRamp

Is an instance of	Function
L_SdSpeedSet	Ramp generator for speed setpoint ▸ Speed setpoint conditioning (📖 18)

Parameter	Possible settings			Information
C03500/1...15	-200.00	%	200.00	Fixed setpoint 1...15
C03501	0		15	Active setpoint • Read only
C03502	0.000	s	1000.000	Basic acceleration time • Initialisation: 1.000 s
C03503	0.000	s	1000.000	Basic deceleration time • Initialisation: 1.000 s
C03504	0.000	s	10.000	Basic S-ramp time • Initialisation: 0.100 s
C03507				Polarity of *bStop* input
	0	**Active HIGH**		
	1	Active LOW		
C03508	0.00	%	100.00	Setpoint tolerance reached • Initialisation: 1.00 %
C03512/1...15	0.000	s	1000.000	Acceleration time 1...15 • Initialisation: 0.000 s
C03513/1...15	0.000	s	1000.000	Deceleration time 1...15 • Initialisation: 0.000 s
C03514/1...15	0.000	s	1000.000	S-ramp time 1...15 • Initialisation: 0.000 s
C03515	0		15	Active ramp parameters • Read only
C03520				Profile mode • Read only
	0	Profile generation with linear ramps • Referred to the reference speed (C00011).		
	1	Profile generation with jerk limitation (S-shaped ramps)		
	10	Profile generation with linear ramps • Referred to the reference speed (C00011). • At an edge change at the input *bStop* referred to the current setpoint (constant time). • The setpoint applied at the input *dnExtSpeedSetpoint_n* is used as the start value.		
C03521	-200.00	%	200.00	Setpoint at the input • Read only
C03522	-200.00	%	200.00	Target setpoint • Read only
C03523	-200.00	%	200.00	Setpoint at the output • Read only

Parameter	Possible settings			Information
C03524				Status "Target setpoint reached" • Read only
	0	Target setpoint not yet reached		
	1	Target setpoint reached		
C03525	0.000	rpm	50000.000	Load reference speed • Read only
C03526	0.000	rpm	50000.000	Load setpoint speed • Read only
C03527	0.0000	Unit/t	214000.0000	Reference speed • Read only
C03528	-214000.0000	Unit/t	214000.0000	Setpoint speed • Read only
C03529	Character string from *AxisData*			Speed unit • Read only
C03537	-200.00	%	200.00	External setpoint • Display of input signal *dnExtSpeedSetpoint_n*.
C03538	-200.00	%	200.00	Current motor speed • Display of input signal *dnActualMotorSpeed_n*.
C03539/1				Invert setpoint • Display of input signal *bInvertSetpoint*.
	0	Setpoint not inverted		
	1	Setpoint inverted		
C03539/2				Hold setpoint output • Display of input signal *bHoldOutput*.
	0	Setpoint output enabled		
	1	Hold setpoint output		
C03539/3				Activate stop • Display of input signal *bStop*.
	0	Stop not active		
	1	Stop requested		
C03539/4...7				Activate fixed setpoint 1 ... 8 • Display of input signals *bJog1* ... *bJog8*.
	0	Jog input not active		
	1	Jog input active		
C03539/8...11				Activate ramp parameter 1 ... 8 • Display of input signals *bTi1* ... *bTi8*.
	0	Ti input not active		
	1	Ti input active		
C03539/12				Load external setpoint • Display of input signal *bLoadExtSpeedSetpoint*.
	0	Loading not active		
	1	Load external setpoint		
C03539/13				Load motor speed • Display of input signal *bLoadActualMotorSpeed*.
	0	Loading not active		
	1	Load motor speed		

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

If you have suggestions for improvement, please e-mail us to:

1 About this documentation

This documentation contains information about the technology application "Actuator – torque" for the Servo Drives 9400 series.

Note!

This documentation supplements the mounting instructions supplied with the controller, the hardware manual and the software manual for the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation applies to:

Technology application	Appl. ID	Required runtime software licence
Actuator – torque	100202101	Available in every license stage

The technology application can be used with the following controllers:

Product series	Type designation	From hardware version	From software version
9400 Servo Drives	E94AxHExxxx	PD	1.35

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	04/2007	TD05	First edition
1.1	10/2008	TD05	New subchapter "Parameterisable function blocks"

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window pane	*Italics*	The *Message window*... / The *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Keyboard command	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program listings	Courier	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**Courier bold**	
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse click in this online documentation.
Symbols		
Page reference	(📖 5)	Optically highlighted reference to another page. It is activated with a mouse click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and suggests how to avoid the danger)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of material damage** Indicates a potential danger that may lead to material damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note for trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Brief description

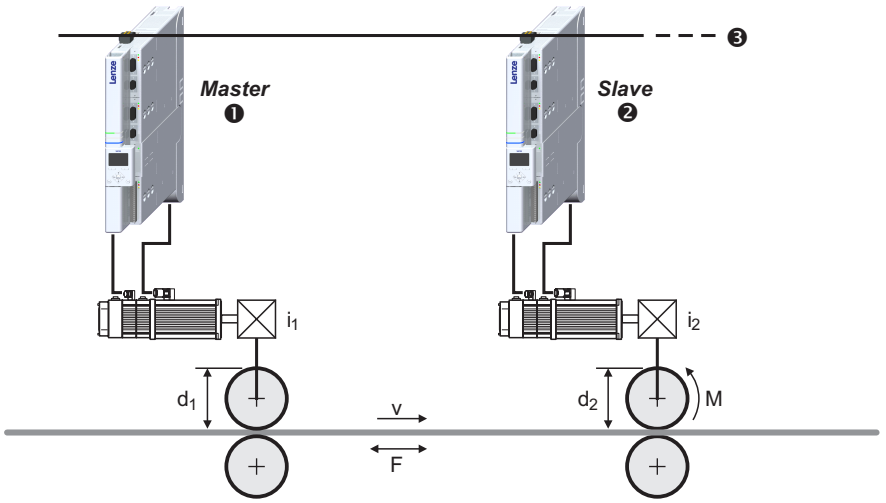
When the technology application "actuator – torque" is used the drive creates a torque to be specified independent of the motor speed. A superimposed speed limitation prevents the drive from accelerating in an uncontrolled mode. The torque setpoint and torque limit value are the main setpoint values of the application.

- The setpoint of the motor torque can be specified for both directions. The drive accordingly acts in a driving or braking way. With a unipolar setpoint the effective direction can be changed via the digital input DI3.
- After the enable of the torque-controlled operation via the digital input DI2 the creation of the torque is controlled via a ramp generator starting from the current torque.
- The torque limit value to be specified refers to the freely setting direction of rotation with positive torque. Based on the current motor speed the internal speed limit value is also led to the setpoint via a ramp generator after enable.
- If the specified speed limit value directly corresponds to the line speed, the internal limit value can be increased by entering an offset in C03008.
- The speed limit value in negative direction of rotation equals, according to amount, the limit value for the positive direction of rotation.
- If the speed of the drive is inside the limitations, the motor generates the specified torque.
- If the positive or negative speed limit value (for CW or CCW rotation) is reached, the drive changes to the speed-controlled operation. The set speed limit values are not exceeded.

Basic drive functions

- A quick stop can be activated via the digital input DI1.
- A manual control is provided for the setting-up operation. It is enabled via the digital input DI6. The digital inputs DI7 and DI8 activate parameterisable setpoints for both directions of rotation.
- The basic function "limiter" enables the travel range to be monitored via limit switches.
- When a brake is available the brake control opens and closes the brake.

Application range



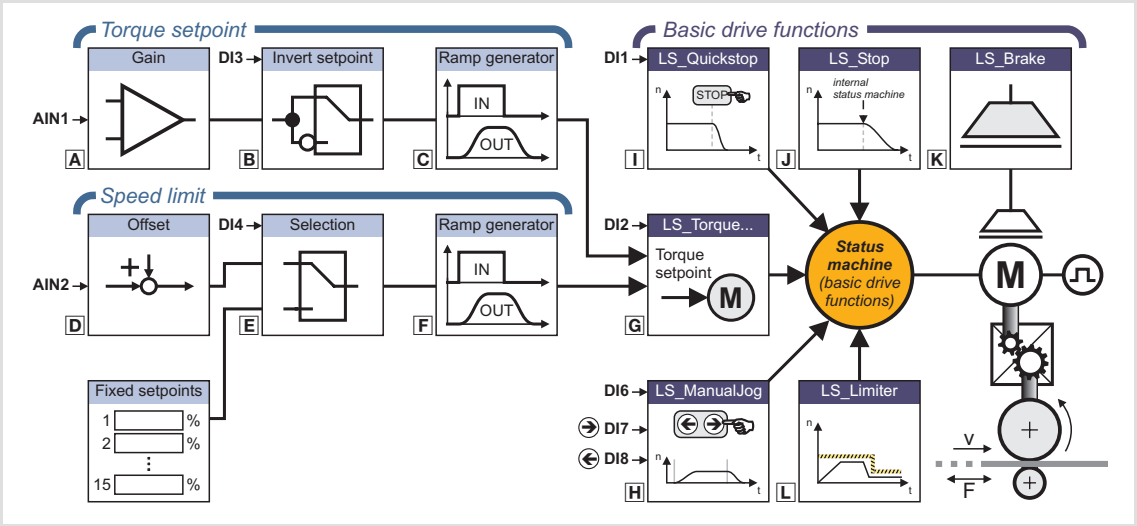
- Slave drives for material transport
  - Chain conveyors
  - S-shaped frame structure
  - Bilateral tandem drives
- Test facilities
  - Test benches for tensile stress
  - Motor test benches
  - Brake assemblies
- Support of higher-level technology solutions for e.g. traction-controlled winders

Required license/delivery

- Available in every license stage.
- The technology application is saved at program memory location 3 in the memory module and can be selected from the »Engineer« application catalog.

3 Application example

Conveyor drive with adjustable tension



❶ Master
❷ Slave with technology application "actuator – torque"
❸ System bus (CAN)
v = speed of the material path
F = tensile stress

[3-1] Example: Conveyor drive with adjustable tension

- The master drive is operated speed-controlled and determines the speed of the material path.
- The slave drive with the standard technology application "actuator – torque" ensures that a certain minimum tensile stress is complied with between master and slave drive. When torque-controlled, the slave drive is permanently able to follow the speed specified by the master drive.

4 Parameter setting & configuration

4.1 Basic signal flow

[4-1] Signal flow of the TA "Actuator – torque" (schematic diagram)

Torque setpoint conditioning

A Setpoint gain

B Setpoint inversion

C Ramp generator

Speed limit value conditioning

D Offset

E Selection of analog input/fixed setpoints

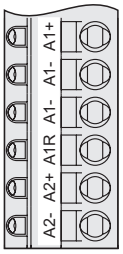
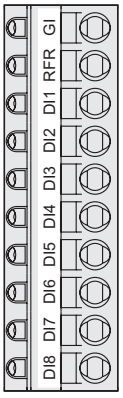
K Brake control (optional)



L Limiter (optional)

4.2 Assignment of the I/O terminals



4.2.1 Setpoint and control signals

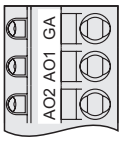
The following tables contain the Lenze assignment of the analog and digital inputs for the "Actuating drive - torque" technology application.

Analog inputs

Terminal X3		Signal (Lenze setting)
	**AI1-** **AI1+**	Torque setpoint ▸ Torque setpoint conditioning (📖 14)
	AI2- **AI2+**	Speed limit value ▸ Speed limit value conditioning (📖 16)

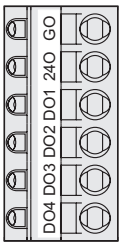
Digital inputs

Terminal X5		Signal (Lenze setting)
	**DI1**	Quick stop • If DI1 is set to LOW level, the drive is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • If the quick stop function is deactivated, the defined torque is available again, as the case may be, an acceleration via the set acceleration time of the speed limit value is effected. ▸ Quick stop (📖 22)
	DI2	Enable torque follower ▸ Torque follower (📖 20)
	DI3	Invert torque setpoint
	DI4	Activate fixed setpoint 1 Instead of the selection via the analog input 2 the fixed setpoint 1 is used as speed limit value. ▸ Change-over to fixed setpoint (📖 17)
	DI5	Reset error • By means of a LOW-HIGH edge an existing error status can be reset if the cause of the fault is removed.
	DI6	Manual jog ▸ Manual jog (📖 21)



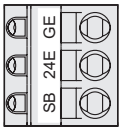
DI7	DI8	Function
LOW	LOW	Stop
HIGH	LOW	Manual control in positive direction
LOW	HIGH	Manual control in negative direction
HIGH	HIGH	- (previous state remains active)

4.2.2 Actual value and status signals



The following tables contain the Lenze assignment of the analog and digital outputs for the "Actuating drive - torque" technology application.

▶ The default signal configuration if required can be easily changed by parameterising the multiplexer parameters assigned.

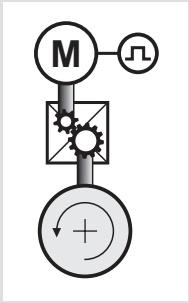


Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	Current speed of the motor shaft • Scaling: ±10 V ≡ motor reference speed (C00011)	C03110/1
	AO2	Filtered torque setpoint • Scaling: ±10 V ≡ Motor reference torque (C00057/2)	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Status "Drive ready" • DC-bus voltage is available and no error has occurred.	C03100/1
	DO2	Status "Torque follower enabled" • The torque follower has been enabled via the digital input DI2.	C03100/2
	DO3	Status "Torque follower in limitation" • If the torque follower is enabled, the torque setpoint or the current setpoint are within the limitation.	C03100/3
	DO4	Status "Error active acknowledgement is required" • A monitoring function with the error response "Error" or "Quick stop by trouble" has been activated and the controller is in the status "Error active" or "Quick stop by trouble active".	C03100/4



State bus

Terminal X2		Signal (Lenze setting)	Signal configuration
	**SB**	Status "Torque follower in limitation" • If the torque follower is enabled, the torque setpoint or the current setpoint are within the limitation. • The state bus is put in the "error" status.	C03100/5

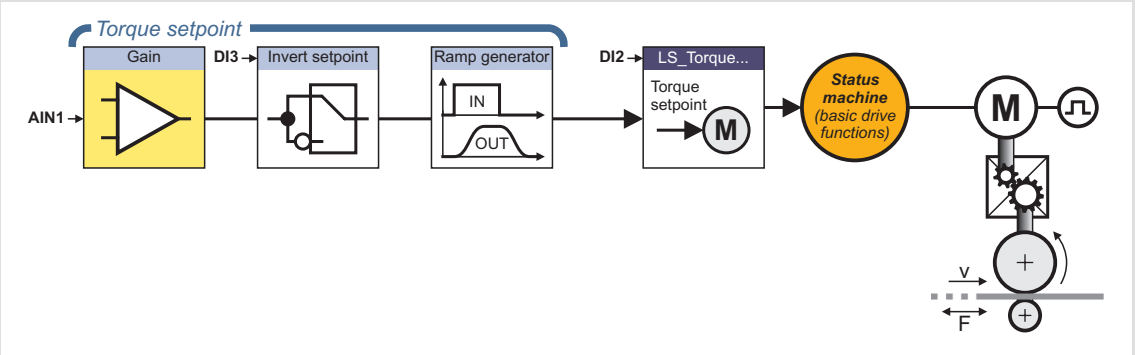
Display elements

User LED	Signal (Lenze setting)	Signal configuration
	Status "Torque follower enabled" • The torque follower has been enabled via the digital input DI2.	C03100/6

4.3 Machine parameters

The machine parameters describe e.g. the motor end of the mechanics used.

The setting of the machine parameters in the »Engineer» is carried out on the **Application parameters** tab in the dialog level *Overview* → *Drive interface* .



Tip!

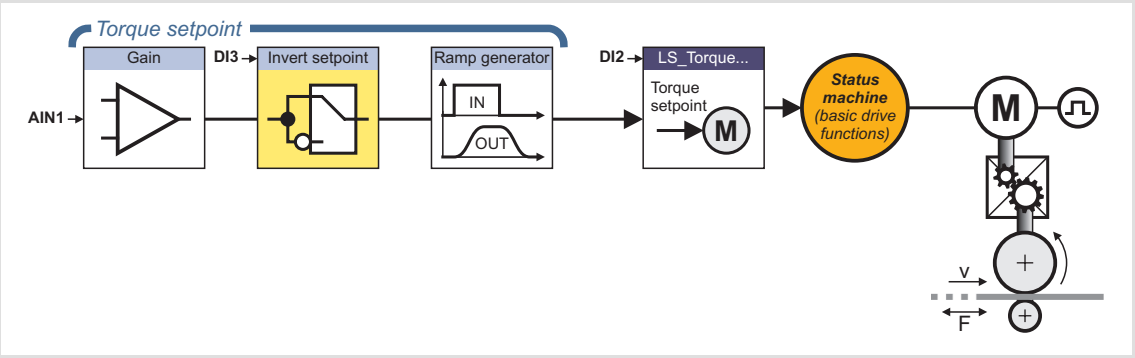
In the »Engineer« the most important machine parameters can be adapted to the machine on the **Application parameter** tab directly in the topmost *Overview* dialog level:

Short overview of machine parameters

Parameter		Lenze setting	
		Value	Unit
C00173	Mains voltage	400/415	V
C00174	Undervoltage (LU) threshold	285	V
C00600	Resp. to DC bus overvoltage	Trouble	
C02520	Gearbox factor numerator: Motor	1	
C02521	Gearbox factor denom: Motor	1	
C02527	Motor mounting direction	Motor rotating CW	
C02570	Position control structure	Phase control	
C02522	Gearbox factor num.: Pos. enc.	1	
C02523	Gearbox factor denom.: Pos. enc.	1	
Description of the mechanics (load, tool)			
C02528	Traversing range	Unlimited	
C02524	Feed constant	360.0000	unit
C02525	Unit	°	
C02526	User-defined unit	°	
C02533	Time unit	s	
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

4.4 Torque setpoint conditioning

[4-2] Torque setpoint conditioning (schematic diagram)



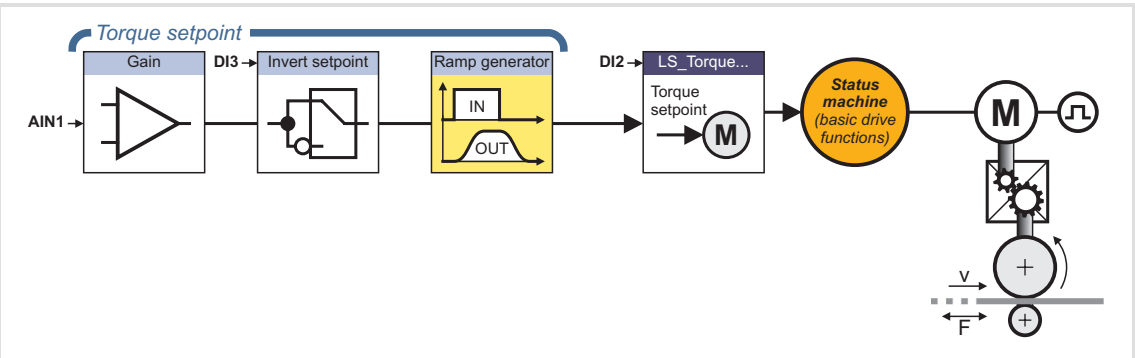
The torque setpoint is defined in the Lenze setting via the analog input 1 and take place in both directions (bipolar) and accordingly the drive acts in a driving or braking manner.

▶ Parameter setting: **Application parameters** tab → dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03002	Setpoint gain	100.00	%

Setpoint inputs of the function		Signal configuration
Lenze setting	Setpoint input	(Multiplexer parameters)
AIN 1	→ Torque setpoint	C03000

4.4.1 Setpoint inversion



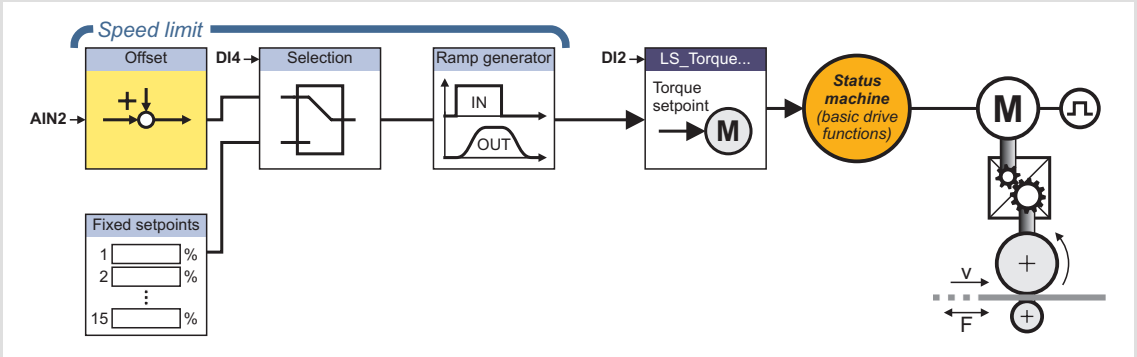
[4-3] Setpoint inversion (schematic diagram)

Via the digital input DI3 the effective direction of the (bipolar) setpoint can be inverted, if required.

▶ Parameter setting: **All parameters** tab ➞ category *Actuator - torque* ➞ *Multiplexer*

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 3	➞ Invert setpoint	C03003

4.4.2 Ramp generator



[4-4] Ramp generator (schematic diagram)

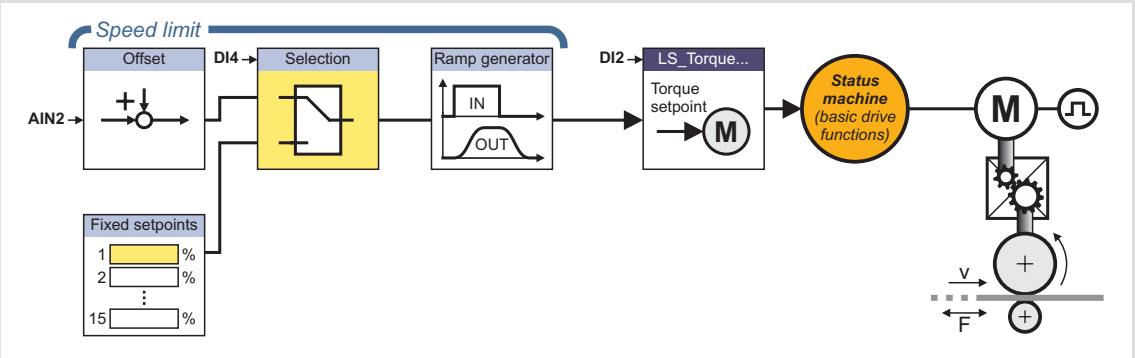
In order to avoid setpoint step-changes the torque setpoint passes a ramp generator with a parameterisable acceleration/deceleration and S-ramp time before it is transmitted to the basic drive function "Torque follower".

▶ Parameter setting: **Application parameters** tab ➞ dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03550	Acceleration / deceleration time	0.010	s
C03551	S-ramp time	0.001	s

4.5 Speed limit value conditioning

[4-5] Speed limit value conditioning (schematic diagram)



The speed limit value is defined in the Lenze setting via the analog input 2.

- The defined speed limit value refers to the direction of rotation which can be set freely with positive torque.
- The speed limit value in negative direction of rotation equals, according to amount, the limit value for the positive direction of rotation.
- If the speed of the drive is inside the limitations, the motor generates the specified torque.
- If the positive or negative speed limit value (for CW or CCW rotation) is reached, the drive changes to the speed-controlled operation. The set speed limit values are not exceeded.
- If the specified speed limit value directly corresponds to the line speed, the internal limit value can be increased by entering an offset in C03008.
- Parameter setting: **Application parameters** tab → dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03008	Offset for limit speed	0.00	%

Setpoint inputs of the function		Signal configuration
Lenze setting	Setpoint input	(Multiplexer parameters)
AIN 2	→ Upper limit speed	C03006
Inverse upper limit speed	→ Lower speed limit value	C03171

4.5.1 Change-over to fixed setpoint

[4-6] Additional offset for the speed limit value (schematic diagram)

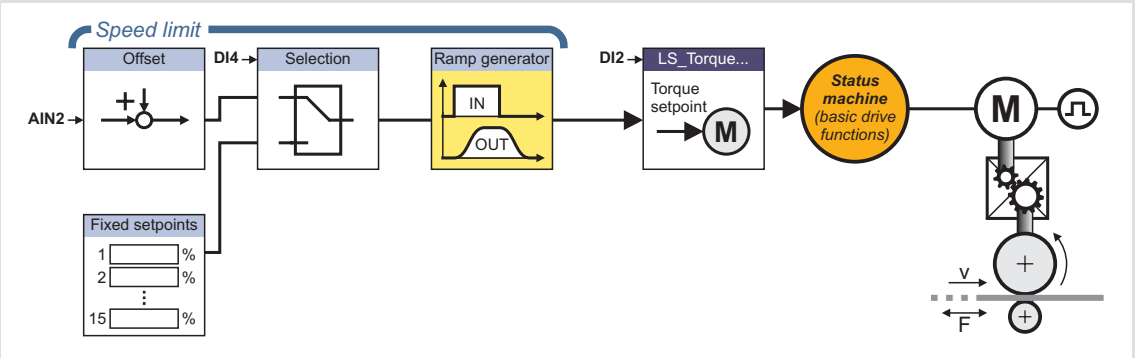
Via the digital input DI4 a change-over to a parameterisable fixed setpoint can take place.

▶ Parameter setting: **Application parameters** tab ➞ dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03500/1	Fixed setpoint 1	10.00	%

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 4	➞ Activate fixed setpoint 1	C03009/4

Use of further fixed setpoints



A total of 15 different fixed setpoints can be parameterised. For the selection of the fixed setpoints 2 ... 15 the selection inputs are to be assigned with the corresponding signals. The selection of the fixed setpoints is carried out in a binary coded manner.

▶ Parameter setting: Tab **Application parameters** ➞ dialog level *Overview* ➞ *Ramp generator* ➞ *All fixed setpoints*

Parameter		Lenze setting	
		Value	Unit
C03500/1	Fixed setpoint 1	10.00	%
C03500/2	Fixed setpoint 2	0.00	%
C03500/...	Fixed setpoint ...	...	...
C03500/15	Fixed setpoint 15	0.00	%

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 4	➞ Activate fixed setpoint 1	C03009/4
FALSE	➞ Activate fixed setpoint 2 a	C03009/5
FALSE	➞ Activate fixed setpoint 4 a	C03009/6
FALSE	➞ Activate fixed setpoint 8 a	C03009/7

4.5.2 Speed ramp generator

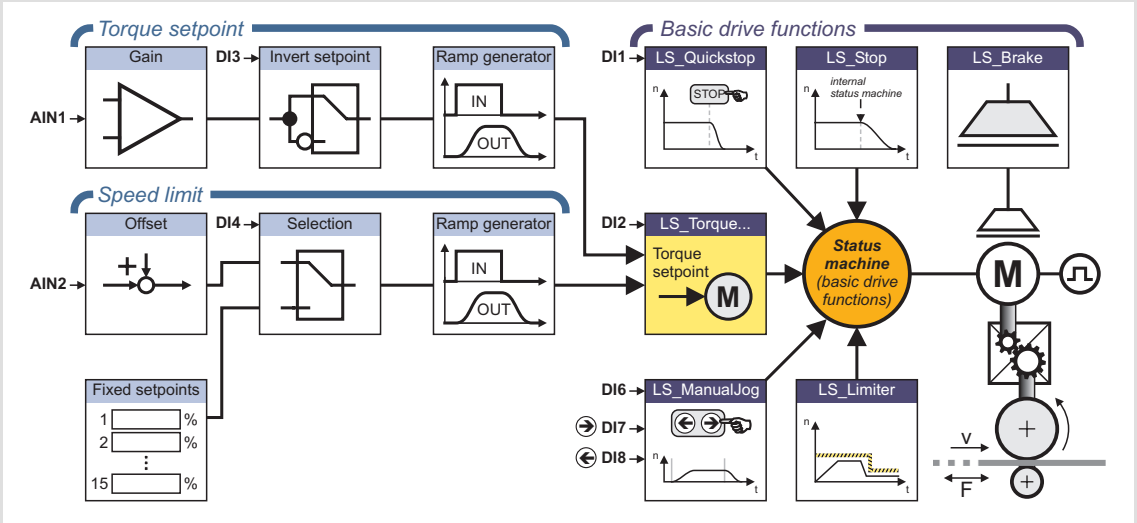
[4-7] Ramp generator (schematic diagram)

In order to avoid setpoint step-changes the speed limit value passes a ramp generator with a parameterisable acceleration and deceleration time before it is transmitted to the basic drive function "Torque follower".

▶ Parameter setting: **Application parameters** tab ➞ dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C03502	Basic acceleration time	1.000	s
C03503	Basic deceleration time	1.000	s
C03010	Profile mode	Linear ramps	

Use of further ramp parameter sets



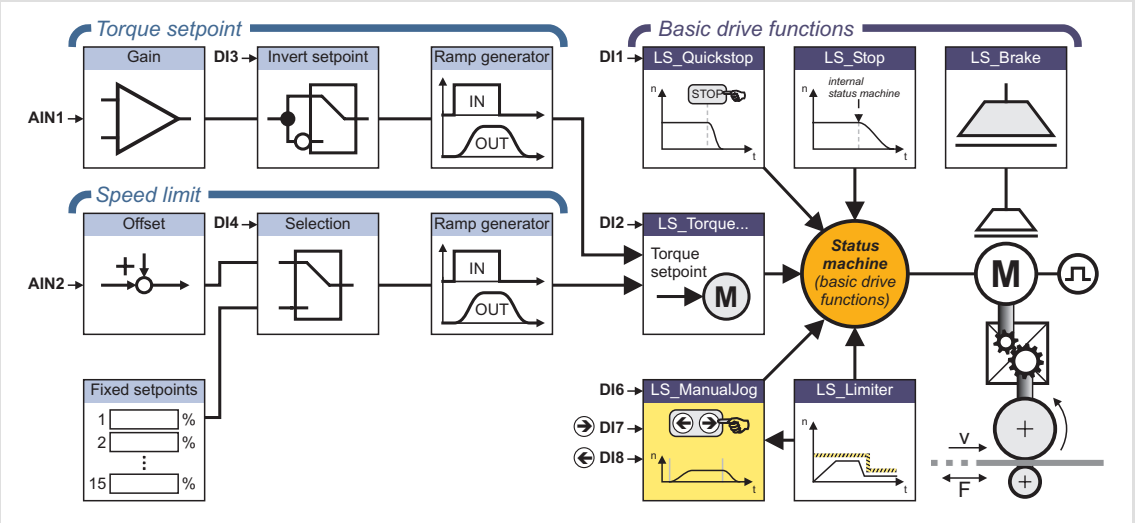
If required, 15 further ramp parameter sets can be parameterised. For the selection of the ramp parameter sets 1 ... 15, the selection inputs are to be assigned with the corresponding signals. The selection of the ramp parameter sets is carried out in a binary coded manner.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Ramp generator* → *All ramp parameters*

Parameter		Lenze setting	
		Value	Unit
C03512/1	Acceleration time 1	0.000	s
C03512/...	Acceleration time ...	...	...
C03512/15	Acceleration time 15	0.000	s
C03513/1	Deceleration time 1	0.000	s
C03513/...	Deceleration time ...	...	...
C03513/15	Deceleration time 15	0.000	s
C03514/1	S-ramp time 1	0.000	s
C03514/...	S-ramp time	...	...
C03514/15	S-ramp time 15	0.000	s

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Activate ramp parameter set 1 a	C03009/8
FALSE	→ Activate ramp parameter set 2	C03009/9
FALSE	→ Activate ramp parameter set 4	C03009/10
FALSE	→ Activate ramp parameter set 8 a	C03009/11

4.6 Torque follower



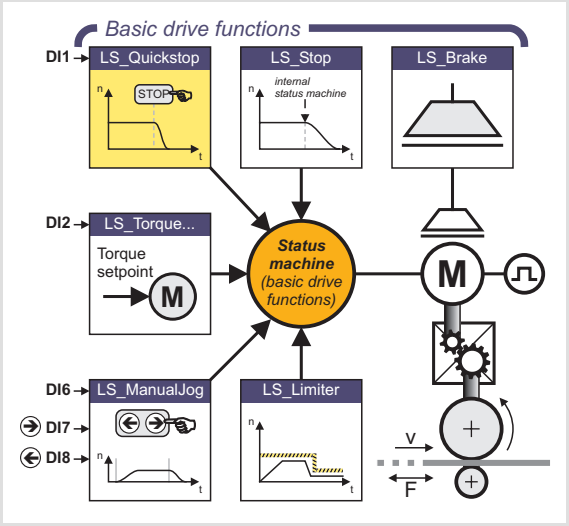
[4-8] Basic function "Torque follower" (schematic diagram)

The torque-controlled operation is requested via the digital input DI2. If no other basic function and error state are active, the torque-controlled operation is enabled.

- The build-up of the defined torque is controlled via a ramp generator based on the current torque.
- Based on the current motor speed the internal speed limit value is also led to the setpoint via a ramp generator after the operation is enabled.
- If the enable of the torque-controlled operation is reset via the digital input DI2, the drive is decelerated to standstill via an independent profile generator of the basic function "Stop".

4.7 Manual jog

[4-9] Basic function "Manual jog" (schematic diagram)



For the setting-up operation the basic function "Manual jog" is available. It is requested via the digital input DI6. If no other basic function and error status are active, enable is carried out and the manual jog via the digital inputs DI7 and DI8 is possible.

▶ Parameter setting: **Application parameters** tab → dialog level *Overview* → *Manual jog*

Parameter		Lenze setting	
		Value	Unit
C02620	Manual jog: Speed 1	360.0000	unit/s
C02621	Manual jog: Speed 2	720.0000	unit/s
C02622	Manual jog: Acceleration	360.0000	unit/s^2
C02623	Manual jog: Deceleration	1440.0000	unit/s^2
C02624	Manual jog: S-ramp time	0.100	s

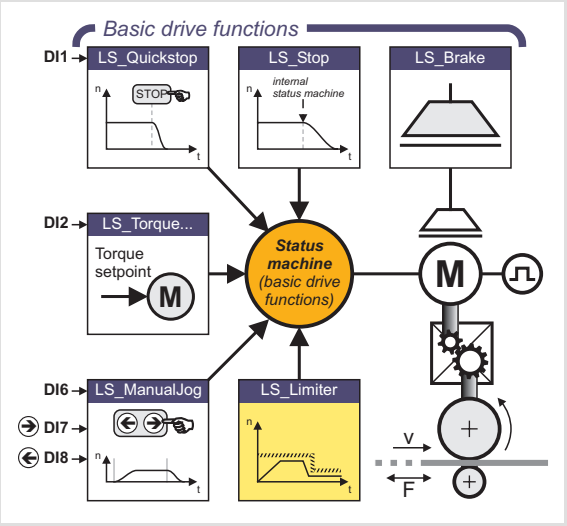
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 6	→ Request manual jog	C03155/1
DIGIN 7	→ Activate positive manual jog	C03155/2
DIGIN 8	→ Activate negative manual jog	C03155/3
FALSE	→ Activate 2. speed	C03155/4

4.8 Quick stop

[4-10] Basic function "Quick stop" (schematic diagram)

The basic function "Quick stop" brakes the drive to standstill within the deceleration time set for the quick stop function after a corresponding request independent of the setpoint selection.

If the quick stop is deactivated, the defined torque is available again, as the case may be, an acceleration via the set acceleration time of the speed limit value is effected.



▶ The quick stop function can be activated as follows in the Lenze setting:
  – By setting the digital input DI1 to LOW level.
  – By a master control via the port *LPortAxisIn1*:
    By setting bit 3 of the bit-coded axis control word.

▶ Parameter setting: **Application parameters** tab → dialog level *Overview* → *Quick stop*

Parameter		Lenze setting	
		Value	Unit
C00105	Quick stop deceleration time	0.000	s
C00106	Quick stop S-ramp time	0.00	%
C00107	Reference for quick stop deceleration time	Motor reference speed (C00011)	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 1	→ Activate quick stop 1	C03135/1
Axis control word bit 03	→ Activate quick stop 2	C03135/2
FALSE	→ Activate quick stop 3	C03135/3

4.9 Limiter

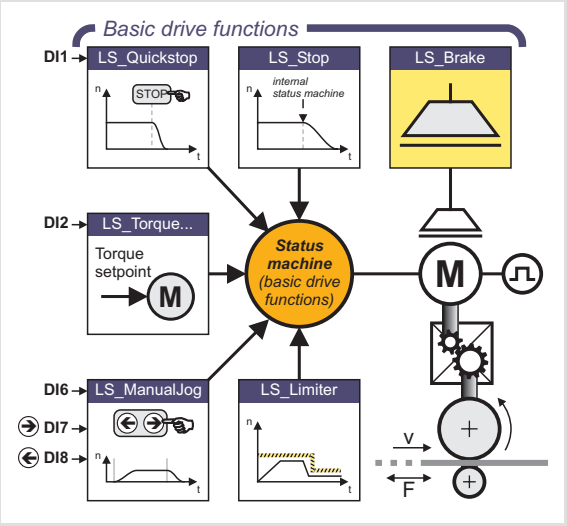
[4-11] Basic function "Limiter" (schematic diagram)

The basic function "Limiter", where applicable, by means of limit switches monitors travel range limits.

In the case of homing, positioning and manual jog the basic function "Limiter" if required provides for the compliance with kinematic limit values.

Note!

The parameterised limit values are not effective for the basic functions "speed follower", "torque follower", and "position follower"!



For the exceeding of the limit values an error response can be set.

▶ Parameter setting: **Application parameters** tab → dialog level *Overview* → *Limiter*

Parameter		Lenze setting	
		Value	Unit
Only for homing, positioning and manual jog			
C02702	Limitations are active	Deactivated	
C02703	Max. speed	3600.0000	unit/s
C02705	Max. acceleration	3600.0000	unit/s^2
C02706	Min. S-ramp time	100	ms
C02707	Permissible direction of rotation	Positive and negative	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Positive limit switch	C03150/1
FALSE	→ Negative limit switch	C03150/2

4.10 Brake control

[4-12] Basic function "Brake control" (schematic diagram)

The basic function "Brake control" serves to the wear free control and monitoring of a holding brake.

In the simplest case, an optionally available brake module is used.

Alternatively the holding brake can also be controlled and monitored via the digital inputs/outputs.

Note!

In the Lenze setting the brake control is switched off to reach a safe status after mains connection.

▶ Parameter setting: **Application parameters** tab → dialog level *Overview* → *Brake control*

Parameter		Lenze setting	
		Value	Unit
C02580	Operating mode of brake	Brake control off	
C02581	Brake activation threshold	50	rpm
C02582	Brake response to pulse inhibit	Activate brake immediately	
C02583	Status input monitoring	Not active	
C02585	Brake control polarity	Not inverted	
C02586	Starting torque 1	0.00	Nm
C02587	Starting torque 2	0.00	Nm
C02588	Starting torque source	Starting torque 1/2	
C02589	Brake closing time	100	ms
C02590	Brake opening time	100	ms
C02591	Waiting time - status monitoring	100	ms
C02593	Waiting time - brake activation	0.000	s
C02594	Test torque	0.00	Nm
C02595	Permissible angle of rotation	5	°
C02596	Grinding speed	100	rpm
C02597	Accel./decel. time - grinding	1.000	s
C02598	Grinding ON time	0.5	s
C02599	Grinding OFF time	0.5	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Open brake (release)	C03165/1
FALSE	→ Activate starting torque 2	C03165/2
FALSE	→ Keep open brake at standstill	C03165/3
FALSE	→ Brake status signal	C03165/4
FALSE	→ Activate brake test	C03165/5
FALSE	→ Grind brake	C03165/6
0 %	→ Additional torque	C03166

4.11 Signal configuration

4.11.1 Drive and motor interface

If required, the preset signal configuration of the control and setpoint inputs of the drive and motor interface can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Drive interface

Signal (Lenze setting)	Control input	Signal configuration
FALSE	→ Set controller inhibit	C03130/1
FALSE	→ Set error	C03130/2
Axis control word bit 00	→ Switch on drive	C03130/3
DIGIN 5	→ Reset error 1	C03130/4
Axis control word bit 07	→ Reset error 2	C03130/5
FALSE	→ Reset error 3	C03130/6

Motor interface

Signal (Lenze setting)	Setpoint input	Signal configuration
100 %	→ Upper torque limit value	C03141/1
-100 %	→ Lower torque limit value	C03141/2
100 %	→ Adaptation of mass inertia	C03141/3

4.11.2 Output ports

If required, the preset signal configuration of the output ports can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Output port "LPortAxisOut1"

The output port **LPortAxisOut1** is intended for the connection with a following axis.

Signal (Lenze setting)	Output port	Signal configuration
Axis status word • Application-specific signals can be supplemented.		
Drive ready	→ Axis status word bit 00	C03120/1
FALSE	→ Axis status word bit 01	C03120/2
Operation enabled	→ Axis status word bit 02	C03120/3
Error is active	→ Axis status word bit 03	C03120/4
FALSE	→ Axis status word bit 04	C03120/5
Quick stop is active	→ Axis status word bit 05	C03120/6
Drive is ready to start	→ Axis status word bit 06	C03120/7
Warning is active	→ Axis status word bit 07	C03120/8
FALSE	→ Axis status word bit 08	C03120/9
FALSE	→ Axis status word bit 09	C03120/10
FALSE	→ Axis status word bit 10	C03120/11
Motor control in limitation	→ Axis status word bit 11	C03120/12
FALSE	→ Axis status word bit 12	C03120/13
FALSE	→ Axis status word bit 13	C03120/14
FALSE	→ Axis status word bit 14	C03120/15
FALSE	→ Axis status word bit 15	C03120/16
Setpoints for horizontal communication		
Filtered torque setpoint	→ Axis-Port Out 1	C03124/1
	Scaling: 16384 ≡ 2^{14} ≡ 100 % motor reference torque (C00057/2)	
Upper speed limit value	→ Axis-Port Out 2	C03124/2
	Scaling: 1073741824 ≡ 2^{30} ≡ 100 % motor reference speed (C00011)	

Output port "LPortStatus1"

The output port **LPortStatus1** is intended for the connection with a higher-level control.

Signal (Lenze setting)	Output port	Signal configuration
Status word 1		
Drive ready	→ Status word 1 bit 00	C03121/1
FALSE	→ Status word 1 bit 01	C03121/2
Operation enabled	→ Status word 1 bit 02	C03121/3
Error is active	→ Status word 1 bit 03	C03121/4
FALSE	→ Status word 1 bit 04	C03121/5
Quick stop is active	→ Status word 1 bit 05	C03121/6
Drive is ready to start	→ Status word 1 bit 06	C03121/7
Warning is active	→ Status word 1 bit 07	C03121/8
FALSE	→ Status word 1 bit 08	C03121/9
FALSE	→ Status word 1 bit 09	C03121/10
FALSE	→ Status word 1 bit 10	C03121/11
Motor control in limitation	→ Status word 1 bit 11	C03121/12
FALSE	→ Status word 1 bit 12	C03121/13
FALSE	→ Status word 1 bit 13	C03121/14
FALSE	→ Status word 1 bit 14	C03121/15
FALSE	→ Status word 1 bit 15	C03121/16

Output port "LPortStatus2"

Signal (Lenze setting)	Output port	Signal configuration
Status word 2		
FALSE	→ Status word 2 bit 00	C03122/1
FALSE	→ Status word 2 bit 01	C03122/2
FALSE	→ Status word 2 bit 02	C03122/3
FALSE	→ Status word 2 bit 03	C03122/4
FALSE	→ Status word 2 bit 04	C03122/5
FALSE	→ Status word 2 bit 05	C03122/6
FALSE	→ Status word 2 bit 06	C03122/7
FALSE	→ Status word 2 bit 07	C03122/8
FALSE	→ Status word 2 bit 08	C03122/9
FALSE	→ Status word 2 bit 09	C03122/10
FALSE	→ Status word 2 bit 10	C03122/11
FALSE	→ Status word 2 bit 11	C03122/12
FALSE	→ Status word 2 bit 12	C03122/13
FALSE	→ Status word 2 bit 13	C03122/14
FALSE	→ Status word 2 bit 14	C03122/15
FALSE	→ Status word 2 bit 15	C03122/16

4.12 Application error messages

For the output of application-specific error messages an FB instance *L_DevApplErr1* of the function block **L_DevApplErr** is available.

- Via the 8 boolean inputs up to 8 different application error messages with parameterisable module ID, error ID and error response can be activated by the application.

Error message		Error ID	Error response
1	Torque follower in limitation	8001	Warning locked
2	-	8000	Error
3	-	8000	Error
4	-	8000	Error
5	-	8000	Error
6	-	8000	Error
7	-	8000	Error
8	-	8000	Error

- Parameter setting: **All parameters** tab

Parameter		Lenze setting
C05900	Module ID	980
C05901/1...8	Error ID 1 ... 8	See table above
C05902/1...8	Error response 1 ... 8	See table above

Reset of error message

In the Lenze setting the digital input DI5 for resetting (acknowledging) an error message is connected to the input *DI_bResetError1* of the drive interface.

4.13 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application and the corresponding parameters in alphabetical order.

4.13.1 L_DevApplErr1

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 29)

Parameter	Possible settings			Information
C03900	980		999	Module ID
C03901/1...8	0		65535	Error ID
C03902/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

4.13.2 SpeedRamp

Is an instance of	Function
L_SdSpeedSet	Ramp generator for speed limit value ▸ Speed limit value conditioning (📖 16)

Parameter	Possible settings			Information
C03500/1...15	-200.00	%	200.00	Fixed setpoint 1...15
C03501	0		15	Active setpoint • Read only
C03502	0.000	s	1000.000	Basic acceleration time • Initialisation: 1.000 s
C03503	0.000	s	1000.000	Basic deceleration time • Initialisation: 1.000 s
C03504	0.000	s	10.000	Basic S-ramp time • Initialisation: 0.100 s
C03507				Polarity of *bStop* input
	0	**Active HIGH**		
	1	Active LOW		
C03508	0.00	%	100.00	Setpoint tolerance reached • Initialisation: 1.00 %

Parameter	Possible settings			Information
C03512/1...15	0.000	s	1000.000	Acceleration time 1...15 • Initialisation: 0.000 s
C03513/1...15	0.000	s	1000.000	Deceleration time 1...15 • Initialisation: 0.000 s
C03514/1...15	0.000	s	1000.000	S-ramp time 1...15 • Initialisation: 0.000 s
C03515	0		15	Active ramp parameters • Read only
C03520				Profile mode • Read only
	0	Profile generation with linear ramps • Referred to the reference speed (C00011).		
	1	Profile generation with jerk limitation (S-shaped ramps)		
	10	Profile generation with linear ramps • Referred to the reference speed (C00011). • At an edge change at the input *bStop* referred to the current setpoint (constant time). • The setpoint applied at the input *dnExtSpeedSetpoint_n* is used as the start value.		
C03521	-200.00	%	200.00	Setpoint at the input • Read only
C03522	-200.00	%	200.00	Target setpoint • Read only
C03523	-200.00	%	200.00	Setpoint at the output • Read only
C03524				Status "Target setpoint reached" • Read only
	0	Target setpoint not yet reached		
	1	Target setpoint reached		
C03525	0.000	rpm	50000.000	Load reference speed • Read only
C03526	0.000	rpm	50000.000	Load setpoint speed • Read only
C03527	0.0000	Unit/t	214000.0000	Reference speed • Read only
C03528	-214000.0000	Unit/t	214000.0000	Setpoint speed • Read only
C03529	Character string from *AxisData*			Speed unit • Read only
C03537	-200.00	%	200.00	External setpoint • Display of input signal *dnExtSpeedSetpoint_n*.
C03538	-200.00	%	200.00	Current motor speed • Display of input signal *dnActualMotorSpeed_n*.
C03539/1				Invert setpoint • Display of input signal *bInvertSetpoint*.
	0	Setpoint not inverted		
	1	Setpoint inverted		

Parameter	Possible settings		Information
C03539/2			Hold setpoint output • Display of input signal *bHoldOutput*.
	0	Setpoint output enabled	
	1	Hold setpoint output	
C03539/3			Activate stop • Display of input signal *bStop*.
	0	Stop not active	
	1	Stop requested	
C03539/4...7			Activate fixed setpoint 1 ... 8 • Display of input signals *bJog1* ... *bJog8*.
	0	Jog input not active	
	1	Jog input active	
C03539/8...11			Activate ramp parameter 1 ... 8 • Display of input signals *bTi1* ... *bTi8*.
	0	Ti input not active	
	1	Ti input active	
C03539/12			Load external setpoint • Display of input signal *bLoadExtSpeedSetpoint*.
	0	Loading not active	
	1	Load external setpoint	
C03539/13			Load motor speed • Display of input signal *bLoadActualMotorSpeed*.
	0	Loading not active	
	1	Load motor speed	

4.13.3 TorqueRamp

Is an instance of	Function
L_SdRampGenerator	Ramp generator for torque setpoint ▸ Ramp generator (📖 15)

Parameter	Possible settings			Information
C03550	0.001	s	1000.000	Acceleration / deceleration time • Initialisation: 0.010 s
C03551	0.001	s	10.000	S-ramp time • Initialisation: 0.001 s
C03552	-200.000	%	200.000	Setpoint at the input • Display of input signal *dnIn_n*.
C03553	-200.000	%	200.000	Setpoint at the output • Display of output signal *dnOut_n*.

FEEDBACK

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

1 About this documentation

This documentation contains information on the technology application "CiA402 device profile" for the 9400 HighLine.

Note!

This documentation completes the mounting instructions delivered with the controller, the hardware manual as well as the software manual of the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation is valid for:

Technology application	Appl. ID	Required runtime software licence
CiA402 device profile	110102102	Motion Control HighLevel or higher

The use of this technology application is permissible with the following basic devices:

Product series	Type designation	As of software version
9400 Servo Drives	E94AxHExxxx	V7

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	08/2009	TD05	First edition
1.1	11/2009	TD05	Error corrections & supplements
1.2	03/2010	TD05	Error corrections & supplements

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window	*Italics*	The *Message window*... / The *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Shortcut	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse click in this online documentation.
Symbols		
Page reference	(📖 9)	Optically highlighted reference to another page. It is activated with a mouse click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.
Parameter		
Lenze parameters (codes)	C[code]	All parameters which you can use to parameterise or monitor the controller are stored in so-called "codes". The codes are numbered and designated by a prefixed "C" (example: C00002)
	C[code]/[subcode]	For the sake of clarity and shortness, some codes contain so-called "subcodes" in which the parameters are stored. This manual uses a slash "/" as a separator between code and subcode (e.g. "C00118/3").
CiA402 objects	0x[index$_{hex}$]	The indexes of the CiA402 objects are given in hexadecimal notation with a prefixed "0x" (example: 0x6040).
	0x[index$_{hex}$]/[subindex]	Some CiA402 objects (of the ARRAY or RECORD object type) contain so-called "subindexes" in which the CiA402 parameters are stored. This manual uses a slash "/" as a separator between index and subindex (example: 0x60FB/7).

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

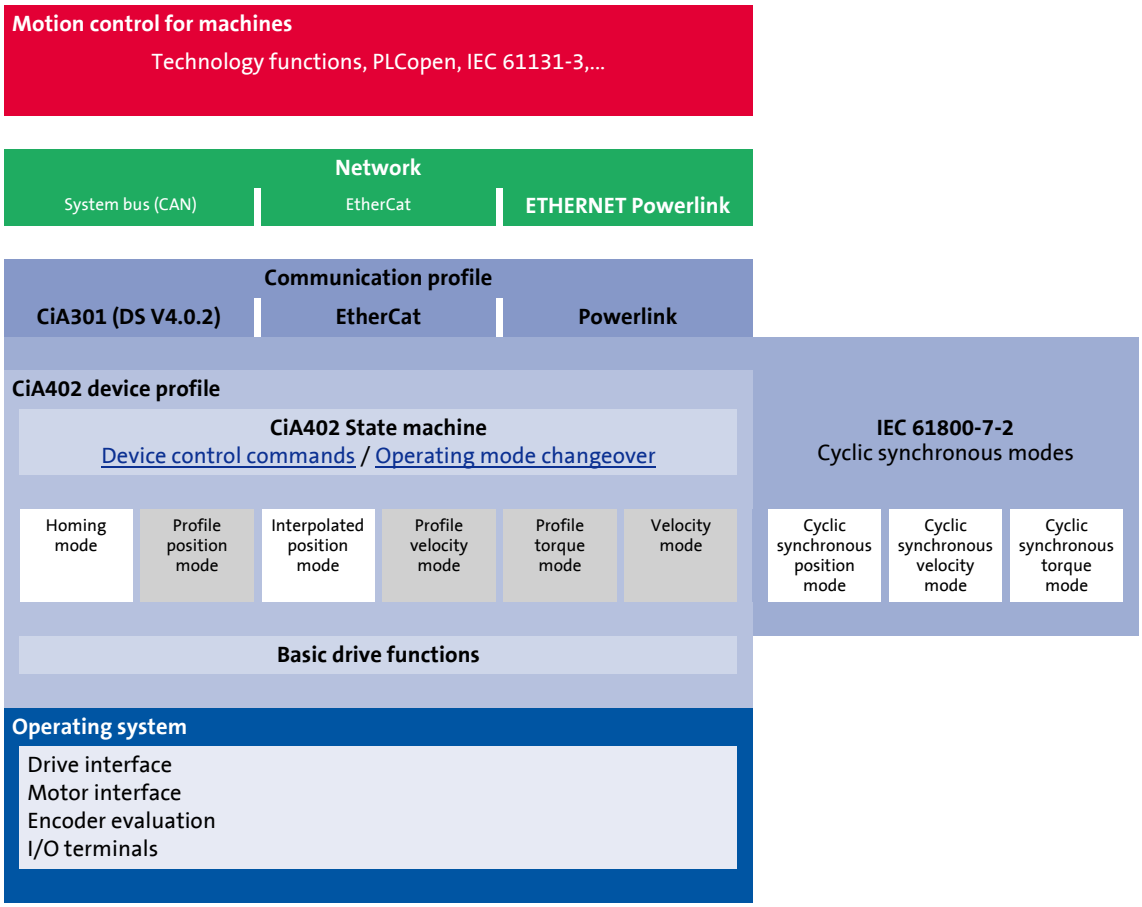
(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes



Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for simple handling
		Reference to another document

2 Short description

The device profile CiA402 available as technology application for the 9400 HighLine controller represents a standardised drive behaviour with the corresponding operating modes and objects.

Possible communication profiles for the MotionBus are:

- CANopen - CiA301 (DS V4.0.2)
- EtherCat
- Powerlink

Tip!

The 9400 HighLine controller has two module slots MXI1 and MXI2 for connecting extension modules. This serves to equip the controller with the required communication interface according to the communication profile selected.

- Detailed information on this subject can be found in the Hardware Manual and Communication Manual for the corresponding communication system.

The CiA402 device profile provides the following operating modes:

Homing Mode

In this operating mode, homing can be executed to transmit the measuring system of the machine to the controller within the physically possible travel range.

Interpolated position mode

This operating mode provides a quick position follower with speed and torque/feed force feedforward control.

Cyclic synchronous position mode (IEC 61800-7)

This operating mode provides a quick position follower with speed and torque/feed force feedforward control.

Cyclic synchronous velocity mode (IEC 61800-7)

This operating mode provides a quick speed follower with speed and torque/feed force feedforward control.

Cyclic synchronous torque mode (IEC 61800-7)

This operating mode provides a quick torque/feed force follower with speed limitation.

3 Parameter setting & configuration

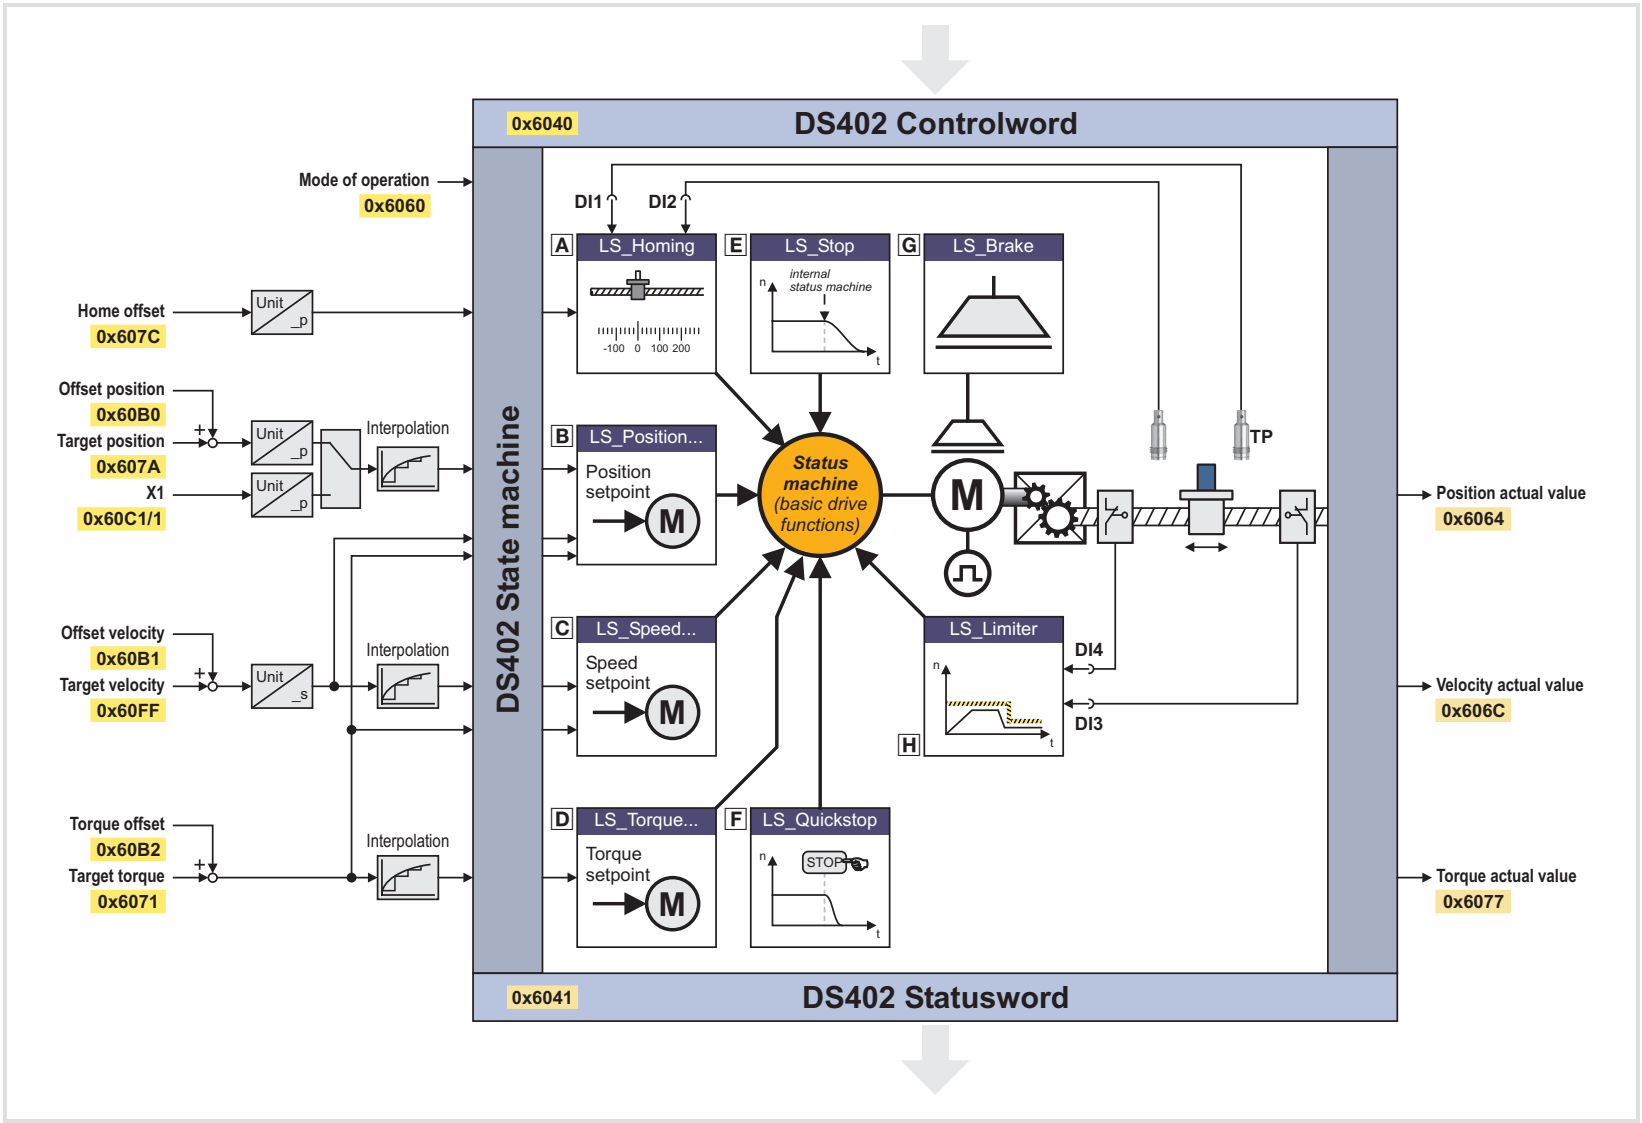
Note!

In general, the "Warning locked" error response should not be set for the operation of the CiA402 application with a control because the control cannot distinguish this error response from the "Warning" error response. Therefore, it cannot be acknowledged.

Conventions for CiA402 objects

The indexes of the CiA402 objects are indicated in the online documentation in hexadecimal notation with a prefixed "0x", e.g. "0x6040".

Some CiA402 objects (of the ARRAY or RECORD object type) contain so-called "subindexes" in which the CiA402 parameters are stored. The slash "/" is used in this online documentation as a separator between the index data and the subindex, e.g. "0x60FB/7".



Tip!

For quick reference of a CiA402 object with a certain name simply use the **Index** of this online documentation. In the index, the corresponding CiA402 object is always given in brackets behind the name.

For general information on how to read and change parameters please see the online documentation for the »Engineer«.

3.1 Basic signal flow

The following illustration shows the basic signal flow of the "CiA402 device profile" technology application:

[3-1] Signal flow

Basic drive functions:

Ⓐ Homing

Ⓑ Position follower

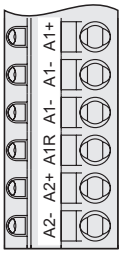
Ⓒ Speed follower

Ⓓ Torque follower

Ⓔ Stop

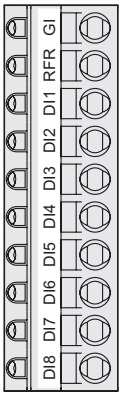
Ⓕ Quick stop

Ⓖ Brake control



Ⓗ Limiter

3.2 Assignment of the I/O terminals

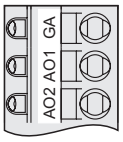


3.2.1 Setpoint and control signals

The following tables contain the Lenze assignment of the analog and digital inputs for the "CiA402 device profile" technology application.

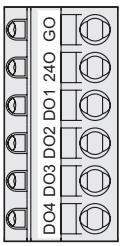
Analog inputs

Terminal X3		Signal (Lenze setting)
	**AI1-** **AI1+**	No signal assigned • The analog input 1 can be queried by the master control via the manufacturer-specific object 0x550F (Lenze code C02800/1).
	AI2- **AI2+**	No signal assigned • The analogue input 2 can be queried by the master control via the manufacturer-specific object 0x550F (Lenze code C02800/2).



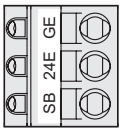
Digital inputs

Terminal X5		Signal (Lenze setting)
	**DI1**	Connection of touch probe sensor or switching contact for status detection of the brake • The DI1 digital input can be queried by the master control via bit 4 of the 0x60FD object (digital inputs).
	DI2	Connection of reference switch • The DI2 digital input can also be queried by the master control via bit 2 of the 0x60FD object (digital inputs).
	DI3	Connection of positive travel range limit switch • The DI3 digital input can also be queried by the master control via bit 1 of the 0x60FD object (digital inputs).
	DI4	Connection of negative travel range limit switch • The DI4 digital input can also be queried by the master control via bit 0 of the 0x60FD object (digital inputs).
	DI5	No signal assigned • The DI5 digital input can also be queried by the master control via bit 6 of the 0x60FD object (digital inputs).
	DI6	No signal assigned • The DI5 digital input can also be queried by the master control via bit 7 of the 0x60FD object (digital inputs).
	DI7	Connection of the touch probe sensor TP channel 1 for supporting the touch probe functionality. ▸ Touch probe (📖 166)
	DI8	Connection of the touch probe sensor TP channel 2 for supporting the touch probe functionality. ▸ Touch probe (📖 166)



3.2.2 Actual value and status signals

The following tables contain the Lenze assignment of the analog and digital outputs for the "CiA402 device profile" technology application.



Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	No signal assigned	C03110/1
	AO2	No signal assigned	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Brake control (via contactor)	C03100/1
	DO2	No signal assigned • The DO2 digital output can be set via the master control via bit 1 of the 0x60FE/1 object (physical outputs).	C03100/2
	DO3	No signal assigned • The DO3 digital output can be set via the master control via bit 2 of the 0x60FE/1 object (physical outputs).	C03100/3
	DO4	No signal assigned • The DO4 digital output can be set via the master control via bit 3 of the 0x60FE/1 object (physical outputs).	C03100/4

State bus

Terminal X2		Signal (Lenze setting)
	**SB**	State bus • The state bus can be set to the "Fault" status by the master control via bit 4 of the 0x60FE/1 object (physical outputs). • The state bus status can be queried via bit 5 of the 0x60FD object (digital inputs).

Display elements

User LED	Signal (Lenze setting)
	No signal assigned • The user LED can be controlled by the master control via bit 5 of the 0x60FE/1 object (physical outputs) (0: LED off, 1: LED on).

3.3 Short overview of the CiA402 objects

3.3.1 Object directory

The object directory for the CiA402 device profile is divided into the following subareas:

Object area	Description
Common entries	General objects
Device control	Objects for the drive control
Factor group	Objects for scaling the position, speed, and acceleration
Position control function	Objects for positioning
Homing mode	Objects for homing
Interpolated position mode	Objects for "Interpolated position mode"
Cyclic synchronous position mode (IEC 61800-7)	Objects for controlling the position
Cyclic synchronous torque mode (IEC 61800-7)	Objects for controlling the torque
Cyclic synchronous velocity mode (IEC 61800-7)	Objects for controlling the speed
Touch probe	Objects for the touch probe functionality
Torque limiting	Objects for selecting the torque limit values

3.3.2 CiA402 objects

Index	Name (Subindex: designation)	Data type	Object type

Grayed out = read access only

Tip!

All Lenze codes from 0 ... 24575 can be activated as objects by the master control. The index of a Lenze code is calculated as follows:

$Index_{hex}$ = 0x5FFF - $Lenze\ code_{hex}$

$Index_{dec}$ = 24575 - $Lenze\ code_{dec}$

3.4 Drive initialisation

The drive is initialised by the master control and consists of the following parts:

1. Change of the communication status: *PREOPERATIONAL*
   – Required as the controller may be in any communication status after starting.
2. Drive identification
3. Initialisation of communication profile objects
4. PDO mapping
5. Initialisation of device profile objects
6. Initialisation of manufacturer-specific objects

After successful initialisation

...the master control may change to the *OPERATIONAL* communication status. In this status, the SYNC telegram is cyclically transferred by the master control and the process data is exchanged via the PDO channel.

3.4.1 PDO mapping

PDO mapping must be executed during the runtime by the master control in the *PREOPERATIONAL* communication status (according to the CiA DS301 communication profile).

▶ The following objects can be defined as process data via the PDO channel:

Index	Name	Data type	Object type
Common entries			
0x60FD	Digital inputs	UNSIGNED_8	VAR
0x60FE/1	Physical outputs	UNSIGNED_8	VAR
Device Control			
0x6040	Control word	UNSIGNED_16	VAR
0x6041	Status word	UNSIGNED_16	VAR

3.4.2 Example of a typical drive initialisation for CANopen

Detailed information on CANopen is provided in the Lenze library in the "CAN" communication manual.

Basic conditions

- The communication takes place via the system bus (CANopen).
- The controller is assigned device address "1".
- The PDO1-Rx to the controller contains the following objects:
  - 0x6040: Controlword
  - 0x60C1/1: Interpolation data record/X1
- The PDO1-Tx from the controller contains the following objects:
  - 0x6041: Statusword
  - 0x6064: Position actual value
- The "Interpolated position mode" operating mode is selected.
- The synchronisation of the Servo Drive 9400 must be set via code C01120 (sync source).
- The cycle time of the sync data transmission of the Servo Drive 9400 must be set via code C01121 (sync cycle time).

Sequence

Communication service	Object	Value	Information
Change of the communication status			
NMT	-	-	Switch drive to the *PREOPERATIONAL* communication status.
Drive identification			
SDO read request	0x1000	-	Check if the drive supports the CiA402 Canopen device profile.
SDO read request	0x1018/1	-	Manufacturer's identification mark
SDO read request	0x1018/2	-	Product identification
SDO read request	0x1018/3	-	Revision number
SDO read request	0x1008	-	Manufacturer's device name
Initialisation of communication profile objects			
SDO read request	0x1010		Manufacturer's software version
SDO write request	0x1005	0x80	Set COB-ID for the SYNC telegram.
SDO write request	0x1014	0x81	Set COB-ID for the EMCY telegram.
PDO mapping			
SDO write request	0x1800/1	0x181	Set COB-ID for the transmit process data (PDO1-Tx).
SDO write request	0x1800/2	1	Set transmission mode for the transmit process data (PDO1-Tx): synchronously for each SYNC telegram.
SDO write request	0x1400/1	0x201	Set COB-ID for the receipt process data (PDO1-Rx).
SDO write request	0x1400/2	1	Set transmission mode for the receipt process data (PDO1-Rx): synchronously for each SYNC telegram.

Communication service	Object	Value	Information
SDO write request	0x1600/0	0	PDO1-Rx does not contain any objects; deactivate mapping.
SDO write request	0x1600/1	0x60400010	Map the 0x6040 object (controlword) to PDO1-Rx.
SDO write request	0x1600/2	0x60C10120	Map the 0x60C1/1 object (interpolation data record/ X1) to PDO1-Rx.
SDO write request	0x1600/0	2	PDO1-Rx contains 2 objects; activate mapping.
SDO write request	0x1A00/0	0	PDO1-Tx does not contain any objects; deactivate mapping.
SDO write request	0x1A00/1	0x60410010	Map the 0x6041 object (statusword) to PDO1-Tx.
SDO write request	0x1A00/2	0x60640020	Map the 0x6064 object (position actual value) to PDO1-Rx.
SDO write request	0x1A00/0	2	PDO1-Tx contains 2 objects; activate mapping.
Initialisation of device profile objects			
SDO write request	0x60C2/1	2	Set time base for interpolation of the position setpoint. • Time base = 2 * 10^{-3} [s] = 2 [ms]
SDO write request	0x60C2/2	0xFD (-3)	
SDO write request	0x6092/1	0x10000	Set feed constant for position values in [increments]. • One encoder revolution corresponds to 0x10000, since the feed is usually already converted into increments in the master control.
SDO write request	0x6060	7	Select Interpolated position mode.
Initialisation of manufacturer-specific objects			
SDO write request	0x55A4	0x10000	Configure touch probe for Homing mode in C02651. • Touch probe is triggered by motor encoder zero pulse.
SDO write request	0x55AF	2	Select "2" for "Homing mode" operating mode in C02640. Process: 1. Movement in positive direction with profile data set 1. 2. Reversing to positive travel range limit switch. 3. Positive edge of the reference switch activates profile data set 2 for the further reference search. 4. Negative edge of the reference switch enables home position detection. 5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C). 6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").
SDO write request	0x5B9F	1	Write request on the code C01120 (sync source) for axis synchronisation. • Value "1" = CAN on board
SDO write request	0x5B9E	2000	Write request to code C01121 (sync cycle time). • Sync cycle time = 2000 µs
Change of the communication status			
NMT	-	-	Switch drive to the *OPERATIONAL* communication status.
Cyclic process data exchange			
PDO1-Rx to the drive	-	-	Transmit the process data to the drive according to PDO mapping.
SYNC	-	-	Process data synchronisation
PDO1-Tx from the drive	-	-	Receive process data from the drive according to PDO mapping.

3.4.3 Example of a typical drive initialisation for EtherCAT

Detailed information on EtherCAT is provided in the Lenze library in the "EtherCAT" communication manual.

Basic conditions

- The communication is carried via an EtherCAT network.
- For communication, the E94AYCET communication module (EtherCAT) must be plugged into the MXI1 module slot of the Servo Drive 9400.
- The first EtherCAT slave in the drive compound is assigned with the station address "1001" during initialisation.
- The PDO1-Rx to the controller contains the following objects:
  - 0x6040: Controlword
  - 0x60C1/1: Interpolation data record/X1
- The PDO1-Tx from the controller contains the following objects:
  - 0x6041: Statusword
  - 0x6064: Position actual value
- The "Interpolated position mode" operating mode is selected.
- The synchronisation of the Servo Drive 9400 must be set via code C01120 (sync source).

Sequence

Communication service	Object	Value	Information
Change of the communication status			
NMT	-	-	Switch drive to the *PREOPERATIONAL* communication status.
Drive identification			
SDO read request	0x1000	-	Check if the drive supports the CiA402 CANopen device profile.
SDO read request	0x1018/1	-	Manufacturer's identification mark
SDO read request	0x1018/2	-	Product identification
SDO read request	0x1018/3	-	Revision number
SDO read request	0x1008	-	Manufacturer's device name
Initialisation of communication profile objects			
SDO read request	0x1010		Manufacturer's software version
PDO mapping			
SDO write request	0x1600/0	0	PDO1-Rx does not contain any objects; deactivate mapping.
SDO write request	0x1600/1	0x60400010	Map the 0x6040 object (controlword) to PDO1-Rx.
SDO write request	0x1600/2	0x60C10120	Map the 0x60C1/1 object (interpolation data record/ X1) to PDO1-Rx.
SDO write request	0x1600/0	2	PDO1-Rx contains 2 objects; activate mapping.
SDO write request	0x1A00/0	0	PDO1-Tx does not contain any objects; deactivate mapping.

Communication service	Object	Value	Information
SDO write request	0x1A00/1	0x60410010	Map the 0x6041 object (statusword) to PDO1-Tx.
SDO write request	0x1A00/2	0x60640020	Map the 0x6064 object (position actual value) to PDO1-Rx.
SDO write request	0x1A00/0	2	PDO1-Tx contains 2 objects; activate mapping.
SDO write request	0x1C12/1		Selection of the PDO-Rx source
SDO write request	0x1C13/1		Selection of the PDO-Tx source
Initialisation of device profile objects			
SDO write request	0x60C2/1	2	Set time base for interpolation of the position setpoint. • Time base = 2 x 10^{-3} [s] = 2 [ms]
SDO write request	0x60C2/2	0xFD (-3)	
SDO write request	0x6092/1	0x10000	Set feed constant for position values in [increments]. • One encoder revolution corresponds to 0x10000, since the feed is usually already converted into increments in the master control.
SDO write request	0x6060	7	Select the "Interpolated position mode" operation mode.
Initialisation of manufacturer-specific objects			
SDO write request	0x55A4	0x10000	Configure touch probe for the "homing mode" operation mode in C02651. • Touch probe is triggered by motor encoder zero pulse.
SDO write request	0x55AF	2	Select "2" for "Homing mode" operating mode in C02640. Process: 1. Movement in positive direction with profile data set 1. 2. Reversing to positive travel range limit switch. 3. Positive edge of the reference switch activates profile data set 2 for the further reference search. 4. Negative edge of the reference switch enables home position detection. 5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C). 6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").
SDO write request	0x5B9F	4	Write request on the code C01120 (sync source) for axis synchronisation. • Value "4" = module in MXI1
Change of the communication status			
NMT	-	-	Switch drive to the *OPERATIONAL* communication status.
Cyclic process data exchange			
PDO1-Rx to the drive	-	-	Transmit the process data to the drive according to PDO mapping.
SYNC	-	-	Process data synchronisation
PDO1-Tx from the drive	-	-	Receive process data from the drive according to PDO mapping.

3.5 Structure of the object descriptions

Each CiA402 object is described in the parameters list in tabular form (similar to the parameters) which consists of the following three areas:

Table header

The table header contains the following general notes:

- Index and – if available – subindex of the object
- Object name (display text in the »Engineer» and in the keypad)
- Data type
- Assigned parameter in the parameters list

Table contents

The table contains further general explanations & notes on the object and the possible settings whose representation depends on the object type:

- Objects with read-only access
- Objects with write access

Table footer

The table footer contains the Object attributes.

3.5.1 Data type

The following data types are available for objects:

Data type	Meaning
INTEGER_8	8-bit value with sign
INTEGER_16	16-bit value with sign
INTEGER_32	32-bit value with sign
INTEGER_64	64-bit value with sign
UNSIGNED_8	8-bit value without sign
UNSIGNED_16	16-bit value without sign
UNSIGNED_32	32-bit value without sign
UNSIGNED_64	64-bit value without sign
FLOATING_POINT	32-bit floating point number
VISIBLE_STRING	String of printable characters
OCTET_STRING	String of arbitrary characters
BITFIELD_8	8-bit value, bit coded
BITFIELD_16	16-bit value, bit-coded
BITFIELD_32	32-bit value, bit coded

3.5.2 Objects with read-only access

Objects for which the "write access" attribute has not been set can only be read and not be changed by the user.

Description structure

Index | Name: ____ | _____	Data type: _____ Code: _____
Description	
Display area (min. value | unit | max. value)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX	

3.5.3 Objects with write access

Only objects with a check mark (☑) in front of the "write access" attribute can be changed by the user. The Lenze setting for these objects is **printed in bold**.

- The settings are either selected by means of a selection list or through direct value entry.
- Values outside the valid setting range are represented in red in the »Engineer«.

3.5.3.1 Objects with setting range

Description structure

Index | Name: ____ | _____			Data type: _____ Code: _____
Description			
Setting range (min. value | unit | max. value)			**Lenze setting**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

3.5.3.2 Objects with selection list

Description structure

Index | Name: ____ | _____		Data type: _____ Code: _____
Description		
Selection list (Lenze setting printed in bold)		
1		
2		
3		

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

3.5.3.3 Objects with bit coded setting

Description structure

Index | Name: ____ | _____		Data type: _____ Code: _____
Description		
Value is bit-coded:		
Bit 0		
...		
Bit 31		

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

3.5.4 Object attributes

Attribute	Meaning	
☑ Read access	Read access to object possible.	
☑ Write access	Write access to object possible. • Please also observe the following attributes:	
	☑ CINH	Access only possible when controller is inhibited
	☑ PLC STOP	Access only possible when the application has stopped.
☑ PDO_MAP_RX	Mapping of the object in an Rx-PDO is possible.	
☑ PDO_MAP_TX	Mapping of the object in a Tx-PDO is possible.	

3.6 Common entries

This chapter describes the general CiA402 parameters.

3.6.1 Object description

All objects correspond to the CiA402 specification, but some of them have only a restricted value range.

Objects described in this chapter:

Index	Name	Data type	Object type
0x6007	Abort connection option code	INTEGER_16	VAR
0x603F	Error code	UNSIGNED_32	VAR
0x6402	Motor type	UNSIGNED_16	VAR
0x6403	Motor catalogue number	VISIBLE_STRING	VAR
0x6404	Motor manufacturer	VISIBLE_STRING	VAR
0x6405	http motor catalogue address	VISIBLE_STRING	VAR
0x6406	Motor calibration date	VISIBLE_STRING	VAR
0x6407	Motor service period	UNSIGNED_32	VAR
0x6410	Motor data	UNSIGNED_32	RECORD
0x6502	Supported drive modes	UNSIGNED_32	BITFIELD
0x6503	Drive catalogue number	VISIBLE_STRING	VAR
0x6504	Drive manufacturer	VISIBLE_STRING	VAR
0x6505	http drive catalogue address	VISIBLE_STRING	VAR
0x6510	Drive data	UNSIGNED_32	RECORD
0x60FD	Digital inputs	UNSIGNED_8	VAR
0x60FE	Digital outputs	UNSIGNED_8	ARRAY

Grayed out = read access only

0x6007 - Abort connection option code

Index | Name:
0x6007 | Abort connection option code

Data type: INTEGER_16
Code: C03519

Response to abortion of the communication link.
3 = activate quick stop. ▸ quick stop

Setting range (min. value | unit | max. value)			Lenze setting
3		3	**3**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

0x603F - Error code

Index | Name: **0x603F | Error code**			Data type: UNSIGNED_32 Code: C00394
Error number			
Display area (min. value | unit | max. value)			
0		4294967295	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

The following table contains all possible error numbers and their meaning:

Error number		Meaning
[dez]	[hex]	
0	**0x0000**	Ok, no error
4096	**0x1000**	An error has occurred in the controller (system fault, fault, trouble, or warning).
33024	**0x8100**	Communication error (warning)
33072	**0x8130**	Network monitoring function "Node guarding" or "Heartbeat" has tripped.
33296	**0x8210**	PDO length is lower than expected.
33312	**0x8220**	PDO length is higher than expected.
34560	**0x8700**	Monitoring of the sync telegram has tripped.

0x6402 - Motor type

Index | Name: **0x6402 | Motor type**		Data type: UNSIGNED_16 Code: C03503
Motor type		
Selection list (Lenze setting printed in bold)		
0	**Non-standard motor**	
1	Phase modulated DC motor	
2	Frequency controlled DC motor	
3	PM synchronous motor	
4	FC synchronous motor	
5	Switched reluctance motor	
6	Wound rotor induction motor	
7	Squirrel cage induction motor	
8	Stepper motor	
9	Micro-step stepper motor	
10	Sinusoidal PM BL motor	
11	Trapezoidal PM BL motor	

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

0x6403 - Motor catalogue number

3.6.2 Motor data

The motor data are set via the Lenze parameters of the motor control.

3.7 Device control

The objects described in this chapter serve to control the states of the controller and select the operating mode.

3.7.1 Object description

All objects correspond to the CiA402 specification, but some of them have only a restricted value range.

Objects described in this chapter:

Index	Name	Data type	Object type
0x6040	Control word	UNSIGNED_16	VAR
0x6041	Status word	UNSIGNED_16	VAR
0x605A	Quick stop option code	INTEGER_16	VAR
0x605B	Shutdown option code	INTEGER_16	VAR
0x605C	Disable operation option code	INTEGER_16	VAR
0x605D	Halt option code	INTEGER_16	VAR
0x605E	Fault reaction option code	INTEGER_16	VAR
0x6060	Mode of operation	INTEGER_8	VAR
0x6061	Mode of operation display	INTEGER_8	VAR
0x6085	Quick stop deceleration	UNSIGNED_32	VAR

Grayed out = read access only

0x6040 - Control word

Index | Name:
0x6040 | Control word

Data type: UNSIGNED_16
Code: C03530

Control word for the drive.

▸ Device control commands

Value is bit-coded:		Information
Bit 0	Switch on	Device control command
Bit 1	Enable voltage	Device control command
Bit 2	Quick stop	Device control command
Bit 3	Enable operation	Device control command
Bit 4	Start homing or enable operation mode	Operating mode-dependent control bit: • Homing mode: start homing. • Interpolated position mode: enable operating mode.
Bit 5	Reserved	Operating mode-dependent control bit: • In all operating modes: reserved.
Bit 6	Reserved	Operating mode-dependent control bit: • In all operating modes: reserved.
Bit 7	Fault reset	Device control command
Bit 8	Stop	Operating mode-dependent control bit: • In all operating modes: Stop.
Bit 9	Reserved	
Bit 10	Reserved	
Bit 11	Load home position	Setting of home position
Bit 12	Reset home position	Resetting of home position
Bit 13	Reserved	
Bit 14	Reserved	
Bit 15	Reserved	

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ PDO_MAP_RX ☐ PDO_MAP_TX

0x6041 - Status word

Index | Name:
0x6041 | Status word

Data type: UNSIGNED_16
Code: C03531

Status word from the drive.

▸ Device states

Value is bit-coded:		Information
Bit 0	Ready to switch on	Device state "Device is ready to start"
Bit 1	Switched on	Device state "Device is switched on"
Bit 2	Operation enabled	Device state "Operation"
Bit 3	Fault	Device state "Fault"
Bit 4	Voltage enabled	DC-bus voltage available
Bit 5	Quick stop	Quick stop active
Bit 6	Switch on disabled	Switch on inhibit is active
Bit 7	Warning	Warning active
Bit 8	Following error	Following error • The difference between position setpoint and actual position value is higher than the window set in 0x6065.
Bit 9	Remote	Drive can receive commands via the fieldbus.
Bit 10	Target reached	Drive has reached target position. • The actual position value is in the position window set in 0x6067.
Bit 11	Reserved	
Bit 12	Homing attained or operation mode active	Operating mode-dependent status bit: • Homing mode: homing executed. • Other operating modes: operating mode is active.
Bit 13	Homing error	Operating mode-dependent status bit: • Homing mode: fault during homing. • Other operating modes: reserved.
Bit 14	Home position available	Home position available
Bit 15	Reserved

3.7.2 Device control commands

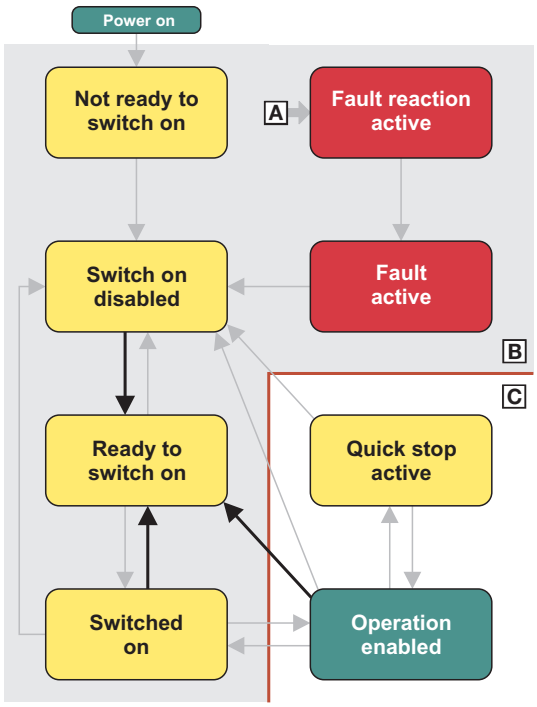
Via the 0x6040 object (control word) "Device Control" commands can be activated to set the controller to a certain device state:

Device control command	Bit pattern in control word							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
Shutdown	0	X	X	X	X	1	1	0
Switch on	0	X	X	X	0	1	1	1
Enable operation	0	X	X	X	1	1	1	1
Quick stop	0	X	X	X	X	0	1	X
Disable operation	0	X	X	X	0	1	1	1
Disable voltage	0	X	X	X	X	X	0	X
Reset fault	0 ↗ 1	X	X	X	X	X	X	X
X = status is not important								

Tip!

The operating-mode-dependent control bits 4 ... 6 listed in the table are not important for the tripping of commands but only provide a better readability of the bit patterns.

Detailed information on the different commands can be obtained from the following subchapters.



3.7.2.1 Shutdown

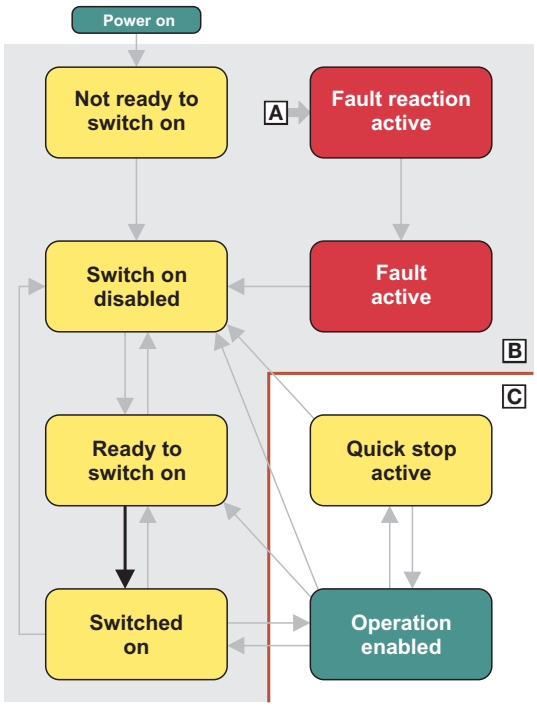
Bit pattern for "Shutdown" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0	X	X	X	X	1	1	0

This command changes the device status from "Switch on disabled" to "Ready to switch on".

If the pulse inhibit has already been deactivated and the device status of the controller is "Operation enabled", this command can be used to set the pulse inhibit again.

- If automatic brake operation is activated, the parameterised brake closing time is observed: The system waits until the brake is applied before the pulse inhibit is set.
- The motor becomes torqueless and coasts if it is not braked.
- The device state "Switched on" or "Operation enabled" changes back to the device state "Ready to switch on".

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled



[3-2] Possible state changes through "Shutdown" command

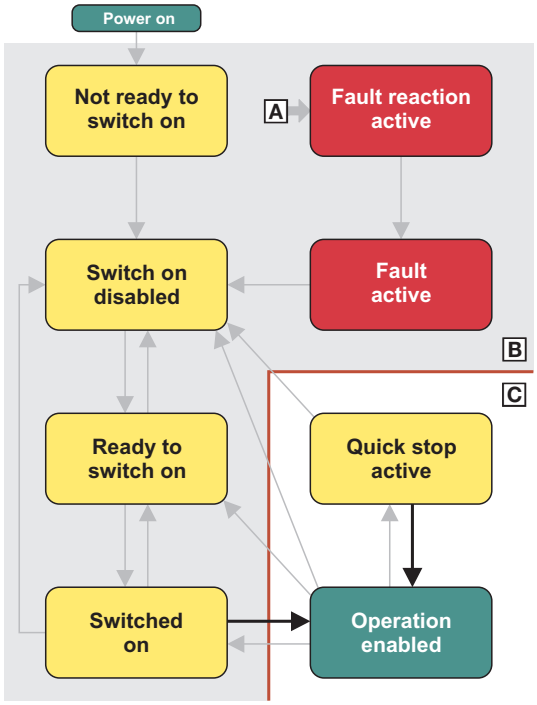
3.7.2.2 Switch on

Bit pattern for "Switch on" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0	X	X	X	X	1	1	1

This command serves to deactivate the switch on inhibit which is active after switch on or after the reset (acknowledgement) of an error.

▶ It is changed to the device state "Switched on":

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled



[3-3] Possible state changes through "Switch on" command

3.7.2.3 Enable operation

Bit pattern for "Enable operation" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0	X	X	X	1	1	1	1

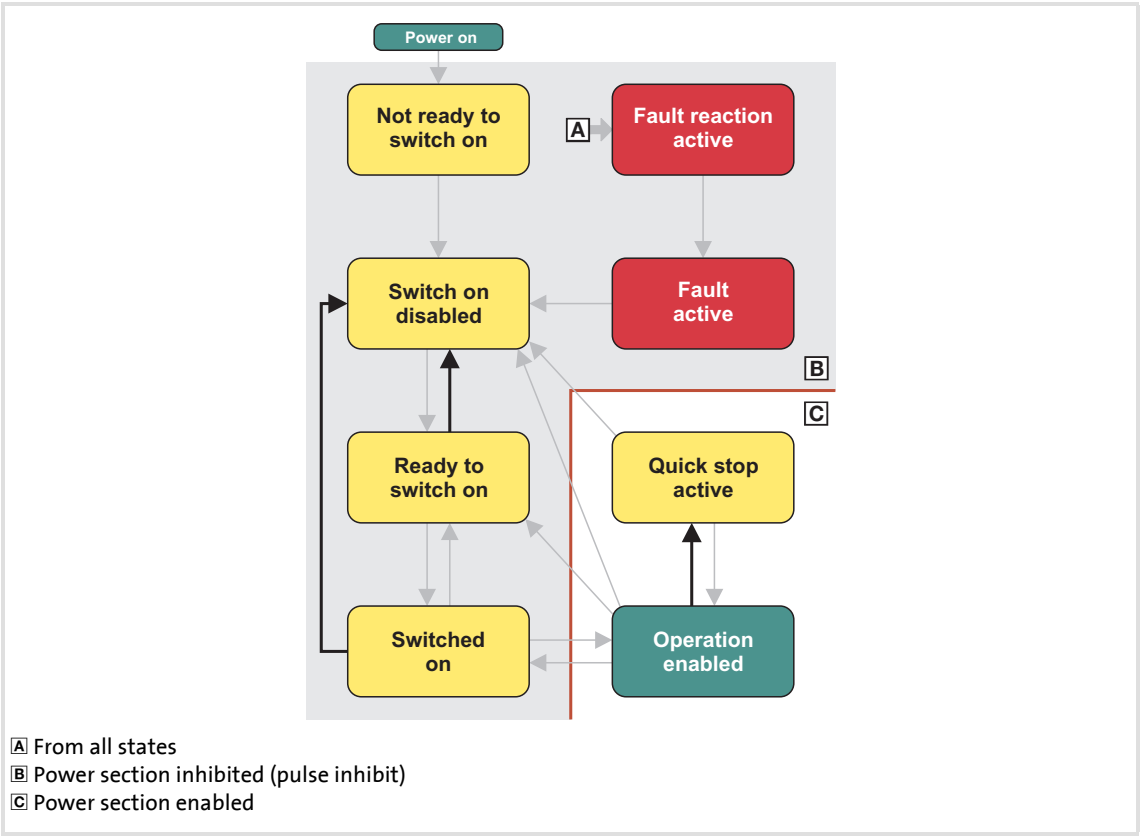
This command serves to enable the operation and stop an active quick stop again.

▶ It is changed to the device state "Operation enabled".

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled

[3-4] Possible state change through "Enable operation" command

3.7.2.4 Quick stop



Bit pattern for "quick stop" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0	X	X	X	X	0	1	X

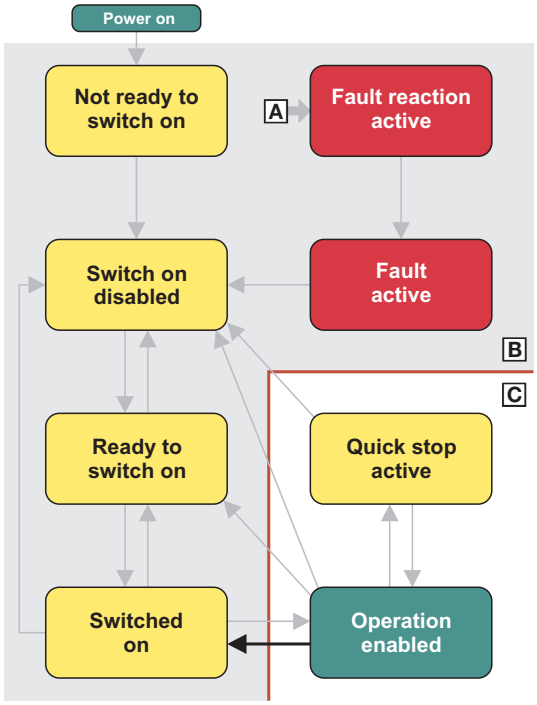
This command serves to activate Quick stop when the operation is enabled.

- The drive is braked to standstill irrespective of the defined setpoint within the deceleration time set for Quick stop.
- It is changed to the device state "Quick stop active".

If the operation is not enabled yet, this command will cause the switch on inhibit to be set again instead.

- At the same time the pulse inhibit is set (unless it is set already), i.e. the pulses of the controller are inhibited.
- If automatic brake operation is activated, the parameterised brake closing time is observed: The system waits until the brake is applied before the pulse inhibit is set.
- The motor becomes torqueless and coasts if it is not braked.
- It is changed back to the device state "Switch on disabled"

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled



[3-5] Possible state changes through "Quick stop" command

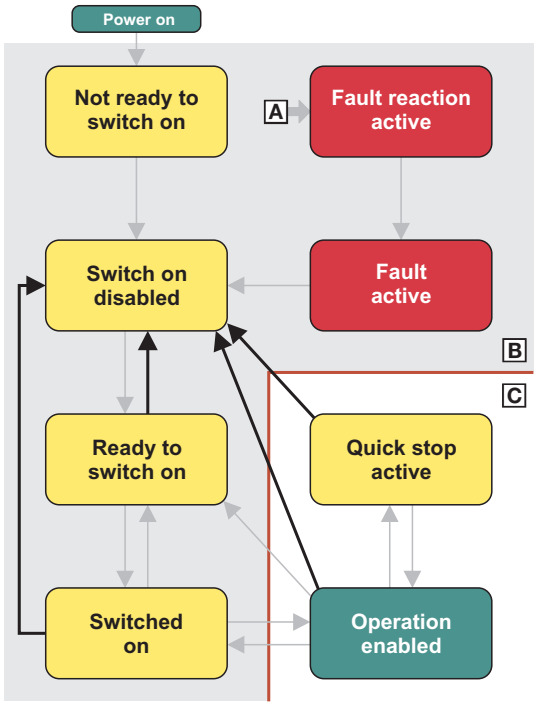
3.7.2.5 Disable operation

Bit pattern for "Disable operation" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0	X	X	X	0	1	1	1

This command serves to inhibit the enabled operation again.

- The pulse inhibit is set.
- If automatic brake operation is activated, the parameterised brake closing time is observed: The system waits until the brake is applied before the pulse inhibit is set.
- It is changed back to the device state "Switched on".

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled



[3-6] Possible state change through "Disable operation" command

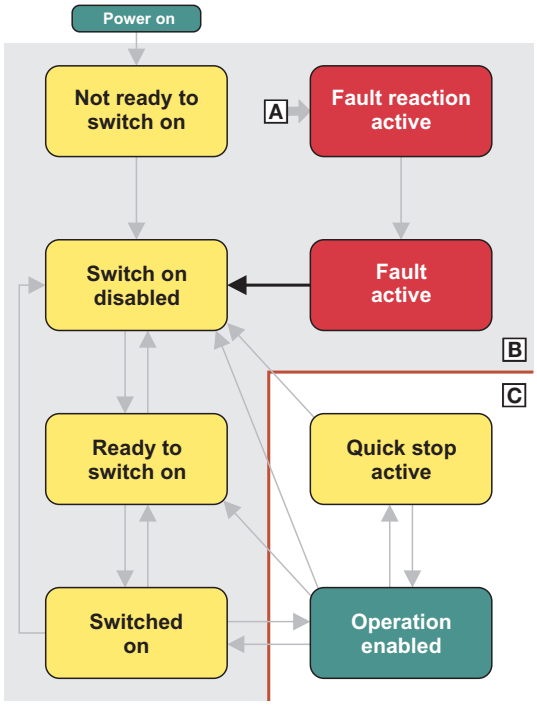
3.7.2.6 Disable voltage

Bit pattern for "Disable voltage" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0	X	X	X	X	X	0	X

This command serves to inhibit the output stages of the controller again.

- The pulse inhibit is set (unless they are set already), i.e. the pulses of the controller are inhibited.
- The motor becomes torqueless and coasts if it is not braked.
- The switch on inhibit is set again.
- It is changed back to the device state "Switch on disabled".

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled



[3-7] Possible state change through "Disable voltage" command

3.7.2.7 Reset fault

Bit pattern for "Reset fault" command in 0x6040 (control word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Reset fault	Operating mode-dependent control bits			Enable operation	Quick stop	Enable voltage	Switch on
0 ↗ 1	X	X	X	X	X	X	X

This command serves to acknowledge an existing error message if the cause of the error has been eliminated.

- The pulse inhibit remains set.
- It is changed to the device state "Switch on disabled", i.e. the switch on inhibit is active.

A From all states
B Power section inhibited (pulse inhibit)
C Power section enabled

[3-8] Possible state changes through "Reset fault" command

3.7.3 Device statuses

The current device state of the drive can be read via the 0x6041 object (status word):

Device control commands	Bit pattern in the status word							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
Not ready to switch on	X	0	X	X	0	0	0	0
Switch on disabled	X	1	X	X	0	0	0	0
Ready to switch on	X	0	1	X	0	0	0	1
Switched on	X	0	1	X	0	0	1	1
Operation enabled	X	0	1	X	0	1	1	1
Quick stop active	X	0	0	X	0	1	1	1
Fault response active	X	0	X	X	1	1	1	1
Fault	X	0	X	X	1	0	0	0
X = status is not important								

Tip!

Bit 4 ("Voltage enabled") and bit 7 ("Warning") listed in the table are not important for the device state but only provide a better readability of the bit patterns.

Detailed information on the different device states can be obtained from the following subchapters.

3.7.3.1 Not ready to switch on

Bit pattern for "Not ready to switch on" device state in 0x6041 (status word):

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	X	X	0	0	0	0

This is the controller status directly after switching on the supply voltage.

- In this device state the operating system is initialised.
- The monitorings are not active yet.
- Communication is not possible yet.
- The controller cannot be parameterised yet and no device commands can be executed.
- The motor brake, if available, is closed.
- The operation is inhibited.

Note!

When the device initialisation is completed, the device state is automatically changed to "Switch on disabled".

3.7.3.2 Switch on disabled

Bit pattern for device state "Switch on disabled" in 0x6041 (status word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	1	X	X	0	0	0	0

This is the controller's status after the device has been initialised successfully.

- The process data monitoring is active.
- Communication is possible.
- DC-bus voltage is available.
- The controller can be parameterised.
- The motor brake, if available, is closed.
- The operation is inhibited.

3.7.3.3 Ready to switch on

Bit pattern for "Ready to switch on" device state in 0x6041 (status word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	1	X	0	0	0	1

This is the device status of the controller after the device has been initialised successfully and after the controller has received the "Shutdown" command.

- The process data monitoring is active.
- Communication is possible.
- DC-bus voltage is available.
- The controller can be parameterised.
- The motor brake, if available, is closed.
- The operation is inhibited.

Note!

It is also changed to this device state if in the device states "Switched on" or "Operation enabled" the "Shutdown" command is tripped.

The change to the sequential state "Switched on" is caused by the tripping of the "Switch on" command.

3.7.3.4 Switched on

Bit pattern for the "Switched on" device state in 0x6041 (status word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	1	X	0	0	1	1

This is the controller's status after being in the "Ready to switch on" device state and receiving the "Switch on" command.

- Process data monitoring is active.
- Communication is possible.
- DC-bus voltage is available.
- The controller can be parameterised.
- The motor brake, if available, is closed.
- The operation is inhibited.

Note!

The change to the device state "Operation enabled" and thus the enable of the operation is caused by the tripping of the "Enable operation" command.

3.7.3.5 Operation enabled

Bit pattern for the "Operation enabled" device state in 0x6041 (status word):							
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	1	X	0	1	1	1

This device state represents the normal operation, i.e. the operation mode selected is enabled and no errors occur.

- Only the parameters of the controller can be changed which do not require controller inhibit.
- The motor brake, if available, is opened.
- The motor has torque.

3.7.3.6 Quick stop active

Bit pattern for device state "Quick stop active" in 0x6041 (status word):

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	0	X	0	1	1	1

This device state is active if Quick stop is executed or active.

- Only the parameters of the controller can be changed which do not require controller inhibit.
- The motor brake, if available, is opened.
- The motor has torque.

Note!

The "Enable operation" command serves to deactivate an active quick stop again.

3.7.3.7 Fault response active

Bit pattern for "Fault response active" device command in 0x6041 (status word):

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	X	X	1	1	1	1

If a minor error occurs, i.e. the drive is still able to operate the motor in a controlled manner, this device state becomes active and the drive is braked to standstill irrespective of the defined setpoint within the deceleration time set in Quick stop.

- Only the parameters of the controller can be changed which do not require controller inhibit.
- The motor brake, if available, is opened.
- The operation is enabled, the motor has torque.

Note!

After the "Quick stop" basic function has been executed, i.e. the drive is at standstill, it is automatically changed to the "Fault" device state.

The "Fault" device state can only be left using the "Reset fault" command if the error cause is removed.

3.7.3.8 Fault

Bit pattern for the "Fault" device state in 0x6041 (status word):

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Warning	Switch on disabled	Quick stop	Voltage enabled	Fault	Operation enabled	Switched on	Ready to switch on
X	0	X	X	1	0	0	0

If a grave error occurs, i.e. the drive is not able to operate the motor in a controlled manner anymore, the drive is switched off immediately and this device state becomes active.

- The pulse inhibit is set, i.e. the pulses of the controller are inhibited.
- The motor is torqueless.
- The motor brake, if available, is closed.
- The operation is inhibited.
- The controller can be parameterised.

Note!

This device state can only be left using the "Reset fault" command if the error cause is removed.

3.7.4 Operating mode changeover

The drive behaviour depends on the operating mode selected. The operating mode changeover is executed via the 0x6060 object (mode of operation) in the communication states *PREOPERATIONAL* or *OPERATIONAL* by the master control. Access is possible via SDO or PDO.

- Only one operating mode at a time can be active.
- Except for the "Homing Mode" the operating modes differ in the way the setpoints are selected.
- The following table shows the permissible operating modes with the corresponding object value:

Operating mode	Object value	Setpoint selection
Homing mode	6	- (Homing function)
Interpolated position mode	7	Position
Cyclic synchronous position mode (IEC 61800-7)	8	Position
Cyclic synchronous velocity mode (IEC 61800-7)	9	Speed
Cyclic synchronous torque mode (IEC 61800-7)	10	Torque
-	All other values	- (Standstill)

Tip!

The currently set operating mode can be read via the 0x6061 object (mode of operation display). Here, access is also possible via SDO or PDO.

Except for the source of the setpoint selection, the operating mode "Interpolated position mode" corresponds to the operating mode "Cyclic synchronous position mode".

3.7.5 Stop

The standard stop of the drive will be automatically activated by the internal state machine if the operating mode selected in the 0x6060 object (mode of operation) is deactivated again and the drive is not yet at standstill.

- The drive is braked to standstill via a parameterisable deceleration ramp.
  - While the drive is braked to standstill, C02530 displays the "Drive is stopped" function state.
  - If meanwhile another basic drive function is activated, this basic function will take over control of the drive from the current speed on and the function state "Drive is stopped" is abandoned.
  - If the drive is at standstill, C02530 will display the basic state "Drive at standstill".
- An acceleration phase active at the time of activating the stopping process is considered by the standard stop, i.e. the current acceleration is first led to "0" with the parameterised S-ramp time before the real deceleration process starts.
- If the controller is enabled while the shaft is coasting (controller inhibit and pulse inhibit are deactivated), the drive will be braked from the current speed to standstill.

Lenze parameters for the "Stop" basic function:

Parameter		Lenze setting	
		Value	Unit
C02610	Deceleration time for stop	0.000	s
C02612	Ref. for decel. time of stop	Motor reference speed (C00011)	

3.7.6 Quick stop

Unlike the Stopfunction, quick stop (QSP) is required for a stop in the event of an error. If quick stop is activated, the drive will be braked to standstill irrespective of the defined setpoint within the deceleration time set.

Note!

During quick stop, the drive carries out the setpoint generation and does not follow the setpoint anymore defined by the master control!

If several drives carry out a coordinated motion by means of actual value transfer, the quick stop function should only be used for the motion master (master drive) in order to maintain the coordination.

Tip!

The quick stop can be set for many monitoring functions as an error response as well ("quick stop by trouble").

The source which activated the quick stop function is shown bit-coded in C00159.

Activation of quick stop by the master control

Quick stop can be activated by the master control using the "Quick stop" command when the operation is enabled.

- The device state "Operation enabled" is changed to device state "Quick stop active".
- The active quick stop function can be deactivated again using the "Enable operation" command.

Lenze parameters for the "Quick stop" basic function:

Parameter		Lenze setting	
		Value	Unit
C00105	Quick stop decel. time	0.000	s
C00106	Quick stop S-ramp time	0.00	%
C00107	Ref. - quick stop decel. time	Motor reference speed (C00011)	

3.7.7 Controller inhibit

Setting the controller inhibit inhibits the power stages in the controller and resets the speed, current, and position controller of the motor control.

- The controller can be inhibited by different sources, e.g.
  - by the master control using the "Shutdown" command.
  - using the RFR digital input.
  - using the C00002 = "41: Inhibit controller" device command.
- The bit code under C00158 shows the source that inhibited the controller.

3.8 Factor group

The objects described in this chapter serve to scale physical values.

3.8.1 Object description

Objects described in this chapter:

Index	Name	Data type	Object type
0x607E	Polarity	UNSIGNED_32	VAR
0x6089	Position notation index	INTEGER_8	VAR
0x608A	Position dimension index	UNSIGNED_8	VAR
0x608B	Velocity notation index	INTEGER_8	VAR
0x608C	Velocity dimension index	UNSIGNED_8	VAR
0x608D	Acceleration notation index	INTEGER_8	VAR
0x608E	Acceleration dimension index	UNSIGNED_8	VAR
0x608F	Position encoder resolution	UNSIGNED_32	ARRAY
0x6090	Velocity encoder resolution	UNSIGNED_32	ARRAY
0x6091	Gear ratio	UNSIGNED_32	ARRAY

3.9 Homing mode

In this operating mode, homing can be executed to transmit the measuring system of the machine to the controller within the physically possible travel range.

Danger!

During homing operations, specially assigned profile parameters are effective. If these parameters are not set correctly, the drive may execute uncontrolled movements!

Note!

Normally homing is only required once during commissioning of systems for which the machine cycle can be represented in the display area of the encoder, e.g. if multiturn absolute value encoders or singleturn absolute value encoders/ resolvers are used during the machine cycle on one motor revolution.

- The encoder position is stored safe against mains failure in the memory module and is therefore known to the drive control even after the mains has been switched.
- Another reference setting is only required in the case of another commissioning or in the event of service (e.g. when drive components are replaced).

Selection of operating mode

The "Homing" operating mode is selected via the 0x6060 object (mode of operation) using the value "6".

3.9.1 Input and output data

Input data

Index	Name	Data type	Object type
0x6040	Control word	UNSIGNED_16	VAR
0x6098	Homing method	INTEGER_8	VAR
0x55AF	Homing mode	UNSIGNED_32	VAR
0x607C	Home offset	UNSIGNED_32	VAR
0x6099	Homing speeds	UNSIGNED_32	ARRAY
0x609A	Homing acceleration	UNSIGNED_32	ARRAY
0x60FB/7	Homing stop mode	UNSIGNED_32	VAR

Output data

Index	Name	Data type	Object type
0x6041	Status word	UNSIGNED_16	VAR

Grayed out = read access only

3.9.2 Object description

- All objects are Lenze-specific.
- The 0x609A object (homing acceleration) is executed as an array according to the 0x6099 object (homing speeds).
- All CiA402 homing modes are supported.
- The homing modes of the "Homing" basic function are supported 1:1.

Objects described in other chapters:

Index	Name	Data type	Object type
▸ Device control			
0x6040	Control word	UNSIGNED_16	VAR
0x6041	Status word	UNSIGNED_16	VAR
▸ Position control function			
0x60FB	Position control parameter set	UNSIGNED_32	RECORD
	1: Load home position	INTEGER_32	
	7: Homing stop mode	UNSIGNED_32	

Grayed out = read access only

Objects described in this chapter:

Index	Name	Data type	Object type
0x607C	Home offset	UNSIGNED_32	VAR

0x6099	Homing speeds	UNSIGNED_32	VAR
0x609A	Homing acceleration	UNSIGNED_32	VAR

0x607C - Home position

Index | Name:	Data type: INTEGER_32
0x607C | Home position	Code: C02642

Position which is set as current position during a reference search in the home position or when setting the reference.

- Direct illustration of the Lenze code C02642 (reference position).

Setting range (min. value | unit | max. value)			**Lenze setting**
-2147483647	pos unit	2147483647	**0 pos unit**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

0x6098 - Homing method

Index | Name:	Data type: INTEGER_8
0x6098 | Homing method	Code: C03601

All CiA402 homing methods are supported.

- If "0" is selected, the homing modes will be selected via the 0x55AF (Lenze code C02640) manufacturer-specific object instead.

Selection list (Lenze setting printed in bold)		**Information**
-2	Lenze cw_Trq_Lim	"Homing to limit stop" (Lenze homing mode 14)
-1	Lenze ccw_Trq_Lim	"Homing to limit stop" (Lenze homing mode 15)
0	**Lenze homing mode**	The homing is done according to the Lenze homing mode selected in 0x55AF (Lenze code C02640)
1	Homing method 01 acc. to DS401	Homing methods according to CiA402
...	Homing method ... acc. to DS401	
35	DS401 homing method 35	

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

0x6099 - Homing speeds

Index | Name:
0x6099 | Homing speeds

Data type: UNSIGNED_32
Code: C03612

For the reference search two speeds can be parameterised to reduce homing time and increase accuracy:

Subindex	Name
▸ 0x6099/1	Speed during search for switch
▸ 0x6099/2	Speed during search for zero

Index | Name:
0x6099/1 | Speed during search for switch

Data type: UNSIGNED_32
Code: C02644

Speed 1 which causes a quick approach of the limit switch/reference switch (depending on the mode selected).
- Direct mapping of the Lenze code C02644 (homing: speed 1).

Setting range (min. value | unit | max. value)			Lenze setting
0	vel unit	2147483647	**0 vel unit**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

Index | Name:
0x6099/2 | Speed during search for zero

Data type: UNSIGNED_32
Code: C02646

Speed 2 which causes the touch probe sensor to be approached slower (but more precisely) after reversing on the limit switch/enabling the reference switch and the subsequent positioning to the target position.
- With "0" setting, the reference search is only executed with speed 1/acceleration 1.
- Direct mapping of the Lenze code C02646 (homing: speed 2).

Setting range (min. value | unit | max. value)			Lenze setting
0	vel unit	2147483647	**0 vel unit**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

0x609A - Homing acceleration

Index | Name:	Data type: UNSIGNED_32
0x609A | Homing acceleration	Code: C03615

For the reference search two accelerations (and decelerations) can be parameterised to reduce homing time and increase accuracy:

Subindex	Name
▸ 0x609A/1	Acc. during search for switch
▸ 0x609A/2	Acc. during search for zero

Index | Name:	Data type: UNSIGNED_32
0x609A/1 | Acc. during search for switch	Code: C02645

Acceleration 1 (and deceleration 1) which causes a quick approach of the limit switch/reference switch (depending on the mode selected).

- Direct mapping of the Lenze code C02645 (homing: acceleration 1).

Setting range (min. value | unit | max. value)			**Lenze setting**
0	acc unit	2147483647	**0 acc unit**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

Index | Name:	Data type: UNSIGNED_32
0x609A/2 | Acc. during search for zero	Code: C02647

Acceleration 2 (and deceleration 2) which causes the touch probe sensor to be approached slower (but more precisely) after reversing on the limit switch/enabling the reference switch and the subsequent positioning to the target position.

- Direct mapping of the Lenze code C02647 (homing: acceleration 2).

Setting range (min. value | unit | max. value)			**Lenze setting**
0	acc unit	2147483647	**0 acc unit**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ PDO_MAP_RX ☐ PDO_MAP_TX

3.9.3 Behaviour of the home position after mains switching

If the reference position/information is to remain available after mains switching, the setting C02652 = "1: Received" must be selected. Furthermore, the max. permissible angle of rotation of the encoder, which can be adjusted in C02653, must be observed.

Note!

When resolvers or single-turn absolute value encoders are used and the mains is switched off (24 V supply off), the encoder may only be moved by ½ revolution since otherwise the home position will get lost due to the ambiguity of the encoder information.

3.9.4 Homing mode

The reference (e.g. zero position of the drive axis in the machine measuring system) can be defined by reference search or reference setting.

- In the event of a reference search, the drive travels according to the defined homing mode to detect the reference in the measuring system independently.
- During reference setting, the motor can be homed manually also when the motor is at standstill. The measuring system is set according to the reference position parameterised in the object 0x607C (home offset).

Tip!

A reference search is mainly used for continuously running systems, or if the traversing range or machine cycle of the drive cannot be represented in the display area of the encoder, e.g. if incremental encoders are used at the motor, or singleturn absolute value encoders or resolvers are used at the gearbox.

A reference is mainly set in systems/machines that bear the risk of collisions, or every time homing cannot be executed (e.g. in the case of a cross cutter having material in the machine).

Definition of the homing mode

The homing modes of the "Homing" basic function are supported 1:1.

- The homing modes are selected via the 0x55AF (Lenze code C02640) manufacturer-specific object.
- Alternatively, all CiA402 homing methods are supported. The homing modes are specified via the object 0x6098 (homing method).
- A detailed process description of the CiA402 homing methods can be found in the chapter "Overview of CiA402 homing modes". (📖 82)

3.9.5 Home position & target position

If the reference position is set during reference search, this selected position in the machine measuring system corresponds to the value set in the object 0x607C (home offset).

Afterwards, the drive proceeds according to the mode parameterised in the object 0x60FB/7 (homing stop mode). See the following chapter "Drive behaviour after setting the home position".

3.9.6 Drive behaviour after setting the home position

Use the object 0x60FB/7 (homing stop mode) to select the behaviour of the drive after setting the home position. The object 0x60FB/7 is directly mapped to the Lenze code C02641.

Selection "0: Move absolute on Target position"

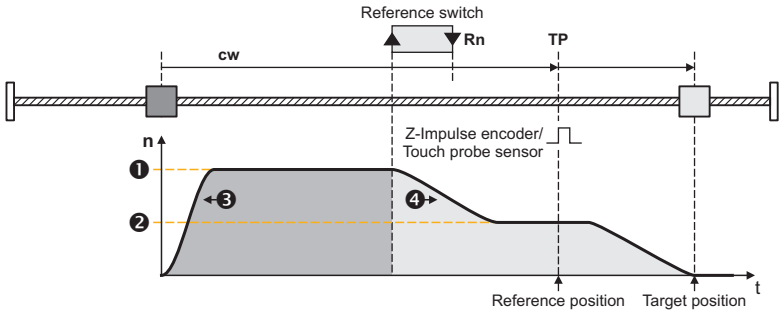
After setting the home position (0x607C), the drive traverses to the absolute target position set in C02643.

This selection is the Lenze setting and corresponds to the behaviour known from the previous versions.

Selection "1: Move relative by Target position"

After setting the home position (0x607C), the drive traverses relative by the target position set in C02643.

Selection "2: Stop immediately"



After setting the home position (0x607C), the drive stops immediately.

3.9.7 Profile data set change-over

For the reference search two profile data sets with different speeds and accelerations can be parameterised to reduce the homing time and increase the accuracy:

- With the profile data set 1 first the limit switch/reference switch (depending on the mode selected) is quickly approached.
- After reversing on the limit switch/tripping of the reference switch the profile data set 2 causes the touch probe sensor to be approached slower but more precisely and the subsequent positioning to the target position (C02643).

Profile data set 1		Profile data set 2	
❶ 0x6099/1	Speed 1	❷0x6099/2	Speed 2
❸ 0x609A/1	Acceleration 1 (and deceleration 1)	❹ 0x609A/2	Acceleration 2 (and deceleration 2)

[3-9] Example: profile data set changeover in the homing mode 0

Note!

The change-over to the profile data set 2 is only carried out if the speed 2 (0x6099/2) is set to > "0"!

In the Lenze setting (0x6099/2 = "0") no change-over to the profile data set 2 takes place and the reference search and positioning to the target position is only executed with the profile parameters of the profile data set 1.

The following process descriptions of the homing modes give information about the time the change over to profile data set 2 takes place in the corresponding homing mode.

3.9.8 Overview of CiA402 homing modes

Short overview

CiA402 homing method	Evaluated signals/sensors			
	Encoder zero pulse/ touch probe sensor	Negative travel range limit switch	Positive travel range limit switch	Reference switch
-2	Positive direction of rotation at torque limit.			
-1	Negative direction of rotation at torque limit.

Note!

Profile data set change-over

For the reference search two profile data sets with different speeds and accelerations can be parameterised to reduce the homing time and increase the accuracy.

▸ Profile data set change-over (📖 81)

The following process descriptions give information about when exactly the change-over to profile data set 2 takes place in the corresponding homing mode.

If the speed 2 (0x6099/2) is set to = "0" (Lenze setting), no change-over to profile data set 2 takes place and the reference search and positioning to the target position is only executed with the profile parameters of profile data set 1.

Note!

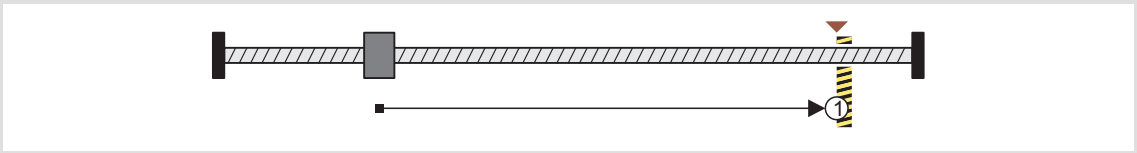
Drive behaviour after setting the reference

Via the object 0x60FB/7 (homing stop mode) you can select how the drive behaves after setting the home position.

▸ Drive behaviour after setting the home position (📖 80)

In the Lenze setting (0x60FB/7 = "0") the drive behaves absolute to the target position set in C02643 like before.

Evaluation of switches/sensors

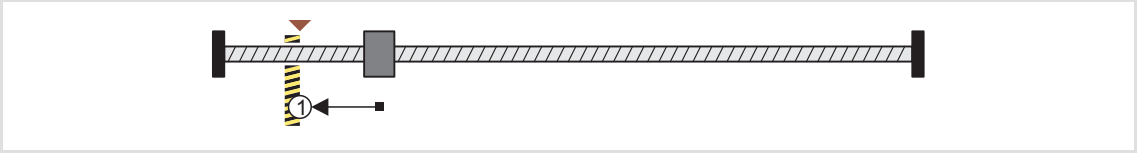


Depending on the mode selected, the following switches/sensors are evaluated during the reference search:

- Reference switch at the digital input DI2
- Positive travel range limit switch at the digital input DI3
- Negative travel range limit switch at the digital input DI4

Touch probe

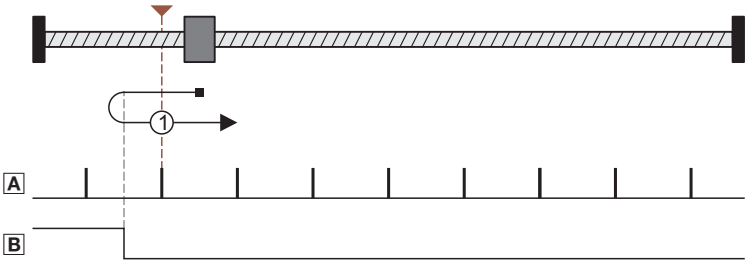
For the homing modes with touch probe, the tripping event is an edge change at digital input DI1 (Lenze setting).



CiA402 Homing method -2

Process:

1. Movement in positive direction with reduced torque and profile data set 1.
2. "Homing to end stop": When the drive hits an end stop so that the torque limit set in C02649 is exceeded for the blocking time defined in C02650 the (0x607C) reference is set.
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

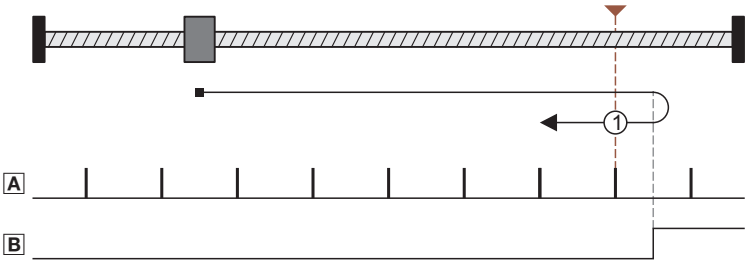


CiA402 Homing method -1

Process:

1. Movement in negative direction with reduced torque and profile data set 1.
2. "Homing to end stop": When the drive hits an end stop so that the torque limit set in C02649 is exceeded for the blocking time defined in C02650 the (0x607C) reference is set.
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 01

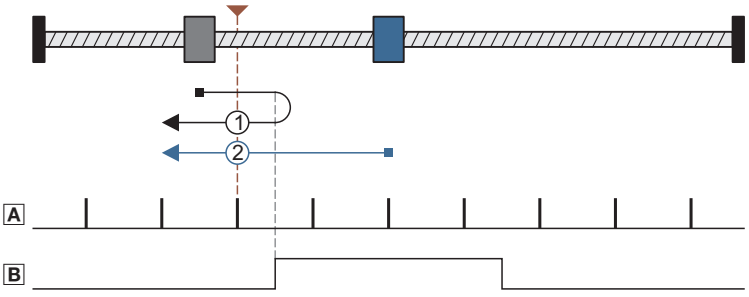


A Touch probe/zero pulse
B Negative travel range limit switch

Process:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch and change to profile data set 2.
3. Negative edge of the travel range limit switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 02



A Touch probe/zero pulse
B Positive travel range limit switch

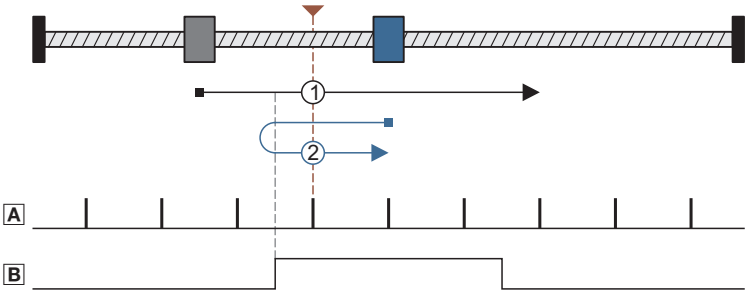
Process:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch and change to profile data set 2.
3. Negative edge of the travel range limit switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 03

A Touch probe/zero pulse
B Reference switch

Processes:



Case 1: Axis has not yet activated reference switch:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change to profile data set 2.
3. Negative edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

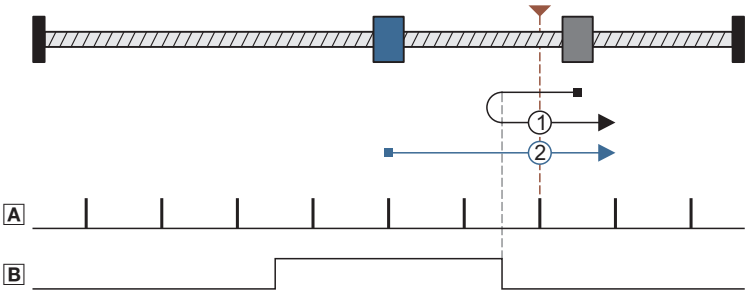
Case 2: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 04

A Touch probe/zero pulse
B Reference switch

Processes:



Case 1: Axis has not yet activated reference switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

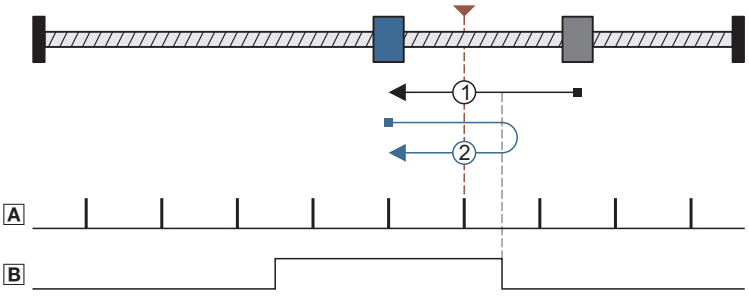
Case 2: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 05

A Touch probe/zero pulse
B Reference switch

Processes:



Case 1: Axis has not yet activated reference switch:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change to profile data set 2.
3. Negative edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

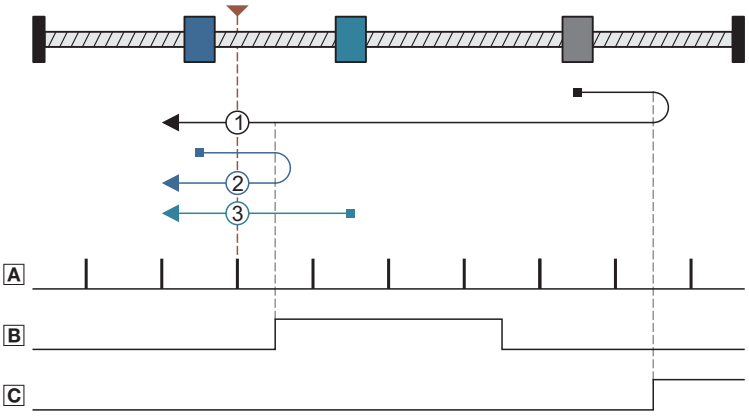
Case 2: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 06

A Touch probe/zero pulse
B Reference switch

Processes:



Case 1: Axis has not yet activated reference switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 2: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

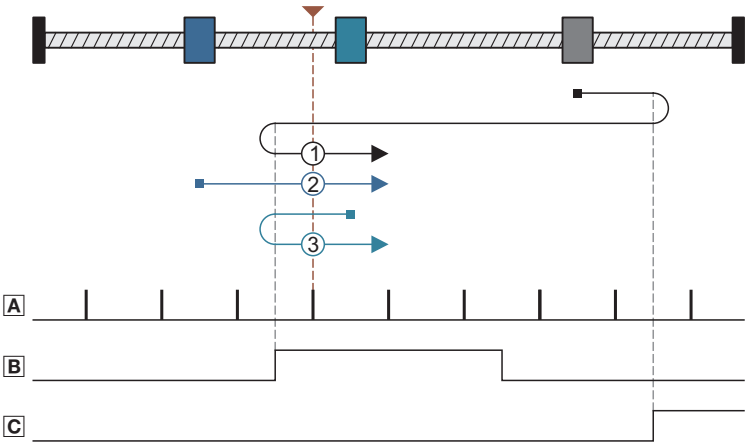
CiA402 Homing method 07

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Negative edge of the reference switch activates touch probe detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change to profile data set 2.
3. Negative edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

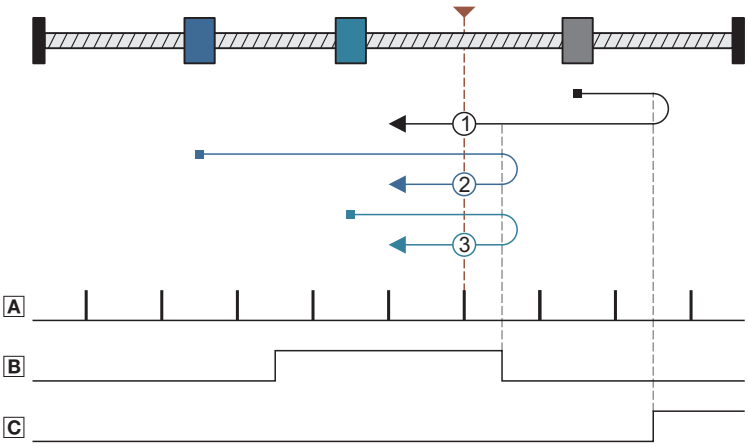
CiA402 Homing method 08

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of reference switch.
5. Positive edge of the reference switch activates touch probe detection.
6. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
7. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

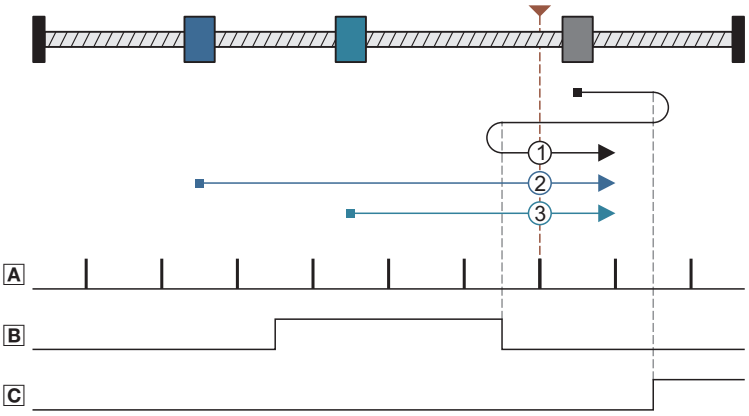
CiA402 Homing method 09

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. Reversing with negative edge of reference switch.
4. Positive edge of the reference switch activates touch probe detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

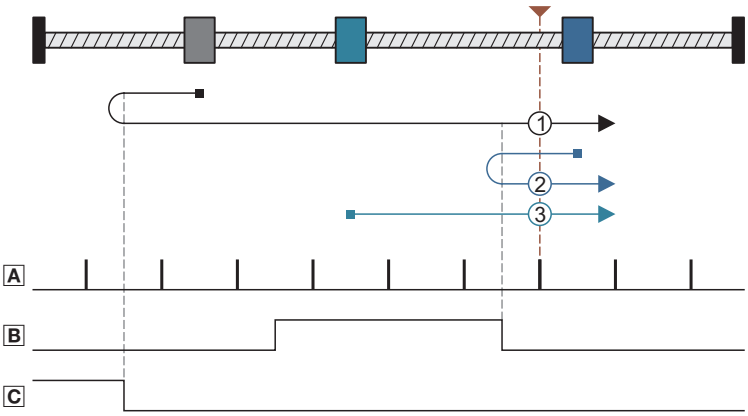
CiA402 Homing method 10

A Touch probe/zero pulse
B Reference switch
C Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Reversing with positive edge of the reference switch and change to profile data set 2.
4. Negative edge of the reference switch activates touch probe detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Negative edge of the reference switch activates touch probe detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

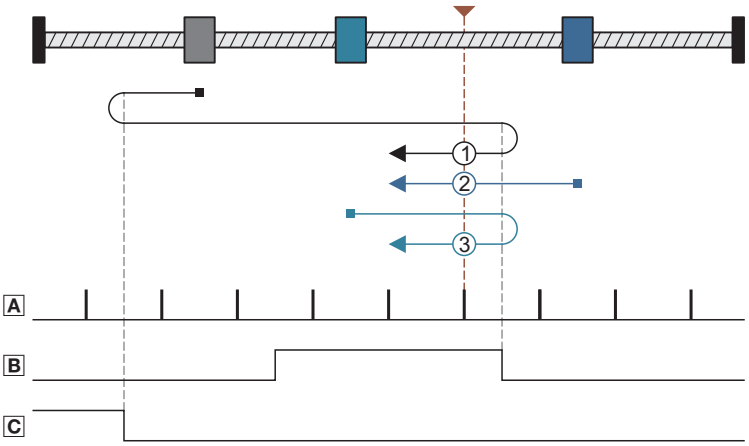
CiA402 Homing method 11

A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Negative edge of the reference switch activates touch probe detection.
5. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change to profile data set 2.
3. Negative edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Negative edge of the reference switch activates touch probe detection.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

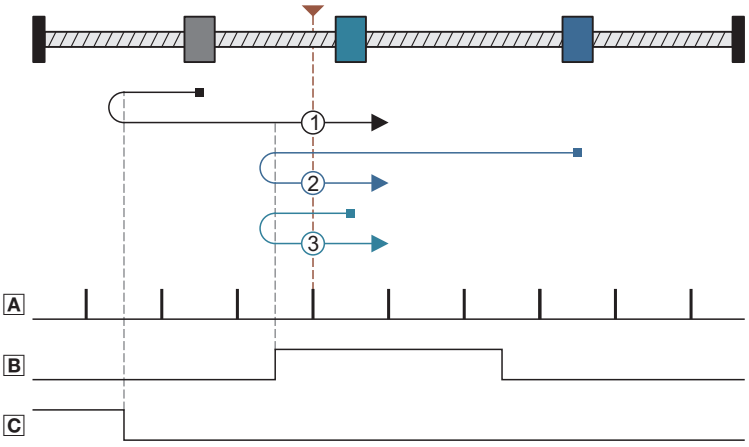
CiA402 Homing method 12

A Touch probe/zero pulse
B Reference switch
C Negative travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of reference switch.
5. Positive edge of the reference switch activates touch probe detection.
6. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
7. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates touch probe detection and change to profile data set 2.
3. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. Positive edge of the reference switch activates touch probe detection.
4. The following positive edge of the encoder zero pulse/touch probe sensor sets the reference (0x607C).

2. Reversing with negative edge of reference switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

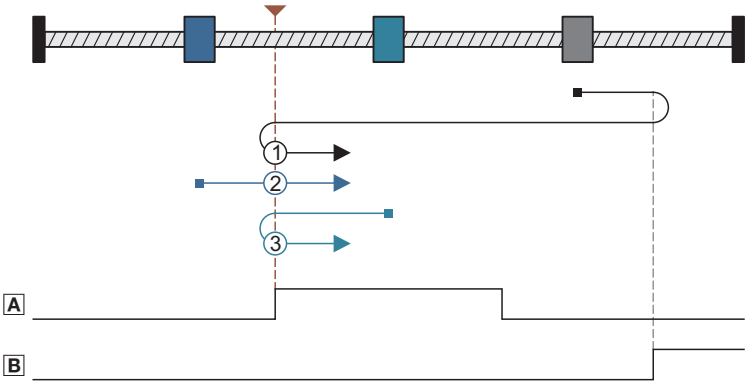
CiA402 Homing method 23

A Homing switch
B Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. The following negative edge of reference switch sets reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change to profile data set 2.
3. The following negative edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. The following negative edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

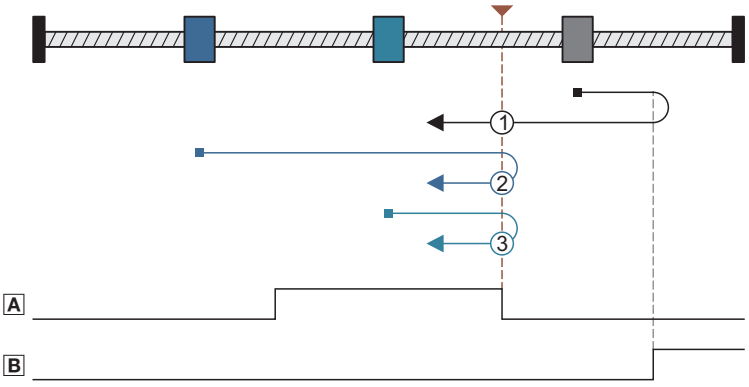
CiA402 Homing method 24

A Homing switch
B Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of reference switch.
5. The following positive edge of reference switch sets reference (0x607C).
6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. The following positive edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

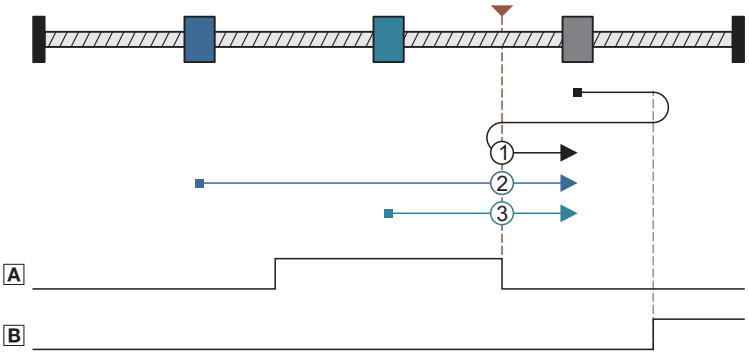
CiA02 homing method 25

A Homing switch
B Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. The following positive edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

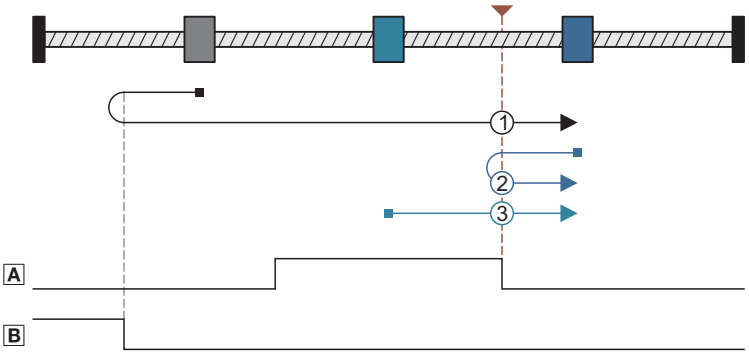
CiA402 Homing method 26

A Homing switch
B Positive travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Reversing to positive travel range limit switch.
3. Reversing with positive edge of the reference switch and change to profile data set 2.
4. The following negative edge of reference switch sets reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in positive direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. The following negative edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. The following negative edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

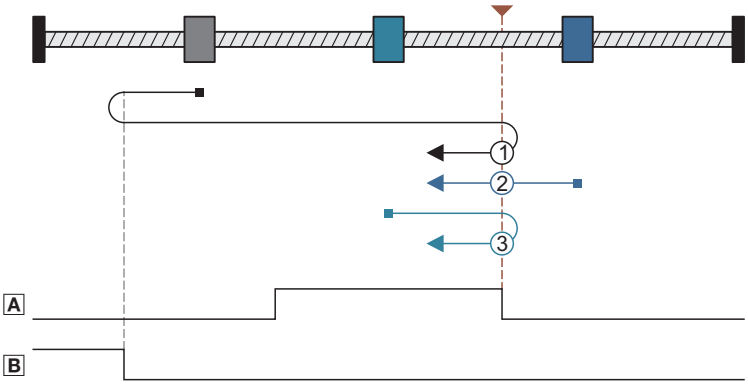
CiA402 Homing method 27

A Homing switch
B Negative travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. The following negative edge of reference switch sets reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing with positive edge of the reference switch and change to profile data set 2.
3. The following negative edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. The following negative edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

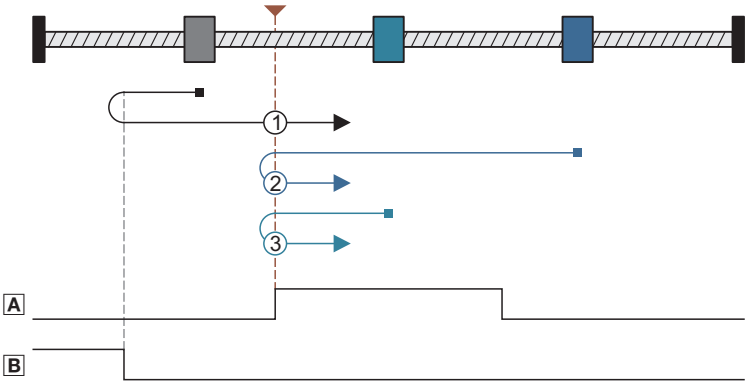
CiA402 Homing method 28

A Homing switch
B Negative travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Positive edge of the reference switch activates profile data set 2.
4. Reversing with negative edge of reference switch.
5. The following positive edge of reference switch sets reference (0x607C).
6. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. The following positive edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in positive direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

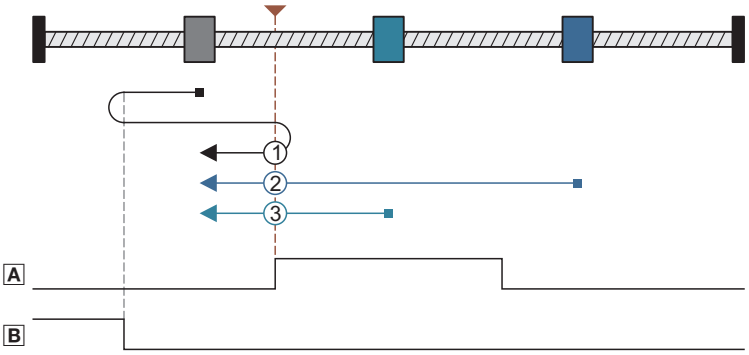
CiA402 Homing method 29

A Homing switch
B Negative travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. Reversing with negative edge of reference switch.
4. The following positive edge of reference switch sets reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. Reversing with negative edge of reference switch.
3. The following positive edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 30

A Homing switch
B Negative travel range limit switch

Processes:

Case 1: Axis does not activate reference switch on the way to the limit switch:

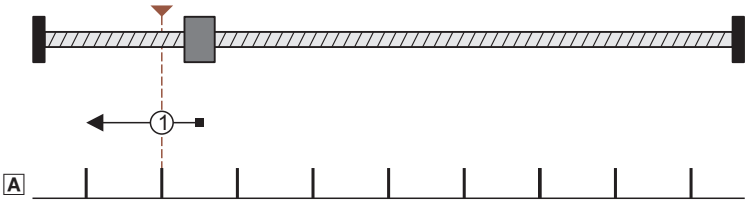
1. Movement in negative direction with profile data set 1.
2. Reversing to negative travel range limit switch.
3. Reversing with positive edge of the reference switch and change to profile data set 2.
4. The following negative edge of reference switch sets reference (0x607C).
5. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 2: Axis activates reference switch first on the way to the limit switch:

1. Movement in negative direction with profile data set 1.
2. Positive edge of the reference switch activates profile data set 2.
3. The following negative edge of reference switch sets reference (0x607C).
4. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

Case 3: Axis already stands on reference switch:

1. Movement in negative direction with profile data set 2.
2. The following negative edge of reference switch sets reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").



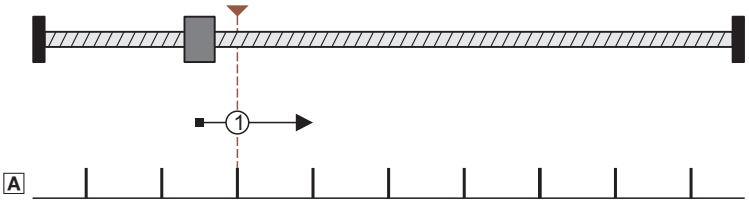
CiA402 Homing method 31

Reserved: Homing is not carried out.

CiA402 Homing method 32

Reserved: Homing is not carried out.

CiA402 Homing method 33

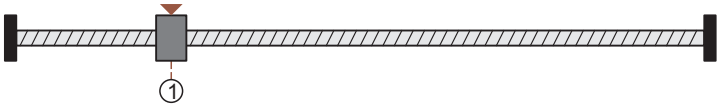


A Touch probe/zero pulse

Process:

1. Movement in negative direction with profile data set 1 and activation of the touch probe detection.
2. The following positive edge of the touch probe sensor sets the reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 Homing method 34



A Touch probe/zero pulse

Process:

1. Movement in positive direction with profile data set 1 and activation of the touch probe detection.
2. The following positive edge of the touch probe sensor sets the reference (0x607C).
3. Absolute positioning to target position (C02643) with profile data set 2 (if 0x60FB/7 = "0").

CiA402 homing method 35

Direct reference setting.

▶ The measuring system is set according to the home position parameterised in the 0x607C object (home offset).

3.9.9 Control commands & status information

The CiA402 control word (0x6040) serves to execute the following control commands in the "homing mode" operation mode:

Control word	Status	Function
Bit 4	0	Homing is not active
	0 ↗ 1	Start reference search
	1 ↘ 0	Cancel reference search
Bit 11	0 ↗ 1	Set reference
Bit 12	0 ↗ 1	Delete reference

The CiA402 status word (0x6041) serves to output the following status information for referencing in the "homing mode" operation mode:

Status word	Status	Meaning
Bit 12	0	Homing is not active or reference search not yet completed
	1	Reference search completed (observe bit 13)
Bit 13	0	Reference search has been executed successfully
	1	An error has occurred during the reference search
Bit 14	0	Home position is not available
	1	Home position is available

3.9.10 Basic function "Homing"

In "Homing mode" the "Homing" basic function is used.

Lenze parameters (short overview)

Parameter		Lenze setting	
		Value	Unit
C02528	Traversing range	Modulo	
C02640	Homing mode	Set home pos. directly	
C02641	Action after detect Home position	Move absolute on Target position	
C02642	Home position	0.0000	Unit
C02643	Homing: Target position	0.0000	Unit
C02644	Homing: Speed 1	360.0000	Unit/s
C02645	Homing: Acceleration 1	720.0000	Unit/s^2
C02646	Homing: Speed 2	0.0000	Unit/s
C02647	Homing: Acceleration 2	360.0000	Unit/s^2
C02649	Homing: Torque limit	10.00	%
C02650	Homing: Blocking time	1.000	s
C02652	Ref. pos. after mains switching	Delete	
C02653	Max. rot. ang. aft. mns. swtch.	180	°

3.10 Position control function

The objects described in this chapter serve to

- control the position control (including following error and in-position recognition),
- control an optional holding brake and
- request the status of the safety functions and safe inputs/outputs of the optional SM3xx safety module.

3.10.1 Input and output data

Input data

Index	Name	Data type	Object type
0x60FC	Position demand value*	INTEGER_32	VAR
0x6062	Position demand value	INTEGER_32	VAR
0x6065	Following error window	UNSIGNED_32	VAR
0x6066	Following error time out	UNSIGNED_32	VAR
0x6067	Position window	UNSIGNED_32	VAR
0x6068	Position window time	UNSIGNED_32	VAR
0x60FB	Position control parameter set	UNSIGNED_32	RECORD

Output data

Index	Name	Data type	Object type

3.10.3 Signal flow

[3-10] Access to the position control via CiA402 device profile

3.10.4 Following error detection

The 0x6065 object (following error window) defines a symmetrical tolerance window around the position setpoint for the purpose of following error detection.

- If the tolerance window is set = "0", the following error detection is deactivated.
- If the tolerance window is set > "0", the following error detection is activated, i.e. a following error will be detected if the position value is outside this tolerance window.
- For activated following error detection: If the following error is detected for a longer time than the time in [ms] defined in object 0x6066 (following error time out),
  - bit 13 ("following error") is set in object 0x6041 (statusword).
  - the error response set in object 0x60FB/4 (following error reaction) is triggered.
  - the "Following error" error message (with error number 0x3B40001) is entered into the logbook.

Tip!

The 0x60F4 object (following error actual value) shows the current deviation of the actual position value from the position setpoint.

3.10.5 In-position recognition

The 0x6067 object (position window) defines a symmetrical tolerance window around the target position for the purpose of in-position recognition.

- If the actual position value is inside this tolerance window, the target position is deemed to be reached and bit 10 ("target position reached") is set in the 0x6041 object (status word).

3.10.6 Brake control

The function of a holding brake, if available, can be controlled via the 0x60FB/2 object (brake control).

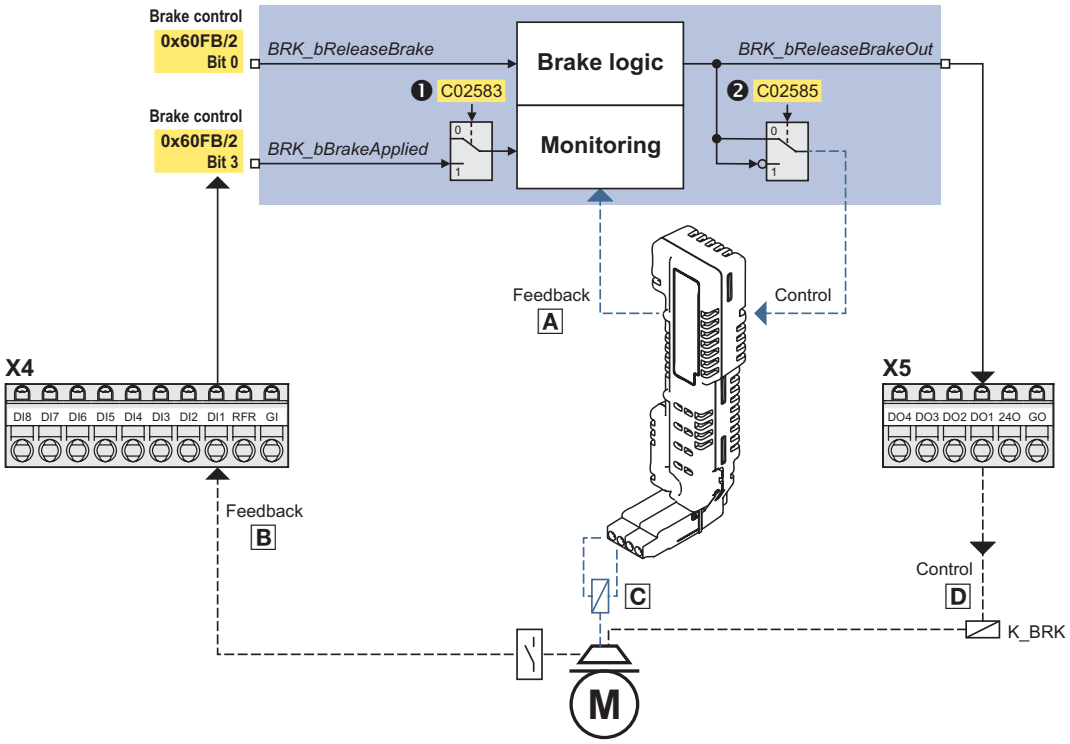
Danger!

Please note that the motor holding brake is an important element of the safety concept of the entire machine. Proceed with special care when commissionning this part of the machine!

Stop!

In general, motor holding brakes on Lenze motors are not designed for braking during operation. The increased wear resulting from braking during operation may lead to an early destruction of the motor holding brake!

Please observe the notes in the hardware manual for mounting and electrical installation of the motor holding brake!



The following applies from software version V2.x of the technology application:

- If the "Operation enabled" device status is abandoned via the "Disable operation" or "Shutdown" command, the system waits until the motor holding brake is applied before inhibiting the controller.

3.10.6.1 Signal configuration

An external brake is supported by a fixed connection of the *BRK_bReleaseBrakeOut* output signal of the "Brake control" basic function to the DO1 digital output and the *BRK_bBrakeApplied* input signal to the DI1 digital input.

▶ The signal configuration of the control and status signals for the brake logic and monitoring function is executed via the parameters shown in the following signal flow:

❶ C02583: Status input monitoring
❷ C02585: Brake control polarity (for motor holding brake control module)
A Feedback by "Motor holding brake control status""
B Feedback by "Brake function test"
C Control of the brake via motor holding brake control module (here: E94AZHX0051)
D Brake control via contactor at digital output

[3-11] Signal configuration of the control and status signals

Note!

If an electrically holding (self-releasing) brake is to be controlled instead of an electrically releasing (self-holding) brake, the corresponding control and status signals must be inverted!

Please observe the notes in the hardware manual for mounting and electrical installation of the motor holding brake!

Status monitoring by "Motor holding brake control module status"

(See signal path Ⓐ in fig. [3-11])

- Indirect status detection of the brake function.
- Monitoring of the motor holding brake control module and the electrical brake circuit.

Status monitoring by "Brake function test"

(See signal path Ⓑ in fig. [3-11])

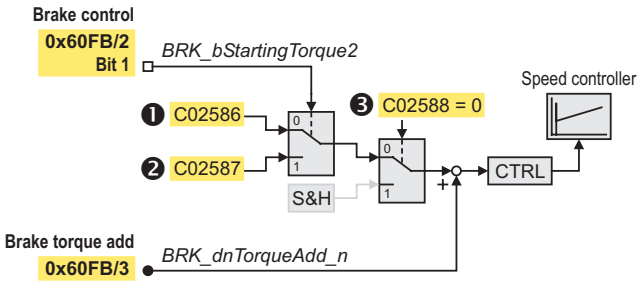
- Direct function test of the complete brake circuit by microswitches at the brake.
- Wear control of the brake rotor.

3.10.6.2 Torque feedforward control

In automatic operation (mode 2/12) the brake control offers the possibility of precontrolling the required torque of the drive when the brake is released.

Note!

The torque is precontrolled for one second. During this time, the actual torque must have reached 90 % of the set torque, otherwise a fault is tripped!



Via C02588 it is selected whether a parameterised starting torque or the torque memorised during the last closing operation shall be used for the feedforward control.

- When setting C02588 = 0, bit 1 of the 0x60FB/2 object (brake control) can be used to switch between two starting torques:
  - Bit 1 = 0: starting torque 1 (C02586) is used.
  - Bit 1 = 1: starting torque 2 (C02587) is used.
- When C02588 = 1, the starting torque is the setpoint which has been automatically memorised during the last closing process (falling below the speed threshold set in C02581).

Note!

The higher the threshold for brake activation set in C02581, the higher is the dynamic part in the memorised torque (e.g. the speed-dependent friction torque).

In the special case that the load changes when the brake is closed, a correction value, which is added to the memorised torque, can be defined for the torque feedforward control via the 0x60FB/3 object (brake torque add).

❶ C02586: Starting torque 1
❷ C02587: Starting torque 2
❸ C02588: Starting torque source

[3-12] Torque feedforward control

3.11 Interpolated position mode

The "Interpolated position mode" is required for a coordinated traversing of axes depending on each other or for traversing of single axes with time interpolation of the setpoints.

Stop!

If a limit switch is approached using this operating mode and an error is caused followed by the "Quick stop by trouble" response, a setpoint/actual value adjustment of the position must always be executed before acknowledging the error as otherwise an uncontrolled motor movement may occur after acknowledging the error!

Selection of operating mode

The "Interpolated position mode" is selected using the value "7" via the 0x6060 object (mode of operation).

3.11.1 Input and output data

Input data

Index	Name	Data type	Object type
0x6040	Control word	UNSIGNED_16	VAR
0x60C0	Interpolation sub mode select	INTEGER_16	VAR
0x60C1	Interpolation data record	INTEGER_32	ARRAY
0x60C2	Interpolation time period	UNSIGNED_32	RECORD

0x60C0 - Interpolation sub mode select

Index | Name:
0x60C0 | Interpolation sub mode select

Data type: INTEGER_16
Code: C03630

Interpolation algorithm

- If "Linear interpolation" or "Quadratic interpolation" has been selected and no feedforward control values for speed and torque/acceleration are transmitted, it is wise to generate the feedforward values by differentiation of the position signal (C02681, C00276).
- If "Optimized mode 1" has been selected, the feedforward control values in the application are differentiated from the set position in the grid of the bus cycle time and then linearly interpolated to the control cycle. (No additional differentiation functions required.)

3.11.3 Signal flow

❶...❹ Signals of the signal flow encoder evaluation
FDB_... = input/output signals of the encoder evaluation
MI_... = Input/output signals of the motor interface

[3-1] Access to the "position follower" basic function via the CiA402 device profile

Internal variables of the motor control (oscilloscope signals)

▶ The red numbers in brackets specified in the signal flow represent internal variables of the motor control which can be recorded with the oscilloscope for diagnostic and documentation purposes.

No.	Variable of the motor control	Meaning
(1)	Torque.dnTotalTorqueAdd	Additive torque feedforward control value
(2)	Torque.dnTorqueSetpoint	Torque setpoint
(3)	Position.dnActualLoadPos	Actual position
(4)	Position.dnPositionSetpoint	Position setpoint
(5)	Position.dnActualMotorPos	Current motor position
(6)	Position.dnContouringError	Following error
(7)	Speed.dnOutputPosCtrl	Output signal - phase controller
(8)	Speed.dnSpeedSetpoint	Speed setpoint
(9)	Speed.dnActualMotorSpeed	Current motor speed

3.11.4 Setpoint selection

The position setpoint for the position follower is selected via the subindex 1 (X1) of the 0x60C1 object (Interpolation data record).

- Furthermore, the following objects are available for speed and torque feedforward control:

Index	Name	Data type	Object type
0x60B2	Torque offset	INTEGER_32	VAR
0x6071	Target torque	INTEGER_32	VAR
0x60B1	Offset velocity	INTEGER_32	VAR
0x60FF	Target velocity	INTEGER_32	VAR

- The setpoints can be supplied to the common limit functions for speed, acceleration, and braking.

3.11.5 Setpoint interpolation

If the communication cycle time differs from the control cycle time of the controller (1 ms), the setpoint for the position follower will be interpolated. For this purpose, the drive accepts one interpolation data setpoint per cycle and calculates for each interpolation cycle the value displayed in the 0x6062 object (position demand value) by interpolating the position over a specific period.

- The interpolation algorithm to be used is defined by the 0x60C0 object (interpolation sub mode select) and is preset to linear interpolation.
- For synchronous operation, the interpolation cycle time is defined by the 0x60C2 object (interpolation time period):

$$\text{Interpolation cycle time}[s] = \text{ip time units} \cdot 10^{\text{ip time index}}[s]$$

0x60C2/1: ip time units
0x60C2/2: ip time index

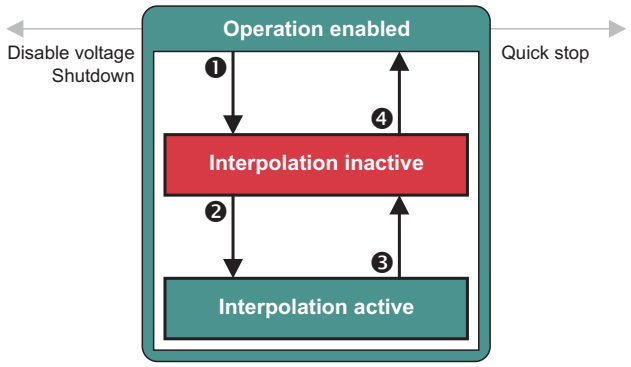
[3-2] Definition of the interpolation cycle time

Tip!

For an interpolation cycle time of e.g. 2 ms, the value "2" must be set in 0x60C2/1 (ip time units) and the value "3" must be set in 0x60C2/2 (ip time index).

- For a time coordination of the connected controllers, the 0x60C3 synchronisation object (interpolation sync definition) is normally used.

3.11.6 Control commands & status information



The CiA402 (0x6040) control word serves to execute control commands in the "interpolated position mode":

Control word	Status	Function
Bit 4	0	"Interpolated position mode" is not active
	0 ↗ 1	Select "Interpolated position mode"
	1 ↘ 0	Deselect "Interpolated position mode"
Bit 5	0	*Reserved* (bit must be set to "0")
Bit 6	0	*Reserved* (bit must be set to "0")
Bit 8	0 ↗ 1	Stop

The CiA402 (0x6041) status word serves to output the following status information in the "interpolated position mode":

Status word	Status	Meaning
Bit 12	0	"Interpolated position mode" is not active
	1	"Interpolated position mode" is active
Bit 13	0	*Reserved* (bit is always set to "0")

Internal states/state changes

❶ "Interpolated position mode" is selected via bit 4 of the control word.
- The "interpolation is not active" status occurs.
- Setpoints are accepted by the master control and buffered for the interpolation, but the axis is not moving yet.

❷ Interpolation is enabled.
- It is changed to the internal "Interpolation is active" status.
- The drive accepts input data and moves the axis.

❸ "Interpolated position mode" is deselected again (bit 4 of the control word is reset).
- It is changed back to the internal "Interpolation is not active" status.

❹ Another operating mode is selected via the control word.

[3-3] Internal state changes

3.11.7 Basic function "Position follower"

The "Position follower" basic function based on the "Interpolated position mode" serves as setpoint interface for position-controlled drives.

- The specified position setpoint can either refer to the encoder on the motor side or to the (position) encoder used additionally to detect the machine position. The selection of the encoder configuration serves to adapt the internal control structure accordingly.
- If the direction of rotation of the motor must be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.
- The speed can also be precontrolled with the position setpoint by a corresponding selection in C02681. Then, the speed is calculated by differentiation of the position setpoint.

Lenze parameters (short overview)

Parameter		Lenze setting	
		Value	Unit
C00050/1	Speed setpoint 1	-	rpm

3.12 Cyclic synchronous position mode (IEC 61800-7)

This operating mode provides a quick position follower with speed/torque/feed force feedforward control. The motion profile to be processed is defined by the master control.

Subfunctions of the operating mode

- Calculation of the position setpoint
- Calculation of the speed feedforward control value
- Calculation of the speed feedforward control value
- Interpolation between communication cycle and control cycle
- Position control
- Speed control
- Torque control
- Update of the actual values for position, speed, and torque

Selection of operating mode

The operating mode "Cyclic synchronous position mode" is selected using the value "9" via the 8x6060 object (mode of operation).

3.12.1 Input and output data

3.12.3 Signal flow

❶...❹ Signals of the signal flow encoder evaluation
FDB_... = input/output signals of the encoder evaluation
MI_... = Input/output signals of the motor interface

[3-1] Access to the "position follower" basic function via the CiA402 device profile

Internal variables of the motor control (oscilloscope signals)

▶ The red numbers in brackets specified in the signal flow represent internal variables of the motor control which can be recorded with the oscilloscope for diagnostic and documentation purposes.

No.	Variable of the motor control	Meaning
(1)	Torque.dnTotalTorqueAdd	Additive torque feedforward control value
(2)	Torque.dnTorqueSetpoint	Torque setpoint
(3)	Position.dnActualLoadPos	Actual position
(4)	Position.dnPositionSetpoint	Position setpoint
(5)	Position.dnActualMotorPos	Current motor position
(6)	Position.dnContouringError	Following error
(7)	Speed.dnOutputPosCtrl	Output signal - phase controller
(8)	Speed.dnSpeedSetpoint	Speed setpoint
(9)	Speed.dnActualMotorSpeed	Current motor speed

3.12.4 Setpoint selection

The position setpoint is selected via the 0x6071 object (target position). Use the 0x60B2 object (offset position) to additionally define an offset which is added to the position setpoint.

The speed feedforward control value is selected via the 0x60FF object (target velocity). Use the 0x60B1 object (offset velocity) to additionally define an offset which is added to the speed setpoint.

The torque feedforward control value is selected via the 0x6071 object (target torque). Use the 0x60B2 object (torque offset) to additionally define an offset which is added to the torque feedforward control value.

3.12.5 Setpoint interpolation

Similar to the "Interpolated position mode", the resulting position setpoint is interpolated in this operating mode as well, if the communication cycle time differs from the control cycle time of the controller (1 ms).

▶ For the determination of the required interpolation steps the 0x60C2 object (interpolation time period) is used.

3.12.6 Control commands & status information

The CiA402 (0x6040) control word serves to execute control commands in the "cyclic synchronous position mode":

Control word	Status	Function
Bit 4	0	*Reserved* (bit must be set to "0")
Bit 5	0	*Reserved* (bit must be set to "0")
Bit 6	0	*Reserved* (bit must be set to "0")
Bit 8	0 ↗ 1	Stop

The CiA402 status word (0x6041) serves to output the following status information in the "Cyclic synchronous velocity mode":

Status word	Status	Meaning
Bit 12	0	"Cyclic synchronous position mode" is not active
	1	"Cyclic synchronous position mode" is active
Bit 13	0	*Reserved* (bit is always set to "0")

3.12.7 Basic function "Position follower"

The "Position follower" basic function based on the "Cyclic synchronous velocity mode" serves as setpoint interface for position-controlled drives.

- The specified position setpoint can either refer to the encoder on the motor side or to the (position) encoder used additionally to detect the machine position. The selection of the encoder configuration serves to adapt the internal control structure accordingly.
- If the direction of rotation of the motor must be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.
- The speed can also be precontrolled with the position setpoint by a corresponding selection in C02681. Then, the speed is calculated by differentiation of the position setpoint.

Lenze parameters (short overview)

C02681	Added speed source	Add. speed input	

3.13 Cyclic synchronous velocity mode (IEC 61800-7)

This operating mode provides a fast speed follower with torque/feed force feedforward control. The speed profile to be processed is defined by the master control.

Subfunctions of the operating mode

- Calculation of the speed setpoint
- Calculation of the speed feedforward control value
- Interpolation between communication cycle and control cycle
- Speed control
- Torque control
- Limitation of the motor speed
- Update of the actual values for position, speed, and torque

Selection of operating mode

The "Cyclic synchronous velocity mode" is selected using the value "9" via the 0x6060 object (mode of operation).

3.13.1 Input and output data

3.13.3 Signal flow

❸ Signal of the signal flow encoder evaluation
MI_... = Input/output signals of the motor interface

[3-1] Access to the "speed follower" basic function via the CiA402 device profile

Internal variables of the motor control (oscilloscope signals)

▶ The red numbers in brackets specified in the signal flow represent internal variables of the motor control which can be recorded with the oscilloscope for diagnostic and documentation purposes.

No.	Variable of the motor control	Meaning
(1)	Torque.dnTotalTorqueAdd	Additive torque feedforward control value
(2)	Torque.dnTorqueSetpoint	Torque setpoint
(3)	Speed.dnTotalSpeedAdd	Additive speed setpoint
(4)	Speed.dnSpeedSetpoint	Speed setpoint
(5)	Speed.dnActualMotorSpeed	Current motor speed

3.13.4 Setpoint selection

The speed setpoint for the speed follower is selected via the 0x60FF object (target velocity). Use the 0x60B1 object (offset velocity) to additionally define an offset which is added to the speed setpoint.

The torque feedforward control value is selected via the 0x6071 object (target torque). Use the 0x60B2 object (torque offset) to additionally define an offset which is added to the torque feedforward control value.

3.13.5 Setpoint interpolation

Similar to the "Interpolated position mode", the resulting position setpoint is interpolated in this operating mode as well, if the communication cycle time differs from the control cycle time of the controller (1 ms).

▶ For the determination of the required interpolation steps the 0x60C2 object (interpolation time period) is used.

3.13.6 Control commands & status information

The CiA402 (0x6040) control word serves to execute control commands in the "cyclic synchronous velocity mode":

Control word	Status	Function
Bit 4	0	*Reserved* (bit must be set to "0")
Bit 5	0	*Reserved* (bit must be set to "0")
Bit 6	0	*Reserved* (bit must be set to "0")
Bit 8	0 ↗ 1	Stop

The CiA402 status word (0x6041) serves to output the following status information in the "Cyclic synchronous velocity mode":

Status word	Status	Meaning
Bit 12	0	"Cyclic synchronous velocity mode" is not active
	1	"Cyclic synchronous velocity mode" is active
Bit 13	0	*Reserved* (bit is always set to "0")

3.13.7 Basic function "Speed follower"

The "Speed follower" basic function based on the "Cyclic synchronous velocity mode" serves as setpoint interface for speed-controlled drives.

- The motor control is switched over automatically to speed control with torque limitation.
- If the direction of rotation of the motor must be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.

Lenze parameters (short overview)

Parameter		Lenze setting	
		Value	Unit
C00050/1	Speed setpoint 1	-	rpm
C00070	Speed controller gain	0.00700	Nm/rpm
C00071	Speed controller reset time	10.0	ms
C00072	Speed controller rate time	0.00	ms
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

C00579	Resp. to speed monitoring	No response	
C00692	Speed setpoint	-	%
C00909/1	Upper speed limit value	175.0	%
C00909/2	Lower speed limit value	-175.0	%
C02527	Motor mounting direction	Motor rotating CW	
C02531/3	Effective gearbox factor (dec.)	-	
C02550/2	Speed setpoint interpolat.	Off	
C02550/3	Torque setpoint interpolat.	Off	
C02559/1	Upper int. torque limit	-	%
C02559/2	Lower int. torque limit	-	%

3.14 Cyclic synchronous torque mode (IEC 61800-7)

This operating mode provides a fast torque follower with speed limitation. The torque profile to be processed is defined by the master control.

Subfunctions of the operating mode

- Calculation of the torque setpoint
- Interpolation between communication cycle and control cycle
- Torque control
- Limitation of the motor speed
- Update of the actual values for position, speed, and torque

Selection of operating mode

The "Cyclic synchronous torque mode" is selected using the value "10" via the 0x6060 object (mode of operation).

3.14.1 Input and output data

3.14.3 Signal flow

❸ Signal of the signal flow encoder evaluation
MI_... = Input/output signals of the motor interface

[3-1] Access to the "torque follower" basic function via the CiA402 device profile

Internal variables of the motor control (oscilloscope signals)

▶ The red numbers in brackets specified in the signal flow represent internal variables of the motor control which can be recorded with the oscilloscope for diagnostic and documentation purposes.

No.	Variable of the motor control	Meaning
(1)	Speed.dnSpeedSetpoint	Speed setpoint
(2)	Speed.dnActualMotorSpeed	Current motor speed

3.14.4 Setpoint selection

The torque setpoint for the torque follower is selected via the 0x6071 object (target torque). Use the 0x60B2 object (torque offset) to additionally define an offset which is added to the torque feedforward control value.

The 0x60F6/1 object (positive speed limit) serves to define the positive speed limit and the 0x60F6/2 object (negative speed limit) serves to define the negative speed limit for speed limitation.

3.14.5 Setpoint interpolation

Similar to the "Interpolated position mode", the resulting torque setpoint is interpolated in this operating mode as well, if the communication cycle time differs from the control cycle time of the controller (1 ms).

▶ For the determination of the required interpolation steps the 0x60C2 object (interpolation time period) is used.

3.14.6 Control commands & status information

The CiA402 (0x6040) control word serves to execute control commands in the "cyclic synchronous torque mode":

Control word	Status	Function
Bit 4	0	*Reserved* (bit must be set to "0")
Bit 5	0	*Reserved* (bit must be set to "0")
Bit 6	0	*Reserved* (bit must be set to "0")
Bit 8	0 ↗ 1	Stop

The CiA402 (0x6041) status word serves to output the following status information in the " cyclic synchronous torque mode":

Status word	Status	Meaning
Bit 12	0	"Cyclic synchronous torque mode" is not active
	1	"Cyclic synchronous torque mode" is active
Bit 13	0	*Reserved* (bit is always set to "0")

3.14.7 Basic function "Torque follower"

The "Torque follower" basic function based on the "Cyclic synchronous torque mode" serves as setpoint interface for torque-controlled drives.

- The motor control is switched over automatically to torque control with speed limitation.
- If the direction of rotation of the motor must be inverted due to the mounting position of the motor or the gearbox ratio available, the use of the control signals can be accordingly changed over by means of parameterisation.
- A stable speed limitation requires a minimum difference of the speed limit values of 50 rpm. If the defined speed limit values fall below this minimum difference, the internal lower speed limit value is lowered accordingly. The upper speed limit value remains unchanged. ▸ Signal flow (📖 162)

Lenze parameters (short overview)

Parameter		Lenze setting	
		Value	Unit
C00070	Speed controller gain	0.00700	Nm/rpm
C00071	Speed controller reset time	10.0	ms
C00909/1	Upper speed limit value	175.0	%
C00909/2	Lower speed limit value	-175.0	%
C02527	Motor mounting direction	Motor rotating CW	
C02550/2	Speed setpoint interpolat.	Off	
C02550/3	Torque setpoint interpolat.	Off

3.15.3 Internal interfaces | function block "L_CiA402TouchProbe"

The IM **L_CiA402TouchProbe** provides the interfaces for the touch probe functionality of the device profile CiA402 in the function block editor.

Inputs

Identifier Data type	Information/possible settings
wCiA402TouchProbeCtrl WORD	Interface of the master / master control • Control word for the touch probe function (0x60B8)
dnFDB_dnActualPos_p DINT	Interface for the "encoder evaluation" basic function • Input for current position. • Connect this input with the output *FDB_dnActualPos_p* of the system block **LS_Feedback**.
dnTP1_ dnTouchProbeTimeLag DINT	Touch probe 1: Input for time stamp
bTP1_bTouchProbeReceived BOOL	Touch probe 1: Input for status signal "Touch probe received"
bTP1_bNegativeEdge BOOL	Touch probe 1: Input for status signal "Negative edge received"
bDigIn_bTP1 BOOL	Touch probe 1: Digital input
dnTP2_ dnTouchProbeTimeLag DINT	Touch probe 2: Input for time stamp
bTP2_bTouchProbeReceived BOOL	Touch probe 2: Input for the status signal "touch probe received"
bTP2_bNegativeEdge BOOL	Touch probe 2: Input for the status signal "negative edge received"
bDigIn_bTP2 BOOL	Touch probe 2: Digital input
dnTPMotor_ dnTouchProbeTimeLag DINT	Zero pulse for touch probe motor encoder: Input for time stamp
bTPMotor_ bTouchProbeReceived BOOL	Zero pulse for touch probe motor encoder: Input for the status signal "touch probe received"
dnTPLoad_ dnTouchProbeTimeLag DINT	Zero pulse for touch probe position encoder: Input for time stamp
bTPLoad_ bTouchProbeReceived BOOL	Zero pulse for touch probe position encoder: Input for the status signal "touch probe received"
AxisData	Input for transfer of the machine parameters of the drive • Connect this input to the output *DI_AxisData* of the system block **LS_DriveInterface**.

Outputs

Identifier Data type	Info/meaning
wCiA402TouchProbeState WORD	Interface to the master / master control • Touch probe status (0x60B9)
dnCiA402 TouchProbe1PosVal_e4 DINT	Interface to the master / master control • Touch probe position 1, recorded with the positive edge. • Output in user units (e4 representation). • CiA402 object: 0x60BA
dnCiA402 TouchProbe1PosVal_p DINT	Interface to the master / master control • Touch probe position 1, recorded with the positive edge. • Output in internal representation.
dnCiA402 TouchProbe1NegVal_e4 DINT	Interface to the master / master control • Touch probe position 1, detected with negative edge. • Output in user units (e4 representation). • CiA402 object: 0x60BB
dnCiA402 TouchProbe1NegVal_p DINT	Interface to the master / master control • Touch probe position 1, detected with negative edge. • Output in internal representation.
dnCiA402 TouchProbe2PosVal_e4 DINT	Interface to the master / master control • Touch probe position 2, recorded with positive edge. • Output in user units (e4 representation). • CiA402 object: 0x60BC
dnCiA402 TouchProbe2PosVal_p DINT	Interface to the master / master control • Touch probe position 2, recorded with positive edge. • Output in internal representation.
dnCiA402 TouchProbe2NegVal_e4 DINT	Interface to the master / master control • Touch probe position 2, recorded with negative edge. • Output in user units (e4 representation). • CiA402 object: 0x60BD
dnCiA402 TouchProbe2NegVal_p DINT	Interface to the master / master control • Touch probe position 2, recorded with negative edge. • Output in internal representation.
bTP1_bEnablePosEdge BOOL	Interface for enabling touch probe 1 (positive edge) • Connect this output to the input *TPx_bEnablePosEdge* of the system block **LS_TouchProbex** (x = used digital input 1 ... 8).
bTP1_bEnableNegEdge BOOL	Interface for enabling touch probe 1 (negative edge) • Connect this output to the input *TPx_bEnableNegEdge* of the system block **LS_TouchProbex** (x = used digital input 1 ... 8).
bTP2_bEnablePosEdge BOOL	Interface for enabling the touch probe 2 (positive edge) • Connect this output to the input *TPx_bEnablePosEdge* of the system block **LS_TouchProbex** (x = used digital input 1 ... 8).
bTP2_bEnableNegEdge BOOL	Interface for enabling the touch probe 2 (negative edge) • Connect this output to the input *TPx_bEnableNegEdge* of the system block **LS_TouchProbex** (x = used digital input 1 ... 8).

3.16 Torque limiting

Selecting the torque limits of the drive.

3.16.1 Input and output data

Input data

Index	Name	Data type	Object type
0x60E0	Positive torque limit value	UNSIGNED_16	VAR
0x60E1	Negative torque limit value	UNSIGNED_16	VAR

3.16.2 Object description

Objects described in other chapters:

Index	Name	Data type	Object type
▸ Cyclic synchronous torque mode (IEC 61800-7)			
0x6072	Max torque	UNSIGNED_16	VAR

Objects described in this chapter:

Index	Name	Data type	Object type
0x60E0	Positive torque limit value	UNSIGNED_16	VAR
0x60E1	Negative torque limit value	UNSIGNED_16	VAR

0x60E0 - Positive torque limit value

Index | Name:
0x60E0 | Positive torque limit value

Data type: INTEGER_32
Code: C03686

Positive torque limit
- Scaling: 16384 ≡ 100%

Setting range (min. value | unit | max. value)			Lenze setting
0		32767	**16384**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ PDO_MAP_RX ☐ PDO_MAP_TX

0x60E1 - Negative torque limit value

Index | Name:
0x60E1 | Negative torque limit value

Data type: INTEGER_32
Code: C03687

Negative torque limit
- Scaling: 16384 ≡ 100%

Setting range (min. value | unit | max. value)			Lenze setting
0		32767	**16384**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ PDO_MAP_RX ☐ PDO_MAP_TX

3.17 Parameterisable additional functions

3.17.1 Undervoltage recognition of the DC link

C03001 serves to parameterise an undervoltage recognition of the DC link. For this, the DC link voltage measured by the motor interface is compared to the voltage limit set in C03001.

- If the DC link voltage falls below the voltage limit, the
  - error response (Lenze setting: "Quick stop by trouble") set in C05902/1 is triggered and the "DC-bus undervoltage" error response is entered into the logbook when the controller is enabled (module ID: 999, error ID: 8001).
  - no error response if the controller is inhibited.
- The voltage threshold can be parameterised in C03001 in the range 0.00 ... 100.00% (100% ≡ 1000V).
- If C03001 = 0% is set (Lenze setting), the undervoltage recognition is deactivated.

Example:

The voltage threshold is set to 51.10% in C03001.

If the DC link voltage falls below the value of 511V, the error response set in C05902/1 (Lenze setting: "quick stop by trouble") is carried out if the controller is enabled.

3.17.2 Connection between limiter and safety module

The connection between the "limiter" basic function and the safety module is useful for a single drive. In a safety case, the drive will autonomously be turned into a "safe state". However, problems can occur in a drive system if single axes carry out independent motion sequences which are not initiated by the control.

C03002 serves to parameterise if the connection between "limiter" basic function and the safety module should be opened or closed (Lenze setting).

3.17.3 Dynamic change of the proportional gain Vp of the speed controller

The dynamic change of the speed controller gain during operation can be parameterised as a function of the desired speed by a characteristic.

- The characteristic is defined by the parameters C04100 ... C04102 of the function block Adaption_Speedcontroller which is an instance of the function block **L_TbCurve**. (📖 182)

3.17.4 Dynamic change of the proportional gain Vp of the angle/position controller

The dynamic change of the angle or position controller gain during operation can be parameterised as a function of the desired speed by a characteristic.

- The characteristic is defined by the parameters C04103 ... C04105 of the function block Adaption_Positioncontroller which is an instance of the function block **L_TbCurve**. (📖 182)

3.17.5 Telegram failure recognition and monitoring

Note!

This function is currently only supported when using the EtherCat as MotionBus.

When a telegram failure is recognised, an extrapolation of the setpoints (position, speed and torque) is carried out. Based on the positon a square-law extrapolation algorithm is taken as a basis.

Telegram failure counter

The telegram failures which ocurred during operation are evaluated in the application.

- The number of the single errors is stored in C03011 and the number of the multiple errors (more than 1 telegram failure in a row) is stored in C03012.
- Via C03013 you can reset the error counter.

Telegram failure monitoring

If the number of telegram failures in a row exceeds the limit value set in C03010 (Lenze setting: 1), the error response set in C05902/2 is triggered (Lenze setting: Information) and the "Maximum value for telegram failure exceeded" error response is entered into the logbook (module ID: 999, error ID: 8002). ▸ Application error messages (📖 181)

3.18 Using the FB Editor

From »Engineer« version 2.12, the CiA402 application (as of V2.x) can be edited with the FB Editor, which means that e.g. other function blocks can be added to the interconnection.

Note!

- Please observe that deleting existing interconnections will affect basic functions of the CiA402 application!
- New port variables cannot be created.

Tip!

If additional process data need to be exchanged with the control system, 5 port variables are provided for input data and 5 port variables are provided for output data:

- Input ports:
  FM1_RxD_DWORD ... FM1_RxD_DWORD
  (indexes 0xA680/1...5)
- Output ports:
  FM1_TxD_DWORD ... FM1_TxD_DWORD
  (indexes 0xA200/1...5)

3.19 Internal interfaces | function block "L_CiA402DeviceProfile"

The **L_CiA402DeviceProfile** function block contains the main functionality of the CiA402 device profile.

Inputs

Identifier Data type	Information/possible settings
wCiA402ControlWord WORD	Interface of the master / master control • Control word (0x6040). ▸ Device control commands
byCiA402ModeOfOperation BYTE	Interface of the master / master control • Selection of the operating mode (0x6060). ▸ Operating mode changeover
dnCiA402SetPosition_e4 DINT	Interface of the master / master control • Selection of the setpoint position in user units (e4 representation) for Interpolated position mode.
dnCiA402TargetPosition_e4 DINT	Interface of the master / master control • Selection of the setpoint position in user units (e4 representation) for Cyclic synchronous position mode (IEC 61800-7).
dnCiA402OffsetPosition_e4 DINT	Interface of the master / master control • Selection of a position offset in user units (e4 representation).
dnCiA402TargetSpeed_e4 DINT	Interface of the master / master control • Selection of a set speed in user units (e4 representation).
dnCiA402OffsetSpeed_e4 DINT	Interface of the master / master control • Selection of a speed offset in user units (e4 representation).
dnCiA402TargetTorque_n DINT	Interface of the master / master control • Selection of a torque in [%]. • $2^{30} \equiv 100\ \% \equiv C00057/2$
dnCiA402OffsetTorque_n DINT	Interface of the master / master control • Selection of a torque offset in [%]. • $2^{30} \equiv 100\ \% \equiv C00057/2$
wCiA402PosTorqueLimit_a WORD	Interface of the master / master control • Selection of the positive torque limit in [%]. • $2^{16} \equiv 100\% \equiv C00057/2$
wCiA402NegTorqueLimit_a WORD	Interface of the master / master control • Selection of the negative torque limit in [%]. • $2^{16} \equiv 100\% \equiv C00057/2$
byCiA402DigitalOutput BYTE	Interface of the master / master control • Selection of the states of the digital outputs.
dnHM_dnState DINT	Interface for the "homing" basic function • Input for the status signal of the basic function. • Connect this input to the *HM_dnState* output of the **LS_Homing** system block.
bHM_bEnabled BOOL	Interface for the "homing" basic function • Input for the status signal "enable homing basic function". • Connect this input to the *HM_bEnabled* output of the **LS_Homing** system block.
bHM_bActive BOOL	Interface for the "homing" basic function • Input for the status signal "homing basic function active". • Connect this input to the *HM_bActive* output of the **LS_Homing** system block.
bHM_bDone BOOL	Interface for the "homing" basic function • Input for the status signal "homing completed". • Connect this input to the *HM_bDone* output of the **LS_Homing** system block.
bHM_bHomePosAvailable BOOL	Interface for the "homing" basic function • Input for the status signal "home position available". • Connect this input to the *HM_bHomePosAvailable* output of the **LS_Homing** system block.

Identifier Data type	Information/possible settings
bQSP_bActive BOOL	Interface for the "quick stop" basic function • Input for the status signal "quick stop active". • Connect this input to the *QSP_bActive* output of the **LS_Quickstop** system block.
bDI_bReady BOOL	Interface for the drive interface • Input for the status signal "controller is ready". • Connect this input to the *DI_bReady* output of the **LS_DriveInterface** system block.
bDI_bFailActive BOOL	Interface for the drive interface • Input for the status signal "failure active". • Connect this input to the *DI_bFailActive* output of the **LS_DriveInterface** system block.
bDI_bImpActive BOOL	Interface for the drive interface • Input for the status signal "pulse inhibit active". • Connect this input to the *DI_bImpActive* output of the **LS_DriveInterface** system block.
bDI_bCInhActive BOOL	Interface for the drive interface • Input for the status signal "controller inhibit active". • Connect this input to the *DI_bCInhActive* output of the **LS_DriveInterface** system block.
bDI_bWarningActive BOOL	Interface for the drive interface • Input for the status signal "warning active". • Connect this input to the *DI_bWarningActive* output of the **LS_DriveInterface** system block.
bDI_bMainSupplyOk WORD	Interface for the drive interface • Input for the status signal "mains voltage applied". • Connect this input to the *DI_bMainSupplyOk* output of the **LS_DriveInterface** system block.
bBRK_bCInhActive BOOL	Interface for the "brake control" basic function • Input for the status signal "controller inhibit active by brake". • Connect this input to the *BRK_bCInhActive* output of the **LS_Brake** system block.
bBRK_dnState BOOL From technology application V2.x	Interface for the "brake control" basic function • Input for the status signal of the brake control • Connect this input to the BRK_dnState output of the **LS_Brake** SB.
dnFDB_dnActualPos_p DINT	Interface for the "encoder evaluation" basic function • Input for the current position. • Connect this input with the output *FDB_dnActualPos_p* of the system block **LS_Feedback**.
dnFDB_dnActualSpeed_s DINT	Interface for the "encoder evaluation" basic function • Input for the actual speed. • Connect this input to the *FDB_dnActualSpeed_s* output of the **LS_Feedback** system block.
dnFDB_ dnPosFollowingError_p DINT	Interface for the "encoder evaluation" basic function • Input for the actual following error. • Connect this input to the *FDB_dnPosFollowingError_p* output of the **LS_Feedback** system block.
dnMI_ dnActualMotorTorque_n DINT	Interface for the motor interface • Input for the actual torque. • Connect this input to the *MI_dnActualMotorTorque_n* output of the **LS_MotorInterface** system block.
dnMI_ dnActualMotorCurrent_n DINT	Interface for the motor interface • Input for the actual motor current. • Connect this input to the *MI_dnActualMotorCurrent_n* output of the **LS_MotorInterface** system block.

Identifier Data type	Information/possible settings
bMI_ bMotorOrientationInverse BOOL	Interface for the motor interface • Input for the motor mounting position. • Connect this input to the *MI_bMotorOrientationInverse* output of the **LS_MotorInterface** system block.
bMI_ bSpeedBelowThresholdC19 BOOL	Interface for the motor interface • Input for the zero speed recognition. • Connect this input to the *bSpeedBelowThresholdC19* output of the **LS_MotorInterface** system block.
bPF_bEnabled BOOL	Interface for the "position follower" basic function • Input for the status signal "position follower basic function active". • Connect this input to the *PF_bEnabled* output of the **LS_Positionfollower** system block.
bSF_bEnabled BOOL	Interface for the "speed follower" basic function • Input for the status signal "speed follower basic function active". • Connect this input to the *SF_bEnabled* output of the **LS_Speedfollower** system block.
bTF_bEnabled BOOL	Interface for the "torque follower" basic function • Input for the status signal "torque follower basic function active". • Connect this input to the *TF_bEnabled* output of the **LS_Torquefollower** system block.
dnSMI_dnState DINT	Interface for the safety module • Input for the status signal. • Connect this input to the *SMI_bEnabled* output of the **LS_SafetyModulinterface** system block.
bSYNC_ bProcessDataExpected BOOL	Input for the status information "process data expected" • Connect this input to the *SYNC_bProcessDataExpected* output of the **LS_SyncInput** system block.
bSYNC_ bProcessDataInvalid BOOL	Input for the status information "process data invalid" • Connect this input to the *SYNC_bProcessDataInvalid* output of the **LS_SyncInput** system block.
byDigitalInput BYTE	Input for the acceptance of the status of the digital inputs
bySafeIOState BYTE	Input for the acceptance of the I/O status of the safety module
AxisData	Input for transfer of the machine parameters of the drive • Connect this input to the output *DI_AxisData* of the system block **LS_DriveInterface**.

Outputs

Identifier Data type	Info/meaning
wCiA402StatusWord WORD	Interface to the master / master control • Status word (0x6041). ▸ Device statuses
byCiA402 ModeOfOperationDisplay BYTE	Interface to the master / master control • Active operating mode (0x6061). ▸ Operating mode changeover
dnCiA402ActualPosition_e4 DINT	Interface to the master / master control • Actual position in user units (e4 representation).
dnCiA402ActualPosition_p DINT	Interface to the master / master control • Actual position in internal units.
dnCiA402 ActualFollowingError_e4 DINT	Interface to the master / master control • Actual following error in user units (e4 representation).

Identifier Data type	Info/meaning
dnCiA402ActualSpeed_e4 DINT	Interface to the master / master control • Actual speed in user units (e4 representation).
dnCiA402ActualTorque_n DINT	Interface to the master / master control • Actual torque in [%]
dnCiA402ActualCurrent_n DINT	Interface to the master / master control • Actual motor current in [%]
byCiA402DigitalInput BYTE	Interface to the master / master control • States of the digital inputs.
bHM_bEnable BOOL	Interface for the "homing" basic function • Control signal to enable the basic function. • Connect this output to the *HM_bEnable* input of the **LS_Homing** system block.
bHM_bActivateHoming BOOL	Interface for the "homing" basic function • Control signal to start the homing process. • Connect this output to the *HM_bActivateHoming* input of the **LS_Homing** system block.
bHM_bLoadHomePos BOOL	Interface for the "homing" basic function • Control signal to load the home position. • Connect this output to the *HM_bLoadHomePos* input of the **LS_Homing** system block.
dnHM_dnHomePos_p DINT	Interface for the "homing" basic function • Home position to load (if *bHM_bLoadHomePos* = TRUE). • Connect this output to the *HM_dnHomePos_p* input of the **LS_Homing** system block.
bHM_bResetHomePos BOOL	Interface for the "homing" basic function • Control signal to reset the homing information. • Connect this output to the *HM_bResetHomePos* input of the **LS_Homing** system block.
bQSP_bActivate BOOL	Interface for the "quick stop" basic function • Control signal to require a quick stop. • Connect this output to the *QSP_bActivate* input of the **LS_Quickstop** system block.
bDI_bSetCInh BOOL	Interface for the drive interface • Control signal to set/deactivate the controller inhibit. • Connect this output to the *DI_bSetCInh* input of the **LS_DriveInterface** system block.
bDI_bResetError BOOL	Interface for the drive interface • Control signal to reset the error. • Connect this output to the *DI_bResetError* input of the **LS_DriveInterface** system block.
bDI_bSwitchOn BOOL	Interface for the drive interface • Control signal to deactivate the switch-on inhibit. • Connect this output to the *DI_bSwitchOn* input of the **LS_DriveInterface** system block.
bPF_bEnable BOOL	Interface for the "position follower" basic function • Control signal to enable the basic function. • Connect this output to the *PF_bEnable* input of the **LS_PositionFollower** system block.
bSF_bEnable BOOL	Interface for the "speed follower" basic function • Control signal to enable the basic function. • Connect this output to the *SF_bEnable* input of the **LS_SpeedFollower** system block.
bTF_bEnable BOOL	Interface for the "torque follower" basic function • Control signal to enable the basic function. • Connect this output to the *TF_bEnable* input of the **LS_TorqueFollower** system block.

Identifier Data type	Info/meaning
dnSetPos_p DINT	Interface for the selection of the position setpoint
dnSetOrAddSpeed_s DINT	Interface for the selection of the speed setpoint or the speed feedforward control value
dnSetOrAddTorque_n DINT	Interface for the selection of the speed setpoint or the speed feedforward control value
dnAddAcc_x DINT	Interface for the selection of a feedforward acceleration
dnPosSpeedLimit_n DINT	Interface for the selection of an upper speed limit
dnNegSpeedLimit_n WORD	Interface for the selection of a lower speed limit
dnPosTorqueLimit_n DINT	Interface for the selection of an upper torque limit
dnNegTorqueLimit_n DINT	Interface for the selection of a lower torque limit
byDigitalOutput BYTE	Interface for the control of the digital outputs
byBrakeControl BYTE	Interface for the control of the brake function
dnBrakeTorqueAdd_n DINT	Interface for the selection of a feedforward control torque for the brake control

3.20 Application error messages

In order to output application-specific error messages, a *L_DevApplErr1* FB instance of the **L_DevApplErr** function block is provided in the interconnection.

- Up to 8 different application error messages with parameterisable module ID, error ID and error response can be triggered by the application via the 8 boolean inputs.
- The first two inputs are fixed connected to trigger signals of the application, the other six inputs are free:

Error message		Error ID	Error response
1	DC-bus undervoltage	8001	Quick stop by trouble
2	Maximal value of the telegram failure exceeded	8002	Information
3	Application error (free input)	8003	Error
4	Application error (free input)	8004	Error
5	Application error (free input)	8005	Error
6	Application error (free input)	8006	Error
7	Application error (free input)	8007	Error
8	Application error (free input)	8008	Error

- Parameterisation: **all parameters** tab

Parameter		Lenze setting
C05900	Module ID	999
C05901/1...8	Error ID 1 ... 8	see table above
C05902/1...8	Error response 1 ... 8	see table above

Note!

In general, the "Warning locked" error response should not be set for the operation of the CiA402 application with a control because the control cannot distinguish this error response from the "Warning" error response. Therefore, it cannot be acknowledged.

3.21 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application in alphabetical order with the corresponding parameters.

3.21.1 Adaption_Positioncontroller

is ans instance of	Function
L_TbCurve	Adaption of the position controller by characteristic or curve function y = f(x)

Parameter	Possible settings				Information
C04103					Characteristic mode
	0	Entire range			
	1	Symmetrical to the Y axis			Lenze setting
	2	Symmetrical to the zero point			
C04104/1...9	-200.00		%	200.00	x value of the characteristic function • Subcode 1 ... 9 corresponding to the support point values X1 ... X9.
C04105/1...9	-200.00		%	200.00	y value of the characteristic function • Subcode 1 ... 9 corresponding to the support point values Y1 ... Y9.

3.21.2 Adaption_Speedcontroller

is ans instance of	Function
L_TbCurve	Adaption of the speed controller by the characterstic or curve function y = f(x)

Parameter	Possible settings				Information
C04100					Characteristic mode
	0	Entire range			
	1	Symmetrical to the Y axis			Lenze setting
	2	Symmetrical to the zero point			
C04101/1...9	-200.00		%	200.00	x value of the characteristic function • Subcode 1 ... 9 corresponding to the support point values X1 ... X9.
C04102/1...9	-200.00		%	200.00	y value of the characteristic function • Subcode 1 ... 9 corresponding to the support point values Y1 ... Y9.

3.21.3 CountMultiError

is ans instance of	Function
L_TbCount	Counter for recognised telegram failures (multiple errors)

Parameter	Possible settings		Information
C04006			Reset function
	0	After reaching the reference value the counter is automatically reset to the starting value.	
	1	The reference value reached is stored until it is reset via *bLoadStartValue*.	Lenze setting

3.21.4 CountSingleError

is ans instance of	Function
L_TbCount	Counter for recognised telegram failures (single errors)

Parameter	Possible settings		Information
C04005			Reset function
	0	After reaching the reference value the counter is automatically reset to the starting value.	
	1	The reference value reached is stored until it is reset via *bLoadStartValue*.	Lenze setting

3.21.5 DetectErrorLimit

is ans instance of	Function
L_TbCompare	Error triggering after exceeding the maximum value of the telegram failure • Comparison of the number of recognised telegram failures with the maximum value set in C03010.

Parameter	Possible settings		Information
C04085			Comparison operation
	0	dnIn1 = dnIn2	
	1	**dnIn1 > dnIn2**	Lenze setting
	2	dnIn1 < dnIn2	
	3	|dnIn1| = |dnIn2|	
	4	|dnIn1| > |dnIn2|	
	5	|dnIn1| < |dnIn2|	

3.21.6 DetectMultiError

is ans instance of	Function
L_TbCompare	Recognition of multiple errors

Parameter	Possible settings		Information
C04087			Comparison operation
	0	dnIn1 = dnIn2	
	1	**dnIn1 > dnIn2**	Lenze setting
	2	dnIn1 < dnIn2	
	3	|dnIn1| = |dnIn2|	
	4	|dnIn1| > |dnIn2|	
	5	|dnIn1| < |dnIn2|	

3.21.7 DetectSingleError

is ans instance of	Function
L_TbCompare	Recognition of single errors

Parameter	Possible settings		Information
C04086			Comparison operation
	0	**dnIn1 = dnIn2**	Lenze setting
	1	dnIn1 > dnIn2	
	2	dnIn1 < dnIn2	
	3	|dnIn1| = |dnIn2|	
	4	|dnIn1| > |dnIn2|	
	5	|dnIn1| < |dnIn2|	

3.21.8 DetectUnderVoltage

is ans instance of	Function
L_TbCompare_n	DC-bus undervoltage recognition • Comparison of the current DC-bus voltage with the UG min. threshold set in C03001.

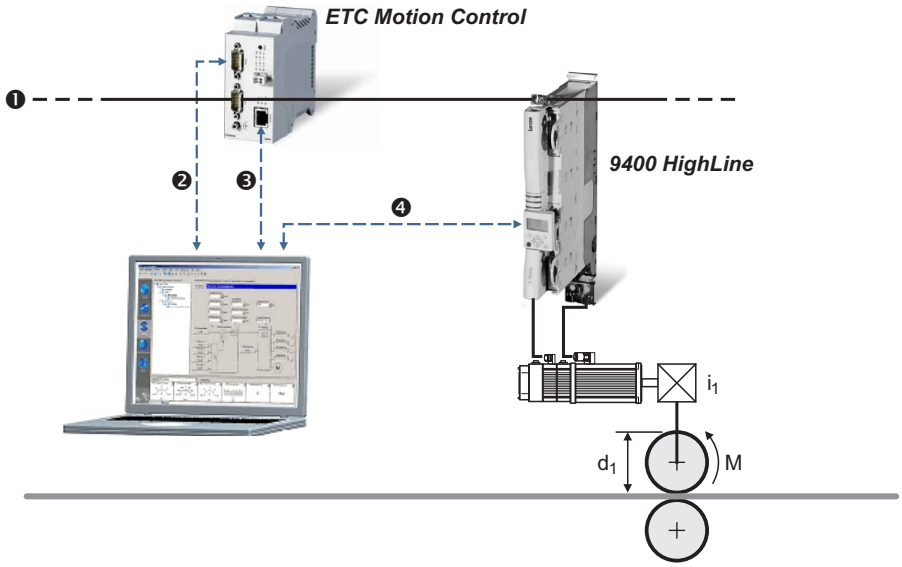
Parameter	Possible settings			Information
C04080				Comparison operation
	0	dnIn1_n = dnIn2_n		
	1	dnIn1_n > dnIn2_n		
	2	**dnIn1_n < dnIn2_n**		Lenze setting
	3	|dnIn1_n| = |dnIn2_n|		
	4	|dnIn1_n| > |dnIn2_n|		
	5	|dnIn1_n| < |dnIn2_n|		
C04081	0.00	%	100.00	Tolerance • Initialisation: 0.00 %
C04082	0.00	%	100.00	Hysteresis • Initialisation: 0.00 %

3.21.9 L_DevApplErr1

is ans instance of	Function
L_DevApplErr	Error triggering ▸ Application error messages (📖 181)

Parameter	Possible settings			Information
C05900	980		999	Module ID • Initialisation: 999
C05901/1...8	0		65535	Error ID • Initialisation: 8001 ... 8008
C05902/1...8				Error response
	0	None		
	1	Error		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

4 Step-by-step commissioning



The technology application "CiA402 device profile" is commissioned with the »Engineer«. The following subchapters describe the commissioning or setting of the required parameters step by step using the example of a system bus (CAN) network.

Note!

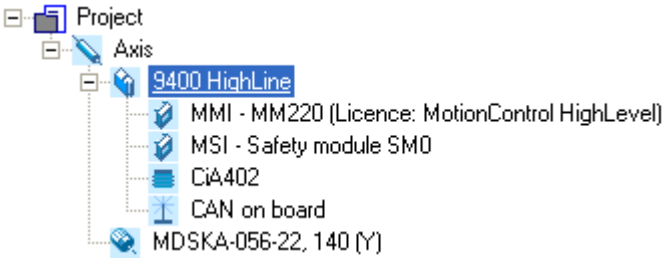
The following step-by-step instructions require that the initial commissioning of the motor and the adaptation of the controller to the electromechanics have already been executed.

For the communication via a system bus (CAN): Ensure that the CAN device address and the CAN transfer rate of the controller are set correctly via the DIP switches on the memory module.

Example: Control of the 9400 HighLine per ETC Motion Control

❶ System bus (CAN)
❷ Option 1: Serial connection PC/ETC (RS232/COM-Port)
❸ Option 2: Network connection PC/ETC (Ethernet)
❹ Connection PC/9400 HighLine (e.g. via USB interface/diagnostic adapter)

[4-1] Example



Tip!

Detailed information on how to establish the PC/ETC connection and to set up and parameterise the ETC Motion Control can be found in the "ETC Motion Control – NC operating system" System Manual.

4.1 Create new Engineer project

Commissioning is carried out with the »Engineer« by selecting the application from the catalogue, transmission to the controller, and parameter setting via corresponding dialogs.

1. Start »Engineer«.
2. Go to *Start-up wizard* and select the option "New project (empty)" and enter a name for the project in a next step.
3. Insert axis for the 9400 HighLine controller.
   – Add the corresponding components to the axis (9400 HighLine controller, motor, safety module, memory module).
   – Select the "CiA402 device profile" application for the controller.
   – Example *project view* in the »Engineer«:

Next step

▸ Set machine parameters (📖 188)

4.2 Set machine parameters

Note!

Usually, the position data is defined and interpreted in increments by the master control. In this case the feed constant and gearbox factor are already considered by the control and must be set in the controller as listed in the following table.

Parameter	Object	Name	Setting
C02524	0x6092/1	Feed constant • General normalisation: 65535 Increment ≡ 1 motor revolution	
		Setting for ETC:	6.5536
C02520	0x6091/1	Gearbox factor numerator: Motor	1
C02521	0x6091/2	Gearbox factor denom.: Motor	1

4.3 Setting communication parameters for CANopen

For the system bus (CAN) communication, the communication cycle time and the control cycle time must be synchronised via the SYNC telegram. You must adapt the following parameters for this mechanism accordingly.

Example:

▶ ETC selection:

Parameter	Object	Name	Setting
-	0x60C2/1	CiA402 Ip time units	20
-	0x60C2/2	CiA402 Ip time index	-4

▶ Additionally required settings in the parameter list:

Parameter	Object	Name	Setting
C01120	0x5B9F	Sync source	1: CAN on board or 2: CAN module
C01121	0x5B9E	Sync cycle time	2000 µs
C01122	0x5B9D	Sync phase position	400 µs
C01124	0x5B9B	Sync-PLL increment	210 ns (> 100 ns)

4.4 Settings for "Homing mode"

For "Homing mode" the following parameters must be set:

Parameter	Object	Information
C02640	0x55AF	Homing mode
C02641	0x60FB/7	Drive behaviour after setting the home position
C02642	0x607C	Home position
C02644	0x6099/1	Speed 1
C02645	0x609A/1	Acceleration 1
C02646	0x6099/2	Speed 2
C02647	0x609A/2	Acceleration 2
C02651	C055A4	TP configuration

4.5 Settings for "Interpolated position mode"

For the "Interpolated position mode" the following parameters must be set:

Parameter	Object	Information
C03630	0x60C0	Selection of the interpolation algorithm
C03637	0x60C2/1	Adaptation of interpolation cycle time to communication cycle time
C03638	0x60C2/2	

$$\text{Interpolation cycle time}[s] = \text{ip time units} \cdot 10^{\text{ip time index}}[s]$$

0x60C2/1: ip time units
0x60C2/2: ip time index

[4-2] Definition of the interpolation cycle time

4.6 Speed feedforward control

The source for the speed feedforward control can be selected in C02680 (CiA402 object 0x5587).

- The following options are available:
  - The source for feedforward control is the 0x60FF object (target velocity).
  - The value for the feedforward control is derived from the position data.
- If you select the interpolation algorithm 0x60C0 = "-11: Optimized mode 1", the feedforward control values are generated from the interpolation process.

4.7 Torque/feed force feedforward control

The source for the torque/feed force feedforward control can be selected in C00276 (CiA402 object 0x5EEB).

- The following options are available:
  - The source for feedforward control is the 0x6071 object (target torque).
  - The value for feedforward control is derived from the 0x60FF object (target velocity).
  - The value for the feedforward control is double-derived from the position data.
- If you select the interpolation algorithm 0x60C0 = "-11: Optimized mode 1", the feedforward control values are generated from the interpolation process.

4.8 Controller settings

In the Lenze setting, the controllers are already set to sensible values. To optimise the control mode, the following parameters can be changed:

Parameter	Object	Information
C00254	0x5EED	Phase controller gain
C00070	0x5FB9	Speed controller gain
C00071	0x5FB8	Speed controller reset time

4.9 Final steps

1. Go online.
2. Download the application into the controller.

Note!

The downloaded application is basically stored in the first application memory location of the controller.

The preinstalled technology applications on the following memory locations are still available.

3. Confirm Dialog box *Save parameter set* with **Yes, all devices**.
4. Confirm Dialog box *Start application* with **Yes, all devices**.
5. Confirm Dialog box *Enable controller* with **Yes, all devices**.
6. Control applications via terminals or network.

5 Parameter reference

All parameters for controller parameter setting or monitoring are stored under "codes".

- The codes are numbered and designated by a "C" in front of the code, e.g. "C00002".
- For the sake of clarity, some codes contain "subcodes" for saving parameters. This Manual uses a slash "/" as a separator between code and subcode, e.g. C00118/3".

Tip!

For quick reference of a parameter with a certain name simply use the **index** of the online documentation. The index always contains the corresponding code in parentheses behind the name.

For general information on how to read and change parameters please see the online documentation for the »Engineer«.

5.1 Structure of the parameter descriptions

Each parameter is described in the Parameter list in the form of a table which consists of the following three areas:

Table header

The table header contains the following general notes:

- Parameter number (Cxxxxx)
- Parameter name (display text in the »Engineer» and keypad)
- Data type
- Decimal and hexadecimal parameter index for access via bus systems

Table contents

The table contains further general explanations & notes on the parameter and the possible settings the representation of which depends on the parameter type:

- Parameters with read-only access
- Parameters with write access

Table footer

The table footer contains the Parameter attributes.

5.1.1 Data type

The following data types are available for parameters:

Data type	Meaning
INTEGER_8	8-bit value with sign
INTEGER_16	16-bit value with sign
INTEGER_32	32-bit value with sign
INTEGER_64	64-bit value with sign
UNSIGNED_8	8-bit value without sign
UNSIGNED_16	16-bit value without sign
UNSIGNED_32	32-bit value without sign
UNSIGNED_64	64-bit value without sign
FLOATING_POINT	32-bit floating point number
VISIBLE_STRING	String of characters from printable characters
OCTET_STRING	String of characters from any characters
BITFIELD_8	8-bit value bit-coded
BITFIELD_16	16-bit value bit-coded
BITFIELD_32	32-bit value bit-coded

5.1.2 Parameters with read-only access

Parameters for which the "write access" attribute has not been set can only be read and not be changed by the user.

Description structure

Parameter | Name: **Cxxxxx | _____**			Data type: _____ Index: _____
Description			
Display range (min. value | unit | max. value)			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			

Representation in the »Engineer«

The »Engineer« displays these parameters with a grey background or, when an online connection has been established, with a pale-yellow background:

	C...	S	Name	Value	Unit
	61	0	Heatsink temperature	30	°C

5.1.3 Parameters with write access

Only parameters with a check mark (☑) in front of the "write access" attribute can be changed by the user. The Lenze setting for these parameters is **printed in bold**.

- The settings are either selected by means of a selection list or through direct value entry.
- Values outside the valid setting range are represented in red in the »Engineer«.

5.1.3.1 Parameters with setting range

Description structure

Parameter | Name: **Cxxxxx | _____**			Data type: _____ Index: _____
Description			
Setting range (min. value | unit | max. value)			**Lenze setting**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

Parameter setting in the »Engineer«

In the »Engineer« parameterisation is carried out by entering the desired value into the input field:

	C...	S	Name	Value	Unit
	22	0	Maximum current	0.00	A

5.1.3.2 Parameters with selection list

Description structure

Parameter | Name: **Cxxxxx | _____**		Data type: _____ Index: _____
Description		
Selection list (Lenze setting printed in bold)		
1		
2		
3		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

Parameter setting in the »Engineer«

In the »Engineer«, a list field is used for parameter setting:

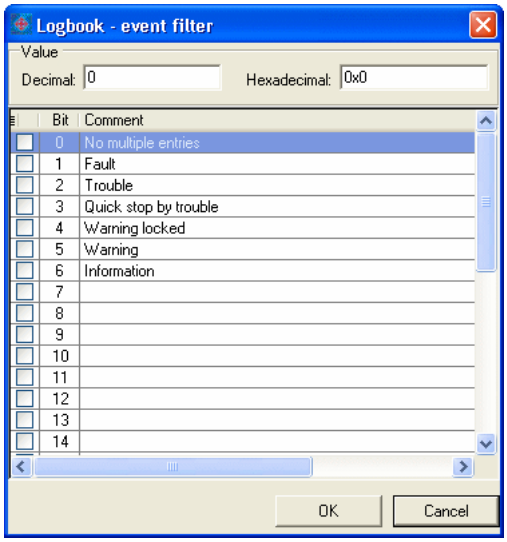
	C...	S	Name	Value	Unit
	34	0	Config. analog input 1	0: -10 ... +10 V	

0: -10 ... +10 V
1: -20...-4 mA, +4...+20 mA
2: -20 ... +20 mA

5.1.3.3 Parameters with bit-code setting

Description structure

Parameter | Name:	Data type: _____
Cxxxxx | _____	Index: _____



Description

Value is bit-coded:	
Bit 0	
...	
Bit 31	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

Parameter setting in the »Engineer«

In the »Engineer« the parameterisation is carried out in a dialog box in which the single bits can be set or reset. Alternatively, the value can be entered as a decimal or hexadecimal value:

5.1.3.4 Parameters with subcodes

Description structure

Parameter | Name: **Cxxxxx | _____**	Data type: _____ Index: _____
Description	
Setting range (min. value | unit | max. value)	

Subcodes	**Lenze setting**
Cxxxxx/1	
Cxxxxx/2	
Cxxxxx/3	
Cxxxxx/4	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

Parameter setting in the »Engineer«

In the »Engineer« parameters list every subcode is listed individually. The parameterisation is carried out as described in the chapters before.

C...	S	Name	Value	Unit
114	1	Dig. input. 1: Terminal polarity	0	
114	2	Dig. input. 2: Terminal polarity	0	
114	3	Dig. input. 3: Terminal polarity	0	
114	4	Dig. input. 4: Terminal polarity	0	

5.1.4 Parameter attributes

Description structure

Parameter attributes are listed in the table footer:

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

Meaning of the attributes

Attribute	Meaning	
☑ Read access	Read access to parameter possible.	
☑ Write access	Write access to parameter possible. • Please also observe the following attributes:	
	☑ CINH	Parameter value can only be changed when the controller is inhibited.
	☑ PLC STOP	Parameter value can only be changed when the application is stopped.
☑ No transfer	When you carry out the command **download parameter set** the parameter is not transfered to the regenerative power supply module.	

Scaling factor

The "scaling factor" is important for the parameter access via a bus system:

$$\text{Read value (via bus system)} = \text{Scaling factor} \cdot \text{Indicated value (Engineer)}$$

5.1.5 Abbreviations used in parameter & selection texts

Since the character length of the parameter and selection texts is limited, the following abbreviations are used:

Abbreviation	Meaning
CAN module	CANopen communication module (E94AYCCA)
ENP	Electronic nameplate
MXI1	*Module eXtension Interface* 1 - module slot for extension 1
MXI2	*Module eXtension Interface* 2 - module slot for extension 2

5.2 Parameter list

In this chapter all parameters of the technology application "CiA402 device profile" are listed in a numerically ascending order.

Note!

The parameters of the operating system (up to and including code C02999) are described in the software documentation of 9400 HighLine.

The parameters of the standard function blocks used in the application (from code C04000 on) are described in the software documentation of the 9400 function library.

C03001

Parameter | Name:
C03001 | UG min threshold

Data type: INTEGER_32
Index: $21574_d = 5446_h$

If the value falls below the threshold set here, the application error message "DC bus undervoltage" is triggered with the default response "quick stop by trouble".

▸ Application error messages

Setting range (min. value | unit | max. value)			Lenze setting
0.00		100.00	**0.00**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 100

C03002

Parameter | Name:
C03002 | Selection of limiter / safety interconnection

Data type: UNSIGNED_8
Index: $21573_d = 5445_h$

The connection between the "limiter" basic function and the safety module is useful for a single drive. In a safety case, the drive will autonomously be turned into a "safe state". However, problems can occur in a drive system if single axes carry out independent motion sequences which are not initiated by the control.
This parameter serves to select if the connection between the "limiter" basic function and the safety module should be opened or closed (Lenze setting).

Selection list (Lenze setting printed in bold)	
0	LS_Limiter not connected
1	**LS_Limiter connected**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C03010

Parameter | Name:
C03010 | Max. telegram failure value

Data type: UNSIGNED_32
Index: $21565_d = 543D_h$

If the recognised telegram failures exceed the value set here, the application error message "telegram failure maximum value exceeded" is triggered with the default response "information".

▸ Application error messages

Setting range (min. value | unit | max. value)			Lenze setting
0		1073741824	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C03011

Parameter | Name:
C03011 | Counter SingleError

Data type: INTEGER_32
Index: $21564_d = 543C_h$

Displays the number of recognised telegram failures (single errors)

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03012

Parameter | Name:
C03012 | Counter MultiError

Data type: INTEGER_32
Index: $21563_d = 543B_h$

Displays the number of recognised telegram failures (multiple errors)

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03013

Parameter | Name:
C03013 | Reset Errorcounter

Data type: UNSIGNED_8
Index: $21562_d = 543A_h$

TRUE = Reset counter for recognised telegram failures

Selection list (Lenze setting printed in bold)	
0	**FALSE**
1	TRUE

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03500

Parameter | Name:
C03500 | CiA402 profile

Data type: UNSIGNED_32
Index: $21075_d = 5253_h$

Display range (min. value | unit | max. value)		
0		4294967295

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03503

Parameter | Name:
C03503 | Motor type

Data type: UNSIGNED_16
Index: $21072_d = 5250_h$

▸ CiA402 object 0x6402

Selection list (Lenze setting printed in bold)	
0	**Non-standard motor**
1	Phase modulated DC motor
2	Frequency controlled DC motor
3	PM synchronous motor
4	FC synchronous motor
5	Switched reluctance motor
6	Wound rotor induction motor
7	Squirrel cage induction motor
8	Stepper motor
9	Micro-step stepper motor
10	Sinusoidal PM BL motor
11	Trapezoidal PM BL motor

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03504

Parameter | Name:
C03504 | Motor catalog number

Data type: VISIBLE_STRING
Index: $21071_d = 524F_h$

▸ CiA402 object 0x6403

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03505

Parameter | Name:
C03505 | Motor manufacturer

Data type: VISIBLE_STRING
Index: $21070_d = 524E_h$

▸ CiA402 object 0x6404

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03506

Parameter | Name:
C03506 | Http motor catalog address

Data type: VISIBLE_STRING
Index: $21069_d = 524D_h$

▸ CiA402 object 0x6405

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03507

Parameter | Name:
C03507 | Motor calibration date

Data type: VISIBLE_STRING
Index: $21068_d = 524C_h$

▸ CiA402 object 0x6406

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03508

Parameter | Name:
C03508 | Motor service period

Data type: UNSIGNED_32
Index: $21067_d = 524B_h$

▸ CiA402 object 0x6407

Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03509

Parameter | Name:
C03509 | Motor data

Data type: UNSIGNED_32
Index: $21066_d = 524A_h$

▸ CiA402 object 0x6410

Display range (min. value | unit | max. value)		
0		4294967295

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03512

Parameter | Name:
C03512 | Drive manufacturer

Data type: VISIBLE_STRING
Index: $21063_d = 5247_h$

▸ CiA402 object 0x6504

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03513

Parameter | Name:
C03513 | Http drive catalogue address

Data type: VISIBLE_STRING
Index: $21062_d = 5246_h$

▸ CiA402 object 0x6505

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03514

Parameter | Name:
C03514 | Supported drive modes

Data type: UNSIGNED_32
Index: $21061_d = 5245_h$

▸ CiA402 object 0x6502

Display range (min. value | unit | max. value)		
0		4294967295

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03515

Parameter | Name:
C03515 | Digital inputs

Data type: UNSIGNED_8
Index: $21060_d = 5244_h$

▸ CiA402 object 0x60FD

Display range (min. value | unit | max. value)		
0		255

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

0		65535	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03531

Parameter | Name:
C03531 | Status word

Data type: UNSIGNED_16
Index: $21044_d = 5234_h$

▸ CiA402 object 0x6041

Display range (min. value | unit | max. value)		
0		65535

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03532

Parameter | Name:
C03532 | Shutdown option code

Data type: INTEGER_16
Index: $21043_d = 5233_h$

▸ CiA402 object 0x605B

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03533

Parameter | Name:
C01533 | DS402 disable operation option code

Data type: INTEGER_16
Index: $21042_d = 5232_h$

▸ CiA402 object 0x605C

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03534

Parameter | Name:
C03534 | Quick stop option code

Data type: INTEGER_16
Index: $21041_d = 5231_h$

▸ CiA402 object 0x605A

Setting range (min. value | unit | max. value)			Lenze setting
2		2	**2**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03535

Parameter | Name:
C03535 | Halt option code

Data type: INTEGER_16
Index: $21040_d = 5230_h$

▸ CiA402 object 0x605D

Setting range (min. value | unit | max. value)			Lenze setting
2		2	**2**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03536

Parameter | Name:
C03536 | Fault reaction option code

Data type: INTEGER_16
Index: $21039_d = 522F_h$

▸ CiA402 object 0x605E

Setting range (min. value | unit | max. value)			Lenze setting
2		2	**2**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03537

Parameter | Name:
C03537 | Mode of operation

Data type: INTEGER_8
Index: $21038_d = 522E_h$

▸ CiA402 object 0x6060

Selection list (Lenze setting printed in bold)	
0	**no mode**
6	Homing mode
7	Interpolated position mode
8	Cyclic synchronous position mode
9	Cyclic synchronous velocity mode
10	Cyclic synchronous torque mode

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03538

Parameter | Name:
C03538 | Mode of operation display

Data type: INTEGER_8
Index: $21037_d = 522D_h$

▸ CiA402 object 0x6061

Selection list (display only)	
0	no mode
6	Homing mode
7	Interpolated position mode
8	Cyclic synchronous position mode
9	Cyclic synchronous velocity mode
10	Cyclic synchronous torque mode

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03550

Parameter | Name:
C03550 | Position notation index

Data type: INTEGER_8
Index: $21025_d = 5221_h$

▸ CiA402 object 0x6089

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03551

Parameter | Name:
C03551 | Position dimension index

Data type: UNSIGNED_8
Index: $21024_d = 5220_h$

▸ CiA402 object 0x608A

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03552

Parameter | Name:
C03552 | Velocity notation index

Data type: INTEGER_8
Index: $21023_d = 521F_h$

▸ CiA402 object 0x608B

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03553

Parameter | Name:
C03553 | Velocity dimension index

Data type: UNSIGNED_8
Index: $21022_d = 521E_h$

▸ CiA402 object 0x608C

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03554

Parameter | Name:
C03554 | Acceleration notation index

Data type: INTEGER_8
Index: $21021_d = 521D_h$

▸ CiA402 object 0x608D

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03555

Parameter | Name:
C03555 | Acceleration dimension index

Data type: UNSIGNED_8
Index: $21020_d = 521C_h$

▸ CiA402 object 0x608E

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03556

Parameter | Name:
C03556 | Position encoder resolution

Data type: UNSIGNED_32
Index: $21019_d = 521B_h$

▸ CiA402 object 0x608F

Display range (min. value | unit | max. value)		
0		4294967295

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03557

Parameter | Name:
C03557 | Encoder increments

Data type: UNSIGNED_32
Index: $21018_d = 521A_h$

▸ CiA402 object 0x608F.1

Setting range (min. value | unit | max. value)			Lenze setting
65536		65536	**65536**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03558

Parameter | Name:
C03558 | Motor revolution

Data type: UNSIGNED_32
Index: $21017_d = 5219_h$

▸ CiA402 object 0x608F.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03559

Parameter | Name:
C03559 | Velocity encoder resolution

Data type: UNSIGNED_32
Index: $21016_d = 5218_h$

▸ CiA402 object 0x6090

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03560

Parameter | Name:
C03560 | Encoder increments per second

Data type: UNSIGNED_32
Index: $21015_d = 5217_h$

▸ CiA402 object 0x6090.1

Setting range (min. value | unit | max. value)			Lenze setting
65536		65536	**65536**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03561

Parameter | Name:
C03561 | Motor revolutions per second

Data type: UNSIGNED_32
Index: $21014_d = 5216_h$

▸ CiA402 object 0x6090.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03562

Parameter | Name:
C03562 | Gear ratio

Data type: UNSIGNED_32
Index: $21013_d = 5215_h$

▸ CiA402 object 0x6091

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03565

Parameter | Name:
C03565 | Feed constant

Data type: UNSIGNED_32
Index: $21010_d = 5212_h$

▸ CiA402 object 0x6092

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03567

Parameter | Name:
C03567 | Feed shaft revolutions

Data type: UNSIGNED_32
Index: $21008_d = 5210_h$

▸ CiA402 object 0x6092.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03568

Parameter | Name:
C03568 | Position factor

Data type: UNSIGNED_32
Index: $21007_d = 520F_h$

▸ CiA402 object 0x6093

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03569

Parameter | Name:
C03569 | Position factor numerator

Data type: UNSIGNED_32
Index: $21006_d = 520E_h$

▸ CiA402 object 0x6093.1

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03570

Parameter | Name:
C03570 | Position factor divisor

Data type: UNSIGNED_32
Index: $21005_d = 520D_h$

▸ CiA402 object 0x6093.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03571

Parameter | Name:
C03571 | Velocity encoder factor

Data type: UNSIGNED_32
Index: $21004_d = 520C_h$

▸ CiA402 object 0x6094

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03572

Parameter | Name:
C03572 | Velocity encoder factor numerator

Data type: UNSIGNED_32
Index: $21003_d = 520B_h$

▸ CiA402 object 0x6094.1

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03573

Parameter | Name:
C03573 | Velocity encoder factor divisor

Data type: UNSIGNED_32
Index: $21002_d = 520A_h$

▸ CiA402 object 0x6094.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03574

Parameter | Name:
C03574 | Velocity factor1

Data type: UNSIGNED_32
Index: $21001_d = 5209_h$

▸ CiA402 object 0x6095

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03575

Parameter | Name:
C03575 | Velocity factor1 numerator

Data type: UNSIGNED_32
Index: $21000_d = 5208_h$

▸ CiA402 object 01x6095.1

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03576

Parameter | Name:
C03576 | Velocity factor1 divisor

Data type: UNSIGNED_32
Index: $20999_d = 5207_h$

▸ CiA402 object 0x6095.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03577

Parameter | Name:
C03577 | Velocity factor2

Data type: UNSIGNED_32
Index: $20998_d = 5206_h$

▸ CiA402 object 0x6096

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03578

Parameter | Name:
C03578 | Velocity factor1 numerator

Data type: UNSIGNED_32
Index: $20997_d = 5205_h$

▸ CiA402 object 01x6096.1

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03579

Parameter | Name:
C03579 | Velocity factor2 divisor

Data type: UNSIGNED_32
Index: $20996_d = 5204_h$

▸ CiA402 object 0x6096.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03580

Parameter | Name:
C03580 | Acceleration factor

Data type: UNSIGNED_32
Index: $20995_d = 5203_h$

▸ CiA402 object 0x6097

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03581

Parameter | Name:
C03581 | Acceleration factor numerator

Data type: UNSIGNED_32
Index: $20994_d = 5202_h$

▸ CiA402 object 01x6097.1

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03582

Parameter | Name:
C03582 | Acceleration factor divisor

Data type: UNSIGNED_32
Index: $20993_d = 5201_h$

▸ CiA402 object 0x6097.2

Setting range (min. value | unit | max. value)			Lenze setting
1		1	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03583

Parameter | Name:
C03583 | Polarity

Data type: UNSIGNED_8
Index: $20992_d = 5200_h$

▸ CiA402 object 0x607E

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03585

Parameter | Name:
C03585 | Load home position

Data type: INTEGER_32
Index: $20990_d = 51FE_h$

▸ CiA402 object 0x60FB.1

Setting range (min. value | unit | max. value)			Lenze setting
-2147483647		2147483647	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03590

Parameter | Name:
C03590 | Position demand value unit

Data type: INTEGER_32
Index: $20985_d = 51F9_h$

▸ CiA402 object 0x6062

Display range (min. value | unit | max. value)		
1		255

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03591

Parameter | Name:
C03591 | Position actual value

Data type: INTEGER_32
Index: $20984_d = 51F8_h$

▸ CiA402 object 0x6063

Display range (min. value | unit | max. value)		
-2147483647		134217727

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03592

Parameter | Name:
C03592 | Position actual value unit

Data type: INTEGER_32
Index: $20983_d = 51F7_h$

▸ CiA402 object 0x6064

Display range (min. value | unit | max. value)		
-2147483647		134217727

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03593

Parameter | Name:
C03593 | Following error window

Data type: UNSIGNED_32
Index: $20982_d = 51F6_h$

▸ CiA402 object 0x6065

Setting range (min. value | unit | max. value)			Lenze setting
0		4294967295	**1000**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03594

Parameter | Name:
C03594 | Following error time out

Data type: UNSIGNED_32
Index: $20981_d = 51F5_h$

▸ CiA402 object 0x6066

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03595

Parameter | Name:
C03595 | Position window

Data type: UNSIGNED_32
Index: $20980_d = 51F4_h$

▸ CiA402 object 0x6067

Setting range (min. value | unit | max. value)			Lenze setting
0		4294967295	**1000**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03596

Parameter | Name:
C03596 | Position window time

Data type: UNSIGNED_32
Index: $20979_d = 51F3_h$

▸ CiA402 object 0x6068

Setting range (min. value | unit | max. value)			Lenze setting
0		0	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03597

Parameter | Name:
C03597 | Following error actual value

Data type: INTEGER_32
Index: $20978_d = 51F2_h$

▸ CiA402 object 0x60F4

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03598

Parameter | Name:
C03598 | Control effort

Data type: INTEGER_32
Index: $20977_d = 51F1_h$

▸ CiA402 object 0x60FA

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03599

Parameter | Name:
C03599 | Position control parameter set

Data type: UNSIGNED_32
Index: $20976_d = 51F0_h$

▸ CiA402 object 0x60FB

Display range (min. value | unit | max. value)		
7		7

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03600

Parameter | Name:
C03600 | Position demand value

Data type: INTEGER_32
Index: $20975_d = 51EF_h$

▸ CiA402 object 0x60FC

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03601

Parameter | Name:
C03601 | Homing method

Data type: INTEGER_8
Index: $20974_d = 51EE_h$

▸ CiA402 object 0x6098

Setting range (min. value | unit | max. value)			Lenze setting
-2		35	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03602

Parameter | Name:
C03602 | Brake control

Data type: UNSIGNED_8
Index: $20973_d = 51ED_h$

▸ CiA402 object 0x60FB.2

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03603

Parameter | Name:
C03603 | Brake torque add

Data type: INTEGER_32
Index: $20972_d = 51EC_h$

▸ CiA402 object 0x60FB.3

Setting range (min. value | unit | max. value)			Lenze setting
-2147483648		2147483647	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03604

Parameter | Name:
C03604 | Following error reaction

Data type: UNSIGNED_16
Index: $20971_d = 51EB_h$

▸ CiA402 object 0x60FB.4

Selection list (Lenze setting printed in bold)	
0	**No response**
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03605

Parameter | Name:
C03605 | Safe IO state

Data type: UNSIGNED_8
Index: $20970_d = 51EA_h$

▸ CiA402 object 0x60FB.5

Display range (min. value | unit | max. value)		
0		255

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03606

Parameter | Name:
C03606 | Safety module state

Data type: UNSIGNED_16
Index: $20969_d = 51E9_h$

▸ CiA402 object 0x60FB.6

Display range (min. value | unit | max. value)		
0		65535

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03612

Parameter | Name:
C03612 | Homing speeds

Data type: UNSIGNED_32
Index: $20963_d = 51E3_h$

▸ CiA402 object 0x6099

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03615

Parameter | Name:
C03615 | Homing acceleration

Data type: UNSIGNED_32
Index: $20960_d = 51E0_h$

▸ CiA402 object 0x609A

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03630

Parameter | Name:
C03630 | Interpolation sub mode select

Data type: INTEGER_16
Index: $20945_d = 51D1_h$

▸ CiA402 object 0x60C0

Setting range (min. value | unit | max. value)			Lenze setting
-11		0	**0**

☑ Read access ☑ Write access ☑ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03631

Parameter | Name:
C03631 | Interpolation data record

Data type: UNSIGNED_32
Index: $20944_d = 51D0_h$

▸ CiA402 object 0x60C1

Display range (min. value | unit | max. value)		
1		1

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03632

Parameter | Name:
C03632 | Interpolated data X1

Data type: INTEGER_32
Index: $20943_d = 51CF_h$

▸ CiA402 object 0x60C1.1

Setting range (min. value | unit | max. value)			Lenze setting
-2147483647		2147483647	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03636

Parameter | Name:
C03636 | Interpolation time period

Data type: UNSIGNED_32
Index: $20939_d = 51CB_h$

▸ CiA402 object 0x60C2

Display range (min. value | unit | max. value)		
2		2

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03637

Parameter | Name:
C03637 | Ip time units

Data type: UNSIGNED_8
Index: $20938_d = 51CA_h$

▸ CiA402 object 0x60C2.1

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03638

Parameter | Name:
C03638 | Ip time index

Data type: INTEGER_8
Index: $20937_d = 51C9_h$

▸ CiA402 object 0x60C2.2

Setting range (min. value | unit | max. value)			Lenze setting

Parameter | Name:
C03685 | Negative speed limit

Data type: INTEGER_32
Index: $20890_d = 519A_h$

▸ CiA402 object 0x60F6.2

Setting range (min. value | unit | max. value)			Lenze setting
-175.00		0.00	**-100.00**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 100

C03686

Parameter | Name:
C03686 | Positive torque limit

Data type: UNSIGNED_16
Index: $20889_d = 5199_h$

▸ CiA402 object 0x60E0

Setting range (min. value | unit | max. value)			Lenze setting
0		32767	**16384**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03687

Parameter | Name:
C03687 | Negative torque limit

Data type: UNSIGNED_16
Index: $20888_d = 5198_h$

▸ CiA402 object 0x60E1

Setting range (min. value | unit | max. value)			Lenze setting
0		32767	**16384**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03688

Parameter | Name:
C03688 | Max torque

Daten type: UNSIGNED_16
Index: $20887_d = 5197_h$

▸ CiA402 object 0x6072

Setting range (min. value | unit | max. value)			Lenze setting
0		32767	**32767**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03690

Parameter | Name:
C03690 | Target position

Data type: INTEGER_32
Index: $20885_d = 5195_h$

▸ CiA402 object 0x607A

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03691

Parameter | Name:
C03691 | Offset position

Data type: INTEGER_32
Index: $20884_d = 5194_h$

▸ CiA402 object 0x60B0

Setting range (min. value | unit | max. value)			Lenze setting
-2147483648		2147483647	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03700

Parameter | Name:
C03700 | Touch probe function

Data type: UNSIGNED_16
Index: $20875_d = 518B_h$

▸ CiA402 object 0x60B8

▸ Touch probe

Setting range (min. value | unit | max. value)			Lenze setting
0		65535	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03701

Parameter | Name:
C03701 | Touch probe function

Data type: UNSIGNED_16
Index: $20874_d = 518A_h$

▸ CiA402 object 0x60B9

▸ Touch probe

Display range (min. value | unit | max. value)		
0		65535

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03706

Parameter | Name:
C03706 | Touch probe pos1 pos value

Data type: INTEGER_32
Index: $20869_d = 5185_h$

▸ CiA402 object: 0x60BA

▸ Touch probe

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03707

Parameter | Name:
C03707 | Touch probe pos1 neg value

Data type: INTEGER_32
Index: $20868_d = 5184_h$

▸ CiA402 object: 0x60BB

▸ Touch probe

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03708

Parameter | Name:
C03708 | Touch probe pos2 pos value

Data type: INTEGER_32
Index: $20867_d = 5183_h$

▸ CiA402 object: 0x60BC

▸ Touch probe

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C03709

Parameter | Name:
C03709 | Touch probe pos2 neg value

Data type: INTEGER_32
Index: $20866_d = 5182_h$

▸ CiA402 object: 0x60BD

▸ Touch probe

Display range (min. value | unit | max. value)		
-2147483647		2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

5.3 Attribute table

The Attribute table contains information required for communicating with the controller via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter designation	Cxxxxx	
Name		Short parameter text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex of array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Only required for access via bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte bit-coded
			BITFIELD_16	2 bytes bit-coded
			BITFIELD_32	4 bytes bit-coded
			INTEGER_8	1 byte with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes without sign
			VISIBLE_STRING	ASCII string
	Factor	Factor for data transmission via bus system, depending on the number of decimal positions	*Factor*	1 ≡ no decimal positions 10 ≡ 1 decimal position 100 ≡ 2 decimal positions 1000 ≡ 3 decimal positions
Access	R	Read access	☑ Reading allowed	
	W	Write access	☑ Writing allowed	
	CINH	Controller inhibit required	☑ Writing only possible when controller is inhibited

1 About this documentation

This documentation contains information about the technology application "Electronic gearbox" for the Servo Drives 9400 series.

Note!

This documentation supplements the mounting instructions supplied with the controller, the hardware manual and the software manual for the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation applies to:

Technology application	Appl. ID	Required runtime software licence
Electronic gearbox	100302202	Motion Control HighLevel or higher
Electronic gearbox *MotionBus*	100302102	Motion Control HighLevel or higher

The technology application can be used with the following controllers:

Product series	Type designation	From hardware version	From software version
9400 Servo Drives	E94AxHExxxx	PD	1.35

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	04/2007	TD05	First edition
1.1	10/2008	TD05	New subchapter "Parameterisable function blocks"
1.2	11/2009	TD05	Error corrections

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window pane	*Italics*	The *Message window*... / The *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Keyboard command	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program listings	Courier	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**Courier bold**	
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse click in this online documentation.
Symbols		
Page reference	(📖 6)	Optically highlighted reference to another page. It is activated with a mouse click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of material damage** Indicates a potential danger that may lead to material damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note for trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Brief description

The technology application "Electronic gearbox" serves to implement a synchronism with adjustable stretching ratio between the drives in the system.

- The ratio can be freely adjusted, the values are input in the form of a fraction (numerator/denominator) with 32 bit resolution.
- The master value can be specified either by a "Virtual master", or via a bus system or the digital frequency extension module. It is selected from the **Application parameter** tab via the **Master value source** list field (C03052).
- The master value transmission (high speed stability) is preset. The actual values can be transmitted by the corresponding selection in the list fields **Master value output** (C3054/1, C3054/2, C3197).

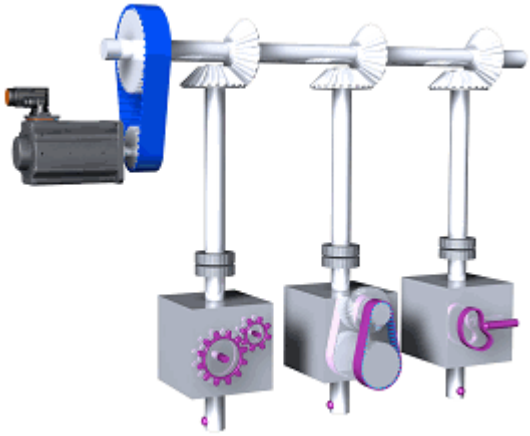
Functions

- Virtual master with inching, handwheel and reduced speed.
- Master value conditioning (master shaft) with master value scaling, stretch factor and reversal of rotation direction.
- Virtual clutch with emergency stop and basic speed
- Trimming function via profile generator.
- Master value conditioning (machine axis/tool) with setpoint scaling.
- Additional operating modes for activating the basic drive functions "Homing", "Manual jog (inching)" and "Position override function".
- Support of the basic drive functions "Quick stop" and "Limiter".
- Following error monitoring.
- Optional control of a holding brake.

Application range

- Slitters
- Calender drives
- Line drives
- Conveying belts
- Vibrators
- Roller mills
- Stretching machines
- Wire drawing machines

Required license/delivery



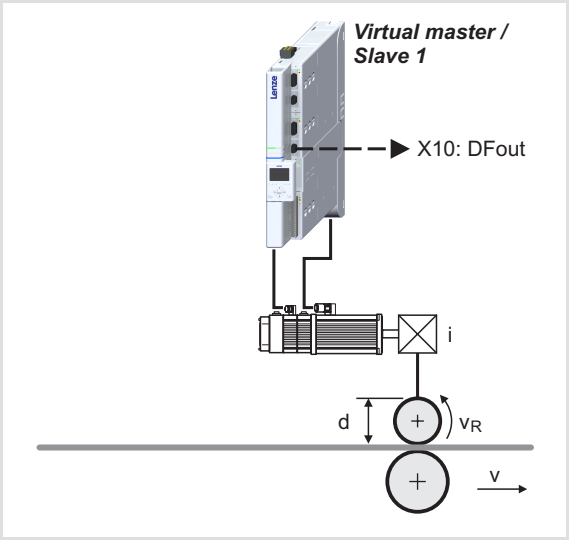
- License stage Motion Control HighLevel or higher required.
- The technology application can be selected in the »Engineer« application catalog.

3 Introduction

The following subchapters provide information on the electrical shaft.

3.1 Synchronisation of the drives via a master angle

By coupling the drives via a master angle the positions are firmly allocated to each other like a mechanical shaft.

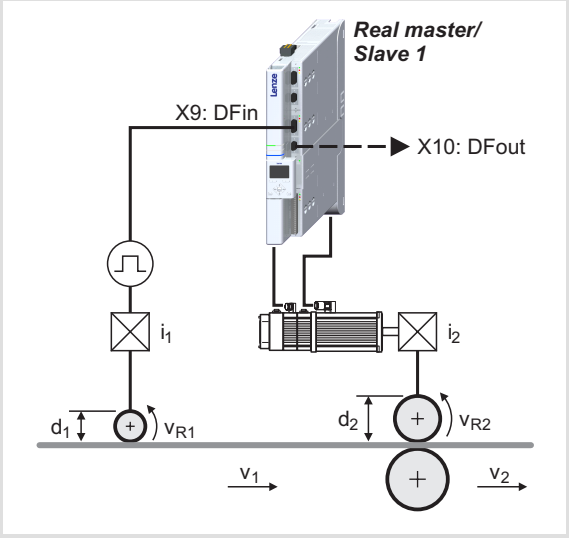


- A drive with a virtual master or a real master (encoder) is able to create the master angle and transmit this to the other drives which follow this master angle.

Advantages of this type of synchronisation

- The communication between the drives is very simple. A time-consuming evaluation of the status signals of each drive and the control signals to be generated from it for each single drive is not required.
- Due to the flexible electronics trimming functions can be carried out very easily. Thus, motion sequences in machines can be easily synchronised and optimised.
- A variation of the master angle speed changes the number of cycles of the machine. The drives keep the position allocation.

3.2 Virtual master/real master



Virtual master

- In an interconnection, a drive takes over the task of the (virtual) master and is the first slave drive at the same time.
- The master value created in the TA by the "Virtual master" function is transmitted via a bus system or the digital frequency output to the other slave drives.

[3-1] Example "Virtual master" (with master value transmission via digital frequency extension module)

Real master

- The master value for a slave drive can be also specified by a real master (e.g. external encoder).
- The master value can be specified e.g. via the digital frequency input of the master frequency extension module or a bus system.
- The master value (possibly conditioned in the TA) by the "Virtual master" function is transmitted via a bus system or the digital frequency output to the other slave drives.

[3-2] Example "Real master" (with master value transmission via digital frequency extension module)

3.3 Transmission of the master angle

The master value/angle can be transmitted via the following transmission media:

- Digital frequency (simulation of an incremental encoder)
- System bus (CAN)
- ETHERNET Powerlink

The transmission medium is selected according to the criteria listed in the below table:

	Transmission medium		
Criterion	**Digital frequency**	**System bus (CAN)**	**ETHERNET Powerlink**
Network structure	Rail or cascade	Rail	Rail or cascade
Master value/master angle transmission	Only relative	Absolute or relative	Absolute or relative
Max. resolution	16 bits/revolution	24 bits/revolution	24 bits/revolution
Cable length	Virtually unlimited, but max. 50 m from drive to drive.	Depends on baud rate, number of nodes and cable cross-section. With a baud rate of 500 kbits/s the total cable length is limited to e.g. 117 metres.	Virtually unlimited, but max. 100 m from drive to drive.
Additional hardware required	Digital frequency extension module (E94AYFLF)	No, interface is already integrated in 9400 HighLine (CAN on board).	ETHERNET Powerlink communication module (E94AYCEP)

* In preparation; at present 16 bits/revolution

3.4 Speed or angular synchronism?

The decision whether to use a speed or angular synchronism mainly refers to the TA "Electronic gearbox".

Angular synchronism

Use the angular synchronism if the material is not able to absorb any force and no remaining positional variation must be available. Please note that a position controller always causes additional trouble in a track since disturbances and reference value variations must be compensated exactly.

Speed synchronism

Use the speed synchronism if the material is able to absorb force which ensures a better concentricity.

3.5 Rail or cascade structure?

Rail structure

All drives obtain the same master value/master angle.

Cascade structure

Each drive obtains its own master value/master angle which is created or merely prepared through the upstream drive.

3.6 Master or actual value transfer?

Master value transmission

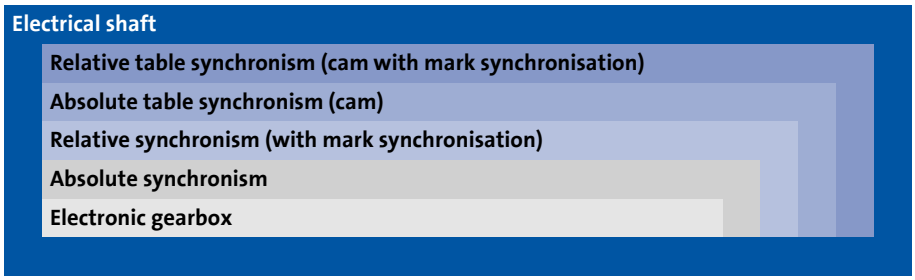
The master value transfer results in a much quieter machine running. The mark corrections, superimposed control functions and disturbances of the drive, however, do not affect the system.

Actual value transfer

The actual value transfer results in an uneven machine running. Mark corrections, superimposed control functions and disturbances of the leading drive affect the system.

3.7 Absolute or relative master angle processing?

Absolute master angle processing



All drives have a common fix reference to each other via the position of the master angle.

Relative master value/master angle processing

Stands for a high-precision transmission of the master value. However, there is no firm reference to the other drives (e.g. in case of a material path each printing roll is synchronised one by one to the print image).

3.8 Functions with synchronisation via the electrical shaft

The functions of the electrical shaft are built on each other and thus are scalable:

Electronic gearbox

The electronic gearbox represents the simplest function in the DC-bus operation via the electrical shaft. The function is suited for e.g. material transport or material processing. A direct synchronism of tools to a material path can be created without direct position reference or for stretching machines with adjustable stretching ratio.

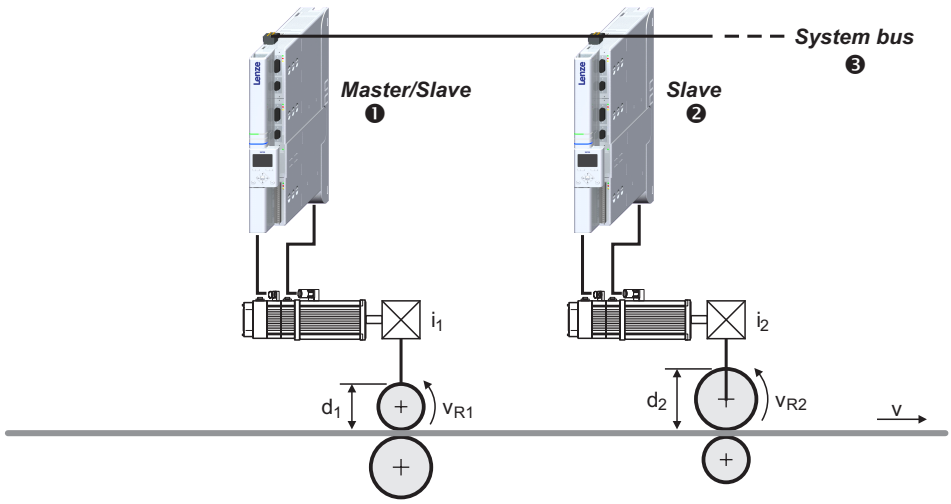
Absolute synchronism

This function is suited for applications with continuously rotating tools (e.g. groove cylinder), which are fed with material in a fixed machine cycle and for which several tools have to be synchronised to each other.

Relative synchronism (with mark synchronisation)

This function is suited for processing continuous material in the form of a material web. Here the tools (e.g. pressure cylinders) are aligned via marks to e.g. print images which are located on the web. There must be no risk of collision. We distinguish between "Relative synchronism with register formation and mark synchronisation" and "Relative synchronism with register control".

Absolute table synchronism (cam)

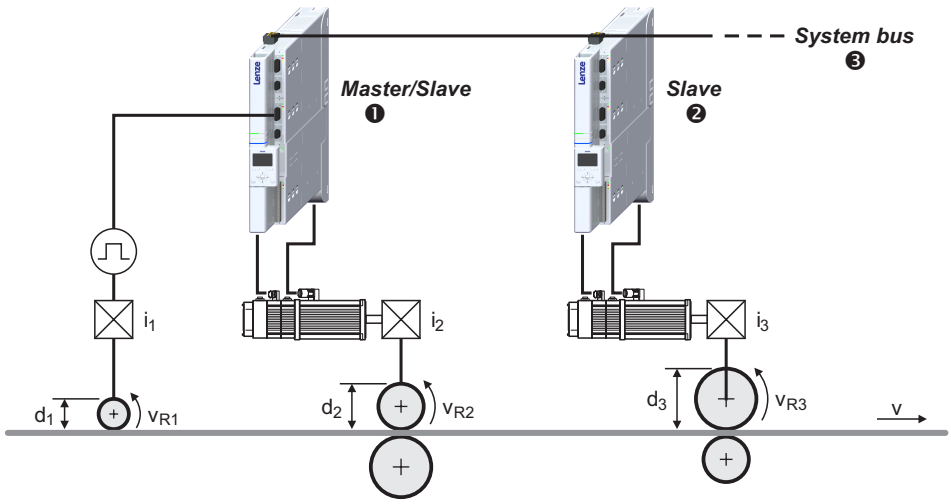


Like "Absolute synchronism", although the tools can also perform a non-linear movement.

Relative table synchronism (with mark synchronisation)

Like "Relative synchronism", although the tools can also perform a non-linear movement.

3.9 Application examples

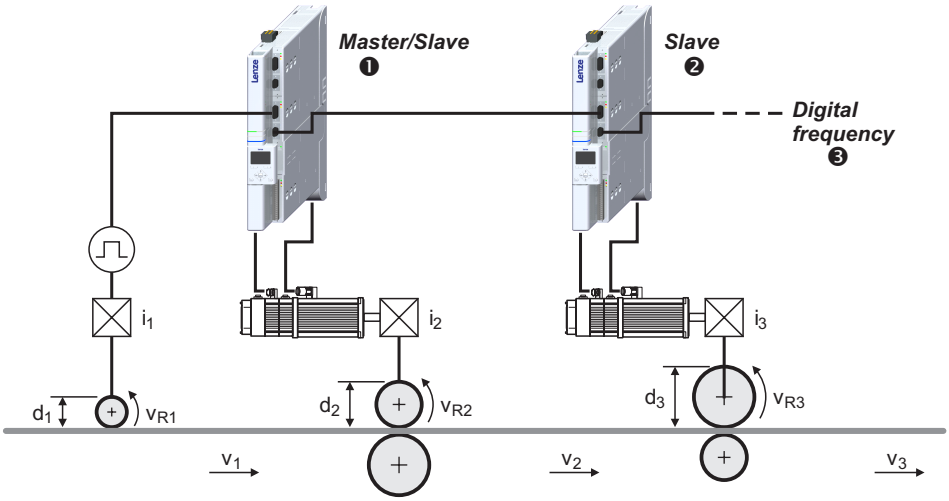


3.9.1 Electronic gearbox with virtual master

❶ Virtual master (and slave 1)
❷ Slave 2
❸ Electrical shaft, implemented here via system bus (CAN).

[3-3] Electronic gearbox with virtual master (rail)

3.9.2 Electronic gearbox with real master



❶ Real master/slave 1 (digital frequency extension module required)
❷ Slave 2
❸ Electrical shaft, implemented here via system bus (CAN).

[3-4] Electronic gearbox with real master (rail)

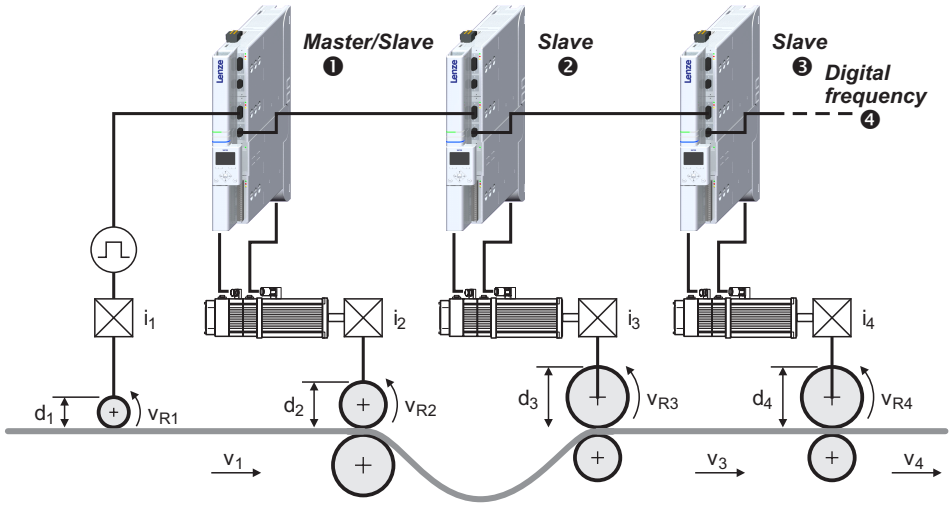
3.9.3 Electronic gearbox as cascade

The technology application "Electronic gearbox" is often operated as cascade since changes of speed/gearbox ratio of an upstream drive also have an effect on the subsequent drive.

- Typical applications are, for instance, stretching machines, wire drawing machines and roller mills.
- There is no position reference between tool and material. However, it may be required to position the tools for maintenance work.
- The master speed is transmitted via the digital frequency or ETHERNET Powerlink.

❶ Real master/slave 1
❷ Slave 2
❸ Digital frequency cascade (digital frequency extension module required)

[3-5] Electronic gearbox with real master (cascade)

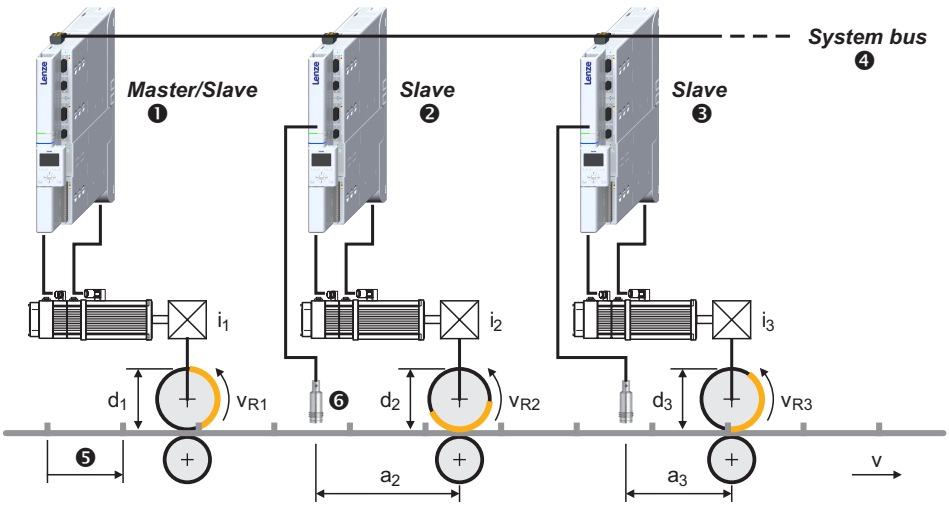


- The following applies to the speed of the web in case of a cascade:

$$v_3 > v_2$$

$$v_3 = v_2 \cdot K$$

3.9.4 Tighten the web via trimming function with cascade

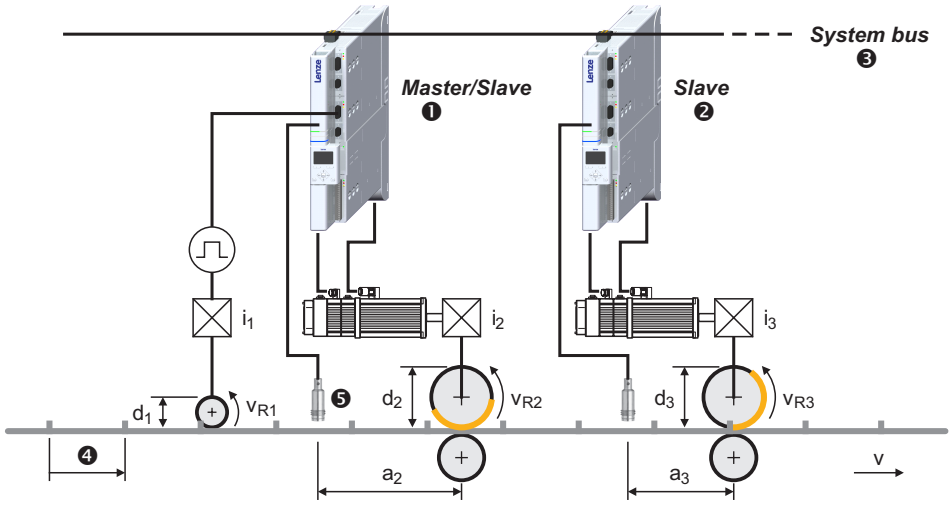


In case a clearance has developed, the web must be "tightened" again. Only then the machine can be accelerated again via the master. The subsequent slave (cascade structure) must run along in the set ratio. Thus, the trimming function acts directly before or after the stretching factor.

❶ Real master/slave 1
❷ Slave 2 with master value trimming
❸ Slave 3
❹ Digital frequency cascade (digital frequency extension module required)

[3-6] Trimming function in case of the electronic gearbox as cascade

3.9.5 Relative synchronism with mark synchronisation and virtual master



❶ Virtual master (and slave 1)
❷ Slave 2
❸ Slave 3
❹ Electrical shaft, implemented here via system bus (CAN).
❺ Register (cycle of guiding angle/guiding angle)
❻ Sensor for mark synchronisation

[3-7] Relative synchronism with virtual master (rail)

In case of the relative synchronism with mark synchronisation, there is a position reference between tool and web, which occurs in each register. For this, a slight correction is superimposed to the synchronous motion with regard to the web. Such applications are, for instance, printing machines.

For the mark synchronisation in particular the register ❺ (the cycle of the guiding angle) and the distance of the sensor ❻ from the home position of the tool (distances a_2 and a_3) are relevant.

3.9.6 Relative synchronism with mark synchronisation and real master

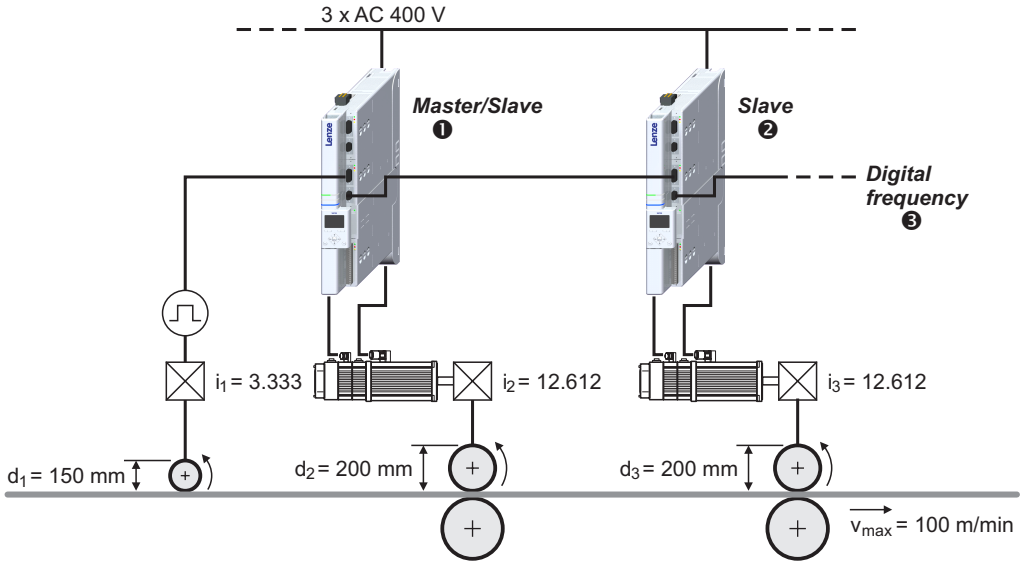
❶ Real master/slave 1 (digital frequency extension module required)
❷ Slave 2
❸ Electrical shaft, implemented here via system bus (CAN).
❹ Register (cycle of guiding angle/guiding angle)
❺ Sensor for mark synchronisation

[3-8] Relative synchronism with real master (rail)

4 Short setup

Note!

The electrical shaft can be implemented with a bus system as e.g. system bus (CAN) or Ethernet Powerlink or via digital frequency transmission.



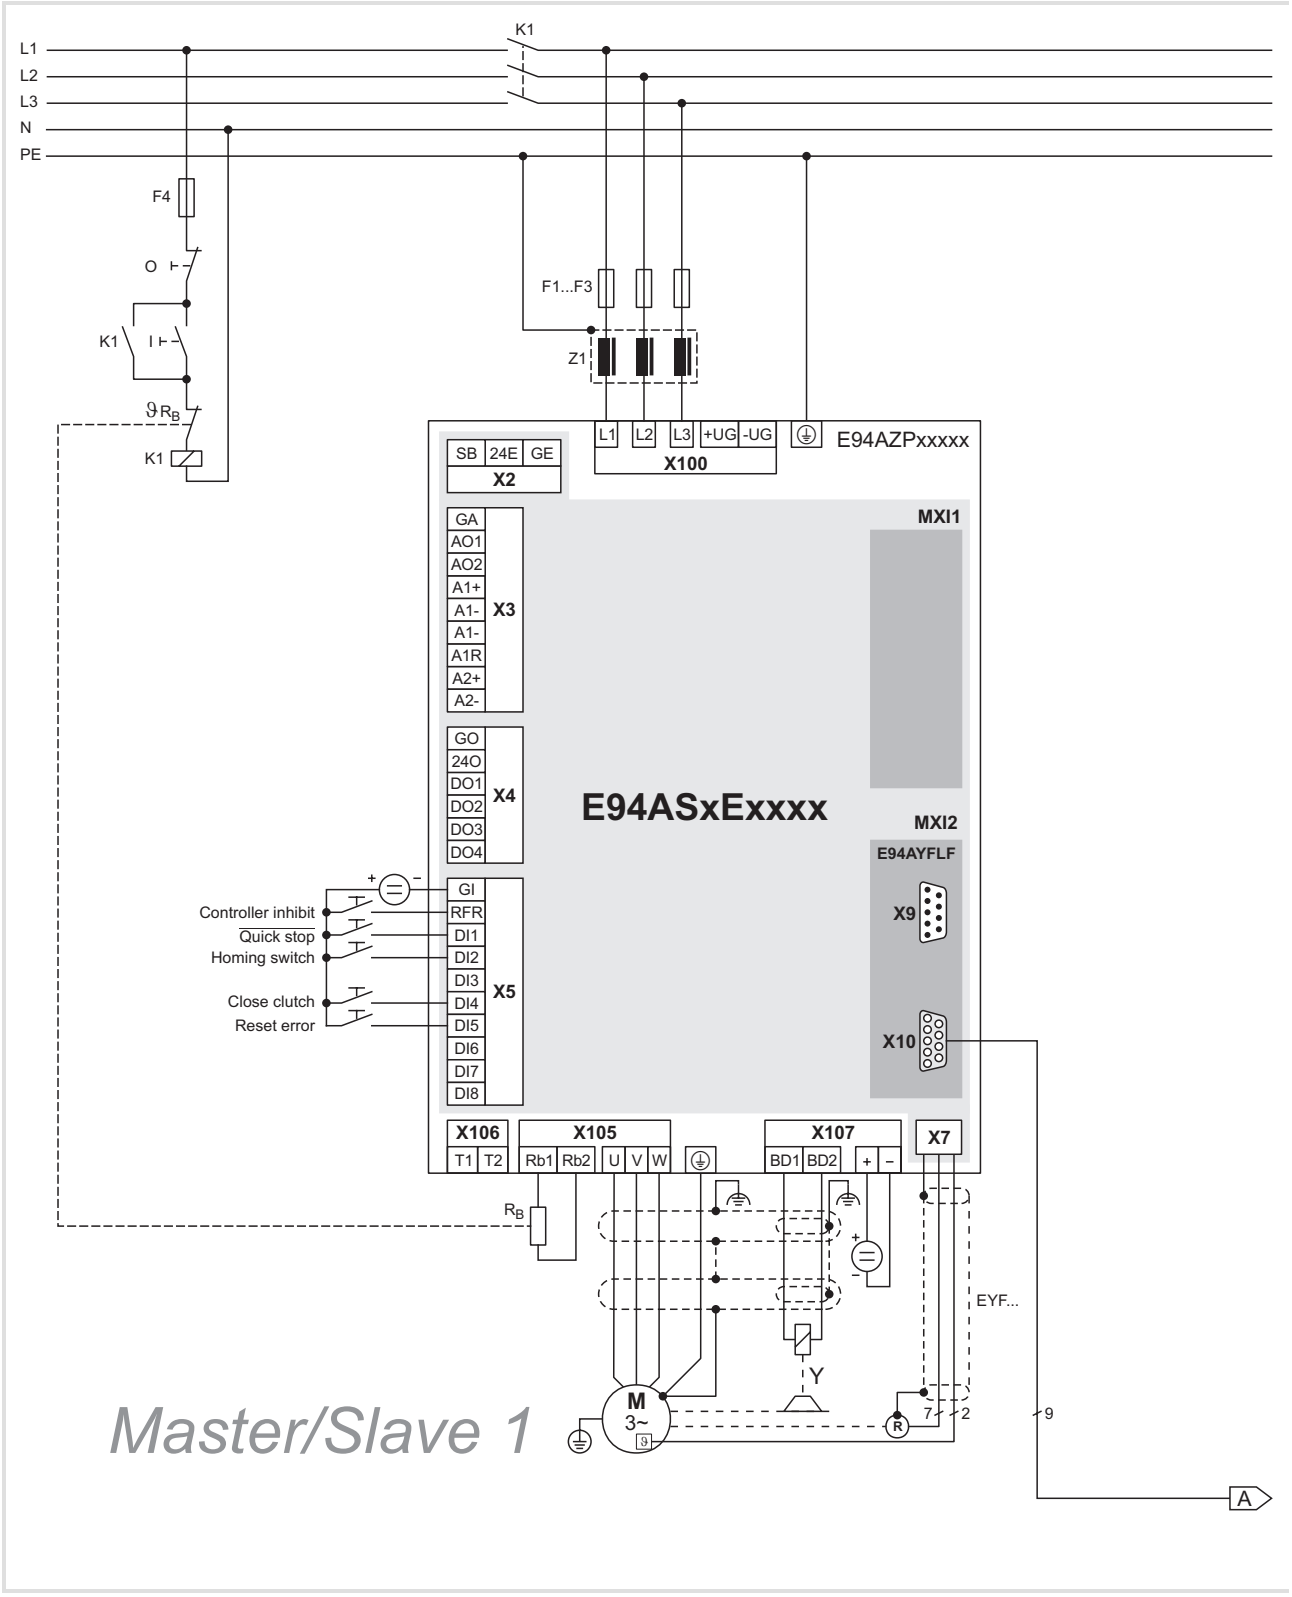
With regard to the configuration of the digital frequency extension module in the controller, two variants of technology applications are available in the »Engineer« application catalog.

- In the TA variant "Electronic gearbox" the configuration of a digital frequency extension module is expected. Therefore, the TA can provide the function of the electrical shaft either via digital frequency transmission and via a bus system.
- In the TA variant "Electronic gearbox *MotionBus*" the configuration of a digital frequency extension module is not included and corresponding interfaces are not available in the TA. Thus the function of the electrical shaft with this TA can only be provided via a bus system.

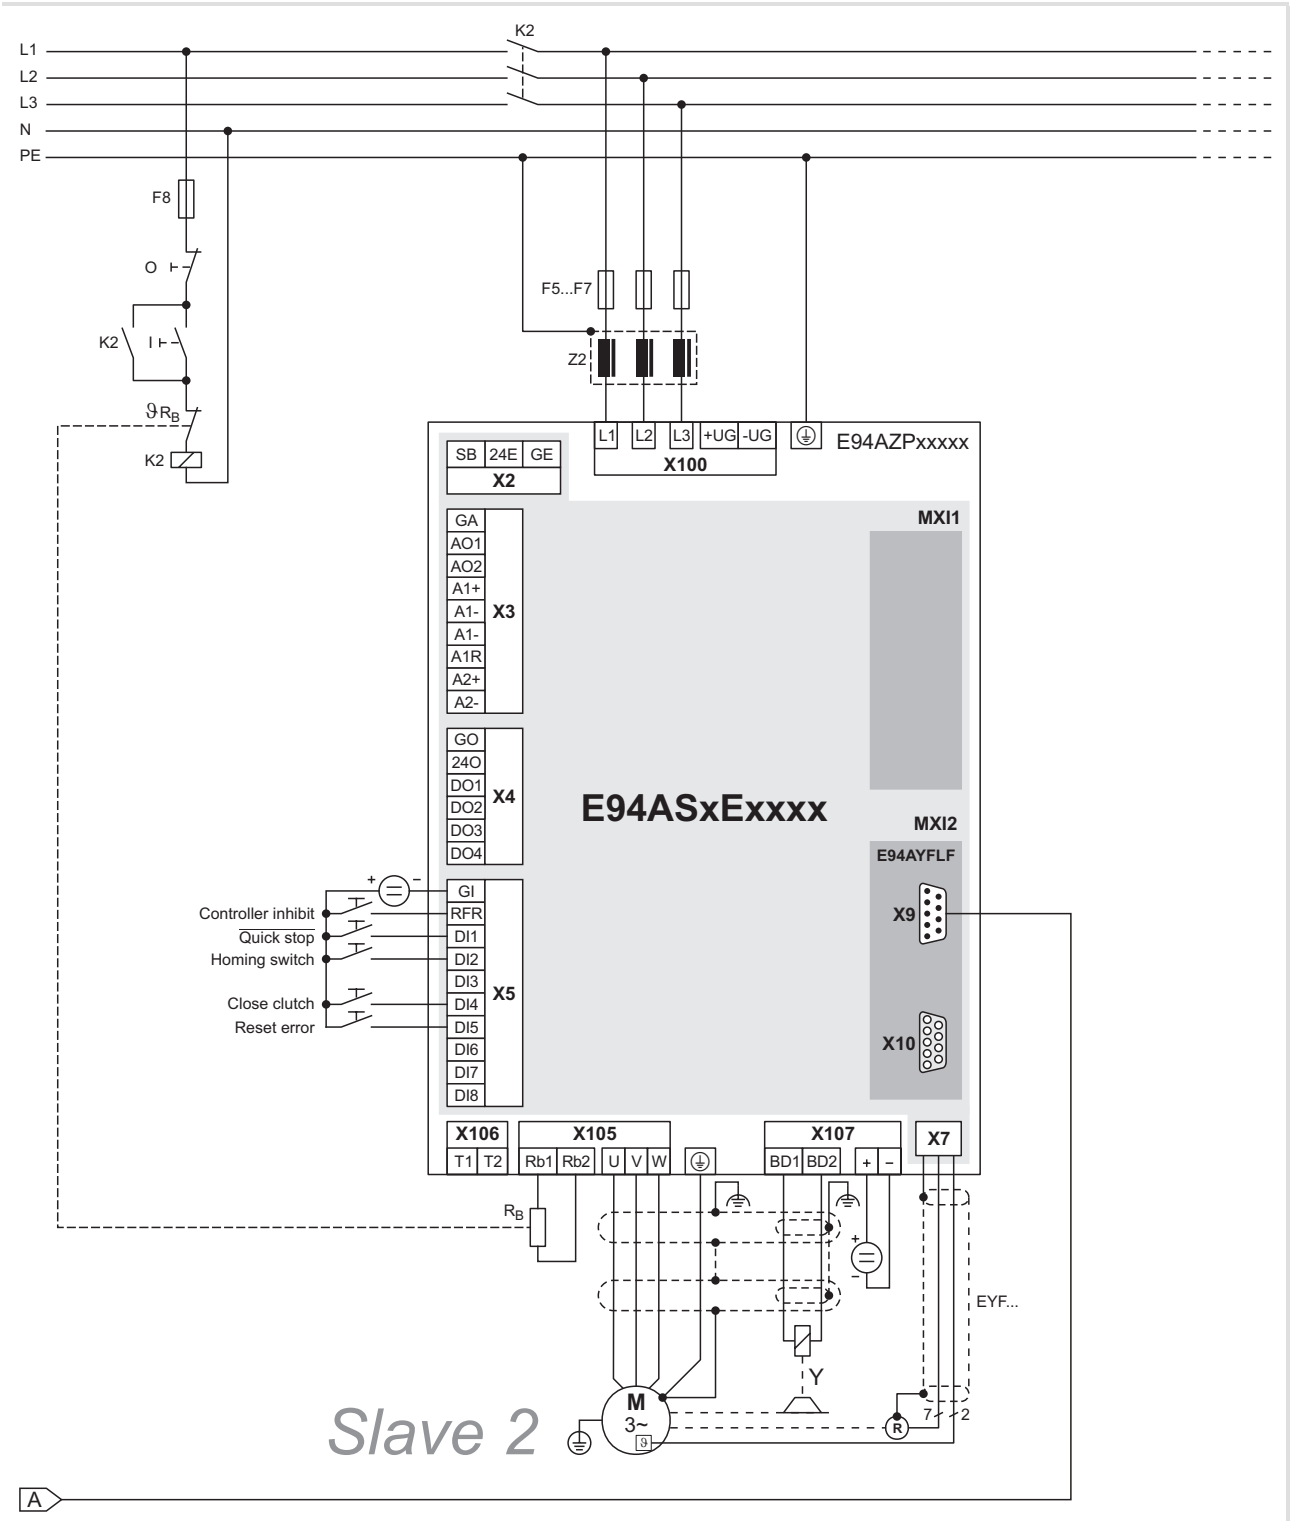
4.1 Application example

In the application example used for short setup, the technology application "Electronic gearbox" is operated as cascade since changes of speed/gearbox ratio of an upstream drive also have an effect on the subsequent drive.

- Typical applications are, for instance, stretching machines, wire drawing machines and roller mills.
- There is no position reference between tool and material. However, it may be required to position the tools for maintenance work.
- The master speed is transmitted via the digital frequency (digital frequency extension module required).



❶ Real master/slave 1
❷ Slave 2
❸ Digital frequency cascade (digital frequency extension module required)



[4-1] Schematic diagram

Component	Technical data	
Controller 1 & 2	9400 SingleDrive HighLine with brake module	
Motor 1 & 2	MDFKA-090-22, 60	
	Type:	Asynchronous servo motor
	Connection:	Y
	Power factor:	0.8
	Rated current:	8.5 A
	Rated frequency:	60 Hz
	Rated power:	3.8 kW
	Rated speed:	1680 rpm
	Rated voltage:	390 V
Gearbox i_1	Gearbox factor:	3.333 (resulting number of teeth: 10/3)
Gearbox i_2, i_3	Gearbox factor:	12.612

4.2 Connection diagram

[4-2] Connection diagram master/slave 1

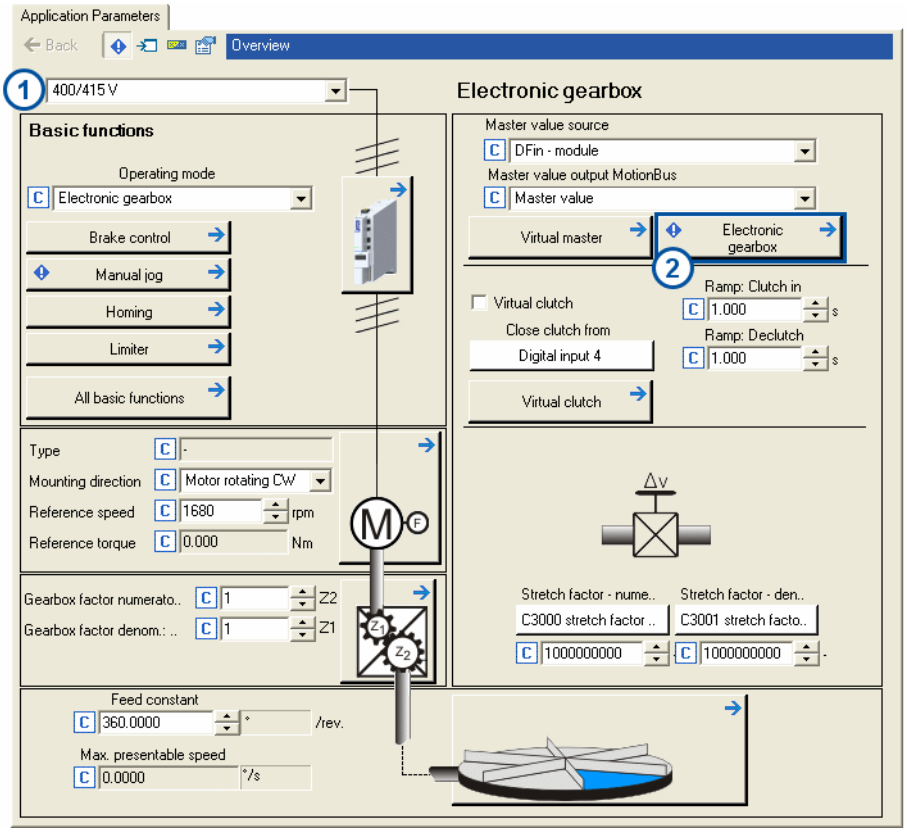
[4-3] Connection diagram slave 2

Designation	Component
E94ASxExxxx	9400 Single Drive servo axis module
E94AZPxxxxx	Mounting backplane
E94AYFLF	Digital frequency extension module (in module slot MXI1)
K1, K2	Mains contactor
F1 ... F8	Fuses
Z1, Z2	Mains filter/RFI filter (option)
⏚	HF-shield termination through large-surface connection to functional earth
EYF...	System cable for resolver feedback
R	Resolver
R_B	Brake resistor
Y	Motor holding brake (at optional motor brake control)

4.3 Step 1: Creating a project

Tip!

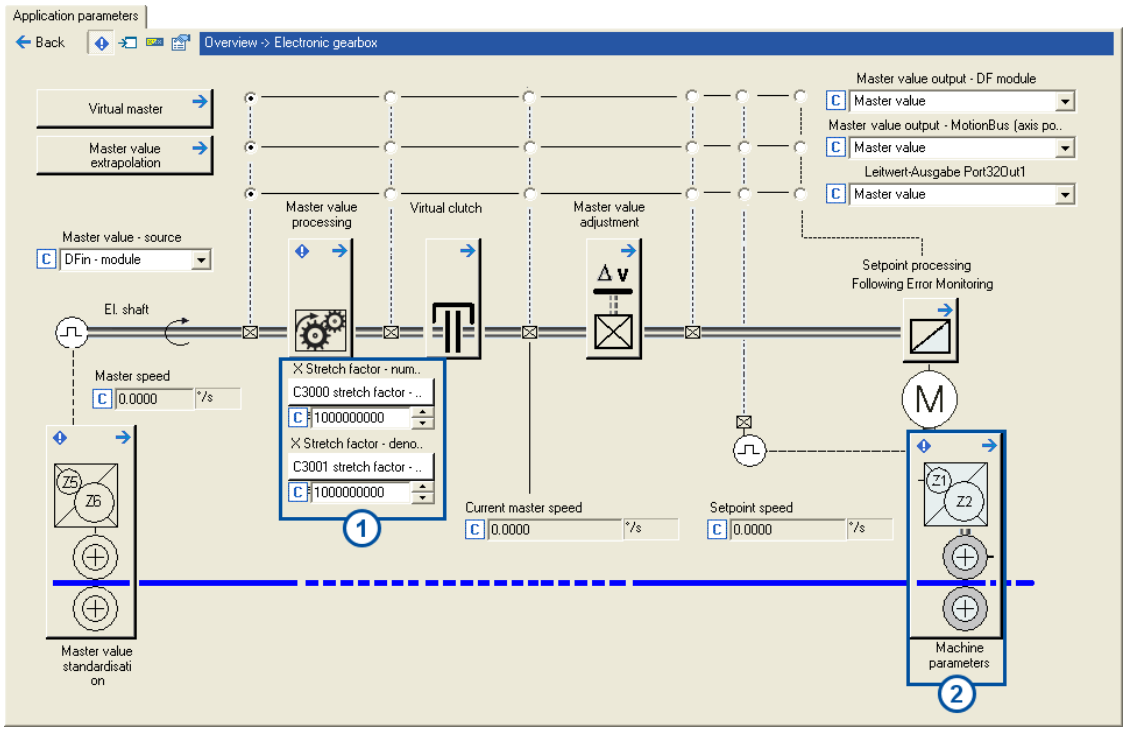
Since the components of the master and slave axis are identical in the application example, you can use the *copy&paste* function to create the project in the »Engineer«:



- In the first step, only insert the master drive axis.
- Then, parameterise the technology application "Electronic gearbox" for the master drive.
- When the required settings have been made, copy the master axis in the project view, paste it, and rename it.

1. Start »Engineer«.
2. Go to *Start-up wizard* and select the option "New project (empty)" and enter a name for the project in a next step.
3. Insert the axis for the master drive.
   – Add the corresponding components to the axis (controller, motor, digital frequency extension module).
   – Select the application "Electronic gearbox" for the controller. (Do not select "Electronic gearbox *MotionBus*" because the digital frequency extension module is only supported by the variant without *MotionBus*.)
   – Example *project view* in the »Engineer«:

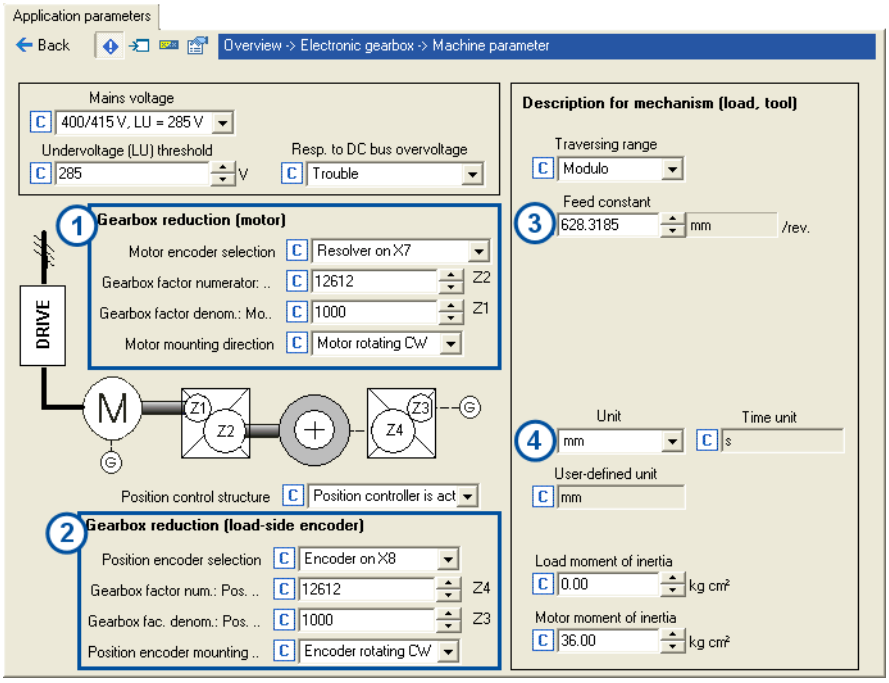
4.4 Step 2: Parameterising the application



For parameterising the application in the »Engineer«, use the **Application parameters** tab which will be displayed by default when selecting the controller in the *project view*:

1. Select the mains voltage (C00173).
2. Click **Electronic gearbox** to change to the dialog level *Overview* → *Electronic gearbox* for further parameter setting.

Electronic gearbox

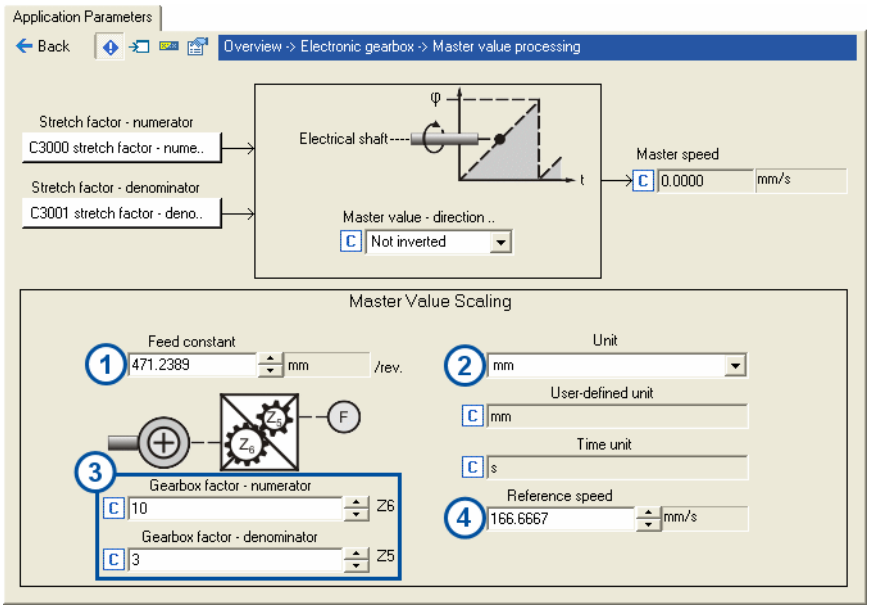


Go to dialog: → **Overview**
→ **Electronic gearbox**

1. Select the synchronism ratio between master and slave drive:
   – Stretch factor numerator (C03000)
   – Stretch factor denominator (C03001)
2. Click **Machine parameters** to change to the dialog level *Overview* → *Electronic gearbox* → *Machine parameters*.

Machine parameters

Go to dialog: → **Overview** → **Electronic gearbox** → **Machine parameters**



1. Set gearbox ratio for the motor in the form of a quotient (numerator and denominator): i_2 = 12.612 = 12612/1000
   - Numerator (C02520) = 12612
   - Denominator (C02521) = 1000
2. Set the same gearbox ratio for the encoder on the load side:
   - Numerator (C02522) = 12612
   - Denominator (C02523) = 1000
3. Set feed constant (C02524).
   - The feed constant corresponds to the motion of the machine at one revolution of the gearbox output shaft.
   - For the conveyor drive: Vk = $d_2 * \pi$ = 628,3185 mm
4. Set the selection "mm" as unit (C02525).
   - This parameter is used to define the real unit of the machine for the selection of physical values (e. g. speeds, accelerations and decelerations).
5. Click **Back** to go back to the *Electronic gearbox* dialog level.
6. In the *Electronic gearbox* dialog level, click **Master value processing** to change to the *Master value processing* dialog level.

Master value processing

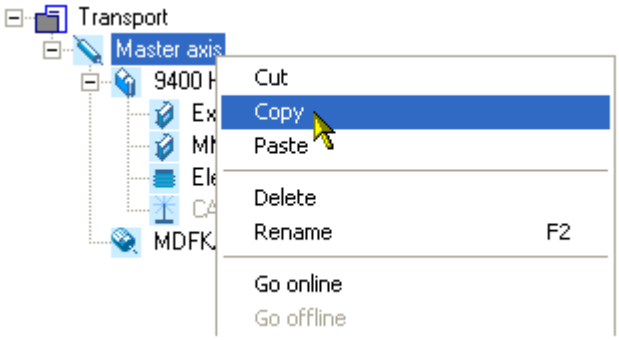
Go to dialog: → Overview → Electronic gearbox → Master value processing

Note!

All controllers in the network must have the same master value processing settings!

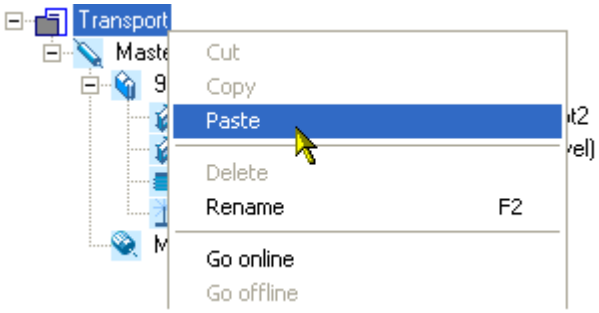
1. Set feed constant (C03932).
   – For the master value: Vk = d_1 * π = 471.2389 mm
2. Set the selection "mm" as path unit (C03933).
3. Set the gearbox ratio for the master value as a quotient (numerator and denominator): i_1 = 3.333 = 10/3
   – Numerator (C03930) = 10
   – Denominator (C03931) = 3
4. Set the max. machine speed as reference speed (C03941):
   – v_{max} = 100 m/min = 166.6667 mm/s

Tip!



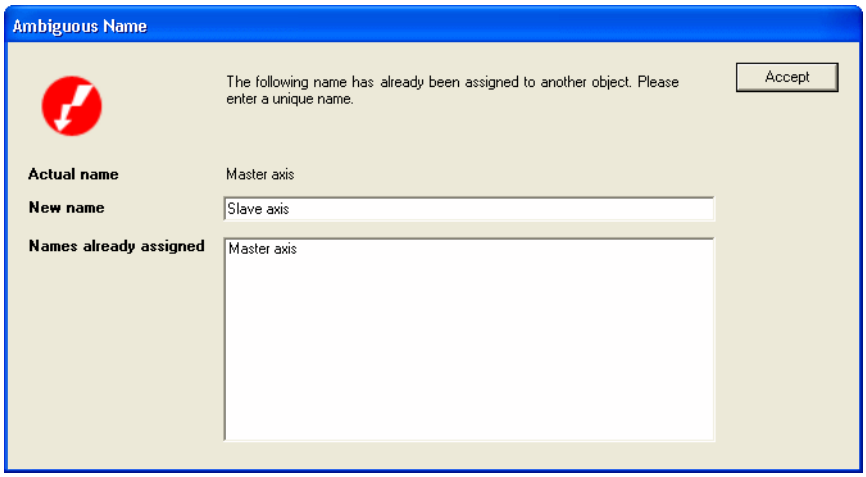
For operation with a virtual master the following setting of the gearbox ratio is recommended to achieve a good resolution of the guiding angle/master value:

- Numerator (C03930) = 100
- Denominator (C03931) = 1

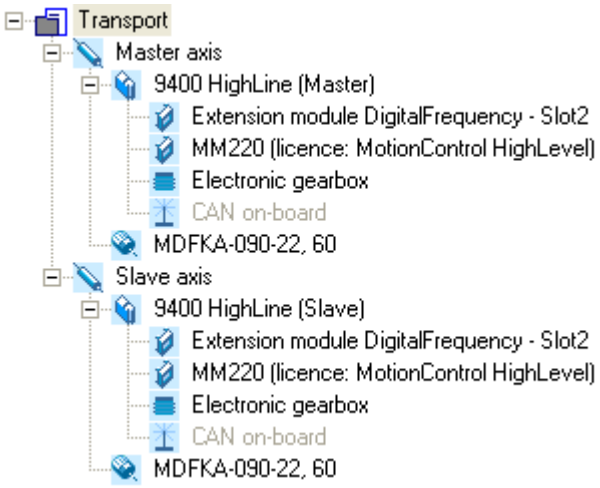


4.5 Step 3: Adding a slave axis to the project

Use the *copy&paste* function in the *project view* for not having to enter all settings for the slave axis once again:



1. Copy the master axis in the *project view*.
   – For this, select the master axis, open the *context menu* (right mouse button) ,and click **Copy**:



2. Paste the copy of the master axis into the *project view*.
   – For this, select the topmost project element, open the *context menu* (right mouse button), and click **Paste**:

3. Rename the copy of the axis pasted.
   – All axes in the *project view* must have an unambiguous name. This is why the following dialog box in which you are asked to rename the axis (e.g."slave axis") appears automatically after pasting:

4. Rename the copy of the controller.
   – The *Ambiguous name* dialog box appears once again for the copied controller because all controllers must have an unambiguous name in the *project view*.
   – Enter e.g. "9400 HighLine (slave)" as controller name.
   – Example *project view* in the »Engineer«:

4.6 Step 4: Transferring applications to the controllers

Note!

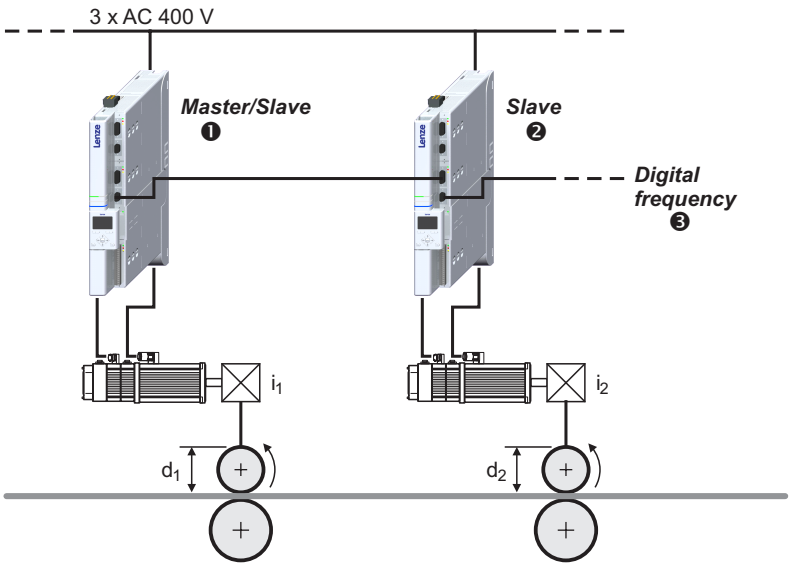
The transferred application is always stored in the first application memory location in the memory module of the controller.

The preinstalled technology applications on the following memory locations are still available.

1. Update devices.
   - Set the checkmark in the control field **Recreate all**.
   - Click **Create** to start the compiling process.
2. Go online and transfer the applications to the controllers.

4.7 Step 5: Controlling applications via terminals

Terminal assignment

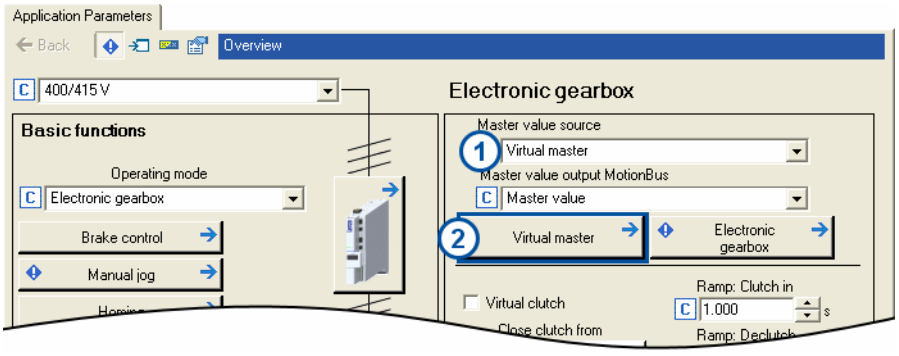


Terminal		Assignment (Lenze setting)
X5	RFR	Controller enable
	DI1	Quick stop • If DI1 is set to LOW level, the drive is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time.
	DI2	Connection of reference switch
	DI3	-
	DI4	Close clutch
	DI5	Reset error • By means of a LOW-HIGH edge an existing error status can be reset if the cause of the fault is removed.
	DI6	-
	DI7	-
	DI8	-

Procedure

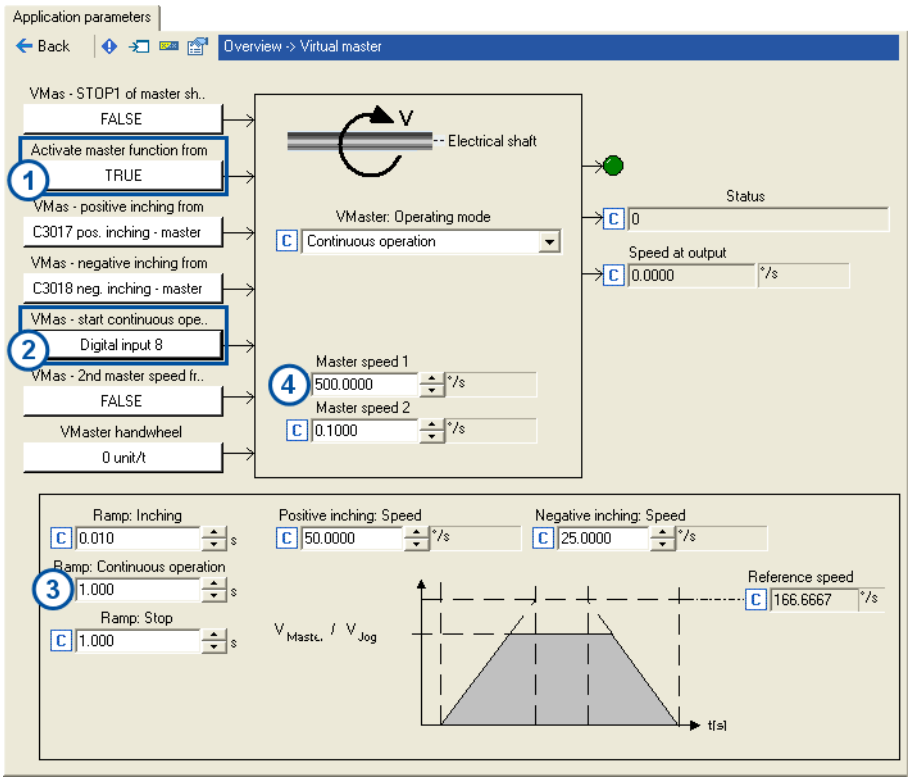
1. Enable controller: Set digital input RFR to HIGH level.
2. Deactivate quick stop: Set digital input DI1 to HIGH level.

4.8 Using the "Virtual master" function



Instead of a real master, you can also use a "virtual master" for operating the electronic gearbox. In this case, one drive in the network acts both as a (virtual) master and the first slave drive. The master value generated by the "Virtual master" function in the TA is transferred to the other slave drives via the digital frequency output:

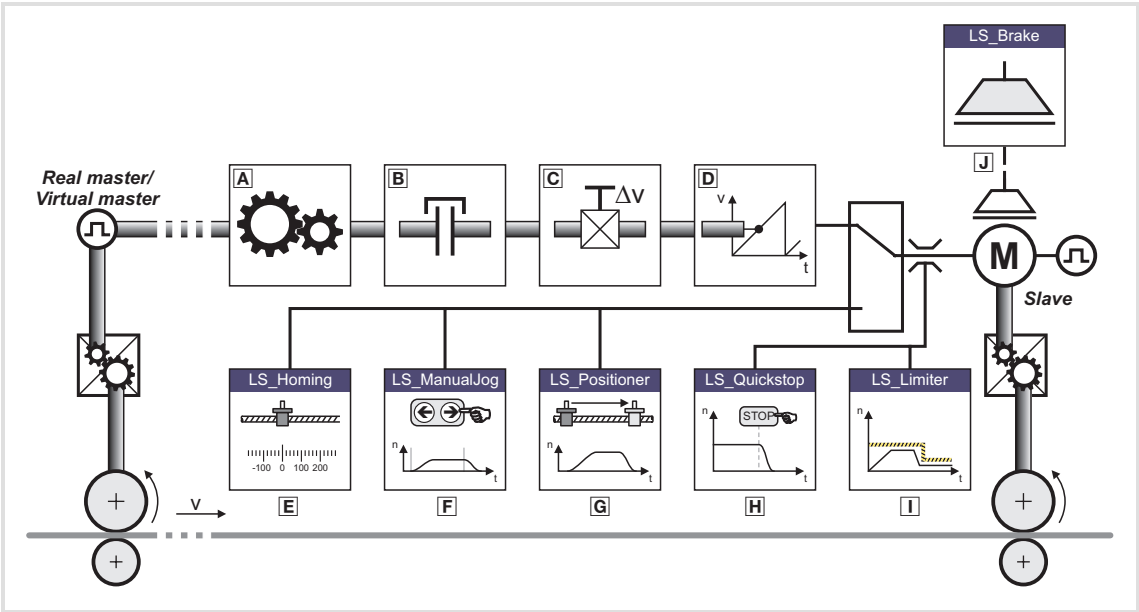
❶ Virtual master/slave 1
❷ Slave 2
❸ Digital frequency cascade (digital frequency extension module required)



[4-4] Schematic diagram

Based on the previously described short setup, the following additional settings have to be made for the master drive for using the "Virtual master" function:

1. Select "Virtual master" as master value source (C03052) in the *Overview* dialog level.
2. Click **Virtual master** to change to the dialog level *Overview* → *Virtual master*.



Go to dialog: → **Overview** → **Virtual master**

1. Set control input **Activate master function** to TRUE.
   – For this, click the white button, go to the *I/O configuration for...* dialog box in the **Constants** tab and activate **TRUE**.
2. Assign control input **VMas - start continuous operation** e.g. to digital input DI8.
   – For this, click the white button, go to the *I/O configuration for...* dialog box in the **Digital input terminals** tab and activate **Digital input 8**.
3. Select Ramp: Continuous operation (C03570/2).
4. Select Master speed 1 (C03568/1).

5 Parameter setting & configuration

5.1 Basic signal flow

[5-1] Signal flow of the TA "Electronic gearbox" (schematic diagram)

Functions in the operating mode "Electronic gearbox"

A Master value processing with stretch factor

B Virtual clutch

C Master value trimming

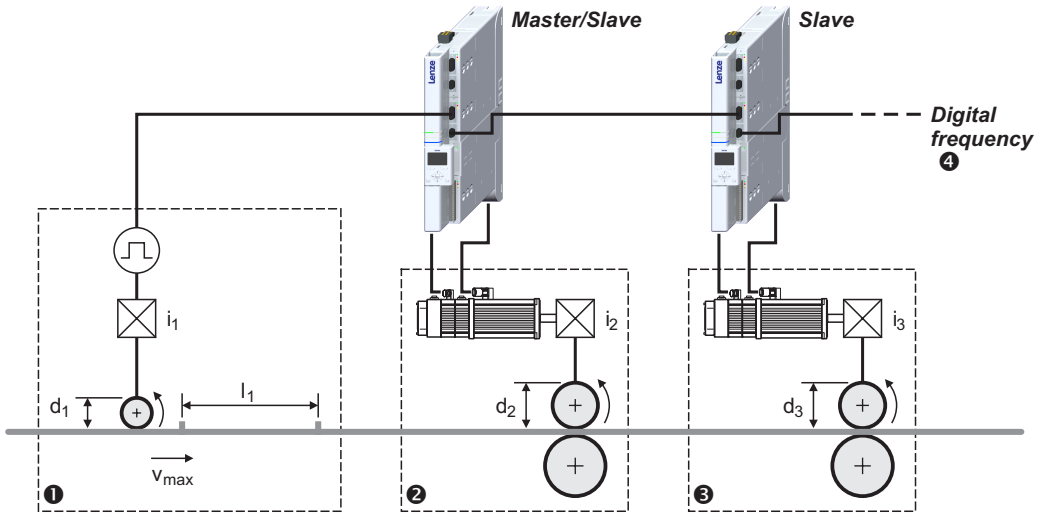
D Setpoint conditioning

Basic drive functions

E Homing

F Manual jog (inching)

G Position override function



H Quick stop

I Limiter (optional)

J Brake control (optional)

5.2 Machine parameters

The following schematic diagram shows the relevant global data (machine parameters) for the interconnection via the electrical shaft:

❶ Master axis (here: master value encoder as real master)
❷ Slave axis 1
❸ Slave axis 2
❹ Digital frequency cascade (digital frequency extension module required)

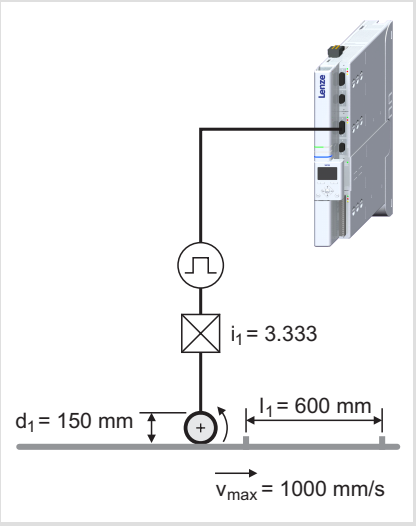
[5-2] Schematic diagram of the most important machine parameters

Symbol	Description
i_1	Gearbox ratio of master value encoder
d_1	Diameter of the master roll
l_1	Master value cycle (if available)
v_{max}	Maximum speed
i_2, i_3	Gearbox ratio of the slave axes
d_2, d_3	Diameter of the slave rolls

Detailed information for setting the machine parameters can be obtained from the following subchapters.

5.2.1 Master axis (master shaft)

For scaling and imaging the master value in the application, the machine parameters of the higher-level drive (master shaft) must be set.



Note!

When setting (scaling) the electrical shaft, ensure that the ratio and encoder constants are identical for all drives in the system. The reference to the scaling of the master drive is sensible.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Master value processing*

Parameter		Lenze setting	
		Value	Unit
C03930	Gearbox ratio - numerator	1	
C03931	Gearbox ratio - denominator	1	
C03932	Feed constant	360.0000	unit/ revolution
C03933	Path units	User-defined	
C03934	User-defined path unit	°	
C03938	Cycle	360.0000	unit
C03941	Reference speed	500.0000	unit/t

Example of determining the machine parameters for the master axis

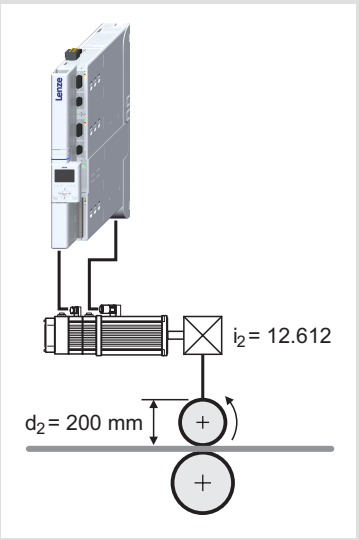
1. Set gearbox ratio for the master value in the form of a quotient (numerator and denominator): $i_1 = 3.333 = 10/3$
   - Numerator (C03930) = 10
   - Denominator (C03931) = 3
2. Set feed constant (C03932).
   - For the master value: $Vk = d_1 * \pi = 471.2389$ mm
3. Set the selection "mm" as path unit (C03933).
4. As reference speed (C03941) set the max. machine speed v_{max} = "1000 mm/s".

Tip!

Setting the cycle (C03938) only is required if the selection "Modulo" is set as traversing range (C02528).

For operation with a virtual master the following setting of the gearbox ratio is recommended to achieve a good resolution of the guiding angle/master value:

- Numerator (C03930) = 100
- Denominator (C03931) = 1



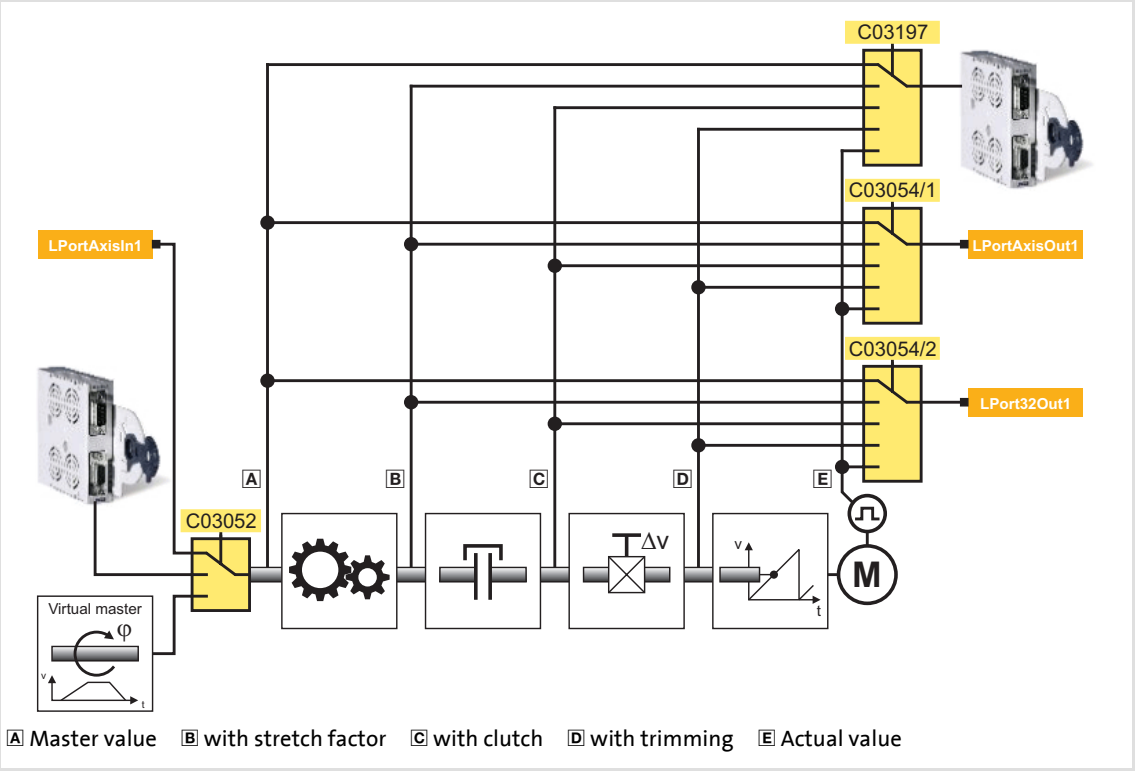
5.2.2 Slave axis (machine axis)

Among other things, the following machine parameters describe the motor end of the mechanics used.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Machine parameter*

Parameter		Lenze setting	
		Value	Unit
C00173	Mains voltage	400/415	V
C00174	Undervoltage (LU) threshold	285	V
C00600	Resp. to DC bus overvoltage	Trouble	
C02520	Gearbox factor numerator: Motor	1	
C02521	Gearbox factor denom: Motor	1	
C02527	Motor mounting direction	Motor rotating CW	
C02570	Position control structure	Position control	
C02522	Gearbox factor num.: Pos. enc.	1	
C02523	Gearbox factor denom.: Pos. enc.	1	
C02529	Mounting direction of position encoder	Encoder rotating CW	
Description of the mechanics (load, tool)			
C02528	Traversing range	Modulo	
C02524	Feed constant	360.0000	unit
C02525	Unit	°	
C02526	User-defined unit	°	
C02533	Time unit	s	
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

Example of determining the machine parameters for the slave axis



1. Set gearbox ratio for the motor in the form of a quotient (numerator and denominator): i_2 = 12.612 = 12612/1000
   - Numerator (C02520) = 12612
   - Denominator (C02521) = 1000
2. Set the same gearbox ratio for the position encoder:
   - Numerator (C02522) = 12612
   - Denominator (C02523) = 1000
3. Set feed constant (C02524).
   - For the conveyor drive: Vk = d_2 * π = 628,3185 mm
4. Set the selection "mm" as unit (C02525).

Tip!

The feed constant corresponds to the movement on the machine side when the gearbox output shaft carries out one revolution (for selection as angle = 360°).

When the unit is set, the real unit of the machine for the selection of physical values (e. g. speeds, accelerations and decelerations) is defined.

5.3 Selection of master value source and output

[5-3] Signal flow for selecting the master value source and the master values to be output

Master value source

The master values can be either selected by a "Virtual master", via a bus system or the digital frequency extension module. ▸ Transmission of the master angle (📖 12)

- They can be selected on the **Application parameters** tab via the **Master value source** list field or via C03052.

Master value output

The master value to be output (A ... E) is selected individually for the three possible communication channels:

- List field **Master value output DF module** (C03197):
  Selection of the master value output for the digital frequency module.
- List field **Master value output MotionBus** (C03054/1):
  Selection of the master value output for horizontal communication.
- List field **Master value output LPort32Out1** (C03054/2):
  Selection of the master value output for vertical communication.

5.3.1 Master value source: Virtual master

If the "Virtual master" is selected as master value source, the master value is created in the TA and transmitted via a bus system or the digital frequency output to the other slave drives.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Virtual master*

Parameter		Lenze setting	
		Value	Unit
C03565	Operating mode	Continuous operation	
C03568/1	Master speed 1	500.0000	unit/t
C03568/2	Master speed 2	0.1000	unit/t
C03569/1	Speed inching right	50.0000	unit/t
C03569/2	Speed inching left	25.0000	unit/t
C03570/1	Inching ramp	0.010	s
C03570/2	Continuous operation ramp	1.000	s
C03570/3	Stop ramp	1.000	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ VMas master shaft STOP1	C03058/1
C03016	→ Activate master function	C03058/3
C03017	→ VMas inching positive	C03058/4
C03018	→ VMas inching negative	C03058/5
FALSE	→ VMas start continuous operation	C03058/7
FALSE	→ VMas 2. master speed	C03058/8
0	→ VMaster handwheel	C03056

▶ Configuration: Tab **FB editor** → FB VirtualMaster

5.3.2 Master value source: Digital frequency input

To use the digital frequency input as master value source, the controller must be provided with digital frequency extension module (E94AYFLF).

To ensure the integration of the extension module in the application, the TA "Electronic gearbox" must be used as technology application.

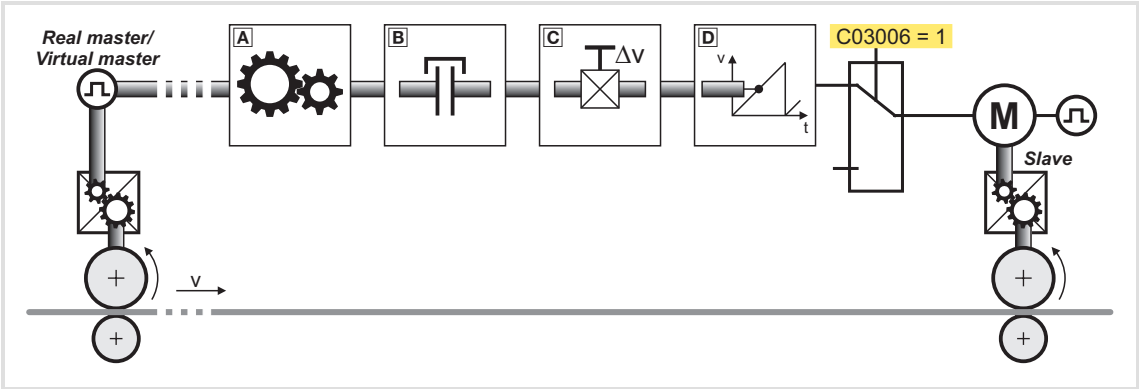
Note!

The technology application "Electronic gearbox" *MotionBus*" which can also be selected in the application catalog does not contain any interfaces to the digital frequency extension module.

5.3.3 Master value source: Bus system

When the master value is selected via a bus system as e.g. system bus (CAN) it is possible to first extrapolate the received position information to compensate higher bus transmission cycles.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Master value extrapolation*



Parameter		Lenze setting	
		Value	Unit
C03550	Number of extrapolation cycles	1	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
TRUE	→ Activate extrapolation	C03058/9

▶ Configuration: Tab **FB editor** → FB MotionBusIn

5.4 Operating mode "Electronic gearbox"

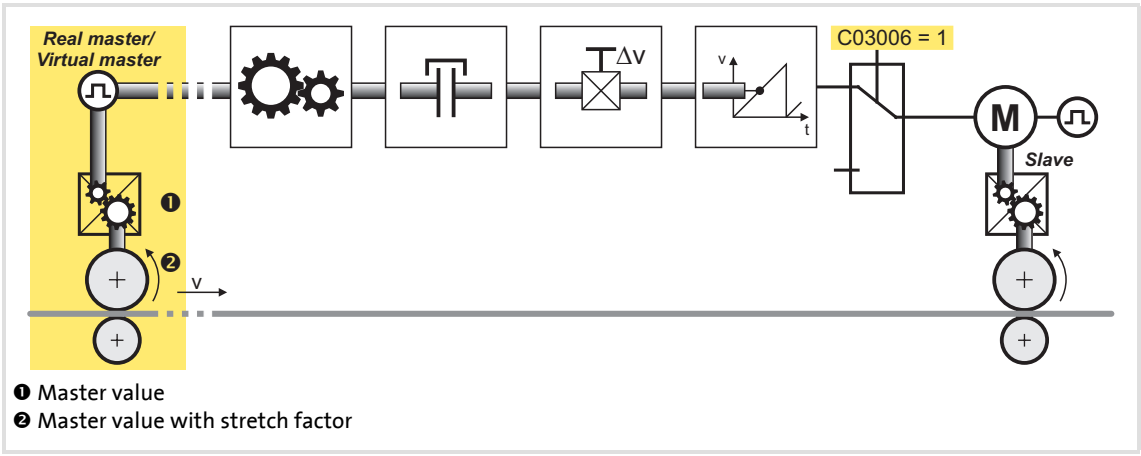
In the "Electronic gearbox" (C03006 = "1") operating mode the drive follows the master value of the electrical shaft if the clutch is engaged.

[5-4] "Electronic gearbox" operating mode (schematic diagram)

Functions in the operating mode "Electronic gearbox"

A Master value processing

B Virtual clutch



C Master value trimming

D Setpoint conditioning

Tip!

A description of the different functions for conditioning the master value can be found in the following subchapters.

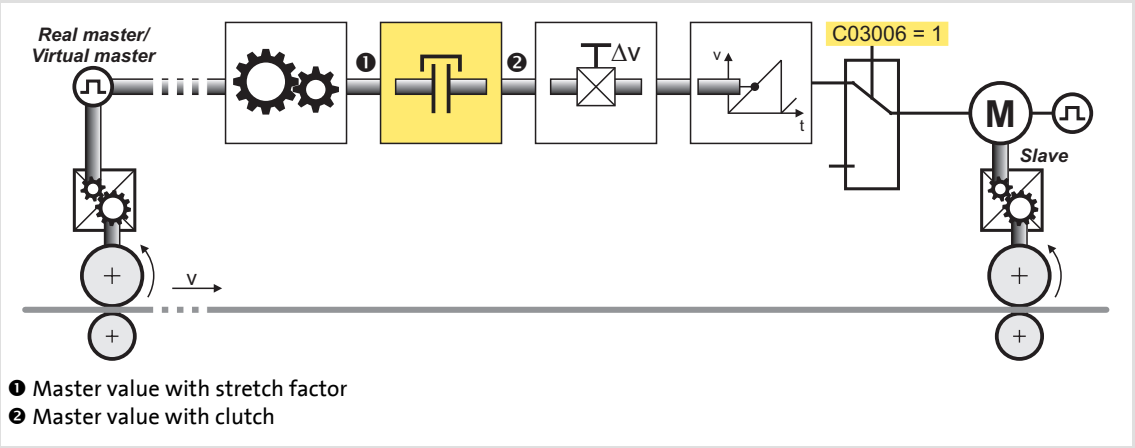
5.4.1 Master value processing

❶ Master value
❷ Master value with stretch factor

[5-5] "Master value processing" function in the signal flow (schematic diagram)

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox*

Parameter		Lenze setting	
		Value	Unit
C03957	Master value	-	unit/t
C03000	Stretch factor - numerator	1000000000	
C03001	Stretch factor - denominator	1000000000	
C03673	Master value with stretch factor	-	unit/t



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Master value processing*

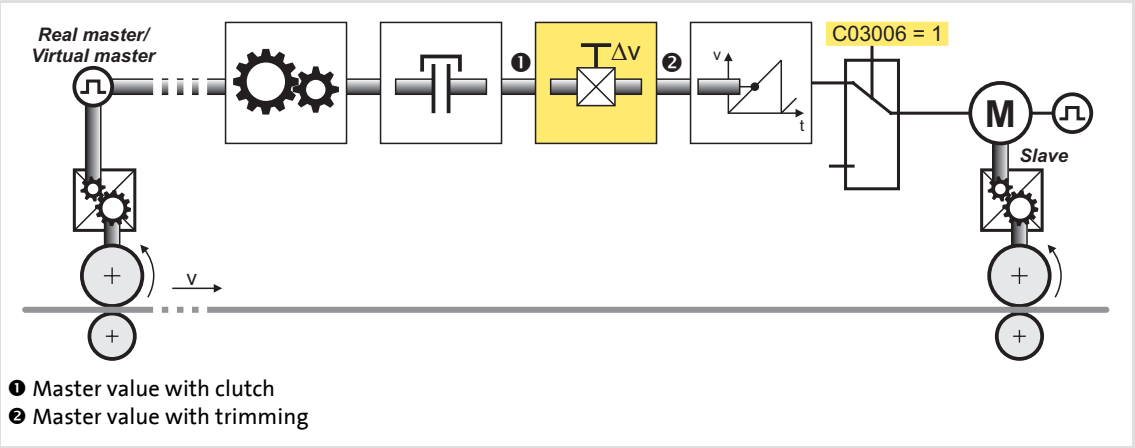
Parameter		Lenze setting	
		Value	Unit
C03025	Master value - direction of rotation	Not inverted	

Setpoint inputs of the function		Signal configuration
Lenze setting	Setpoint input	(Multiplexer parameters)
C03000	→ Stretch factor - numerator	C03050/1
C03001	→ Stretch factor - denominator	C03050/2

▶ Configuration: Tab **FB editor** → FB *GearElectricalShaft*

5.4.2 Virtual clutch

[5-6] Function "Virtual clutch" in the signal flow (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Virtual clutch*

Parameter		Lenze setting	
		Value	Unit
C03673	Master value with stretch factor	-	unit/t
C03021	Activate clutch	Deactivated	
C03665/1	Clutch in ramp	1.000	s
C03665/2	Decoupling ramp	1.000	s
C03665/3	Stop ramp	1.000	s
C03668	Jerk limitation	1.000	s
C03674	Master value with clutch	-	unit/t

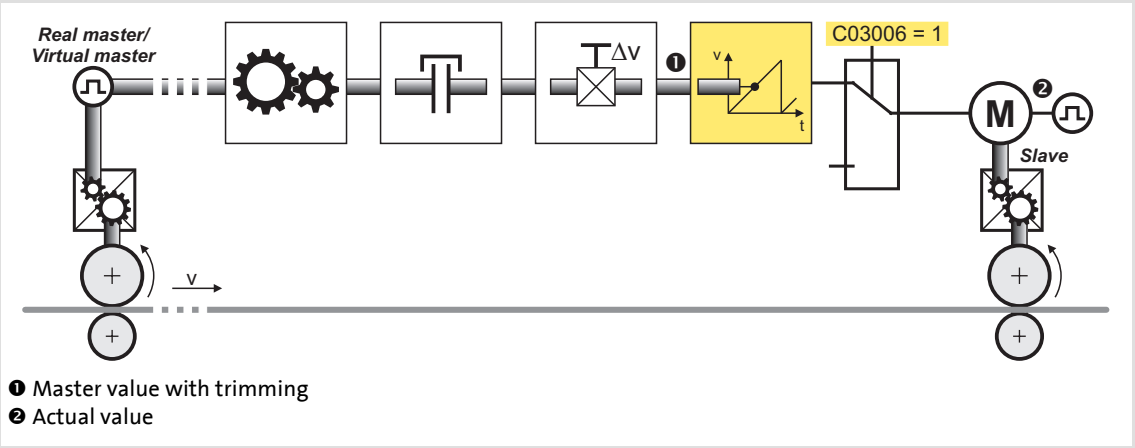
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DigIn 4	→ Close clutch	C03058/13
FALSE	→ Clutch - positive opening operation	C03058/14

▶ Configuration: Tab **FB editor** → FB ClutchElectricalShaft

5.4.3 Master value trimming

[5-7] "Master value trimming" function in the signal flow (schematic diagram)

This function serves to adjust the master value.



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Master value trimming*

Parameter		Lenze setting	
		Value	Unit
C03674	Master value with clutch	-	unit/t
C03026	Activate trimming	Deactivated	
C03027	Positive trimming	Inactive	
C03028	Negative trimming	Inactive	
C03685	Positive speed	400.0000	unit/t
C03686	Negative speed	-200.0000	unit/t
C03687	Acceleration ramp	1.000	s
C03688	Deceleration ramp	1.000	s
C03689	Disable ramp	1.000	s
C03690	Master value with trimming	-	unit/t

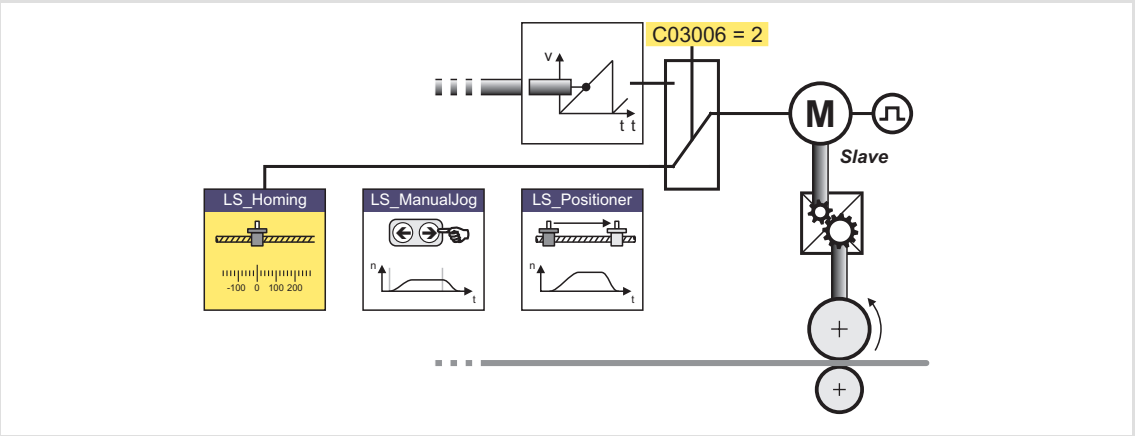
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
C03026	→ Activate trimming	C03058/16
C03027	→ Positive trimming	C03058/18
C03028	→ Negative trimming	C03058/19

▶ Configuration: Tab **FB editor** → FB Trimming

5.4.4 Setpoint conditioning

[5-8] "Setpoint conditioning" function in the signal flow (schematic diagram)

This function is used for speed ratio between the master shaft and the machine axis.



▶ Parameter setting: Tab **All parameters** → Category *Electronic gearbox* → *ConvertElShaftMotor*

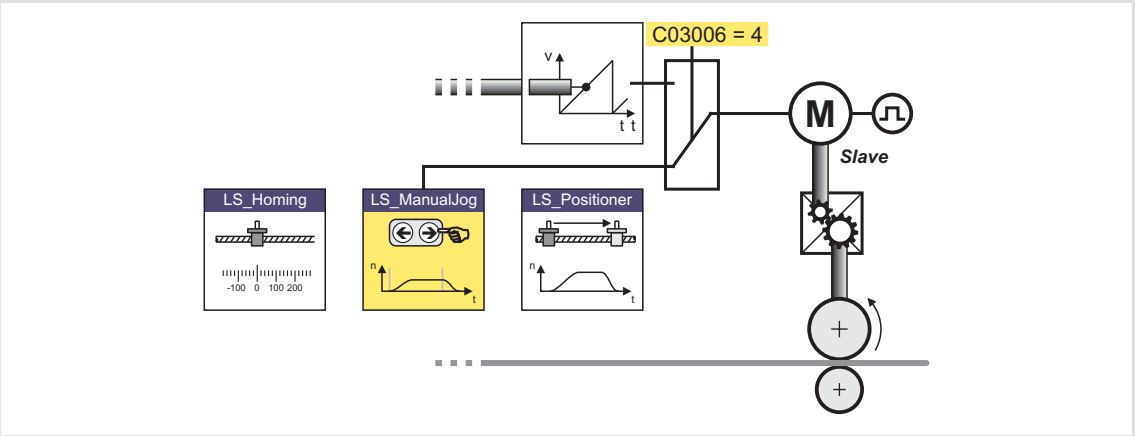
Parameter		Lenze setting	
		Value	Unit
C03715	Operating mode	Unit coupling	
C03717/1	Reference variable X	1.0000	
C03717/2	Reference variable Y	1.0000	

▶ Configuration: Tab **FB editor** → FB ConvertElShaftMotor

5.5 "Homing" mode

In the "Homing" mode (C03006 = "2") the drive is decoupled from the electrical shaft and the basic function "Homing" is enabled:

[5-9] "Homing" mode (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Homing*

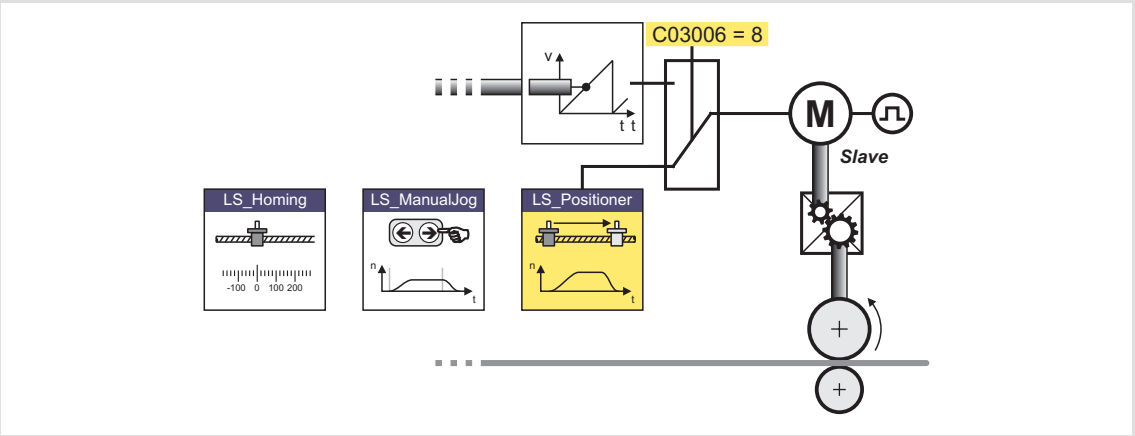
Parameter		Lenze setting	
		Value	Unit
C02528	Traversing range	Modulo	
C02640	Homing mode	Set home pos. directly	
C02642	Home position	0.0000	unit
C02643	Homing: Target position	0.0000	unit
C02644	Homing: Speed 1	360.0000	unit/s
C02645	Homing: Acceleration 1	720.0000	unit/s^2
C02646	Homing: Speed 2	0.0000	unit/s
C02647	Homing: Acceleration 2	360.0000	unit/s^2
C02648	Homing: S-ramp time	100	ms
C02649	Homing: Torque limit	10.00	%
C02650	Homing: Blocking time	1.000	s
C02652	Ref. pos. after mains switching	Delete	
C02653	Max. rot. ang. aft. mns. swtch.	180	°
C03011	Set home position	Inactive	
C03012	Home position	100.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Start homing	C03160/2
DigIn 2	→ Home mark	C03160/3
C03011	→ Set home position	C03160/4
C03012	→ Home position	C03163
FALSE	→ Reset home position	C03160/5

5.6 "Manual jog" mode

In the "Manual jog" mode (C03006 = "4") the drive is decoupled from the electrical shaft and the basic function "Manual jog" is enabled:

[5-10] "Manual jog" mode (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Manual jog*

Parameter		Lenze setting	
		Value	Unit
C02620	Manual jog: Speed 1	360.0000	unit/s
C02621	Manual jog: Speed 2	720.0000	unit/s
C02622	Manual jog: Acceleration	360.0000	unit/s^2
C02623	Manual jog: Deceleration	1440.0000	unit/s^2
C02624	Manual jog: S-ramp time	0.100	s
C03007	Positive manual jog	Inactive	
C03008	Negative manual jog	Inactive	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
C03007	→ Activate positive manual jog	C03155/2
C03008	→ Activate negative manual jog	C03155/3
FALSE	→ Activate 2. speed	C03155/4
FALSE	→ Retract limit switch	C03155/5

5.7 "Positioning" mode

In the "Positioning" mode (C03006 = "8") the drive is decoupled from the electrical shaft and the basic function "Positioning" is enabled:

[5-11] "Positioning" mode (schematic diagram)

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *All basic functions* → *Positioning*

Parameter		Lenze setting	
		Value	Unit
C00070	Speed controller gain	0.00700	Nm/rpm
C00071	Reset time - speed controller	10.0	ms
C00072	D component of speed controller	0.00	ms
C02570	Position control structure	Phase control	
C02554	Integral-action time of position controller	60.000	s
C02553	Position controller gain	20.00	1/s
C03040	Positioning - profile no.	0	
C03041	Positioning - teach profile no.	0	

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Start positioning step	C03185/2
FALSE	→ Abort positioning step	C0318?5/3
FALSE	→ Restart positioning step	C03185/4
FALSE	→ Activate override	C03185/5
100 %	→ Speed override	C03186/1
100 %	→ Acceleration override	C03186/2
FALSE	→ Inhibit touch probe evaluation	C03185/6
FALSE	→ Teach position	C03185/7

Profile data record management

For the profile data record management the FB **L_PosProfileTable** is used. This FB serves to file and manage up to four (travel) profiles and to "teach" target positions.

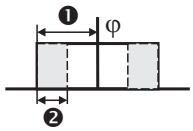
- A profile describes a motion request which can be implemented by the SB **LS_Positioner** into a rotary motion.
- A profile is described via the following profile parameters: Mode (type of positioning), position, speed, acceleration, deceleration, S-ramp time, TP sequence profile and TP selection.
- The data of the profile parameters is directly input in the assigned codes:

Profile parameters	Unit	Profile no. 1	Profile no. 2	Profile no. 3	Profile no. 4
Positioning mode	-	C03970/1	C03970/2	C03970/3	C03970/4
Position	unit	Set position	C03971/2	C03971/3	C03971/4
Speed	unit/t	C03972/1	C03972/2	C03972/3	C03972/4
Acceleration	unit/t^2	C03973/1	C03973/2	C03973/3	C03973/4
Deceleration	unit/t^2	C03974/1	C03974/2	C03974/3	C03974/4
S-ramp time	s	C03975/1	C03975/2	C03975/3	C03975/4
TP sequence profile	-	C03976/1	C03976/2	C03976/3	C03976/4
TP selection	-	C03977/1	C03977/2	C03977/3	C03977/4

Note!

For profile no. 1 the set position of the tool which belongs to the master position is always used as target position.

- Application: Returning the tool e.g. from a maintenance position to the network.



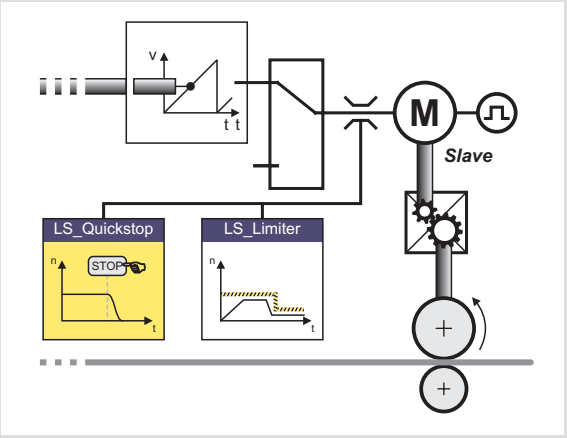
"Teach" position

When the control input "Teach position" is set to TRUE, the current tool position is saved in the profile the number of which is set in C03041. After the control input is reset to FALSE the position saved last is maintained in the profile.

5.8 Following error monitoring

In the Lenze setting the following error monitoring is active.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Electronic gearbox* → *Following error monitoring*



❶ Switching threshold
❷ Hysteresis

Parameter		Lenze setting	
		Value	Unit
C03911	Switching threshold	1.0000	unit
C03916	Hysteresis	0.5000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
TRUE	→ Activate following error monitoring	C03058/21

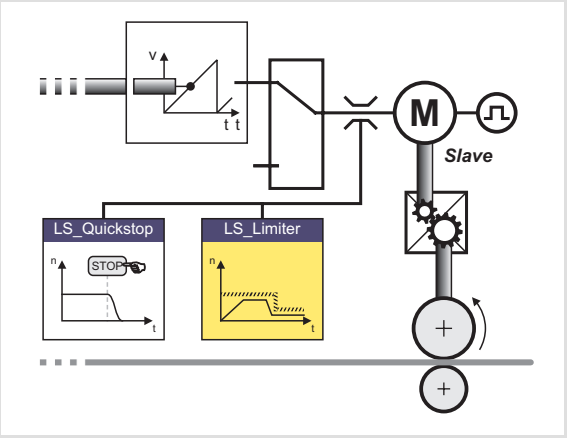
▶ Configuration: Tab **FB editor** → FB MonitFollowError

5.9 Quick stop

[5-12] Basic function "Quick stop" (schematic diagram)

The basic function "Quick stop" brakes the drive to standstill within the deceleration time set for the quick stop function after a corresponding request independent of the setpoint selection.

If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time.



▶ The quick stop function can be activated as follows in the Lenze setting:
  – By setting the digital input DI1 to LOW level.
  – By a master control via the port *LPortControl1*:
    By setting bit 2 of the bit-coded control word 1.

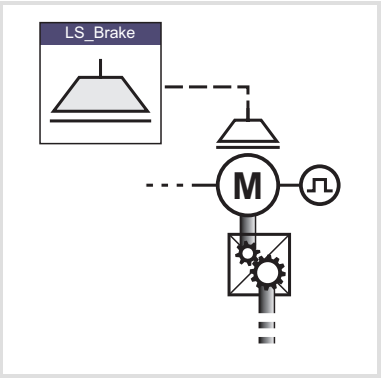
▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *All basic functions* → *Quick stop*

Parameter		Lenze setting	
		Value	Unit
C00105	Quick stop deceleration time	0.000	s
C00106	Quick stop S-ramp time	0.00	%
C00107	Reference for quick stop deceleration time	Motor reference speed (C00011)	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 1	→ Activate quick stop 1	C03135/1
Control word 1 bit 02	→ Activate quick stop 2	C03135/2
FALSE	→ Activate quick stop 3	C03135/3

5.10 Limiter

[5-13] Basic function "Limiter" (schematic diagram)



The basic function "Limiter" monitors the travel range limits via limit switches and parameterised software limit positions and can lead the drive to defined limit ranges when being asked accordingly by the safety module.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Limiter*

Parameter		Lenze setting	
		Value	Unit
Limit values			
C02707	Permissible direction of rot.	Positive and negative	
C02700	Software limit positions are active	Deactivated	
C02701/1	Positive software limit position	0.0000	unit
C02701/2	Negative software limit position	0.0000	unit
Only for homing, positioning and manual jog			
C02702	Limitations are active	Deactivated	
C02703	Max. speed	3600.0000	unit/s
C02705	Max. acceleration	3600.0000	unit/s^2
C02706	Min. S-ramp time	100	ms
Limited speed 1 ... 4 (only for homing, positioning, and manual jog)			
C02708/1	Limited speed 1	3600.0000	unit/s
C02710/1	Delay lim. speed 1	0.0100	unit/s^2
C02711/1	S-ramp time lim. speed 1	100	ms
C02708/2	Limited speed 2	7200.0000	unit/s
C02710/2	Delay lim. speed 2	0.0100	unit/s^2
C02711/2	S-ramp time lim. speed 2	100	ms
C02708/3	Limited speed 3	14400.0000	unit/s
C02710/3	Delay lim. speed 3	0.0100	unit/s^2
C02711/3	S-ramp time lim. speed 3	100	ms
C02708/4	Limited speed 4	28800.0000	unit/s
C02710/4	Delay lim. speed 4	0.0100	unit/s^2
C02711/4	S-ramp time lim. speed 4	100	ms
For manual jog only			
C02713	Max. dist. manual jog	360.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Positive limit switch	C03150/1
FALSE	→ Negative limit switch	C03150/2

5.11 Brake control

[5-14] Basic function "Brake control" (schematic diagram)

The basic function "Brake control" serves to the wear free control and monitoring of a holding brake.

In the simplest case, an optionally available brake module is used.

Alternatively the holding brake can also be controlled and monitored via the digital inputs/outputs.

Note!

In the Lenze setting the brake control is switched off to reach a safe status after mains connection.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Brake control*

Parameter		Lenze setting	
		Value	Unit
C02580	Operating mode of brake	Brake control off	
C02581	Brake activation threshold	50	rpm
C02582	Brake resp. to pulse inhibit	Activate the brake immediately	
C02583	Status input monitoring	Not active	
C02585	Brake control polarity	Not inverted	
C02586	Starting torque 1	0.00	Nm
C02587	Starting torque 2	0.00	Nm
C02588	Source of starting torque	Starting torque 1/2	
C02589	Brake closing time	100	ms
C02590	Brake opening time	100	ms
C02591	Waiting time - status monitoring	100	ms
C02593	Waiting time - brake activation	0.000	s
C02594	Test torque	0.00	Nm
C02595	Permissible angle of rotation	5	°
C02596	Grinding speed	100	rpm
C02597	Accel./decel. time - grinding	1.000	s
C02598	Grinding ON time	0.5	s
C02599	Grinding OFF time	0.5	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Release brake	C03165/1
FALSE	→ Activate starting torque 2	C03165/2
FALSE	→ Keep open brake at standstill	C03165/3
FALSE	→ Brake status signal	C03165/4
FALSE	→ Activate brake test	C03165/5
FALSE	→ Grind brake	C03165/6
0 %	→ Additional torque	C03166

5.12 Signal configuration

5.12.1 Drive and motor interface

If required, the preset signal configuration of the control and setpoint inputs of the drive and motor interface can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Drive interface

Signal (Lenze setting)	Control input	Signal configuration
FALSE	→ Set controller inhibit	C03130/1
DIGIN 5	→ Reset error 1	C03130/2
Control word 1 bit 07	→ Reset error 2	C03130/3
FALSE	→ Reset error 3	C03130/4
FALSE	→ Set error	C03130/5
Control word 1 bit 00	→ Switch on drive	C03130/6

Motor interface

Signal (Lenze setting)	Setpoint input	Signal configuration
100 %	→ Position controller adaptation	C03141/1
100 %	→ Phase controller adaptation	C03141/2
100 %	→ Adaptation of speed controller	C03141/3
100 %	→ Upper torque limit value	C03141/4
-100 %	→ Lower torque limit value	C03141/5
100 %	→ Flux setpoint	C03141/6
100 %	→ Mass inertia	C03141/7

5.12.2 Output ports

If required, the preset signal configuration of the output ports can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Output port "LPortAxisOut1"

The output port **LPortAxisOut1** is intended for the connection with a following axis.

Signal (Lenze setting)	Output port	Signal configuration
Axis status word • Application-specific signals can be supplemented.		
FALSE	→ Axis status word bit 00	C03120/1
FALSE	→ Axis status word bit 01	C03120/2
FALSE	→ Axis status word bit 02	C03120/3
FALSE	→ Axis status word bit 03	C03120/4
FALSE	→ Axis status word bit 04	C03120/5
FALSE	→ Axis status word bit 05	C03120/6
FALSE	→ Axis status word bit 06	C03120/7
FALSE	→ Axis status word bit 07	C03120/8
FALSE	→ Axis status word bit 08	C03120/9
FALSE	→ Axis status word bit 09	C03120/10
FALSE	→ Axis status word bit 10	C03120/11
FALSE	→ Axis status word bit 11	C03120/12
FALSE	→ Axis status word bit 12	C03120/13
FALSE	→ Axis status word bit 13	C03120/14
FALSE	→ Axis status word bit 14	C03120/15
FALSE	→ Axis status word bit 15	C03120/16
Setpoints for horizontal communication		
0 %	→ Axis-Port Out 1	C03124/1
Master value (Position in [increments])	→ Axis-Port Out 2	C03054/1

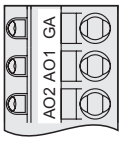
Output port "LPortStatus1"

The output port **LPortStatus1** is intended for the connection with a higher-level control.

Signal (Lenze setting)	Output port	Signal configuration
Status word 1		
Drive ready	→ Status word 1 bit 00	C03121/1
FALSE	→ Status word 1 bit 01	C03121/2
Drive is ready to start	→ Status word 1 bit 02	C03121/3
Error is active	→ Status word 1 bit 03	C03121/4
FALSE	→ Status word 1 bit 04	C03121/5
Quick stop is active	→ Status word 1 bit 05	C03121/6
Switch-on inhibit is active	→ Status word 1 bit 06	C03121/7
Warning is active	→ Status word 1 bit 07	C03121/8
FALSE	→ Status word 1 bit 08	C03121/9
FALSE	→ Status word 1 bit 09	C03121/10
FALSE	→ Status word 1 bit 10	C03121/11
Drive in the limitation	→ Status word 1 bit 11	C03121/12
Homing complete	→ Status word 1 bit 12	C03121/13
Home position available	→ Status word 1 bit 13	C03121/14
FALSE	→ Status word 1 bit 14	C03121/15
FALSE	→ Status word 1 bit 15	C03121/16

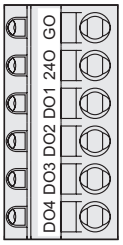
Output port "LPortStatus2"

The output port **LPortStatus2** is intended for the connection with a higher-level control.



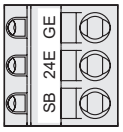
Signal (Lenze setting)	Output port	Signal configuration
Status word 2		
Virtual master is active	→ Status word 2 bit 00	C03122/1
Clutch is disengaged	→ Status word 2 bit 01	C03122/2
Trimming is active	→ Status word 2 bit 02	C03122/3
FALSE	→ Status word 2 bit 03	C03122/4
FALSE	→ Status word 2 bit 04	C03122/5
FALSE	→ Status word 2 bit 05	C03122/6
FALSE	→ Status word 2 bit 06	C03122/7
FALSE	→ Status word 2 bit 07	C03122/8
FALSE	→ Status word 2 bit 08	C03122/9
FALSE	→ Status word 2 bit 09	C03122/10
FALSE	→ Status word 2 bit 10	C03122/11
FALSE	→ Status word 2 bit 11	C03122/12
FALSE	→ Status word 2 bit 12	C03122/13
FALSE	→ Status word 2 bit 13	C03122/14
FALSE	→ Status word 2 bit 14	C03122/15
FALSE	→ Status word 2 bit 15	C03122/16

5.13 Actual value and status signals



The following tables contain the Lenze assignment of the analog and digital outputs for the technology application "Electronic gearbox".

▶ The default signal configuration if required can be easily changed by parameterising the multiplexer parameters assigned.



Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	Motor speed • Scaling: ±10 V ≡ motor reference speed (C00011)	C03110/1
	AO2	Motor torque (setpoint) • Scaling: ±10 V ≡ Motor reference torque (C00057/2)	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Status "Drive ready" • DC-bus voltage is available and no error has occurred.	C03100/1
	DO2	Status "Electrical shaft enabled"	C03100/2
	DO3	Status "Limitation active" • A setpoint is limited at the moment.	C03100/3
	DO4	"Error" status • If the controller is in the error state, the digital output DO4 is set to HIGH level.	C03100/4

State bus

Terminal X2		Signal (Lenze setting)	Signal configuration
	**SB**	"Application error" status • The state bus is put in the "error" status.	C03100/5

Display elements

User LED	Signal (Lenze setting)	Signal configuration
	Status "Electrical shaft enabled"	C03100/6

5.14 Application error messages

For the output of application-specific error messages an FB instance *ApplicationError* of the function block **L_DevApplErr** is available in the network.

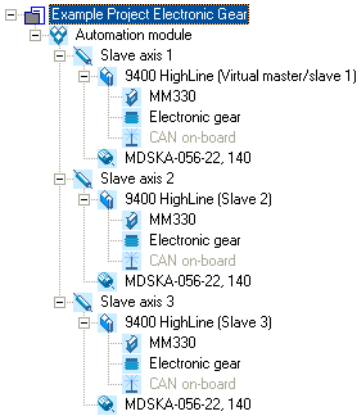
- Via the 8 boolean inputs up to 8 different application error messages with parameterisable module ID, error ID and error response can be activated by the application.
- The first four inputs can be connected to the multiplexer parameters with the desired tripping signals. The next four inputs are firmly connected to the tripping signals of the application.

Error message		Error ID	Error response
1	Free (configurable via C03060/1)	8001	No response
2	Free (configurable via C03060/2)	8002	Error
3	Free (configurable via C03060/3)	8003	Error
4	Free (configurable via C03060/4)	8004	Error
5	Following error	8005	Warning
6	Drive cannot follow	8006	Warning
7	Drive system interrupted	8007	Quick stop by trouble
8	External fault in drive system	8008	Quick stop by trouble

- Parameter setting: Tab **All parameters**

Parameter		Lenze setting
C05900	Module ID	999
C05901/1...8	Error ID 1 ... 8	See table above
C05902/1...8	Error response 1 ... 8	See table above

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Application fault 1	C03060/1
FALSE	→ Application fault 2	C03060/2
FALSE	→ Application fault 3	C03060/3
FALSE	→ Application fault 4	C03060/4



5.15 Master value transmission via system bus (CAN)

In the application example described in the chapter "Short setup", the master speed is transmitted via the digital frequency. (📖 20)

The following instructions describe step by step the proceeding for commissioning the electrical shaft via the system bus (CAN).

Create project view

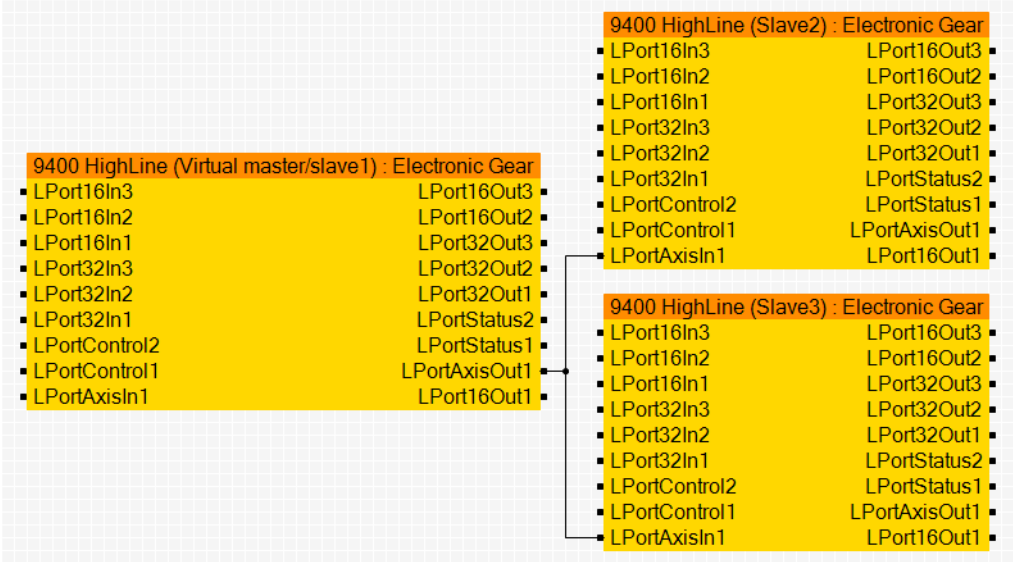
1. Start »Engineer«.
2. Go to *Start-up wizard* and select the option "New project (empty)" and enter a name for the project in a next step.
3. Insert system module.
4. Enter axes for master and slave(s).
   – Add the corresponding components (controller, motor, extension module) to the axes.
   – Select for each controller the application "Electronic gearbox".
   – Example *project view* in the »Engineer«:

Parameterise the virtual master

1. Go to the *Project view* and select the controller which is to take over the part of the "Virtual master" in the network.
2. Go to the **Application parameters** tab and select the entry "Virtual master" in the list field **Master value source** (C03052).
3. Click **Electronic gearbox** to change to the dialog level *Overview* → *Electronic gearbox*.
4. Click **Master value processing** to change to the dialog level *Overview* → *Electronic gearbox* → *Master value processing*.
   – Parameterise gearbox ratio, feed constant, cycle, path unit, and reference speed for the master value.

5. Click **Back** to change to the previous dialog level.
6. Click **virtual master** to change to the dialog level *Overview* → *Electronic gearbox* → *Virtual master*.
   – Parameterise desired operating mode, speed and ramps.

Parameterising slave(s)



1. Go to *Project view* and select the first slave controller .
2. Go to the **Application parameters** tab and select the entry "Virtual master in the list field **Virtual master** (C03052).
3. Make the same settings for all other slave controllers.

Establish network

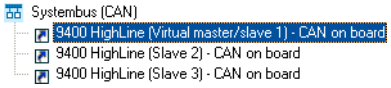
1. Go to *Project view* and select the system module .
2. Insert network.
   – Go to the dialog box *Insert network* to select the entry "System bus (CAN) from the list field.
   – The checkmark in the control field **Insert and configure node** must be set so that a machine application is inserted in the *Project view* together with the network.
3. On the **Node** tab for the inserted network:
   – Set node addresses for the controllers according to the DIP switch setting of the CAN address of the memory module.
   – Go to *Context menu* for the master controller (right mouse button) and the select the command **Set as master**.
4. On the **Synchronisation** tab for the inserted network:
   – Select the master controller as sync source in the list field **Node**.
   – Select all slave controllers as sync receivers by setting the checkmark in the first column **Appl.**.

Connect ports in the machine application

1. Go to *Project view* and select the machine application which has been inserted automatically with the insertion of the network.
2. Go to the **Connections** tab and connect the output port *LPortAxisOut1* of the master controller with the input port *LPortAxisIn1* of all slave controllers.

Compile the project

1. Go to *Project view* and select the system module .
2. Update devices.
   - Set the checkmark in the control field **Recreate all**.
   - Click **Create** to start the compiling process.



Optimise bus load

To ensure that the bus load will not be too high, the transmission time for the master controller can be set to a value > 1 ms. Then, the same time must be set in the slave controllers for the master value extrapolation.

Note!

This setting is only possible after the compiling process is completed since only then the process data objects are defined for the data exchange among the devices.

1. Go to *Project view* below the network and select the master controller.

2. Go to the **Process data objects** tab and set a transmission time > 1 ms (e.g. 5 ms) for the process data object.

3. Go to *Project view* and select the first slave controller .
4. Go to the **Application parameters** and change to the dialog level *Electronic gearbox* → *Electronic gearbox* → *Master value extrapolation*.
5. Set the number of extrapolation cycles to the same value than the transmission time set before.
   – This means: In case of a transmission time of 5 ms set for the master set the number of extrapolation cycles for the slave to the value "5".
6. Make the same settings for all other slave controllers.

Transmit applications to the controller

1. Go online.
2. Download applications in the controller.

Note!

The downloaded application is basically stored in the first application memory location of the controller.

The preinstalled technology applications on the following memory locations are still available.

3. Confirm Dialog box *Save parameter set* with **Yes, all devices**.
4. Confirm Dialog box *Start application* with **Yes, all devices**.
5. Confirm Dialog box *Enable controller* with **Yes, all devices**.
6. Control applications via terminals or network.

5.16 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application and the corresponding parameters in alphabetical order.

5.16.1 ApplicationError

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 63)

Parameter	Possible settings			Information
C05900	980		999	Module ID • Initialisation: 999
C05901/1...8	0		65535	Error ID • Initialisation: 8001 ... 8008
C05902/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

5.16.2 ClutchElectricalShaft

Is an instance of	Function
L_LdClutchV	▸ Virtual clutch (📖 46)

Parameter	Possible settings			Information
C03665/1	0.010	s	130.000	Clutch in ramp • Acceleration ramp for synchronising to *dnSpeedIn_s*. • Initialisation: 1.000 s
C03665/2	0.010	s	130.000	Decoupling ramp • Deceleration ramp for synchronising to *dnSetSpeed_s*. • Initialisation: 1.000 s
C03665/3	0.010	s	130.000	Ramp for positive opening operation • Deceleration ramp for positive opening operation. • Initialisation: 1.000 s
C03666	Character string			Speed unit • Read only
C03667	-214748.3647	unit/t	214748.3647	Reference speed • Read only • Reference value for selecting speeds.
C03668	0.010	s	130.000	S-ramp time • For limiting the jerk • Initialisation: 1.000 s
C03670	-2147483647		2147483647	State • Display of the bit-coded output signal *dnState*.
C03672	-214748.3647	unit	214748.3647	Setpoint speed after decoupling • Read only • Is generated from the speed signal *dnSetSpeed_s*.
C03673	-214748.3647	unit	214748.3647	Speed at the input • Read only • Is generated from the speed signal *dnSpeedIn_s*.
C03674	-214748.3647	unit	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.

5.16.3 ConvertElShaftMotor

Is an instance of	Function
L_LdConvAxisV	Transformation ratio of speed between two axes. ▸ Setpoint conditioning (📖 48)

Parameter	Possible settings			Information
C03715				Coupling of measuring systems X and Y
	0	Coupling via feed constants		Lenze setting
	1	Coupling via cycles		
	2	Free coupling		
C03716/1	0	unit	214748.3647	Cycle X • Read only
C03716/2	0	unit	214748.3647	Cycle Y • Read only
C03717/1	0.0000		214748.3647	Coupling factor X • Initialisation: 1.0000
C03717/2	0.0000		214748.3647	Coupling factor Y • Initialisation: 1.0000
C03718/1	Character string			User-defined unit X • Read only
C03718/2	Character string			User-defined unit Y • Read only
C03720/1	-214748.3647	unit/t	214748.3647	Speed X at the input • Read only • Is generated from the speed signal *dnSpeedIn_s*.
C03720/2	-214748.3647	unit/t	214748.3647	Speed Y at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03724	-2147483647		2147483647	State • Display of the bit-coded output signal *dnState*.

5.16.4 ElectricalShaftData

Is an instance of	Function
L_SdSetAxisData	Mapping of the machine parameters of the higher-level drive (master shaft). ▸ Master axis (master shaft) (📖 38)

Parameter	Possible settings			Information
C03930	1		2147483647	Gearbox ratio - numerator • Initialisation: 1
C03931	1		2147483647	Gearbox ratio - denominator • Initialisation: 1
C03932	0.0001	Unit/incr.	214748.3647	Feed constant • Initialisation: 360 units/incr.
C03933				Path unit
	0	User-defined		Selection in C03934
	1	Inc		
	2	µm		
	3	mm		
	4	m		
	5	inch		
	6	yard		
	7	°		Lenze setting
C03934	Character string, max. 8 characters			User-defined path unit
C03935	At present, the unit of the time base is permanently set to "s" and cannot be changed!			Time unit
C03938	0.0000	unit	214748.3647	Cycle • Initialisation: 360 units
C03939	10	Bit	24	Resolution of encoder revolution • Initialisation: 16 bits
C03941	-214748.3647	unit/t	214748.3647	Reference speed • Initialisation: 214748.3647 units/t
C03942				Traversing range
	0	Unlimited		
	1	Limited		
	2	Modulo		Lenze setting
C03948	-2147483.647		2147483.647	Resulting gearbox factor • Read only
C03949	-214748.3647	Incr.	214748.3647	Resolution of application unit • Read only

5.16.5 FollowError_Hysteresis

Is an instance of	Function
L_SdSetPosition	Conversion of the following error hysteresis selected in the real units of the machine via C03916 into a position in [increments]. ▸ Following error monitoring (📖 53)

Parameter	Possible settings			Information
C03916	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.5000 units
C03917	Character string			Position unit • Read only
C03918	-2147483647		2147483647	State • Read only

5.16.6 FollowError_Limit

Is an instance of	Function
L_SdSetPosition	Conversion of the following error limit selected in the real units of the machine via C03911 into a position in [increments]. ▸ Following error monitoring (📖 53)

Parameter	Possible settings			Information
C03911	-214000.0000	unit	214000.0000	Position value • Initialisation: 1.0000 units
C03912	Character string			Position unit • Read only
C03913	-2147483647		2147483647	State • Read only

5.16.7 HomingSetPosition

Is an instance of	Function
L_SdSetPosition	Conversion of the home position selected in the real units of the machine via C03012 into a position in [increments]. ▸ "Homing" mode (📖 49)

Parameter	Possible settings			Information
C03012	-214000.0000	unit	214000.0000	Position value • Initialisation: 100.0000 units
C03013	Character string			Position unit • Read only
C03014	-2147483647		2147483647	State • Read only

5.16.8 L_PosProfileTable1

Is an instance of	Function
L_PosProfileTable	Storage and management of up to four travel profiles for the "positioning" mode. ▸ "Positioning" mode (📖 51)

Parameter	Possible settings			Information
C03970/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)				Positioning mode • For absolute positioning, the home position must be known.
	1	Absolute		
	2	Absolute TP		
	5	Relative		
	6	Relative TP		
	7	Speed		
	8	Speed TP		
	11	Absolute CW		
	12	Absolute CW TP		
	13	Absolute CCW		
	14	Absolute CCW TP		
	15	Absolute ShortestWay		
	16	Absolute ShortestWay TP		
C03971/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	-214748.3647	unit	214748.3647	Position
C03972/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	-214748.3647	unit/t	214748.3647	Speed
C03973/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	0.0000	$unit/t^2$	214748.3647	Acceleration
C03974/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	0.0000	$unit/t^2$	214748.3647	Deceleration
C03975/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	0.0000	s	214748.3647	S-ramp time
C03976/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)				TP sequence profile • Sequence profile for touch probe residual path positioning.
	0	No residual path positioning		
	1	Profile no. 1		
	...	...		
	4	Profile no. 4		

Parameter	Possible settings			Information
C03977/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	Value is bit-coded:			Touch probe configuration • The touch probe channels to be used are selected by setting the corresponding bits to "1".
	Bit 0	TP channel 1, rising edge		Digital input 1
	Bit 1	TP channel 1, falling edge		
	Bit 2	TP channel 2, rising edge		Digital input 2
	Bit 3	TP channel 2, falling edge		
	Bit 4	TP channel 3, rising edge		Digital input 3
	Bit 5	TP channel 3, falling edge		
	Bit 6	TP channel 4, rising edge		Digital input 4
	Bit 7	TP channel 4, falling edge		
	Bit 8	TP channel 5, rising edge		Digital input 5
	Bit 9	TP channel 5, falling edge		
	Bit 10	TP channel 6, rising edge		Digital input 6
	Bit 11	TP channel 6, falling edge		
	Bit 12	TP channel 7, rising edge		Digital input 7
	Bit 13	TP channel 7, falling edge		
	Bit 14	TP channel 8, rising edge		Digital input 8
	Bit 15	TP channel 8, falling edge		
	Bit 16	TP channel 9		Motor encoder zero pulse
	Bit 18	TP channel 10		Load encoder zero pulse
	Bit 20	TP channel 11		DFIN zero pulse
	Bit 22	TP channel 12		DFOUT zero pulse
C03978				"Teach" position • For execution via parameter channel.
	0↗1	The position applied at the input *dnTeachPos_p* is saved in the profile selected via the input *dwTeachProfileNumber*.		
C03979/1	Character string			Position unit • Read only
C03979/2	Character string			Speed unit • Read only
C03979/3	Character string			Acceleration unit • Read only
C03980/1	-214748.3647	unit	214748.3647	External target position • Display of input signal *dnExtPos_p* in real unit of the machine.
C03980/2	-214748.3647	unit	214748.3647	Teach position • Display of input signal *dnTeachPos_p* in real unit of the machine.
C03981/1	0		4	Selected profile • Display of input signal *dwProfileNumber*.
C03981/2	0		4	Selected teach profile • Display of input signal *dwTeachProfileNumber*.

Parameter	Possible settings			Information
C03983				DIS:bPosTeach • Display of input signal *bPosTeach*.
	0	FALSE		
	1	TRUE		
C03984				DIS:bBusy • Display of output signal *bBusy*.
	0	Profile parameters are available.		
	1	Conversion active, no access to profile parameters at the moment.		
C03985	-2147483647		2147483647	State • Display of the bit-coded output signal *dnState*.

5.16.9 MonitFollowError

Is an instance of	Function
L_LdMonitFollowError	▸ Following error monitoring (📖 53)

Parameter	Possible settings			Information
C03960	-214748.3647	unit	214748.3647	Following error at the input • Display of input signal *dnFollowErrorIn_p* in real unit of the machine.
C03961	Character string			Position unit • Read only
C03963				Following error out of tolerance • Read only
	FALSE	Following error smaller than set switching threshold		
	TRUE	Following error larger than set switching threshold		
C03964				Following error monitoring activated • Read only
	FALSE	Deactivated		
	TRUE	Activated		

5.16.10 MotionBusIn

Is an instance of	Function
L_LdExtrapolate	Optional extrapolation of the position information received via a bus system in order to compensate for larger bus transmission cycles. ▸ Master value source: Bus system (📖 43)

Parameter	Possible settings			Information
C03550	1		127	Number of extrapolation cycles • Initialisation: 1
C03551/1	Character string			Position unit • Read only
C03551/2	Character string			Speed unit • Read only
C03557	-214748.3647	unit/t	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03558	-214748.3647	unit	214748.3647	Position at the output • Display of output signal *dnPosOut_p* in real unit of the machine.
C03559				Extrapolation cycles > selected value • Read only
	0	No (OK)		
	1	Yes (error)		

5.16.11 Trimming

Is an instance of	Function
L_LdMPot	▸ Master value trimming (📖 47)

Parameter	Possible settings			Information
C03685	-214000.0000	unit/t	214000.0000	Positive speed • Initialisation: 400.0000 units/t
C03686	-214000.0000	unit/t	214000.0000	Negative speed • Initialisation: -200.0000 units/t
C03687	0.001	s	130.000	Acceleration ramp • Initialisation: 1.000 s
C03688	0.001	s	130.000	Deceleration ramp • Initialisation: 1.000 s
C03689	0.001	s	130.000	Ramp for motor potentiometer off • Initialisation: 1.000 s
C03690	-214748.3647	unit	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03691	Character string			Speed unit • Read only
C03692	-214748.3647	unit/t	214748.3647	Reference speed • Read only • Reference value for selecting speeds.

5.16.12 VirtualMaster

Is an instance of	Function
L_LdVirtualMaster	"Virtual master" ▸ Master value source: Virtual master (📖 42)

Parameter	Possible settings			Information
C03565				Virtual master operating mode
	0	Continuous operation		Lenze setting
	1	Inching		
	2	Handwheel function		
C03566	Character string			Speed unit • Read only
C03567	-214748.3647	unit/t	214748.3647	Reference speed • Read only • Reference value for selecting speeds.
C03568/1	-214000.0000	unit/t	214000.0000	Master speed 1 • Initialisation: 1.0000 units/t
C03568/2	-214000.0000	unit/t	214000.0000	Master speed 2 • Initialisation: 1.0000 units/t
C03569/1	0.0000	unit/t	214000.0000	Manual speed CW rotation • Initialisation: 1.0000 units/t
C03569/2	0.0000	unit/t	214000.0000	Manual speed CCW rotation • Initialisation: 1.0000 units/t
C03570/1	0.010	s	130.000	Ramp for manual jog • Initialisation: 1.000 s
C03570/2	0.010	s	130.000	Ramp for continuous operation/ single cycle • Initialisation: 1.000 s
C03570/3	0.010	s	130.000	Stop ramp • Initialisation: 1.000 s
C03579	-2147483647		2147483647	State • Display of the bit-coded output signal *dnState*.
C03582	-214748.3647	unit	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03583	-214748.3647	unit	214748.3647	External master speed at the input • Read only • Is generated from the speed signal *dnExtMaster_s*.

FEEDBACK

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

If you have suggestions for improvement, please e-mail us to:

1 About this documentation

This documentation contains information about the technology application "Positioning sequence control" for the Servo Drives 9400 series.

Note!

This documentation supplements the mounting instructions supplied with the controller, the hardware manual and the software manual for the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation applies to:

Technology application	Appl. ID	Required runtime software licence
Positioning sequence control	100602103	Motion Control TopLevel or higher

The technology application can be used with the following controllers:

Product series	Type designation	From hardware version	From software version
9400 Servo Drives	E94AxHExxxx	PD	1.35

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	04/2007	TD05	First edition
1.1	10/2008	TD05	New subchapter "Parameterisable function blocks"
1.2	03/2010	TD05	Error corrections & supplements

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window pane	*Italics*	The *Message window*... / the *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Keyboard command	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program listings	`Courier`	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**`Courier bold`**	
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse click in this online documentation.
Symbols		
Page reference	(📖 7)	Optically highlighted reference to another page. It is activated with a mouse click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and suggests how to avoid the danger)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of material damage** Indicates a potential danger that may lead to material damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note for trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

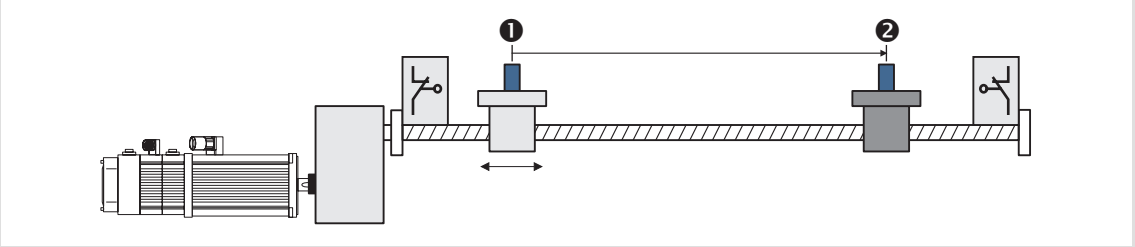
2 Brief description

The technology application "Positioning sequence control" enables the drive to execute parameterisable travel profiles. The program sequence is defined by a sequence table.

Functions

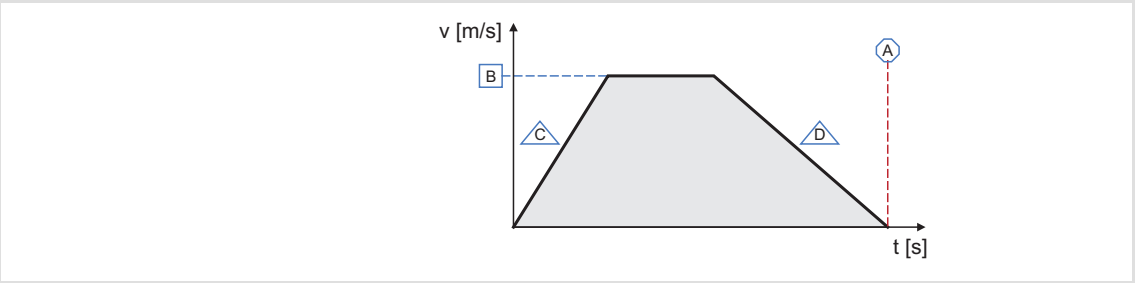
- Sequence control for several successive positioning steps with a break and stop functions and different auxiliary functions (e. g. deriving, counting, waiting).
- Positioning in different positioning modes
  - Point-to-point positioning
  - Touch probe positioning (residual path positioning)
  - Profile chaining with velocity changeover (overchange)
- Homing in different homing modes
- Profile data management
  - Support of S profiles (jerk limitation)
  - Separate setting for acceleration and deceleration
  - "Teach" function
- Speed/acceleration override
- Path-dependent switching of outputs
- Following error monitoring
- Support of absolute value encoders
- Support of the basic drive functions "Manual jog" and "Quick stop"
- Monitoring of travel range limits with the basic drive function "Limiter"
- Optional control of a holding brake with the basic drive function "Brake control"

Application range



- Transport units
- Rotary tables
- Storage and retrieval units
- Feed drives
- Dosing machines
- Hoists

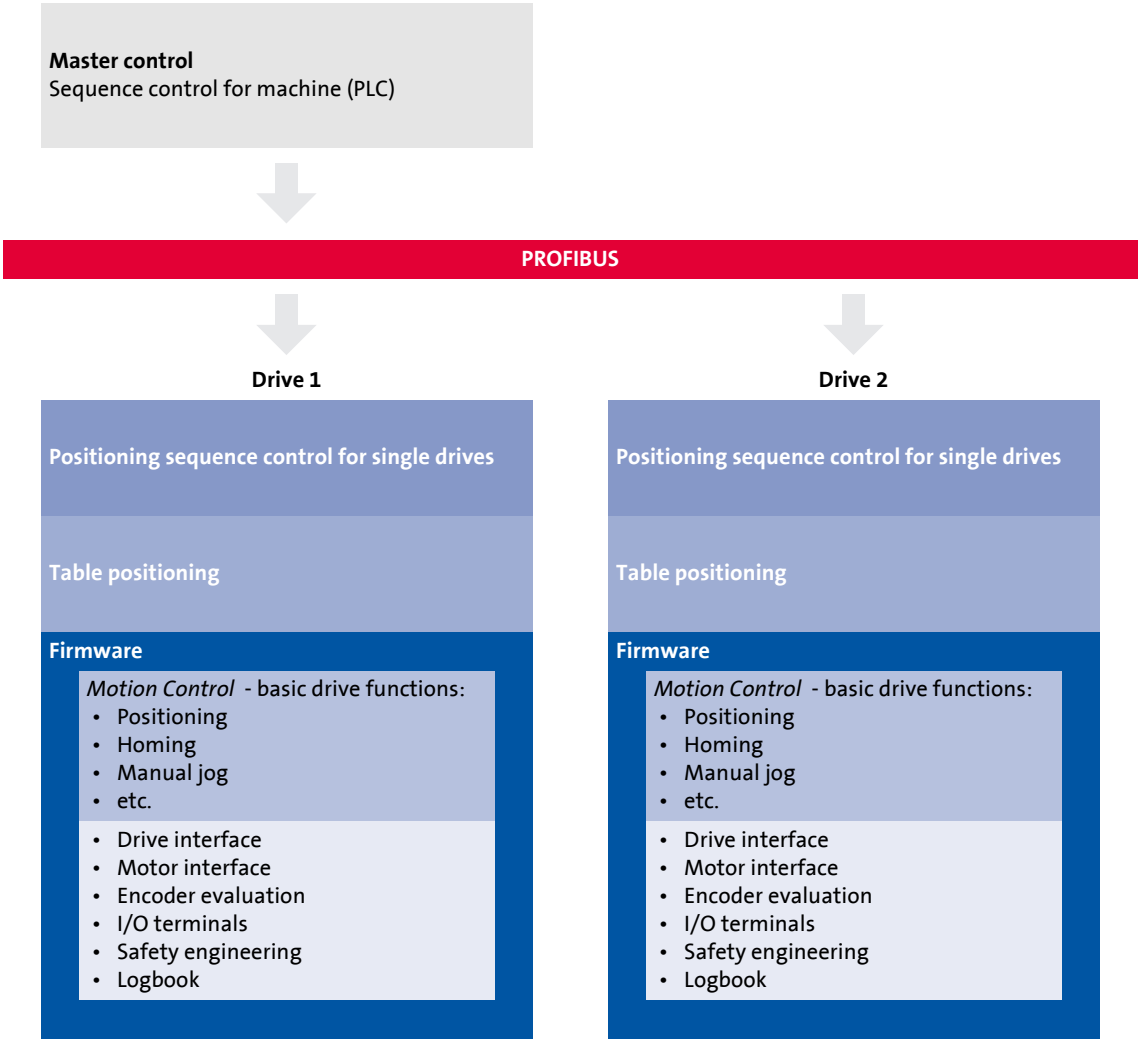
Required license/delivery



- License stage Motion Control TopLevel or higher required.
- The technology application can be selected in the »Engineer« application catalog.

3 Introduction

Positioning means to move a workpiece/tool or a piece of material from a starting position ❶ to a defined target❷.

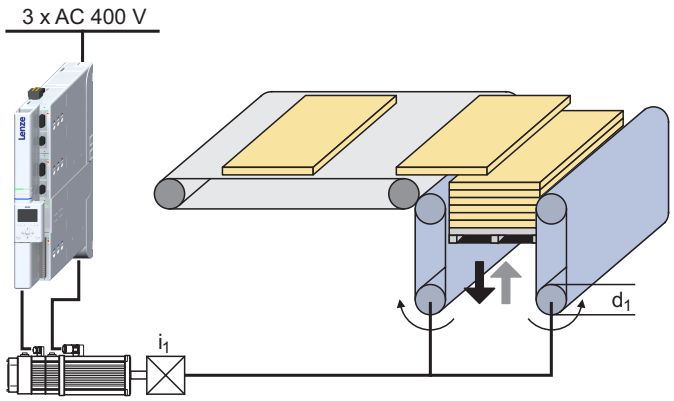


For this purpose a travel profile is to be provided in the controller, for which at least the following profile parameters are required:

Symbol	Profile parameters
A	**Position** Target position or path distance to be traversed.
B	**Speed** Maximum speed with which the target is to be approached.
C	**Acceleration** Selection of the change in speed by which acceleration is to be carried out maximally.
D	**Deceleration** Selection of the change in speed by means of which deceleration to standstill is to be maximally effected again.

- A positioning can consist of several profiles which are executed in a specified mode.
- For a detailed explanation of the profile parameters, please see the section "Profile parameters". (📖 44)

3.1 Example: Positioning sequence control with networking via PROFIBUS



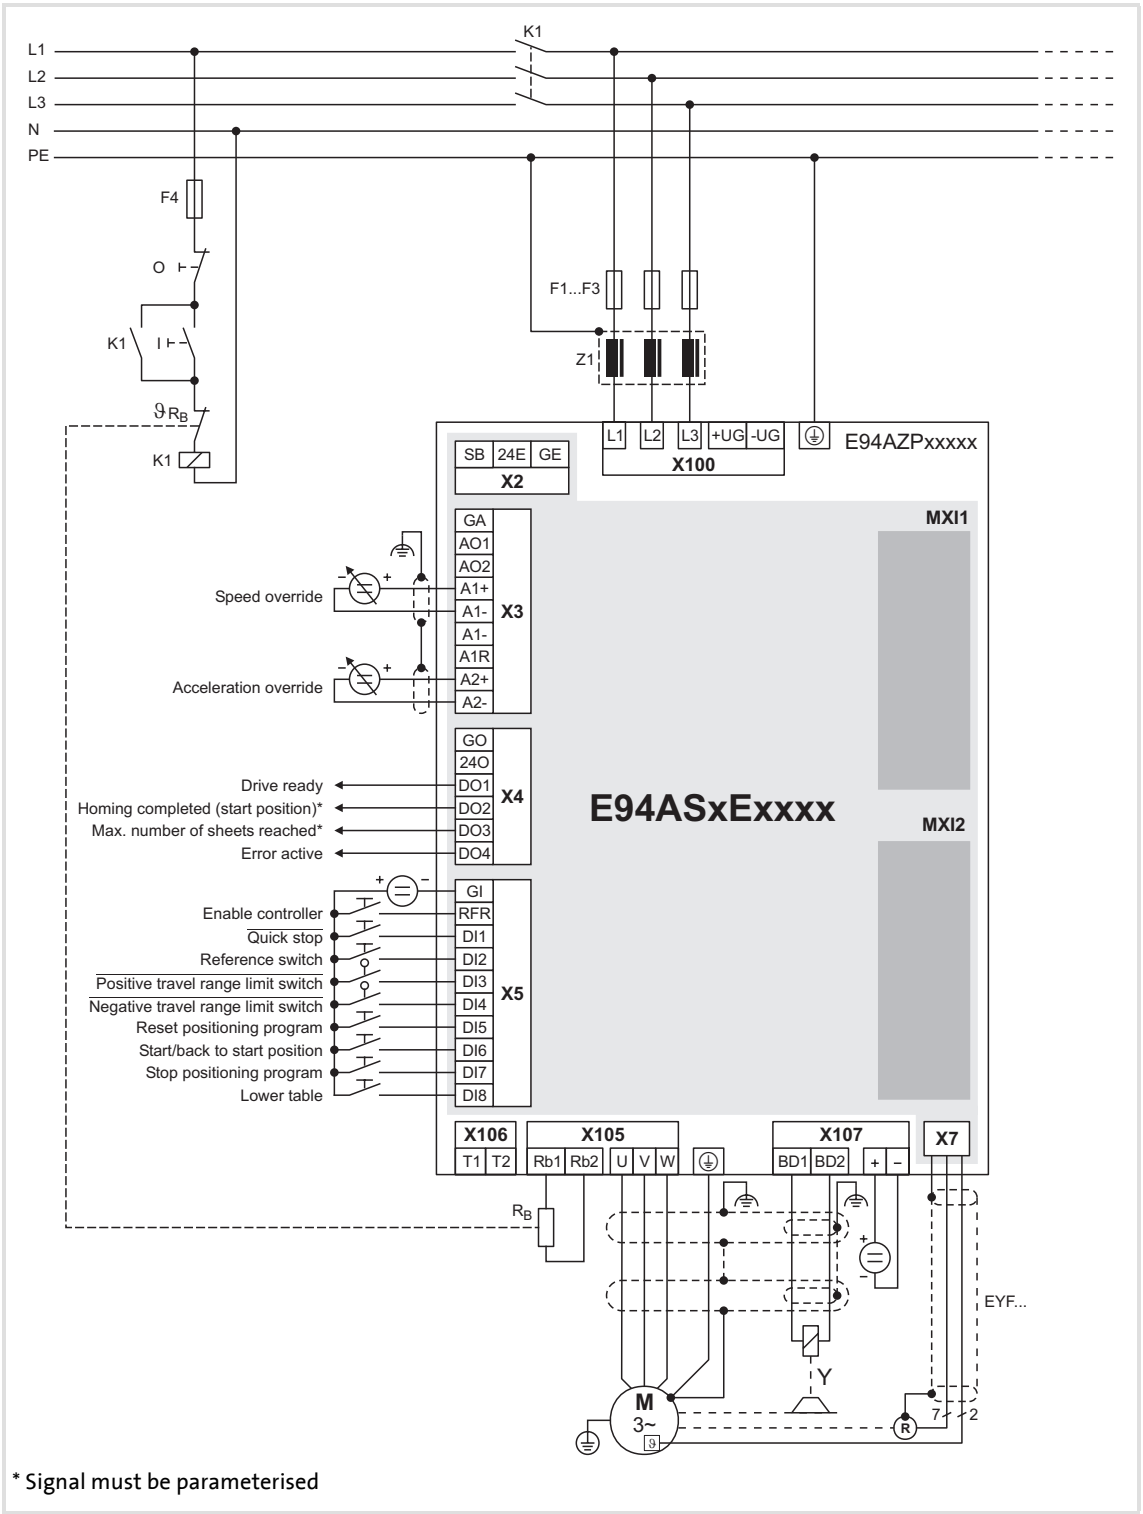
[3-1] Example: Positioning sequence control with networking via PROFIBUS

- The positioning sequence control utilises the traversing blocks of the table positioning and like this activates the basic function "Positioning" containing the profile generation.
- Here, the positioning sequence control only control the "own motor".
- The sequence of the motor/tool/material control are defined in the positioning sequence control.

4 Short setup

4.1 Application example

A sheet stacker is used as an application example for short setup:



N_{motor} = 1680 rpm
i_1 = 12.612
d_1 = 80 mm
Feed constant = 250 mm/rev.

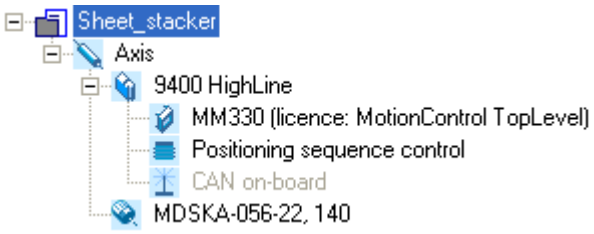
[4-1] Schematic diagram

Component	Technical data	
Controller	9400 SingleDrive HighLine with brake module	
Motor	MDFKA-090-22, 60	
	Type:	Asynchronous servo motor
	Connection:	Y
	Power factor:	0.8
	Rated current:	8.5 A
	Rated frequency:	60 Hz
	Rated power:	3.8 kW
	Rated speed:	1680 rpm
	Rated voltage:	390 V
Brake	24 V DC	
Gearbox	GKS06	
	Gearbox factor:	12.612

4.2 Connection diagram

* Signal must be parameterised

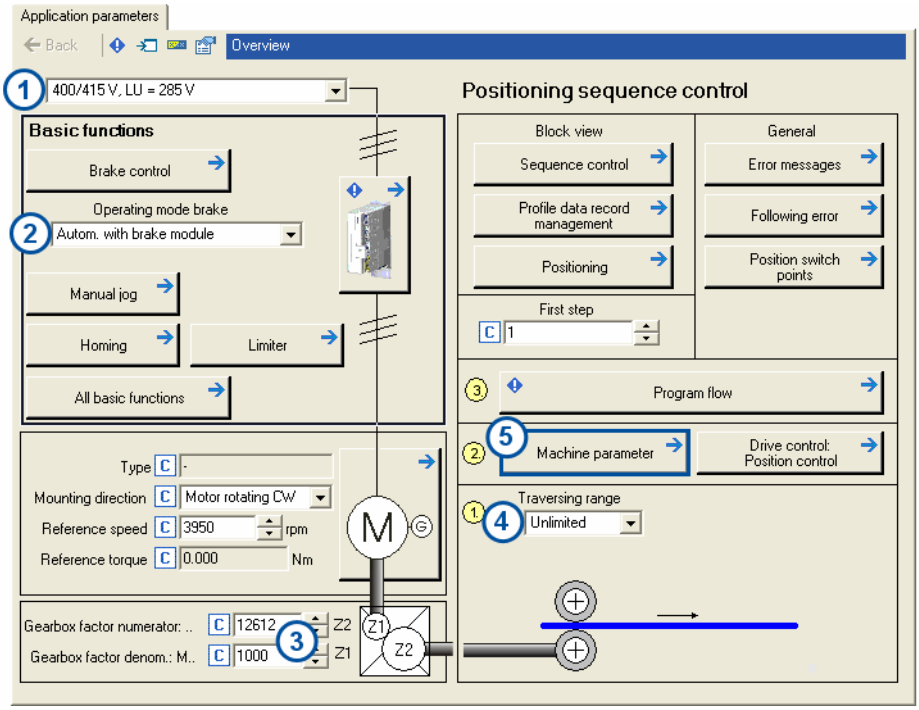
[4-2] Connection diagram



Designation	Component
E94ASxExxxx	9400 Single Drive servo axis module
E94AZPxxxxx	Mounting backplane
k1	Mains contactor
F1 ... F4	Fuses
Z1	Mains filter/RFI filter (option)
⏚	HF-shield termination through large-surface connection to functional earth
EYF...	System cable for resolver feedback
R	Resolver
R_B	Brake resistor
Y	Motor holding brake (at optional motor brake control)

4.3 Sequence

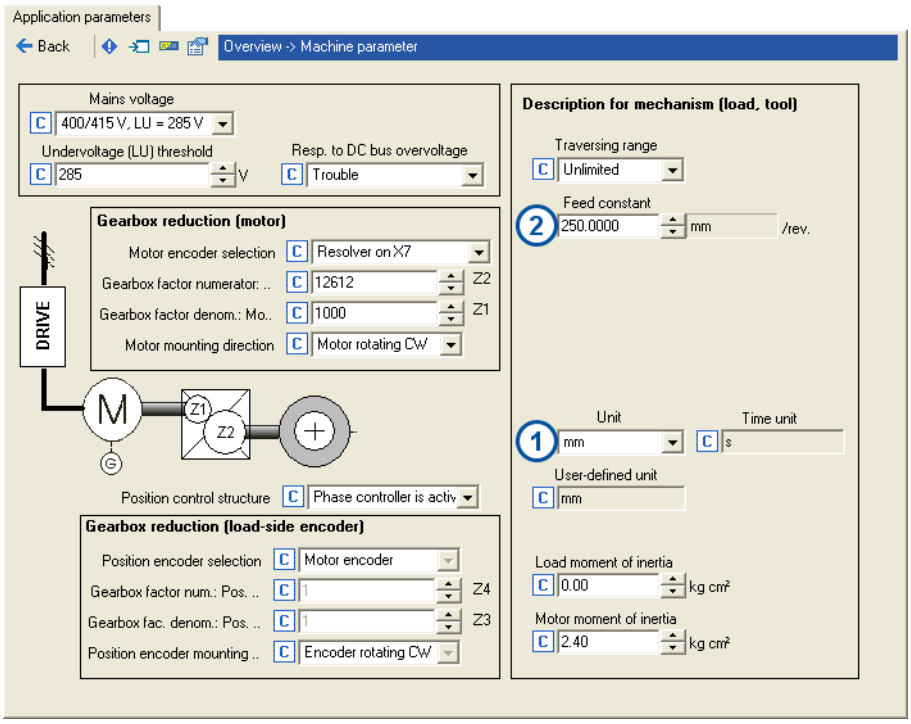
1. After power-on, the drive indicates the status "Drive ready" by setting digital output DO1 to HIGH level.
2. After controller enable, the positioning program is started by setting digital input DI6 to HIGH level.
3. The table traverses upwards until reaching the home switch.
   – The home switch is 10 mm above the start position and connected to digital input DI2.
4. After the homing mark has been detected, the table traverses downwards until reaching the start position (first pick-up position).
5. The drive indicates the status "Homing completed/table in start position" by setting digital output DO2 to HIGH level.
6. The internal sheet counter is reset to zero and stacking can start.
7. When a sheet has been added, digital input DI8 changes to HIGH level.
   – After this, the table is lowered by one sheet thickness each.
8. 10 sheets can be piled up before the drive indicates the status "Maximum number of sheets reached" by setting digital output DO3 to HIGH level.
   – Then, the stack must be removed.
9. After the stack has been removed and digital input DI6 has been set to HIGH level, the table traverses back to the start position (first pick-up position).
   – A new stacking process can be started.



4.4 Step 1: Creating a project

1. Start »Engineer«.
2. Go to *Start-up wizard* and select the option "New project (empty)" and enter a name for the project in a next step.
3. Insert the axis for the sheet stacker.
   – Add the corresponding components (controller, motor, extension module) to the axis.
   – Select the application "Positioning sequence control" for the controller.
   – Example *project view* in the »Engineer«:

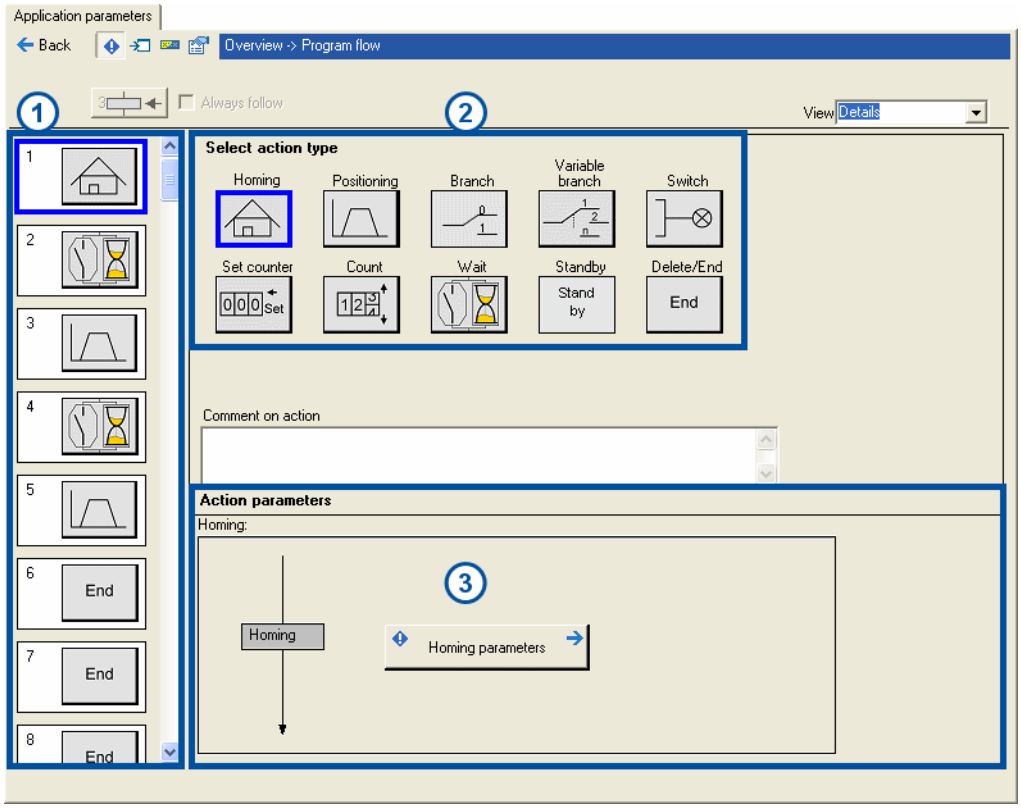
4.5 Step 2: Parameterising the application



For parameterising the application in the »Engineer«, use the **Application parameters** tab which will be displayed by default when selecting the controller in the *project view*:

1. Select the mains voltage (C00173).
2. Activate automatic brake control via brake module (C02580 = "Autom. with brake module").
3. Enter gearbox ratio as a quotient (numerator and denominator): i_1 = 12.612 = 12612/1000
   - Numerator (C02520) = 12612
   - Denominator (C02521) = 1000
4. Select "Unlimited" as traversing range (C02528).
5. Click **Machine parameter** to change to the dialog level *Overview* → *Machine parameter* for further parameter setting.

Setting the machine parameters



Go to dialog: → **Overview**
→ **Machine parameter**

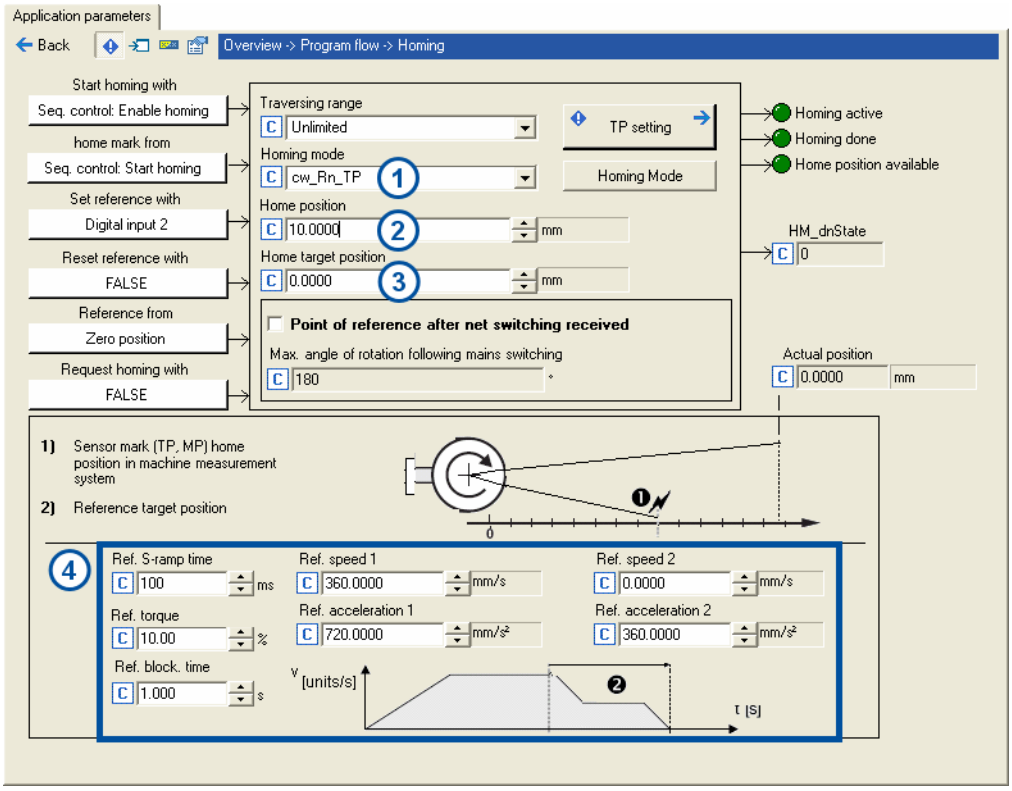
1. Set the selection "mm" as unit (C02525).
   – This parameter is used to define the real unit of the machine for the selection of physical values (e. g. speeds, accelerations and decelerations).
2. Set feed constant (C02524).
   – The feed constant corresponds to the motion of the machine at one revolution of the gearbox output shaft.
   – For the sheet stacker: Feed constant = 250 mm/rev.
3. Click **Back** to go back to the *Overview* dialog level.
4. In the *Overview* dialog level, click **Program flow** to change to the dialog level *Overview* → *Program flow* and select the positioning program.

4.6 Step 3: Parameterising the program flow

The program flow of the positioning sequence control is parameterised in the dialog level *Overview → Program flow:*

Basic procedure

In the default setting the sequence table contains a small "Positioning program", which first rotates the axis 360° clockwise and afterwards 360° counter-clockwise.



Proceed as follows to define the desired program flow:

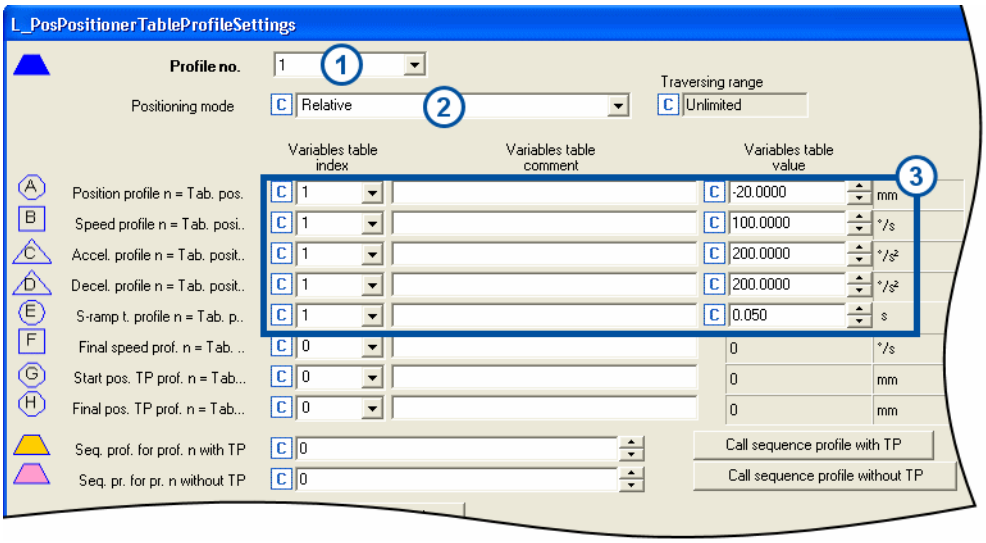
1. Select the program step (1 .... 100) to be edited on the left in the sequence table.
2. Select the action type for the selected program step by clicking it.
   – If the selected action type provides more than one action, the next free action will be automatically suggested in the **Selection Action Number** list field.
   – Enter a comment on the action (option).
3. Set parameters of the action.
   – If required, call the corresponding subsequent dialogs.
4. Repeat steps 1 ... 3 until all actions required for the program flow have been parameterised (see the following sections).
5. Click **Back** to go back to the *Overview* dialog level.

4.6.1 Program step 1: Homing

Action	Comment
	Homing with homing mark (home switch at digital input DI2), after homing, approach start position (0 mm).

The "Homing" action does not have its own parameters. The settings for homing are made via the parameters of the basic function "Homing":

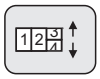
1. Select "cw_Rn_TP" as homing mode (C02640).
2. Select the position of the home switch (10 mm) as home position (C02642).
3. Select the position of the first sheet (0 mm) as home target position (C02643).
4. If necessary, adapt the profile parameters for homing to your application.



4.6.2 Program step 2: Setting counter 1 to "0"

Action	Comment	Parameter	Setting
	Step 2: Set counter 1 to "0".	Selection Action Number:	1
		Counter no.:	1
		Start value:	0

4.6.3 Program step 3: Positioning action 1



Action	Comment	Parameter	Setting
	When input 8 of sequence control is set to "1", lower table relatively by 20 mm. In the Lenze setting, sequence control input 8 is connected to digital input DI8.	Selection Action Number:	1
		Start with:	Input 8
		Profile no.:	1
		Jump destination:	0

Click **Profile settings** to open the following dialog box:

1. Select Profile no. 1.
2. Select "Relative" as positioning mode.
3. Select the profile parameters as described above.
4. Click **Back** to close the dialog box again.

4.6.4 Program step 4: Counting the sheets

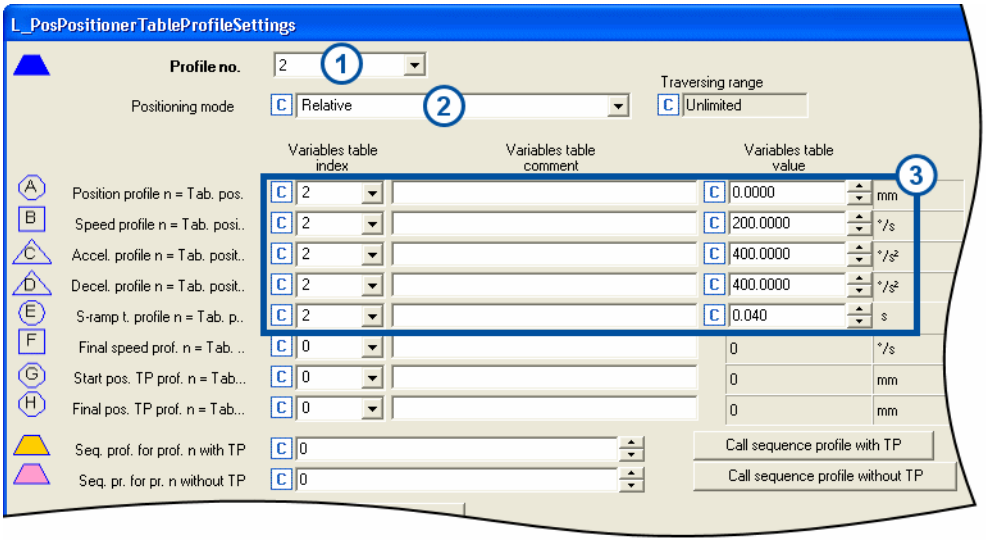
Action	Comment	Parameter	Setting
	Count the sheets and go back to program step 3, unless 10 sheets are reached.	Selection Action Number:	1
		Counter no.:	1
		Comparison function:	Count < comparison value
		Step value:	1
		Comparison value:	10
		Sequence step:	3

4.6.5 Program step 5: Setting the status output

Action	Comment	Parameter	Setting
	Set sequence control output 1 to "1", when maximum number of sheets (10) is reached.	Selection Action Number:	1
		Output for A switching:	Output 1
		Signal state for A switching:	
		Output for B switching:	Deactivated
		Signal state for B switching:	

Tip!

In a later step, sequence control output 1 will be connected with digital output DO3.



4.6.6 Program step 6: Positioning action 2

Action	Comment	Parameter	Setting
	When sequence control input 6 is set to "1", go back to start position.	Selection Action Number:	2
		Start with:	Input 6
		Profile no.:	2
		Jump destination:	0

Tip!

In a later step, sequence control input 6 will be connected with digital input DO6.

Click **Profile settings** to open the following dialog box:

1. Select Profile no. 2.
2. Select "Absolute" as positioning mode.
3. Select the profile parameters as described above.
4. Click **Back** to close the dialog box again.

4.6.7 Program step 7: Resetting the status output

Action	Comment	Parameter	Setting
	Reset sequence control output 1 to "0", when start position is reached.	Selection Action Number:	2
		Output for A switching:	Output 1
		Signal state for A switching:	
		Output for B switching:	Deactivated
		Signal state for B switching:	

4.6.8 Program step 8: Going back to program step 2

Action	Comment	Parameter	Setting
	Go back to program step 2.	Selection Action Number:	1
		Jump input:	Continue with next step
		Jump destination:	2

4.7 Step 4: Parameterising the multiplexer for the digital outputs

1. Go to the **All parameters** tab.
2. Set the following multiplexer parameters:

Parameter		Setting
C03100/2	X digital output 2 of	Homing completed
C03100/3	X digital output 3 of	Sequence control output 1

4.8 Step 5: Transferring the application to the controller

Note!

The transferred application is always stored in the first application memory location in the memory module of the controller.

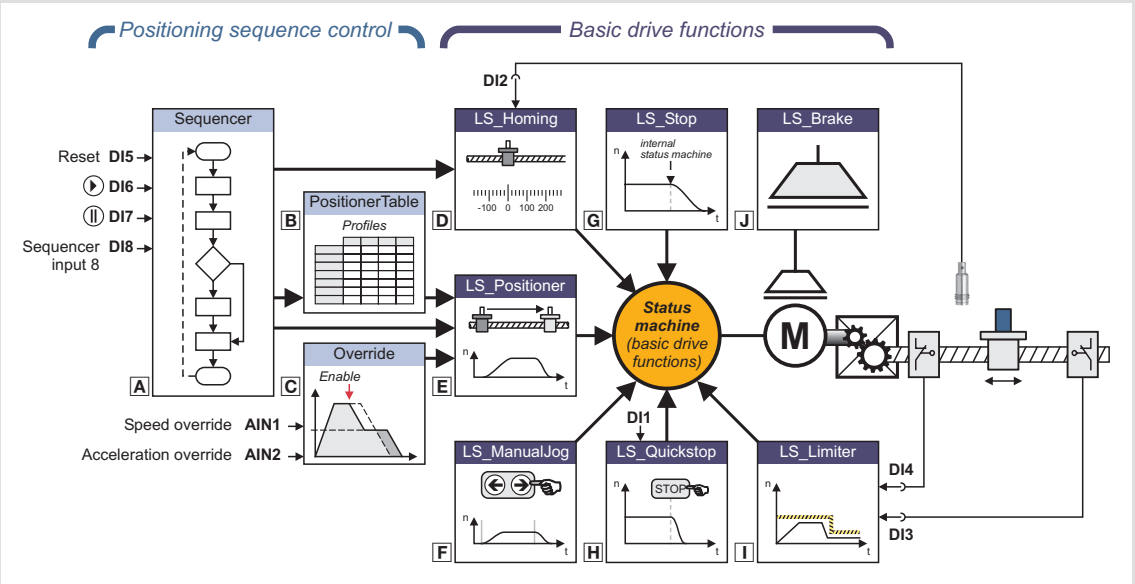
The preinstalled technology applications on the following memory locations are still available.

1. Update devices.
   - Set the checkmark in the control field **Recreate all**.
   - Click **Create** to start the compiling process.
2. Go online and transfer the application to the controller.
   - With an online connection, the »Engineer« displays the current controller parameter settings with a yellow background colour.

4.9 Step 6: Controlling the application via terminals

Terminal assignment

Terminal		Signal (Lenze setting)
X3	AI1- AI1+	Selection for speed override ▸ Speed/acceleration override (📖 53)
	AI2- AI2+	Selection for acceleration override ▸ Speed/acceleration override (📖 53)
X5	DI1	Quick stop • If DI1 is set to LOW level, the positioning program is interrupted and drive is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • After the quick stop function is deactivated, a new LOW/HIGH edge is required at DI6 in order that the positioning program is continued with the next step. ▸ Quick stop (📖 56)
	DI2	Connection of reference switch/touch probe sensor ▸ Action type "Homing" (📖 36)
	DI3 DI4	Connection of travel range limit switch for basic function "Limiter". (📖 57) • DI3 = positive travel range limit switch, DI4 = negative travel range limit switch. • The inputs respond to the FALSE state (fail-safe).
	DI5	Reset error and positioning program • By means of a LOW-HIGH edge an existing error status can be reset if the cause of the fault is removed. At the same time the positioning program is reset.
	DI6	Start positioning program/back to start position ▸ Control of the sequence table (📖 43)
	DI7	Stop positioning program (break) ▸ Control of the sequence table (📖 43)
	DI8	Lower table



Procedure

1. Enable controller: Set digital input RFR to HIGH level.
2. Deactivate quick stop: Set digital input DI1 to HIGH level.
3. Start sequence control: Set digital input DI6 to HIGH level.

5 Parameter setting & configuration

5.1 Basic signal flow

The functional core of the positioning sequence control is formed by the sequence table and the profile data management, which transmit the required control signals and profile data to the basic drive function "Positioning".

[5-1] Signal flow of the TA " Positioning sequence control" (schematic diagram)

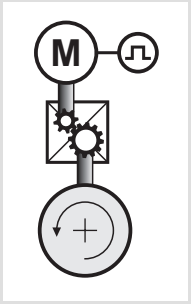
D Homing

E Positioning

F Manual jog

G Stop



H Quick stop

I Limiter

J Brake control (optional)

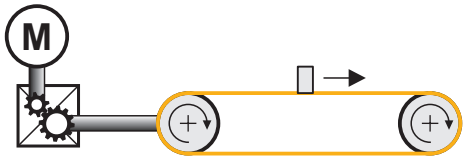
5.2 Basic settings

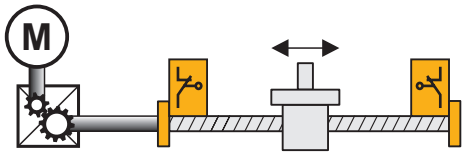
5.2.1 Machine parameters

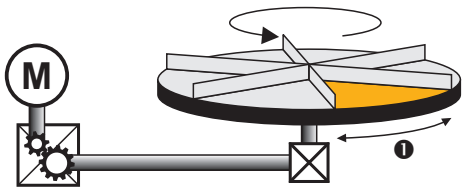
The machine parameters describe e.g. the motor end of the mechanics used.

The setting of the machine parameters in the »Engineer» is carried out on the **Application parameters** tab in the dialog level *Overview* → *Machine parameters*.

Tip!







In the »Engineer« the most important machine parameters can be directly adapted to the machine on the **Application parameters** tab in the topmost *Overview* dialog level.

Short overview of machine parameters

Parameter		Lenze setting	
		Value	Unit
C00173	Mains voltage	400/415	V
C00174	Undervoltage (LU) threshold	285	V
C00600	Resp. to DC bus overvoltage	Trouble	
C02520	Gearbox factor numerator: Motor	1	
C02521	Gearbox factor denom: Motor	1	
C02527	Motor mounting direction	Motor rotating CW	
C02570	Position control structure	Phase control	
C02522	Gearbox factor num.: Pos. enc.	1	
C02523	Gearbox factor denom.: Pos. enc.	1	
C02529	Mounting direction of position encoder	Encoder rotating CW	
Description of the mechanics (load, tool)			
C02528	Traversing range	Limited	
C02524	Feed constant	360.0000	unit
C02525	Unit	°	
C02526	User-defined unit	°	
C02533	Time unit	s	
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

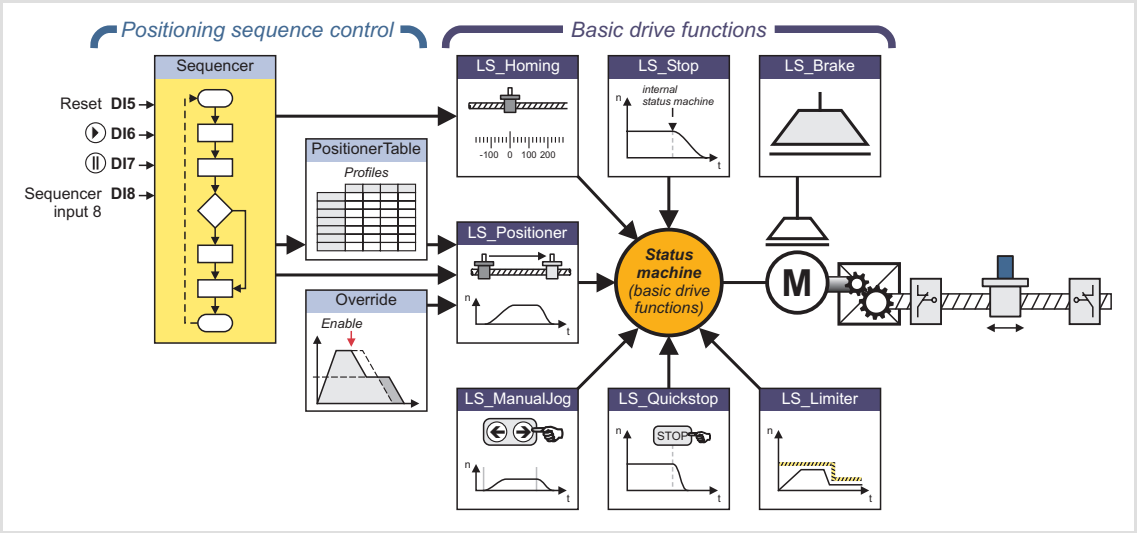
5.2.2 Traversing range

By setting the traversing range the machine type/measuring system is set:

Traversing range	
Unlimited 	The drive can traverse optionally in both directions without reaching limitations. • Positioning here generally is effected in the positioning modes "Relative with/without TP" or "Speed with/ without TP". • The positioning measuring system is reset to zero with every new positioning process. • By homing, the positioning measuring system receives a fixed reference point (zero point), so that also the positioning modes "Absolute with/without TP"can be used. Then also the software limit positions for limiting the traversing range are provided.
Limited 	After reaching the position limits, the drive must travel in the opposite direction again. • For positioning, the home position has to be known. By homing, the positioning measuring system receives a fixed reference point (zero point). • Basically, monitoring to the internally maximum usable value range (±2^{31} increments) takes place (software limit position monitoring of the internal value range). An overflow of the value range results in the loss of the home position. • Additionally parameterisable software limit positions can be activated on the user side for limiting the travel range.
Modulo 	The measuring system is repeated. • If the cycles ❶ set are exceeded a defined overflow occurs. The cycle typically corresponds to a rotation or tool distance in a rotative system. • For positioning, the home position has to be known. • Software limit positions are not effective. • Absolute targets can be approached by exceeding the measuring system limit, e.g. from 10° via 0° to 350°.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview*

Parameter		Lenze setting	
		Value	Unit
C02528	Traversing range	Limited	
C02536	Cycle (only relevant for traversing range "Modulo")	360.0000	unit

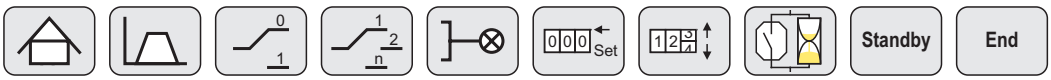


5.2.3 Position control

In the dialog level *Overview* → *LS_Positioner* and the subordinate dialog levels, you can adapt the parameters for the position control, if necessary.

Parameter		Lenze setting	
		Value	Unit
C00254	Phase controller gain	20.00	1/s
C02553	Position controller gain	20.00	1/s
C02556	Position controller limitation	214748.3647	unit/s

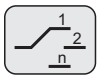
5.3 Program flow

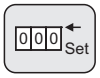


The program flow of the positioning sequence control is selected according to a sequence table which can contain up to 100 references to "actions".

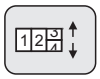
[5-2] Sequence table (schematic diagram)

What is an action?



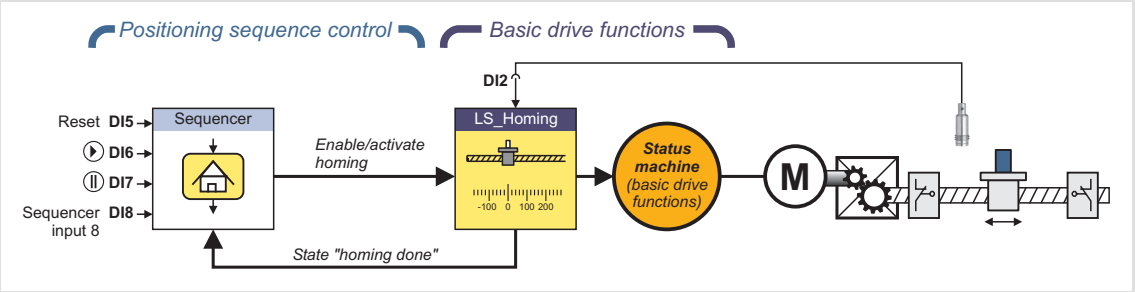


- An action comprises a clear functionality which is described with a few parameters.
- Different action types are available which serve to implement, for instance, program branching, switching operations, waiting times and counters.



- Before every action type a defined number of actions is available which can be individually parameterised. The parameters of the actions of the same type only differ in the subcode.
- An action can be used in several steps if always exactly the same task is to be carried out.
- After an action has been processed, the action in the next step of the sequence table is automatically processed unless it is jumped to another step in the sequence table due to a branch.
- One action can be maximally processed per computing cycle.

5.3.1 Overview of action types



Action type	Function/parameter		
Homing			
	In order to execute a homing process, the action type "Homing" is available which activates the basic function "Homing". **Note:** The "Homing" action does not have its own parameters. The settings for homing are made via the parameters of the basic function "Homing".		
Positioning			
	To execute a profile, 50 actions of the "Positioning" type are available. • The execution of the adjusted profile is only started with activated waiting function if the sequencer input selected for the waiting function accepts the selected signal state. ▸ Sequencer inputs (📖 40)		
	Parameter		**Information**
	C04513/1...50	Profile number	Specification of the profile to be executed. • Press the "Set up profile" button to open a dialog box to enter the corresponding profile parameters. • In this dialog a sequence profile can also be set.
	C04511/1...50	Input for waiting function	Sequencer input 1 ... 32 to be evaluated. • With the default setting "0" the waiting function is skipped and the profile execution is started immediately.
	C04512/1...50	Signal state for waiting function	Profile processing is only started when the sequencer input to be evaluated is in this state.
	C04514/1...50	Sequence step	Step inside the sequence table which will be processed after the profile has been executed.
	C04515/1...50	Watchdog time	Monitoring time within which positioning must be completed. Otherwise, a branch to the watchdog sequence step defined in C04516 is executed.
	C04516/1...50	Watchdog sequence step	Executed when the watchdog time has expired.
Branching			
	25 actions of type "Branching" are available for conditional and unconditional branches (jumps). • A branch to the indicated step is executed when the selected sequencer input has the selected signal state at the time of processing. If not, the sequence step is processed in the sequence table. ▸ Sequencer inputs (📖 40)		
	Parameter		**Information**
	C04530/1...25	Input for comparison	Sequencer input 1 ... 32 to be evaluated. • With the default setting "0" a branch to the adjusted sequence step is executed.
	C04531/1...25	Comparison value	State in which the sequencer input to be evaluated is compared.
	C04532/1...25	Sequence step in case of equality	If the sequencer input to be evaluated equals the comparison value, a branch to the step set here is executed. In case of inequality or "0" setting, the next step in the sequence table is processed.

Action type	Function/parameter		
Variable branching			
	For variable branches (jumps) 5 actions of type "Variable branching" are available. • The branch to one of 20 possible steps is executed depending on the value in C03001 ... C03005 at the time or processing. • The parameters C03001 ... C03005 are firmly assigned to the five available actions: – C03001 determines the branch for action 1. – C03002 determines the branch for action 2, etc. **Example:** If C03002 is assigned to the value "15" at the time of processing the action no. 2, it is branched to the step which is entered in the parameter "Sequence step at branch value 15" for action no. 2 (C04554/2).		
	Parameter		**Information**
	C04540/1...5	Sequence step at branch value 1	Step which is executed next when C03001 ... C03005 = "1". • With the default setting "0" the branching is deactivated (sequence step is processed).
	C04541/1...5	Sequence step at branch value 2	Step which is executed next when C03001 ... C03005 = "2". • In the default setting "0", branching is deactivated and the next step in the sequence table is processed.
	...	...	...
	C04559/1...5	Sequence step at branch value 20	Step which is executed next when C03001 ... C03005 = "20". • In the default setting "0", branching is deactivated and the next step in the sequence table is processed.
Switching			
	In order to switch digital output signals 25 actions of type "Switching" are available. • Each action can set two selectable sequencer outputs independently of each other to FALSE or TRUE. ▸ Sequencer outputs (📖 41)		
	Parameter		**Information**
	C04520/1...25	Output for A switching	Sequencer output 1 ... 32 to be switched. • With the setting "0" switching is deactivated.
	C04521/1...25	Signal state for A switching	State to which the sequencer output is to be set.
	C04522/1...25	Output for B switching	Sequencer output 1 ... 32 to be switched. • With the setting "0" switching is deactivated.
	C04523/1...25	Signal state for B switching	State to which the sequencer output is to be set.
Set counter			
	10 actions of type "Set counter" are available for setting one of the 10 available counters to a certain starting value. • The 10 actions of type "Set counter" are not firmly assigned to the 10 actions of the "Counting" type. • You can use, for instance, an action of type "Set counter" to set a counter to a value and later you can set the same counter with another action of type "Set counter" to another value.		
	Parameter		**Information**
	C04580/1...10	Counter selection	With the setting "0" the setting of the counter is deactivated.
	C04581/1...10	New counter content	-2147483648 ... 2147483648
	C04582/1...10	Current counter content	Read only

Action type	Function/parameter		
Count			
	25 actions of type "Count" are available for counting processes. • With each action processing the counter content of the counter selected is increased or reduced by the specified step value depending on the setting (count upwards or downwards). • When the comparison condition for comparing the counter content with an adjustable comparison value is fulfilled, a branch to any step is possible. • 10 actions of type "Set counter" are available for setting a counter to a starting value.		
	Parameter		**Information**
	C04590/1...25	Counter selection	With the setting "0" the setting of the counter is deactivated.
	C04591/1...25	Step value	Value by which the counter is increased or reduced. • Range: -2147483648 ... 2147483648
	C04592/1...25	Comparison value	Value with which the counter is compared. • Range: -2147483648 ... 2147483648
	C04593/1...25	Sequence step	When the set comparison condition is met, a branch to the step set here is executed. If the condition is not met, the next step in the sequence table is processed instead.
	C04594/1...25	Comparison condition	Selection of the condition for the comparison of the counter content with the comparison value.
Wait			
	25 actions of type "Wait" are available for the insertion of wait times into the program flow. • The sequence step is only processed after the waiting time has elapsed or when the selected sequencer input has the selected signal state at the time of processing. ▸ Sequencer inputs (📖 40)		
	Parameter		**Information**
	C04571/1...25	Waiting time	With setting "0", the waiting time is deactivated.
	C04572/1...25	Input for waiting function	Sequencer input 1 ... 32 to be evaluated. • The sequence step will be processed when this input has the set state, but no later than after the set waiting time has elapsed.
	C04573/1...25	Signal state for waiting function	Required state for completing the waiting function.
Stand-by			
	5 actions of type "Stand-by" are available for the temporary activation of a setpoint follower. • For a sensible use of the "Standby" action, appropriate signal combinations are required in the (enabled) function block editor. • The setpoint follower is enabled until the condition for exiting the stand-by is met.		
	Parameter		**Information**
	C04601/1...5	Input for "Stand-by" end	Sequencer input 1 ... 32 to be evaluated.
	C04602/1...5	Signal state for "Stand-by" end	Only if the sequencer input to be evaluated has this state, the standby step is exited, and the next step in the sequence table is processed.
Program end			
	To define the program end in the sequence table or delete a program step, the action of type "Program end" is available.		

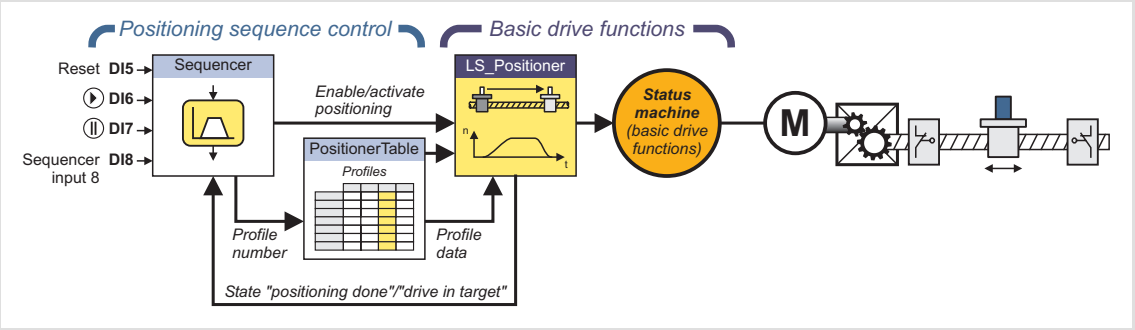
5.3.2 Action type "Homing"

In order to execute a homing process, the action type "Homing" is available for the sequence table which activates the basic function "Homing".

[5-3] "Homing" (schematic diagram for limited traversing range)

Note!

The "Homing" action for the sequence table does not have its own parameters. The settings for homing are made via the parameters of the basic function "Homing".



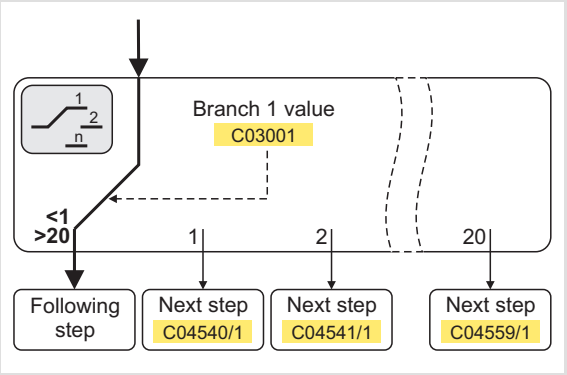
▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Homing*

Parameter		Lenze setting	
		Value	Unit
C02528	Traversing range	Limited	
C02640	Homing mode	Set home pos. directly	
C02642	Home position	0.0000	unit
C02643	Homing: Target position	0.0000	unit
C02644	Homing: Speed 1	360.0000	unit/s
C02645	Homing: Acceleration 1	720.0000	unit/s^2
C02646	Homing: Speed 2	180.0000	unit/s
C02647	Homing: Acceleration 2	360.0000	unit/s^2
C02648	Homing: S-ramp time	100	ms
C02649	Homing: Torque limit	10.00	%
C02650	Homing: Blocking time	1.000	s
C02652	Ref. pos. after mains switching	Delete	
C02653	Max. rot. ang. aft. mns. swtch.	180	°

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
Sequencer Enable Homing	→ Request homing	C03160/1
Sequencer Activate Homing	→ Start homing	C03160/2
DIGIN 2	→ Home mark	C03160/3
FALSE	→ Set home position	C03160/4
FALSE	→ Reset home position	C03160/5
Zero position	→ Home position	C03163
+100 %	→ Homing override	C03186/4

5.3.3 Action type "Positioning"

In order to execute a positioning process, 50 actions of "Positioning" type are available for the sequence table which activates the basic function "Positioning":



[5-4] "Positioning" (schematic diagram for limited traversing range)

- Use the parameter **Profile number** of the action to select the number or the table position of the profile to be executed. The final profile data are then given to the basic function by the Profile data management. (📖 44)
- The execution of the adjusted profile is only started with activated waiting function if the sequencer input selected for the waiting function accepts the selected signal state. ▸ Sequencer inputs (📖 40)

5.3.4 Action type "Variable branching"

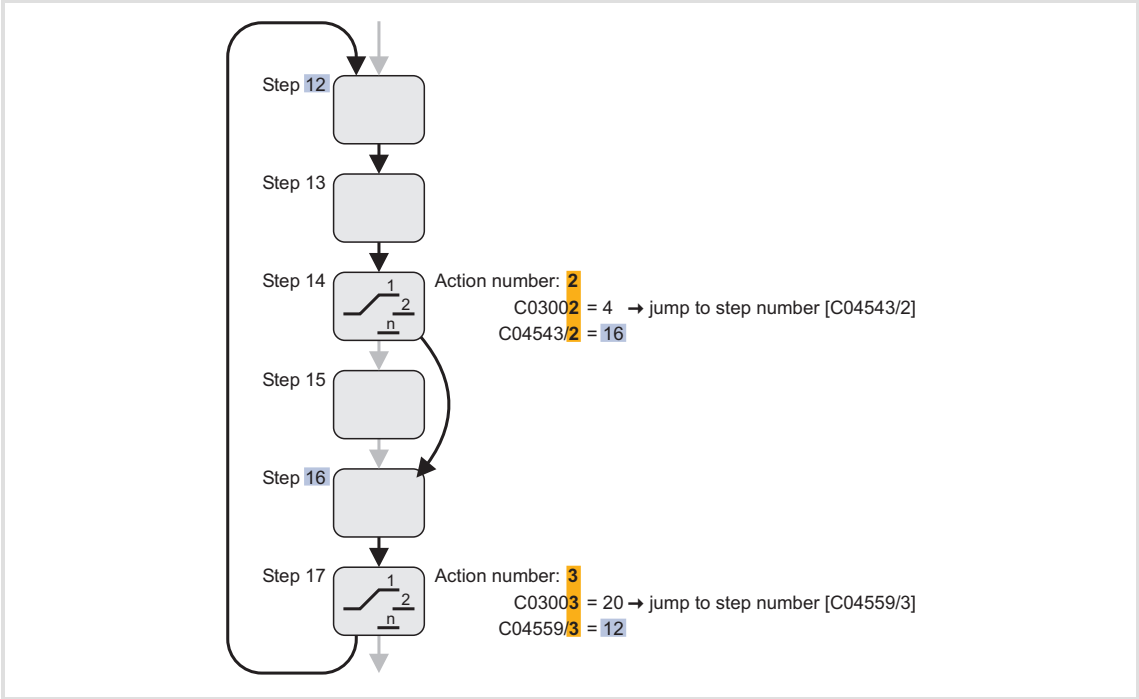
For variable branches (jumps) 5 actions of type "Variable branching" are available for the sequence table.

[5.1] Principle of the variable branch (here for action no. 1)

- The branch to one of 20 possible steps is executed in the Lenze setting depending on the value in C03001 ... C03005 at the time or processing.
- The parameters C03001 ... C03005 are firmly assigned to the five available actions, i.e. C03001 determines the branch for action 1, C03002 for action 2, etc.

Tip!

Instead of the parameters C03001 ... C03005 you can also assign other signal sources of the application to the "branch" inputs via multiplexer parameters.



- Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Sequence control*

Parameter		Lenze setting	
		Value	Unit
C03001	Branch value 1	1	
C03002	Branch value 2	1	
C03003	Branch value 3	1	
C03004	Branch value 4	1	
C03005	Branch value 5	1	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
C03001	→ Sequencer branch 1	C03079/1
C03002	→ Sequencer branch 2	C03079/2
C03003	→ Sequencer branch 3	C03079/3
C03004	→ Sequencer branch 4	C03079/4
C03005	→ Sequencer branch 5	C03079/5

Example

The following example illustrates the function of the variable branch based on a program flow which contains, among other things, two actions of the "Variable branching" type.

[5.2] Example "Variable branch"

5.3.5 Sequencer inputs

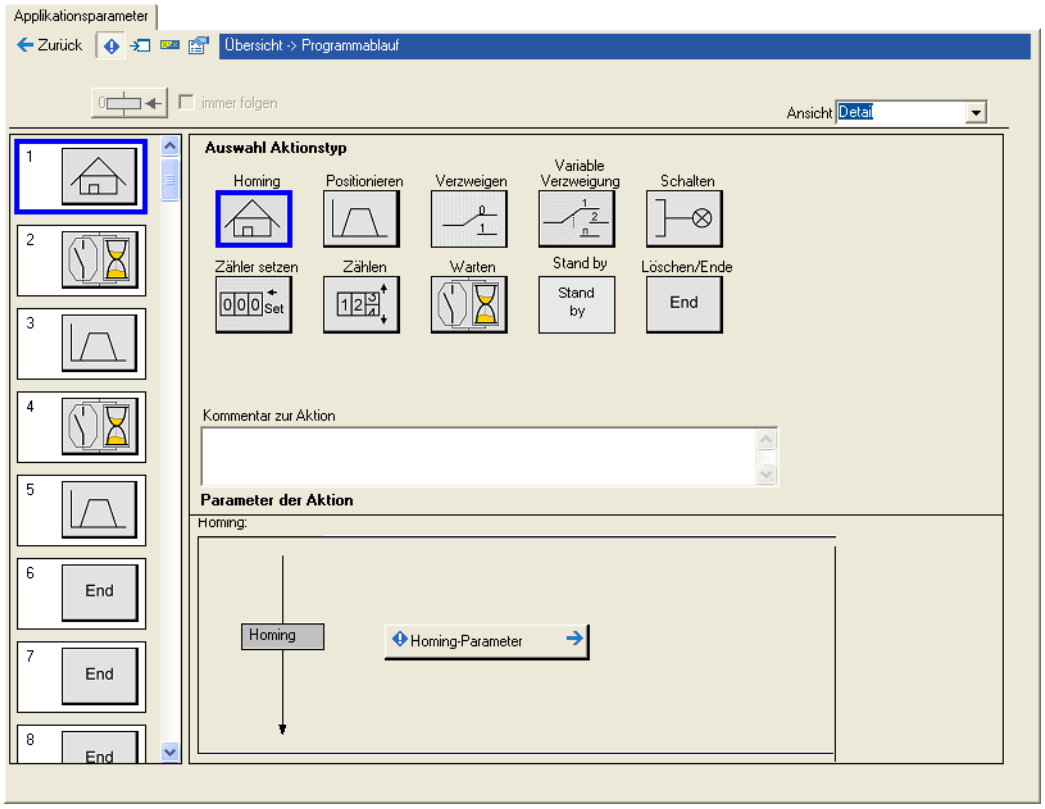
In order to control conditional branches and the optional waiting function of some action types during the program flow, 32 sequencer inputs of "BOOL" type.

- The sequencer inputs 1 ... 16 can be linked with the signal sources of the application or device interfaces in the dialog level *Overview* → *L_Sequencer* → *Program inputs* via multiplexer parameters.
- For the action types "positioning", "branching", "waiting" and "stand-by", you can individually define for each action which of the sequencer inputs is to be called for the corresponding function when the program is executed.

Note!

The sequencer input 8 in the Lenze setting is linked with the digital input DI8.

5.3.6 Sequencer outputs



Via a DWORD-to-BIT-converter, 32 sequencer outputs of type "BOOL" are available for "switching" which can be set to FALSE or TRUE with the action type "switching".

- These sequencer outputs can be connected with the inputs of the application or device interfaces via multiplexer parameters.
- The following table lists the corresponding module outputs of the FB interconnection and the corresponding selection numbers for the multiplexer parameters:

Module output	Signal type	Selection no.	Selection text
SequencerOutput.bBit0	☐	551	Sequencer output 1
SequencerOutput.bBit1		552	Sequencer output 2
SequencerOutput.bBit2		553	Sequencer output 3
...		...	...
SequencerOutput.bBit31		582	Sequencer output 32

5.3.7 Parameter setting of the program flow in the Engineer

Go to the »Engineer« to the **Application parameter** tab and click **Program flow** in the topmost dialog level to change to the dialog for the sequence table:

Basic procedure

In the default setting the sequence table contains a small "Positioning program", which first rotates the axis 360° clockwise and afterwards 360° counter-clockwise.

Proceed as follows to define the desired program flow:

1. Select the program step (1 .... 100) to be edited on the left in the sequence table.
2. Select the action type for the selected program step by clicking it.
3. If the selected action type provides more than one action, select the action to be parameterised from the list field **Selection of action number**.
   – The next free action is suggested automatically.
4. Enter a comment about the action (optional).
5. Set parameters of the action.
   – If required, call the corresponding subsequent dialogs.
6. Repeat step 1 ... 5 until all actions required for the program flow are parameterised.

5.3.8 Control of the sequence table

A LOW/HIGH edge at the digital input DI6 starts the parameterised program flow if the controller is enabled and no error is pending.

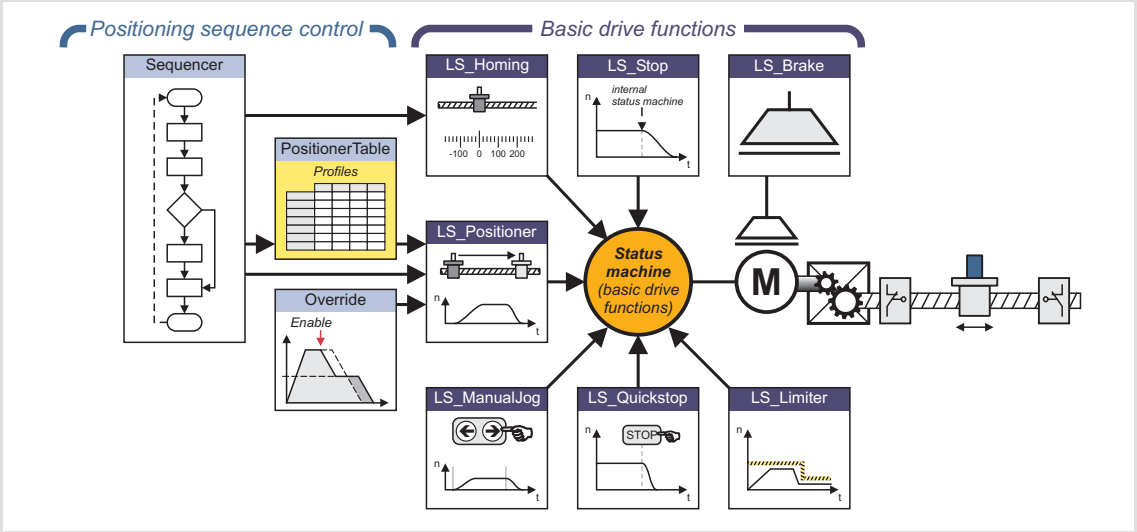
- ▶ The first step set in C03000 of the sequence table is executed.
- ▶ By setting the digital input DI7 to HIGH level, the program flow can be stopped, if required (break).

Note!

In the following cases the program flow is interrupted:

- The controller inhibit is activated.
- Quick stop is activated.
- The drive interface changes to an error status.

If the controller is not inhibited, a shutdown of the drive via the basic function "Quick stop" is effected.



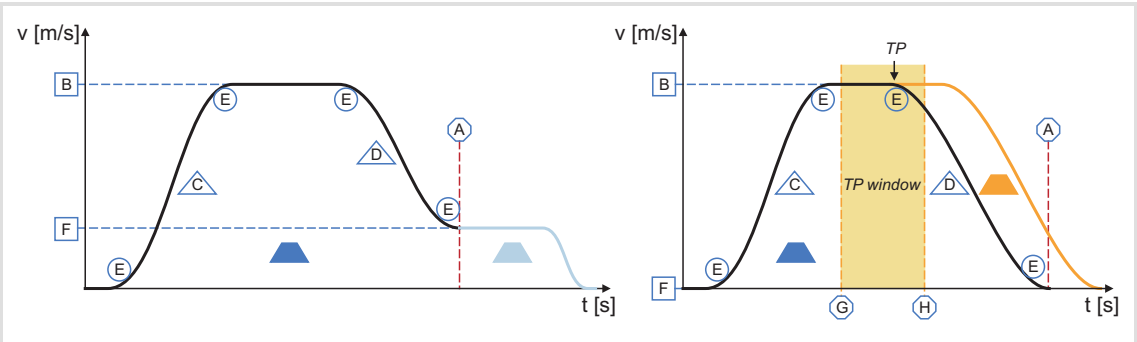
After the interruption is deactivated again (e.g. because an activated quick stop has been deactivated again), a renewed LOW/HIGH edge is required at the digital input DI6 in order that the positioning program can be continued with the sequence step.

- ▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *L_Sequencer*

Parameter		Lenze setting	
		Value	Unit
C03000	First step	1	
C04504	Jump destination	0	

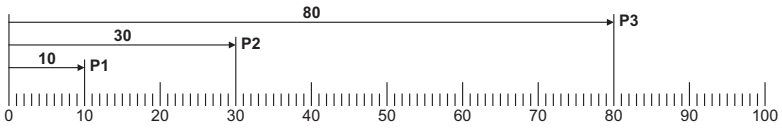
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
C03000	→ First step	C03079/6
DIGIN 6	→ Sequencer start	C03070/1
DIGIN 7	→ Sequencer break	C03070/2
FALSE	→ Sequencer jump	C03070/3
FALSE	→ Sequencer abort	C03070/4
FALSE	→ Sequencer interruption	C03070/5
Controller inhibit or Quick stop active or Error active	→ Reset program status	C03070/6
DIGIN 5	→ Reset program/error status	C03070/8

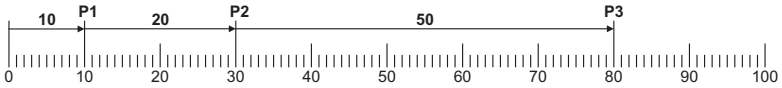
5.4 Profile data management

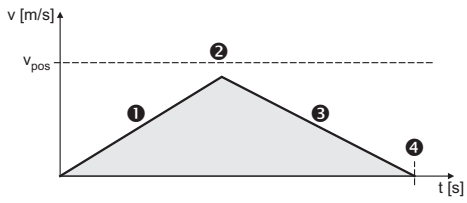


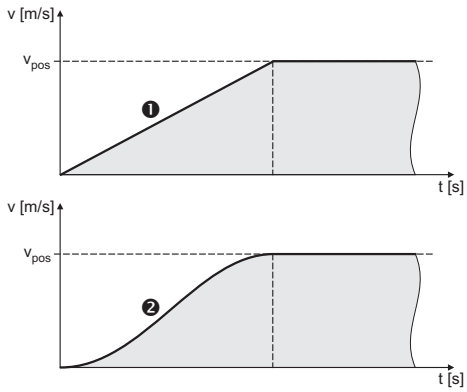
[5-5] Profile data management (schematic diagram)

The profile data management serves to file and manage up to 75 (travel) profiles.

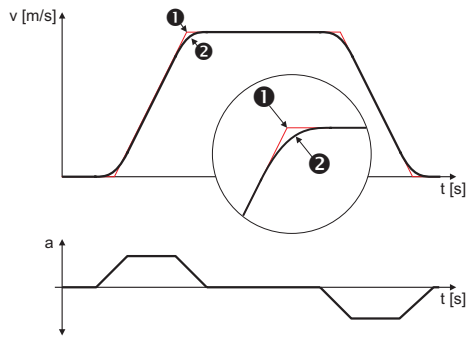


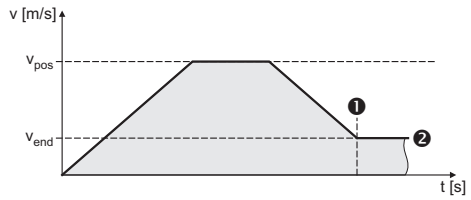






- A profile describes a motion request which can be converted by the basic drive function "Positioning" into a rotary motion.
- To execute a profile, 50 actions of type "Positioning" are available for the sequence table.
- The profile data management also enables the "teaching" of speed, acceleration/ deceleration and S-ramp times. ▸ "Teach" function (📖 52)





5.4.1 Profile parameters

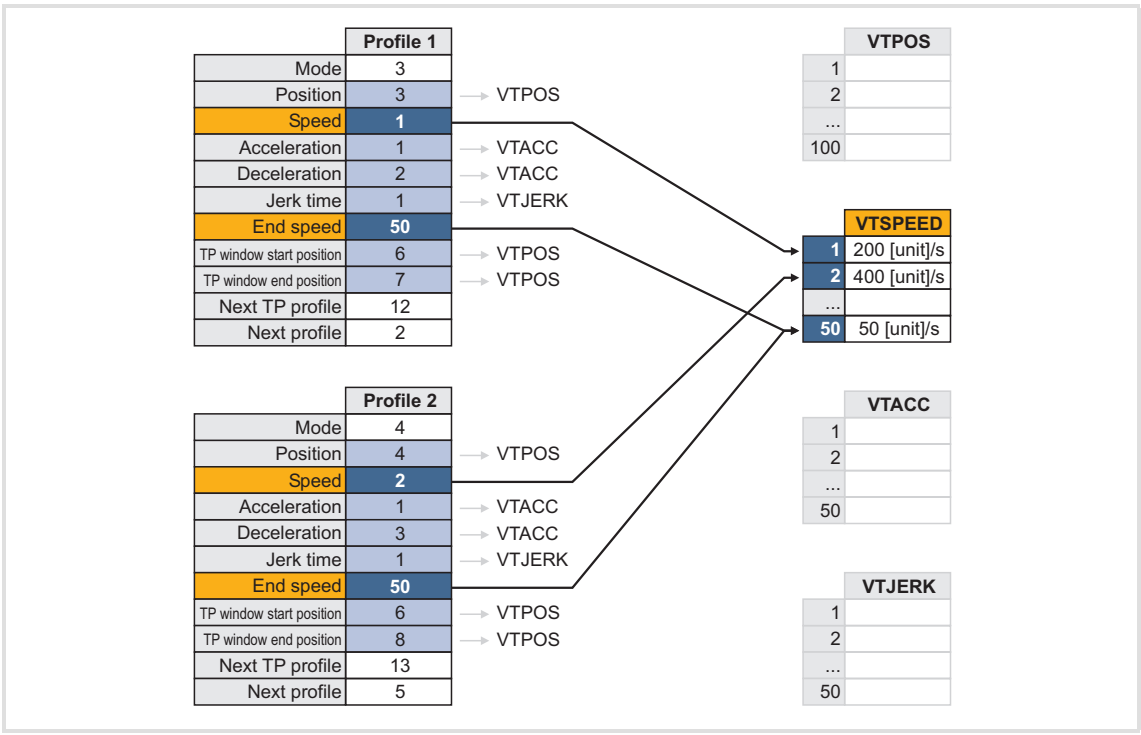
A profile is described by the following profile parameters:

[5-6] Profile parameters

Symbol	Profile parameters
	(Standard) profile Profile data set (profile no. 1 ... 75) in which the profile data are stored.
	Mode Selection of the positioning mode. ▸ Positioning modes (📖 48)
A	**Position** Target position or path distance to be traversed. The position is either indicated as absolute or relative position. • An absolute position always specifies the distance to the zero position defined: absolute position = target position  • A relative position indicates the distance to the starting position (current position): Relative position = target position - starting position 
B	**Speed** Maximum speed with which the target is to be approached. • Depending on the profile parameter position, acceleration and deceleration, it is possible that the drive may not reach the maximum speed. In this case, the graph would display a triangle instead of a trapezium.  ❶ Acceleration ❷ Travelling speed (is not reached here) ❸ Deceleration ❹ Target position (or feed distance)
C	**Acceleration** Selection of the change in speed by which acceleration is to be carried out maximally. • The following two acceleration types are distinguished: – Constant acceleration: the speed increases linearly. – Linearly increasing acceleration: The speed increases in S-shapes.  ❶ Constant acceleration ❷ Linearly increasing acceleration
D	**Deceleration** Selection of the change in speed by means of which deceleration to standstill is to be maximally effected again.

Symbol	Profile parameters
Ⓔ	**S-ramp time** When the S-ramp time is selected for a profile, it is executed with S-shaped ramps, e.g. acceleration and deceleration processes are started smoothly to reduce the jerk and thus prevent the drive components from damage. • The acceleration/deceleration specified in the profile are only reached after the defined S-ramp time has elapsed. • This type of acceleration/deceleration is required for e.g. sensitive machine parts with clearance. • The slower acceleration increase with the S profile prolongs the positioning time compared to the time optimal L profile.  ❶ without jerk limitation (L profile) ❷ with jerk limitation (S profile)
Ⓕ	**Final speed** Selection of the speed by which the drive is to start the next profile after reaching the target position. "Velocity changeover" or "Overchange" can be implemented with a final speed that is non-zero, i.e. when the target position is reached, a second positioning process is started immediately without the drive being decelerated to standstill at the first target position:  ❶ Target position ❷ Final speed (here unequal "0")
Ⓖ Ⓗ	**Start of TP window / End of TP window** These profile parameters serve to restrict the range for a touch probe positioning (residual path positioning) in which touch probes are to be detected.
	Sequence profile with TP Profile data set (profile no. 1 ... 75) in which the profile data of the profile are stored which is to be executed after a touch probe has been detected. • For the setting "0" no further profile connection by touch probe is effected.
	Sequence profile without TP Profile data set (profile no. 1 ... 75) in which the profile data of the profile is stored which is to be executed after the standard profile has been executed (profile chaining). • With the setting "0" no profile chaining is carried out. • The sequence profile defined in this profile parameter is executed even if no touch probe has been detected within the defined TP window.

5.4.2 Variable tables



To simplify parameter handling, the four most important physical sizes for profile parameters are stored in separate "variable tables".

	VTPOS Positions	VTSPEED Speeds	VTACC Acceleration/ deceleration	VTJERK S-ramp times
Unit	unit	unit/s	unit/s^2	s
Data format	DINT with four decimal positions			
Memory locations	75	50	50	50
Code	C04711/1...75	C04712/1...50	C04713/1...50	C04714/1...50
For profile parameters	Target position TP window starting position TP window end position	Speed Final speed	Acceleration Deceleration	S-ramp time

Note!

A value is assigned to a profile parameter by referring to a table position of the assigned variable table.

- Hence, not the value itself is entered into the profile parameter but the index of the table position which contains the value to be used.
- See the example in the illustration [5-7]. (📖 47)

[5-7] Principle: References to variable tables (here: References to VTSPEED)

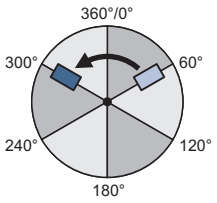
▶ In case of several references to the same table position, a change of the value in this table position affects several profiles at the same time. Thus, recurring profile parameters only need to be changed on one position.

- If e.g. in case of a profile linkage, several profiles are to be executed with the same speed, the corresponding profile parameters "speed" can all refer to the same table position.
- For an easier assignment and identification of the entered values, each table position can be optionally provided with a comment in the »Engineer«.

5.4.3 Positioning modes

Depending on the traversing range/application, you can select between different positioning modes which are described in the below table.

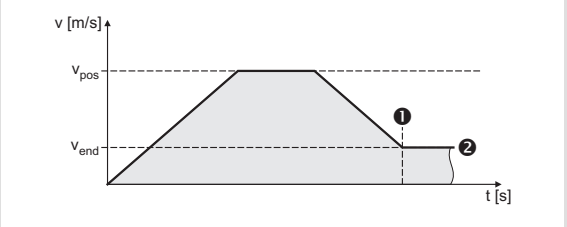
Note!



For absolute positioning, the home position must be known!

- If an absolute positioning process (positioning modes 1 ... 2 and 11 ... 16) is started although the home position is not known, an error message is indicated.
  - In this case a programming error has occurred and the program flow must be reset.
  - If the error only occurs in a sequence profile, the last valid deceleration is used to decelerate the drive to standstill.

The modulo positioning modes may involve reversing processes!



- If a modulo positioning process (positioning modes 11 ... 16) is started at an initial speed other than zero, the target position may be overtravelled and a reversing process may follow, depending on the selected deceleration / S-ramp time parameters. This would also cause e.g. counter-clockwise rotation in the "Absolute CW (modulo)" positioning mode.

Positioning mode	
1	**Absolute** The axis travels to an absolute position. • Reference for the absolute position is zero position. • The home position must be known. • The traversing range is limited: –to 214748.3647 [unit] –by the internal display area ($\pm 2^{31}$ increments) • Not possible with "modulo" traversing range.
2	**Absolute TP** Like mode 1, but with profile change when a touch probe is detected. ▸ Touch probe positioning. (📖 51)
5	**Relative** The axis is traversed by a distance. • Reference for the distance is the target position of the profile executed before. • The feed per positioning is limited: –to 214748.3647 [unit] –by the internal display area ($\pm 2^{31}$ increments)
6	**Relative TP** Like mode 5, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 51)

Positioning mode	
7	**Speed** Continuous constant travel. • Only possible with "unlimited" and "limited" traversing range • This mode does not approach a defined position, but follows the profile. • Acceleration and deceleration are based on profile values. • The traversing direction is defined by the sign of the traversing speed. • Stopped through break signal.
8	**Speed TP** Like mode 7, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 51)
11	**Absolute CW** The axis travels in CW direction to an absolute position. • Only possible with "Modulo" traversing range. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.
12	**Absolute CW TP** Like mode 11, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 51)
13	**Absolute CCW** The axis travels in CCW direction to an absolute position. • Only possible with "Modulo" traversing range. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.
14	**Absolute CCW TP** Like mode 13, but with profile change when a touch probe is detected. ▸ Touch probe positioning. (📖 51)
15	**Absolute ShortestWay** The axis travels to an absolute position in best time. • Only possible with "Modulo" traversing range. • Reference for the absolute position is zero position. • The rotary table positioning is basically an absolute positioning with target positions between 0 and 360 angular degree [°]. In this mode the zero point can also be overtravelled if this is the shortest way to the target position: 
16	**Absolute ShortestWay TP** Like mode 15, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 51)

5.4.4 Positioning with final speed

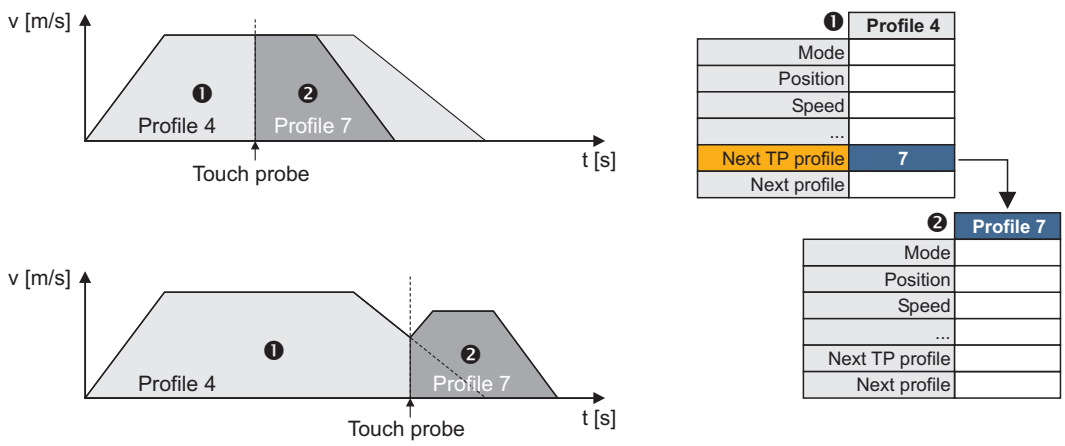
If a positioning process with a final speed other than zero is carried out, a velocity changeover / overchange can be realised, i.e. a second positioning process is started immediately once the target position is reached, and the drive does not come to a standstill at the first target position.

❶ Target position
❷ Final speed (here unequal "0")

[5-8] The principle of velocity changeover / overchange

- ▶ Normally, the drive has reached the final speed when the target position is reached.
- ▶ The profile is run through which is defined via "Profile data sequence profile without TP".
- ▶ The final speed must not exceed the maximum profile speed.
  - – The speed is internally limited to the profile speed.
  - – This is the maximum value for the final speed if the profile speed is reduced via override. (This behaviour may add to the cases described in the note below.)
  - – The speed limitation is not affected by subsequent increases in the override value.

Note!



Positioning processes with final speeds other than zero do not permit reversing. In this case, the positioning process is aborted and an error is issued.

In the case of positioning processes with final speeds and if S-shaped ramps are used, a plausibility check as to whether the final speed can be reached is carried out when the profile is started. If the final speed cannot be reached, the positioning process is aborted and an error is issued. This is often the case if the positioning process has been paused and is then to be continued.

5.4.5 Touch probe positioning

In the touch probe positioning mode, the profile is first executed according to the Profile parameters set. If a touch probe is detected during the process, it is automatically changed to the profile specified in the profile parameter "Sequence profile with TP".

- Here the current actual position is stored at the time of the touch probe activation (by a touch probe sensor).
- In the following relative positioning process, the "residual path" to this stored position is travelled according to the increments.

❶ "Starting profile"
❷ "Residual path profile" that is defined in the profile parameter "Sequence profile with TP" of the starting profile.

[5-9] Examples for a "residual path positioning" after a touch probe is detected

- The profile parameters "TP window start" and "TP window end" the range in which touch probes are to be detected can be restricted.
  - If both profile parameters are "0", touch probe detection will be active over the whole profile/the whole traversing range.
- If no touch probe is detected and after the profile is executed, the positioning is continued with the profile defined in the profile parameter "Sequence profile without TP" (profile chaining).

Note!

If a profile is travelled with high speed and a touch probe positioning is started the residual path of which is shorter than the result from current speed and set deceleration ramp, the target position is "overtravelled".

- Normally a reversing movement occurs, i.e. the drive returns.
- If, for instance, a CCW rotation of the drive is forbidden by the safety module, the target cannot be approached since in this case the reversing movement is not permissible.

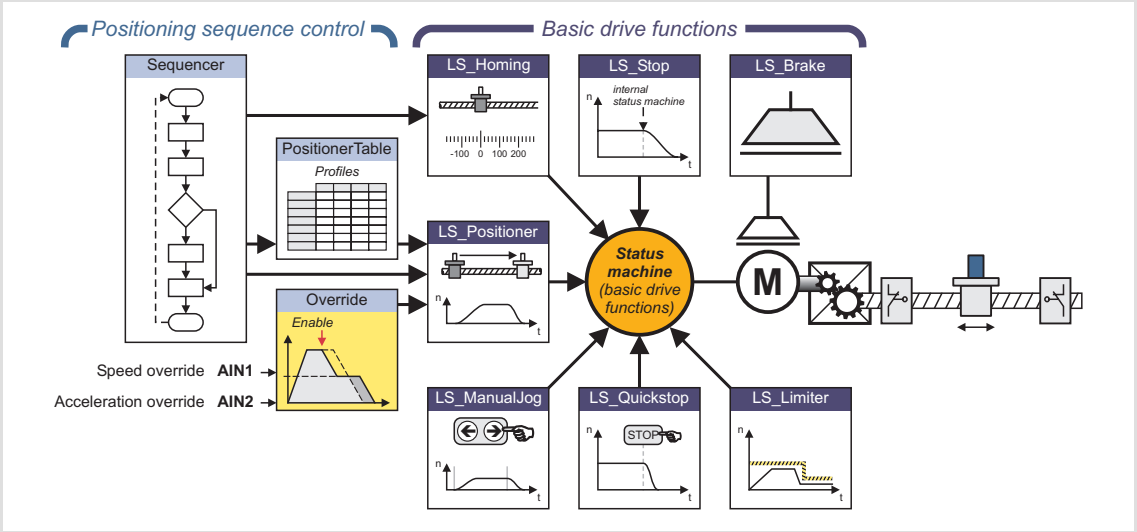
Further constellations are possible in connection with profile chaining in which an approach of the target position is impossible.

5.4.6 "Teach" function

The "Teach" function of the profile data management enables the teaching of positions, speeds, accelerations and S-ramp times.

The basic function "Manual jog" serves, for instance to approach the desired position manually and transmits it via "Teaching" to the variable table for positions.

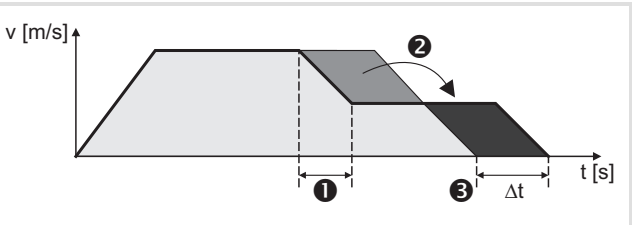
▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *L_PositionerTable*



Control/setpoint inputs of the function		Signal configuration
Lenze setting	**Control/setpoint input**	**(Multiplexer parameters)**
FALSE	→ Teach position	C03020/1
C03016	→ Selection of table position for position	C03029/1
Zero position	→ Teach position	C03125/1
FALSE	→ Teach speed	C03020/2
C03017	→ Selection of table position for speed	C03029/2
Speed setpoint	→ Teach speed	C03024/1
FALSE	→ Teach acceleration	C03020/3
C03018	→ Selection of table position for acceleration	C03029/3
0	→ Teach acceleration	C03027
FALSE	→ Teach S-ramp time	C03020/4
C03019	→ Selection of table position for S-ramp time	C03029/4
0	→ Teach S-ramp time	C03028

Note!

After the function block editor is enabled the "Teach" function must be configured directly in the FB interconnection instead of via the parameters mentioned before!



5.5 Speed/acceleration override

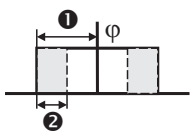
[5-10] Speed/acceleration override (schematic diagram)

"Override" is the change of profile parameters and their acceptance during the positioning process.

In this case, the travel profile is adapted accordingly to ensure that the defined target position is still exactly approached if, for example, the speed is changed during the positioning process ("speed override"):

❶ The speed is reduced during the positioning process.

❷ To reach the defined position, the missing surface must be "attached" to the profile.



❸ When the speed is reduced the positioning process takes a longer time (Δt).

[5-11] Override (here: Speed override)

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *LS_Positioner*

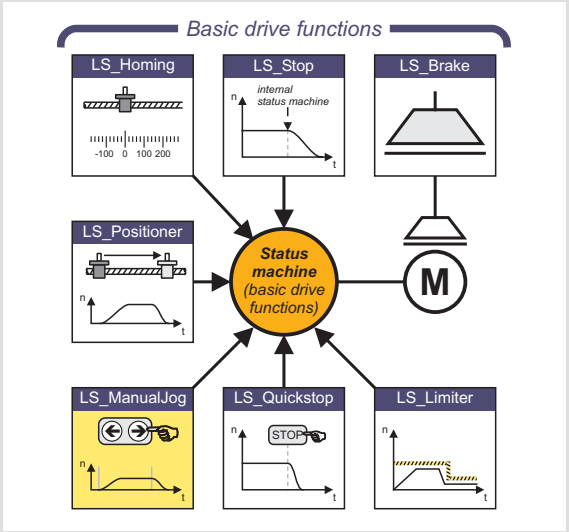
Control/setpoint inputs of the function		Signal configuration
Lenze setting	**Control/setpoint input**	**(Multiplexer parameters)**
C03013	→ Activate override	C03185/5
AIN 1	→ Speed override	C03186/1
AIN 2	→ Acceleration override	C03186/2
+100 %	→ Deceleration override	C03186/3

5.6 Following error monitoring

❶ Switching threshold
❷ Hysteresis

[5-12] Following error monitoring

In the Lenze setting a two-stage following error monitoring is active.



If the parameterisable switching threshold 1 is exceeded, a warning appears. If the higher-set switching threshold 2 is exceeded, a "warning locked" appears.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Following error*

Parameter		Lenze setting	
		Value	Unit
C03911	Switching threshold 1	100.0000	unit
C03914	Switching threshold 2	200.0000	unit
C03917	Hysteresis 1	0.0000	unit
C03920	Hysteresis 2	0.0000	unit
C05902/1	Error response - following error 1	Warning	
C05902/2	Error response - following error 2	Warning locked	

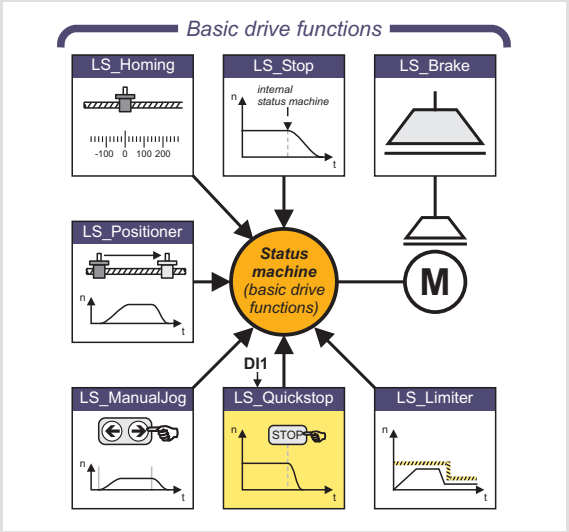
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
TRUE	→ Activate following error limit 1	C03058/1
TRUE	→ Activate following error limit 2	C03058/2

5.7 Manual jog

[5-13] Basic function "Manual jog" (schematic diagram)

For the setting-up operation and "Teaching" of positions the basic function "Manual jog" is available.

Manual jog is controlled via parameters (e. g. via HMI).



Manual jog can always be carried out if the sequence control is not active and no other basic function and no error status are active. The request of manual jog then is effected automatically with the travel commands.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Manual jog*

Parameter		Lenze setting	
		Value	Unit
C02620	Manual jog: Speed 1	360.0000	unit/s
C02621	Manual jog: Speed 2	720.0000	unit/s
C02622	Manual jog: Acceleration	360.0000	unit/s^2
C02623	Manual jog: Deceleration	1440.0000	unit/s^2
C02624	Manual jog: S-ramp time	0.100	s
C03007	Activate positive manual jog	FALSE	
C03008	Activate negative manual jog	FALSE	
C03009	Activate "Retract limit switch"	FALSE	

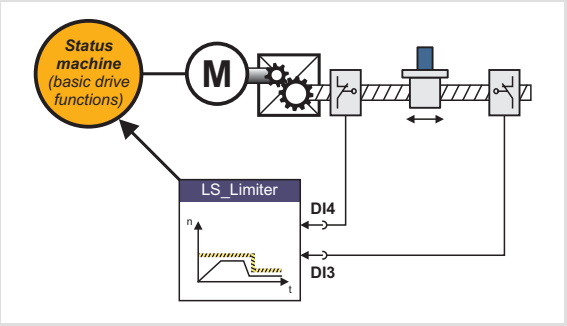
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
Automatic activation	→ Request manual jog	C03155/1
C03007	→ Activate positive manual jog	C03155/2
C03008	→ Activate negative manual jog	C03155/3
FALSE	→ Activate 2. speed	C03155/4
C03009	→ Activate "Retract limit switch"	C03155/5
+100 %	→ Manual jog override	C03186/5

5.8 Quick stop

[5-14] Basic function "Quick stop" (schematic diagram)

The basic function "Quick stop" brakes the drive to standstill within the deceleration time set for the quick stop function after a corresponding request independent of the setpoint selection. The sequence control is interrupted.

If the quick stop is deactivated, the drive remains in standstill until the sequence control is started again and takes over the drive control.



▶ The quick stop function can be activated as follows in the Lenze setting:
  – By setting the digital input DI1 to LOW level.
  – By a master control via the port *LPortControl*:
    By setting bit 2 of the bit-coded control word 1.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *All basic functions* → *Quick stop*

Parameter		Lenze setting	
		Value	Unit
C00105	Deceleration time "quick stop"	0.000	s
C00106	S-ramp time "quick stop"	0.00	%
C00107	Reference for quick stop deceleration time	Motor reference speed (C00011)	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 1	→ Activate quick stop 1	C03135/1
Control word 1 bit 02	→ Activate quick stop 2	C03135/2
FALSE	→ Activate quick stop 3	C03135/3

5.9 Limiter

[5-15] Basic function "Limiter" (schematic diagram)

The basic function "Limiter" monitors the travel range limits via limit switches and parameterisable software limit positions and after an according request from the safety module can lead the drive into defined limit ranges. Furthermore higher-level limit values for travel profiles can be entered and activated.

- The software limit positions which can be set via parameters serve to limit the travel range by means of software and prevent that travel commands are executed which would cause an exit of the permissible travel range.
- Moreover, the travel range limits are monitored via limit switches via the digital inputs DI3 and DI4.

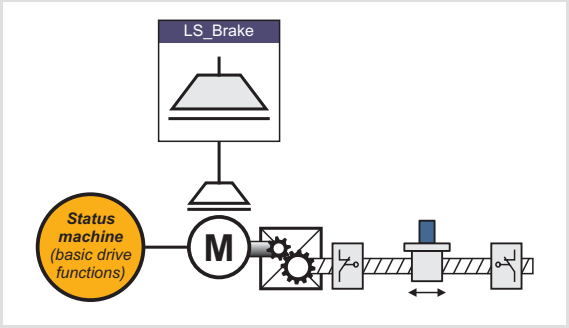
Note!

The digital inputs DI3 and DI4 are configured fail-safe in C00114/3 and C00114/4 , i.e. a HIGH level is expected at both inputs in idle state.

- If the travel range limits should not be monitored (e.g. in case of a rotary axis), set the limit switch inputs of the basic function "Limiter" permanently to FALSE.

The parameterised limit values for travel profiles are not effective for the basic functions "speed follower", "torque follower", and "position follower"!

- For the exceeding of the limit values an error response can be set.



- Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Limiter*

Parameter		Lenze setting	
		Value	Unit
Limit values			
C02707	Permissible direction of rotation	Positive and negative	
C02700	Software limit positions are active	Deactivated	
C02701/1	Positive software limit position	0.0000	unit
C02701/2	Negative software limit position	0.0000	unit
Only for homing, positioning and manual jog			
C02702	Limitations are active	Deactivated	
C02703	Max. speed	3600.0000	unit/s
C02705	Max. acceleration	3600.0000	unit/s^2
C02706	Min. S-ramp time	100	ms

Parameter		Lenze setting	
		Value	Unit
For manual jog only			
C02713	Max. manual jog distance	360.0000	unit
Limited speed 1 ... 4 (only for homing, positioning, and manual jog)			
C02708/1	Limited speed 1	3600.0000	unit/s
C02710/1	Delay lim. speed 1	0.0100	unit/s^2
C02711/1	S-ramp time lim. speed 1	100	ms
C02708/2	Limited speed 2	7200.0000	unit/s
C02710/2	Delay lim. speed 2	0.0100	unit/s^2
C02711/2	S-ramp time lim. speed 2	100	ms
C02708/3	Limited speed 3	14400.0000	unit/s
C02710/3	Delay lim. speed 3	0.0100	unit/s^2
C02711/3	S-ramp time lim. speed 3	100	ms
C02708/4	Limited speed 4	28800.0000	unit/s
C02710/4	Delay lim. speed 4	0.0100	unit/s^2
C02711/4	S-ramp time lim. speed 4	100	ms

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 3	→ Positive limit switch	C03150/1
DIGIN 4	→ Negative limit switch	C03150/2

5.10 Brake control

[5-16] Basic function "Brake control" (schematic diagram)

The basic function "Brake control" serves to the wear free control and monitoring of a holding brake.

In the simplest case, an optionally available brake module is used.

Alternatively the holding brake can also be controlled and monitored via the digital inputs/outputs.

Note!

In the Lenze setting the brake control is switched off to reach a safe state after mains connection.

If the automatic operation (operating mode 2 or 12) is selected in C02580, the brake is controlled automatically, i.e. if the multi-purpose positioning or another basic function is activated which causes the drive to traverse, the brake is opened automatically and the operation is enabled.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Brake control*

Parameter		Lenze setting	
		Value	Unit
C02580	Operating mode of brake	Brake control off	
C02581	Threshold for brake activation	50	rpm
C02582	Brake resp. to pulse inhibit	Activate brake immediately	
C02583	Status input monitoring	Not active	
C02585	Brake control polarity	Not inverted	
C02586	Starting torque 1	0.00	Nm
C02587	Starting torque 2	0.00	Nm
C02588	Starting torque source	Starting torque 1/2	
C02589	Brake closing time	100	ms
C02590	Brake opening time	100	ms
C02591	Waiting time - status monitoring	100	ms
C02593	Waiting time - brake activation	0.000	s
C02594	Test torque	0.00	Nm
C02595	Permissible angle of rotation	5	°
C02596	Grinding speed	100	rpm
C02597	Accel./decel. time - grinding	1.000	s
C02598	Grinding ON time	0.5	s
C02599	Grinding OFF time	0.5	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Open brake (release)	C03165/1
FALSE	→ Activate starting torque 2	C03165/2
FALSE	→ Keep open brake at standstill	C03165/3
FALSE	→ Brake status signal	C03165/4
FALSE	→ Activate brake test	C03165/5
FALSE	→ Grind brake	C03165/6
0 %	→ Additional torque	C03166

5.11 Signal configuration

5.11.1 Drive and motor interface

If required, the preset signal configuration of the control and setpoint inputs of the drive and motor interface can be easily reconfigured by parameterising the assigned multiplexer parameters.

Drive interface

Signal (Lenze setting)	Control input	Signal configuration
FALSE	→ Set controller inhibit	C03130/1
DIGIN 5	→ Reset error 1	C03130/2
FALSE	→ Reset error 2	C03130/3
FALSE	→ Reset error 3	C03130/4
FALSE	→ Set error	C03130/5
FALSE	→ Switch on drive	C03130/6

Motor interface

Signal (Lenze setting)	Setpoint input	Signal configuration
100 %	→ Position controller adaptation	C03141/1
100 %	→ Phase controller adaptation	C03141/2
100 %	→ Speed controller adaptation	C03141/3
100 %	→ Upper torque limit value	C03141/4
-100 %	→ Lower torque limit value	C03141/5
100 %	→ Flux setpoint	C03141/6
100 %	→ Adaptation of mass inertia	C03141/7

5.11.2 Output ports

If required, the preset signal configuration of the output ports can be easily reconfigured by parameterising the assigned multiplexer parameters.

Output port "LPortAxisOut1"

The output port **LPortAxisOut1** is intended for the connection with a following axis.

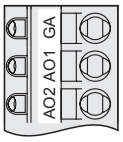
Signal (Lenze setting)	Output port	Signal configuration
Axis status word • The bit assignment is identical to that of status word 1/2. • Application-specific signals can be supplemented.		
Drive ready	→ Axis status word bit 00	C03120/1
FALSE	→ Axis status word bit 01	C03120/2
Operation enabled	→ Axis status word bit 02	C03120/3
Error active	→ Axis status word bit 03	C03120/4
FALSE	→ Axis status word bit 04	C03120/5
Quick stop active	→ Axis status word bit 05	C03120/6
Drive is ready to start	→ Axis status word bit 06	C03120/7
Warning active	→ Axis status word bit 07	C03120/8
FALSE	→ Axis status word bit 08	C03120/9
FALSE	→ Axis status word bit 09	C03120/10
FALSE	→ Axis status word bit 10	C03120/11
Motor control in limitation	→ Axis status word bit 11	C03120/12
Sequence control ready to start	→ Axis status word bit 12	C03120/13
Sequence control started	→ Axis status word bit 13	C03120/14
Sequence control reset	→ Axis status word bit 14	C03120/15
Sequence control processed	→ Axis status word bit 15	C03120/16
Setpoints for horizontal communication		
Filtered torque setpoint	→ Axis-Port Out 1	C03124/1
	Scaling: 16384 ≡ 2^{14} ≡ 100 % motor reference torque (C00057/2)	
Motor speed	→ Axis port out 2	C03124/2
	Scaling: 1073741824 ≡ 2^{30} ≡ 100 % motor reference speed (C00011)	

Output port "LPortStatus1"

The output port **LPortStatus1** is intended for the connection with a higher-level control.

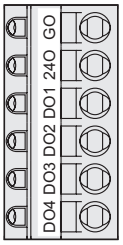
Signal (Lenze setting)	Output port	Signal configuration
Status word 1		
Drive ready	→ Status word 1 bit 00	C03121/1
FALSE	→ Status word 1 bit 01	C03121/2
Operation enabled	→ Status word 1 bit 02	C03121/3
Error active	→ Status word 1 bit 03	C03121/4
FALSE	→ Status word 1 bit 04	C03121/5
Quick stop active	→ Status word 1 bit 05	C03121/6
Drive is ready to start	→ Status word 1 bit 06	C03121/7
Warning active	→ Status word 1 bit 07	C03121/8
FALSE	→ Status word 1 bit 08	C03121/9
FALSE	→ Status word 1 bit 09	C03121/10
FALSE	→ Status word 1 bit 10	C03121/11
Motor control in limitation	→ Status word 1 bit 11	C03121/12
Sequence control ready to start	→ Status word 1 bit 12	C03121/13
Sequence control started	→ Status word bit 13	C03121/14
Sequence control reset	→ Status word 1 bit 14	C03121/15
Sequence control processed	→ Status word 1 bit 15	C03121/16

Output port "LPortStatus2"



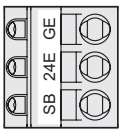
Signal (Lenze setting)	Output port	Signal configuration
Status word 2		
FALSE	→ Status word 2 bit 00	C03122/1
FALSE	→ Status word 2 bit 01	C03122/2
FALSE	→ Status word 2 bit 02	C03122/3
FALSE	→ Status word 2 bit 03	C03122/4
FALSE	→ Status word 2 bit 04	C03122/5
FALSE	→ Status word 2 bit 05	C03122/6
FALSE	→ Status word 2 bit 06	C03122/7
FALSE	→ Status word 2 bit 07	C03122/8
FALSE	→ Status word 2 bit 08	C03122/9
FALSE	→ Status word 2 bit 09	C03122/10
FALSE	→ Status word 2 bit 10	C03122/11
FALSE	→ Status word 2 bit 11	C03122/12
FALSE	→ Status word 2 bit 12	C03122/13
FALSE	→ Status word 2 bit 13	C03122/14
FALSE	→ Status word 2 bit 14	C03122/15
FALSE	→ Status word 2 bit 15	C03122/16

5.12 Actual value and status signals



The following tables contain the Lenze assignment of the analog and digital outputs for the "Positioning sequence control" technology application.

▶ The default signal configuration if required can be easily changed by parameterising the multiplexer parameters assigned.



Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	Motor speed • Scaling: ±10 V ≡ motor reference speed (C00011)	C03110/1
	AO2	Motor torque (setpoint) • Scaling: 10 V ≡ Motor reference torque (C00057/2)	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Status "Drive ready" • DC-bus voltage is available and no error has occurred.	C03100/1
	DO2	Status "Positioner active"	C03100/2
	DO3	Status "Limitation active" • At the moment a setpoint is limited or a software or hardware limit switch has been reached.	C03100/3
	DO4	Status "Error active acknowledgement is required" • A monitoring function with the error response "Error" or "Quick stop by trouble" has been activated and the controller is in the status "Error active" or "Quick stop by trouble active".	C03100/4

Statebus

Terminal X2		Signal (Lenze setting)	Signal configuration
	**SB**	Status "Error active acknowledgement is required" • A monitoring function with the error response "Error" or "Quick stop by trouble" has been activated and the controller is in the status "Error active" or "Quick stop by trouble active". • The state bus is put in the "error" status.	C03100/5

Display elements

User LED	Signal (Lenze setting)	Signal configuration
	"Positioning sequence control active" status	C03100/6

5.13 Application error messages

For the output of application-specific error messages, the FB instances *ApplicationError1* and *ApplicationError2* of the function block **L_DevApplErr** are available in the network.

▶ Via the boolean inputs up to 16 different application error messages with parameterisable module ID, error ID and error response can be released by the application.

Error message		Error ID	Error response
FB instance "ApplicationError1"			
1	Following error limit 1	8001	Warning
2	Following error limit 2	8002	Warning locked
3	Positioner: Home position is not known	8003	Warning
4	Positioner: Cycle is not known	8004	Warning
5	Positioner: Wrong positioning mode	8005	Warning
6	Positioner: Invalid change of the positioning mode	8006	Warning
7	Positioner: Profile data is not plausible or faulty	8007	Warning
8	Positioner: Error in profile generation	8008	Warning
FB instance "ApplicationError2"			
1	Free error message 1	8011	Information
2	Free fault message 2	8012	Information
3	PositionerTable: Invalid axis data structure	8013	Warning
4	PositionerTable: Invalid profile no.	8014	Information
5	PositionerTable: Invalid table no.	8015	Warning
6	Watch-Dog	8016	Quick stop by trouble
7	Sequencer: Error due to variable branch	8017	Warning
8	Sequencer: Pause	8018	Information

▶ Parameter setting: Tab **All parameters**

Parameter		Lenze setting
FB instance "ApplicationError1"		
C05900	Function block ID	999
C05901/1...8	Error ID 1 ... 8	See table above
C05902/1...8	Error response 1 ... 8	See table above
FB instance "ApplicationError2"		
C05903	Function block ID	998
C05904/1...8	Error ID 1 ... 8	See table above
C05905/1...8	Error response 1 ... 8	See table above

Reset of error message

In the Lenze setting the digital input DI5 for resetting (acknowledging) an error message is connected to the input *DI_bResetError1* of the drive interface.

5.14 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application and the corresponding parameters in alphabetical order.

5.14.1 ActualSpeedScaling

Is an instance of	Function
L_TbNormalize	Scaling of actual speed to a parameterisable reference variable

Parameter	Possible settings			Information
C04036	-2147483647		2147483647	Reference variable • Setting "0" is not possible. • Initialisation: 44739243

5.14.2 ApplicationError1

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 65)

Parameter	Possible settings			Information
C05900	980		999	Module ID • Initialisation: 999
C05901/1...8	0		65535	Error ID • Initialisation: 8001 ... 8008
C05902/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

5.14.3 ApplicationError2

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 65)

Parameter	Possible settings			Information
C05903	980		999	Module ID • Initialisation: 998
C05904/1...8	0		65535	Error ID • Initialisation: 8011 ... 8018
C05905/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

5.14.4 FollowingErrorScaling

Is an instance of	Function
L_TbNormalize	Scaling of the following error to a parameterisable reference variable

Parameter	Possible settings			Information
C04035	-2147483647		2147483647	Reference variable • Setting "0" is not possible. • Initialisation: 65536

5.14.5 HysteresisFollowingError1

Is an instance of	Function
L_SdSetPosition	Conversion of the following error hysteresis 1 selected in the real units of the machine via C03917 into a position in [increments]. ▸ Following error monitoring (📖 54)

Parameter	Possible settings			Information
C03917	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03918	String of digits			Position unit • Read only
C03919	-2147483647		2147483647	State • Read only

5.14.6 HysteresisFollowingError2

Is an instance of	Function
L_SdSetPosition	Conversion of the following error hysteresis 2 selected in the real units of the machine via C03920 into a position in [increments]. ▸ Following error monitoring (📖 54)

Parameter	Possible settings			Information
C03920	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03921	String of digits			Position unit • Read only
C03922	-2147483647		2147483647	State • Read only

5.14.7 L_PosPositionerTable1

Is an instance of	Function
L_PosPositionerTable	▸ Profile data management (📖 44)

Parameter	Possible settings			Information
C04700/1				Teach position • For execution via parameter channel.
	0↗1	The position applied at the input *dnPos_p* is saved to the VTPOS table position selected via the input *dwPosTableNumber*.		
C04700/2				Teach speed • For execution via parameter channel.
	0↗1	The speed applied at the input *dnSpeed_s* is saved to the VTSPEED table position selected via the input *dwSpeedTableNumber*.		
C04700/3				Teach acceleration • For execution via parameter channel.
	0↗1	The acceleration/deceleration applied at the input *dnAcc_s* is saved to the VTACC table position selected via the input *dwAccTableNumber*.		
C04700/4				Teach S-ramp time • For execution via parameter channel.
	0↗1	The S-ramp time applied at the input *dwJerk* is saved to the VTJERK table position selected via the input *dwJerkTableNumber*.		
C04701/1...75	-214748.3648	unit	214748.3648	VTPOS: variable positions • For selecting the target positions and TP window start and end positions for the profiles.
C04702/1...50	-214748.3648	unit/s	214748.3648	VTSPEED: variable speeds • For selecting the traversing and final speeds for the profiles.
C04703/1...50	-214748.3648	unit/s^2	214748.3648	VTACC: variable accelerations • For selecting the accelerations and decelerations for the profiles.

Parameter	Possible settings			Information
C04704/1...50	-2147483.648	s	2147483.648	VTJERK: variable S-ramp times • For selecting the S-ramp times for the profiles.
C04705/1				DIS:bPosTeach • Display of the input signal *bPosTeach*.
	0	FALSE		
	1	TRUE		
C04705/2				DIS:bSpeedTeach • Display of the input signal *bSpeedTeach*.
	0	FALSE		
	1	TRUE		
C04705/3				DIS:bAccTeach • Display of the input signal *bAccTeach*.
	0	FALSE		
	1	TRUE		
C04705/4				DIS:bJerkTeach • Display of the input signal *bJerkTeach*.
	0	FALSE		
	1	TRUE		
C04706/1	0		100	DIS:VTPosNum • Display of the input signal *dwPosTableNumber*.
C04706/2	0		100	DIS:VTSpeedNum • Display of the input signal *dwSpeedTableNumber*.
C04706/3	0		100	DIS:VTAccNum • Display of the input signal *dwAccTableNumber*.
C04706/4	0		100	DIS:VTJerkNum • Display of the input signal *dwJerkTableNumber*.
C04706/5	0		100	DIS:ProfileNum • Display of the input signal *dwProfileNumber*.
C04707/1	-214748.3648	unit	214748.3648	DIS:dnTeachPos • Display of the input signal *dnPos_p* in the real unit of the machine.
C04707/2	-214748.3648	unit/s	214748.3648	DIS:dnTeachSpeed • Display of the input signal *dnSpeed_s* in the real unit of the machine.
C04707/1	-214748.3648	$unit/s^2$	214748.3648	DIS:dnTeachAcc • Display of the input signal *dnAcc_x* in the real unit of the machine.
C04707/1	-214748.3648	s	214748.3648	DIS:dnTeachJerk • Display of the input signal *dwJerk* in the real unit of the machine.
C04708	-2147483647		2147483647	State • Display of the bit-coded output signal *dnState*.

Parameter	Possible settings		Information
C04710/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Positioning mode • For absolute positioning, the home position must be known.
	1	Absolute	
	2	Absolute TP	
	5	Relative	
	6	Relative TP	
	7	Speed	
	8	Speed TP	
	11	Absolute CW	
	12	Absolute CW TP	
	13	Absolute CCW	
	14	Absolute CCW TP	
	15	Absolute ShortestWay	
	16	Absolute ShortestWay TP	
C04711/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Position from VTPOS • Reference to VTPOS table position for defining the profile parameter "position".
	1	VTPOS position 1 (C04701/1)	
	2	VTPOS position 2 (C04701/2)	
	...	...	
	75	VTPOS position 75 (C04701/75)	
C04712/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Speed from VTSPEED • Reference to VTSPEED table position for defining the profile parameter "speed".
	1	VTSPEED position 1 (C04702/1)	
	2	VTSPEED position 2 (C04702/2)	
	...	...	
	50	VTSPEED position 50 (C04702/50)	
C04713/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Acceleration from VTACC • Reference to VTACC table position for defining the profile parameter "acceleration".
	1	VTACC position 1 (C04703/1)	
	2	VTACC position 2 (C04703/2)	
	...	...	
	50	VTACC position 50 (C04703/50)	
C04714/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Deceleration from VTACC • Reference to VTACC table position for defining the profile parameter "deceleration".
	1	VTACC position 1 (C04703/1)	
	2	VTACC position 2 (C04703/2)	
	...	...	
	50	VTACC position 50 (C04703/50)	
C04715/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			S-ramp time from VTJERK • Reference to VTJERK table position for defining the profile parameter "S-ramp time".
	1	VTJERK position 1 (C04704/1)	
	2	VTJERK position 2 (C04704/2)	
	...	...	
	50	VTJERK position 50 (C04704/50)	
C04716/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Final speed from VTSPEED • Reference to VTSPEED table position for defining the profile parameter "final speed". • An existing sequence profile is required.
	1	VTSPEED position 1 (C04702/1)	
	2	VTSPEED position 2 (C04702/2)	
	...	...	
	50	VTSPEED position 50 (C04702/50)	

Parameter	Possible settings		Information
C04717/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			TP window start position from VTPOS • Reference to VTPOS table position for defining the profile parameter "TP window start position". • For the position value "0", the start position is the negative travel range limit.
	1	VTPOS position 1 (C04701/1)	
	2	VTPOS position 2 (C04701/2)	
	...	...	
	75	VTPOS position 75 (C04701/75)	
C04718/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			TP window end position from VTPOS • Reference to VTPOS table position for defining the profile parameter "TP window end position". • For the position value "0", the end position is the positive travel range limit.
	1	VTPOS position 1 (C04701/1)	
	2	VTPOS position 2 (C04701/2)	
	...	...	
	75	VTPOS position 75 (C04701/75)	
C04719/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Sequence profile with TP • Sequence profile for touch probe residual path positioning.
	1	Profile no. 1	
	...	...	
	75	Profile no. 75	
C04720/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Sequence profile without TP • Sequence profile for profile linkage.
	0	No sequence profile (End of profile linkage)	
	1	Profile no. 1	
	...	...	
	75	Profile no. 75	
C04721/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)	Value is bit-coded:		Touch probe configuration • The touch probe channels to be used are selected by setting the corresponding bits to "1".
	Bit 0	TP channel 1, rising edge	Digital input 1
	Bit 1	TP channel 1, falling edge	
	Bit 2	TP channel 2, rising edge	Digital input 2
	Bit 3	TP channel 2, falling edge	
	Bit 4	TP channel 3, rising edge	Digital input 3
	Bit 5	TP channel 3, falling edge	
	Bit 6	TP channel 4, rising edge	Digital input 4
	Bit 7	TP channel 4, falling edge	
	Bit 8	TP channel 5, rising edge	Digital input 5
	Bit 9	TP channel 5, falling edge	
	Bit 10	TP channel 6, rising edge	Digital input 6
	Bit 11	TP channel 6, falling edge	
	Bit 12	TP channel 7, rising edge	Digital input 7
	Bit 13	TP channel 7, falling edge	
	Bit 14	TP channel 8, rising edge	Digital input 8
	Bit 15	TP channel 8, falling edge	
	Bit 16	TP channel 9	Motor encoder zero pulse
	Bit 18	TP channel 10	Load encoder zero pulse
	Bit 20	TP channel 11	DFIN zero pulse
	Bit 22	TP channel 12	DFOUT zero pulse

5.14.8 L_PosSequencer1

Is an instance of	Function
L_PosSequencer	Sequence control ▸ Program flow (📖 32)

Note!

The parameters of the different actions for the sequence table are described in the chapter "Overview of action types". (📖 33)

Parameter	Possible settings			Information
C04500/1...100				Sequence table • The calls of the actions required for the positioning program are stored in the subcodes. • In this way, the basic process sequence (except for branches) is described.
	0	Program end		
	xxyyy	Action call • xx ≡ action type • yyy ≡ action number		
C04501	1		100	Current program step • Read only
C04502				State of sequence control • Read only
	0	READY: Positioning program ready to start/program end reached.		
	1	RUN: Positioning program is running.		
	2	PAUSE: Current step interrupted, pause is active.		
	3	BREAK: Positioning program interrupted.		
	4	RESET: Positioning program reset.		
C04503				Sequence control • Bit-coded code for sequencer control via a PC or a higher-level control by means of the parameter channel. • Setting a bit to "1" activates the corresponding function.
	Bit 0	Start		
	Bit 1	Pause		
	Bit 2	Break		
	Bit 3	Cancel		
	Bit 4	Reset		
	Bit 5	NextStep		
C04504				Program step for abort • This step is processed when the input *bCancel* is set to TRUE.
	0	**Sequence step**		
	1...100	Step 1 ... 100		
	101	Program end		
C04505	Text			Current comment • Read only

5.14.9 L_SdSwitchPoint1

Is an instance of	Function
L_SdSwitchPoint	Position switch points (cams)

Parameter	Possible settings			Information
C04395/1...8				State of switching range 1 ... 8 • Read only
	0	Switch is off		
	1	Switch is on		
C04396	String of digits			Position unit • Read only
C04397/1...8	-2147483648	unit	2147483648	Switch-on position switching range 1 ... 8
C04398/1...8	-2147483648	unit	2147483648	Switch-off position switching range 1 ... 8
C04399/1...8				Enable switching range 1 ... 8
	0	Switching range not enabled		
	1	Switching range enabled		

5.14.10 LimitFollowingError1

Is an instance of	Function
L_SdSetPosition	Conversion of the following error switching threshold 1 selected in the real units of the machine via C03911 into a position in [increments]. ▸ Following error monitoring (📖 54)

Parameter	Possible settings			Information
C03911	-214000.0000	unit	214000.0000	Position value • Initialisation: 100.0000 unit
C03912	String of digits			Position unit • Read only
C03913	-2147483647		2147483647	State • Read only

5.14.11 LimitFollowingError2

Is an instance of	Function
L_SdSetPosition	Conversion of the following error switching threshold 2 selected in the real units of the machine via C03914 into a position in [increments]. ▸ Following error monitoring (📖 54)

Parameter	Possible settings			Information
C03914	-214000.0000	unit	214000.0000	Position value • Initialisation: 200.0000 unit

Parameter	Possible settings			Information
C03915	String of digits			Position unit • Read only
C03916	-2147483647		2147483647	State • Read only

5.14.12 MonitFollowError1

Is an instance of	Function
L_LdMonitFollowError	▸ Following error monitoring (📖 54)

Parameter	Possible settings			Information
C03960	-214748.3647	unit	214748.3647	Following error at the input • Display of the input signal *dnFollowErrorIn_p* in the real unit of the machine.
C03961	String of digits			Position unit • Read only
C03963				Following error out of tolerance • Read only
	FALSE	Following error smaller than set switching threshold		
	TRUE	Following error larger than set switching threshold		
C03964				Following error monitoring activated • Read only
	FALSE	Deactivated		
	TRUE	Activated		

5.14.13 MonitFollowError2

Is an instance of	Function
L_LdMonitFollowError	▸ Following error monitoring (📖 54)

Parameter	Possible settings			Information
C03965	-214748.3647	unit	214748.3647	Following error at the input • Display of the input signal *dnFollowErrorIn_p* in the real unit of the machine.
C03966	String of digits			Position unit • Read only
C03968				Following error out of tolerance • Read only
	FALSE	Following error smaller than set switching threshold		
	TRUE	Following error larger than set switching threshold		
C03969				Following error monitoring activated • Read only
	FALSE	Deactivated		
	TRUE	Activated		

5.14.14 PosStarted

Is an instance of	Function
L_TbTransition	Edge generation for resetting the "drive at the target" state

Parameter	Possible settings			Information
C04000				Trigger edge
	0	Rising edge		Lenze setting
	1	Falling edge		
	2	Both edges		
C04001	0.001	s	60.000	Pulse duration • Initialisation: 0.001 s

5.14.15 RestartPosTransition

Is an instance of	Function
L_TbTransition	Edge generation for restart of positioning

Parameter	Possible settings			Information
C04002				Trigger edge
	0	Rising edge		Lenze setting
	1	Falling edge		
	2	Both edges		
C04003	0.001	s	60.000	Pulse duration • Initialisation: 0.005 s

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

1 About this documentation

This documentation contains information about the technology application "Synchronism with mark synchronisation" for the Servo Drives 9400 series.

Note!

This documentation supplements the mounting instructions supplied with the controller, the hardware manual and the software manual for the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation applies to:

Technology application	Appl. ID	Required runtime software licence
Synchronism with mark synchronisation	100402202	Motion Control HighLevel or higher
Synchronism with mark synchronisation *MotionBus*	100402102	Motion Control HighLevel or higher

The technology application can be used with the following controllers:

Product series	Type designation	From hardware version	From software version
9400 Servo Drives	E94AxHExxxx	PD	1.35

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	04/2007	TD05	First edition
1.1	10/2008	TD05	New subchapter "Parameterisable function blocks"

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window pane	*Italics*	The *Message window*... / the *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Keyboard command	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program listings	`Courier`	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and suggests how to avoid the danger)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of material damage** Indicates a potential danger that may lead to material damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note for trouble-free operation
	**Tip!**	Useful tip for easy handling

2 Brief description

The technology application "Synchronism with register formation and mark synchronisation" serves to implement a high-precision angular synchronism between the drives in the system.

- Thanks to a free adjustable position resolution of up to 24 bits per motor revolution a very good synchronism result is achieved so that applications with direct drive can be resolved with high precision.
- The ratio can be freely adjusted, the values are input in the form of a fraction (numerator/denominator) with 32 bit resolution.
- The master value can be specified either by a "Virtual master", or via a bus system or the digital frequency extension module. It is selected from the **Application parameter** tab via the **Master value source** list field (C03052).
- The master value transmission (high speed stability) is preset. The actual values can be transmitted by the corresponding selection in the list fields **Master value output** (C3054/1, C3054/2, C3197).

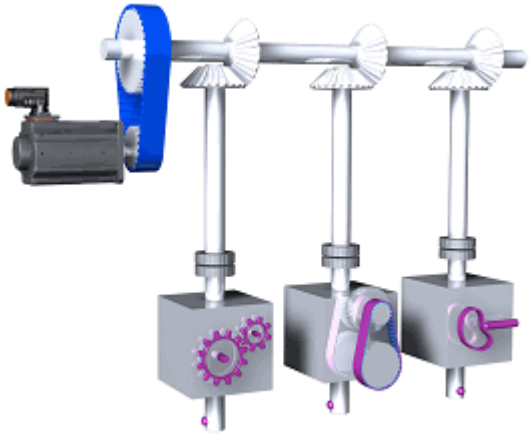
Functions

- Virtual master with inching, handwheel and reduced speed.
- Conditioning of the master value (master shaft) with master value scaling, register generation, stretch factor, reversal of rotation direction, and mark synchronisation via profile generator.
- Virtual clutch with emergency stop and basic speed
- Trimming function via profile generator.
- Conditioning of the setpoint (machine axis/tool) with setpoint scaling, register generation, and mark synchronisation via profile generator.
- Additional operating modes for activating the basic drive functions "Homing", "Manual jog (inching)" and "Position override function".
- Support of the basic drive functions "Quick stop" and "Limiter".
- Following error monitoring.
- Optional control of a holding brake.

Application range

- Printing units
- Asynchronous cross cutters
- Perforating machines
- Insetters
- Vibrating drives
- Line drives
- Labelling machines

Required license/delivery



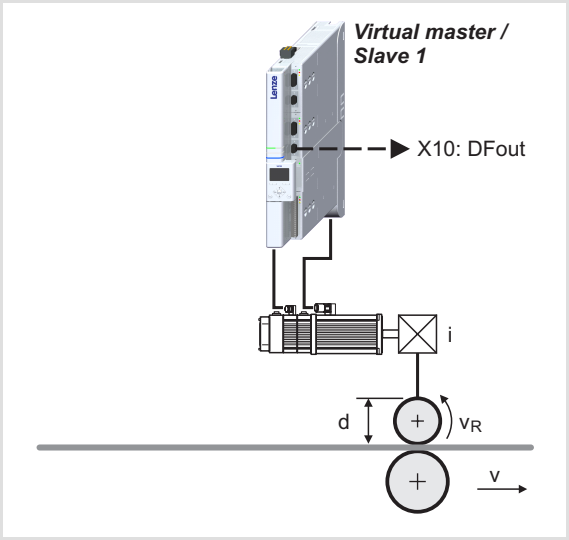
- License stage Motion Control HighLevel or higher required.
- The technology application can be selected in the »Engineer« application catalog.

3 Introduction

The following subchapters provide information on the electrical shaft.

3.1 Synchronisation of the drives via a master angle

By coupling the drives via a master angle the positions are firmly allocated to each other like a mechanical shaft.

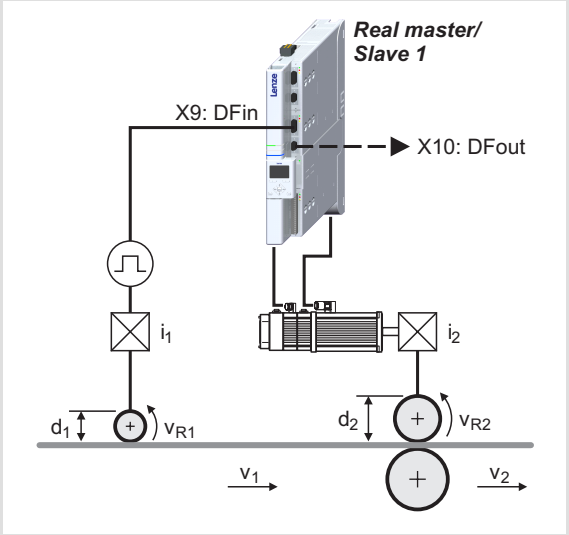


- A drive with a virtual master or a real master (encoder) is able to create the master angle and transmit this to the other drives which follow this master angle.

Advantages of this type of synchronisation

- The communication between the drives is very simple. A time-consuming evaluation of the status signals of each drive and the control signals to be generated from it for each single drive is not required.
- Due to the flexible electronics trimming functions can be carried out very easily. Thus, motion sequences in machines can be easily synchronised and optimised.
- A variation of the master angle speed changes the number of cycles of the machine. The drives keep the position allocation.

3.2 Virtual master/real master



Virtual master

- In an interconnection, a drive takes over the task of the (virtual) master and is the first slave drive at the same time.
- The master value created in the TA by the "Virtual master" function is transmitted via a bus system or the digital frequency output to the other slave drives.

[3-1] Example "Virtual master" (with master value transmission via digital frequency extension module)

Real master

- The master value for a slave drive can be also specified by a real master (e.g. external encoder).
- The master value can be specified e.g. via the digital frequency input of the master frequency extension module or a bus system.
- The master value (possibly conditioned in the TA) by the "Virtual master" function is transmitted via a bus system or the digital frequency output to the other slave drives.

[3-2] Example "Real master" (with master value transmission via digital frequency extension module)

3.3 Transmission of the master angle

The master value/angle can be transmitted via the following transmission media:

- Digital frequency (simulation of an incremental encoder)
- System bus (CAN)
- ETHERNET Powerlink

The transmission medium is selected according to the criteria listed in the below table:

	Transmission medium		
Criterion	**Digital frequency**	**System bus (CAN)**	**ETHERNET Powerlink**
Network structure	Rail or cascade	Rail	Rail or cascade
Master value/master angle transmission	Only relative	Absolute or relative	Absolute or relative
Max. resolution	16 bits/revolution	24 bits/revolution	24 bits/revolution
Cable length	Virtually unlimited, but max. 50 m from drive to drive.	Depends on baud rate, number of nodes and cable cross-section. With a baud rate of 500 kbits/s the total cable length is limited to e.g. 117 metres.	Virtually unlimited, but max. 100 m from drive to drive.
Additional hardware required	Digital frequency extension module (E94AYFLF)	No, interface is already integrated in 9400 HighLine (CAN on board).	ETHERNET Powerlink communication module (E94AYCEP)

* In preparation; at present 16 bits/revolution

3.4 Speed or angular synchronism?

The decision whether to use a speed or angular synchronism mainly refers to the TA "Electronic gearbox".

Angular synchronism

Use the angular synchronism if the material is not able to absorb any force and no remaining positional variation must be available. Please note that a position controller always causes additional trouble in a track since disturbances and reference value variations must be compensated exactly.

Speed synchronism

Use the speed synchronism if the material is able to absorb force which ensures a better concentricity.

3.5 Rail or cascade structure?

Rail structure

All drives obtain the same master value/master angle.

Cascade structure

Each drive obtains its own master value/master angle which is created or merely prepared through the upstream drive.

3.6 Master or actual value transfer?

Master value transmission

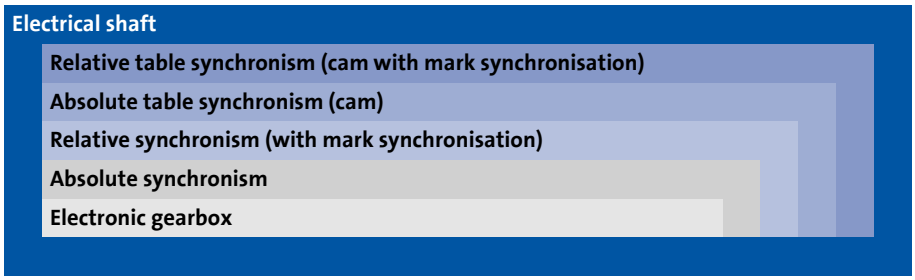
The master value transfer results in a much quieter machine running. The mark corrections, superimposed control functions and disturbances of the drive, however, do not affect the system.

Actual value transfer

The actual value transfer results in an uneven machine running. Mark corrections, superimposed control functions and disturbances of the leading drive affect the system.

3.7 Absolute or relative master angle processing?

Absolute master angle processing



All drives have a common fix reference to each other via the position of the master angle.

Relative master value/master angle processing

Stands for a high-precision transmission of the master value. However, there is no firm reference to the other drives (e.g. in case of a material path each printing roll is synchronised one by one to the print image).

3.8 Functions with synchronisation via the electrical shaft

The functions of the electrical shaft are built on each other and thus are scalable:

Electronic gearbox

The electronic gearbox represents the simplest function in the DC-bus operation via the electrical shaft. The function is suited for e.g. material transport or material processing. A direct synchronism of tools to a material path can be created without direct position reference or for stretching machines with adjustable stretching ratio.

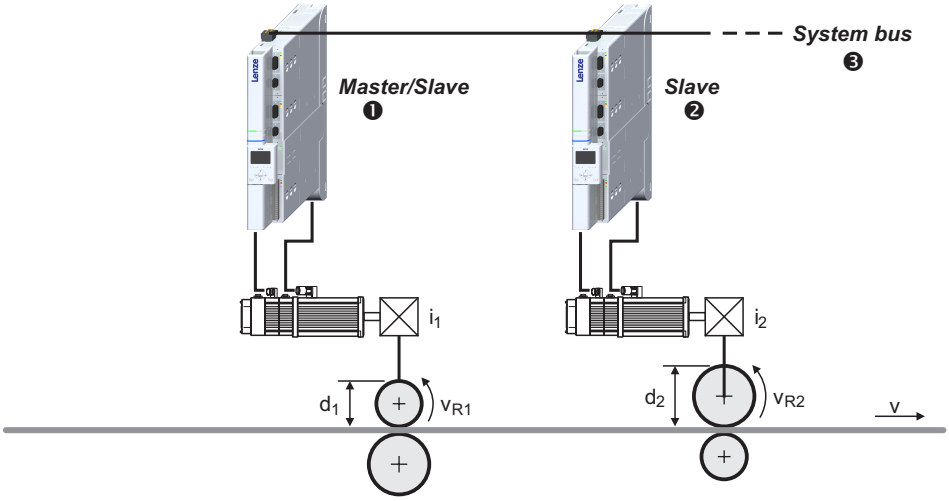
Absolute synchronism

This function is suited for applications with continuously rotating tools (e.g. groove cylinder), which are fed with material in a fixed machine cycle and for which several tools have to be synchronised to each other.

Relative synchronism (with mark synchronisation)

This function is suited for processing continuous material in the form of a material web. Here the tools (e.g. pressure cylinders) are aligned via marks to e.g. print images which are located on the web. There must be no risk of collision. We distinguish between "Relative synchronism with register formation and mark synchronisation" and "Relative synchronism with register control".

Absolute table synchronism (cam)

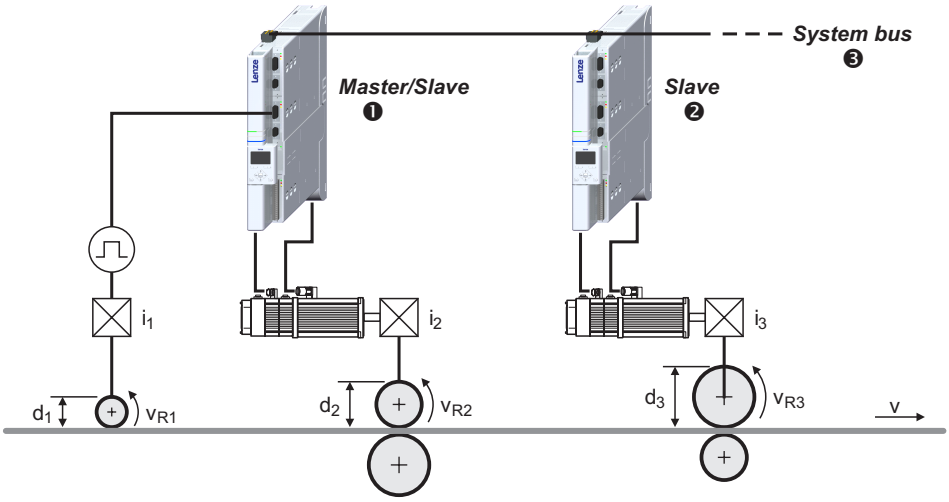


Like "Absolute synchronism", although the tools can also perform a non-linear movement.

Relative table synchronism (with mark synchronisation)

Like "Relative synchronism", although the tools can also perform a non-linear movement.

3.9 Application examples

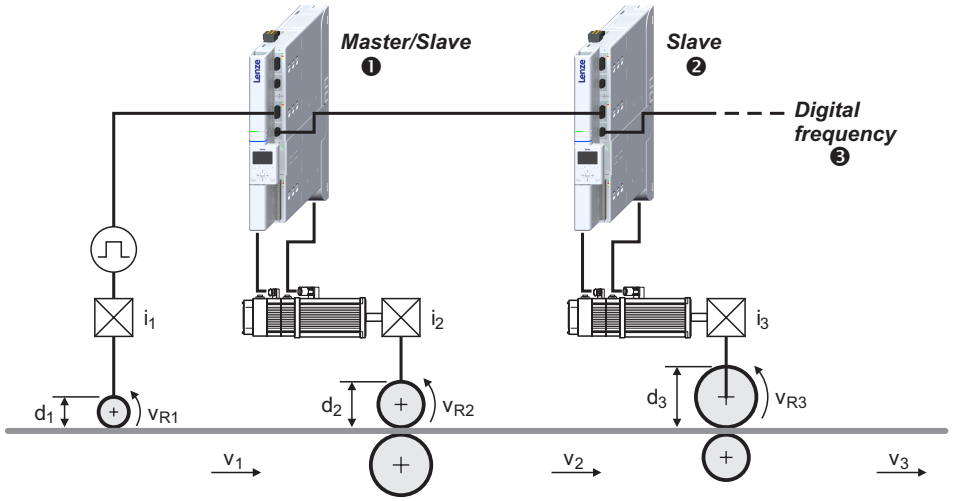


3.9.1 Electronic gearbox with virtual master

❶ Virtual master (and slave 1)
❷ Slave 2
❸ Electrical shaft, implemented here via system bus (CAN).

[3-3] Electronic gearbox with virtual master (rail)

3.9.2 Electronic gearbox with real master



❶ Real master/slave 1 (digital frequency extension module required)
❷ Slave 2
❸ Electrical shaft, implemented here via system bus (CAN).

[3-4] Electronic gearbox with real master (rail)

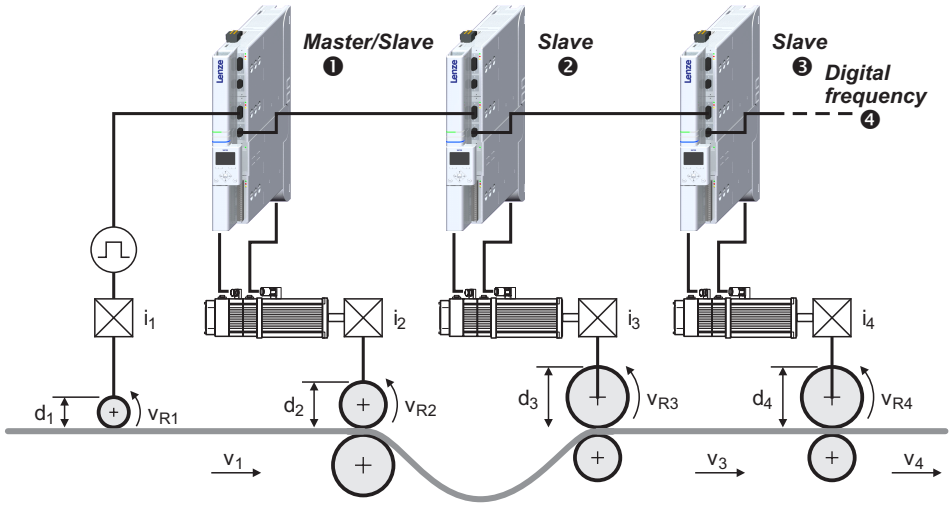
3.9.3 Electronic gearbox as cascade

The technology application "Electronic gearbox" is often operated as cascade since changes of speed/gearbox ratio of an upstream drive also have an effect on the subsequent drive.

- Typical applications are, for instance, stretching machines, wire drawing machines and roller mills.
- There is no position reference between tool and material. However, it may be required to position the tools for maintenance work.
- The master speed is transmitted via the digital frequency or ETHERNET Powerlink.

❶ Real master/slave 1
❷ Slave 2
❸ Digital frequency cascade (digital frequency extension module required)

[3-5] Electronic gearbox with real master (cascade)

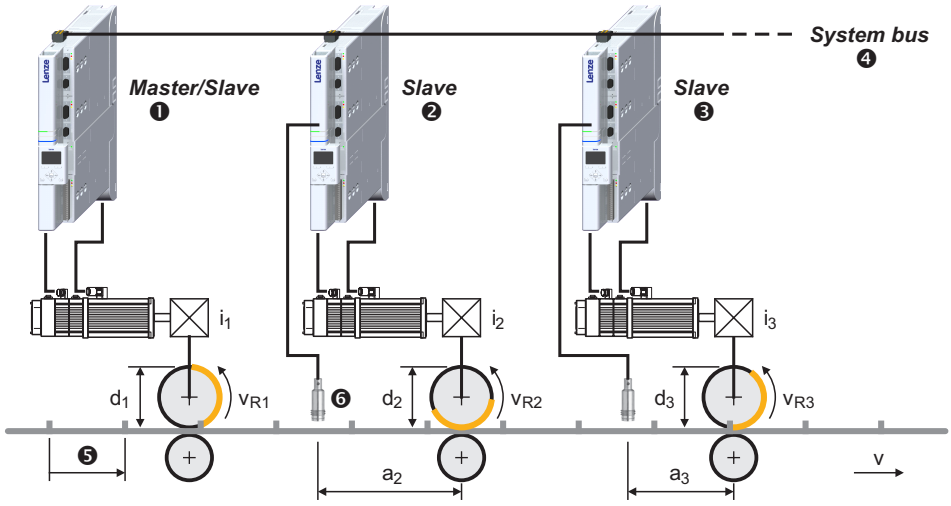


- The following applies to the speed of the web in case of a cascade:

$$v_3 > v_2$$

$$v_3 = v_2 \cdot K$$

3.9.4 Tighten the web via trimming function with cascade

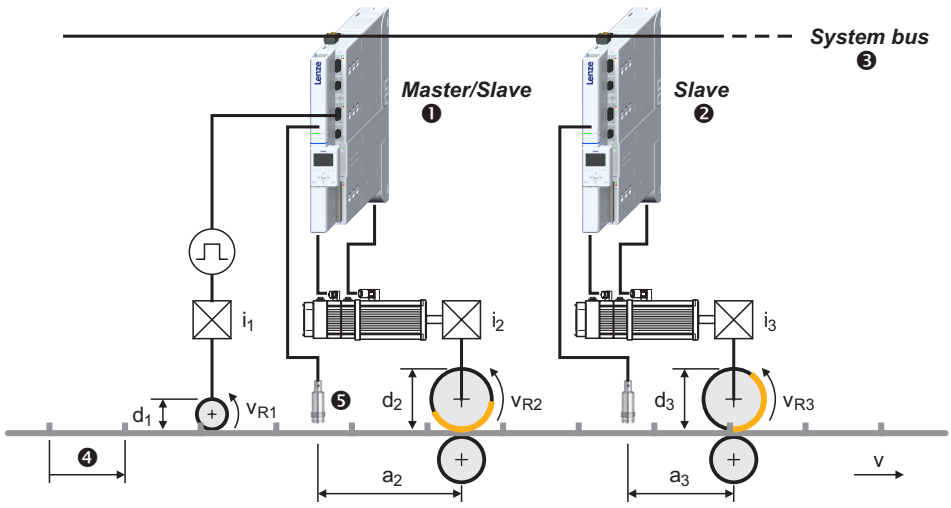


In case a clearance has developed, the web must be "tightened" again. Only then the machine can be accelerated again via the master. The subsequent slave (cascade structure) must run along in the set ratio. Thus, the trimming function acts directly before or after the stretching factor.

❶ Real master/slave 1
❷ Slave 2 with master value trimming
❸ Slave 3
❹ Digital frequency cascade (digital frequency extension module required)

[3-6] Trimming function in case of the electronic gearbox as cascade

3.9.5 Relative synchronism with mark synchronisation and virtual master



❶ Virtual master (and slave 1)
❷ Slave 2
❸ Slave 3
❹ Electrical shaft, implemented here via system bus (CAN).
❺ Register (cycle of guiding angle/guiding angle)
❻ Sensor for mark synchronisation

[3-7] Relative synchronism with virtual master (rail)

In case of the relative synchronism with mark synchronisation, there is a position reference between tool and web, which occurs in each register. For this, a slight correction is superimposed to the synchronous motion with regard to the web. Such applications are, for instance, printing machines.

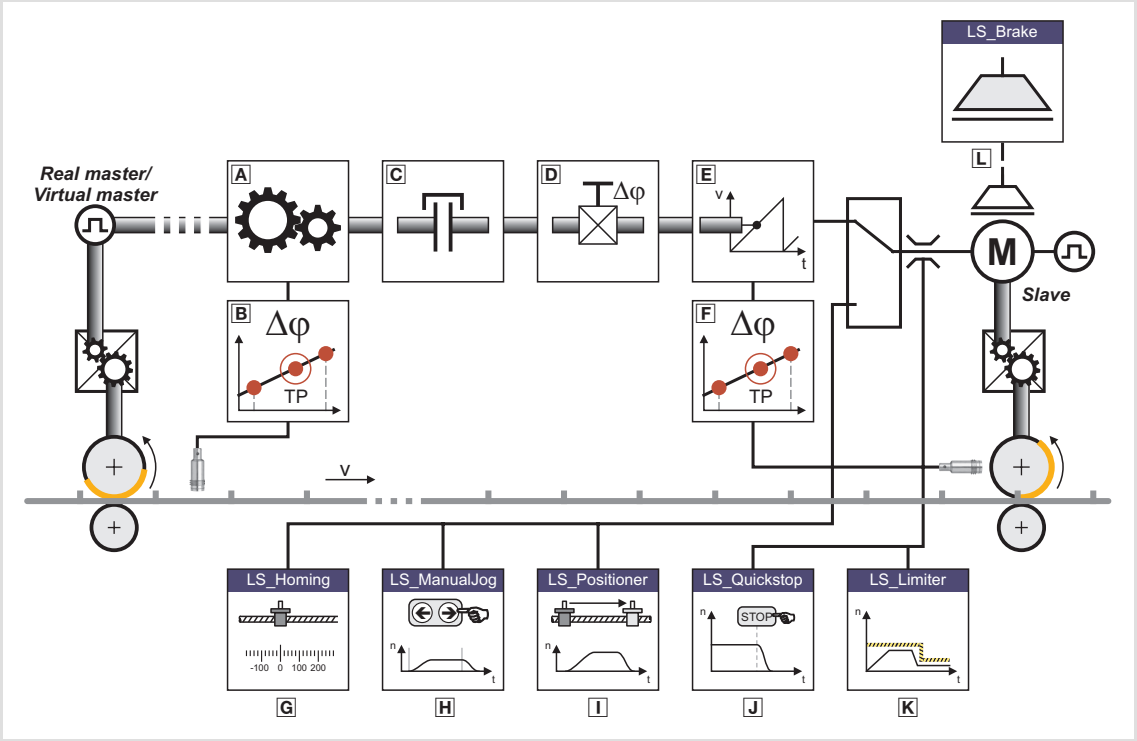
For the mark synchronisation in particular the register ❺ (the cycle of the guiding angle) and the distance of the sensor ❻ from the home position of the tool (distances a_2 and a_3) are relevant.

3.9.6 Relative synchronism with mark synchronisation and real master

❶ Real master/slave 1 (digital frequency extension module required)
❷ Slave 2
❸ Electrical shaft, implemented here via system bus (CAN).
❹ Register (cycle of guiding angle/guiding angle)
❺ Sensor for mark synchronisation

[3-8] Relative synchronism with real master (rail)

4 Parameter setting & configuration



Note!

The electrical shaft can be implemented with a bus system such as system bus (CAN) or Ethernet Powerlink or via digital frequency transmission.

With regard to the configuration of the digital frequency extension module in the controller, two variants of technology applications are available in the »Engineer« application catalog.

- In the TA variant "Synchronism with mark synchronisation" the configuration of a digital frequency extension module is expected. Therefore, the TA can provide the function of the electrical shaft either via digital frequency transmission and via a bus system.
- In the TA variant "Synchronism with mark synchronisation *MotionBus*" the configuration of a digital frequency extension module is not included and corresponding interfaces are not available in the TA. Thus the function of the electrical shaft with this TA can only be provided via a bus system.

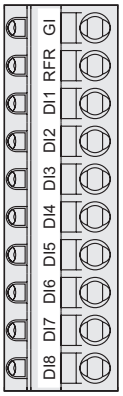
4.2 Assignment of the I/O terminals



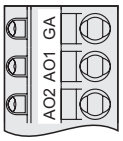
4.2.1 Setpoint and control signals

The following tables contain the Lenze assignment of the analog and digital inputs for the "Synchronism" technology application.

Analog inputs

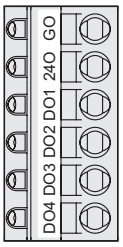
Terminal X3		Signal (Lenze setting)
	**AI1-** **AI1+**	-
	AI2- **AI2+**	-

Digital inputs



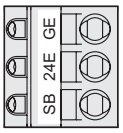
Terminal X5		Signal (Lenze setting)
	**DI1**	Quick stop • If DI1 is set to LOW level, the drive is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time.
	DI2	Connection of reference switch/touch probe sensor for tool synchronisation
	DI3	Connection of touch probe sensor for master value synchronisation
	DI4	Close clutch
	DI5	Reset error • By means of a LOW-HIGH edge an existing error status can be reset if the cause of the fault is removed.
	DI6	-
	DI7	-
	DI8	-

4.2.2 Actual value and status signals



The following tables contain the Lenze assignment of the analog and digital outputs for the "Synchronism" technology application.

▶ The default signal configuration if required can be easily changed by parameterising the multiplexer parameters assigned.



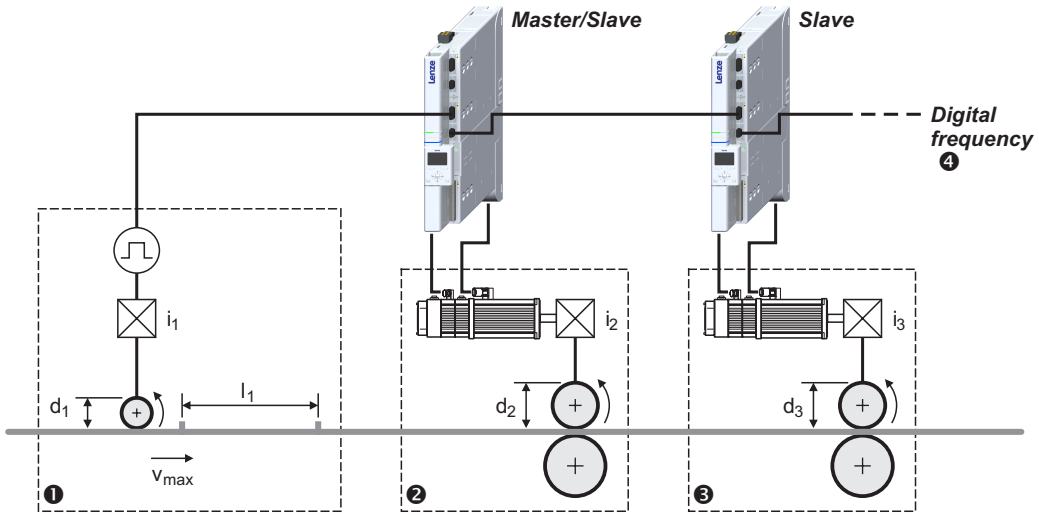
Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	Motor speed • Scaling: ±10 V ≡ motor reference speed (C00011)	C03110/1
	AO2	Motor torque (setpoint) • Scaling: ±10 V ≡ Motor reference torque (C00057/2)	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Status "Drive ready" • DC-bus voltage is available and no error has occurred.	C03100/1
	DO2	Status "Electrical shaft enabled"	C03100/2
	DO3	Status "Limitation active" • A setpoint is limited at the moment.	C03100/3
	DO4	"Error" status • If the controller is in the error state, the digital output DO4 is set to HIGH level.	C03100/4

State bus



Terminal X2		Signal (Lenze setting)	Signal configuration
	**SB**	"Application error" status • The state bus is put in the "error" status.	C03100/5

Display elements

User LED	Signal (Lenze setting)	Signal configuration
	Status "Electrical shaft enabled"	C03100/6

4.3 Machine parameters

The following schematic diagram shows the relevant global data (machine parameters) for the interconnection via the electrical shaft:

❶ Master axis (here: master value encoder as real master)
❷ Slave axis 1
❸ Slave axis 2
❹ Digital frequency cascade (digital frequency extension module required)

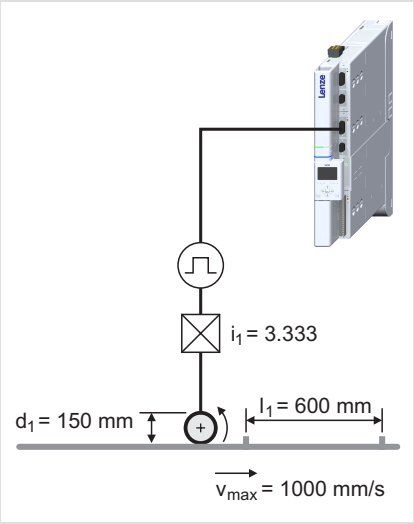
[4-2] Schematic diagram of the most important machine parameters

Symbol	Description
i_1	Gearbox ratio of master value encoder
d_1	Diameter of the master roll
l_1	Master value cycle (if available)
v_{max}	Maximum speed
i_2, i_3	Gearbox ratio of the slave axes
d_2, d_3	Diameter of the slave rolls

Detailed information for setting the machine parameters can be obtained from the following subchapters.

4.3.1 Master axis (master shaft)

For scaling and imaging the master value in the application, the machine parameters of the higher-level drive (master shaft) must be set.



Note!

When setting (scaling) the electrical shaft, ensure that the ratio and encoder constants are identical for all drives in the system. The reference to the scaling of the master drive is sensible.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Master value scaling*

Parameter		Lenze setting	
		Value	Unit
C03930	Gearbox ratio - numerator	1	
C03931	Gearbox ratio - denominator	1	
C03932	Feed constant	360.0000	unit/ revolution
C03933	Path units	User-defined	
C03934	User-defined path unit	°	
C03938	Cycle	360.0000	unit
C03941	Reference speed	500.0000	unit/t

Example of determining the machine parameters for the master axis

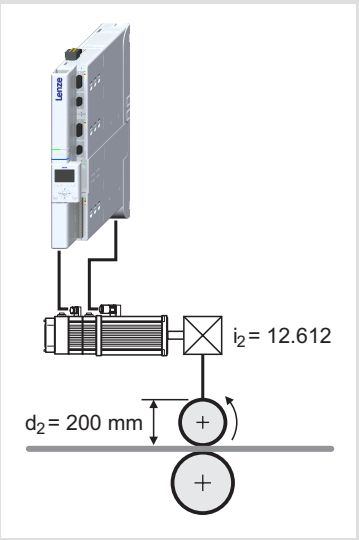
1. Set gearbox ratio for the master value in the form of a quotient (numerator and denominator): $i_1 = 3.333 = 10/3$
   - Numerator (C03930) = 10
   - Denominator (C03931) = 3
2. Set feed constant (C03932).
   - For the master value: $Vk = d_1 * \pi = 471.2389$ mm
3. Set the selection "mm" as path unit (C03933).
4. As reference speed (C03941) set the max. machine speed v_{max} = "1000 mm/s".

Tip!

Setting the cycle (C03938) only is required if the selection "Modulo" is set as traversing range (C02528).

For operation with a virtual master the following setting of the gearbox ratio is recommended to achieve a good resolution of the guiding angle/master value:

- Numerator (C03930) = 100
- Denominator (C03931) = 1



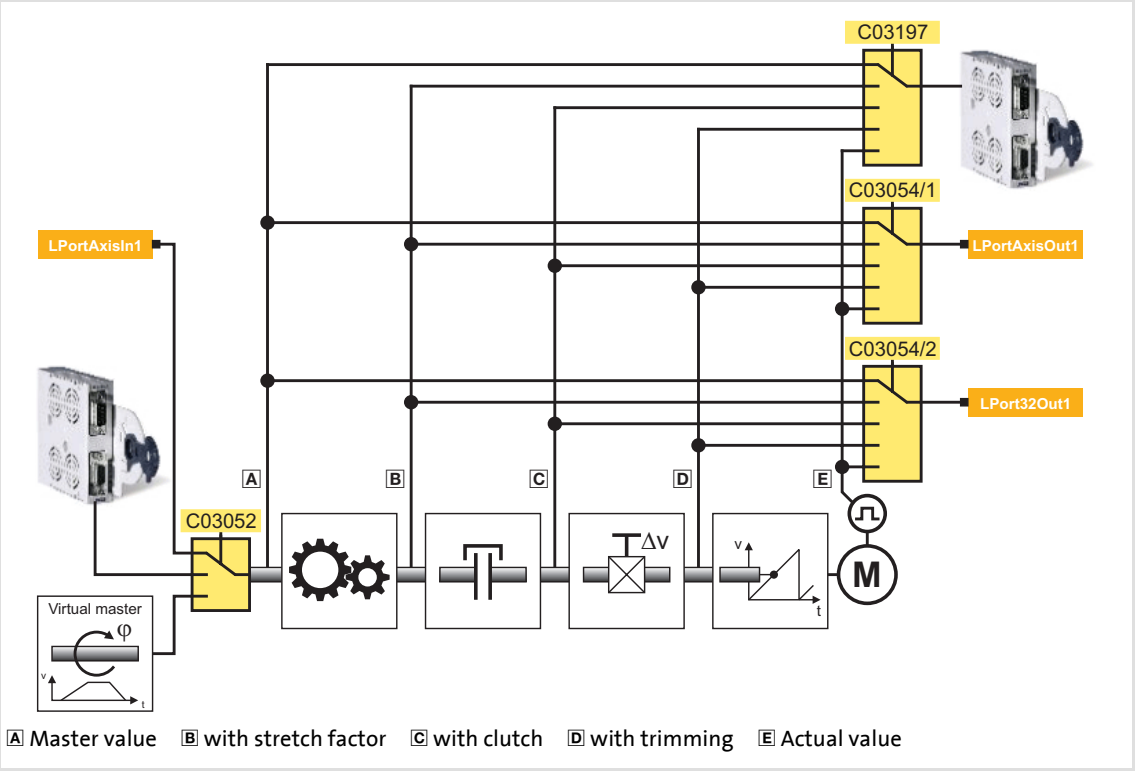
4.3.2 Slave axis (machine axis)

Among other things, the following machine parameters describe the motor end of the mechanics used.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Machine parameters*

Parameter		Lenze setting	
		Value	Unit
C00173	Mains voltage	400/415	V
C00174	Undervoltage (LU) threshold	285	V
C00600	Resp. to DC bus overvoltage	Trouble	
C02520	Gearbox factor numerator: Motor	1	
C02521	Gearbox factor denom: Motor	1	
C02527	Motor mounting direction	Motor rotating CW	
C02570	Position control structure	Position control	
C02522	Gearbox factor num.: Pos. enc.	1	
C02523	Gearbox factor denom.: Pos. enc.	1	
C02529	Mounting direction of position encoder	Encoder rotating CW	
Description of the mechanics (load, tool)			
C02528	Traversing range	Modulo	
C02524	Feed constant	360.0000	unit
C02525	Unit	°	
C02526	User-defined unit	°	
C02533	Time unit	s	
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

Example of determining the machine parameters for the slave axis



1. Set gearbox ratio for the motor in the form of a quotient (numerator and denominator): i_2 = 12.612 = 12612/1000
   - Numerator (C02520) = 12612
   - Denominator (C02521) = 1000
2. Set the same gearbox ratio for the position encoder:
   - Numerator (C02522) = 12612
   - Denominator (C02523) = 1000
3. Set feed constant (C02524).
   - For the conveyor drive: Vk = d_2 * π = 628,3185 mm
4. Set the selection "mm" as unit (C02525).

Tip!

The feed constant corresponds to the movement on the machine side when the gearbox output shaft carries out one revolution (for selection as angle = 360°).

When the unit is set, the real unit of the machine for the selection of physical values (e. g. speeds, accelerations and decelerations) is defined.

4.4 Selection of master value source and output

[4-3] Signal flow for selecting the master value source and the master values to be output

Master value source

The master values can be either selected by a "Virtual master", via a bus system or the digital frequency extension module.

- They can be selected on the **Application parameters** tab via the **Master value source** list field or via C03052.

Master value output

The master value to be output (A ... E) is selected individually for the three possible communication channels:

- List field **Master value output DF module** (C03197):
  Selection of the master value output for the digital frequency module.
- List field **Master value output MotionBus** (C03054/1):
  Selection of the master value output for horizontal communication.
- List field **Master value output LPort32Out1** (C03054/2):
  Selection of the master value output for vertical communication.

4.4.1 Master value source: Virtual master

If the "Virtual master" is selected as master value source, the master value is created in the TA and transmitted via a bus system or the digital frequency output to the other slave drives.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Virtual master*

Parameter		Lenze setting	
		Value	Unit
C03565	Operating mode	Continuous operation	
C03566	STOP position	0.0000	unit
C03567	START position	0.0000	unit
C03568/1	1. master speed	360.0000	unit/t
C03568/2	2. master speed	180.0000	unit/t
C03569/1	Speed - inching - CW rotation	900.0000	unit/t
C03569/2	Speed - inching - CCW rotation	900.0000	unit/t
C03570/1	Inching ramp	5.000	s
C03570/2	Ramp - single cycle/continuous operation	5.000	s
C03570/3	STOP ramp	0.5000	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ VMas master shaft STOP1	C03058/1
C03016	→ Activate master function	C03058/3
C03017	→ VMas inching positive	C03058/4
C03018	→ VMas inching negative	C03058/5
FALSE	→ VMas start single cycle	C03058/6
FALSE	→ VMas start continuous operation	C03058/7
FALSE	→ VMas 2. master speed	C03058/8
0	→ VMaster handwheel	C03056

▶ Configuration: Tab **FB editor** → FB Virtual_Master

4.4.2 Master value source: Digital frequency input

To use the digital frequency input as master value source, the controller must be provided with digital frequency extension module (E94AYFLF).

To ensure the integration of the extension module in the application, the TA "Synchronism with mark synchronisation" must be used as technology application.

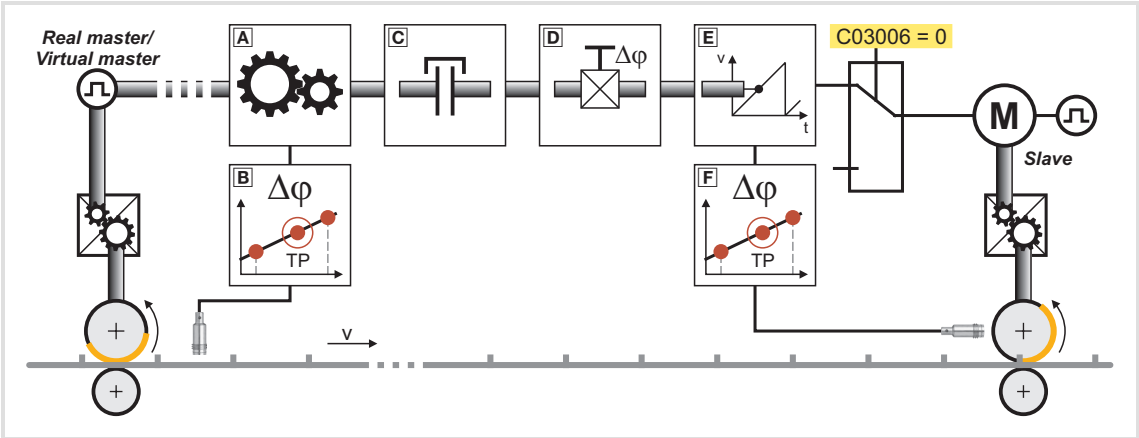
Note!

The technology application "Synchronism with mark synchronisation" *MotionBus*" which can also be selected in the application catalog does not contain any interfaces to the digital frequency extension module.

4.4.3 Master value source: Bus system

When the master value is selected via a bus system as e.g. system bus (CAN) it is possible to first extrapolate the received position information to compensate higher bus transmission cycles.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Master value extrapolation*



Parameter		Lenze setting	
		Value	Unit
C03550	Number of extrapolation cycles	1	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Activate extrapolation	C03058/9

▶ Configuration: Tab **FB editor** → FB MotionBusIn

4.5 "Synchronism" mode"

In the "Synchronism" (C03006 = "0") operating mode the drive follows the master value of the electrical shaft if the clutch is engaged.

[4-4] "Synchronism" mode (schematic diagram)

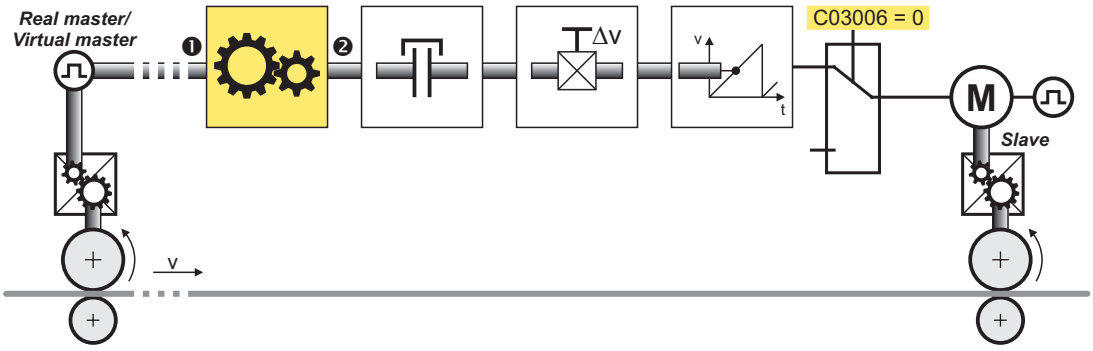
Functions in the "Synchronism" operating mode

A Master value processing

B Mark synchronisation (master value)

C Virtual clutch

D Master value adjustment



E Setpoint processing

F Mark synchronisation (setpoint)

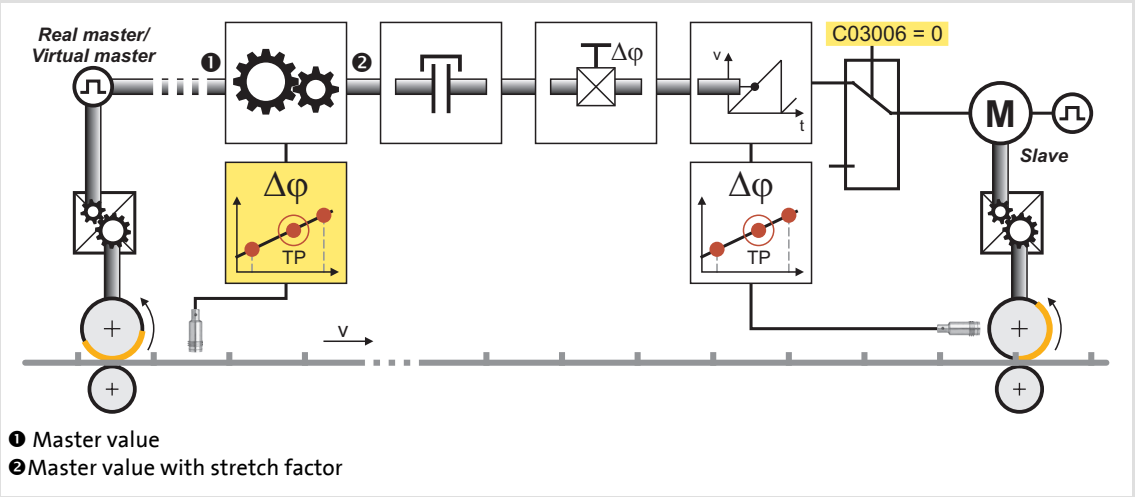
Tip!

A description of the different functions for processing the master value can be found in the following subchapters.

4.5.1 Master value processing

❶ Master value
❷Master value with stretch factor

[4-5] "Master value processing" function in the signal flow (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Master value processing*

Parameter		Lenze setting	
		Value	Unit
C03587	Master value	-	unit
C03000	Stretch factor - numerator	1000000000	
C03001	Stretch factor - denominator	1000000000	
C03025	Master value - direction of rotation	Not inverted	
C03034	Starting position	0.0000	unit
C03938	Cycle (register)	360.0000	unit
C03672	Master value with stretch factor	-	unit

Setpoint inputs of the function		Signal configuration
Lenze setting	Setpoint input	(Multiplexer parameters)
DIGIN CINH	→ Set starting position of master shaft	C03058/11
C03034	→ Master shaft starting position	C03053/1
C03000	→ Stretch factor - numerator	C03050/1
C03001	→ Stretch factor - denominator	C03050/2

▶ Configuration: Tab **FB editor** → FB ElectricalShaftVal

4.5.2 Mark synchronisation (master value)

❶ Master value
❷ Master value with stretch factor

[4-6] "Mark synchronisation" function in signal flow (schematic diagram)

This function serves to carry out a mark synchronisation of the master value via touch probe sensor.

Note!

For this purpose, the touch probe sensor must be connected to the digital input DI3!

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Master value processing*

Parameter		Lenze setting	
		Value	Unit
C03023	Master value synchronisation (TP)	Deactivated	
C03612	TP position (register)	0.0000	unit
C03651	TP limit	1.0000	unit
C03656	Hysteresis	0.0000	unit/t^2

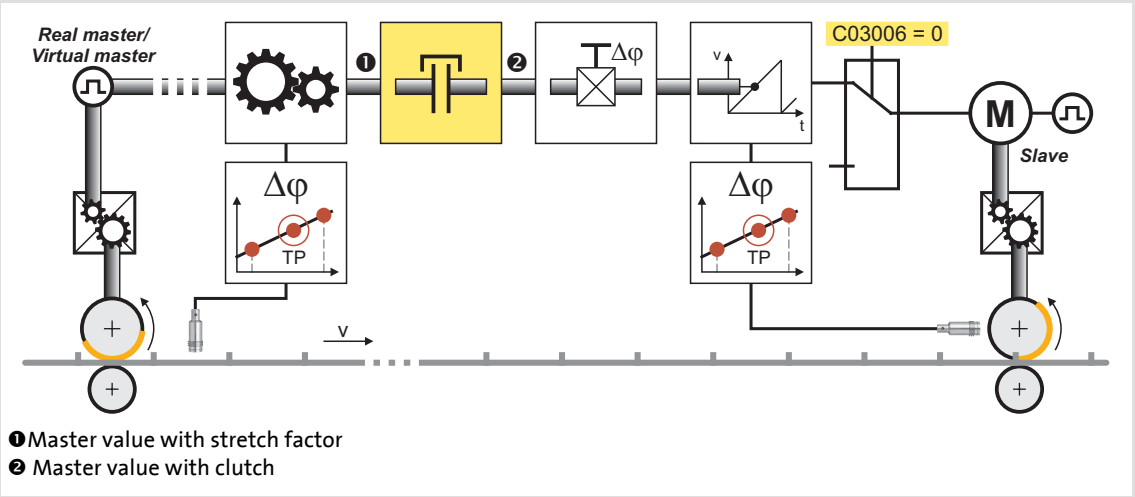
▶ Configuration: Tab **FB editor** → FB ElectricalShaftVal

TP profile parameters

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *TP profile parameters*

Parameter		Lenze setting	
		Value	Unit
C03620	Positioning mode	0	
C03621	Deactivation mode	0	
C03623/1	Positive speed	3600.0000	unit/t
C03623/2	Negative speed	3600.0000	unit/t
C03626/1	Acceleration ramp	1.000	s
C03626/2	Deceleration ramp	1.000	s
C03626/3	Stop ramp	1.000	s

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Activate master value TP correction	C03058/12



▶ Configuration: Tab **FB editor** → FB MarkSynchronizationShaft

TP interface

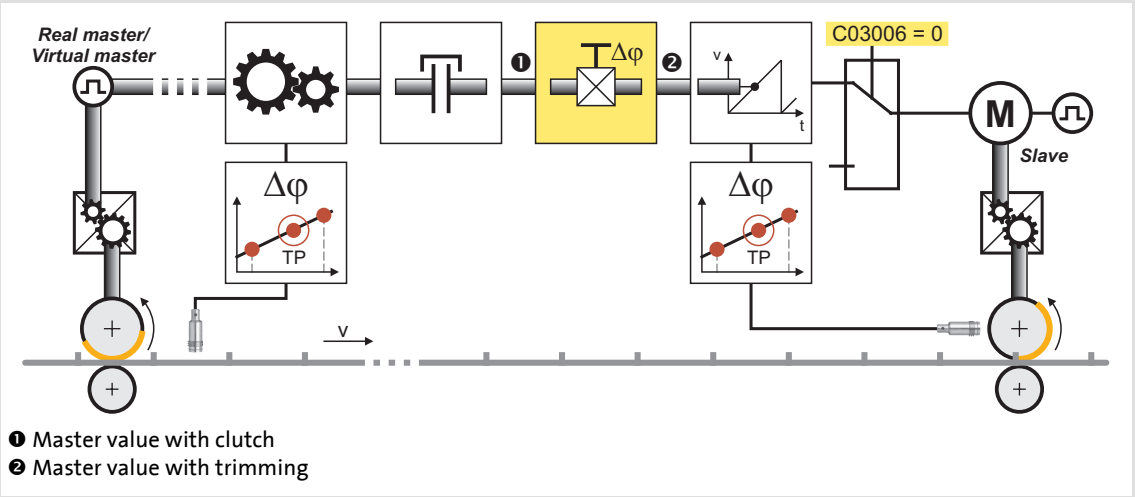
▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *TP interface*

Parameter		Lenze setting	
		Value	Unit
C02810/3	Signal delay TP3	0	µs
C03022	Edge evaluation of positive edge	TRUE	
C03024	Edge evaluation of negative edge	FALSE	

4.5.3 Virtual clutch

❶Master value with stretch factor
❷ Master value with clutch

[4-7] Function "Virtual clutch" in the signal flow (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Virtual clutch*

Parameter		Lenze setting	
		Value	Unit
C03672	Master value with stretch factor	-	unit
C03021	Activate clutch	Deactivated	
C03665/1	Clutch in ramp	1.000	s
C03665/2	Decoupling ramp	2.000	s
C03665/3	Ramp for positive opening operation	1.000	s
C03674	Master value with clutch	-	unit
C03679	Standstill position selection	0.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 4	→ Close clutch	C03058/13
FALSE	→ Clutch - positive opening operation	C03058/14

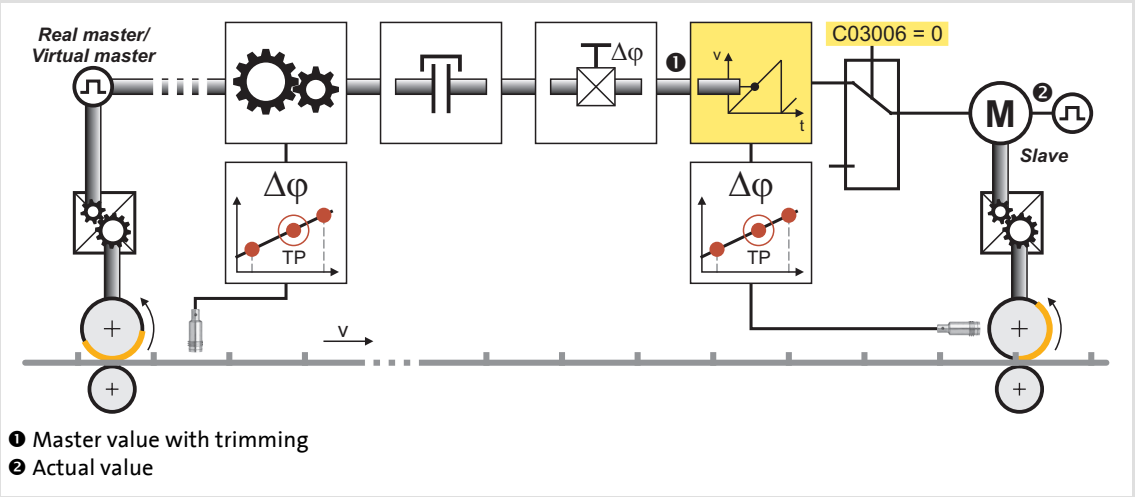
▶ Configuration: Tab **FB editor** → FB ClutchElectricalShaft

4.5.4 Master value trimming

❶ Master value with clutch
❷ Master value with trimming

[4-8] "Master value trimming" function in the signal flow (schematic diagram)

This function serves to adjust the master value.



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Master value trimming*

Parameter		Lenze setting	
		Value	Unit
C03674	Master value with clutch	-	unit
C03026	Activate trimming	Deactivated	
C03676	Adjustable range	0.0000	unit/t
C03685	Positioning mode	0	
C03686	Deactivation mode	1	
C03688/1	Positive speed	1000.0000	unit/t
C03688/2	Negative speed	1000.0000	unit/t
C03691/1	Acceleration ramp	0.500	s
C03691/2	Deceleration ramp	0.500	s
C03691/3	Stop ramp	1.000	s
C03723	Master value with trimming	-	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Start trimming	C03058/15
C03026	→ Activate trimming	C03058/16
FALSE	→ Set trimming setpoint to 0	C03058/17

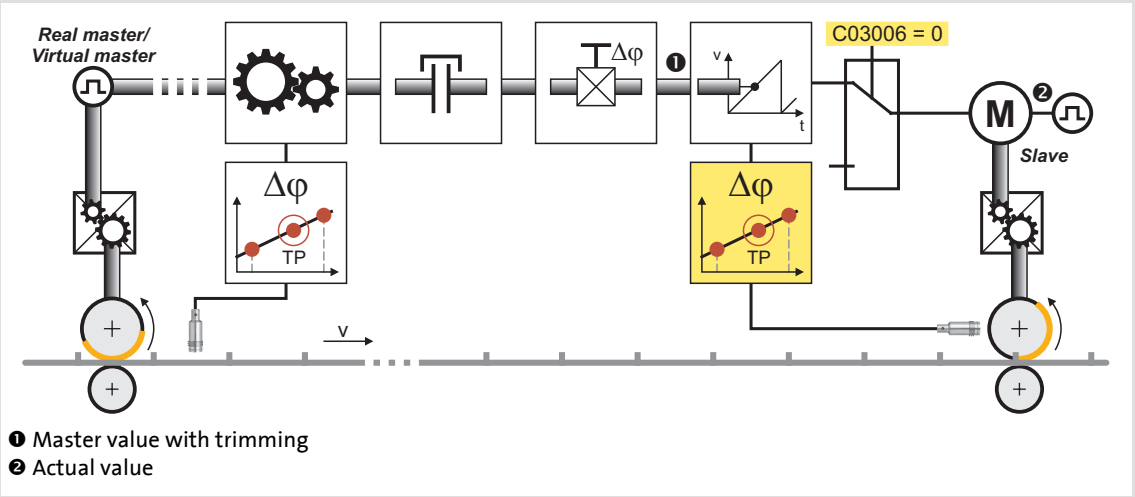
▶ Configuration: Tab **FB editor** → FB Trimming

4.5.5 Setpoint processing

❶ Master value with trimming
❷ Actual value

[4-9] "Setpoint processing" function in the signal flow (schematic diagram)

This function is used for position ratio between the master shaft and the machine axis.



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *Setpoint processing*

Parameter		Lenze setting	
		Value	Unit
C02527	Motor mounting direction	Motor rotating CW	
C02536	Cycle	360.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
Controller inhibit active	→ Delete following error	C03058/20

▶ Configuration: Tab **FB editor** → FB ToolControl

4.5.6 Mark synchronisation (setpoint)

[4-10] "Mark synchronisation" function in signal flow (schematic diagram)

This function serves to carry out a mark synchronisation of the setpoint via touch probe sensor.

Note!

For this purpose, the touch probe sensor must be connected to the digital input DI2!

▶ Parameter setting: Tab **Application parameters** → dialog level *Synchronism* → *Overview* → *Setpoint processing*

Parameter		Lenze setting	
		Value	Unit
C03033	Tool synchronisation (TP)	Deactivated	
C03851	Positive TP limit	1.0000	unit
C03876	TP limit - hysteresis	0.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Set TP position	C03058/24

▶ Configuration: Tab **FB editor** → FB ToolControl

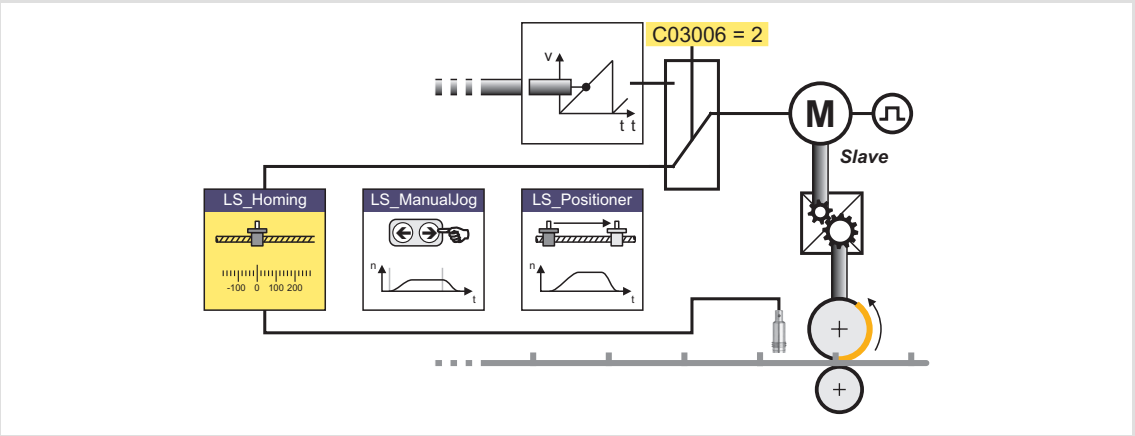
TP profile parameters

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *TP profile parameters*

Parameter		Lenze setting	
		Value	Unit
C03855	Positioning mode	0	
C03856	Deactivation mode	0	
C03858/1	Positive speed	1000.0000	unit/t
C03858/2	Negative speed	1000.0000	unit/t
C03861/1	Acceleration ramp	1.000	s
C03861/2	Deceleration ramp	1.000	s
C03861/3	Stop ramp	1.000	s

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Activate tool TP correction	C03058/23

▶ Configuration: Tab **FB editor** → FB MarkSynchronizationTool



TP interface

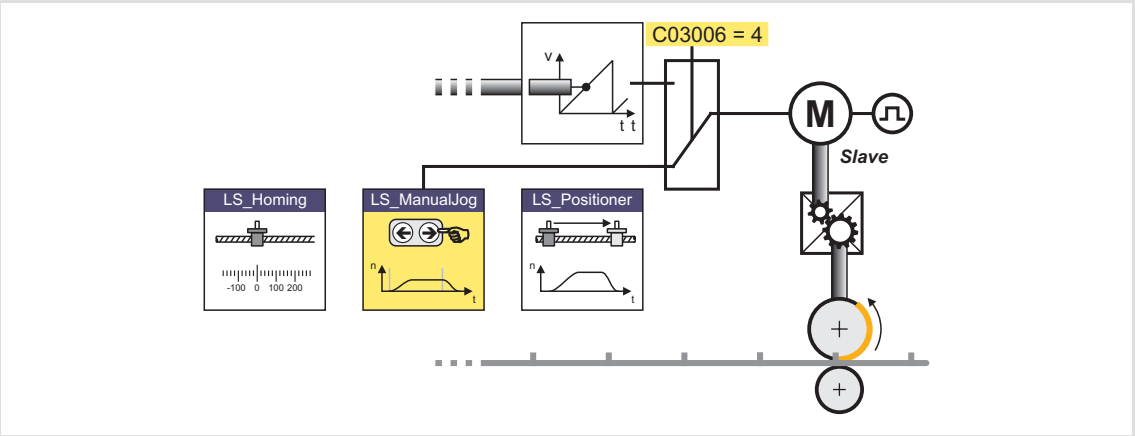
▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Synchronism* → *TP interface*

Parameter		Lenze setting	
		Value	Unit
C02810/2	Signal delay TP2	0	µs
C03031	Edge evaluation of positive edge	TRUE	
C03032	Edge evaluation of negative edge	FALSE	

4.6 "Homing" mode

In the "Homing" mode (C03006 = "2") the drive is decoupled from the electrical shaft and the basic function "Homing" is enabled:

[4-11] "Homing" mode (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Homing*

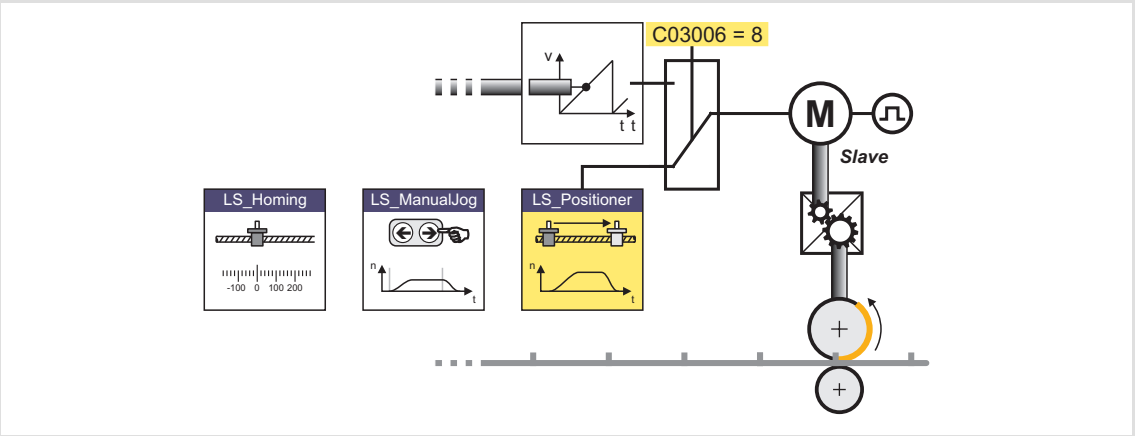
Parameter		Lenze setting	
		Value	Unit
C02528	Traversing range	Modulo	
C02640	Homing mode	Set home pos. directly	
C02642	Home position	0.0000	unit
C02643	Homing: Target position	0.0000	unit
C02644	Homing: Speed 1	360.0000	unit/s
C02645	Homing: Acceleration 1	720.0000	unit/s^2
C02646	Homing: Speed 2	0.0000	unit/s
C02647	Homing: Acceleration 2	360.0000	unit/s^2
C02648	Homing: S-ramp time	100	ms
C02649	Homing: Torque limit	10.00	%
C02650	Homing: Blocking time	1.000	s
C02652	Ref. pos. after mains switching	Delete	
C02653	Max. rot. ang. aft. mns. swtch.	180	°
C03011	Set home position	Inactive	
C03012	Home position	0.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Start homing	C03160/2
DIGIN 2	→ Home mark	C03160/3
C03011	→ Set home position	C03160/4
C03012	→ Home position	C03163
FALSE	→ Reset home position	C03160/5

4.7 "Manual jog" mode

In the "Manual jog" mode (C03006 = "4") the drive is decoupled from the electrical shaft and the basic function "Manual jog" is enabled:

[4-12] "Manual jog" mode (schematic diagram)



▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Manual jog*

Parameter		Lenze setting	
		Value	Unit
C02620	Manual jog: Speed 1	360.0000	unit/s
C02621	Manual jog: Speed 2	720.0000	unit/s
C02622	Manual jog: Acceleration	360.0000	unit/s^2
C02623	Manual jog: Deceleration	1440.0000	unit/s^2
C02624	Manual jog: S-ramp time	0.100	s
C03007	Positive manual jog	Inactive	
C03008	Negative manual jog	Inactive	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
C03007	→ Activate positive manual jog	C03155/2
C03008	→ Activate negative manual jog	C03155/3
FALSE	→ Activate 2. speed	C03155/4
FALSE	→ Retract limit switch	C03155/5

4.8 "Positioning" mode"

In the "Positioning" mode (C03006 = "8") the drive is decoupled from the electrical shaft and the basic function "Positioning" is enabled:

[4-13] "Positioning" mode (schematic diagram)

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Positioning*

Parameter		Lenze setting	
		Value	Unit
C00070	Speed controller gain	0.00700	Nm/rpm
C00071	Integral-action time of speed controller	10.0	ms
C00072	D component of speed controller	0.00	ms
C02570	Position control structure	Phase control	
C02554	Integral-action time of position controller	60.000	s
C02553	Position controller gain	20.00	1/s
C03040	Positioning - profile no.	0	
C03041	Positioning - teach profile no.	0	

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Start positioning step	C03185/2
FALSE	→ Abort positioning step	C0318?5/3
FALSE	→ Restart positioning step	C03185/4
FALSE	→ Activate override	C03185/5
0 %	→ Speed override	C03186/1
0 %	→ Acceleration override	C03186/2
FALSE	→ Inhibit touch probe evaluation	C03185/6
FALSE	→ Teach position	C03185/7

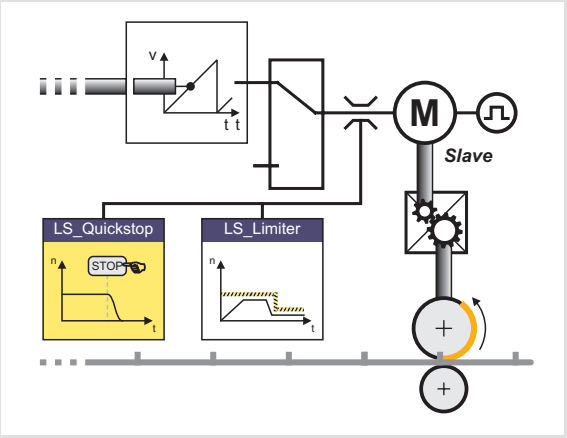
Profile data record management

For the profile data record management the FB **L_PosProfileTable** is used. This FB serves to file and manage up to four (travel) profiles and to "teach" target positions.

- A profile describes a motion request which can be implemented by the SB **LS_Positioner** into a rotary motion.
- A profile is described via the following profile parameters: Mode (type of positioning), position, speed, acceleration, deceleration, S-ramp time, TP sequence profile and TP selection.
- The data of the profile parameters is directly input in the assigned codes:

Profile parameters	Unit	Profile no. 1	Profile no. 2	Profile no. 3	Profile no. 4
Positioning mode	-	C03970/1	C03970/2	C03970/3	C03970/4
Position	unit	Set position	C03971/2	C03971/3	C03971/4
Speed	unit/t	C03972/1	C03972/2	C03972/3	C03972/4
Acceleration	unit/t^2	C03973/1	C03973/2	C03973/3	C03973/4
Deceleration	unit/t^2	C03974/1	C03974/2	C03974/3	C03974/4
S-ramp time	s	C03975/1	C03975/2	C03975/3	C03975/4
TP sequence profile	-	C03976/1	C03976/2	C03976/3	C03976/4
TP selection	-	C03977/1	C03977/2	C03977/3	C03977/4

Note!



For profile no. 1 the set position of the tool which belongs to the master position is always used as target position.

- Application: Returning the tool e.g. from a maintenance position to the network.

"Teach" position

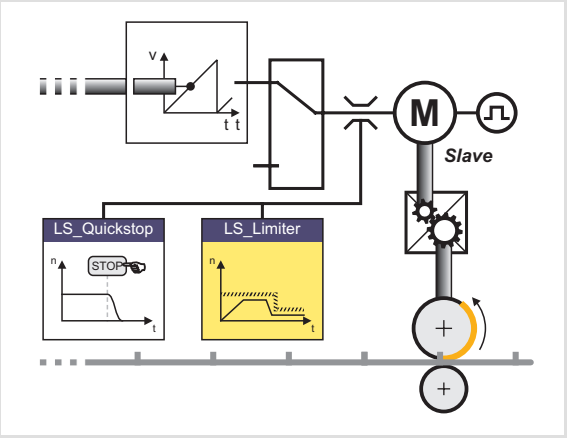
When the control input "Teach position" is set to TRUE, the current tool position is saved in the profile the number of which is set in C03041. After the control input is reset to FALSE the position saved last is maintained in the profile.

4.9 Quick stop

[4-14] Basic function "Quick stop" (schematic diagram)

The basic function "Quick stop" brakes the drive to standstill within the deceleration time set for the quick stop function after a corresponding request independent of the setpoint selection.

If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time.



▶ The quick stop function can be activated as follows in the Lenze setting:
  – By setting the digital input DI1 to LOW level.
  – By a master control via the port *LPortControl1*:
    By setting bit 2 of the bit-coded control word 1.

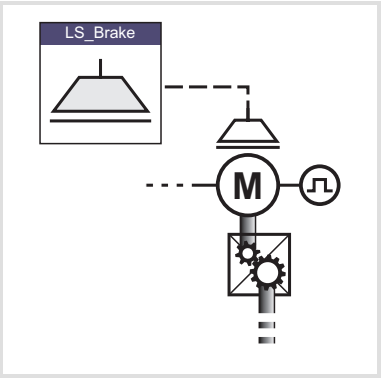
▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *All basic functions* → *Quick stop*

Parameter		Lenze setting	
		Value	Unit
C00105	Quick stop deceleration time	0.000	s
C00106	Quick stop S-ramp time	0.00	%
C00107	Reference for quick stop deceleration time	Motor reference speed (C00011)	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 1	→ Activate quick stop 1	C03135/1
Control word 1 bit 02	→ Activate quick stop 2	C03135/2
FALSE	→ Activate quick stop 3	C03135/3

4.10 Limiter

[4-15] Basic function "Limiter" (schematic diagram)



The basic function "Limiter" monitors the travel range limits via limit switches and parameterised software limit positions and can lead the drive to defined limit ranges when being asked accordingly by the safety module.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Limiter*

Parameter		Lenze setting	
		Value	Unit
Limit values			
C02707	Permissible direction of rot.	Positive and negative	
C02700	Software limit positions are active	Deactivated	
C02701/1	Positive software limit position	0.0000	unit
C02701/2	Negative software limit position	0.0000	unit
Only for homing, positioning and manual jog			
C02702	Limitations are active	Deactivated	
C02703	Max. speed	3600.0000	unit/s
C02705	Max. acceleration	3600.0000	unit/s^2
C02706	Min. S-ramp time	100	ms
Limited speed 1 ... 4 (only for homing, positioning, and manual jog)			
C02708/1	Limited speed 1	3600.0000	unit/s
C02710/1	Delay lim. speed 1	0.0100	unit/s^2
C02711/1	S-ramp time lim. speed 1	100	ms
C02708/2	Limited speed 2	7200.0000	unit/s
C02710/2	Delay lim. speed 2	0.0100	unit/s^2
C02711/2	S-ramp time lim. speed 2	100	ms
C02708/3	Limited speed 3	14400.0000	unit/s
C02710/3	Delay lim. speed 3	0.0100	unit/s^2
C02711/3	S-ramp time lim. speed 3	100	ms
C02708/4	Limited speed 4	28800.0000	unit/s
C02710/4	Delay lim. speed 4	0.0100	unit/s^2
C02711/4	S-ramp time lim. speed 4	100	ms
For manual jog only			
C02713	Max. dist. manual jog	360.0000	unit

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Positive limit switch	C03150/1
FALSE	→ Negative limit switch	C03150/2

4.11 Brake control

[4-16] Basic function "Brake control" (schematic diagram)

The basic function "Brake control" serves to the wear free control and monitoring of a holding brake.

In the simplest case, an optionally available brake module is used.

Alternatively the holding brake can also be controlled and monitored via the digital inputs/outputs.

Note!

In the Lenze setting the brake control is switched off to reach a safe status after mains connection.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Brake control*

Parameter		Lenze setting	
		Value	Unit
C02580	Operating mode of brake	Brake control off	
C02581	Brake activation threshold	50	rpm
C02582	Brake resp. to pulse inhibit	Activate the brake immediately	
C02583	Status input monitoring	Not active	
C02585	Brake control polarity	Not inverted	
C02586	Starting torque 1	0.00	Nm
C02587	Starting torque 2	0.00	Nm
C02588	Starting torque source	Starting torque 1/2	
C02589	Brake closing time	100	ms
C02590	Brake opening time	100	ms
C02591	Waiting time - status monitoring	100	ms
C02593	Waiting time - brake activation	0.000	s
C02594	Test torque	0.00	Nm
C02595	Permissible angle of rotation	5	°
C02596	Grinding speed	100	rpm
C02597	Accel./decel. time - grinding	1.000	s
C02598	Grinding ON time	0.5	s
C02599	Grinding OFF time	0.5	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Release brake	C03165/1
FALSE	→ Activate starting torque 2	C03165/2
FALSE	→ Keep open brake at standstill	C03165/3
FALSE	→ Brake status signal	C03165/4
FALSE	→ Activate brake test	C03165/5
FALSE	→ Grind brake	C03165/6
0 %	→ Additional torque	C03166

4.12 Signal configuration

4.12.1 Drive and motor interface

If required, the preset signal configuration of the control and setpoint inputs of the drive and motor interface can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Drive interface

Signal (Lenze setting)	Control input	Signal configuration
FALSE	→ Set controller inhibit	C03130/1
DIGIN 5	→ Reset error 1	C03130/2
Control word 1 bit 07	→ Reset error 2	C03130/3
FALSE	→ Reset error 3	C03130/4
FALSE	→ Set error	C03130/5
Control word 1 bit 00	→ Switch on drive	C03130/6

Motor interface

Signal (Lenze setting)	Setpoint input	Signal configuration
100 %	→ Position controller adaptation	C03141/1
100 %	→ Phase controller adaptation	C03141/2
100 %	→ Speed controller adaptation	C03141/3
100 %	→ Upper torque limit value	C03141/4
-100 %	→ Lower torque limit value	C03141/5
100 %	→ Flux setpoint	C03141/6
100 %	→ Adaptation of mass inertia	C03141/7

4.12.2 Output ports

If required, the preset signal configuration of the output ports can be easily reconfigured per parameter setting of the assigned multiplexer parameters.

Output port "LPortAxisOut1"

The output port **LPortAxisOut1** is intended for the connection with a following axis.

Signal (Lenze setting)	Output port	Signal configuration
Axis status word • Application-specific signals can be supplemented.		
FALSE	→ Axis status word bit 00	C03120/1
FALSE	→ Axis status word bit 01	C03120/2
FALSE	→ Axis status word bit 02	C03120/3
FALSE	→ Axis status word bit 03	C03120/4
FALSE	→ Axis status word bit 04	C03120/5
FALSE	→ Axis status word bit 05	C03120/6
FALSE	→ Axis status word bit 06	C03120/7
FALSE	→ Axis status word bit 07	C03120/8
FALSE	→ Axis status word bit 08	C03120/9
FALSE	→ Axis status word bit 09	C03120/10
FALSE	→ Axis status word bit 10	C03120/11
FALSE	→ Axis status word bit 11	C03120/12
FALSE	→ Axis status word bit 12	C03120/13
FALSE	→ Axis status word bit 13	C03120/14
FALSE	→ Axis status word bit 14	C03120/15
FALSE	→ Axis status word bit 15	C03120/16
Setpoints for horizontal communication		
0 %	→ Axis-Port Out 1	C03124/1
Master value (Position in [increments])	→ Axis-Port Out 2	C03054/1

Output port "LPortStatus1"

The output port **LPortStatus1** is intended for the connection with a higher-level control.

Signal (Lenze setting)	Output port	Signal configuration
Status word 1		
Drive ready	→ Status word 1 bit 00	C03121/1
FALSE	→ Status word 1 bit 01	C03121/2
Drive is ready to start	→ Status word 1 bit 02	C03121/3
Error is active	→ Status word 1 bit 03	C03121/4
FALSE	→ Status word 1 bit 04	C03121/5
Normal stop is active	→ Status word 1 bit 05	C03121/6
Switch-on inhibit is active	→ Status word 1 bit 06	C03121/7
Warning is active	→ Status word 1 bit 07	C03121/8
FALSE	→ Status word 1 bit 08	C03121/9
FALSE	→ Status word 1 bit 09	C03121/10
FALSE	→ Status word 1 bit 10	C03121/11
Drive in the limitation	→ Status word 1 bit 11	C03121/12
Homing complete	→ Status word 1 bit 12	C03121/13
Home position available	→ Status word 1 bit 13	C03121/14
FALSE	→ Status word 1 bit 14	C03121/15
FALSE	→ Status word 1 bit 15	C03121/16

Output port "LPortStatus2"

The output port **LPortStatus2** is intended for the connection with a higher-level control.

Signal (Lenze setting)	Output port	Signal configuration
Status word 2		
FALSE	→ Status word 2 bit 00	C03122/1
FALSE	→ Status word 2 bit 01	C03122/2
FALSE	→ Status word 2 bit 02	C03122/3
FALSE	→ Status word 2 bit 03	C03122/4
FALSE	→ Status word 2 bit 04	C03122/5
FALSE	→ Status word 2 bit 05	C03122/6
FALSE	→ Status word 2 bit 06	C03122/7
FALSE	→ Status word 2 bit 07	C03122/8

4.13 Application error messages

For the output of application-specific error messages, an FB instance *ApplicationError* of the function block **L_DevApplErr** is available.

- Via the 8 boolean inputs up to 8 different application error messages with parameterisable module ID, error ID and error response can be activated by the application.
- The first four inputs can be connected to the multiplexer parameters with the desired tripping signals. The next four inputs are firmly connected to the tripping signals of the application.

Error message		Error ID	Error response
1	Free (configurable via C03060/1)	8001	Error
2	Free (configurable via C03060/2)	8002	Error
3	Free (configurable via C03060/3)	8003	Error
4	Activate Modulo mode	8004	Warning
5	Following error	8005	Warning
6	Drive cannot follow	8006	No response
7	Drive system interrupted	8007	Quick stop by trouble
8	Reserved	8008	Warning

- Parameter setting: Tab **All parameters**

Parameter		Lenze setting
C05900	Module ID	999
C05901/1...8	Error ID 1 ... 8	See table above
C05902/1...8	Error response 1 ... 8	See table above

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
FALSE	→ Application fault 1	C03060/1
FALSE	→ Application fault 2	C03060/2
FALSE	→ Application fault 3	C03060/3

4.14 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application and the corresponding parameters in alphabetical order.

4.14.1 ApplicationError

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 53)

Parameter	Possible settings			Information
C05900	980		999	Module ID • Initialisation: 999
C05901/1...8	0		65535	Error ID • Initialisation: 8001 ... 8008
C05902/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

4.14.2 ClutchElectricalShaft

Is an instance of	Function
L_LdClutchAxisP	Time-controlled virtual clutch with position reference ▸ Virtual clutch (📖 36)

Parameter	Possible settings			Information
C03665/1	0.010	s	130.000	Clutch in ramp • Acceleration ramp for synchronising to the master shaft. • Initialisation: 1.000 s
C03665/2	0.010	s	130.000	Decoupling ramp • Deceleration ramp for stop of master position. • Initialisation: 2.000 s
C03665/3	0.010	s	130.000	Ramp for positive opening operation • Deceleration ramp for positive opening operation. • Initialisation: 1.000 s
C03666/1	String of digits			Position unit • Read only
C03666/2	String of digits			Speed unit • Read only
C03667	-214748.3647	unit/t	214748.3647	Reference speed • Read only • Reference value for selecting speeds.
C03669	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C03671	-214748.3647	unit	214748.3647	Set position after decoupling • Display of the *dnOpenPosition_p* input signal in the real unit of the machine.
C03672	-214748.3647	unit	214748.3647	Actual position of the master angle • Display of input signal *dnActPostion_p* in real unit of the machine.
C03673	-214748.3647	unit	214748.3647	Master position at the input • Display of input signal *dnSetPostion_p* in real unit of the machine.
C03674	-214748.3647	unit	214748.3647	Master position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.

4.14.3 ClutchStopPosition

Is an instance of	Function
L_SdSetPosition	Conversion of the set position after decoupling selected in the real units of the machine via C03679 into a position in [increments]. ▸ Virtual clutch (📖 36)

Parameter	Possible settings			Information
C03679	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03680	String of digits			Position unit • Read only
C03681	-2147483647		2147483647	Status • Read only

4.14.4 CompareTPDiffShaft

Is an instance of	Function
L_TbCompare	Mark synchronisation (master value): Comparison of the determined TP difference and the TP limit parameterised in C03651 for the status message "TP limit exceeded" via C03655. ▸ Mark synchronisation (master value) (📖 34)

Parameter	Possible settings		Information
C03650			Comparison function
	0	dnIn1 = dnIn2	
	1	dnIn1 > dnIn2	Lenze setting
	2	dnIn1 < dnIn2	
	3	|dnIn1| = |dnIn2|	
	4	|dnIn1| > |dnIn2|	
	5	|dnIn1| < |dnIn2|	

4.14.5 CompareTPDiffTool

Is an instance of	Function
L_TbCompare	Mark synchronisation (setpoint): Comparison of the determined TP difference and the TP limit parameterised in C03851 for the status message "TP limit exceeded" via C03875. ▸ Mark synchronisation (setpoint) (📖 39)

Parameter	Possible settings		Information
C03885			Comparison function
	0	dnIn1 = dnIn2	
	1	dnIn1 > dnIn2	Lenze setting
	2	dnIn1 < dnIn2	
	3	|dnIn1| = |dnIn2|	
	4	|dnIn1| > |dnIn2|	
	5	|dnIn1| < |dnIn2|	

4.14.6 ConversionShaftToTool

Is an instance of	Function
L_LdSyncOperation	Master value linking

Parameter	Possible settings			Information
C03715				Coupling of measuring systems X and Y
	0	Unit coupling		
	1	Cycle equality		
	2	Free coupling		Lenze setting
C03716/1	String of digits			User-defined unit X • Read only
C03716/2	String of digits			User-defined unit Y • Read only
C03717/1	0.0000		214748.3647	Coupling factor X • Initialisation: 0.0000
C03717/2	0.0000		214748.3647	Coupling factor Y • Initialisation: 0.0000
C03718/1	0	unit	2147483647	Cycle X • Read only
C03718/2	0	unit	2147483647	Cycle Y • Read only
C03719	-214748.3647	unit	214748.3647	Position X at the input • Display of the *dnXPosIn_p* input signal in the real unit of the machine.
C03720	-214748.3647	unit	214748.3647	Trimming X • Display of input signal *dnXOffset_p* in real unit of the machine.

Parameter	Possible settings			Information
C03721	-214748.3647	unit/t	214748.3647	Speed X at the output • Read only • Is generated from the speed signal *dnXSpeedOut_s*.
C03722	-214748.3647	unit/t	214748.3647	Speed Y at the output • Read only • Is generated from the speed signal *dnYSpeedOut_s*.
C03723	-214748.3647	unit	214748.3647	Position X at the output • Display of output signal *dnXActPos_p* in real unit of the machine.
C03724	-214748.3647		214748.3647	Status • Display of the bit-coded output signal *dnState*.

4.14.7 DisplayClutchSpeed

Is an instance of	Function
L_LdExtrapolate	Extrapolation of current master shaft position in the register for speed display.

Parameter	Possible settings			Information
C03705	1		127	Number of extrapolation cycles • Initialisation: 1
C03706/1	String of digits			Position unit • Read only
C03706/2	String of digits			Speed unit • Read only
C03712	-214748.3647	unit/t	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03713	-214748.3647	unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C03714				Extrapolation cycles > selected value • Read only
	0	No (OK)		
	1	Yes (error)		

4.14.8 ElectricalShaftData

Is an instance of	Function
L_SdSetAxisData	Mapping of the machine parameters of the higher-level drive (master shaft). ▸ Master axis (master shaft) (📖 26)

Parameter	Possible settings			Information
C03930	1		2147483647	Gearbox ratio - numerator • Initialisation: 1
C03931	1		2147483647	Gearbox ratio - denominator • Initialisation: 1
C03932	0.0001	Unit/incr.	214748.3647	Feed constant • Initialisation: 360 units/incr.
C03933				Path unit
	0	User-defined		Selection in C03934
	1	Inc		
	2	µm		
	3	mm		
	4	m		
	5	inch		
	6	yard		
	7	°		Lenze setting
C03934	Character string, max. 8 characters			User-defined path unit
C03935	At present, the unit of the time base is permanently set to "s" and cannot be changed!			Time unit
C03938	0.0000	unit	214748.3647	Cycle • Initialisation: 360 unit
C03939	10	Bit	24	Resolution of encoder revolution • Initialisation: 16 bits
C03941	-214748.3647	unit/t	214748.3647	Reference speed • Initialisation: 36000.0000 units/t
C03942				Traversing range
	0	Unlimited		
	1	Limited		
	2	Modulo		Lenze setting
C03948	-2147483.647		2147483.647	Resulting gearbox factor • Read only
C03949	-214748.3647	Incr.	214748.3647	Resolution - application unit • Read only

4.14.9 ElectricalShaftVal

Is an instance of	Function
L_SdSetAxisVelocity	▸ Master value processing (📖 33)

Parameter	Possible settings			Information
C03590	-214748.3647		214748.3647	Status • Display of the bit-coded output signal *dnState*.
C03591/1	String of digits			Position unit • Read only
C03591/2	String of digits			Speed unit • Read only
C03592	-214748.3647	unit/t	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03593	-214748.3647	unit/t	214748.3647	Master speed • Read only • Is generated from the speed signal *dnSpeedIn_s*.
C03597	-214748.3647	unit	214748.3647	Measured cycle • Display of output signal *dnTpTpDistance_p* in real unit of the machine.
C03598	-214748.3647	unit	214748.3647	Measured Tp deviation • Display of output signal *dnDifference_p* in real unit of the machine.
C03599	-214748.3647	unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C03604				TP deviation detected • Display of output signal *bTpDiffRecogn*.
	0	FALSE		
	1	TRUE		
C03605				Start of cycle • Display of output signal *bZeroPos*.
	0	FALSE		
	1	TRUE		

4.14.10 FollowErrorHysteresis

Is an instance of	Function
L_SdSetPosition	Following error monitoring: Conversion of the following error hysteresis selected in the real units of the machine via C03916 into a position in [increments].

Parameter	Possible settings			Information
C03916	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03917	String of digits			Position unit • Read only
C03918	-2147483647		2147483647	Status • Read only

4.14.11 FollowErrorLimit

Is an instance of	Function
L_SdSetPosition	Following error monitoring: Conversion of the following error limit select in the real units of the machine via C03911 into a position in [increments].

Parameter	Possible settings			Information
C03911	-214000.0000	unit	214000.0000	Position value • Initialisation: 10.0000 unit
C03912	String of digits			Position unit • Read only
C03913	-2147483647		2147483647	Status • Read only

4.14.12 HomingSetPosition

Is an instance of	Function
L_SdSetPosition	Conversion of the home position selected in the real units of the machine via C03012 into a position in [increments]. ▸ "Homing" mode (📖 41)

Parameter	Possible settings			Information
C03012	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03013	String of digits			Position unit • Read only
C03014	-2147483647		2147483647	Status • Read only

4.14.13 HystTPDiffShaft

Is an instance of	Function
L_SdSetPosition	Mark synchronisation (master value): Conversion of the TP hysteresis selected in the real units of the machine via C03656 into a position in [increments]. ▸ Mark synchronisation (master value) (📖 34)

Parameter	Possible settings			Information
C03656	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03657	String of digits			Position unit • Read only
C03658	-2147483647		2147483647	Status • Read only

4.14.14 HystTPDiffTool

Is an instance of	Function
L_SdSetPosition	Mark synchronisation (setpoint): Conversion of the TP hysteresis selected in the real units of the machine via C03876 into a position in [increments]. ▸ Mark synchronisation (setpoint) (📖 39)

Parameter	Possible settings			Information
C03876	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03877	String of digits			Position unit • Read only
C03879	-2147483647		2147483647	Status • Read only

4.14.15 LimitTPDiffShaft

Is an instance of	Function
L_SdSetPosition	Mark synchronisation (master value): Conversion of the TP limit selected in the real units of the machine via C03651 into a position in [increments]. ▸ Mark synchronisation (master value) (📖 34)

Parameter	Possible settings			Information
C03651	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03652	String of digits			Position unit • Read only
C03653	-2147483647		2147483647	Status • Read only

4.14.16 LimitTPDiffTool

Is an instance of	Function
L_SdSetPosition	Mark synchronisation (setpoint): Conversion of the TP limit selected in the real units of the machine via C03851 into a position in [increments]. ▸ Mark synchronisation (setpoint) (📖 39)

Parameter	Possible settings			Information
C03851	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03852	String of digits			Position unit • Read only
C03853	-2147483647		2147483647	Status • Read only

4.14.17 MarkSynchronizationShaft

Is an instance of	Function
L_LdPosCtrlLin	Time-controlled profile generation with linear acceleration/deceleration ramps for mark synchronisation (master value). ▸ Mark synchronisation (master value) (📖 34)

Parameter	Possible settings		Information
C03620			Positioning mode
	0	Absolute positioning without limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path results from the difference between current position *dnActPos_p* and target position *dnSetPos_p*. • A new positioning profile is started as soon as the target position changes. An edge change at the control input *bExecute* is not required for this purpose.	Lenze setting
	1	Absolute Positioning with limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path results from the difference between current position *dnActPos_p* and target position *dnSetPos_p*. • When the set position has been reached (*bInTarget* = TRUE), a FALSE↗TRUE edge must occur at the control input *bExecute* to start a new positioning process.	
	2	Relative positioning with limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path is selected directly via the input *dnSetPos_p*. • When the set position has been reached (*bInTarget* = TRUE), a FALSE↗TRUE edge must occur at the control input *bExecute* to start a new positioning process.	

Parameter	Possible settings			Information
C3621				Deactivation mode
	0	Positioning function deactivated: • The position output *dnPosOut_p* is set to 0. • The status signal *bInTarget* is reset to FALSE.		Lenze setting
	1	Positioning function changes to the stand-by state: • The position output *dnPosOut_p* is held on the current position *dnActPos_p*. • The status signal *bInTarget* is reset to FALSE.		
	2	Positioning function changes to the stand-by state: • If *bSetPosZero* = FALSE: The position output *dnPosOut_p* is held on the set position *dnSetPos_p*. • If *bSetPosZero* = TRUE: The position output *dnPosOut_p* is held on zero. • The status signal *bInTarget* is reset to FALSE.		
C03622/1	String of digits			Position unit • Read only
C03622/2	String of digits			Speed unit • Read only
C03623/1	0.0000	unit/t	214748.3647	Positive traversing speed • Initialisation: 3600 unit/t
C03623/2	0.0000	unit/t	214748.3647	Negative traversing speed • Initialisation: 3600 unit/t
C03624	-214748.3647	unit/t	214748.3647	Reference speed • Read only (generated from the machine parameters applied at the input *AxisData*) • Reference value for selecting speeds.
C03626/1	0.010	s	130.000	Acceleration ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03626/2	0.010	s	130.000	Deceleration ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03626/3	0.010	s	130.000	Stop ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03635	-2147483647	unit/t	2147483647	Speed at the output • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C03637	-214748.3647	unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.

Parameter	Possible settings		Information
C03639			Set position reached • Display of output signal *bInTarget*.
	0	Set position not yet reached.	
	1	Set position reached.	

4.14.18 MarkSynchronizationTool

Is an instance of	Function
L_LdPosCtrlLin	Time-controlled profile generation with linear acceleration/deceleration ramps for mark synchronisation (setpoint). ▸ Mark synchronisation (setpoint) (📖 39)

Parameter	Possible settings		Information
C03855			Positioning mode
	0	Absolute positioning without limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path results from the difference between current position *dnActPos_p* and target position *dnSetPos_p*. • A new positioning profile is started as soon as the target position changes. An edge change at the control input *bExecute* is not required for this purpose.	Lenze setting
	1	Absolute Positioning with limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path results from the difference between current position *dnActPos_p* and target position *dnSetPos_p*. • When the set position has been reached (*bInTarget* = TRUE), a FALSE↗TRUE edge must occur at the control input *bExecute* to start a new positioning process.	
	2	Relative positioning with limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path is selected directly via the input *dnSetPos_p*. • When the set position has been reached (*bInTarget* = TRUE), a FALSE↗TRUE edge must occur at the control input *bExecute* to start a new positioning process.	

Parameter	Possible settings			Information
C3856				Deactivation mode
	0	Positioning function deactivated: • The position output *dnPosOut_p* is set to 0. • The status signal *bInTarget* is reset to FALSE.		Lenze setting
	1	Positioning function changes to the stand-by state: • The position output *dnPosOut_p* is held on the current position *dnActPos_p*. • The status signal *bInTarget* is reset to FALSE.		
	2	Positioning function changes to the stand-by state: • If *bSetPosZero* = FALSE: The position output *dnPosOut_p* is held on the set position *dnSetPos_p*. • If *bSetPosZero* = TRUE: The position output *dnPosOut_p* is held on zero. • The status signal *bInTarget* is reset to FALSE.		
C03857/1	String of digits			Position unit • Read only
C03857/2	String of digits			Speed unit • Read only
C03858/1	0.0000	unit/t	214748.3647	Positive traversing speed • Initialisation: 1000 unit/t
C03858/2	0.0000	unit/t	214748.3647	Negative traversing speed • Initialisation: 1000 unit/t
C03859	-214748.3647	unit/t	214748.3647	Reference speed • Read only (generated from the machine parameters applied at the input *AxisData*) • Reference value for selecting speeds.
C03861/1	0.010	s	130.000	Acceleration ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03861/2	0.010	s	130.000	Deceleration ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03861/3	0.010	s	130.000	Stop ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03870	-2147483647	unit/t	2147483647	Speed at the output • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C03872	-214748.3647	unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.

Parameter	Possible settings		Information
C03874			Set position reached • Display of output signal *bInTarget*.
	0	Set position not yet reached.	
	1	Set position reached.	

4.14.19 MonitFollowError

Is an instance of	Function
L_LdMonitFollowError	Following error monitoring

Parameter	Possible settings			Information
C03960	-214748.3647	unit	214748.3647	Following error at the input • Display of input signal *dnFollowErrorIn_p* in real unit of the machine.
C03961	String of digits			Position unit • Read only
C03963				Following error out of tolerance • Read only
	FALSE	Following error smaller than set switching threshold		
	TRUE	Following error larger than set switching threshold		
C03964				Following error monitoring activated • Read only
	FALSE	Deactivated		
	TRUE	Activated		

4.14.20 MotionBusIn

Is an instance of	Function
L_LdExtrapolate	Optional extrapolation of the position information received via a bus system in order to compensate for larger bus transmission cycles. ▸ Master value source: Bus system (📖 31)

Parameter	Possible settings			Information
C03550	1		127	Number of extrapolation cycles • Initialisation: 1
C03551/1	String of digits			Position unit • Read only
C03551/2	String of digits			Speed unit • Read only
C03557	-214748.3647	unit/t	214748.3647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03558	-214748.3647	unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.

Parameter	Possible settings		Information
C03559			Extrapolation cycles > selected value • Read only
	0	No (OK)	
	1	Yes (error)	

4.14.21 OverrideProfile

Is an instance of	Function
L_PosProfileTable	Storage and management of up to four travel profiles for the "positioning" mode. ▸ "Positioning" mode (📖 43)

Parameter	Possible settings			Information
C03970/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)				Positioning mode • For absolute positioning, the home position must be known.
	1	Absolute		
	2	Absolute TP		
	5	Relative		
	6	Relative TP		
	7	Speed		
	8	Speed TP		
	11	Absolute CW		
	12	Absolute CW TP		
	13	Absolute CCW		
	14	Absolute CCW TP		
	15	Absolute ShortestWay		
	16	Absolute ShortestWay TP		
C03971/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	-214748.3647	unit	214748.3647	Position
C03972/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	-214748.3647	unit/t	214748.3647	Speed
C03973/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	0.0000	unit/t^2	214748.3647	Acceleration
C03974/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	0.0000	unit/t^2	214748.3647	Deceleration
C03975/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	0.0000	s	214748.3647	S-ramp time
C03976/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)				TP sequence profile • Sequence profile for touch probe residual path positioning.
	0	No residual path positioning		
	1	Profile no. 1		
	...	...		
	4	Profile no. 4		

Parameter	Possible settings			Information
C03977/1...4 (subcode 1 ... 4 ≡ profile no. 1 ... 4)	Value is bit-coded:			Touch probe configuration • The touch probe channels to be used are selected by setting the corresponding bits to "1".
	Bit 0	TP channel 1, rising edge		Digital input 1
	Bit 1	TP channel 1, falling edge		
	Bit 2	TP channel 2, rising edge		Digital input 2
	Bit 3	TP channel 2, falling edge		
	Bit 4	TP channel 3, rising edge		Digital input 3
	Bit 5	TP channel 3, falling edge		
	Bit 6	TP channel 4, rising edge		Digital input 4
	Bit 7	TP channel 4, falling edge		
	Bit 8	TP channel 5, rising edge		Digital input 5
	Bit 9	TP channel 5, falling edge		
	Bit 10	TP channel 6, rising edge		Digital input 6
	Bit 11	TP channel 6, falling edge		
	Bit 12	TP channel 7, rising edge		Digital input 7
	Bit 13	TP channel 7, falling edge		
	Bit 14	TP channel 8, rising edge		Digital input 8
	Bit 15	TP channel 8, falling edge		
	Bit 16	TP channel 9		Motor encoder zero pulse
	Bit 18	TP channel 10		Load encoder zero pulse
	Bit 20	TP channel 11		DFIN zero pulse
	Bit 22	TP channel 12		DFOUT zero pulse
C03978				"Teach" position • For execution via parameter channel.
	0↗1	The position applied at the input *dnTeachPos_p* is saved in the profile selected via the input *dwTeachProfileNumber*.		
C03979/1	String of digits			Position unit • Read only
C03979/2	String of digits			Speed unit • Read only
C03979/3	String of digits			Acceleration unit • Read only
C03980/1	-214748.3647	unit	214748.3647	External target position • Display of input signal *dnExtPos_p* in real unit of the machine.
C03980/2	-214748.3647	unit	214748.3647	Teach position • Display of input signal *dnTeachPos_p* in real unit of the machine.
C03981/1	0		4	Selected profile • Display of input signal *dwProfileNumber*.
C03981/2	0		4	Selected teach profile • Display of input signal *dwTeachProfileNumber*.

Parameter	Possible settings			Information
C03983				DIS:bPosTeach • Display of input signal *bPosTeach*.
	0	FALSE		
	1	TRUE		
C03984				DIS:bBusy • Display of output signal *bBusy*.
	0	Profile parameters are available.		
	1	Conversion active, no access to profile parameters at the moment.		
C03985	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.

4.14.22 ShaftStartPosition

Is an instance of	Function
L_SdSetPosition	Conversion of the master shaft starting position selected in the real units of the machine via C03034 into a position in [increments].

Parameter	Possible settings			Information
C03034	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03035	String of digits			Position unit • Read only
C03036	-2147483647		2147483647	Status • Read only

4.14.23 ToolControl

Is an instance of	Function
L_LdToolControl	▸ Setpoint processing (📖 38)

Parameter	Possible settings			Information
C03825	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C03826/1	String of digits			Position unit • Read only
C03826/2	String of digits			Speed unit • Read only
C03827	-214748.3647	unit/t	214748.3647	Reference speed • Read only • Reference value for selecting speeds.
C03830	-2147483647	unit/t	2147483647	Correction speed at the input • Read only • Is generated from the speed signal *dnTpMakeUpLeeway_s*.

Parameter	Possible settings			Information
C03831	-2147483647	unit/t	2147483647	Speed at the input • Read only • Is generated from the speed signal *dnSetSpeedIn_s*.
C03832	-2147483647	unit/t	2147483647	Speed at the output • Read only • Is generated from the speed signal *dnSpeedOut_s*.
C03833	-214748.3647	unit	214748.3647	Set position at the output • Display of output signal *dnSetPosCycle_p* in real unit of the machine.
C03834	-214748.3647	unit	214748.3647	Actual position at the output • Display of output signal *dnActPosCycle_p* in real unit of the machine.
C03835	-214748.3647	unit	214748.3647	Following error • Display of output signal *dnFollowErrore_p* in real unit of the machine.
C03836	-214748.3647	unit	214748.3647	Measured TP deviation • Display of output signal *dnDifference_p* in real unit of the machine.
C03837	-214748.3647	unit	214748.3647	Measured cycle • Display of output signal *dnTpTpDistance_p* in real unit of the machine.
C03838	-214748.3647	unit	214748.3647	TP set position at the input • Display of the *dnTpPos_p* input signal in the real unit of the machine.

4.14.24 TouchProbePositionShaft

Is an instance of	Function
L_SdSetPosition	Mark synchronisation (master value): Conversion of the TP position selected in the real units of the machine via C03612 into a position in [increments]. ▸ Mark synchronisation (master value) (📖 34)

Parameter	Possible settings			Information
C03612	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03613	String of digits			Position unit • Read only
C03614	-2147483647		2147483647	Status • Read only

4.14.25 TouchProbePositionTool

Is an instance of	Function
L_SdSetPosition	Mark synchronisation (setpoint): Conversion of the TP position selected in the real units of the machine via C03846 into a position in [increments]. ▸ Mark synchronisation (setpoint) (📖 39)

Parameter	Possible settings			Information
C03846	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.5000 unit
C03847	String of digits			Position unit • Read only
C03848	-2147483647		2147483647	Status • Read only

4.14.26 Trimming

Is an instance of	Function
L_LdPosCtrlLin	▸ Master value trimming (📖 37)

Parameter	Possible settings		Information
C03685			Positioning mode
	0	Absolute positioning without limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path results from the difference between current position *dnActPos_p* and target position *dnSetPos_p*. • A new positioning profile is started as soon as the target position changes. An edge change at the control input *bExecute* is not required for this purpose.	Lenze setting
	1	Absolute Positioning with limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path results from the difference between current position *dnActPos_p* and target position *dnSetPos_p*. • When the set position has been reached (*bInTarget* = TRUE), a FALSE↗TRUE edge must occur at the control input *bExecute* to start a new positioning process.	
	2	Relative positioning with limit stop: • When the positioning process is started (*bExecute* = TRUE), the outputs *dnPosOut_p* and *dnSpeedOut_s* are led to the target position using the set profile parameters. • The traverse path is selected directly via the input *dnSetPos_p*. • When the set position has been reached (*bInTarget* = TRUE), a FALSE↗TRUE edge must occur at the control input *bExecute* to start a new positioning process.	

Parameter	Possible settings			Information
C3686				Deactivation mode
	0	Positioning function deactivated: • The position output *dnPosOut_p* is set to 0. • The status signal *bInTarget* is reset to FALSE.		Lenze setting
	1	Positioning function changes to the stand-by state: • The position output *dnPosOut_p* is held on the current position *dnActPos_p*. • The status signal *bInTarget* is reset to FALSE.		
	2	Positioning function changes to the stand-by state: • If *bSetPosZero* = FALSE: The position output *dnPosOut_p* is held on the set position *dnSetPos_p*. • If *bSetPosZero* = TRUE: The position output *dnPosOut_p* is held on zero. • The status signal *bInTarget* is reset to FALSE.		
C03687/1	String of digits			Position unit • Read only
C03687/2	String of digits			Speed unit • Read only
C03688/1	0.0000	unit/t	214748.3647	Positive traversing speed • Initialisation: 1000 unit/t
C03688/2	0.0000	unit/t	214748.3647	Negative traversing speed • Initialisation: 1000 unit/t
C03689	-214748.3647	unit/t	214748.3647	Reference speed • Read only (generated from the machine parameters applied at the input *AxisData*) • Reference value for selecting speeds.
C03691/1	0.010	s	130.000	Acceleration ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03691/2	0.010	s	130.000	Deceleration ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03691/3	0.010	s	130.000	Stop ramp • Initialisation: 1.000 s • Reference = reference speed (display under C05054)
C03700	-2147483647	unit/t	2147483647	Speed at the output • Display of the *dnSpeedOut_s* output signal in the real unit of the machine.
C03702	-214748.3647	unit	214748.3647	Position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.

Parameter	Possible settings		Information
C03704			Set position reached • Display of output signal *bInTarget*.
	0	Set position not yet reached.	
	1	Set position reached.	

4.14.27 TrimmingOffsetAdjustment

Is an instance of	Function
L_SdSetPosition	Conversion of the offset position selected in the real units of the machine via C03676 into a position in [increments]. ▸ Master value trimming (📖 37)

Parameter	Possible settings			Information
C03676	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.5000 unit
C03677	String of digits			Position unit • Read only
C03678	-2147483647		2147483647	Status • Read only

4.14.28 Virtual_Master

Is an instance of	Function
L_LdVirtualMasterP	"Virtual master" ▸ Master value source: Virtual master (📖 30)

Parameter	Possible settings			Information
C03565				Virtual master operating mode
	0	Continuous operation		Lenze setting
	1	Inching		
	2	Handwheel function		
C03566	0.0000	unit	214000.0000	Target position • The target position must be within the cycle. • Initialisation: 0.0000 unit
C03567	0.0000	unit	214000.0000	Starting position • The starting position must be within the cycle. • Initialisation: 0.0000 unit
C03568/1	-214000.0000	unit/t	214000.0000	Master speed 1 • Initialisation: 1.0000 unit/t
C03568/2	-214000.0000	unit/t	214000.0000	Master speed 2 • Initialisation: 1.0000 unit/t
C03569/1	0.0000	unit/t	214000.0000	Manual speed CW rotation • Initialisation: 1.0000 unit/t
C03569/2	0.0000	unit/t	214000.0000	Manual speed CCW rotation • Initialisation: 1.0000 unit/t

Parameter	Possible settings			Information
C03570/1	0.010	s	130.000	Ramp for manual jog • Initialisation: 1.000 s
C03570/2	0.010	s	130.000	Ramp for continuous operation/ single cycle • Initialisation: 1.000 s
C03570/3	0.010	s	130.000	Stop ramp • Initialisation: 1.000 s
C03571/1	String of digits			Position unit • Read only
C03571/2	String of digits			Speed unit • Read only
C03572	-214748.3647	unit/t	214748.3647	Reference speed • Read only • Reference value for selecting speeds.
C03579	-2147483647		2147483647	Status • Display of the bit-coded output signal *dnState*.
C03580				Master position in the target • Same as output *bInTarget* • Read only
	0	No		
	1	Yes		
C03581	-214748.3647	unit	214748.3647	Cycle • Read only
C03582	-214748.3647	unit	214748.3647	Master position at the output • Display of the *dnPosOut_p* output signal in the real unit of the machine.
C03583	-214748.3647	unit	214748.3647	External master position at the input • Display of input signal *dnExtMaster_p* in real unit of the machine.

FEEDBACK

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

If you have suggestions for improvement, please e-mail us to:

feedback-docu@Lenze.de

Thank you for your support.

1 About this documentation

This documentation contains information about the technology application "Table positioning" for the Servo Drives 9400 series.

Note!

This documentation supplements the mounting instructions supplied with the controller, the hardware manual and the software manual for the controller.

The Mounting Instructions contain safety information which must be observed!

The information in this documentation applies to:

Technology application	Appl. ID	Required runtime software licence
Table positioning	100502101	Available in every license stage

The technology application can be used with the following controllers:

Product series	Type designation	From hardware version	From software version
9400 Servo Drives	E94AxHExxxx	PD	1.35

Target group

This documentation is directed at qualified personnel according to IEC 364.

Document history

Version			Description
1.0	04/2007	TD05	First edition
1.1	10/2008	TD05	New subchapter "Parameterisable function blocks"
1.2	03/2010	TD05	Error corrections & supplements

1.1 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Program name	» «	The Lenze PC software »Engineer«...
Window pane	*Italics*	The *Message window*... / the *Options* dialog box...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Keyboard command	**<Bold>**	Use **<F1>** to open the Online Help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Program listings	`Courier`	`IF var1 < var2 THEN`
		`  a = a + 1`
		`  END IF`

Keyword	**`Courier bold`**	
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse click in this online documentation.
Symbols		
Page reference	(📖 6)	Optically highlighted reference to another page. It is activated with a mouse click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Definition of notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and suggests how to avoid the danger)

Pictograph	Signal word	Meaning
	Danger!	**Danger of personal injury through dangerous electrical voltage** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
	Danger!	**Danger of personal injury through a general source of danger** Indicates an impending danger that may lead to death or severe personal injury if the corresponding measures are not taken.
STOP	**Stop!**	**Danger of material damage** Indicates a potential danger that may lead to material damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	Note!	Important note for trouble-free operation
	Tip!	Useful tip for easy handling
		Reference to another document

2 Brief description

The technology application "table positioning" enables the drive to execute parameterisable travel profiles. The sequence is controlled by a superimposed control (e.g. PLC).

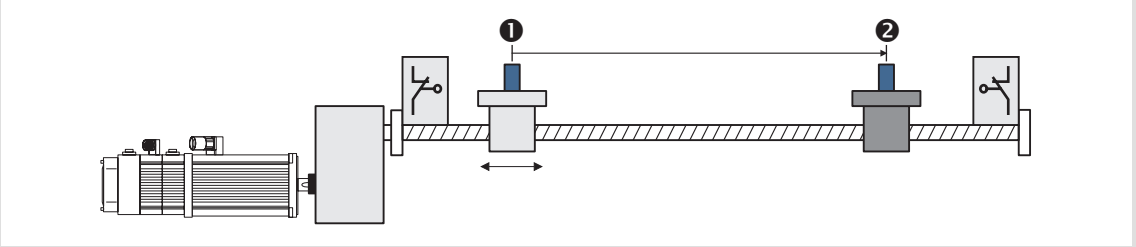
Note!

With the exception of the sequence table, the functionality of the table positioning is identical to the positioning sequence control.

Functions

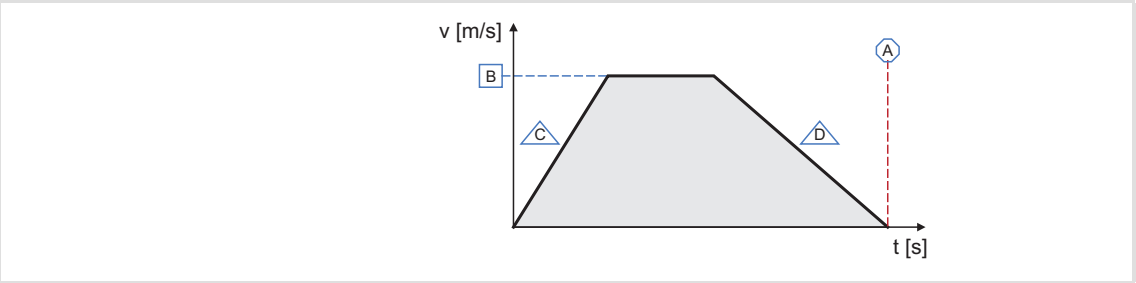
- Control of the program flow via predefined ports
- Positioning in different positioning modes
  - Point-to-point positioning
  - Touch probe positioning (residual path positioning)
  - Profile chaining with velocity changeover (overchange)
- Homing in different homing modes
- Profile data management
  - Support of S profiles (jerk limitation)
  - Separate setting for acceleration and deceleration
  - "Teach" function
- Speed/acceleration override
- Following error monitoring
- Support of absolute value encoders
- Support of the basic drive functions "Manual jog" and "Quick stop"
- Monitoring of travel range limits with the basic drive function "Limiter"
- Optional control of a holding brake with the basic drive function "Brake control"

Application range



- Transport units
- Rotary tables
- Storage and retrieval units
- Feed drives
- Dosing machines
- Hoists

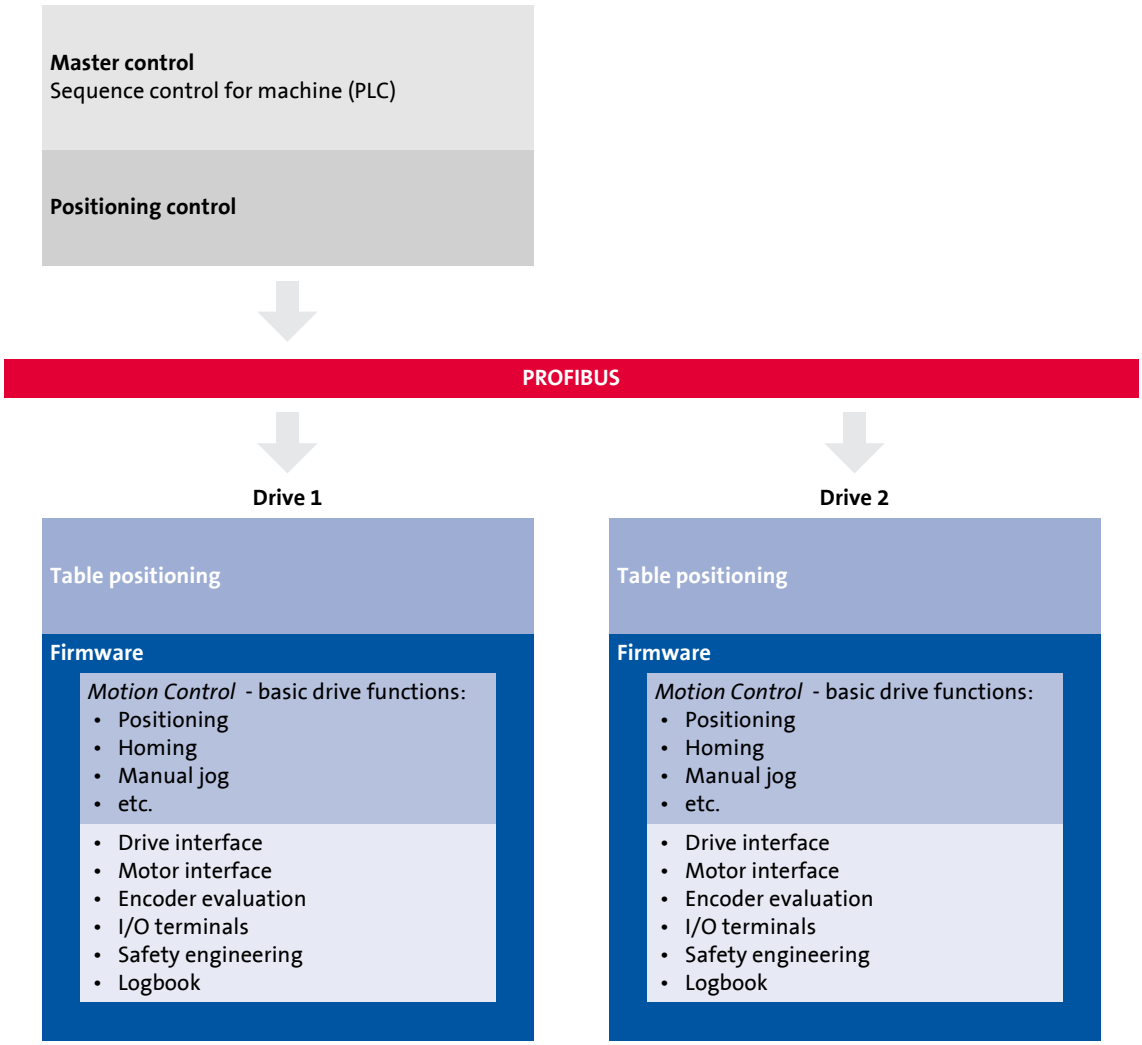
Required license/delivery



- Available in every license stage.
- The technology application can be selected in the »Engineer« application catalog.

3 Introduction

Positioning means to move a workpiece/tool or a piece of material from a starting position ❶ to a defined target❷.

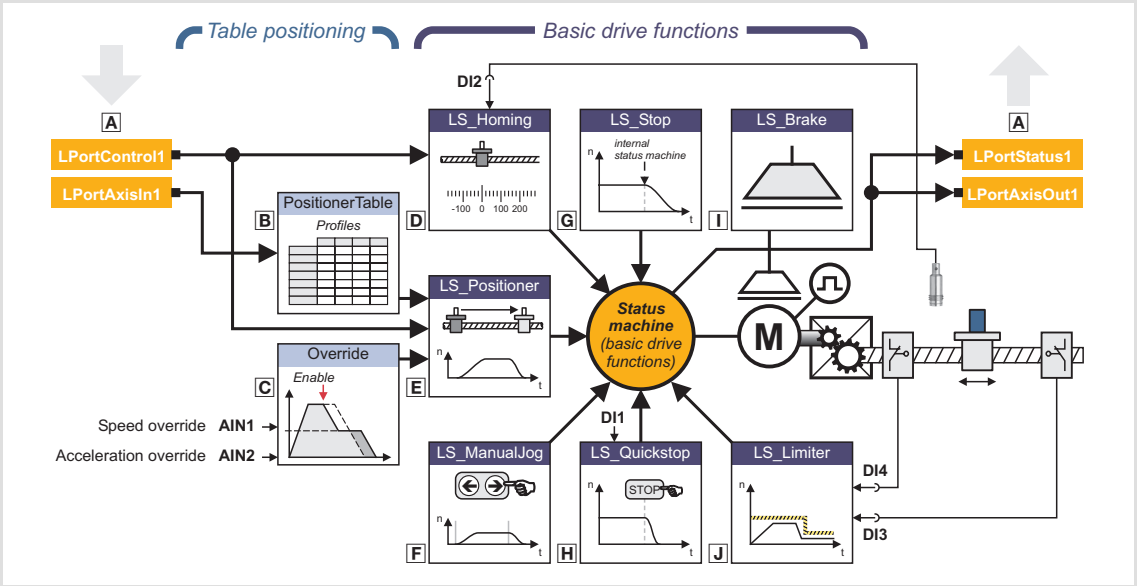


For this purpose a travel profile is to be provided in the controller, for which at least the following profile parameters are required:

Symbol	Profile parameters
A	**Position** Target position or path distance to be traversed.
B	**Speed** Maximum speed with which the target is to be approached.
C	**Acceleration** Selection of the change in speed by which acceleration is to be carried out maximally.
D	**Deceleration** Selection of the change in speed by means of which deceleration to standstill is to be maximally effected again.

▶ A positioning can consist of several profiles which are executed in a specified mode.

4 Application example



[4-1] Example: Table positioning with higher-level positioning control and networking via PROFIBUS

5 Parameter setting & configuration

5.1 Basic signal flow

The functional core of the table positioning is the profile data management which transmits the required profile data to the basic drive function "Positioning". The true sequence control is carried out by a master control (e.g. PLC) which communicates with the application via predefined ports.

[5-1] Signal flow of the TA "Table positioning" (schematic diagram)

Table positioning

A Predefined ports for the communication with a master control

B Profile data management

C Speed/acceleration override

Basic drive functions

D Homing

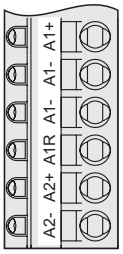
E Positioning

F Manual jog

G Stop

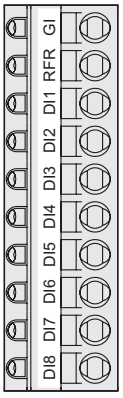
H Quick stop

I Brake control (optional)



J Limiter (optional)

5.2 Assignment of the I/O terminals



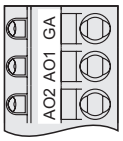
5.2.1 Setpoint and control signals

The following tables contain the Lenze assignment of the analog and digital inputs for the "Table positioning" technology application.

Analog inputs

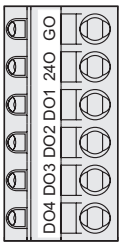
Terminal X3		Signal (Lenze setting)
	**AI1-** **AI1+**	Selection for speed override ▸ Speed/acceleration override (📖 27)
	AI2- **AI2+**	Selection for acceleration override ▸ Speed/acceleration override (📖 27)

Digital inputs



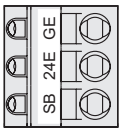
Terminal X5		Signal (Lenze setting)
	**DI1**	Quick stop • If DI1 is set to LOW level, the drive is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time. ▸ Quick stop (📖 30)
	DI2	Connection of reference switch/touch probe sensor
	DI3	Connection of travel range limit switch positive/negative for basic function "Limiter". (📖 31)
	DI4	• The inputs respond to the FALSE state (fail-safe).
	DI5	Reset error • By means of a LOW-HIGH edge an existing error status can be reset if the cause of the fault is removed.
	DI6	-
	DI7	-
	DI8	-

5.2.2 Actual value and status signals



The following tables contain the Lenze assignment of the analog and digital outputs for the "Table positioning" technology application.

▶ The default signal configuration if required can be easily changed by parameterising the multiplexer parameters assigned.



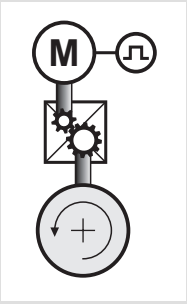
Analog outputs

Terminal X3		Signal (Lenze setting)	Signal configuration
	**AO1**	Motor speed • Scaling: ±10 V ≡ motor reference speed (C00011)	C03110/1
	AO2	Motor torque (setpoint) • Scaling: ±10 V ≡ Motor reference torque (C00057/2)	C03110/2

Digital outputs

Terminal X4		Signal (Lenze setting)	Signal configuration
	**DO1**	Status "Drive ready" • DC-bus voltage is available and no error has occurred.	C03100/1
	DO2	Status "Positioner active"	C03100/2
	DO3	Status "Limitation active" • At the moment a setpoint is limited or a software or hardware limit switch has been reached.	C03100/3
	DO4	Status "Error active acknowledgement is required" • A monitoring function with the error response "Error" or "Quick stop by trouble" has been activated and the controller is in the status "Error active" or "Quick stop by trouble active".	C03100/4

Statebus



Terminal X2		Signal (Lenze setting)	Signal configuration
	**SB**	Status "Error active acknowledgement is required" • A monitoring function with the error response "Error" or "Quick stop by trouble" has been activated and the controller is in the status "Error active" or "Quick stop by trouble active". • The state bus is put in the "error" status.	C03100/5

Display elements

User LED	Signal (Lenze setting)	Signal configuration
	Status "Positioning enabled"	C03100/6

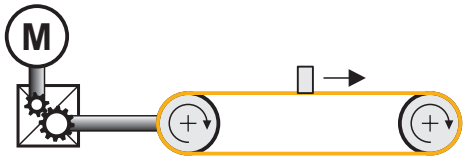
5.3 Basic settings

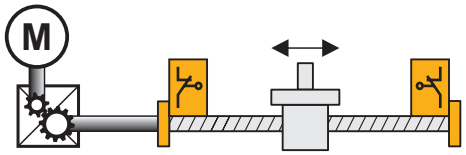
5.3.1 Machine parameters

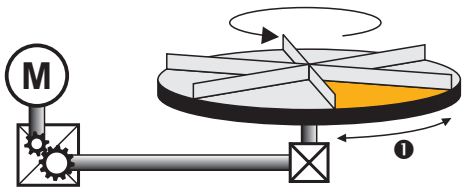
The machine parameters describe e.g. the motor end of the mechanics used.

The setting of the machine parameters in the »Engineer» is carried out on the **Application parameters** tab in the dialog level *Overview* → *Machine parameters*.

Tip!







In the »Engineer« the most important machine parameters can be directly adapted to the machine on the **Application parameters** tab in the topmost *Overview* dialog level.

Short overview of machine parameters

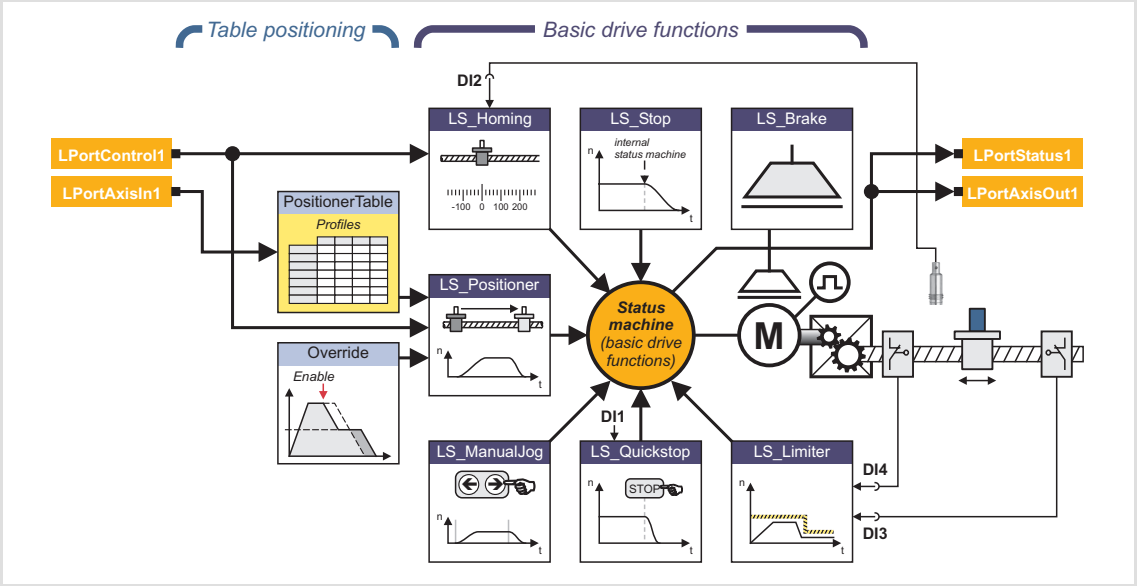
Parameter		Lenze setting	
		Value	Unit
C00173	Mains voltage	400/415	V
C00174	Undervoltage (LU) threshold	285	V
C00600	Resp. to DC bus overvoltage	Trouble	
C02520	Gearbox factor numerator: Motor	1	
C02521	Gearbox factor denom: Motor	1	
C02527	Motor mounting direction	Motor rotating CW	
C02570	Position control structure	Phase control	
C02522	Gearbox factor num.: Pos. enc.	1	
C02523	Gearbox factor denom.: Pos. enc.	1	
C02529	Mounting direction of position encoder	Encoder rotating CW	
Description of the mechanics (load, tool)			
C02528	Traversing range	Limited	
C02524	Feed constant	360.0000	unit
C02525	Unit	°	
C02526	User-defined unit	°	
C02533	Time unit	s	
C00273/1	Motor moment of inertia	Motor-dependent	kg cm^2
C00273/2	Load moment of inertia	0.00	kg cm^2

5.3.2 Traversing range

By setting the traversing range the machine type/measuring system is set:

Traversing range	
Unlimited 	The drive can traverse optionally in both directions without reaching limitations. • Positioning here generally is effected in the positioning modes "Relative with/without TP" or "Speed with/ without TP". • The positioning measuring system is reset to zero with every new positioning process. • By homing, the positioning measuring system receives a fixed reference point (zero point), so that also the positioning modes "Absolute with/without TP"can be used. Then also the software limit positions for limiting the traversing range are provided.
Limited 	After reaching the position limits, the drive must travel in the opposite direction again. • For positioning, the home position has to be known. By homing, the positioning measuring system receives a fixed reference point (zero point). • Basically, monitoring to the internally maximum usable value range ($\pm 2^{31}$ increments) takes place (software limit position monitoring of the internal value range). An overflow of the value range results in the loss of the home position. • Additionally parameterisable software limit positions can be activated on the user side for limiting the travel range.
Modulo 	The measuring system is repeated. • If the cycles ❶ set are exceeded a defined overflow occurs. The cycle typically corresponds to a rotation or tool distance in a rotative system. • For positioning, the home position has to be known. • Software limit positions are not effective. • Absolute targets can be approached by exceeding the measuring system limit, e.g. from 10° via 0° to 350°.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview*



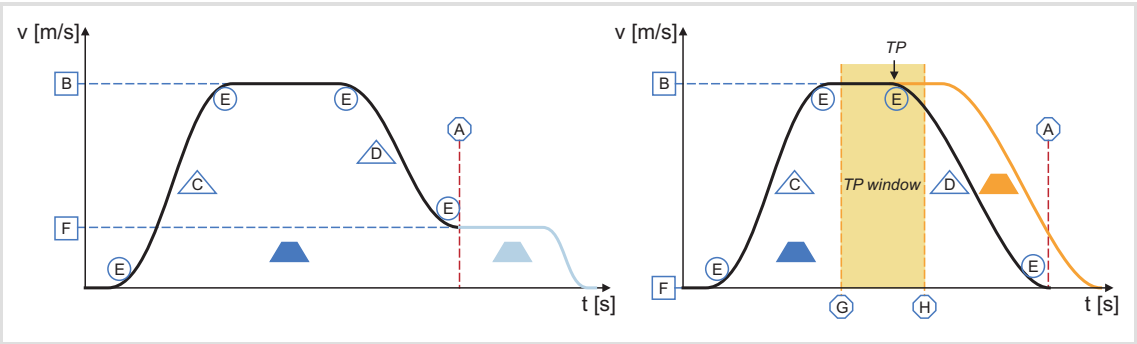
Parameter		Lenze setting	
		Value	Unit
C02528	Traversing range	Limited	
C02536	Cycle (only relevant for traversing range "Modulo")	360.0000	unit

5.3.3 Position control

In the dialog level *Overview* → *LS_Positioner* and the subordinate dialog levels, you can adapt the parameters for the position control, if necessary.

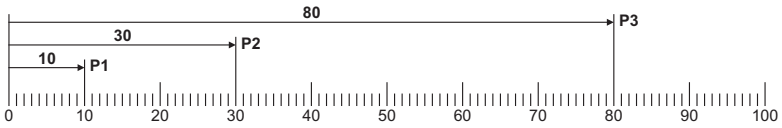
Parameter		Lenze setting	
		Value	Unit
C00254	Phase controller gain	20.00	1/s
C02553	Position controller gain	20.00	1/s
C02556	Position controller limitation	214748.3647	unit/s

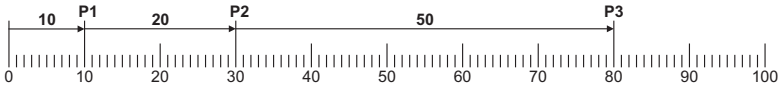
5.4 Profile data management

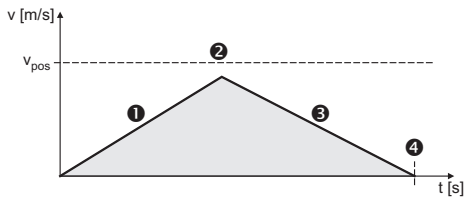


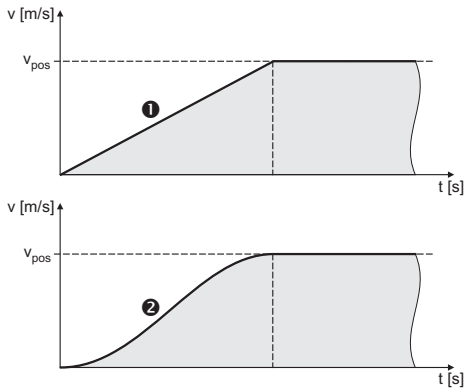
[5-2] Profile data management (schematic diagram)

The profile data management serves to file and manage up to 75 (travel) profiles.

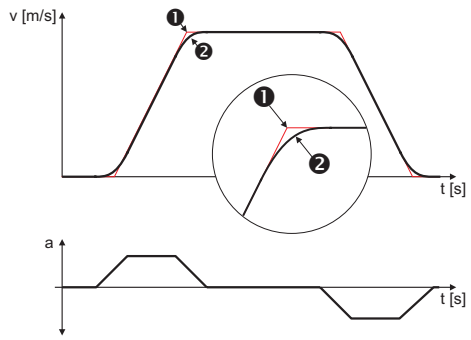


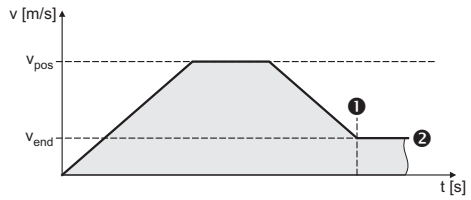






- A profile describes a motion request which can be converted by the basic drive function "Positioning" into a rotary motion.
- To execute a profile, 50 actions of type "Positioning" are available for the sequence table.
- The profile data management also enables the "teaching" of speed, acceleration/ deceleration and S-ramp times. ▸ "Teach" function (📖 26)





5.4.1 Profile parameters

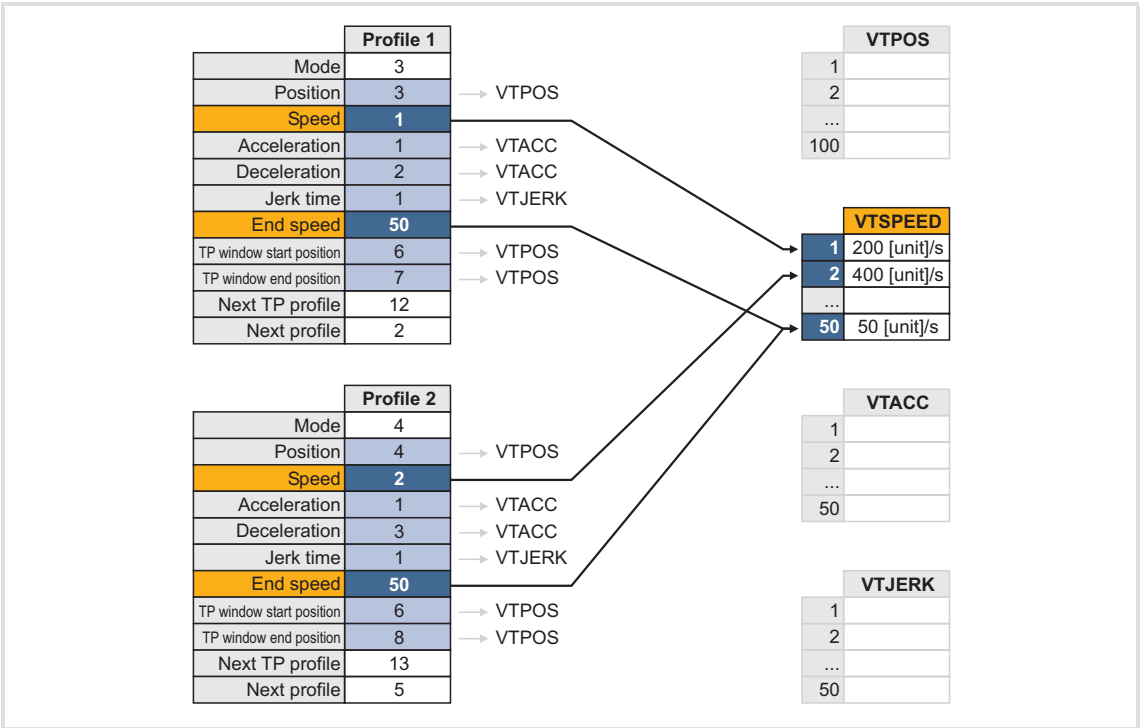
A profile is described by the following profile parameters:

[5-3] Profile parameters

Symbol	Profile parameters
	(Standard) profile Profile data set (profile no. 1 ... 75) in which the profile data are stored.
	Mode Selection of the positioning mode. ▸ Positioning modes (📖 22)
A	**Position** Target position or path distance to be traversed. The position is either indicated as absolute or relative position. • An absolute position always specifies the distance to the zero position defined: absolute position = target position  • A relative position indicates the distance to the starting position (current position): Relative position = target position - starting position 
B	**Speed** Maximum speed with which the target is to be approached. • Depending on the profile parameter position, acceleration and deceleration, it is possible that the drive may not reach the maximum speed. In this case, the graph would display a triangle instead of a trapezium.  ❶ Acceleration ❷ Travelling speed (is not reached here) ❸ Deceleration ❹ Target position (or feed distance)
C	**Acceleration** Selection of the change in speed by which acceleration is to be carried out maximally. • The following two acceleration types are distinguished: – Constant acceleration: the speed increases linearly. – Linearly increasing acceleration: The speed increases in S-shapes.  ❶ Constant acceleration ❷ Linearly increasing acceleration
D	**Deceleration** Selection of the change in speed by means of which deceleration to standstill is to be maximally effected again.

Symbol	Profile parameters
Ⓔ	**S-ramp time** When the S-ramp time is selected for a profile, it is executed with S-shaped ramps, e.g. acceleration and deceleration processes are started smoothly to reduce the jerk and thus prevent the drive components from damage. • The acceleration/deceleration specified in the profile are only reached after the defined S-ramp time has elapsed. • This type of acceleration/deceleration is required for e.g. sensitive machine parts with clearance. • The slower acceleration increase with the S profile prolongs the positioning time compared to the time optimal L profile.  ❶ without jerk limitation (L profile) ❷ with jerk limitation (S profile)
Ⓕ	**Final speed** Selection of the speed by which the drive is to start the next profile after reaching the target position. "Velocity changeover" or "Overchange" can be implemented with a final speed that is non-zero, i.e. when the target position is reached, a second positioning process is started immediately without the drive being decelerated to standstill at the first target position:  ❶ Target position ❷ Final speed (here unequal "0")
Ⓖ Ⓗ	**Start of TP window / End of TP window** These profile parameters serve to restrict the range for a touch probe positioning (residual path positioning) in which touch probes are to be detected.
	Sequence profile with TP Profile data set (profile no. 1 ... 75) in which the profile data of the profile are stored which is to be executed after a touch probe has been detected. • For the setting "0" no further profile connection by touch probe is effected.
	Sequence profile without TP Profile data set (profile no. 1 ... 75) in which the profile data of the profile is stored which is to be executed after the standard profile has been executed (profile chaining). • With the setting "0" no profile chaining is carried out. • The sequence profile defined in this profile parameter is executed even if no touch probe has been detected within the defined TP window.

5.4.2 Variable tables



To simplify parameter handling, the four most important physical sizes for profile parameters are stored in separate "variable tables".

	VTPOS Positions	VTSPEED Speeds	VTACC Acceleration/ deceleration	VTJERK S-ramp times
Unit	unit	unit/s	unit/s^2	s
Data format	DINT with four decimal positions			
Memory locations	75	50	50	50
Code	C04711/1...75	C04712/1...50	C04713/1...50	C04714/1...50
For profile parameters	Target position TP window starting position TP window end position	Speed Final speed	Acceleration Deceleration	S-ramp time

Note!

A value is assigned to a profile parameter by referring to a table position of the assigned variable table.

- Hence, not the value itself is entered into the profile parameter but the index of the table position which contains the value to be used.
- See the example in the illustration [5-4]. (📖 21)

[5-4] Principle: References to variable tables (here: References to VTSPEED)

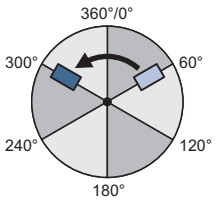
▶ In case of several references to the same table position, a change of the value in this table position affects several profiles at the same time. Thus, recurring profile parameters only need to be changed on one position.

- If e.g. in case of a profile linkage, several profiles are to be executed with the same speed, the corresponding profile parameters "speed" can all refer to the same table position.
- For an easier assignment and identification of the entered values, each table position can be optionally provided with a comment in the »Engineer«.

5.4.3 Positioning modes

Depending on the traversing range/application, you can select between different positioning modes which are described in the below table.

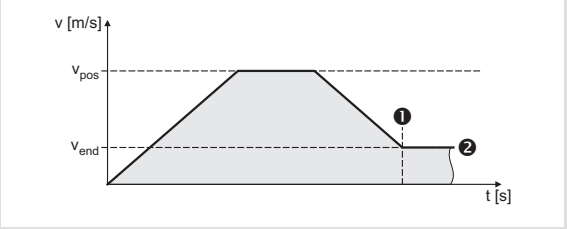
Note!



For absolute positioning, the home position must be known!

- If an absolute positioning process (positioning modes 1 ... 2 and 11 ... 16) is started although the home position is not known, an error message is indicated.
  - In this case a programming error has occurred and the program flow must be reset.
  - If the error only occurs in a sequence profile, the last valid deceleration is used to decelerate the drive to standstill.

The modulo positioning modes may involve reversing processes!



- If a modulo positioning process (positioning modes 11 ... 16) is started at an initial speed other than zero, the target position may be overtravelled and a reversing process may follow, depending on the selected deceleration / S-ramp time parameters. This would also cause e.g. counter-clockwise rotation in the "Absolute CW (modulo)" positioning mode.

Positioning mode	
1	**Absolute** The axis travels to an absolute position. • Reference for the absolute position is zero position. • The home position must be known. • The traversing range is limited: –to 214748.3647 [unit] –by the internal display area ($\pm 2^{31}$ increments) • Not possible with "modulo" traversing range.
2	**Absolute TP** Like mode 1, but with profile change when a touch probe is detected. ▸ Touch probe positioning. (📖 25)
5	**Relative** The axis is traversed by a distance. • Reference for the distance is the target position of the profile executed before. • The feed per positioning is limited: –to 214748.3647 [unit] –by the internal display area ($\pm 2^{31}$ increments)
6	**Relative TP** Like mode 5, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 25)

Positioning mode	
7	**Speed** Continuous constant travel. • Only possible with "unlimited" and "limited" traversing range • This mode does not approach a defined position, but follows the profile. • Acceleration and deceleration are based on profile values. • The traversing direction is defined by the sign of the traversing speed. • Stopped through break signal.
8	**Speed TP** Like mode 7, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 25)
11	**Absolute CW** The axis travels in CW direction to an absolute position. • Only possible with "Modulo" traversing range. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.
12	**Absolute CW TP** Like mode 11, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 25)
13	**Absolute CCW** The axis travels in CCW direction to an absolute position. • Only possible with "Modulo" traversing range. • Reference for the absolute position is zero position. • In this direction the zero position of the axis can be overtravelled.
14	**Absolute CCW TP** Like mode 13, but with profile change when a touch probe is detected. ▸ Touch probe positioning. (📖 25)
15	**Absolute ShortestWay** The axis travels to an absolute position in best time. • Only possible with "Modulo" traversing range. • Reference for the absolute position is zero position. • The rotary table positioning is basically an absolute positioning with target positions between 0 and 360 angular degree [°]. In this mode the zero point can also be overtravelled if this is the shortest way to the target position: 
16	**Absolute ShortestWay TP** Like mode 15, but with profile change on touch probe detection. ▸ Touch probe positioning. (📖 25)

5.4.4 Positioning with final speed

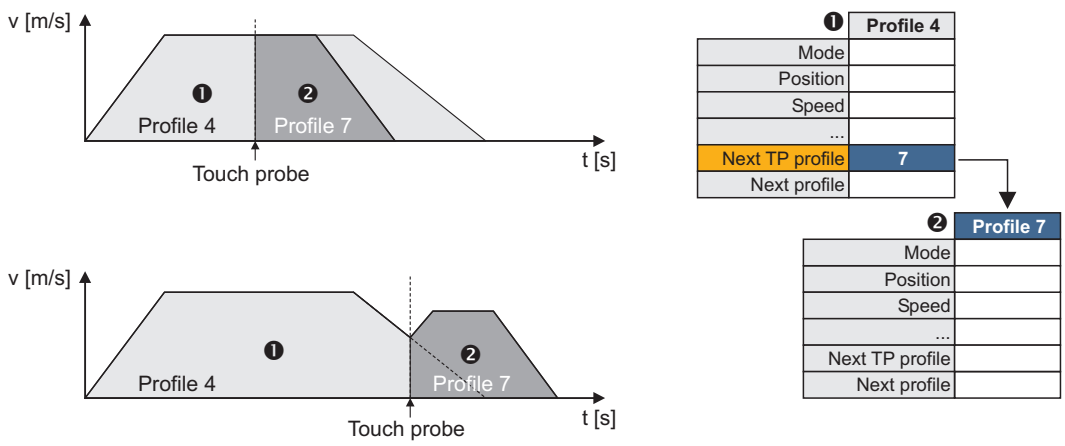
If a positioning process with a final speed other than zero is carried out, a velocity changeover / overchange can be realised, i.e. a second positioning process is started immediately once the target position is reached, and the drive does not come to a standstill at the first target position.

❶ Target position
❷ Final speed (here unequal "0")

[5-5] The principle of velocity changeover / overchange

- ▶ Normally, the drive has reached the final speed when the target position is reached.
- ▶ The profile is run through which is defined via "Profile data sequence profile without TP".
- ▶ The final speed must not exceed the maximum profile speed.
  - – The speed is internally limited to the profile speed.
  - – This is the maximum value for the final speed if the profile speed is reduced via override. (This behaviour may add to the cases described in the note below.)
  - – The speed limitation is not affected by subsequent increases in the override value.

Note!



Positioning processes with final speeds other than zero do not permit reversing. In this case, the positioning process is aborted and an error is issued.

In the case of positioning processes with final speeds and if S-shaped ramps are used, a plausibility check as to whether the final speed can be reached is carried out when the profile is started. If the final speed cannot be reached, the positioning process is aborted and an error is issued. This is often the case if the positioning process has been paused and is then to be continued.

5.4.5 Touch probe positioning

In the touch probe positioning mode, the profile is first executed according to the Profile parameters set. If a touch probe is detected during the process, it is automatically changed to the profile specified in the profile parameter "Sequence profile with TP".

- Here the current actual position is stored at the time of the touch probe activation (by a touch probe sensor).
- In the following relative positioning process, the "residual path" to this stored position is travelled according to the increments.

❶ "Starting profile"
❷ "Residual path profile" that is defined in the profile parameter "Sequence profile with TP" of the starting profile.

[5-6] Examples for a "residual path positioning" after a touch probe is detected

- The profile parameters "TP window start" and "TP window end" the range in which touch probes are to be detected can be restricted.
  - If both profile parameters are "0", touch probe detection will be active over the whole profile/the whole traversing range.
- If no touch probe is detected and after the profile is executed, the positioning is continued with the profile defined in the profile parameter "Sequence profile without TP" (profile chaining).

Note!

If a profile is travelled with high speed and a touch probe positioning is started the residual path of which is shorter than the result from current speed and set deceleration ramp, the target position is "overtravelled".

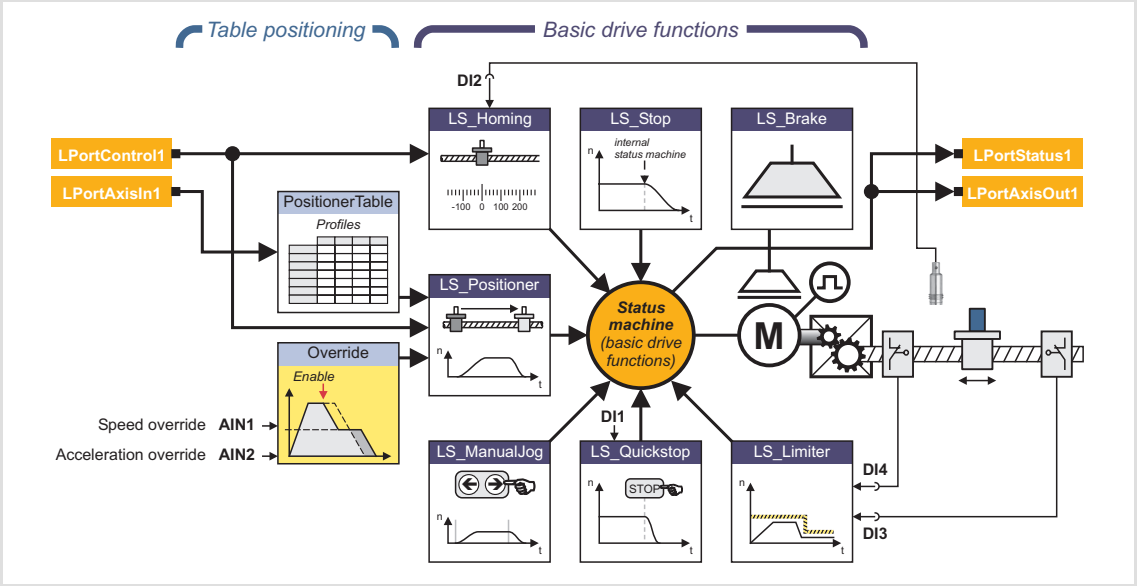
- Normally a reversing movement occurs, i.e. the drive returns.
- If, for instance, a CCW rotation of the drive is forbidden by the safety module, the target cannot be approached since in this case the reversing movement is not permissible.

Further constellations are possible in connection with profile chaining in which an approach of the target position is impossible.

5.4.6 "Teach" function

The "Teach" function of the profile data management enables the teaching of positions, speeds, accelerations and S-ramp times.

The basic function "Manual jog" serves, for instance to approach the desired position manually and transmits it via "Teaching" to the variable table for positions.

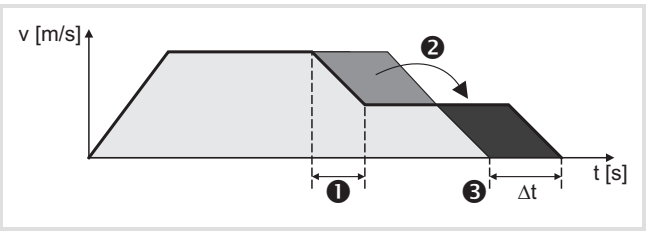


▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *L_PositionerTable*

Control/setpoint inputs of the function		Signal configuration
Lenze setting	**Control/setpoint input**	**(Multiplexer parameters)**
FALSE	→ Teach position	C03020/1
C03016	→ Selection of table position for position	C03029/1
Zero position	→ Teach position	C03125/1
FALSE	→ Teach speed	C03020/2
C03017	→ Selection of table position for speed	C03029/2
Speed setpoint	→ Teach speed	C03024/1
FALSE	→ Teach acceleration	C03020/3
C03018	→ Selection of table position for acceleration	C03029/3
0	→ Teach acceleration	C03027
FALSE	→ Teach S-ramp time	C03020/4
C03019	→ Selection of table position for S-ramp time	C03029/4
0	→ Teach S-ramp time	C03028

Note!

After the function block editor is enabled the "Teach" function must be configured directly in the FB interconnection instead of via the parameters mentioned before!



5.5 Speed/acceleration override

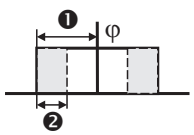
[5-7] Speed/acceleration override (schematic diagram)

"Override" is the change of profile parameters and their acceptance during the positioning process.

In this case, the travel profile is adapted accordingly to ensure that the defined target position is still exactly approached if, for example, the speed is changed during the positioning process ("speed override"):

❶ The speed is reduced during the positioning process.

❷ To reach the defined position, the missing surface must be "attached" to the profile.



❸ When the speed is reduced the positioning process takes a longer time (Δt).

[5-8] Override (here: Speed override)

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *LS_Positioner*

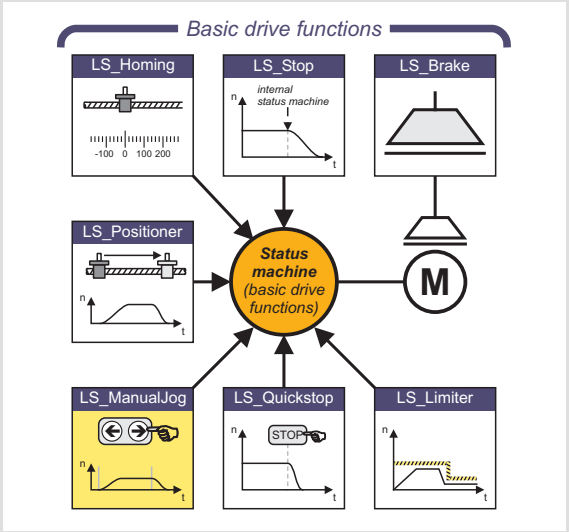
Control/setpoint inputs of the function		Signal configuration
Lenze setting	**Control/setpoint input**	**(Multiplexer parameters)**
C03013	→ Activate override	C03185/5
AIN 1	→ Speed override	C03186/1
AIN 2	→ Acceleration override	C03186/2
+100 %	→ Deceleration override	C03186/3

5.6 Following error monitoring

❶ Switching threshold
❷ Hysteresis

[5-9] Following error monitoring

In the Lenze setting a two-stage following error monitoring is active.



If the parameterisable switching threshold 1 is exceeded, a warning appears. If the higher-set switching threshold 2 is exceeded, a "warning locked" appears.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Following error*

Parameter		Lenze setting	
		Value	Unit
C03911	Switching threshold 1	100.0000	unit
C03914	Switching threshold 2	200.0000	unit
C03917	Hysteresis 1	0.0000	unit
C03920	Hysteresis 2	0.0000	unit
C05902/1	Error response - following error 1	Warning	
C05902/2	Error response - following error 2	Warning locked	

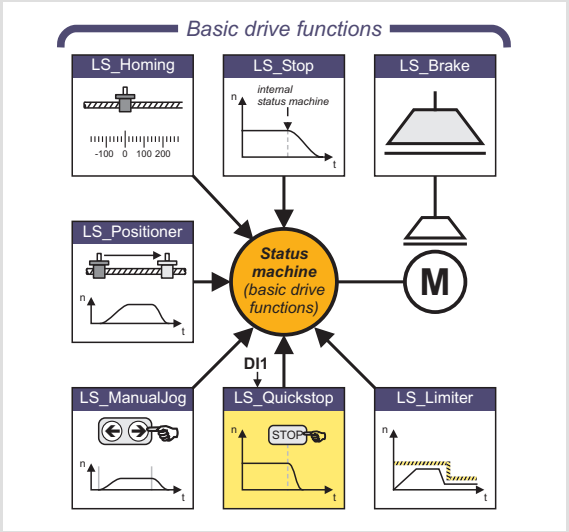
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
TRUE	→ Activate following error limit 1	C03058/1
TRUE	→ Activate following error limit 2	C03058/2

5.7 Manual jog

[5-10] Basic function "Manual jog" (schematic diagram)

For the setting-up operation and "Teaching" of positions the basic function "Manual jog" is available.

Manual jog is controlled via parameters (e. g. via HMI).



Manual jog can always be carried out if the sequence control is not active and no other basic function and no error status are active. The request of manual jog then is effected automatically with the travel commands.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Manual jog*

Parameter		Lenze setting	
		Value	Unit
C02620	Manual jog: Speed 1	360.0000	unit/s
C02621	Manual jog: Speed 2	720.0000	unit/s
C02622	Manual jog: Acceleration	360.0000	unit/s^2
C02623	Manual jog: Deceleration	1440.0000	unit/s^2
C02624	Manual jog: S-ramp time	0.100	s
C03007	Activate positive manual jog	FALSE	
C03008	Activate negative manual jog	FALSE	
C03009	Activate "Retract limit switch"	FALSE	

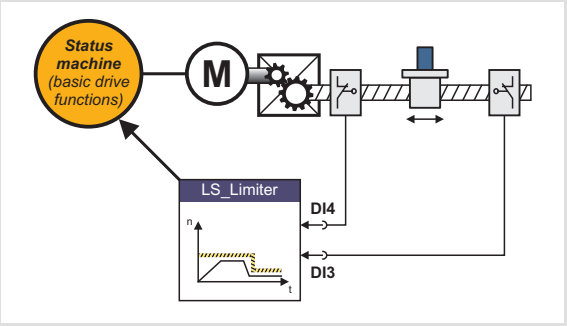
Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
Automatic activation	→ Request manual jog	C03155/1
C03007	→ Activate positive manual jog	C03155/2
C03008	→ Activate negative manual jog	C03155/3
FALSE	→ Activate 2. speed	C03155/4
C03009	→ Activate "Retract limit switch"	C03155/5
+100 %	→ Manual jog override	C03186/5

5.8 Quick stop

[5-11] Basic function "Quick stop" (schematic diagram)

The basic function "Quick stop" brakes the drive to standstill within the deceleration time set for the quick stop function after a corresponding request independent of the setpoint selection. The sequence control is interrupted.

If the quick stop is deactivated, the drive remains in standstill until the sequence control is started again and takes over the drive control.



▶ The quick stop function can be activated as follows in the Lenze setting:
  – By setting the digital input DI1 to LOW level.
  – By a master control via the port *LPortControl*:
    By setting bit 2 of the bit-coded control word 1.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *All basic functions* → *Quick stop*

Parameter		Lenze setting	
		Value	Unit
C00105	Quick stop deceleration time	0.000	s
C00106	Quick stop S-ramp time	0.00	%
C00107	Reference for quick stop deceleration time	Motor reference speed (C00011)	

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 1	→ Activate quick stop 1	C03135/1
Control word 1 bit 02	→ Activate quick stop 2	C03135/2
FALSE	→ Activate quick stop 3	C03135/3

5.9 Limiter

[5-12] Basic function "Limiter" (schematic diagram)

The basic function "Limiter" monitors the travel range limits via limit switches and parameterisable software limit positions and after an according request from the safety module can lead the drive into defined limit ranges. Furthermore higher-level limit values for travel profiles can be entered and activated.

- The software limit positions which can be set via parameters serve to limit the travel range by means of software and prevent that travel commands are executed which would cause an exit of the permissible travel range.
- Moreover, the travel range limits are monitored via limit switches via the digital inputs DI3 and DI4.

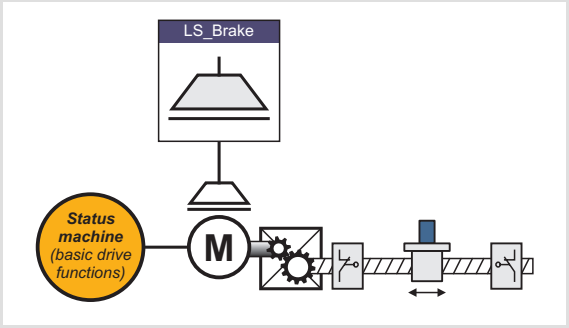
Note!

The digital inputs DI3 and DI4 are configured fail-safe in C00114/3 and C00114/4 , i.e. a HIGH level is expected at both inputs in idle state.

- If the travel range limits should not be monitored (e.g. in case of a rotary axis), set the limit switch inputs of the basic function "Limiter" permanently to FALSE.

The parameterised limit values for travel profiles are not effective for the basic functions "speed follower", "torque follower", and "position follower"!

- For the exceeding of the limit values an error response can be set.



- Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Limiter*

Parameter		Lenze setting	
		Value	Unit
Limit values			
C02707	Permissible direction of rotation	Positive and negative	
C02700	Software limit positions are active	Deactivated	
C02701/1	Positive software limit position	0.0000	unit
C02701/2	Negative software limit position	0.0000	unit
Only for homing, positioning and manual jog			
C02702	Limitations are active	Deactivated	
C02703	Max. speed	3600.0000	unit/s
C02705	Max. acceleration	3600.0000	unit/s^2
C02706	Min. S-ramp time	100	ms

Parameter		Lenze setting	
		Value	Unit
For manual jog only			
C02713	Max. manual jog distance	360.0000	unit
Limited speed 1 ... 4 (only for homing, positioning, and manual jog)			
C02708/1	Limited speed 1	3600.0000	unit/s
C02710/1	Delay lim. speed 1	0.0100	unit/s^2
C02711/1	S-ramp time lim. speed 1	100	ms
C02708/2	Limited speed 2	7200.0000	unit/s
C02710/2	Delay lim. speed 2	0.0100	unit/s^2
C02711/2	S-ramp time lim. speed 2	100	ms
C02708/3	Limited speed 3	14400.0000	unit/s
C02710/3	Delay lim. speed 3	0.0100	unit/s^2
C02711/3	S-ramp time lim. speed 3	100	ms
C02708/4	Limited speed 4	28800.0000	unit/s
C02710/4	Delay lim. speed 4	0.0100	unit/s^2
C02711/4	S-ramp time lim. speed 4	100	ms

Control inputs of the function		Signal configuration
Lenze setting	Control input	(Multiplexer parameters)
DIGIN 3	→ Positive limit switch	C03150/1
DIGIN 4	→ Negative limit switch	C03150/2

5.10 Brake control

[5-13] Basic function "Brake control" (schematic diagram)

The basic function "Brake control" serves to the wear free control and monitoring of a holding brake.

In the simplest case, an optionally available brake module is used.

Alternatively the holding brake can also be controlled and monitored via the digital inputs/outputs.

Note!

In the Lenze setting the brake control is switched off to reach a safe state after mains connection.

If the automatic operation (operating mode 2 or 12) is selected in C02580, the brake is controlled automatically, i.e. if the multi-purpose positioning or another basic function is activated which causes the drive to traverse, the brake is opened automatically and the operation is enabled.

▶ Parameter setting: Tab **Application parameters** → dialog level *Overview* → *Brake control*

Parameter		Lenze setting	
		Value	Unit
C02580	Operating mode of brake	Brake control off	
C02581	Brake activation threshold	50	rpm
C02582	Brake response to pulse inhibit	Activate the brake immediately	
C02583	Status input monitoring	Not active	
C02585	Brake control polarity	Not inverted	
C02586	Starting torque 1	0.00	Nm
C02587	Starting torque 2	0.00	Nm
C02588	Starting torque source	Starting torque 1/2	
C02589	Brake closing time	100	ms
C02590	Brake opening time	100	ms
C02591	Waiting time - status monitoring	100	ms
C02593	Waiting time - brake activation	0.000	s
C02594	Test torque	0.00	Nm
C02595	Permissible angle of rotation	5	°
C02596	Grinding speed	100	rpm
C02597	Acc./dec. time - grinding	1.000	s
C02598	Grinding ON time	0.5	s
C02599	Grinding OFF time	0.5	s

Control/setpoint inputs of the function		Signal configuration
Lenze setting	Control/setpoint input	(Multiplexer parameters)
FALSE	→ Open brake (release)	C03165/1
FALSE	→ Activate starting torque 2	C03165/2
FALSE	→ Keep open brake at standstill	C03165/3
FALSE	→ Brake status signal	C03165/4
FALSE	→ Activate brake test	C03165/5
FALSE	→ Grind brake	C03165/6
0 %	→ Additional torque	C03166

5.11 Control of the program flow via predefined ports

For a sequence control by a higher-level control (e.g. PLC) the application is provided with predefined ports the signals of which are linked with the setpoint and control inputs of the application via multiplexer parameters.

Input port "LPortAxisIn1" for control and setpoint signals

Element variable/data type	Information/possible settings
nIn1 INT	Profile number (1 .... 75) of the profile of the profile data management to be executed

Input port "LPortControl1" for control signals

The input port **LPortControl1** is intended for the connection with a master control.

Element variable/data type		Information/possible settings
LPortControl1 WORD		Control word (bit coded) • Bits which are not listed are not assigned with a function.
	Bit 3	Activate quick stop • The is decelerated to standstill within the deceleration time set for the quick stop function independent of the setpoint selection. • If the quick stop function is deactivated, the drive is led to the selected setpoint again via the set acceleration time.
	Bit 7	Reset error • An existing error status is reset if the cause of the fault is removed.
	Bit 11	Requesting control via the basic function "Positioning" • If no other basic function is active, the status changes to "Positioning" and positioning can be executed via the control inputs. • If bit 11 is reset, an active positioning is stopped, i.e. it is changed from the active function state "Positioning" to the basic function " Standstill" via the function state "Stopping".
	Bit 12	Start positioning/restart • The profile with the profile number defined via *nIn2* is executed. • During an active positioning process, another profile can be defined via *nIn2* which is executed after restart (renewed state change of bit 12 from "0" to "1").
	Bit 13	Profile restart • Profile data is read in again considering the distances already covered. • The positioning process interrupted before is completed.
	Bit 14	Profile reset • Profile data is read in again without considering the distances already covered. • The positioning process interrupted before is completed.
	Bit 15	Request control via the basic function "Homing" and start reference search in the selected homing mode (C02640).

5.12 Signal configuration

5.12.1 Drive and motor interface

If required, the preset signal configuration of the control and setpoint inputs of the drive and motor interface can be easily reconfigured by parameterising the assigned multiplexer parameters.

Drive interface

Signal (Lenze setting)	Control input	Signal configuration
FALSE	→ Set controller inhibit	C03130/1
DIGIN 5	→ Reset error 1	C03130/2
Control word 1 bit 07	→ Reset error 2	C03130/3
FALSE	→ Reset error 3	C03130/4
FALSE	→ Set error	C03130/5
Control word 1 bit 00	→ Switch on drive	C03130/6

Motor interface

Signal (Lenze setting)	Setpoint input	Signal configuration
100 %	→ Load position controller adaptation	C03141/1
100 %	→ Motor position controller adaptation	C03141/2
100 %	→ Speed controller adaptation	C03141/3
100 %	→ Upper torque limit value	C03141/4
-100 %	→ Lower torque limit value	C03141/5
100 %	→ Flux setpoint	C03141/6
100 %	→ Mass inertia adaptation	C03141/7

5.12.2 Output ports

If required, the preset signal configuration of the output ports can be easily reconfigured by parameterising the assigned multiplexer parameters.

Output port "LPortAxisOut1"

The output port **LPortAxisOut1** is intended for the connection with a following axis.

Signal (Lenze setting)	Output port	Signal configuration
Axis status word • The bit assignment is identical to that of status word 1/2. • Application-specific signals can be supplemented.		
Drive ready	→ Axis status word bit 00	C03120/1
FALSE	→ Axis status word bit 01	C03120/2
Operation enabled	→ Axis status word bit 02	C03120/3
Error active	→ Axis status word bit 03	C03120/4
FALSE	→ Axis status word bit 04	C03120/5
Quick stop active	→ Axis status word bit 05	C03120/6
Drive is ready to start	→ Axis status word bit 06	C03120/7
Warning active	→ Axis status word bit 07	C03120/8
FALSE	→ Axis status word bit 08	C03120/9
FALSE	→ Axis status word bit 09	C03120/10
FALSE	→ Axis status word bit 10	C03120/11
Motor control in limitation	→ Axis status word bit 11	C03120/12
Positioning enabled	→ Axis status word bit 12	C03120/13
Positioning active	→ Axis status word bit 13	C03120/14
Positioning complete	→ Axis status word bit 14	C03120/15
Pos. status "Restart not possible"	→ Axis status word bit 15	C03120/16
Setpoints for horizontal communication		
Filtered torque setpoint	→ Axis-Port Out 1	C03124/1
	Scaling: $16384 \equiv 2^{14} \equiv 100$ % motor reference torque (C00057/2)	
Motor speed	→ Axis port out 2	C03124/2
	Scaling: $1073741824 \equiv 2^{30} \equiv 100$ % motor reference speed (C00011)	

Output port "LPortStatus1"

The output port **LPortStatus1** is intended for the connection with a higher-level control.

Signal (Lenze setting)	Output port	Signal configuration
Status word 1		
Drive ready	→ Status word 1 bit 00	C03121/1
FALSE	→ Status word 1 bit 01	C03121/2
Operation enabled	→ Status word 1 bit 02	C03121/3
Error active	→ Status word 1 bit 03	C03121/4
FALSE	→ Status word 1 bit 04	C03121/5
Quick stop active	→ Status word 1 bit 05	C03121/6
Drive is ready to start	→ Status word 1 bit 06	C03121/7
Warning active	→ Status word 1 bit 07	C03121/8
FALSE	→ Status word 1 bit 08	C03121/9
FALSE	→ Status word 1 bit 09	C03121/10
FALSE	→ Status word 1 bit 10	C03121/11
Motor control in limitation	→ Status word 1 bit 11	C03121/12
Positioning enabled	→ Status word 1 bit 12	C03121/13
Positioning active	→ Status word bit 13	C03121/14
Positioning complete	→ Status word 1 bit 14	C03121/15
Pos. status "Restart not possible"	→ Status word 1 bit 15	C03121/16

Output port "LPortStatus2"

Signal (Lenze setting)	Output port	Signal configuration
Status word 2		
FALSE	→ Status word 2 bit 00	C03122/1
FALSE	→ Status word 2 bit 01	C03122/2
FALSE	→ Status word 2 bit 02	C03122/3
FALSE	→ Status word 2 bit 03	C03122/4
FALSE	→ Status word 2 bit 04	C03122/5
FALSE	→ Status word 2 bit 05	C03122/6
FALSE	→ Status word 2 bit 06	C03122/7
FALSE	→ Status word 2 bit 07	C03122/8
FALSE	→ Status word 2 bit 08	C03122/9
FALSE	→ Status word 2 bit 09	C03122/10
FALSE	→ Status word 2 bit 10	C03122/11
FALSE	→ Status word 2 bit 11	C03122/12
FALSE	→ Status word 2 bit 12	C03122/13
FALSE	→ Status word 2 bit 13	C03122/14
FALSE	→ Status word 2 bit 14	C03122/15
FALSE	→ Status word 2 bit 15	C03122/16

5.13 Application error messages

For the output of application-specific error messages, the FB instances *ApplicationError1* and *ApplicationError2* of the function block **L_DevApplErr** are available in the network.

▶ Via the boolean inputs up to 16 different application error messages with parameterisable module ID, error ID and error response can be released by the application.

Error message		Error ID	Error response
FB instance "ApplicationError1"			
1	Following error limit 1	8001	Warning
2	Following error limit 2	8002	Warning locked
3	Positioner: Home position is not known	8003	Warning
4	Positioner: Cycle is not known	8004	Warning
5	Positioner: Wrong positioning mode	8005	Warning
6	Positioner: Invalid change of the positioning mode	8006	Warning
7	Positioner: Profile data is not plausible or faulty	8007	Warning
8	Positioner: Error in profile generation	8008	Warning
FB instance "ApplicationError2"			
1	Free error message 1	8011	Information
2	Free fault message 2	8012	Information
3	PositionerTable: Invalid axis data structure	8013	Warning
4	PositionerTable: Invalid profile no.	8014	Information
5	PositionerTable: Invalid table no.	8015	Warning
6	-	-	-
7	-	-	-
8	-	-	-

▶ Parameter setting: Tab **All parameters**

Parameter		Lenze setting
FB instance "ApplicationError1"		
C05900	Function block ID	999
C05901/1...8	Error ID 1 ... 8	See table above
C05902/1...8	Error response 1 ... 8	See table above
FB instance "ApplicationError2"		
C05903	Function block ID	998
C05904/1...8	Error ID 1 ... 8	See table above
C05905/1...8	Error response 1 ... 8	See table above

Reset of error message

In the Lenze setting the digital input DI5 for resetting (acknowledging) an error message is connected to the input *DI_bResetError1* of the drive interface.

5.14 Parameterisable function blocks

This subchapter lists all relevant parameterisable function blocks of the technology application and the corresponding parameters in alphabetical order.

5.14.1 ActualSpeedScaling

Is an instance of	Function
L_TbNormalize	Scaling of actual speed to a parameterisable reference variable

Parameter	Possible settings			Information
C04036	-2147483647		2147483647	Reference variable • Setting "0" is not possible. • Initialisation: 44739243

5.14.2 ApplicationError1

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 39)

Parameter	Possible settings			Information
C05900	980		999	Module ID • Initialisation: 999
C05901/1...8	0		65535	Error ID • Initialisation: 8001 ... 8008
C05902/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

5.14.3 ApplicationError2

Is an instance of	Function
L_DevApplErr	Error handling ▸ Application error messages (📖 39)

Parameter	Possible settings			Information
C05903	980		999	Module ID • Initialisation: 998
C05904/1...8	0		65535	Error ID • Initialisation: 8011 ... 8018
C05905/1...8				Error response
	0	None		
	1	Fault		
	2	Trouble		
	3	Quick stop by trouble		
	4	Warning locked		
	5	Warning		
	6	Information		

5.14.4 FollowingErrorScaling

Is an instance of	Function
L_TbNormalize	Scaling of the following error to a parameterisable reference variable

Parameter	Possible settings			Information
C04035	-2147483647		2147483647	Reference variable • Setting "0" is not possible. • Initialisation: 65536

5.14.5 HysteresisFollowingError1

Is an instance of	Function
L_SdSetPosition	Conversion of the following error hysteresis 1 selected in the real units of the machine via C03917 into a position in [increments]. ▸ Following error monitoring (📖 28)

Parameter	Possible settings			Information
C03917	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03918	String of digits			Position unit • Read only
C03919	-2147483647		2147483647	State • Read only

5.14.6 HysteresisFollowingError2

Is an instance of	Function
L_SdSetPosition	Conversion of the following error hysteresis 2 selected in the real units of the machine via C03920 into a position in [increments]. ▸ Following error monitoring (📖 28)

Parameter	Possible settings			Information
C03920	-214000.0000	unit	214000.0000	Position value • Initialisation: 0.0000 unit
C03921	String of digits			Position unit • Read only
C03922	-2147483647		2147483647	State • Read only

5.14.7 L_PosPositionerTable1

Is an instance of	Function
L_PosPositionerTable	▸ Profile data management (📖 18)

Parameter	Possible settings			Information
C04700/1				Teach position • For execution via parameter channel.
	0↗1	The position applied at the input *dnPos_p* is saved to the VTPOS table position selected via the input *dwPosTableNumber*.		
C04700/2				Teach speed • For execution via parameter channel.
	0↗1	The speed applied at the input *dnSpeed_s* is saved to the VTSPEED table position selected via the input *dwSpeedTableNumber*.		
C04700/3				Teach acceleration • For execution via parameter channel.
	0↗1	The acceleration/deceleration applied at the input *dnAcc_s* is saved to the VTACC table position selected via the input *dwAccTableNumber*.		
C04700/4				Teach S-ramp time • For execution via parameter channel.
	0↗1	The S-ramp time applied at the input *dwJerk* is saved to the VTJERK table position selected via the input *dwJerkTableNumber*.		
C04701/1...75	-214748.3648	unit	214748.3648	VTPOS: variable positions • For selecting the target positions and TP window start and end positions for the profiles.
C04702/1...50	-214748.3648	unit/s	214748.3648	VTSPEED: variable speeds • For selecting the traversing and final speeds for the profiles.
C04703/1...50	-214748.3648	unit/s^2	214748.3648	VTACC: variable accelerations • For selecting the accelerations and decelerations for the profiles.

Parameter	Possible settings			Information
C04704/1...50	-2147483.648	s	2147483.648	VTJERK: variable S-ramp times • For selecting the S-ramp times for the profiles.
C04705/1				DIS:bPosTeach • Display of the input signal *bPosTeach*.
	0	FALSE		
	1	TRUE		
C04705/2				DIS:bSpeedTeach • Display of the input signal *bSpeedTeach*.
	0	FALSE		
	1	TRUE		
C04705/3				DIS:bAccTeach • Display of the input signal *bAccTeach*.
	0	FALSE		
	1	TRUE		
C04705/4				DIS:bJerkTeach • Display of the input signal *bJerkTeach*.
	0	FALSE		
	1	TRUE		
C04706/1	0		100	DIS:VTPosNum • Display of the input signal *dwPosTableNumber*.
C04706/2	0		100	DIS:VTSpeedNum • Display of the input signal *dwSpeedTableNumber*.
C04706/3	0		100	DIS:VTAccNum • Display of the input signal *dwAccTableNumber*.
C04706/4	0		100	DIS:VTJerkNum • Display of the input signal *dwJerkTableNumber*.
C04706/5	0		100	DIS:ProfileNum • Display of the input signal *dwProfileNumber*.
C04707/1	-214748.3648	unit	214748.3648	DIS:dnTeachPos • Display of the input signal *dnPos_p* in the real unit of the machine.
C04707/2	-214748.3648	unit/s	214748.3648	DIS:dnTeachSpeed • Display of the input signal *dnSpeed_s* in the real unit of the machine.
C04707/1	-214748.3648	$unit/s^2$	214748.3648	DIS:dnTeachAcc • Display of the input signal *dnAcc_x* in the real unit of the machine.
C04707/1	-214748.3648	s	214748.3648	DIS:dnTeachJerk • Display of the input signal *dwJerk* in the real unit of the machine.
C04708	-2147483647		2147483647	State • Display of the bit-coded output signal *dnState*.

Parameter	Possible settings		Information
C04710/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Positioning mode • For absolute positioning, the home position must be known.
	1	Absolute	
	2	Absolute TP	
	5	Relative	
	6	Relative TP	
	7	Speed	
	8	Speed TP	
	11	Absolute CW	
	12	Absolute CW TP	
	13	Absolute CCW	
	14	Absolute CCW TP	
	15	Absolute ShortestWay	
	16	Absolute ShortestWay TP	
C04711/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Position from VTPOS • Reference to VTPOS table position for defining the profile parameter "position".
	1	VTPOS position 1 (C04701/1)	
	2	VTPOS position 2 (C04701/2)	
	...	...	
	75	VTPOS position 75 (C04701/75)	
C04712/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Speed from VTSPEED • Reference to VTSPEED table position for defining the profile parameter "speed".
	1	VTSPEED position 1 (C04702/1)	
	2	VTSPEED position 2 (C04702/2)	
	...	...	
	50	VTSPEED position 50 (C04702/50)	
C04713/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Acceleration from VTACC • Reference to VTACC table position for defining the profile parameter "acceleration".
	1	VTACC position 1 (C04703/1)	
	2	VTACC position 2 (C04703/2)	
	...	...	
	50	VTACC position 50 (C04703/50)	
C04714/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Deceleration from VTACC • Reference to VTACC table position for defining the profile parameter "deceleration".
	1	VTACC position 1 (C04703/1)	
	2	VTACC position 2 (C04703/2)	
	...	...	
	50	VTACC position 50 (C04703/50)	
C04715/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			S-ramp time from VTJERK • Reference to VTJERK table position for defining the profile parameter "S-ramp time".
	1	VTJERK position 1 (C04704/1)	
	2	VTJERK position 2 (C04704/2)	
	...	...	
	50	VTJERK position 50 (C04704/50)	
C04716/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Final speed from VTSPEED • Reference to VTSPEED table position for defining the profile parameter "final speed". • An existing sequence profile is required.
	1	VTSPEED position 1 (C04702/1)	
	2	VTSPEED position 2 (C04702/2)	
	...	...	
	50	VTSPEED position 50 (C04702/50)	

Parameter	Possible settings		Information
C04717/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			TP window start position from VTPOS • Reference to VTPOS table position for defining the profile parameter "TP window start position". • For the position value "0", the start position is the negative travel range limit.
	1	VTPOS position 1 (C04701/1)	
	2	VTPOS position 2 (C04701/2)	
	...	...	
	75	VTPOS position 75 (C04701/75)	
C04718/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			TP window end position from VTPOS • Reference to VTPOS table position for defining the profile parameter "TP window end position". • For the position value "0", the end position is the positive travel range limit.
	1	VTPOS position 1 (C04701/1)	
	2	VTPOS position 2 (C04701/2)	
	...	...	
	75	VTPOS position 75 (C04701/75)	
C04719/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Sequence profile with TP • Sequence profile for touch probe residual path positioning.
	1	Profile no. 1	
	...	...	
	75	Profile no. 75	
C04720/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)			Sequence profile without TP • Sequence profile for profile linkage.
	0	No sequence profile (End of a profile linkage)	
	1	Profile no. 1	
	...	...	
	75	Profile no. 75	
C04721/1...75 (subcode 1 ... 75 ≡ profile no. 1 ... 75)	Value is bit-coded:		Touch probe configuration • The touch probe channels to be used are selected by setting the corresponding bits to "1".
	Bit 0	TP channel 1, rising edge	Digital input 1
	Bit 1	TP channel 1, falling edge	
	Bit 2	TP channel 2, rising edge	Digital input 2
	Bit 3	TP channel 2, falling edge	
	Bit 4	TP channel 3, rising edge	Digital input 3
	Bit 5	TP channel 3, falling edge	
	Bit 6	TP channel 4, rising edge	Digital input 4
	Bit 7	TP channel 4, falling edge	
	Bit 8	TP channel 5, rising edge	Digital input 5
	Bit 9	TP channel 5, falling edge	
	Bit 10	TP channel 6, rising edge	Digital input 6
	Bit 11	TP channel 6, falling edge	
	Bit 12	TP channel 7, rising edge	Digital input 7
	Bit 13	TP channel 7, falling edge	
	Bit 14	TP channel 8, rising edge	Digital input 8
	Bit 15	TP channel 8, falling edge	
	Bit 16	TP channel 9	Motor encoder zero pulse
	Bit 18	TP channel 10	Load encoder zero pulse
	Bit 20	TP channel 11	DFIN zero pulse
	Bit 22	TP channel 12	DFOUT zero pulse

5.14.8 L_SdSwitchPoint1

Is an instance of	Function
L_SdSwitchPoint	Position switch points (cams)

Parameter	Possible settings			Information
C04395/1...8				State of switching range 1 ... 8 • Read only
	0	Switch is off		
	1	Switch is on		
C04396	String of digits			Position unit • Read only
C04397/1...8	-2147483648	unit	2147483648	Switch-on position switching range 1 ... 8
C04398/1...8	-2147483648	unit	2147483648	Switch-off position switching range 1 ... 8
C04399/1...8				Enable switching range 1 ... 8
	0	Switching range not enabled		
	1	Switching range enabled		

5.14.9 LimitFollowingError1

Is an instance of	Function
L_SdSetPosition	Conversion of the following error switching threshold 1 selected in the real units of the machine via C03911 into a position in [increments]. ▸ Following error monitoring (📖 28)

Parameter	Possible settings			Information
C03911	-214000.0000	unit	214000.0000	Position value • Initialisation: 100.0000 unit
C03912	String of digits			Position unit • Read only
C03913	-2147483647		2147483647	State • Read only

5.14.10 LimitFollowingError2

Is an instance of	Function
L_SdSetPosition	Conversion of the following error switching threshold 2 selected in the real units of the machine via C03914 into a position in [increments]. ▸ Following error monitoring (📖 28)

Parameter	Possible settings			Information
C03914	-214000.0000	unit	214000.0000	Position value • Initialisation: 200.0000 unit

Parameter	Possible settings			Information
C03915	String of digits			Position unit • Read only
C03916	-2147483647		2147483647	State • Read only

5.14.11 MonitFollowError1

Is an instance of	Function
L_LdMonitFollowError	▸ Following error monitoring (📖 28)

Parameter	Possible settings			Information
C03960	-214748.3647	unit	214748.3647	Following error at the input • Display of the input signal *dnFollowErrorIn_p* in the real unit of the machine.
C03961	String of digits			Position unit • Read only
C03963				Following error out of tolerance • Read only
	FALSE	Following error smaller than set switching threshold		
	TRUE	Following error larger than set switching threshold		
C03964				Following error monitoring activated • Read only
	FALSE	Deactivated		
	TRUE	Activated		

5.14.12 MonitFollowError2

Is an instance of	Function
L_LdMonitFollowError	▸ Following error monitoring (📖 28)

Parameter	Possible settings			Information
C03965	-214748.3647	unit	214748.3647	Following error at the input • Display of the input signal *dnFollowErrorIn_p* in the real unit of the machine.
C03966	String of digits			Position unit • Read only
C03968				Following error out of tolerance • Read only
	FALSE	Following error smaller than set switching threshold		
	TRUE	Following error larger than set switching threshold		
C03969				Following error monitoring activated • Read only
	FALSE	Deactivated		
	TRUE	Activated		

5.14.13 PosStarted

Is an instance of	Function
L_TbTransition	Edge generation for resetting the "drive at the target" state

Parameter	Possible settings			Information
C04000				Trigger edge
	0	Rising edge		Lenze setting
	1	Falling edge		
	2	Both edges		
C04001	0.001	s	60.000	Pulse duration • Initialisation: 0.001 s

FEEDBACK

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

If you have suggestions for improvement, please e-mail us to:

1 About this documentation

This documentation contains information on how to parameterise & configure the SM302 safety module.

Note!

This documentation supplements the manual for the safety module and the documentation for Servo Drives 9400.

The manual for the safety module contains safety instructions that must be observed!

Target group

This documentation addresses to persons who want to parameterise, configure, and diagnose an SM302 safety module attached to the Servo Drives 9400 using the L-force »Engineer« engineering software.

Information regarding the validity

The information in this documentation applies to:

Safety module	Type designation	From hardware version	From software version
SM302	E94AYAF	VA	1.00

This safety module can be used together with the following standard devices:

Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxxx	2A	13.xx
Servo Drives 9400 PLC	E94AxPExxxx	2A	07.xx

This safety module can be used together with the following communication modules:

Product series	Type designation	From hardware version	From software version
9400 EtherCAT	E94AYCET	VF	4.xx
9400 PROFINET	E94AYCER	VF	3.xx

Tip!

We recommend the use of the documentation for the 9400 EtherCAT communication module, especially for configuring the EtherCAT interface.

Information and tools regarding the Lenze products can be found on the Internet:

http://www.Lenze.com → Download

1.1 Document history

Version			Description
2.1	12/2020	TD05	Supplements
2.0	02/2017	TD06	Extended by new functions for software version: 01.10
1.0	07/2016	TD06	First edition, software version: 01.00

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Highlighting	Examples/notes
Spelling of numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Version information	Blue text colour	All information applying to from a certain software version of Servo Drives 9400 is marked accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze PC software »Engineer«...
Window	*italics*	The *Message window*... / The dialog box *Options*...
Variable names		Setting *bEnable* to TRUE...
Control element	**bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Shortcut	**<bold>**	Press **<F1>** to open the online help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...

Page reference	(📖 6)	Optically highlighted reference to another page. It is activated with a mouse-click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning	
Engineering tools	Software solutions for easy engineering in all project stages	
		»EASY Navigator« – ensures easy operator guidance • All convenient Lenze engineering tools at a glance • Tools can be quickly selected • The clear structure simplifies the engineering process from the start
		»Engineer« – multi-device engineering • For all products in our L-force portfolio • Practical user interface • Graphic interfaces make it easy to navigate • Can be applied in every phase of a project (project planning, commissioning, production) • Parameter setting and configuration
		»PLC Designer« – for programming processes • Creating your own programs • Programming Logic & Motion according to IEC 61131-3 (AWL, KOP, FUP, ST, AS and CFC-Editor), based on CoDeSys V3 • Certified function blocks according to PLCopen part 1 + 2 • Graphic DIN 66025 Editor (G code) with DXF import • Integrated visualisation for easy process visualisation • All important information at a glance during the commissioning process
	EtherCAT® (**Ether**net for **C**ontroller and **A**utomation **T**echnology) is an Ethernet-based fieldbus system meeting the application profile for industrial realtime systems. EtherCAT® is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany.	
	Safety over EtherCAT® is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany.	
Function block	A function block (FB) can be compared with an integrated circuit that contains a certain control logic and provides one or several values when being executed. • An instance (reproduction, copy) of the function block is always inserted into the circuit. • It is also possible to insert several instances of a function block into a circuit. • Each instance has an unequivocal identifier (the instance name) and a processing number that defines the position in which the function block is calculated during the task cycle.	
System block	System blocks provide interfaces to basic functions and to the hardware of Servo Drives 9400 in the function block editor of the »Engineer« (e.g. to the digital inputs). • In contrast to function blocks, system blocks cannot be instanced.	

1.4 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	Danger!	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	Danger!	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
STOP	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	Note!	Important note to ensure trouble-free operation
	Tip!	Useful tip for easy handling
		Reference to another document

2 Introduction

Drive-based safety with L-force | Servo Drives 9400

The Lenze Servo Drives 9400 can be equipped with a safety module. The individual safety module types have a different range of functions to optimally meet different requirements.

"Integrated safety" stands for application-oriented safety functions that can be used on machines for the protection of persons and machines.

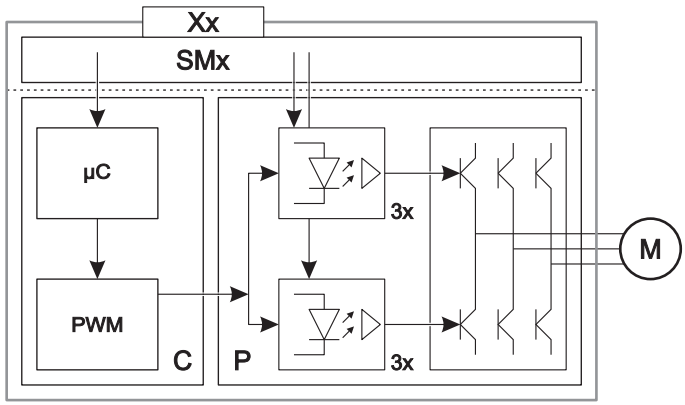
The motion functions are still executed by the Servo Drives 9400. The safety module monitors safe compliance with the limit values and provides the safe inputs and outputs. When the limit values are exceeded, the safety module starts the control functions in accordance with EN 60204-1 directly in the Servo Drives 9400.

The safety functions are suitable for applications according to IEC 61508 to SIL 3 and, depending on the module, achieve the requirements of the EN ISO 13849-1 up to control category 4 and performance level (PL) "e".

2.1 Terms and abbreviations used in drive-based safety

Abbreviation	Meaning
AIE	Error acknowledgement ("Acknowledge In Error")
AIS	Restart acknowledgement ("Acknowledge In Stop")
OFF state	Signal state of the sensors when they are activated or respond.
CCF	Common cause error (also β value)
EC_FS	Error class fail-safe
EC_SS1	Error class stop 1
EC_SS2	Error class stop 2
EC_STO	Error class stop 0
ON state	Signal state of the sensors in normal operation
FIT	Failure In Time, 1 FIT = 10^{-9} errors/h
FMEA	Failure mode and effects analysis
FSoE	Safety over EtherCAT **(F**ail-**S**afe-**o**ver-**E**therCAT)
GSDML	File with device-specific data for establishing PROFINET communication.
HFT	Hardware Failure Tolerance
Cat.	Category in accordance with EN ISO 13849-1
Optocoupler supply	Supply of optocouplers to control the power drivers
OSSD	Signal output tested ("Output Signal Switching Device")
PELV	Protective Extra Low Voltage
PL	Performance Level (in compliance with ISO 13849)
PM	P/N switched signal paths
PP	P/P switched signal paths
PS	PROFIsafe
PWM	Pulse width modulation
SD-In	Safe input ("Safe Digital Input")
SD-Out	Safe output ("Safe Digital Output")
SELV	Safety Extra Low Voltage
SFF	Safe Failure Fraction
SIL	Safety Integrity Level in compliance with IEC61508
SM	Safety module

Abbreviation	Safety function
ES	Enable switch
OMS	Operation mode selector
PDSS	Position-dependent safe speed
RMS	Repair mode ("Repair mode select")
SCA	Safe cam
SDI	Safe direction
SLI	Safely limited increment
SLP	Safely limited absolute position ("Safely Limited Position")
SLS	Safely limited speed
SMS	Safe maximum speed



Abbreviation	Safety function
SOS	Safe operating stop
SS1	Safe stop 1
SS2	Safe stop 2
SSE	Safe stop emergency
SSM	Safe speed monitor
STO	Safe torque off • Formerly: safe standstill

2.2 Function mode of the safety module

Disconnecting paths

The transmission of the pulse width modulation is safely (dis-)connected by the safety module. Hence the power drivers do not create a rotating field. The motor is safely switched to torqueless operation (STO).

Disconnecting paths of the safety module

C	Control section
M	Motor
µC	Microcontroller
P	Power section
PWM	Pulse width modulation
SMx	SM302 safety module
Xx	Input terminals, output terminal

Safety state

If Servo Drives 9400 is switched off by a safety module, Servo Drives 9400 is changed to the "Safe torque off active" device status.

- "Drive is torqueless" (0x00750003) is entered in the logbook.
- In C00183, "Safe torque off active" is displayed.

Fail-safe state

If internal errors of the safety module are detected, the motor is safely switched to torqueless operation (fail-safe state).

2.3 Functional range of SM302 (short overview)

SM302

The SM302 safety module provides the following functions:

- ES (enable switch)
- CAS (safe cascading via SD-In4 / SD-Out1)
- OMS (operation mode selector)
- PDSS (position-dependent safe speed)
- RMS (repair mode select)
- SCA (safe cam)
- SDI (safe direction)
- SLI (safely limited increment)
- SLP (safely limited absolute position)
- SLS1 - 4 (safely limited speed 1 ... 4)
- SMS (safely limited maximum speed)
- SOS (safe operational stop)
- SREF (safe referencing)
- SS1 / SS2 (safe stop 1 and 2)
  - with a safely monitored deceleration ramp
- SSE (safe stop emergency)
- SSM (safe speed monitor)
- STO (safe torque off)
- Safe speed and position detection with resolver
- Safety bus connection (PROFIsafe via PROFINET, Safety over EtherCAT (FSoE))
- Safe monitor (safe output SD-Out1)
- Connection of safety sensors (SD-In1 ... SD-In4)
- Safe parameter setting

2.4 Integration into the application

When a safety function is requested, the safety system activates the corresponding safe monitoring function. The only standstill function executed directly, however, is the "safe torque off" (STO) function. All other safety functions require a safely monitored action by Servo Drives 9400.

Note!

The implementation of the corresponding action (e.g. braking, braking to a standstill, holding the standstill position) must be triggered by an interconnection in the application.

LS_SafetyModuleInterface **system block** (📖 19)

The **LS_SafetyModuleInterface** system block in the function block editor of the »Engineer« serves to transmit the control and status information from the safety module to the application.

- For "Servo Drives 9400 PLC" devices, the **SMI_SafetyModuleInterface** system block provides the interface to the safety module in the control configuration of the »PLC Designer«. The contents of this interface comply with the description for the **LS_SafetyModuleInterface** system block.

"LS_Limiter" system block/basic function "Limiter"

Furthermore the **LS_Limiter** system block, which contains the basic function "Limiter", is available in the function block editor to integrate the safety system into the application.

- For one thing, the basic function "Limiter" provides a parameter setting interface in »Engineer« for setting limit positions, limited speeds, and limit values, and for another it provides for the targeted braking of the drive **on request** by the safety module.
- If the basic function "Limiter" is to act directly on a request by the safety module, the *LIM_dwControl* input of the **LS_Limiter** system block must be connected to the *SMI_dwControl* output of the **LS_SafetyModuleInterface** system block.

Basic workflow

1. Activation of the safety function on the safety module (e. g. SS1 - safe stop 1).
   ➞ Monitoring starts.
2. Via a control word, the safety module notifies Servo Drives 9400 about the activation of the safety function.
3. The application evaluates the control word and starts the required motion sequence (e.g. braking).

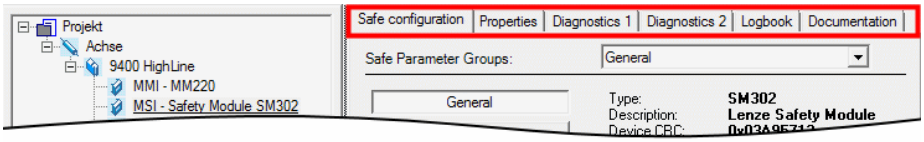
Note!

If communication with Servo Drives 9400 is interrupted, e.g. by switching off Servo Drives 9400, the safety module responds with the following actions:

- Fault stop with STO is activated.
- "Warning" error message is transmitted.
- The LED "ME" is blinking.

The required error acknowledgement (AIE) is possible via terminal or safety bus.

Further information can be found in the chapter "Error management". (📖 26)



2.5 Parameter setting & configuration

Note!

Safety-relevant parameters can only be transmitted to the safety module via safe parameter setting with the »Engineer«.

The parameter set is saved in the memory module and in the safety module with a unique module ID which must correspond to the effective safety address in the safety module.

If you select the SM302 safety module in the »Engineer« *Project view*, the *Operating range* offers you the following tabs:

Tab	Info
Safe configuration	Via the *Safe configuration* tab, the SM302 safety module can be safely configured. ▸ Safe configuration (📖 29)
Product features	The *Properties* tab displays general information for the safety module, e.g. product name, order number, and version.
Diagnostics 1	Display on the *Diagnostics 1* tab: • Module information • Status of the local I/Os and LEDs • Current position and speed values
Diagnostics 2	Display on the *Diagnostics 2* tab: • Module information • S bus control data • Status of the safety functions
Logbook	Display on the *Logbook* tab: • 10 log states • Current error type • Error history of the SM302
Documentation	The *Documentation* tab serves to add notes and electronic documents to the safety module. • Detailed information on adding documentations can be found in the »Engineer« documentation in the chapter "Project structure".

Safe parameter transfer

By clicking **Safe transfer** on the *Safe configuration* tab, the *Safe transfer* dialog box opens which provides the functions for the safe parameter transfer. ▸ Safe parameter transfer (📖 93)

Service status

If you request the "Send safe data to device" function in the *Safe transfer* dialog box via the **Send** button, the safety module changes to the "Service status" which is required for a safe parameter setting. ▸ Sending safe data (📖 94)

The service status means:

- Normal stop is active and the drive is safely switched to torqueless operation (STO). ▸ Safe stop (SSE, SS1, SS2, SOS) (📖 53)
- The safe inputs are evaluated as OFF state.
- The safe output has been set to the OFF state.
- Safe communication via the safety bus is - if possible - active, but passivated.

Note!

- The service status is also active if the parameter set in the memory module does not correspond to the parameter set in the safety module during the initialisation.
- The service status can be exited by reinitialising the safety module, i.e. safe communication via the safety bus is interrupted.

Supported interfaces for a safe parameter setting

Safe parameter setting with the »Engineer« is supported via the following interfaces:

- Diagnostic interface X6 (with E94AZCUS diagnostic USB adapter)
- Ethernet (E94AYCEN communication module)
- System bus (CAN on board / E94AYCCA communication module)
- PROFINET (E94AYCER communication module)
- EtherCAT (E94AYCET communication module)

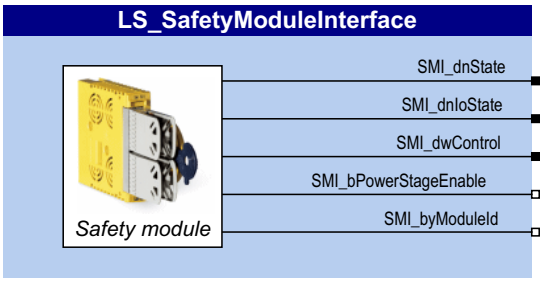
2.5.1 Required settings for Servo Drives 9400

Note!

When using online communication via a bus system, several users can access the same drive simultaneously and process the safety parameter set.

After transferring the safe parameters, it must be checked whether the check sums (CRC) of the parameter set, memory module, and the safety module comply with each other in the *Safe Transfer* dialog box.

Currently, the access to the safety parameter by several users cannot be prevented technically, thus organisational measures are required to ensure the consistency of the safety parameters.



The safety module expected by the application and by Servo Drives 9400 is to be set in C00214.

- In »Engineer« this setting is carried out automatically by assigning the device modules to Servo Drives 9400, i.e. »Engineer« automatically sets C00214 in compliance with the safety module selected.
- If the safety module set in C00214 does not comply with the plugged-in safety module type, an error (fault) is triggered. The error can only be eliminated by mains switching.

Parameter | Name: **C00214 | Required safety module**	Data type: UNSIGNED_8 Index: $24361_d = 5F29_h$
Setting of the expected safety module	
Selection list	
1	SM0
2	SM100
4	SM300
5	SM301
6	SM302
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ COM ☐ MOT	

2.5.2 System block " LS_SafetyModuleInterface"

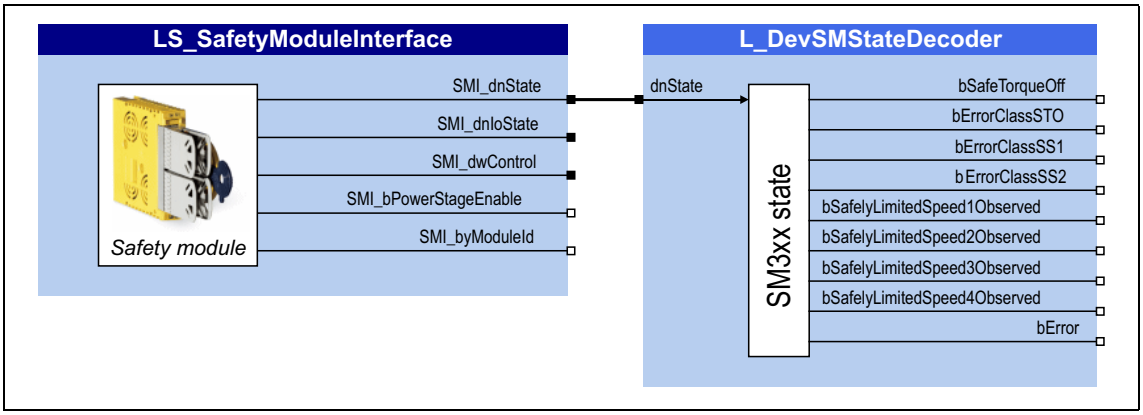
The **LS_SafetyModuleInterface** system block is the interface to the safety module in the function block editor of the »Engineer«.

Outputs

Output Data type	Value/meaning
SMI_dnState DINT	Bit coded status information from the safety module ▸ Status information (📖 20)
SMI_dnIoState DINT	Bit coded I/O status information from the safety module ▸ I/O status information (📖 22)
SMI_dwControl DWORD	Bit coded control information from the safety module ▸ Control information (📖 23)
SMI_bPowerStageEnable BOOL	Status signal "Inverter enable" TRUE: Inverter is enabled by the safety module.
SMI_byModuleId BYTE	ID of the safety module available in Servo Drives 9400

2.5.2.1 Status information

Via the bit-coded *SMI_dnState* status signal of the **LS_SafetyModuleInterface** SB, the SM302 safety module transmits the status of safety functions to the application.



Bit coding of the status signal **SMI_dnState**		
Bit	Name	Meaning
0	STO	Safe torque off (STO) function is active. • The drive is safely switched to torqueless operation.
1	Reserved	
2	Safe speed OK	"Safe speed" status signal • TRUE: the speed value displayed is valid. • FALSE: the speed value displayed is invalid.
3	EC_STO	Error stop category 0: Function Safe torque off (STO) is active.
4	EC_SS1	Error stop category 1: Function Safe stop 1 (SS1) is active.
5	EC_SS2	Error stop category 2: Function Safe stop 2 (SS2) is active.
6	n = 0	The safe speed is within the tolerance window parameterised with code C15310. • TRUE: n = 0 • FALSE: n ≠ 0
7	Positive direction of movement	Status signal for showing the direction of movement • TRUE: positive direction of movement • FALSE: negative direction of movement
8	SLS1 monitored	Safely limited speed 1 is activated and observed.
9	SLS2 monitored	Safely limited speed 2 is activated and observed.
10	SLS3 monitored	Safely limited speed 3 is activated and observed.
11	SLS4 monitored	Safely limited speed 4 is activated and observed.
12	SDIpos monitored	Safe positive direction (SDIpos) is activated and observed.
13	SDIneg monitored	Safe negative direction (SDIneg) is activated and observed.
14	Fault active	SM302 safety module in error status (trouble or warning).
15	SLP1 monitored	Safely limited position 1 has been activated and is complied with.
16	SLP2 monitored	Safely limited position 2 has been activated and is complied with.
17	SLP3 monitored	Safely limited position 3 has been activated and is complied with.
18	SLP4 monitored	Safely limited position 4 has been activated and is complied with.
19	SCA1 within the limits	Safe cam 1 has been parameterised and is complied with.
20	SCA2 within the limits	Safe cam 2 has been parameterised and is complied with.
21	SCA3 within the limits	Safe cam 3 has been parameterised and is complied with.
22	SCA4 within the limits	Safe cam 4 has been parameterised and is complied with.
23	Reserved	
24	SREF active	Homing / mini-homing is active.
25	SREF available	Homing / mini-homing has been completed. The safe reference is known.
26	Level 1 slip monitoring	In the 2 encoder system, the position deviation refers to • the maximum slip that can be compensated (C15540) • the tolerance window for position comparison C15412 ≥ 25 %
27	Level 2 slip monitoring	In the 2 encoder system, the position deviation refers to • the maximum slip that can be compensated (C15540) • the tolerance window for position comparison C15412 ≥ 50 %

Bit coding of the status signal **SMI_dnState**		
Bit	Name	Meaning
28	Level 3 slip monitoring	In the 2 encoder system, the position deviation refers to • the maximum slip that can be compensated (C15540) • the tolerance window for position comparison C15412 ≥ 75 %
29	PDSSpos monitored	For position-dependent speed monitoring, the positive direction of movement is monitored.
30	PDSSneg monitored	For position-dependent speed monitoring, the negative direction of movement is monitored.
31	Reserved	

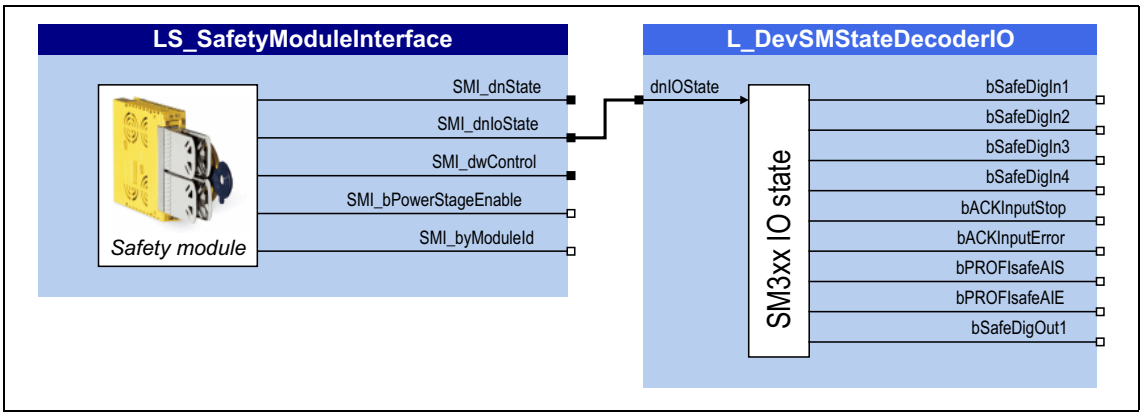
Example of decoding the status signal

Tip!

In order to decode the status signal into individual boolean status signals, just connect the *SMI_dnState* output to the **L_DevSMStateDecoder** FB provided in the function library.

[2-1] Example: Decoding of the SMI_dnState status signal into individual boolean status signals

2.5.2.2 I/O status information



Via the bit-coded *SMI_dnIoState* status signal of the **LS_SafetyModuleInterface** SB, the SM302 safety module transmits the status of the safe inputs and the safe output to the application:

Bit coding of the **SMI_dnIoState** status signal		
Bit	Name	Meaning
0	SD-In1	Sensor input 1 in ON state.
1	SD-In2	Sensor input 2 in ON state.
2	SD-In3	Sensor input 3 in the ON state.
3	SD-In4	Sensor input 4 in the ON state.
4	Reserved	
5	AIS	Restart acknowledgement via terminal effected (negative edge: 1↘0).
6	AIE	Error acknowledgement via terminal effected (negative edge: 1↘0).
7	Reserved	
8	PS_AIS	Restart acknowledgement via safety bus effected (positive edge: 0↗1).
9	PS_AIE	Error acknowledgement via safety bus effected (positive edge: 0↗1).
10	SREF_Start_SBUS	Start homing via safety bus (positive edge: 0↗1).
11	SREF_Load_SBUS	Accept home position via safety bus (positive edge: 0↗1).
12	SD-Out1	Safe output 1 (feedback output) in the ON state.
13	Reserved	
...		
31		

Example of decoding the status signal

Tip!

In order to decode the status signal into individual boolean status signals, just connect the *SMI_dnIoState* output to the **L_DevSMStateDecoderIO** FB provided in the function library.

[2-2] Example: Decoding of the *SMI_dnIoState* status signal into individual boolean status signals

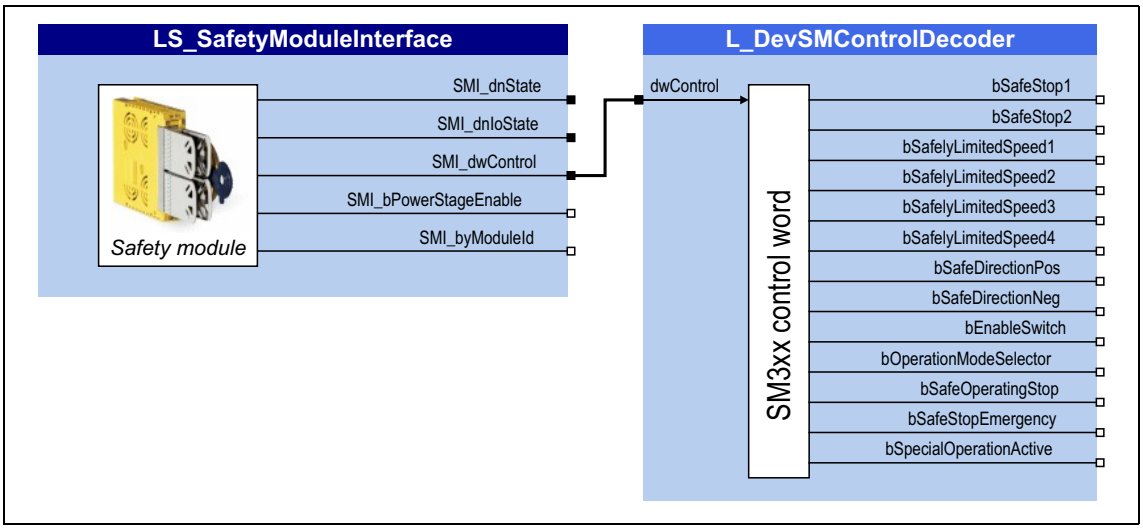
2.5.2.3 Control information

Via the bit-coded *SMI_dwControl* control signal of the **LS_SafetyModuleInterface** SB, the SM302 safety module transmits information about requested/active safety functions to the application.

- Several safety functions can be requested/active at the same time.

Bit coding of the SMI_dwControl status signal		
Bit	**Name**	**Meaning**
0	Reserved	
1	SS1 active	Safe stop 1 (SS1) function is active. • After the parameterised stopping time has elapsed, bit 0 of the status signal *SMI_dnState* (STO active) is set.
2	SS2 active	Safe stop 2 (SS2) function is active. • After the parameterised stopping time has elapsed, bit 16 (SOS monitored) is set.
3	SLS1 active	Safely limited speed 1 (SLS1) function is active. • After the parameterised braking time Nlim1 has elapsed, bit 8 of the status signal *SMI_dnState* (SLS1 monitored) is set additionally.
4	SLS2 active	Safely limited speed 2 (SLS2) function is active. • After the parameterised braking time Nlim2 has elapsed, bit 9 of the status signal *SMI_dnState* (SLS2 monitored) is set additionally.
5	SLS3 active	Safely limited speed 3 (SLS3) function is active. • After the parameterised braking time Nlim3 has elapsed, bit 10 of the status signal *SMI_dnState* (SLS3 monitored) is set additionally.
6	SLS4 active	Safely limited speed 4 (SLS4) function is active. • After the parameterised braking time Nlim4 has elapsed, bit 11 of the status signal *SMI_dnState* (SLS4 monitored) is set additionally.
7	SDIpos active	Function Safe positive direction (SDIpos) is active. • After the parameterised SDI delay time has elapsed, bit 12 of the status signal *SMI_dnState* (SDIpos monitored) is set additionally.
8	SDIneg active	Function Safe negative direction (SDIneg) is active. • After the parameterised SDI delay time has elapsed, bit 13 of the status signal *SMI_dnState* (SDIneg monitored) is set additionally.
9	ES active	Enable switch (ES) function for motion functions in special operation is active.
10	SLI active	"Safely limited increment (SLI)" function is active.
11	OMS	Operation mode selection (OMS) function for special operation is requested.
12	SLP1 active	Control bits 12 ... 15 are only included for reasons of compatibility. They are not supported.
13	SLP2 active	
14	SLP3 active	
15	SLP4 active	
16	SOS active	"Safe operating stop" (SOS) function is active. • The safe operating stop is monitored. • The function will be active after the function Safe stop 2 (SS2) has ended.
17-22	Reserved	
23	SSE active	Emergency stop function (SSE) is active. • Depending on the parameterisation of the emergency stop function, bit 1 (SS1 active) or bit 0 of the status signal *SMI_dnState* (STO active) is set after the function has ended.
24-27	Reserved	
28	RMS active	Repair mode is active.
29	OMS active	Special operation is active.
30	Reserved	
31	Reserved	

Note!



To effect the corresponding action (e.g. braking to standstill, holding the standstill position), the application engineer has to provide an appropriate interconnection in the application.

- To integrate the basic function "Limiter", the output *SMI_dwControl* is to be connected to the input *LIM_dwControl* of the **LS_Limiter** system block.

Example of decoding the control signal

Tip!

For decoding/coding the control signal, the function blocks **L_DevSMControlDecoder** and **L_DevSMControlEncoder** are available in the function library from V2.0.

[2-3] Example: Decoding of the SMI_dwControl control signal into individual boolean control signals

2.5.3 "SMI_SafetyModuleInterface" system block for Servo Drives 9400 PLC

For "Servo Drives 9400 PLC" devices, the **SMI_SafetyModuleInterface** system block provides the interface to the safety module in the »PLC Designer« control configuration.

System variable Data type	Value/meaning
SMI_dnState DINT	Bit coded status information from the safety module ▸ Status information (📖 20)
SMI_dnIoState DINT	Bit coded I/O status information from the safety module ▸ I/O status information (📖 22)
SMI_dwControl DWORD	Bit coded control information from the safety module ▸ Control information (📖 23)
SMI_bPowerStageEnable BOOL	Status signal "Inverter enable" TRUE: Inverter is enabled by the safety module.
SMI_byModuleId BYTE	ID of the safety module available in the Servo Drives 9400 PLC

The descriptions in the previous chapter System block " LS_SafetyModuleInterface" apply to this system block in the same way.

2.6 Error management

Error messages of the safety module

For a description of all error messages of the safety module and their causes & possible remedies, please see the chapter "Error messages". (📖 149)

Error states

Detected errors or maloperation of the drive are assigned to error states with definite responses. The response can be co-ordinated with the whole drive via the error states.

Features	Error status		
	System fault	Trouble	Warning
Event	Fatal internal error	Error	Monitoring function
LED "ME"	On	Blinking	Flashing
Status of safety module	Lockout (CPU stopped)	Error status	Normal operation
The control category in accordance with EN 13849-1...	... has been exited		... has not been exited
Response	The motor is safely switched to torqueless operation via STO immediately	The motor is safely switched to torqueless operation via STO or shut down via SS1 immediately (parameterisable)	
Acknowledgement after event has been eliminated	Switching the 24 V supply at the safety module off and then on again	• Error acknowledgement (AIE) via terminal X82.2 (positive signal pulse with a signal duration of 0.3 ... 10 s) • Error acknowledgement (AIE) via safety bus (bit "PS_AIE") • Switching the 24 V supply at the safety module off and then on again	

Note!

If the system error still occurs after switching the 24 V supply, please contact the Lenze service!

Errors in safe communication

If errors in safe communication occur, the safe communication driver passivates the data. After safe communication has been reinitialised, the drive is automatically enabled again unless a standstill function is selected.

Events causing an error status are sent via PROFINET/EtherCAT as a diagnostic frame.

2.6.1 Logbook function in Servo Drives 9400

The logbook function integrated into Servo Drives 9400 records important events in the system in chronological order, including error states of the safety module.

Tip!

When an online connection has been established, the logbook can be displayed in the »Engineer« via the **Logbook** button on the **Diagnostics** tab of Servo Drives 9400.

Detailed information on the logbook can be found in the Servo Drives 9400 online help.

2.6.2 Logbook function in the SM302 safety module

For purposes of diagnostics, a simple logbook with ten entries is implemented in the SM302. Changes with regard to the request of safety functions in the SM302 are logged. The bit coded log status created in a 2-ms cycle serves as a basis for the logbook. A logbook entry is generated when the log status has changed.

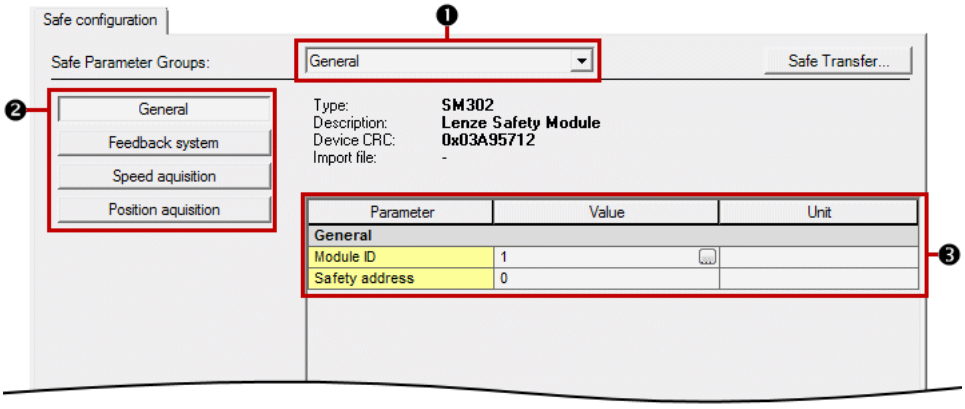
- The logbook function can be controlled via the "Log function" parameter (C15891).
  - The parameter can be written without using the safe parameter setting interface.
  - Possible settings:

Selection list		Info
0	**Logging active**	The logbook function is permanently active (Lenze setting). • When this value is written, all logbook entries are deleted.
1	Logging stopped	The logging of further entries is stopped.
2	Stop logging in the event of an error	Logbook entries are logged until an error occurs (bit 31 in C15000 set). • When this value is written, all logbook entries are deleted.
3	Stop logging in the case of STO	Logbook entries are logged until Safe torque off (STO) is triggered (bit 0 in C15000 set). • When this value is written, all logbook entries are deleted.
4	Stop logging in the case of SS1	Logbook entries are logged until Safe stop 1 (SS1) is triggered (bit 1 in C15000 set). • When this value is written, all logbook entries are deleted.
5	Stop logging in the case of SS2	Logbook entries are logged until Safe stop 2 (SS2) is triggered (bit 2 in C15000 set). • When this value is written, all logbook entries are deleted.

- A logbook entry consists of the two corresponding subcodes of parameters "Log time" (C15892) and "Log status" (C15893).

Short overview of the relevant parameters:

Parameter	Info	Lenze setting	
C15890	Current time	-	ms
C15891	Log function	Logging active	
C15892/1...10	Log time • Time of the entry in milliseconds since switch-on of the module supply.	-	ms
C15893/1...10	Log status • Status (bit coded) at the time displayed in C15892/1...10.	-	
Greyed out = display parameter			



Note!

Before the display parameters of the logbook are read out for purposes of diagnostics, the logbook function should be stopped by selecting "1: Logging stopped" in C15891, in order to avoid inconsistencies.

3 Safe configuration

The SM302 safety module can be safely configured in the »Engineer« on the *Safe configuration* tab:

The parameters of the safety module are divided into different groups according to their functions.

- A group is selected via the **Parameter groups** ❶ list field.
- For a better overview, some parameter groups are divided again into functional subgroups which can be selected via the buttons ❷ on the left.
- In the parameter list ❸ all parameters of the parameter group/subgroup selected are displayed.
  - The **Value** field serves to change the corresponding parameter value.
    ▸ Changing parameter settings (📖 30)
  - The context menu (right mouse button) provides functions for the import/export of the parameter settings.
    ▸ Importing/exporting parameter settings (📖 31)

Tip!

If you place the mouse pointer on a parameter, further information on the parameter will be displayed in a pop-up window.

If you select the entry "All parameters" in the **Parameter groups** list field, all parameters of the safety module are displayed on the tab.

The **File→Print** command in the »Engineer« *menu bar* serves to print all parameter settings of the safety module for the purpose of documentation.

3.1 Changing parameter settings

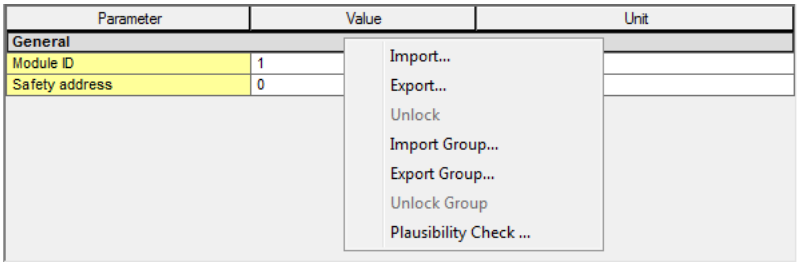
Note!

Changed parameters of the safety module are not transferred automatically to the device, even if an online connection has been established!

The parameter set for the safety module is only safely transmitted when clicking the **Send** button in the *Safe transfer* dialog box!

▸ Sending safe data (📖 94)

How to change a parameter setting:



1. Select the parameter to be altered from the list.
2. Enter the new value in the **Value** column, or select it from the options defined.
   - Invalid or impermissible values are "red" in the input field.
   - A selection from the list field may cause a deactivation of parameters which are now irrelevant due to the selection (marked by a grey background colour).
3. Press the **<Return key>** or click into another box to accept the changed value.
   - You can reject the entry by pressing the **<Esc>** key.

Tip!

The parameter settings of the safety module can also be displayed in the »Engineer« parameter list (*All parameters* tab→ **MSI safety module SM302** category) and on the keypad. Changes, however, can only be carried out via the *Safe configuration* tab!

3.2 Importing/exporting parameter settings

For transmitting/copying the parameter settings of the safety module to other safety modules, the import/export functions can be used which are available in the parameter list via the *Context menu* (right mouse button).

Command in the context menu	Info
Import...	Import all parameter settings from the file. • Only compatible files are offered for the import.
Export...	Export all parameter settings to the file.
Unlock	Unlock imported parameter settings. • After the "Import" function has been executed, the imported parameter settings are protected against change by the user. Only an explicit unlocking enables a change again.
Import group...	Import parameter settings of a group from a file. • Only possible when selecting a parameter group. • Only compatible files are offered for the import.
Export group...	Export parameter settings of a group to a file. • Only possible when selecting a parameter group.
Unlock group	Unlock imported parameter settings of a group. • After the "Import group" function has been executed, the imported parameter settings are protected against change by the user. Only an explicit unlocking enables a change again.
Plausibility check	See description for the Plausibility check (📖 31)

3.3 Plausibility check

Before transmitting the parameter set to the safety module, a plausibility check always takes place.

Note!

Only a plausible parameter set can be transmitted to the safety module using the "Send safe data" function!

With the **Plausibility check...** command in the *Context menu* (right mouse button) of the parameter list you can start the plausibility check manually to check the changes made in the parameter settings with regard to plausibility.

- After the plausibility check a status message indicates whether the plausibility check was successful.
- If the plausibility check failed, the status message contains the parameters with implausible settings.

3.4 Compatibility mode

The functional range of the SM302 safety module which can be parameterised in the »Engineer« via the *Safe configuration* tab depends on the version of the safety module selected for Servo Drives 9400 via the *Insert device module* dialog box.

Existing projects that have for instance been created using a SM302 V1.0 safety module can also be downloaded in a higher, future version of the SM302 safety module. In this example, the functional range which can be parameterised via the *Safe configuration* tab then corresponds to that of the SM302 V1.0 safety module (V1.0 compatibility mode).

Tip!

C15016 displays the parameter set version of the safety module.

3.5 Protection of the safe parameters by project-related password entry

»Engineer« provides a password protection feature serving to protect the parameter setting of the higher-order safety functions for the 8400 and 9400 device series from alterations in the project:

- The password can be set on the *Protection* tab when the project root element has been selected in the project tree.
- The password only applies within the project (no transmission of the password to Servo Drives 9400 or to the safety modules). If a password is stored within the project and this project is used, the safe parameters can only be edited after the password has been entered.

How to activate the protection of the save parameters:

1. Select the project root element in the project tree.
2. Assign the desired password on the *Protection* tab.
   - After the password has been set, the safe parameters (tab *Safe configuration*, safe parameters) of all included devices can only be edited inside the project after the corresponding password has been entered.

3.6 General parameters

3.6.1 General

Short overview of the "General → General" parameter group:

Parameter	Info	Lenze setting
-	Module ID	1
C15111	Safety address	0

Module ID

Unique identification (1 ... 65534) for the safe device.

Safety address

The safety address serves to uniquely identify the SM302 safety module in systems containing several drives.

3.6.1.1 Setting of the safety address

The safety address can be set via the DIP switch of the safety module or via the "safety address" parameter (C15111).

Note!

- The DIP switch in the left housing side of the safety module can only be set if the safety module is not plugged into Servo Drives 9400.
- The setting of the safety address via parameter setting is only possible if the safety address "0" is set with the DIP switch. Otherwise the safety address set via the DIP switch is used.
- The safety address "0" is not permissible!

Setting via DIP switch

- The DIP switch serves to set addresses in the range of 0 ... 1023:

DIP switch	Labelling									
	1	2	3	4	5	6	7	8	9	0
Value of the address bit	1	2	4	8	16	32	64	128	256	512

- Changes of the safety address via the DIP switch are only activated when the 24 V supply is switched on.
- C15101 displays the safety address set with the DIP switch.

Setting via parameter setting

- Via the parameter "safety address" (C15111) addresses in the range of 0 ... 65534 can be set.

Effective safety address

The effective safety address is the result of the setting via DIP switch or parameter setting.

- The effective safety address must match the module ID assigned in the safe parameter set.
- If "PROFIsafe" or "FSoE" has been selected as safety bus, the effective safety address is at the same time accepted as the PROFIsafe target address or FSoE target address. This address must match the corresponding configuration of the safety PLC.

Tip!

C15112 displays the effective safety address.

3.6.2 Feedback system

For safe speed measurement, a sin/cos encoder must be connected to terminal X8 (Sub-D) at Servo Drives 9400.

You can connect a 1-encoder system or, as an alternative, a 2-encoder system. In addition to the motor encoder (1-encoder system), the 2-encoder system contains a position encoder.

Short overview of the "General → Encoder system" parameter group:

Parameter	Info	Lenze setting
C15400	Motor encoder system	Sin-cos encoder
C15409	Motor mounting direction	Motor rotating CW
C15420	Sin-cos encoder - number of increments	1
C15430	Number of resolver pole pairs	1
C15500	Position encoder system	No position encoder
C15501	Position encoder gearbox factor	100 %
C15502	Position encoder mounting direction	As motor encoder

Motor encoder system

Selection of the motor encoder system for safe position and speed evaluation.

▸ Position evaluation (📖 38)

Motor mounting direction

Via the setting of the motor mounting direction, information regarding the sign is taken into consideration for the calculation of the safe position and speed evaluation.

Sin-cos encoder - number of increments

Number of increments of the sin/cos encoder used for safe position and speed evaluation if "Sin/cos encoder" is selected as encoder system.

▸ Position evaluation (📖 38)

Position encoder system

In order to establish a 2-encoder system, the position encoder system must be selected here.

Position encoder gearbox factor

Setting of the gearbox factor between motor and position encoder, e.g.

- 100 → i = 1.00
- 2543 → i = 25.43

Position encoder mounting direction

Setting of the mounting direction of the position encoder referred to the motor encoder.

If the mounting directions of the motor (C02527/0) and position encoder (C02529/0) are set to different directions of rotation in the standard device, this parameter must be set to "Inverted with regard to motor encoder".

List of the permissible encoder combinations for the position evaluation process

Motor	Type	Encoder	SM302
MCS06...19 MDxKS 56/71 MCA 10...26 MQA 20...26	Resolver	RV03	1-encoder concept up to PL e / SIL 3
MCS 06...19 MDxKS 56/71	Sin/cos absolute value • single-turn • multi-turn	• AS1024-8V-K2 • AM1024-8V-K2	1-encoder concept up to PL d / SIL 2
MCA 10...26 MQA 20...26	Sin/cos incremental	IG1024-5V-V3	1-encoder concept up to PL e / SIL 3
MDxMA063-xx...225-xx MHxMA063-xx...225-xx MFxMA063-xx...132-xx	Sin/cos incremental	IG2048-5V-V2	Single-encoder concept up to PL d / SIL 2
MDxMA080-xx...225-xx MHxMA080-xx...225-xx MFxMA080-xx...132-xx	Sin/cos incremental	IG2048-5V-V3	1-encoder concept up to PL e / SIL 3

3.6.3 Speed evaluation

Short overview of the "General → Speed evaluation" parameter group:

Parameter	Info	Lenze setting	
C15310	Speed window (n=0)	0	min^{-1}
C15410	Response time of encoder monitoring	12	ms
C15411	Speed comparison tolerance	20	min^{-1}

Speed window (n=0)

If the speed threshold parameterised is not reached, the "n = 0 rpm" status applies.

Response time of encoder monitoring

Time required to detect faults caused by continuous signal errors at the encoder interface. If the resolver is used as motor encoder without an additional position encoder, a response time of ≥ 50 ms must be set.

Tolerance of speed comparison

A plausibility check of the speed determined by the standard device and the speed determined by the safety module is carried out. The deviation between the two speed values must not exceed the value parameterised, since otherwise an error is triggered, shutting down the system.

3.6.4 Position evaluation

In the case of the safe position evaluation, a distinction between

- safe speed measurement and relative position evaluation and
- the safe evaluation of an absolute position must be made.

Short overview of the "General → Position evaluation" parameter group:

Parameter	Info	Lenze setting	
C15412	Tolerance of position comparison	0	Incr.
C15540	Maximum slip compensated	0	Incr.
C15550	SREF: SREF_Start input source	Homing deactivated	
C15551	SREF: Ref-InA edge trigger	Rising edge	
C15552	SREF: SREF_Load input source	Homing deactivated	
C15553	SREF: Ref-InB edge trigger	Rising edge	
C15554	SREF: Timeout	0	ms
C15555	SREF: Home Position	0	Incr.
C15556	SREF: restart condition	Homing required	
C15557	SREF: tolerance of starting position	0	Incr.
C15558	SREF: SLS homing	SLS1	

Tolerance of position comparison

A plausibility check of the position determined by the standard device and the position determined by the safety module is carried out. The deviation between the two position values must not exceed the value parameterised, since otherwise an error is triggered, shutting down the system.

Maximum slip compensated

For systems that are prone to slip (2-encoder system), the maximum slip to be compensated per motor revolution can be parameterised. The value "0" deactivates the slip compensation function.

SREF parameters

The parameters for safe homing are explained in the following sections.

3.6.4.1 Safe speed measurement and relative position evaluation

Safe speed measurement - properties		Explanations
Max. speed	± 16000 min^{-1}	Restriction for the use of a resolver: ±(10000 min^{-1}/number of resolver pole pairs)
Response time encoder monitoring	≥ 12 ms	Time required to detect faults caused by continuous signal errors at the encoder interface.
		The response time can be parameterised via C15410. If the resolver is used as a motor encoder without an additional position encoder, the response time ≥ 50 ms has to be set.
Error response	Error stop (STO)	
Tolerance threshold of speed comparison	20 min^{-1}	The speed measured by the standard device and the speed measured by the safety module are checked for plausibility. The filter time of approx. 2 s is part of the diagnostics function and irrespective of the response time.
		The response time can be parameterised via C15411. **Important:** Select the tolerance threshold as low as possible. If a speed/position information does not come in during operation, the diagnostics function must be able to detect this. So, the parameterised tolerance threshold must be exceeded during operation for at least more than 2 seconds to ensure the two-channel encoder information transfer. Selecting the tolerance threshold too low may lead to restricted plant availability.

Note!

It is necessary to assess the minimum response time required for the respective system.

A longer response time results in a higher system availability if, for instance, short-time, process-related speed steps occur at safe operational stop during setting-up operation.

The following speed-dependent functions require information from the safe speed measurement:

- Ramp monitoring (SS1/SS2) (📖 60)
- Safe stop 2 (SS2) (📖 58)
- Safe maximum speed (SMS) (📖 62)
- Safely limited speed (SLS) (📖 64)
- Safe speed monitor (SSM)

The following position-dependent functions require information from the safe position evaluation process:

- Safe operational stop (SOS)
- Safe direction (SDI) (📖 66)
- Safely limited increment (SLI) (📖 75)

Note!

The speed-dependent functions must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly.

Stop!

Malfunctions due to slip, shaft fractures, etc.

Due to slip, shaft fractures, etc. between the motor and the encoder system, the safe speed measurement is faulty.

Possible consequences:

- The speed-dependent functions are executed incorrectly.

Protective measures:

- Prevent malfunctions by constructive measures.
- Use motors and encoder systems with guaranteed qualities. Your Lenze contact person will inform you about suitable systems.
- This must also be observed in the event of service for the motor or encoder system.

Scaling of position values

The safety module stores the motor encoder and, if necessary, the position encoder position as 32-bit values. The lower-order 16 bits contain the fraction of a motor revolution and the higher-order 16 bits contain the multiple of a motor revolution.

Example	Calculation		Result (hex)
¼ motor revolution	65536 / 4	= 16384	0x0000'4000
½ motor revolution	65536 / 2	= 32768	0x0000'8000
1 motor revolution	1 * 65536	= 65536	0x0001'0000
2 motor revolutions	2 * 65536	= 131072	0x0002'0000
2½ motor revolutions	2 * 65536 + 65536 / 2	= 163840	0x0002'8000

3.6.4.2 Use of encoders for the safe position evaluation

If the absolute position of a machine is not directly linked with the motor encoder position, an additional position encoder must be installed.

This concept of a 2-encoder system is based on the fact that we are dealing with a position encoder without safety assessment. For this reason, the use of a motor encoder and position encoder as a two-channel system is required for determining the absolute position

▸ Slip compensation (📖 73).

The potential position deviation between the two channels (e.g. caused by slip) must be taken into consideration in the respective application and must entail corresponding parameter settings.

▸ Position evaluation

More detailed information regarding the functions provided for the safe position evaluation can be found in this section:

▸ Safely limited position (SLP) (📖 68)

The following position-dependent functions require information from the safe absolute position evaluation process:

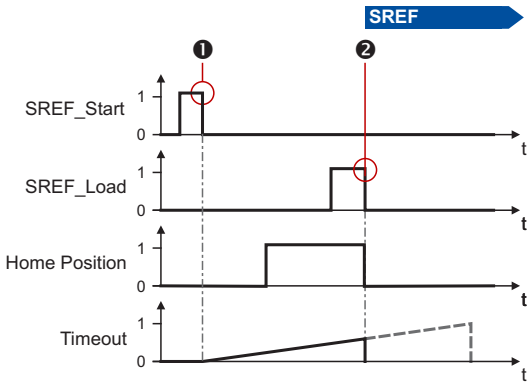
- Safe referencing (SREF) (📖 42)
- Safely limited position (SLP) (📖 68)
- Safe cam (SCA) (📖 70)
- Position-dependent speed (PDSS) (📖 71)

Note!

The evaluation of the absolute position refers to the position encoder and possibly contains a gearbox factor.

The evaluation of the relative position is based on the motor encoder increments.

Scaling of position values



The absolute positions are registered as 32-bit values in the safety module.

Example	Calculation		Result (hex)
¼ motor revolution	65536 / 4	= 16384	0x0000'4000
½ motor revolution	65536 / 2	= 32768	0x0000'8000
1 motor revolution	1 * 65536	= 65536	0x0001'0000
2 motor revolutions	2 * 65536	= 131072	0x0002'0000
2½ motor revolutions	2 * 65536 + 65536 / 2	= 163840	0x0002'8000

3.6.5 Safe referencing (SREF)

Short overview of the "Safety functions → Safe referencing" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15550	Setting of the input source for the SREF_Start signal	Homing deactivated	
C15551	Setting of the edge at Ref-InA or Ref-InB to be evaluated	Rising edge	
C15552	Setting of the input source for the SREF_Load signal	Homing deactivated	
C15553	Setting of the edge at Ref-InA or Ref-InB to be evaluated	Rising edge	
C15554	Maximum time between the SREF_Start and SREF_Load signals	0	ms
C15555	Setting of the safe home position that is accepted for SREF_Load	0	Incr.
C15556	Setting specifying whether safe homing is required after the restart.	Homing required	
C15557	Setting of the tolerance between the safe position that is saved and the current safe position after restarting.	0	Incr.
C15558	Setting of the active SLS function during homing.	SLS1	
C15559	Deletion of the safe reference in order to set a new reference.	No response	
C15560	Status of the safe reference	No reference	
Greyed out = display parameter			

Safe **REF**erence / SREF			
Description	For calculating and monitoring the absolute position, the safety module requires an absolute reference point. This function is required since the encoder systems described in the Position evaluation section do not provide any safe absolute position.		
	In applications with only one position switch, this switch has to be connected in parallel to the "Ref-InA" and "Ref-InB" inputs. The edge evaluation for both inputs can be parameterised, see C15551 / C15553.		
Function	 Execution order: 1. Via the input source defined in C15550, homing is started. • The start of a homing process does not result in the drive carrying out the actual homing process. The initialisation and motion control are carried out autonomously by the drive. • The safety module always activates a safely limited speed (SLS). 2. Within a time period defined by C15554 ("time-out"), the "SREF_Load" reference signal (C15552) is expected, which defines the safe "Home Position" reference point (C15555) in the absolute position range. 3. When the reference point has been defined, the homing process is completed. A change-over to normal operation is effected. The home position parameterised is the absolute reference point for the safety functions ▸ Safely limited position (SLP) ▸ Safe cam (SCA) ▸ Position-dependent speed (PDSS) The following states are shown: • The "SREF active" state (C15560) is reset. • The valid reference is shown via "SREF available" (C15560) .		
Parameter	❶	C15550	Setting of the input source for the SREF_Start signal
	❷	C15552	Setting of the input source for the SREF_Load signal
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameterisation. Evaluation is carried out via parameterisable edges. ▸ Safe inputs (📖 46)		
Error behaviour	If no signal is detected at the SREF-Load input within the time-out period parameterised, an error stop with the STO function is activated.		

3.6.5.1 Operating states that do not require homing processes

Starting performance after mains switching

The absolute position value loaded last is saved permanently in the SM302 safety module as a function of C15556 when the supply voltage is switched off.

After reconnecting the mains, the drive is allowed to continue its travel with the current value if the following preconditions are met:

1. The restart condition parameterised in C15556 defines whether a new homing process has to be carried out after mains switching.
2. At the time of restarting, the position value saved by the safety module complies with the position value that is currently received by Servo Drives 9400, including the tolerance parameterised in C15557.
3. The minimum movement described causes plausibility of the absolute position values ▸ Mini-homing process (📖 45).

Danger!

The design of the device must ensure that it is not possible to shift the drive by a value that is many times higher than that of the motor position when it is switched off.

Note!

If the SM302 safety module detects that the voltage of the 24 V supply is not reaching the minimum value, the following values are stored permanently in the safety module:

- The absolute position value received as valid at this time and
- the offset for the home position parameterised, which has been determined during the homing process.

Short-time interruption of the SSI encoder laser beam

The short-time interruption of the optical signal causes the safety module to trigger the safety function parameterised, which results in the shutdown of the axis concerned. The status bit in C15560, "SREF available", is reset.

Irrespective of the error response triggered and the corresponding overtravel, the absolute position data are furthermore determined on both channels of the safety module.

After the error acknowledgement, the status bit in C15560, "SREF available", is set by the safety module under the following conditions:

1. The position data of both encoders are checked with regard to their maximum permissible deviations in C15412 ("tolerance of position comparison") by the safety module and must be within the tolerance window parameterised.
2. The Mini-homing process results in plausibility of the absolute position values.
   - The mini-homing process can only be carried out if a full homing process has been carried out before the error occurs.

Response after "Repair Mode Select" (RMS)

In "Repair mode select" (RMS), temporary and restricted operation without encoder evaluation is permissible. ▸ Repair mode select (RMS) (📖 81)

When the repair mode is exited, the axis changes over to normal operation, taking the restart behaviour into consideration. ▸ Restart behaviour (📖 55)

This requires the following conditions to be met:

1. The position data of both encoders are checked with regard to their maximum permissible deviations in C15412 ("tolerance of position comparison") by the safety module and must be within the tolerance window parameterised.

2. The Mini-homing process results in plausibility of the absolute position values.
   - The mini-homing process can only be carried out if a full homing process has been carried out before the error occurs.

Mini-homing process

The mini-homing process serves to reach plausibility of the safety module's absolute position values.

The mini-homing process is carried out via the Safely limited speed (SLS) function and is monitored by the safety module.

Take the following into consideration:

- The safely limited speed **Nlim** must have been parameterised in C15330 before.
- The distance of the mini-homing process should be greater than or at least equal 4 times the value of C15412:

$$\text{Minimum distance} \geq 4 \times \text{C15412}$$

When the mini-homing process has been carried out successfully, the status bit in C15560 is set to indicate that a safe reference value is available.

When the SM302 has returned from the above-described states, the motion control can, as a general rule, take over the movement in the direction of the home position if a safe home position has been parameterised. This procedure is activated if the safety module resets the "SREF available" status bit in all cases, not exceeding the safely limited speed (to be parameterised) corresponding to the homing process.

After having obtained plausibility of the absolute position values, the status bit in C15560, "SREF available", is set by the safety module.

In this case it is not necessary anymore to approach the home position parameterised, since the bit indicating a safe home position has already been set. Overtravelling the home position in this case would not have any effect.

If a full homing process via the home position switch is to be carried out although the status bit in C15560, "SREF available", has been set, the status bit must be reset by Servo Drives 9400 by writing to a command code of SM302 for a homing process that has already taken place. Since it is only possible to request the status bit to be reset, this cannot cause a safety-critical error.

3.7 Safe inputs

General information

The following applies to the sensors on the SM302:

- The sensor type and function can be parameterised.
- A local evaluation is executed if corresponding parameters are set.
- If a safety bus is activated, the sensor signals are sent as status information to the higher-level control.
- Deactivated sensor inputs must not be connected. The status of a non-connected input is OFF.
- If a signal is detected at a deactivated sensor input during initialisation, the drive remains inhibited (STO).
- Faulty inputs are assessed as OFF state.

If the "Safe cascading" safety function is active, the safe SD-In4 input is used as a cascading input and can no longer be used as a universal input. For the cascading function, the SD-In4 input must be parameterised as an active input for the "emergency stop" function. ▸ Cascading (CAS) (📖 83)

Note!

Make sure that an internal contact function test is carried out at the safe inputs:

- Safe input in the ON state
  - A LOW level at one channel puts the input in the OFF state. The discrepancy monitoring starts simultaneously.
  - A LOW level must be detected at both channels within the discrepancy time, otherwise a discrepancy error will be reported.
  - To be able to confirm the discrepancy error, a LOW level must be detected before at both channels.
- Safe input in the OFF state
  - A HIGH level at one channel starts the discrepancy monitoring.
  - A HIGH level must be detected at both channels within the discrepancy time, otherwise a discrepancy error will be reported.
  - To be able to confirm the discrepancy error, a HIGH level must be detected before at both channels.

Tip!

Detailed information on the contact function test, the connection of passive/active sensors and example circuits can be found in the manual for the safety module.

Short overview of "Safe inputs" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15030/1...4	SD-In1...4 sensor type	Input deactivated	
C15031/1...4	SD-In1...4 sensor function	Free assignment	
C15032/1...4	SD-In1...4 free assignment	STO	
C15033/1...4	SD-In1...4 discrepancy time	10	ms
C15034/1...4	SD-In1...4 input delay	0	ms

Sensor type/sensor function

The sensor type and function can be parameterised.

Note!

If an error (e.g. a discrepancy error) occurs at a safe input to which the "operation mode selector" sensor function is assigned, the corresponding input is valued as OFF state.

- When there is a LOW level at the safe input, the operating mode can be parameterised via C15202.
- The "Module Error ME" LED blinks, STO is not tripped.
- Special operation can only be selected again if the error has been eliminated and acknowledged.

Tip!

Detailed information on sensor inputs, active and passive sensors can be found in the manual for the safety module.

Free assignment

If "Free assignment" has been selected as sensor function, the safety function selected via this parameter is assigned to the safe input. The following safety functions can be selected:

- Safe torque off (STO) (📖 56)
- Safe stop 1 (SS1) (📖 57)
- Safe stop 2 (SS2) (📖 58)
- Safely limited speed (SLS) (📖 64)
- Safely limited position (SLP) (📖 68)
- Position-dependent speed (PDSS) (📖 71)
- Safe direction (SDI) (📖 66)
- Safely limited increment (SLI) (📖 75)

Note!

If "No function" has been selected, no safety function is assigned to the safe input. The functional test and monitoring of the discrepancy time remain active and the status of the input is transmitted to the control via the safety bus (if parameterised).

Discrepancy time

Maximum time for which both channels of a safe input may have non-equivalent states without the safety system detecting an error.

Input delay

Time between the recognition of the signal change and the effective evaluation of an input signal. As a result, multiple and short signal changes due to contact bounce of the components are not taken into account.

3.8 Safe output

General information

Via the safe output O1A/O1B information can be output to a higher-level unit (e.g. safety PLC) or external switching elements (actuators) can be controlled.

- The 24V supply of the safety module and the safe output must be provided by safely separated power supply units. In order to keep the circuits electrically isolated, separate voltage supplies are required.
- The status of the safe output is controlled by two ways:
  - Directly by the safety module through a corresponding setting of the parameters "SD-Out1 switching condition" and "SD-Out1 logic function".
  - Via the PROFIsafe and FSoE output data in connection with the "SD-Out1 logic function" parameterised.
- The safe output is PP switching, i.e. two plus channels are switched.

If the "Safe cascading" safety function is active, the safe SD-Out1 output is used as cascading output and cannot be parameterised as a universal feedback output. ▸ Cascading (CAS) (📖 83)

Stop!

In case of polarity reversal of the supply voltage of the safe outputs, we recommend an immediate replacement of the module, as there is a risk of increased unavailability due to damage to protective elements.

Note!

The safe output in ON state is cyclically tested by quick LOW switching.

- When selecting the downstream control elements, ensure that the test pulses will not be detected as LOW signal.
- These errors will be detected and set the output to OFF state:
  - Short circuit to supply voltage.
  - In the ON state: Short circuit between the output signals.
  - In the ON state: Missing 24-V supply voltage at terminal 24O is detected as "Stuck-at-Low" error.
- These errors are not detected:
  - In the OFF state: short circuit between the output signals.

Tip!

Detailed information on the functional test by means of test pulses and example circuits can be found in the manual for the safety module.

Short overview of the "Safe output" parameter group:

Parameter	Info	Lenze setting
C15051/1 C15052/1	SD-Out1 switching condition: STO active	Not evaluated
	SD-Out1 switching condition: SS1 active	Not evaluated
	SD-Out1 switching condition: SS2 active	Not evaluated

	SD-Out1 switching condition: positive direction	Not evaluated
C15055/1	SD-Out1 logic function	OR

SD-Out1 switching condition

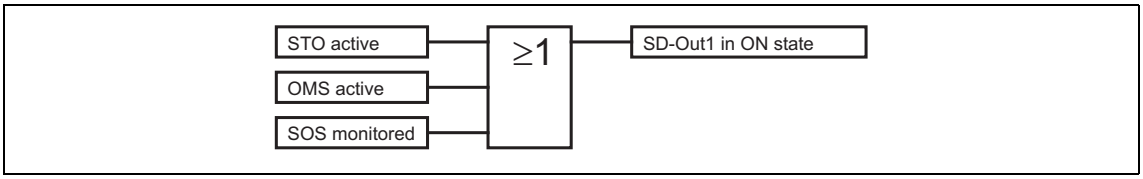
Configuration of the switching conditions that are to be assigned to the safe output.

- Several switching conditions can be simultaneously assigned to the safe output.
- For each switching condition it can be individually set whether it is to be evaluated with a positive or negative logic.
- In order to assign one or several conditions to the safe output, simply change the settings for these conditions from "Not evaluated" to "Positive logic" or "Negative logic".
- The "SD-Out1" bit of the PROFIsafe and FSoE output data is included in the evaluation via the logic function selected. The evaluation for this bit can be deactivated via the "S bus: Configuration" and "S bus: Filter control data" parameters.

SD-Out1 logic function

Selection of the logic AND / OR operation for the switching conditions to be evaluated.

Tip!



- Examples regarding the parameterisation of the safe output can be found in the following subchapters.
- C15060 displays the output image of the safety module.

3.8.1 Example 1: "Safety door"

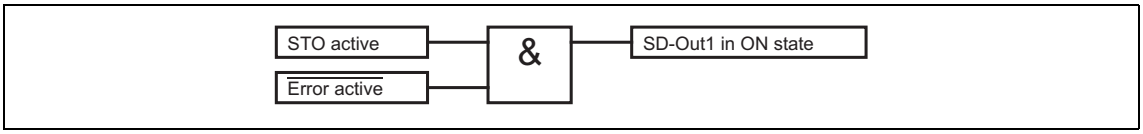
Switching condition

The following switching condition is to be implemented for the safe output SD-Out1:

- Opening the safety door is permitted (SD-Out1 in ON state) if
  - the power supply for the motor is safely interrupted (STO active)
  - **OR** special operation is active (OMS active)
  - **OR** the safe operating stop is active and monitored (SOS monitored).

[3-1] Logic operation for "Safety door" case study

Required parameter setting for SD-Out1



1. Set the following switching conditions to "Positive logic":
   - STO is active
   - OMS active
   - SOS monitored
2. Set all other switching conditions to "Not evaluated".
3. Set logic function to "OR".
4. If a safety bus has been parameterised:
   - The "SD-Out1" bit of the safety control is considered in the ORing.
   - Hide the "SD-Out1" bit via the "S bus: Filter control data" parameter to suppress this access.

3.8.2 Example 2: "Signalling"

Switching condition

The following switching condition is to be implemented for the safe output SD-Out1:

- Safe signalling is carried out (SD-Out1 in ON state) if
  - the power supply for the motor is safely interrupted (STO active)
  - **AND NO** error is active ($\overline{\text{Error active}}$).

[3-2] Logic operation for case study "Signalling"

Required parameter setting for SD-Out1

1. Set the following switching condition to "Positive logic":
   - STO is active
2. Set the following switching condition to "Negative logic":
   - Fault active
3. Set all other switching conditions to "Not evaluated".
4. Set logic function to "AND".
5. If a safety bus has been parameterised:
   - The "SD-Out1" bit of the safety control is considered in the ANDing.
   - Hide the "SD-Out1" bit via the "S bus: Filter control data" parameter to suppress this access.

3.9 Safety functions

The parameterisable safety functions are divided into functional subgroups:

- Safe stop (SSE, SS1, SS2, SOS) (📖 53)
- Safe speed (SMS / SLS) (📖 62)
-
- Safe direction (SDI) (📖 66)
- Safely limited position (SLP) (📖 68)
- Safe cam (SCA) (📖 70)
- Position-dependent speed (PDSS) (📖 71)
- Safely limited increment (SLI) (📖 75)
- Operation mode selection (OMS) (📖 77)
- Repair mode select (RMS) (📖 81)
- Cascading (CAS) (📖 83)

3.9.1 Safe stop (SSE, SS1, SS2, SOS)

General information

The stop functions are divided according to the tripping reason:

- Standard stop (simple stop)
  - Tripping by a safe input with the parameterised functions STO, SS1, or SS2.
  - Tripping by activating the STO, SS1 or SS2 bits via the safety bus.
  - In special operation (OMS) the standard stop can be avoided by confirming it with the enable switch (ES).
- Emergency stop
  - Tripping by a safe input with the parameterised function SSE.
  - Tripping by activating the bit SSE via the safety bus.
  - STO or SS1 can be set as the function to be executed via the parameter "SSE: Emergency stop function".
  - In special operation (OMS) the emergency stop cannot be avoided.
- Error stop
  - Tripping as response to an error.
  - In special operation (OMS) the error stop cannot be avoided.
- Repair Mode Select ()

Short overview of the "Safety functions → Safe stop" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15205	Assignment of the stop function for emergency stop	STO	
C15300/1	Restart behaviour after the STO and SS1 standstill functions have been deactivated	Acknowledged restart	
C15300/2	Restart behaviour after the SS2 and SOS standstill functions have been deactivated	Acknowledged restart	
C15305	Stopping time for the SS1 and SS2 safety functions.	0	ms
C15306	Selection whether STO is already activated after reaching n=0 when SS1 is executed or only after the parameterised stopping time.	STO after stopping time	
C15307	Delay time after the detection of n = 0 until the triggering of STO. Only relevant if "SS1 mode" equals "STO at n = 0" and operation with an encoder system.	0	ms
C15308	Selection whether SOS is already activated after reaching n=0 when SS2 is executed or only after the parameterised stopping time.	SOS after stopping time	
C15311	Safely monitored tolerance margin for zero position change.	0	Incr.
C15315	Safely monitored tolerance margin for zero speed.	Ramp monitoring activated	
C15316	Safely monitored tolerance margin for zero position change.	0	%
C15317	Value of the maximum position change while SOS was active.	0	%
C15318	Selection for whether the deceleration ramp is to be monitored when SS1 and SS2 are executed.	0	min^{-1}
C15319	S-ramp time of the deceleration ramp for SS1 and SS2 if no linear ramp is used.	Relative	

3.9.1.1 Prioritisation

Stop functions with priority influence the process of already started subordinated functions.

1. Safe torque off (STO)
   - The STO function has the highest priority and thus takes priority over all other functions. Functions already started (e.g. SS1 or SS2) are cancelled and the drive is switched off.
2. Safe stop 1 (SS1)
   - The SS1 function takes priority over SS2. Taking the stopping time set for SS1 and SS2 as well as that of the SS1 mode into consideration, the drive is switched to torque-free operation.
3. Monitoring functions
   - The monitoring functions have the same priorities. They can also be executed parallel to the stop function.

3.9.1.2 Restart behaviour

The restart behaviour of the drive after a stop function has been executed can be set via the following parameters:

- "Restart behaviour - STO, SS1" (C15300/1)
- "Restart behaviour - SS2, SOS" (C15300/2)

Danger!

If the request for the safety function is cancelled, the drive can restart automatically.

In the case of an automatic restart, you have to provide external measures which ensure that the drive only restarts after a confirmation (EN 60204).

Restart behaviour in the case of the "Acknowledged restart" setting

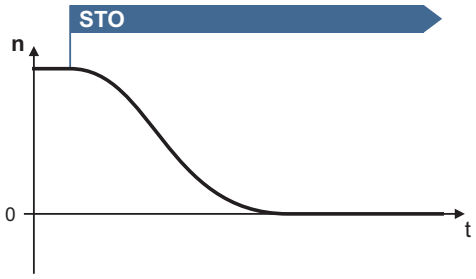
- After a standard stop the restart must be acknowledged (AIS) via terminal or safety bus.
- After an error stop, the error must be acknowledged first (AIE), before the restart is acknowledged with AIS.

Acknowledgement	via terminal	via safety bus
AIS	X82.3 or X82.4 (Positive signal pulse with a signal duration of 0.3 ... 10 s)	"PS_AIS" PROFIsafe/FSoE bit (positive edge) ▸ Safety bus (📖 84)
AIE	X82.2 (Positive signal pulse with a signal duration of 0.3 ... 10 s)	"PS_AIE" PROFIsafe/FSoE bit (positive edge) ▸ Safety bus (📖 84)

Note!

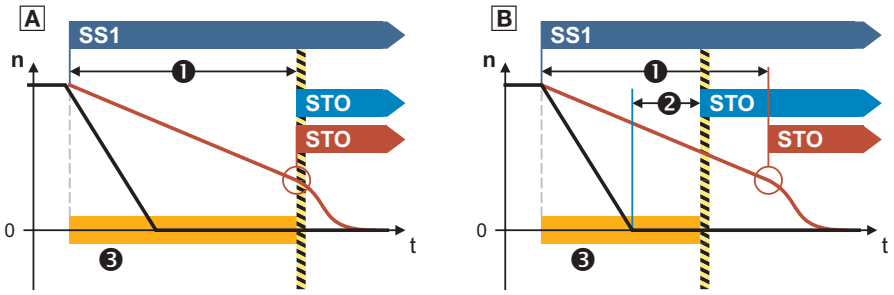
The restart behaviour after an emergency stop corresponds to the restart behaviour parameterised for the STO/SS1 stop function.

Restart behaviour in the case of the "Automatic restart" setting



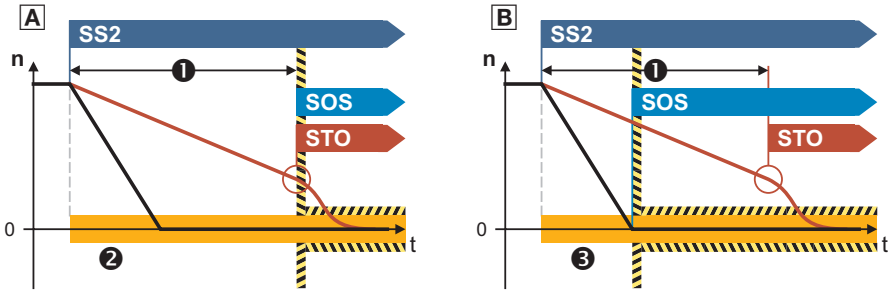
The higher-level control must ensure that the drive only restarts after an acknowledgement. The stop status of the drive is reported to the higher-level control via bit STO or SOS.

If the "Safe cascading" safety function is active, an automatic restart after STO is not permissible. The plausibility check rejects such a setting. ▸ Cascading (CAS) (📖 83)

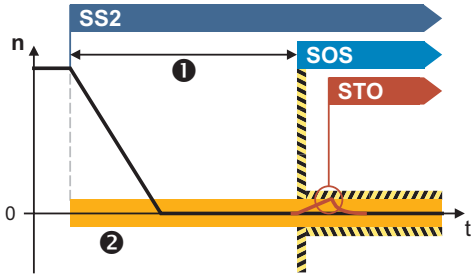


3.9.1.3 Emergency stop function (SSE)

Safe Stop Emergency / SSE		
Description	The emergency stop function starts STO or SS1, depending on the setting of the "SSE: emergency stop function" parameter.	
	• In special operation the emergency stop cannot be avoided. • Connect the emergency stop buttons, which must not be overruled by special operation, to the emergency stop function. For this purpose, parameterise the safe input as "emergency stop" (C15031).	
Parameter	C15205	SSE: Emergency stop function • Selection of the function to be performed (STO or SS1).
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46)	

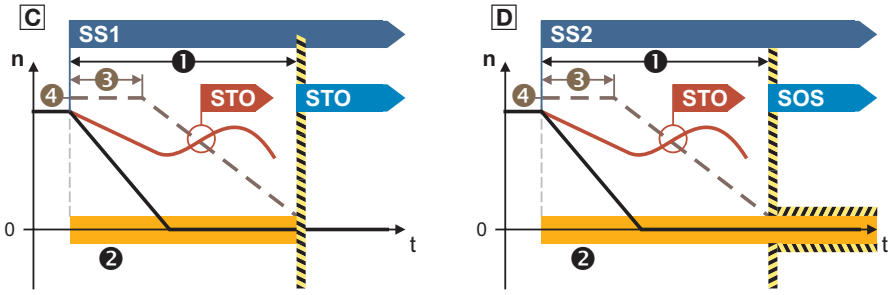


3.9.1.4 Safe torque off (STO)



Safe Torque Off / STO (corresponds to a "Stop 0" in accordance with EN 60204)	
Description	By using this function the power supply for the motor is safely interrupted immediately. The motor cannot generate a torque and thus no dangerous motions of the drive.
	• Additional measures are required against movements caused by external forces, e.g. mechanical brakes. • The restart behaviour can be set. ▸ Restart behaviour (📖 55)
Priority	Priority function: none Subordinated function: SS1, SS2
Function	
Parameter	Function sequence and error response have no adjustable parameters.
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46) • As response to the error stop request. • As response to the emergency stop request.

3.9.1.5 Safe stop 1 (SS1)



Safe **S**top **1** / SS1 (corresponds to a "Stop1" according to EN 60204)			
Description	The safety module monitors whether the drive has reached the set tolerance margin (n=0) within the parameterised stopping time and, depending on the parameterised SS1 mode, after the stopping time has elapsed or after falling below the tolerance margin (n=0), switches the drive to torque-free operation via the STO safety function.		
	• The deceleration ramp can be parameterised and monitored for the SS1 stop function. ▸ Ramp monitoring (SS1/SS2) (📖 60) • The drive must be braked to a standstill through the application! • The speed is calculated from the encoder data. ▸ Position evaluation (📖 38) • In SS1 mode "STO with n=0", you can use the parameter "STO delay after n=0" to set a waiting time which determines when the STO status is adopted. • Without an encoder, the function evaluates the speed status n=0 Servo Drives 9400, the stopping time monitored in the safety module having to be 0.5 s longer than the stopping time parameterised in Servo Drives 9400. • Additional measures are required against movements caused by external forces, e.g. mechanical brakes. The application time of a brake must be considered when determining the stopping time. • A restart is only possible after the stopping time has elapsed completely. This does not apply to special operation. ▸ Restart behaviour (📖 55)		
Priority	Priority function: STO Subordinated function: SS2		
Function	 Function B (STO with n=0) can be selected as SS1 mode.		
Parameter		C15306	SS1 mode: A STO after stopping time B STO with n=0
	❶	C15305	SS1, SS2: Stopping time
	❷	C15307	SS1: STO delay after n=0
	❸	C15310	Speed window (n=0)
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46) • As response to the error stop request. • As response to the emergency stop request.		
Normal behaviour	When the stopping time has elapsed or after falling below the tolerance margin (n=0), a standard stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.		
Error behaviour	If standstill has not been reached when the stopping time has elapsed, or if the deceleration ramp parameterised was exceeded during the Ramp monitoring was activated, an error message is triggered and an error stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.		

3.9.1.6 Safe stop 2 (SS2)

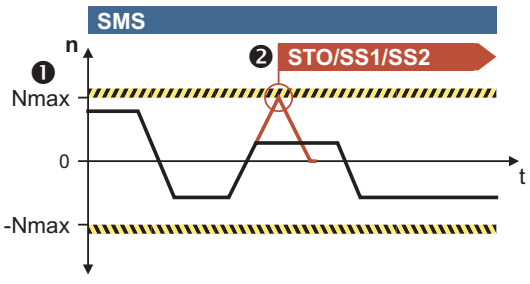
Safe Stop 2 / SS2 (corresponds to a "Stop 2" in accordance with EN 60204)			
Description	The safety module monitors whether the drive has reached the set tolerance margin (n=0) within the parameterised stopping time and, depending on the parameterised SS2 mode, after the stopping time has elapsed or after falling below the tolerance margin (n=0), activates the monitoring of the safe operating stop (SOS). In the safe operational stop the drive is not switched to torque-free operation but all control functions remain active and the position reached must be maintained actively.		
	• The deceleration ramp can be parameterised and monitored for the SS2 stop function. ▸ Ramp monitoring (SS1/SS2) (📖 60) • The application must ensure that the drive is braked to a standstill and the position is maintained! • The speed and the position data are calculated from the encoder data. ▸ Position evaluation (📖 38) • Without an encoder the function cannot be used. • Additional measures are required against movements caused by external forces, e.g. mechanical brakes. The application time of a brake must be considered when determining the stopping time. • A restart is only possible after the stopping time has elapsed completely. This does not apply to special operation. ▸ Restart behaviour (📖 55)		
Priority	Priority functions: STO, SS1		
Function	 Function B (SOS with n=0) can be selected as SS2 mode.		
Parameter		C15308	SS2 mode: A SOS after stopping time B SOS with n=0
	❶	C15305	SS1, SS2: Stopping time
	❷	C15310	Speed window (n=0)
	❸	C15311	SOS: Tolerance margin (delta p=0) *
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46) • As response to the error stop request.		
	In the SOS state, relative position changes are added and compared with the permissible value in the parameter "Tolerance margin delta p=0". • When the SOS state is left, the maximum relative position change is displayed in the parameter C15312. • When the SOS state is requested again, the sum of the last position changes is reset to zero. **Example:** The "SS2 active" state and the "SOS active" state are interrupted by an STO request. If the STO request is reset, the status immediately changes to SOS. This leads to a reset of the current position deviation to p=0.		

Safe **S**top **2** / SS2 (corresponds to a "Stop 2" in accordance with EN 60204)	
Normal behaviour	When the stopping time has elapsed or after falling below the tolerance margin (n=0), the monitoring of the safe operating stop (SOS) becomes active.
Error behaviour	If standstill has not been reached when the stopping time has elapsed, or if the deceleration ramp parameterised was exceeded during the Ramp monitoring was activated, an error message is triggered and an error stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.
	Safe operating stop (SOS) in final state: If the speed gets out off the set tolerance margin (n=0 or delta p=0) during a safe operational stop, an error message is generated and an error stop starts. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive. 

3.9.1.7 Ramp monitoring (SS1/SS2)

Ramp monitoring (SS1/SS2)			
Description	The SS1 and SS2 stop functions monitor whether the drive has reached the set tolerance window (n=0) within the stopping time parameterised. The deceleration ramp can be parameterised and monitored for the SS1 and SS2 stop functions. By monitoring the deceleration process, safety can be increased. The longer the deceleration times due to high moments of inertia are, the more important is ramp monitoring, in order to still be able to ensure acceptable safety margins.		
	• The application must ensure that the drive is braked to a standstill and the position is maintained! • The safe speed evaluation is a precondition for safe ramp monitoring, i. e. an encoder system has to be parameterised in the safety module. ▸ Position evaluation (📖 38) • When ramp monitoring is activated, the starting value of the ramp and the S-ramp time must be defined in percent. • The starting value refers to the current speed value at the time of the SS1/SS2 request. • The starting time of the deceleration ramp is delayed via the S-ramp time in order to consider a possible S-ramp smoothing.		
Function	 Safe ramp monitoring for SS1 (Ⓒ) and SS2 (Ⓓ)		
Parameter	❶	C15305	SS1, SS2: Stopping time
	❷	C15310	Speed window (n=0)
		C15315	SS1, SS2: Ramp monitoring
	❸	C15316	SS1, SS2: Ramp - S-ramp time
	❹	C15317	SS1, SS2: Ramp - start-offset
Activation	How to activate the function: • The ramp monitoring function has to be activated via parameter C15315. • If the SS1/SS2 stop function is requested, a monitoring ramp is calculated and is layed on the current speed characteristic.		
	• The parameterisation of the monitoring ramp in the safety module has to take the parameters of the deceleration ramp from the application into consideration. • On the basis of the actual speed, a parameterisable percentage proportion (0 ... 30 %) is added to the actual speed as start offset and is considered as a constant starting value. • As an alternative, an absolute value can be parameterised as a starting offset via C15318. By parameterising the offset module (C15319) it is defined whether the relative or the absolute offset value is to be used. • In the Lenze setting of the start offset (C15317) the tolerance window (n=0) is considered as the offset. • The monitoring ramp is only started after an internal deceleration time has elapsed, which is generated depending on the "SS1, SS2: S-ramp time" and "SS1, SS2: Stopping time" parameters: • The "SS1, SS2: S-ramp time" parameter is scaled linearly from 10 ... 30 % to the stopping time: 0 % S-ramp time ≡ 10 % deceleration 100 % S-ramp time ≡ 30 % deceleration • In the Lenze setting of the S-ramp time, the deceleration time is 10 % of the stopping time set. • In the SM302 the same value as in the standard device can be set for the S-ramp time.		

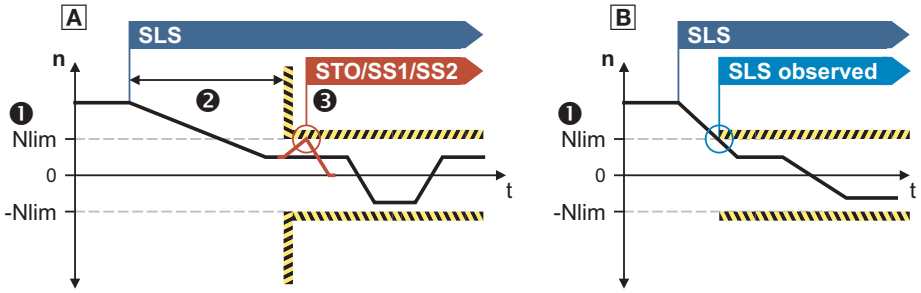
Ramp monitoring (SS1/SS2)	
Normal behaviour	During the stopping time elapses, or before the tolerance window (n=0) is reached, the speed ramp parameterised is not exceeded. Afterwards there is the transition to the STO or SOS stop function parameterised.
Error behaviour	If the current speed exceeds the parameterised speed ramp within the stopping time or before the tolerance window (n=0) is reached, an error message is triggered and an error stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.



3.9.2 Safe speed (SMS / SLS)

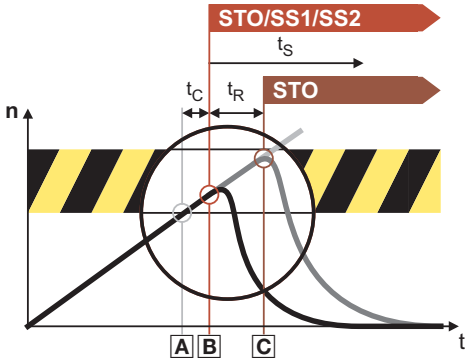
SM302 supports the safe monitoring of a maximum speed (SMS) that is active for all operating states. The SLS1 ... SLS4 functions can be activated at the same time via safe inputs or via the safety bus.

Short overview of the "Safety functions → Safe speed" parameter group:



Parameter	Info	Lenze setting	
		Value	Unit
C15320	Activation of the SMS function and selection of the maximum speed. Maximum speed = 0: SMS function deactivated.	1	min^{-1}
C15321	Reaction to exceeding the set maximum speed Nmax.	SS1	
C15330/1 ... /4	Setting of the safely limited speeds Nlim1 ... Nlim4.	0	min^{-1}
C15331/1 ... /4	Safely monitored time for braking the drive below the limited speeds Nlim1 ... Nlim4.	0	ms
C15332/1 ... /4	Response carried out in the safety module when the limited speeds Nlim1 ... Nlim4 are exceeded.	SS1	
C15333/1 ... /4	Permissible direction of movement when monitoring SLS1 ... SLS4.	Both directions enabled	
C15350	Maximum time after a speed exceedance has been detected, after which the speed has to fall below the limit (SLS and SMS).	0	ms

3.9.2.1 Safe maximum speed (SMS)

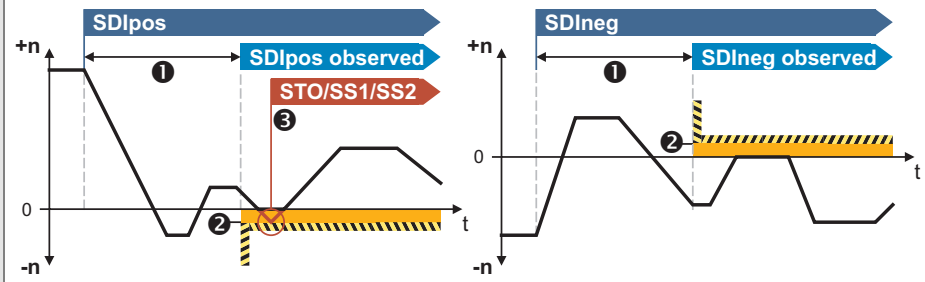


Safe **M**aximum **S**peed / SMS	
Description	The safety module monitors the adjusted safe maximum speed of the motor.
	The function can only be activated by parameter setting. • See parameter "SMS: Maximum speed Nmax". • The function must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly.
Function	

Safe **M**aximum **S**peed / SMS			
Parameter	❶	C15320	SMS: Max. speed Nmax • A value > 0 activates the function, a value = 0 deactivates the function.
	❷	C15321	SMS: Reaction (n>Nmax) • Selection of the function to be executed (STO, SS1 or SS2) if monitoring responds.
		C15350	SLS, SMS: Max. response time • If in the event of an error the speed is still outside the limit values after the response time has elapsed, STO is tripped immediately. • Detailed information can be found in the chapter "Error analysis for the functions SMS and SLS". (📖 65)
Activate	How to activate the function: • Set the parameter "SMS: Maximum speed Nmax" > 0.		
Error behaviour	If the speed exceeds the set maximum speed Nmax, an error message is generated and an error stop is started with the function set in the parameter "SMS: Reaction (n>Nmax)" (STO, SS1 or SS2).		

3.9.2.2 Safely limited speed (SLS)

Safely-Limited Speed / SLS			
Description	When the value has fallen below the parameterised speed limit Nlim or, at the latest, after the adjustable braking time has elapsed, the safety module monitors that the set limited speed Nlim is not exceeded.		
	• The drive must be braked to the limited speed through the application! • For operation within the limit values the "SLS1...4 monitored" status is set (C15000). • The status can be assigned to the safe output as a safe speed monitor. ▸ Safe output (📖 49) • The status can also be reported via the safety bus. • The function must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly. • The permissible direction of movement can be set via a parameter. • When the direction monitoring SDIxxx is combined with the SLSx function, the delay times must be adapted to each other. The braking time Nlim then starts at the same time as the SDI delay time.		
Function	 Function B (monitoring is active before the braking time has elapsed)		
Parameter	❶	C15330/1...4	SLS1...4: Limited speed Nlim
	❷	C15331/1...4	SLS1...4: Braking time Nlim
	❸	C15332/1...4	SLS1...4: Reaction (n>Nlim) • Selection of the function to be executed (STO, SS1 or SS2) if monitoring responds.
		C15333/1...4	SLS1...4: Perm. direction of movement
		C15350	SLS, SMS: Max. response time • If in the event of an error the speed is still outside the limit values after the response time has elapsed, STO is tripped immediately. • Detailed information can be found in the chapter "Error analysis for the functions SMS and SLS". (📖 65)
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46)		
Error behaviour	If the speed exceeds the set limited speed Nlim in the monitored state, an error message is generated and an error stop is triggered with the function set in the parameter "SLS1...4: Reaction (n>Nlim)" (STO, SS1 or SS2).		



3.9.2.3 Error analysis for the functions SMS and SLS

Error analysis	
	The speed values are evaluated and checked for plausibility in a cycle of 2 ms. The following illustration shows the process from the moment the error occurred. 
	A Occurrence of the error event • The speed exceeds the limit value parameterised for SMS or SLS.
	B Detection of the error event • After the internal response time t_C of max. one evaluation cycle has elapsed, the parameterised function (STO, SS1 or SS2) is started as the error response. • With the parameterised function SS1 or SS2, the stopping time t_S set for SS1/SS2 is added to the internal response time, until STO is started in the event of an error.
	C Response instance in the case of continuous exceedance • By parameterising the maximum response time t_R (C15350), continuous exceedance of the limit values can be avoided. • If the speed is outside the limit values even after the response time t_R has elapsed, STO is started immediately.
	In the event of an error, the set limited speed will be exceeded. In order to evaluate the risk for the system, you must calculate the amount of the maximum exceedance. The following must be taken into account: • Internal response time • Application-specific response time • Application-specific maximum acceleration

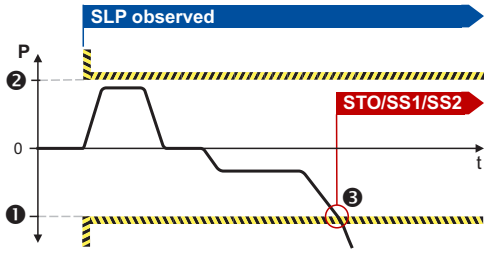
3.9.3 Safe direction (SDI)

Short overview of the "Safety functions → Safe direction" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15340	Setting of a permanent monitoring function for the direction of movement in normal operation.	Enable both directions	
C15341	Safely monitored time from activation up to switching on of the SDIpos/SDIneg monitoring.	0	ms
C15342	Setting of the tolerance threshold specifying by how many increments the motor may move in the direction locked by SDI.	0	Incr.
C15343	Response to a violation of the permissible direction of movement of the motor.	SS1	

Safe **Di**rection / SDI			
Description	This function allows you to monitor a direction. The safety module monitors whether the drive reaches the set direction in the parameterised delay time and, after the delay time has elapsed, indicates that the direction is monitored. In the monitoring phase, a tolerance threshold ensures that the drive does not leave the permissible direction.		
	• The direction must be observed by the application! • For operation within the limit values the "SDIpos/SDIneg monitored" status is set (C15000). • The status can be assigned to the safe output. ▸ Safe output (📖 49) • The status can also be reported via the safety bus. • The function must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly.		
Preconditions	The safe directions SDIpos and SDIneg.		
Function			
Parameter		C15340	SDI: Normal operation monitoring
	❶	C15341	SDI: Delay time
	❷	C15342	SDI: Tolerance threshold
	❸	C15343	SDI: Error response
	If the SDI delay time (C15341) is parameterised higher than zero, either the "SDIxxx monitored" response must be evaluated (safety bus or safe output) or the risk analysis must show that the delay does not represent a danger. This must e.g. be considered for the calculation of the safety distance.		

Safe **Di**rection / SDI	
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46) • For normal operation, the safe direction can be fixedly set via a safe parameter. • The safe direction can be combined with the safely-limited speed SLS.
Error behaviour	If the SDI tolerance threshold for the set SDIpos/SDIneg direction is exceeded after the SDI delay time has elapsed an error message is activated and an error stop with the function set in the "SDI: Error response" parameter (STO, SS1 or SS2) is triggered.



3.9.4 Safely limited position (SLP)

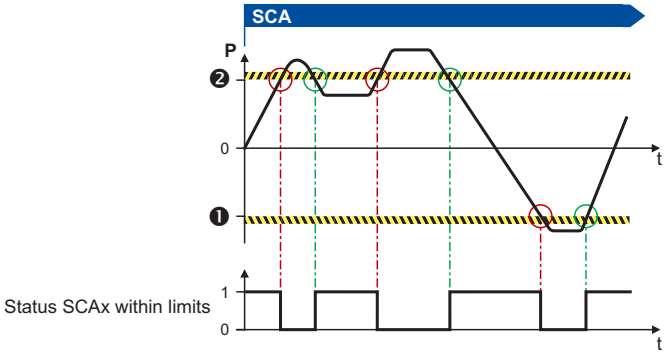
The SM302 safety module supports safe monitoring of absolute positions by the functions:

- Safe referencing (SREF) (📖 42)
- Safe cam (SCA) (📖 70)
- Position-dependent speed (PDSS) (📖 71)

Short overview of the "Safety functions → Safely limited position" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
SLP safety function: safely limited absolute position			
C15360/1 ... /4	Lower position limit for SLP1 ... SLP4	0	Incr.
C15361/1 ... /4	Upper position limit for SLP1 ... SLP4	0	Incr.
C15362/1 ... /4	Error response for SLP1 ... SLP4	SS1	

<table>
<tr><th colspan="4">Safely-limited position / SLP</th></tr>
<tr><td>Description</td><td colspan="3">The safety module monitors the lower and upper Plim position limit.</td></tr>
<tr><td>  </td><td colspan="3">If the drives violates the upper or lower limit value in the course of limit value monitoring, an error response is activated, providing the possibility that the position value monitored is exceeded by the coast-down of the torqueless motor.</td></tr>
<tr><td>Function</td><td colspan="3">For monitoring an absolute position range, an upper and a lower position value must be set via a safe parameter. Up to four absolute position limit value pairs can be parameterised and monitored at the same time.
In order to execute this function, an absolute home position must be available in the system, which is approached before the function is executed.
▸ Safe referencing (SREF) (📖 42)
Otherwise the safe speed limitation (SLS1 - SLS4) parameterised is triggered when the SLP function is activated, which can be executed during normal operation and special operation. It is to be possible to execute the SLP function during normal operation and special operation (OMS).
If a safe reference is available, monitoring of the upper and lower position limit values parameterised is carried out at the time of request.
This state is shown by the "SLPx monitored" status bit.
 
</td></tr>
<tr><td rowspan="3">Parameter</td><td>❶</td><td>C15360/1...4</td><td>SLP1...4: lower position limit</td></tr>
<tr><td>❷</td><td>C15361/1...4</td><td>SLP1...4: upper position limit</td></tr>
<tr><td>❸</td><td>C15362</td><td>SLP: error response (p_{safe}<>Plim)
• Selection of the function to be executed (STO, SS1 or SS2) if monitoring responds.
• If in the event of an error the speed is still outside the limit values after the response time has elapsed, STO is tripped immediately.</td></tr>
<tr><td>Activation</td><td colspan="3">How to activate the function:
• A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus.
▸ Safety bus (📖 84)
• "OFF state" at a safe input which has been assigned to the function by parameter setting.
▸ Safe inputs (📖 46)</td></tr>
<tr><td>Error behaviour</td><td colspan="3">If the drive, whilst being monitored, exceeds the absolute position Plim that has been set, an error message is triggered and an error stop is activated using the function set in the "SLP1...4: error response (p_{safe}<>Plim)" parameter (STO, SS1, or SS2).</td></tr>
</table>



3.9.5 Safe cam (SCA)

Note!

In order to execute this function, a safety-rated encoder system must be used.

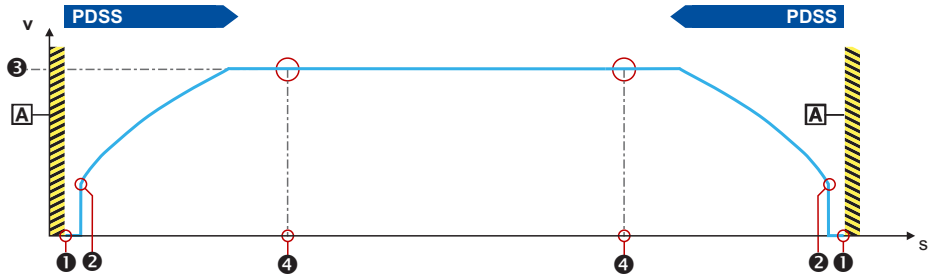
Short overview of the "Safety functions → Safe cam" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15365/1 ... /4	SCA1 ... SCA4: lower position limit	0	Incr.
C15366/1 ... /4	SCA1 ... SCA4: upper position limit	0	Incr.

Safe CAm / SCA			
Description	The safety module monitors the lower and upper position limit value.		
	In order to execute the SCA function, a safe home position must be available in the system.		
Function	When this function is executed, the current absolute position is compared to the position limits parameterised. This binary state is shown via status bits 4 ... 7 in C15001. The function is activated by entering a parameter value (≠ 0). The status is transferred to the safety and standard application. 		
Parameter	❶	C15365/1...4	SCA: lower position limit
	❷	C15366/1...4	SCA: upper position limit
Activation	By entering the corresponding parameter value > 0, the function is activated.		

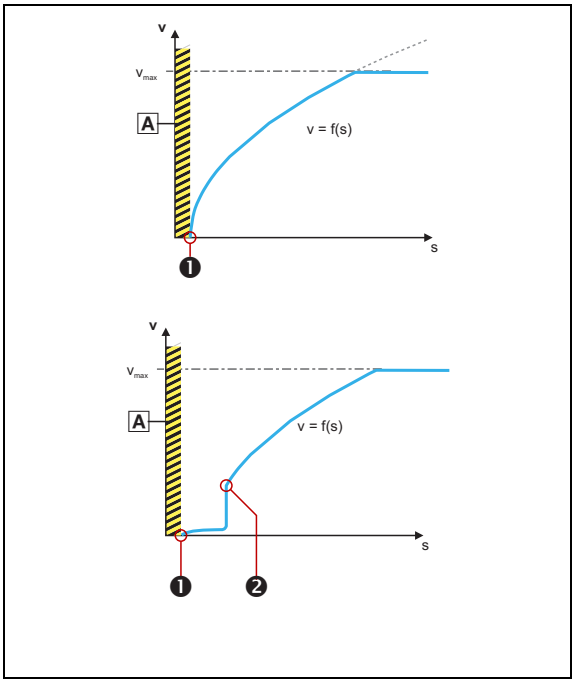
3.9.6 Position-dependent speed (PDSS)

Danger!



The suitability of the slip compensation described in this section must be checked for the application in each case.

If slip compensation is used, the diagnostic marks must be cyclically overtravelled. The diagnostic interval has to be defined by a corresponding risk assessment process.



The diagnostic test interval has to be ensured by a higher-level control component.

Short overview of the "Safety functions → Position-dependent speed" parameter group:

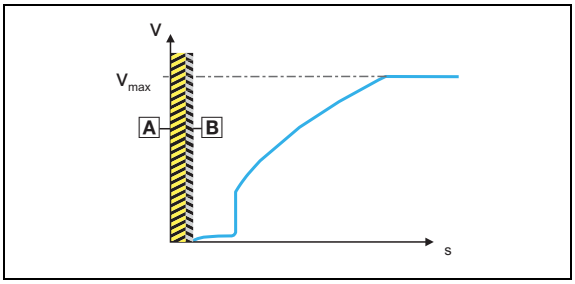
Parameter	Info	Lenze setting	
		Value	Unit
C15370	Lower position limit for PDSS.	0	Incr.
C15371	Upper position limit for PDSS.	0	Incr.
C15372	Lower SCS limit for PDSS. A value of zero deactivates the function.	0	Incr.
C15373	Upper SCS limit for PDSS. A value of zero deactivates the function.	0	Incr.
C15374	Safe creeping speed from the lower SCS limit onwards in the direction of the lower position limit.	0	min^{-1}
C15375	Safe creeping speed from the upper SCS limit onwards in the direction of the upper position limit.	0	min^{-1}
C15376	Value of the maximum permissible speed for PDSS.	0	min^{-1}
C15377	Value of the maximum negative acceleration in the direction of the lower position limit for PDSS.	0	m/s^2
C15378	Value of the maximum negative acceleration in the direction of the upper position limit for PDSS.	0	m/s^2
C15379	Setting of the input source for the PDSS diagnostic positions.	deactivated	
C15380	Setting of the level for detecting a PDSS diagnostic position if Ref-In or PDSS-Diag-In is parameterised as input source at SD-In.	LOW level	
C15381	Setting of the lower diagnostic position for PDSS.	0	Incr.
C15382	Setting of the upper diagnostic position for PDSS.	0	Incr.
C15383	Setting of the permissible tolerance margin when overtravelling the diagnostic positions for PDSS.	0	Incr.
C15384	Activation/deactivation of the slip compensation in the end regions of the PDSS function.	deactivated	
C15385	Permanent activation of the PDSS function without any request via S-bus or SD-In.	On request	
C15387	Response to errors detected in the PDSS function.	SS1	

Position-dependent Safe Speed / PDSS			
Description	The "Position-dependent safe speed" function • monitors the speed of a drive as a function of the absolute position along a motion range. • enables the use of a physically limited motion range without the use of mechanical buffers and limit switches. Further descriptions for this function can be found in the following sections: ▸ Safe creeping speed (SCS) (📖 73) ▸ Slip compensation (📖 73)		
			
Function	 A prohibited range of the lower / upper position limit B impermissible range of the lower / upper position limit		
Parameter	❶	C15370 C15371	PDSS: lower / upper position limit
	❷	C15372 C15373	PDSS: lower / upper SCS limit
		C15374 C15375	PDSS: SCS from the lower / upper limit onwards
		C15377 C15378	PDSS: max. deceleration of the lower / upper limit
	❸	C15376	PDSS: max. speed
	❹	C15381 C15382	PDSS: lower / upper diagnostic position
		C15379	PDSS: diag-pos. input source
		C15380	PDSS: detection of diagnostic position
		C15383	PDSS: tolerance of diagnostic position
		C15384	PDSS: slip comp. in the end region
		C15385	PDSS: permanent activation
		C15387	PDSS: error response
		C15388	PDSS: curr. difference of diag. pos.
		C15389	PDSS: curr. speed monitored
Activation	How to activate the function: • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46) Furthermore the function can be parameterised as permanently active.		
Error behaviour	If the envelope curve is exceeded or if the absolute position limits are exited, an error message is triggered and an error stop is initiated with the function set in the C15387 parameter (STO, SS1 or SS2).		

Safe creeping speed (SCS)

Depending on the application, the drive often is not able to approach the end point ❶ with the speed limited by the monitoring function without running the risk of exceeding the limit to the impermissible range A.

By parameterising a safe creeping speed (SCS, **S**afe **C**rawling **S**peed) which becomes effective when the position ❷ is reached, the impermissible range A can be nearly approached.



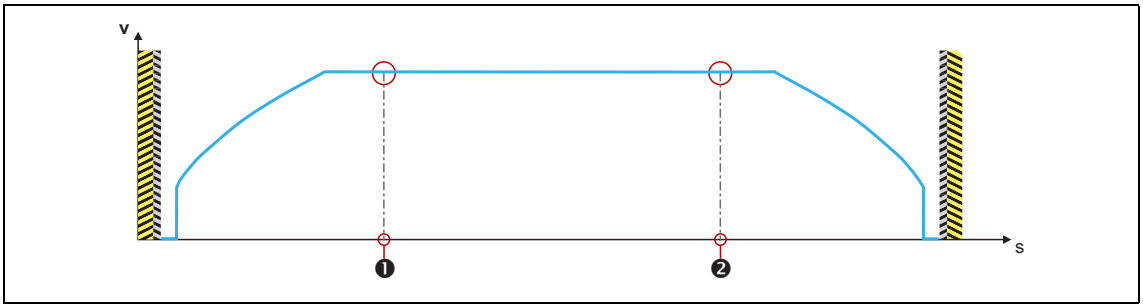
The distance of the end point ❶ to the impermissible range must be selected so great, taking all tolerance margins parameterised into consideration, that it does not collide with the impermissible range in any case.

The changeover of the speed that depends on the direction of movement makes it possible for the drive to move away from the impermissible range A at maximum speed afterwards.

Slip compensation

If an operational slip between the load encoder and the motor encoder is to be expected (e.g. friction wheel drive), the slip can be evaluated by the safety module and can be adapted or compensated cyclically.

The possibility of permanently activating the slip compensation that is not linked with the PDSS function is provided. It can be deactivated for the ranges between the diagnostic positions and the end of the travel path by parameterisation in the PDSS function.



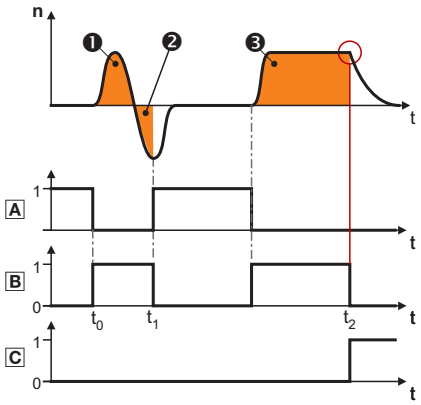
With regard to the application, it must be ensured that the limit to the impermissible range A is not overtravelled.

Therefore the buffer end range must be increased by the maximum permissible slip, range B.

The function must be activated by the user (C15540) and is in particular provided for the travel ranges beyond the buffer zones. The function brings about a reduction of the buffer end zones and serves to provide for a better availability of the system.

When the slip compensation function is activated, diagnostic marks are required to cyclically verify the faultlessness of the position encoder. In order to provide for a sufficient braking distance in the event of an error, it has to be ensured that the diagnostic marks are arranged so as to make it possible to detect errors in the range of the maximum permissible speed. The cycle for overtravelling the diagnostic marks must be controlled by the application and has to be monitored with regard to safety.

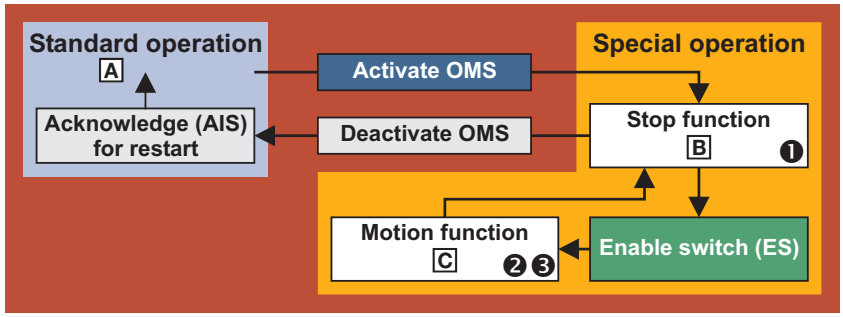
When the function is activated, a cyclic position comparison between the diagnostic marks ❶ and ❷ is carried out within every computing cycle of the safety module between the motor encoder and the position encoder. Therefore the diagnostic marks are located upstream of the buffer zones of the travel path ends in each case:



When the diagnostic positions are overtravelled, a comparison of the safely parameterised diagnostic marks with the current absolute value encoder position is carried out. If the difference is outside a tolerance window to be parameterised, the error response parameterised is triggered.

3.9.7 Safely limited increment (SLI)

Short overview of the "Safety functions → Safely limited increment" parameter group:



Parameter	Info	Lenze setting	
		Value	Unit
C15203	Number of increments for a safely limited increment in special operation. The value "0" deactivates the SLI function.	1	Incr.
C15325	Number of increments for a safely limited increment in normal operation. The value "0" deactivates the SLI function.	1	Incr.
C15204	Value of the maximum position change while SLI has been active.		
Greyed out = display parameter			

Safely limited Increment / SLI	
Description	With this function, a maximum permissible change in position can be set. This function is activated via the safety bus by activation of a safe sensor input or as a function of the operating mode changeover by selection of special operation. In order to execute this function, a safety-rated encoder system must be used. Within this position window, the increments parameterised can be traversed in positive and negative directions. There is no time limit for executing this function. Exceeding the increment limits parameterised triggers the "Safely limited increment exceeded" error. The "SLI active" bit is provided as status information or control information.
Function	 A SLI request B SLI status active C SLI error exceeded ❶ Time segment t_0 ... t_1 • Distance covered in the positive direction. • The SLI function is active. ❷ Time segment t_0 ... t_1 • Distance covered in the negative direction. • The SLI function is deactivated at the time t_1. ❸ Time t_2 • When the SLI is active, the "Safely limited increment exceeded" error is triggered. • The drive is switched off and reaches a standstill after having covered a distance.
Activation	How to activate the function: • When the SLI increment is exceeded, an error message is triggered and the STO error stop is activated. • A data frame with a corresponding content is sent to Servo Drives 9400 via the safety bus. ▸ Safety bus (📖 84) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 46)
Error behaviour	If the maximum permissible change in position is exceeded, an error stop is activated with the STO function.

3.9.8 Operation mode selection (OMS)

Short overview of the "Safety functions → Operation mode selection" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15200	Defines the stop function in special operation.	STO	
C15201	Defines the motion function in special operation.	SLS1	
C15202	Function that is executed with a LOW level at the safe input using the OMS function. Please note: On the basis of the closed-circuit principle, the parameter setting must not pose any additional risk!	Normal operation	

<table>
<tr><th colspan="4">Operation Mode Selector / OMS</th></tr>
<tr><td>Description</td><td colspan="3">This function serves to switch between normal operation and "special operation" of the drive.</td></tr>
<tr><td>  </td><td colspan="3">• Special operation enables the overriding of a standard stop (STO, SS1 and SS2) by release through the enable switch. ▸ Enable switch (ES) (📖 80)
• The monitoring function of the safely limited increment is active as soon as a value > 0 has been entered in C15203. The setting "0" deactivates the SLI monitoring function.
• The monitoring function parameterised is automatically activated with the transition to special operation. A motion function other than "traverse freely" at the same time is monitoring function in special operation.</td></tr>
<tr><td>  </td><td colspan="3">OMS: Function at LOW level
If the operation mode selector is implemented via a safe input, the operating mode for the LOW level is to be selected with care.
According to the closed-circuit principle, no additional danger must be caused by normal or special operation in the corresponding application.
For detailed information, please see the manual for the safety module.</td></tr>
<tr><td>Preconditions</td><td colspan="3">• A safe input must be parameterised and interconnected as an operation mode selector. You can only connect and parameterise one operation mode selector. The OMS bit of the safety bus must be deactivated (C15113). When a safe input is used, the LOW level function must be set depending on the application.
• Special operation can also be selected via the safety bus with the OMS bit unless a safety input is set as an operation mode selector.
• The plausibility check rejects ambiguous settings until you have parameterised them correctly.</td></tr>

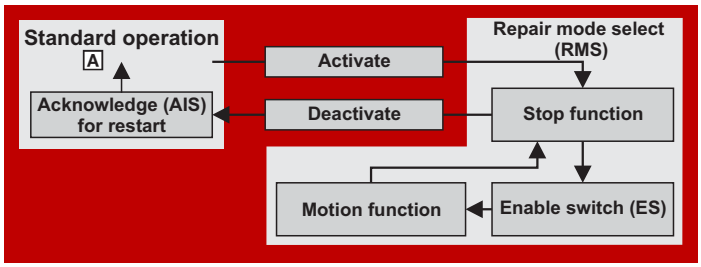
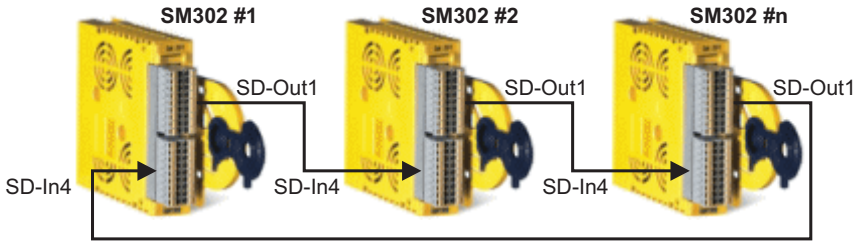
<tr><td></td><td>❸</td><td>C15203</td><td>Safely limited increment</td></tr>
<tr><td>Requesting the special operation</td><td colspan="3">How to request the special operation:
• "ON state" at a safe input to which the "operation mode selector" function has been assigned by parameter setting. ▸ Safe inputs (📖 46)
• Only if no safe input is used, the function can be activated via the safety bus by sending a data frame with a corresponding content to Servo Drives 9400.</td></tr>
<tr><td>  </td><td colspan="3">If the OMS bit is received via the safety bus, the value 0 (normal operation) is adopted in the case of passivation. In special applications (e.g. safety door requests OMS, i.e. open safety door = special operation), this must not lead to a dangerous state through an automatic restart!</td></tr>
</table>

Operation **M**ode **S**elector / OMS	
Deactivating special operation	A change-over from special operation to normal operation is only possible when the drive is at standstill (stop function STO, SS1 or SS2 active). • For a restart, the restart must be acknowledged (AIS) via terminal or safety bus. • The automatic restart is not permitted. If the "Automatic restart" is parameterised, this must be prevented by special measures, e.g. programming in the master control.
Error behaviour	• The monitoring functions SMS and SLS can be activated in both operating modes and trigger the parameterised stop function in the event of a error. • If the SLI monitoring function is active, exceeding the position window activates the parameterised stop function for special operation. • The emergency stop function can be triggered in both operating modes.



3.9.8.1 Enable switch (ES)

Enable **S**witch / ES	
Description	This function enables overriding of the standard stop functions STO, SS1 and SS2 during special operation.
	A release via the enable switch activates the parameterised motion function during special operation and the drive can be traversed. The stopping times assigned to the stop functions are directly deactivated/stopped.
Preconditions	• A safe input must be parameterised and interconnected as an enable switch. You can only connect and parameterise one enable switch. The ES bit of the safety bus must be deactivated (C15113). • The confirmation can also be selected via the safety bus using the ES bit unless a safe input is set as an enable switch. • Special operation must be activated. ▸ Operation mode selection (OMS) (📖 77) • The plausibility check rejects ambiguous settings until you have parameterised them correctly.
Activation	How to activate the function: • "ON state" at a safe input to which the "enable switch" function has been assigned by parameter setting. ▸ Safe inputs (📖 46) • Only if no safe input is used, the function can be activated via the safety bus by sending a data frame with a corresponding content to Servo Drives 9400.



3.9.9 Repair mode select (RMS)

Short overview of the "Safety functions → Repair mode select" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15210	Defines the stop function in repair mode.	STO	

Repair Mode Select (RMS)			
Description	This function moves the drive from a situation that is blocking it ("Deadlock").		
	In the safety concept, this state is accounted for as a special case for actuating an axis connected, the encoders connected being evaluated in a non-safety-rated fashion.		
	This function must only be used for a vertical axis with a brake on the load side, in order to move a drive from a deadlock, thus re-enabling the special operation that has been parameterised.		
Examples of special cases	1. In the case of a hoist drive with a brake on the load side, a difference between the motor position value and the load encoder position value may occur if the motor brake is applied with a delay. The axis must then be traversed to the position in which the position of both encoders is identical again. The load encoder must not be evaluated in this process, since it would supply static values until the operating position is reached. 2. If the load encoder fails, or if the motor encoder is defective, the corresponding axis must be moved to a position in which it can be repaired.		
Function			
	In repair mode, the safety functions are solely restricted to the parameterisable stop functions STO and SS1 (without ramp monitoring) and the effectiveness of the enable switch.		
Parameter	❶	C15210	RMS: stop function
Requesting the repair mode	How to request the repair mode: • "ON state" at a safe input to which the "Repair mode select (RMS)" has been assigned by parameterisation. ▸ Safe inputs (📖 46) • Only if no safe input is used, the function can be activated via the safety bus by sending a data frame with a corresponding content to Servo Drives 9400.		
	In repair mode, an automatic deactivation of all speed and absolute position functions is effected on the safety module, resetting the "SREF available" status bit (C15560).		
Returning to special operation	• A changeover from the repair mode can only be executed while the drive is at a standstill (STO or SS1 stop function active). • In order to restart, release is only to be carried out via the Enable switch (ES). When the repair mode has been exited, the encoder evaluation is re-activated on the basis of the present parameter setting. If the position values of the motor encoder and the Servo Drives 9400 values including the tolerance window parameterised (C15557) comply with each other after the repair mode has been exited, operation can be continued after a successful Mini-homing process, automatically activating the "SREF available" status bit (C15560) and the absolute position functions currently requested.		
Error behaviour	If the position values of the motor encoder and those of the load encoder do not comply with each other when the repair mode has been exited, the following error states are shown when the absolute position monitoring function is activated: • Exit position window • Slip error • Deactivation of the PDDS function		

3.9.10 Cascading (CAS)

Cascading / CAS		
Description	This function enables the synchronised shutdown of an entire drive system.	
	• The function can only be activated via parameter setting. See parameter "CAS: Cascading". • When the function is active: • The safe SD-In4 input is used as a cascading input and can no longer be used as universal input. • The safe SD-Out1 output is used as a cascading output and can no longer be parameterised as universal feedback output. • An emergency stop function (SSE) tripped by cascading cannot be overridden by the Enable switch (ES) during special operation. • The cascade triggers with every STO, independently of which safety module has the STO status and for what reason. • All safety modules of the cascade can only be enabled if all cascading inputs (SD-In4) are in the OFF state.	
Preconditions	• The SD-In4 input must be parameterised as an active input for the "emergency stop" function and the input delay for SD-In4 must be ≤ 10 ms. ▸ Safe inputs (📖 46) • Via the "SSE: Emergency stop function" parameter, STO must be parameterised as the emergency stop function to be executed. ▸ Emergency stop function (SSE) (📖 56) • The restart behaviour following the execution of the STO/SS1 stop function must be parameterised to "acknowledged restart". ▸ Restart behaviour (📖 55) • The control of the SD-Out1 output via a parameterised safety bus must be inhibited. ▸ Safety bus (📖 84) • The plausibility check rejects other settings until they are parameterised correctly. • In the cascade connection, you can only change from the SS2/SOS stop function to the confirmation during special operation. The STO/SS1 stop function would always trigger the interconnection and a confirmation would thus not be possible.	
Principle		
Parameter	C15035	CAS: Cascading
	C15036	CAS: Stop delay • Display of the time that passes between switching of the SD-Out1 output to the OFF state and the detection of the OFF state at the SD-In4 input. This information can be helpful when commissioning/maintaining the system. • If "0 ms" is displayed after a stop, another safety module has triggered the stop via the cascade. • The time that passes until the next system acknowledgement is displayed.
Activate	How to activate the function: • Set "CAS: Cascading" parameter to "cascading with SD-In4".	

Tip!

Detailed information on cascade wiring can be found in the manual for the safety module.

3.10 Safety bus

The safety module provides parameterisable interfaces for standardised safety bus systems. By selecting the bus system, the corresponding parameters are made available.

Short overview of "Safety bus" parameter group:

Parameter	Info		Lenze setting
C15100	S-bus: Configuration		No safety bus
C15113	S bus: Filter control data (bit-coded):		
	Bit 0	STO	Passing through
	Bit 1	SS1	Passing through
	Bit 2	SS2	Passing through
	Bit 3	SLS1	Passing through
	Bit 4	SLS2	Passing through
	Bit 5	SLS3	Passing through
	Bit 6	SLS4	Passing through
	Bit 7	SDIpos	Passing through
	Bit 8	SDIneg	Passing through
	Bit 9	ES	Passing through
	Bit 10	SLI	Passing through
	Bit 11	OMS	Passing through
	Bit 12	SLP1	Passing through
	Bit 13	SLP2	Passing through
	Bit 14	SLP3	Passing through
	Bit 15	SLP4	Passing through
	Bit 16	PS_AIS	Passing through
	Bit 17	PS_AIE	Passing through
	Bit 18	Reserved	
	Bit 19	RMS	Passing through
	Bit 20	SREF Start	Passing through
	Bit 21	SREF Load	Passing through
	Bit 22	PDSS	Passing through
	Bit 23	SSE	Passing through
	Bit 24	SD-Out1	Passing through
	Bits 25 ... 31	Reserved	
Bits not listed are reserved for future extensions!			

S-bus: Configuration

Selection of the safety bus system used. Communication modes that are currently being supported:

- Operation without safety bus
- Operation with PROFIsafe protocol via PROFINET
- Operation with Safety over EtherCAT (FSoE)

S bus: Filter control data

Unused functions in the control data of the safety bus must be set to "Inhibit" via this parameter. Then, these functions cannot be activated anymore via the safety bus independently of the transmitted control data.

3.10.1 PROFIsafe connection

Preconditions

The SM302 safety module supports the transmission of safe information via the PROFIsafe protocol in compliance with the "PROFIsafe - Profile for Safety Technology" specification, version 2.0 of the PROFIBUS user organisation (PNO). Servo Drives 9400 forwards the PROFIsafe information to the safety module for safe evaluation.

PROFIsafe connection	Required communication module	S bus: Configuration (C15100)
PROFINET	E94AYCER (PROFINET) From software version V3	PROFIsafe / PROFINET

Note!

Operation with PROFIsafe via PROFINET is only permissible according to the "PROFIsafe-Profile for Safety Technology" specification, version 2.x!

Addressing

In order that a data telegram reaches the correct device, a unique PROFIsafe target address is required. If "PROFIsafe" has been selected as safety bus, the safety address is accepted simultaneously as the PROFIsafe target address. This address must match the corresponding configuration of the safety PLC.

▸ Setting of the safety address (📖 34)

PROFIsafe frame

Note!

The PROFIsafe data is sent in the second slot of a PROFINET data telegram. This must be observed for the hardware configuration of the safety PLC!

PROFINET data telegram			
header	Slot 1	Slot 2	Trailer
	Data	PROFIsafe message	

PROFIsafe message

One bit of the PROFIsafe data is always used to control specific safety functions.

- The structure of the PROFIsafe data is described in the PROFIsafe profile.
- The length of the PROFIsafe data (PROFIsafe message) in the SM302 is 16 bytes (fix).

PROFIsafe message - V2 mode								
	Bit offset							
Byte offset	7	6	5	4	3	2	1	0
0 ... 11	PROFIsafe process data (PROFIsafe output data/PROFIsafe input data)							
12	Control byte or status byte							
13 ... 15	CRC2 (Signature originating from PROFIsafe process data, PROFIsafe parameters and the consecutive number)							

- In the following subchapters, the meaning of the PROFIsafe process data is separately described for PROFIsafe output data and PROFIsafe input data.

Tip!

For detailed information about the PROFIsafe message, please see the manual for the safety module and the PROFINET communication manual.

3.10.2 FSoE connection

Preconditions

The SM302 safety module supports the transmission of safe information via the Safety over EtherCAT protocol in compliance with the "ETG.5100 S" specification, version 1.2.0, of the EtherCAT user organisation (ETG). The Servo Drives 9400 forwards the FSoE information to the safety module for safe evaluation.

FSoE connection	Required communication module	S bus: Configuration (C15100)
EtherCAT	E94AYCET (EtherCAT) From software version V04.xx	FSoE / EtherCAT

Note!

A safety bus system can only be actuated via the upper module slot (MXI1) of Servo Drives 9400.

Addressing

In order that a data telegram reaches the right node, a unique safety address is required. This address must comply with the corresponding configuration of the safety PLC and may be allocated only once within the EtherCAT network.

▸ Setting of the safety address (📖 34)

Configuration of the safety process data (PDO mapping)

Without configuring the safety process data, an FSoE connection is not possible.

The Safety-PDO-Mapping must be set exclusively via the EtherCAT configuration software. The structure of the safety process data are predefined in the device description file (ESI) and cannot be modified.

Observe the following for the PDO configuration:

- The standard data must always be inserted as "module 1" and
- the safety process data can be optionally inserted as "module 2".

FSoE frame

Protocol data	
Range	**Values**
Process data	1 ... 32 process data words for each direction (max. 64 bytes, 16 bits/word)
Parameter data	Max. 128 bytes (mailbox size for CoE transfer)
Safety data when using the SM302	Safety outputs: 11 bytes Safety inputs: 19 bytes

Configuration of the FSoE master

Set the following FSoE communication parameters for the FSoE connection with the SM302 safety module in the FSoE master as follows:

- Safety address / FSoE address
  - Permitted values: 1 ... 65534
  - For display see C15112
- FSoE watchdog time
  - Permitted values: 30 ... 5000 ms
  - For display see C15127
- Connection ID
  - Permitted values: 1 ... 65535
  - For display see C15121
- Communication Parameter Length
  - Permitted value: 2
  - For display see C15129
- Application Parameter Length
  - Permitted value: 0
  - For display see C15130

3.10.3 PROFIsafe output data

The PROFIsafe output data (control data) is transmitted from the control to the safety module.

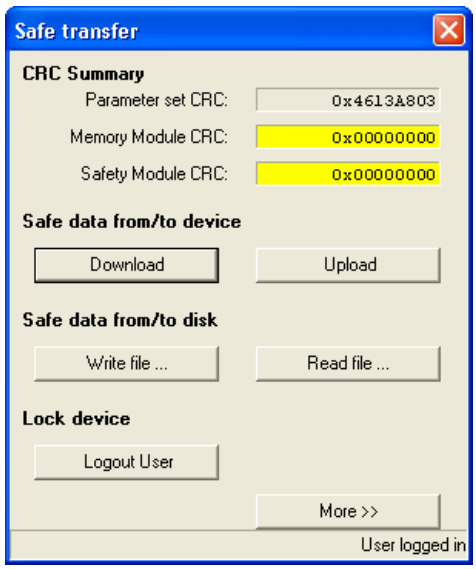
Bit	Name	Value	Meaning
0	STO	0	The STO function is activated.
1	SS1	0	The SS1 function is activated.
2	SS2	0	The SS2 function is activated.
3	SLS1	0	The SLS1 function is activated.
4	SLS2	0	The SLS2 function is activated.
5	SLS3	0	The SLS3 function is activated.
6	SLS4	0	The SLS4 function is activated.
7	SDIpos	0	The SDIpos function is activated.
8	SDIneg	0	The SDIneg function is activated.
9	ES	1	Confirmation is active: During special operation ➞ motion functions are possible.
10	SLI	0	The SLI function is activated.
11	OMS	0	Normal operation
		1	Special operation
12	SLP1	0	The SLP1 function is activated.
13	SLP2	0	The SLP2 function is activated.
14	SLP3	0	The SLP3 function is activated.
15	SLP4	0	The SLP4 function is activated.
16	AIS	0↗1	Activate restart acknowledgement. The bit must be set for at least one S bus cycle.
17	AIE	0↗1	Activation of error acknowledgement. The bit must be set for at least one S bus cycle.
18	Reserved		
19	RMS	1	Repair mode is activated.
20	SREF Start	0↗1	Starts the homing process.
21	SREF Load	0↗1	Acceptance of the absolute home position parameterised.
22	PDSS	0	The PDSS function is activated.
23	SSE	0	The SSE function is activated.
24	SD-Out1	1	The SD-Out1 output is set to ON state.
25-26	Reserved		

Unused functions in the control data of the safety bus must be set to "Inhibit" via the parameter "S-bus: Control data filter" (C15113). Then, these functions cannot be activated anymore via the safety bus independently of the transmitted control data.

The parameter "S-bus: display control data" (C15115) displays the control data filtered via C15113.

3.10.4 PROFIsafe input data

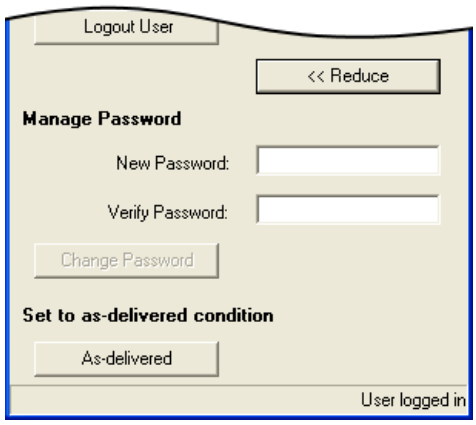
The PROFIsafe input data (status information) is transmitted from the safety module to the control.



Bit	Name	Value	Meaning
0	STO is active	1	The STO function is active and the drive is safely switched to torqueless operation • This bit is also set by SS1 after the stopping time has elapsed.
1	SS1 active	1	The SS1 function is active. • At the end of the function the bit 0 (STO active) is set.
2	SS2 active	1	The SS2 function is active. • At the end of the function bit 16 (SOS monitored) is set.
3	SLS1 active	1	The SLS1 function is active. • After the Nlim1 braking time has elapsed, bit 17 (SLS1 monitored) is set in addition.
4	SLS2 active	1	The SLS2 function is active. • After the Nlim2 braking time has elapsed, bit 18 (SLS2 monitored) is set in addition.
5	SLS3 active	1	The SLS3 function is active. • After the Nlim3 braking time has elapsed, bit 19 (SLS3 monitored) is set in addition.
6	SLS4 active	1	The SDIpos function is active. • After the Nlim4 braking time has elapsed, bit 20 (SLS4 monitored) is set in addition.
7	SDIpos active	1	The SDIpos function is active. • After the delay time has elapsed, bit 21 (SDIpos monitored) is set in addition.
8	SDIneg active	1	The SDIneg function is active. • After the delay time has elapsed, bit 22 (SDIneg monitored) is set in addition.
9	ES active	1	ES function is active during special operation: Motion function
		0	ES function is not active during special operation: Stop function
10	SLI active	1	The SLI function is active.
11	OMS	1	Special operation via safe input or safety bus is requested.
12	SLP1 monitored	1	The SLP1 function is active, i.e. compliance with the absolute position limits parameterised is monitored.
13	SLP2 monitored	1	The SLP2 function is active, i.e. compliance with the absolute position limits parameterised is monitored.
14	SLP3 monitored	1	The SLP3 function is active, i.e. compliance with the absolute position limits parameterised is monitored.
15	SLP4 monitored	1	The SLP4 function is active, i.e. compliance with the absolute position limits parameterised is monitored.
16	SOS active	1	The SOS function is active, i.e. the safe operating stop is monitored.
17	SLS1 monitored	1	The SLS1 function is active, i.e. the compliance with the limited speed 1 is monitored.
18	SLS2 monitored	1	The SLS2 function is active, i.e. the compliance with the limited speed 2 is monitored.
19	SLS3 monitored	1	The SLS3 function is active, i.e. the compliance with the limited speed 3 is monitored.
20	SLS4 monitored	1	The SLS4 function is active, i.e. the compliance with the limited speed 4 is monitored.
21	SDIpos monitored	1	The SDIpos function is active, i.e. the compliance with the safe direction SDIpos is monitored.
22	SDIneg monitored	1	The SDIneg function is active, i.e. the compliance with the safe direction SDIneg is monitored.

Bit	Name	Value	Meaning
23	SSE active	1	The SSE function is monitored. • When the emergency stop function STO is parameterised, bit 0 (STO active) is set as well. • When the emergency stop function SS1 is parameterised, first bit 1 (SS1 active) is set and at the end of the function bit 0 (STO active) is set.
24	SD-In1	1	Sensor at I1A and I1B: Channels A and B are in ON state.
25	SD-In2	1	Sensor at I2A and I2B: Channels A and B are in ON state.
26	SD-In3	1	Sensor at I3A and I3B: Channels A and B are in ON state.
27	SD-In4	1	Sensor at I4A and I4B: Channels A and B are in ON state.
28	RMS active	1	Repair mode is active.
29	OMS active	1	The OMS function is active: Special operation. • In contrast to bit 11 (OMS), this bit remains set until the special operation is cancelled and the change-over to normal operation has taken place via the stop function.
		0	The OMS function is not active: Normal operation.
30	Reserved		
31	Fault active	1	Error status is active (fault or warning).
32	SREF active	1	Homing / mini-homing is active.
33	SREF available	1	Homing / mini-homing has been completed. The safe reference is known.
34	PDSSpos monitored	1	For position-dependent speed monitoring, the positive direction of movement is monitored.
35	DSSneg monitored	1	For position-dependent speed monitoring, the negative direction of movement is monitored.
36	SCA1 within the limits	1	Safe cam 1 has been parameterised and is complied with.
37	SCA2 within the limits	1	Safe cam 2 has been parameterised and is complied with.
38	SCA3 within the limits	1	Safe cam 3 has been parameterised and is complied with.
39	SCA4 within the limits	1	Safe cam 4 has been parameterised and is complied with.
40	Reserved		
41	Safe speed OK	1	"Safe speed" status signal • The speed value displayed is valid. • Value = 0: the speed value displayed is invalid.
42	n = 0	1	The safe speed is within the tolerance window parameterised with code C15310. • Value = 0: $n \neq 0$
43	Positive direction of movement	1	Status signal for showing the direction of movement • Value = 0: negative direction of movement
44	SD-Out1	1	Safe output 1 (feedback output) in the ON state.
45	Reserved		
46	Reserved		
47	Reserved		
48-55	n safe, byte 0		Safe speed in min^{-1}, byte 0
56-63	n safe, byte 1		Safe speed in min^{-1}, byte 1
64-71	p safe, byte 0		Safe position in increments, byte 0
72-79	p safe, byte 1		Safe position in increments, byte 1
80-87	p safe, byte 2		Safe position in increments, byte 2
88-95	p safe, byte 3		Safe position in increments, byte 3

4 Safe parameter transfer



The functions for a safe parameter transfer are available in the *Safe transfer* dialog box.

The *Safe transfer* dialog box is opened via the **Safe transfer** button on the *Safe configuration* tab for the SM302 safety module.

By clicking the **More >>** button in the *Safe transfer* dialog box, the functions for password management and general reset are displayed in addition.

Clicking the button now labelled with **<< Reduce** hides these functions again.

Note!

To execute the functions for a safe parameter transfer, you have to enter a device password!

When the memory module is used for the first time together with the safety module, the required password file for the safe parameter transfer is not yet available in the memory module and the error message "Reading of the password file failed" is displayed. In this case a general reset of the device is required!

With a general reset, the safe parameter set is deleted in the memory module and in the safety module and the required password file is created in the memory module. After this, the safety module must be re-parameterised. ▸ General reset of the device (📖 97)

4.1 Sending safe data

After the SM302 safety module has been completely parameterised via the *Safe configuration* tab, the parameter set can be safely transmitted to the device using this function.

Note!

This function serves to overwrite the current parameter settings of the safety module with the settings in the »Engineer«!

Before the parameter set is transferred to the safety module, a plausibility check is always carried out. Only a plausible parameter set can be transferred to the safety module!

Before the safe parameter set is transferred, the module ID is checked. If the module ID defined in the parameter set does not correspond to the module ID saved in the safety module, a confirmation prompt appears in order to prevent an unintended change of the module ID through parameter setting.

- If - after having checked the module IDs - you answer the confirmation prompt with **Yes**, the module ID defined in the parameter set is stored in the non-volatile memory of the safety module.
- C15017 displays the module ID stored in the safety module at the last parameter set transfer.
- The module ID stored in the safety module also remains available after a general reset.

How to download the parameter set:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the *Safe transfer* dialog box and click **Send**.
   - A confirmation prompt appears asking whether the parameter is really to be transmitted to the device.
3. Answer the confirmation prompt with **Yes** to continue the action.

   If you are not yet registered as user, first the *Password entry* dialog box is displayed.
4. Enter the device password and confirm with **OK**.
   - Unless an individual password has been defined, enter the standard password which is indicated in the manual for the safety module.
   - After the password has been entered, you are registered as user for a period of 30 minutes. Within this period, the password does not need to be entered again for calling a password-protected function if the online connection to the device remains established without any interruptions.

   After the registration, the parameter set is transmitted to the device, and a status message displays whether the action was successful.
5. Confirm the status message with **OK**.

Note!

After the parameter set has been transmitted, make a check of the item designation and a check/acceptance of the safety functions!

Detailed information on the check/acceptance can be found in the manual for the safety module in the "Acceptance" chapter.

4.2 Read safe data from device

Note!

This function serves to overwrite the parameter settings in the »Engineer« with the current settings of the safety module!

Only a valid parameter set can be read back from the safety module.

How to upload the parameter set:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the *Safe transfer* dialog box and click **Upload**.
   - A confirmation prompt appears asking whether the parameter is really to be uploaded from the device.
3. Answer the confirmation prompt with **Yes** to continue the action.

   If you are not yet registered as user, first the *Password entry* dialog box is displayed.
4. Enter the device password and confirm with **OK**.
   - Unless an individual password has been defined, enter the standard password which is indicated in the manual for the safety module.
   - After the password has been entered, you are registered as user for a period of 30 minutes. Within this period, the password does not need to be entered again for calling a password-protected function if the online connection to the device remains established without any interruptions.

   After the registration, the parameter set is uploaded from the device, and a status message displays whether the action was successful.
5. Confirm the status message with **OK**.

4.3 Write parameter set into file

How to write the parameter set into a file:

1. Go to the *Safe transfer* dialog box and click **Write file**.
   - The *Safe parameter set* dialog box is displayed.
2. Select the directory from the **Save in** list field, in which the file is to be saved.
3. Enter a file name into the **File name** input field.
4. Click the **Save** button.
   - The current parameter settings are saved in the selected parameter set file (*.bin) and the *Save parameter set* dialog box is closed.
   - After this, a status message displays whether the action could be carried out successfully.
5. Confirm the status message with **OK**.

4.4 Read parameter set out of file

Note!

This function serves to overwrite the parameter settings in the »Engineer« with the settings of the selected parameter set file (*.bin)!

How to read the parameter set out of the file:

1. Go to the *Safe transfer* dialog box and click **Read file**.
   - A confirmation prompt appears asking whether the data is really to be uploaded and the parameter settings in the »Engineer« are to be overwritten.
2. Answer the confirmation prompt with **Yes** to continue the action.
   - The *Read parameter set* dialog box is displayed.
3. Select the directory which contains the file to be read from the **Search in** list field.
4. Enter the name of the file to be read in the **File name** input field.
5. Click **Open**.
   - The current parameter settings are overwritten with the settings of the selected parameter set file (*.bin) and the *Open parameter set* dialog box is closed.
   - After this, a status message displays whether the action could be carried out successfully.
6. Confirm the status message with **OK**.

4.5 General reset of the device

A general reset is, among other things, required for initialising the memory module if Servo Drives 9400 (with the memory module) is used together with an SM302 safety module for the first time.

Note!

This function is used to reset safety data in the memory module.

- The safety parameter set in the memory module and in the safety module is deleted.
- The password file required for the safe parameter transfer is re-created in the memory module. By this the individual device password defined before is reset to the standard password.
- Afterwards the safety module must be re-parameterised.
- The module ID saved in the safety module is preserved.

How to execute a general reset of the device:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the advanced *Safe transfer* dialog box and click **General reset**.
   - The *Standard password entry* dialog box is displayed.
3. Enter the standard password and confirm with **OK**.
   - The default password is given in the manual for the safety module.

   The general reset is executed and then a status message displays whether the action could be carried out successfully.
4. Confirm the status message with **OK**.

4.6 Password management

For a safe parameter transfer, the device password must be entered.

- For initial commissioning, use the standard password as the device password, which is given in the manual for the safety module.
- The **Change Password** function serves to define an individual device password.

Note!

After the password has been entered, you are registered as user for a period of 30 minutes.

- Within this period, the password does not need to be entered again for calling a password-protected function if the online connection to the device remains established without any interruptions.
- The registration status is displayed at the bottom right side of the *Safe transfer* dialog box.
- Click the **Logout User** button to log out before the 30 minutes have elapsed.

Change password

This function serves to define an individual device password.

How to change the device password:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the advanced *Safe transfer* dialog box and enter the new password into the **New Password** input field.
   - The password must have at least 6 characters.
3. For verifying the new password re-enter it into the **Verify Password** input field.
   - Only if this input matches the input in the **New Password** input field, the password can be changed.
4. Click the **Change Password** button.

   If you are not yet registered as user, first the *Password entry* dialog box is displayed.
5. Enter the device password and confirm with **OK**.
   - Unless an individual password has been defined, enter the standard password which is indicated in the manual for the safety module.

   After log-on the password is changed and then a status message displays whether the action could be carried out successfully.
6. Confirm the status message with **OK**.

5 Parameter reference

Note!

This chapter supplements the parameter list and the table of attributes provided in the online documentation for Servo Drives 9400 by parameters of the SM302 safety module.

Tip!

For general information regarding parameters, please see the online documentation for Servo Drives 9400.

5.1 Parameter list

This chapter lists all parameters of the SM302 safety module in numerically ascending order.

Note!

Parameter settings are only possible via the *Safe configuration* tab for the safety module!

▸ Safe configuration (📖 29)

Only read access is possible to the parameters of the safety module via the »Engineer« parameter list (*All parameters* → **SM302 safety module** category) and the keypad!

C15000

Parameter | Name: **C15000 | Status 1 safety functions**			Data type: BITFIELD_32 Index: $9575_d = 2567_h$
Bit-coded status word 1 of the safety functions			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	STO is active		▸ Safe torque off
Bit 1	SS1 active		▸ Safe stop 1
Bit 2	SS2 active		▸ Safe stop 2
Bit 3	SLS1 active		▸ Safely limited speed 1
Bit 4	SLS2 active		▸ Safely limited speed 2
Bit 5	SLS3 active		▸ Safely limited speed 3
Bit 6	SLS4 active		▸ Safely limited speed 4
Bit 7	SDIpos active		▸ Safe positive direction of movement
Bit 8	SDIneg active		▸ Safe negative direction of movement
Bit 9	ES active		▸ Safe enable switch
Bit 10	SLI active		▸ Safely limited increment
Bit 11	OMS		▸ Safe operation mode selector
Bit 12	SLP1 monitored		▸ Safely limited absolute position 1
Bit 13	SLP2 monitored		▸ Safely limited absolute position 2
Bit 14	SLP3 monitored		▸ Safely limited absolute position 3
Bit 15	SLP4 monitored		▸ Safely limited absolute position 4
Bit 16	SOS monitored		▸ Safe operational stop is monitored
Bit 17	SLS1 monitored		▸ Safely limited speed 1 is monitored.
Bit 18	SLS2 monitored		▸ Safely limited speed 2 is monitored.
Bit 19	SLS3 monitored		▸ Safely limited speed 3 is monitored.
Bit 20	SLS4 monitored		▸ Safely limited speed 4 is monitored.
Bit 21	SDIpos monitored		▸ Safe positive direction of movement is monitored.
Bit 22	SDIneg monitored		▸ Safe negative direction of movement is monitored.
Bit 23	SSE active		▸ Emergency stop function
Bit 24	SD-In1 active		▸ Safe inputs
Bit 25	SD-In2 active		▸ Safe inputs
Bit 26	SD-In3 active		▸ Safe inputs
Bit 27	SD-In4 active		▸ Safe inputs
Bit 28	RMS active		▸ Repair mode
Bit 29	OMS active		▸ Safe operation mode selector
Bit 30	SMS monitored		▸ Safe maximum speed
Bit 31	Fault active		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15001

Parameter | Name: **C15001 | Status 2 safety functions**			Data type: BITFIELD_32 Index: $9574_d = 2566_h$
Bit-coded status word 2 of the safety functions			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	SREF active		▸ Safe referencing
Bit 1	SREF available		▸ Safe referencing
Bit 2	PDSSpos monitored		▸ Position-dependent safe speed
Bit 3	PDSSneg monitored		▸ Position-dependent safe speed
Bit 4	SCA1 within the limits		▸ Safe cam
Bit 5	SCA2 within the limits		▸ Safe cam
Bit 6	SCA3 within the limits		▸ Safe cam
Bit 7	SCA4 within the limits		▸ Safe cam
Bit 8	Reserved		
Bit 9	Safe speed OK		Validity status of the safe speed shown: • 1 = OK • 0 = error
Bit 10	n = 0		The safe speed is lower than the tolerance window (n = 0) parameterised in C15013.
Bit 11	Positive direction of movement		Display of the current direction of rotation: • 1 = positive • 0 = negative
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
Bit 16	Reserved		
Bit 17	Reserved		
Bit 18	Reserved		
Bit 19	Reserved		
Bit 20	Reserved		
Bit 21	SD-Out1		▸ Safe outputs
Bit 22	Reserved		
Bit 23	Reserved		
Bit 24	Reserved		
Bit 25	Reserved		
Bit 26	Reserved		
Bit 27	Reserved		

Parameter | Name: **C15001 | Status 2 safety functions**		Data type: BITFIELD_32 Index: $9574_d = 2566_h$
Bit 28	Level 1 slip monitoring	Distance to the maximum slip limit (status bit is transferred to Servo Drives 9400 when the 2-encoder concept is applied): Level 1 = 25 %
Bit 29	Level 2 slip monitoring	Distance to the maximum slip limit (status bit is transferred to Servo Drives 9400 when the 2-encoder concept is applied): Level 2 = 50 %
Bit 30	Level 3 slip monitoring	Distance to the maximum slip limit (status bit is transferred to Servo Drives 9400 when the 2-encoder concept is applied): Level 3 = 75 %
Bit 31	Reserved	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15003

Parameter | Name: **C15003 | Command status**			Data type: UNSIGNED_16 Index: $9572_d = 2564_h$
Status of the current command • The command is repeated in the high byte. • In the low byte the status is displayed: 0x00: No command 0x01: Command executed 0x02: Password invalid 0x03: Command in process 0x04: Command not known 0x05: Command error			
Display range (min. value | unit | max. value)			
0		2309	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

Parameter | Name: **C15010 | Parameter set status**		Data type: UNSIGNED_8 Index: $9565_d = 255D_h$
Status of the parameter set		
Selection list (read only)		
0	No parameter set	
1	Parameter set valid	
2	Read error - memory module	
3	Unequal parameter set	
4	CRC error	
5	Version error	
6	Format error	
7	Plausibility error	
8	Assignment error	
9	Local read error	
10	GG communication error	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15011

Parameter | Name: **C15011 | Parameter CRC**			Data type: UNSIGNED_32 Index: $9564_d = 255C_h$
Parameter checksum (CRC = Cyclic Redundancy Code)			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Info**
C15011/1			CRC safety module
C15011/2			CRC memory module
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15013

Parameter | Name: **C15013 | Parameter set creation time**			Data type: UNSIGNED_64 Index: $9562_d = 255A_h$
Time of parameter set creation			
Display range (min. value | unit | max. value)			
0		18446744073709551615	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15014

Parameter | Name: **C15014 | Time of RTC parameter setting**	Data type: VISIBLE_STRING Index: $9561_d = 2559_h$
Time of acceptance of the parameter set from the memory module as value of the real-time clock (RTC).	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15015

Parameter | Name: **C15015 | Time of sec. parameter setting**			Data type: UNSIGNED_32 Index: $9560_d = 2558_h$
Time of acceptance of the parameter set from the memory module as value of the power-on time meter from the controller.			
Display range (min. value | unit | max. value)			
0	s	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15016

Parameter | Name: **C15016 | Parameter set version**		Data type: UNSIGNED_8 Index: $9559_d = 2557_h$
Display of the parameter set version available in the safety module.		
Selection list (read only)		**Info**
0	No current parameter set	
21	Parameter set SM302 V0.6	
22	Parameter set SM302 V0.7	
23	Parameter set SM302 V0.8	
24	Parameter set SM302 V1.1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15017

Parameter | Name: **C15017 | Stored module ID**			Data type: UNSIGNED_16 Index: $9558_d = 2556_h$
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15030

Parameter | Name: **C15030 | SD-In sensor type**		Data type: UNSIGNED_8 Index: $9545_d = 2549_h$
Configuration of sensor types which are connected to the safe inputs. ▸ Safe inputs		
Selection list		
0	Input deactivated	
1	Passive sensor	
2	Active sensor	
Subcodes	**Lenze setting**	**Info**
C15030/1	0: Input is deactivated	SD-In1 sensor type
C15030/2	0: Input is deactivated	SD-In2 sensor type
C15030/3	0: Input is deactivated	SD-In3 sensor type
C15030/4	0: Input is deactivated	SD-In4 sensor type
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15031

Parameter | Name: **C15031 | SD-In sensor function**		Data type: UNSIGNED_8 Index: $9544_d = 2548_h$
Function configuration of the safe inputs. • The "operation mode selector" and "enable switch" functions each may only be assigned to one of the four safe inputs. ▸ Safe inputs		
Selection list		**Info**
0	Free assignment	Safety function set in C15032.
1	Emergency stop	▸ Emergency stop function (SSE)
2	Operation mode selector	▸ Safe operation mode selector (OMS)
3	Enable switch	▸ Safe enable switch (ES)
4	Ref-In	▸ Safe enable switch (ES)
6	PDSS-Diag-In	▸ Position-dependent safe speed
7	Repair mode select (RMS)	▸ Repair mode
Subcodes	**Lenze setting**	**Info**
C15031/1	0: Free assignment	SD-In1 sensor function
C15031/2	0: Free assignment	SD-In2 sensor function
C15031/3	0: Free assignment	SD-In3 sensor function
C15031/4	0: Free assignment	SD-In4 sensor function
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15032

Parameter | Name: **C15032 | SD-In free assignment**		Data type: UNSIGNED_8 Index: $9543_d = 2547_h$
Assignment of a safety function to a safe input. • Only possible if the sensor function "Free assignment" is set for the safe input in C15031. ▸ Safe inputs		
Selection list		**Info**
0	STO	▸ Safe torque off
1	SS1	▸ Safe stop 1
2	SS2	▸ Safe stop 2
3	SLS1	▸ Safely limited speed 1
4	SLS2	▸ Safely limited speed 2
5	SLS3	▸ Safely limited speed 3
6	SLS4	▸ Safely limited speed 4
7	SDIpos	▸ Safe positive direction of movement
8	SDIneg	▸ Safe negative direction of movement
9	No response	No (local) safety function assigned. • Function test and monitoring of the discrepancy time are active. • The status of the input is transferred to the control via the safety bus (if parameterised).
10	SLI	▸ Safely limited increment
12	SLP1	▸ Safely limited absolute position 1
13	SLP2	▸ Safely limited absolute position 2
14	SLP3	▸ Safely limited absolute position 3
15	SLP4	▸ Safely limited absolute position 4
16	PDSS	▸ Position-dependent safe speed
Subcodes	**Lenze setting**	**Info**
C15032/1	0: STO	SD-In1 free assignment
C15032/2	0: STO	SD-In2 free assignment
C15032/3	0: STO	SD-In3 free assignment
C15032/4	0: STO	SD-In4 free assignment
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15033

Parameter | Name: **C15033 | SD-In discrepancy time**			Data type: UNSIGNED_16 Index: $9542_d = 2546_h$
Maximum time for which both channels of a safe input may have non-equivalent states without the safety system detecting an error. ▸ Safe inputs			
Setting range (min. value | unit | max. value)			
0	ms	30000	
Subcodes	**Lenze setting**		**Info**
C15033/1	10 ms		SD-In1 discrepancy time
C15033/2	10 ms		SD-In2 discrepancy time
C15033/3	10 ms		SD-In3 discrepancy time
C15033/4	10 ms		SD-In4 discrepancy time
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15034

Parameter | Name: **C15034 | SD-In input delay**			Data type: UNSIGNED_8 Index: $9541_d = 2545_h$
Time between the recognition of the signal change and the effective evaluation of an input signal. As a result, multiple and short signal changes due to contact bounce of the components are not taken into account. ▸ Safe inputs			
Setting range (min. value | unit | max. value)			
0	ms	100	

Subcodes	Lenze setting	Info
C15034/1	0 ms	SD-In1 input delay
C15034/2	0 ms	SD-In2 input delay
C15034/3	0 ms	SD-In3 input delay
C15034/4	0 ms	SD-In4 input delay

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C15035

Parameter | Name: **C15035 | CAS: Cascading**	Data type: UNSIGNED_8 Index: $9540_d = 2544_h$
Activation of cascading function. Application of SD-In4 as cascading input and SD-Out1 as cascading output. ▸ Safe cascading	
Selection list (Lenze setting printed in bold)	
0	**No cascading**
4	Cascading with SD-In4

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C15036

Parameter | Name: **C15036 | CAS: Stop delay**			Data type: UNSIGNED_16 Index: $9539_d = 2543_h$
Delay between setting and receiving the stop signal via cascading. ▸ Safe cascading			
Display range (min. value | unit | max. value)			
0	ms	65535	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C15040

Parameter | Name: **C15040 | Input image**			Data type: BITFIELD_32 Index: $9535_d = 253F_h$
Input image of the external module inputs of the safety module, displayed according to channels.			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	SD-In1 channel A		▸ Safe inputs
Bit 1	SD-In1 channel B		▸ Safe inputs
Bit 2	SD-In2 channel A		▸ Safe inputs
Bit 3	SD-In2 channel B		▸ Safe inputs
Bit 4	SD-In3 channel A		▸ Safe inputs
Bit 5	SD-In3 channel B		▸ Safe inputs
Bit 6	SD-In4 channel A		▸ Safe inputs
Bit 7	SD-In4 channel B		▸ Safe inputs
Bit 8	Reserved		
Bit 9	Reserved		
Bit 10	Reserved		
Bit 11	Reserved		
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
Bit 16	AIE		AIE input (error acknowledgement)
Bit 17	AIS		AIS input (restart acknowledgement)
Bit 18	Module switch		Module switch in housing front (acceptance of parameter set)
Bit 19	Reserved		
Bit 20	Reserved		
Bit 21	Reserved		
Bit 22	Reserved		
Bit 23	Reserved		
Bit 24	Reserved		
Bit 25	Reserved		
Bit 26	Reserved		
Bit 27	Reserved		
Bit 28	Reserved		
Bit 29	Reserved		
Bit 30	Reserved		
Bit 31	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15051

Parameter | Name: **C15051 | SD-Out switching condition**		Data type: BITFIELD_32 Index: $9524_d = 2534_h$
Bit-coded selection of the conditions for switching the safe output. ▸ Safe output		
Setting range		
0x00000000		0xFFFFFFFF
Value is bit-coded: (☑ = bit set)		**Info**
Bit 0 ☐	STO is active	▸ Safe torque off
Bit 1 ☐	STO active - neg. logic	▸ Safe torque off
Bit 2 ☐	SS1 active	▸ Safe stop 1
Bit 3 ☐	SS1 active - neg. logic	▸ Safe stop 1
Bit 4 ☐	SS2 active	▸ Safe stop 2
Bit 5 ☐	SS2 active - neg. logic	▸ Safe stop 2
Bit 6 ☐	SLS1 active	▸ Safely limited speed 1
Bit 7 ☐	SLS1 active - neg. logic	▸ Safely limited speed 1
Bit 8 ☐	SLS2 active	▸ Safely limited speed 2
Bit 9 ☐	SLS2 active - neg. logic	▸ Safely limited speed 2
Bit 10 ☐	SLS3 active	▸ Safely limited speed 3
Bit 11 ☐	SLS3 active - neg. logic	▸ Safely limited speed 3
Bit 12 ☐	SLS4 active	▸ Safely limited speed 4
Bit 13 ☐	SLS4 active - neg. logic	▸ Safely limited speed 4
Bit 14 ☐	SDIpos active	▸ Safe positive direction of movement
Bit 15 ☐	SDIpos active - neg. logic	▸ Safe positive direction of movement
Bit 16 ☐	SDIneg active	▸ Safe negative direction of movement
Bit 17 ☐	SDIneg active - neg. logic	▸ Safe negative direction of movement
Bit 18 ☐	ES active	▸ Safe enable switch
Bit 19 ☐	ES active - neg. logic	▸ Safe enable switch
Bit 20 ☐	SLI active	▸ Safely limited increment
Bit 21 ☐	SLI active - neg. logic	▸ Safely limited increment
Bit 22 ☐	OMS	▸ Safe operation mode selector
Bit 23 ☐	OMS neg. logic	▸ Safe operation mode selector
Bit 24 ☐	SLP1 monitored	▸ Safely limited absolute position 1
Bit 25 ☐	SLP1 monitored neg. logic	▸ Safely limited absolute position 1
Bit 26 ☐	SLP2 monitored	▸ Safely limited absolute position 2
Bit 27 ☐	SLP2 monitored neg. logic	▸ Safely limited absolute position 2
Bit 28 ☐	SLP3 monitored	▸ Safely limited absolute position 3
Bit 29 ☐	SLP3 monitored neg. logic	▸ Safely limited absolute position 3
Bit 30 ☐	SLP4 monitored	▸ Safely limited absolute position 4
Bit 31 ☐	SLP4 monitored neg. logic	▸ Safely limited absolute position 4
Subcodes	**Lenze setting**	**Info**
C15051/1	0x00000000	SD-Out1 switching condition
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15052

Parameter | Name: **C15052 | SD-Out switching condition**		Data type: BITFIELD_32 Index: $9523_d = 2533_h$
Bit-coded selection of the conditions for switching the safe output. ▸ Safe output		
Setting range		
0x00000000		0xFFFFFFFF
Value is bit-coded: (☑ = bit set)		**Info**
Bit 0 ☐	SOS monitored	Safe operating stop is monitored.
Bit 1 ☐	SOS monitored - neg. logic	Safe operating stop is not monitored.
Bit 2 ☐	SLS1 monitored	▸ Safely limited speed 1
Bit 3 ☐	SLS1 monitored - neg. logic	▸ Safely limited speed 1
Bit 4 ☐	SLS2 monitored	▸ Safely limited speed 2
Bit 5 ☐	SLS2 monitored - neg. logic	▸ Safely limited speed 2
Bit 6 ☐	SLS3 monitored	▸ Safely limited speed 3
Bit 7 ☐	SLS3 monitored - neg. logic	▸ Safely limited speed 3
Bit 8 ☐	SLS4 monitored	▸ Safely limited speed 4
Bit 9 ☐	SLS4 monitored - neg. logic	▸ Safely limited speed 4
Bit 10 ☐	SDIpos monitored	▸ Safe direction
Bit 11 ☐	SDIpos monitored - neg. logic	▸ Safe direction
Bit 12 ☐	SDIneg monitored	▸ Safe direction
Bit 13 ☐	SDIneg monitored - neg. logic	▸ Safe direction
Bit 14 ☐	SSE active	▸ Emergency stop function
Bit 15 ☐	SSE active - neg. logic	▸ Emergency stop function
Bit 16 ☐	SD-In1 active	▸ Safe inputs
Bit 17 ☐	SD-In1 active - neg. logic	▸ Safe inputs
Bit 18 ☐	SD-In2 active	▸ Safe inputs
Bit 19 ☐	SD-In2 active - neg. logic	▸ Safe inputs
Bit 20 ☐	SD-In3 active	▸ Safe inputs
Bit 21 ☐	SD-In3 active - neg. logic	▸ Safe inputs
Bit 22 ☐	SD-In4 active	▸ Safe inputs
Bit 23 ☐	SD-In4 active - neg. logic	▸ Safe inputs
Bit 24 ☐	RMS active	▸ Repair mode
Bit 25 ☐	RMS active - neg. logic	▸ Repair mode
Bit 26 ☐	OMS active	▸ Safe operation mode selector
Bit 27 ☐	OMS active - neg. logic	▸ Safe operation mode selector
Bit 28 ☐	Reserved	
Bit 29 ☐	Reserved	
Bit 30 ☐	Fault active	
Bit 31 ☐	Error active - neg. logic	
Subcodes	**Lenze setting**	**Info**
C15052/1	0x00000000	SD-Out1 switching condition
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15053

Parameter | Name: **C15053 | SD-Out switching condition**		Data type: BITFIELD_32 Index: $9522_d = 2532_h$
Bit-coded selection of the conditions for switching the safe output. ▸ Safe output		
Setting range		
0x00000000		0xFFFFFFFF
Value is bit-coded: (☑ = bit set)		**Info**
Bit 0 ☐	SREF active	▸ Safe referencing
Bit 1 ☐	SREF active - neg. logic	▸ Safe referencing
Bit 2 ☐	SREF available	▸ Safe referencing
Bit 3 ☐	SREF available - neg. logic	▸ Safe referencing
Bit 4 ☐	PDSSpos monitored	▸ Position-dependent safe speed
Bit 5 ☐	PDSSpos monitored - neg. logic	▸ Position-dependent safe speed
Bit 6 ☐	PDSSneg monitored	▸ Position-dependent safe speed
Bit 7 ☐	PDSSneg monitored - neg. logic	▸ Position-dependent safe speed
Bit 8 ☐	SCA1 within the limits	▸ Safe cam
Bit 9 ☐	SCA1 within the limits - neg. logic	▸ Safe cam
Bit 10 ☐	SCA2 within the limits	▸ Safe cam
Bit 11 ☐	SCA2 within the limits - neg. logic	▸ Safe cam
Bit 12 ☐	SCA3 within the limits	▸ Safe cam
Bit 13 ☐	SCA3 within the limits - neg. logic	▸ Safe cam
Bit 14 ☐	SCA4 within the limits	▸ Safe cam
Bit 15 ☐	SCA4 within the limits - neg. logic	▸ Safe cam
Bit 16 ☐	Reserved	
Bit 17 ☐	Reserved	
Bit 18 ☐	Reserved	
Bit 19 ☐	Reserved	
Bit 20 ☐	n = 0	
Bit 21 ☐	n=0 neg. logic	
Bit 22 ☐	Positive direction	
Bit 23 ☐	Positive direction - neg. logic	
Bit 24 ☐	Reserved	
Bit 25 ☐	Reserved	
Bit 26 ☐	Reserved	
Bit 27 ☐	Reserved	
Bit 28 ☐	Reserved	
Bit 29 ☐	Reserved	
Bit 30 ☐	Reserved	
Bit 31 ☐	Reserved	
Subcodes	**Lenze setting**	**Info**
C15053/1	0x00000000	SD-Out1 switching condition
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15055

Parameter | Name: **C15055 | SD-Out logic function**		Data type: UNSIGNED_8 Index: $9520_d = 2530_h$
Selection of the logic operation for the switching conditions to be evaluated. ▸ Safe output		
Selection list		
0	OR	
1	AND	
Subcodes	**Lenze setting**	**Info**
C15055/1	0: OR	SD-Out1 logic function
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1	

C15060

Parameter | Name: **C15060 | Output image**			Data type: BITFIELD_16 Index: $9515_d = 252B_h$
Output image of the feedbacks from the safety module, displayed according to channels.			
Display range			
0x0000		0xFFFF	
Value is bit-coded:			**Info**
Bit 0	SD-Out1 channel A		▸ Safe output
Bit 1	SD-Out1 channel B		▸ Safe output
Bit 2	Reserved		
Bit 3	Reserved		
Bit 4	Reserved		
Bit 5	Reserved		
Bit 6	Reserved		
Bit 7	Reserved		
Bit 8	Reserved		
Bit 9	Reserved		
Bit 10	Reserved		
Bit 11	Reserved		
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15100

Parameter | Name: **C15100 | S bus: Configuration**			Data type: UNSIGNED_8 Index: $9475_d = 2503_h$
Configuration of safe bus system. ▸ Safety bus			
Selection list (Lenze setting printed in bold)			**Info**
0	**No safety bus**		
4	PROFIsafe / PROFINET 8 words		
10	FSoE / EtherCAT		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15101

Parameter | Name: **C15101 | Current DIP switch display**			Data type: UNSIGNED_16 Index: $9474_d = 2502_h$
Display of DIP switch settings (safety address) on safety module. ▸ Safety address			
Display range (min. value | unit | max. value)			
0		1023	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15111

Parameter | Name: **C15111 | Safety address**			Data type: UNSIGNED_16 Index: $9464_d = 24F8_h$
Safety address in the safety module. ▸ Safety address			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65534	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15112

Parameter | Name: **C15112 | Effective safety address**			Data type: UNSIGNED_16 Index: $9463_d = 24F7_h$
Safety address in the safety module effectively used. ▸ Safety address			
Display range (min. value | unit | max. value)			
1		65534	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15113

Parameter | Name: **C15113 | S bus: Filter control data**			Data type: BITFIELD_32 Index: $9462_d = 24F6_h$
Bit-coded selection of the active bits in the safety bus control data ▸ Safety bus			
Setting range			**Lenze setting**
0x00000000		0xFFFFFFFF	**0x01FBFFFF** (decimal: 33292287)
Value is bit-coded: (☑ = bit set)			**Info**
Bit 0 ☑	STO		▸ Safe torque off
Bit 1 ☑	SS1		▸ Safe stop 1
Bit 2 ☑	SS2		▸ Safe stop 2
Bit 3 ☑	SLS1		▸ Safely limited speed 1
Bit 4 ☑	SLS2		▸ Safely limited speed 2
Bit 5 ☑	SLS3		▸ Safely limited speed 3
Bit 6 ☑	SLS4		▸ Safely limited speed 4
Bit 7 ☑	SDIpos		▸ Safe positive direction of movement
Bit 8 ☑	SDIneg		▸ Safe negative direction of movement
Bit 9 ☑	ES		▸ Safe enable switch
Bit 10 ☑	SLI		▸ Safely limited increment
Bit 11 ☑	OMS		▸ Safe operation mode selector
Bit 12 ☑	SLP1		▸ Safely limited position 1
Bit 13 ☑	SLP2		▸ Safely limited position 2
Bit 14 ☑	SLP3		▸ Safely limited position 3
Bit 15 ☑	SLP4		▸ Safely limited position 4
Bit 16 ☑	AIS		Restart acknowledgement via safety bus
Bit 17 ☑	AIE		Error acknowledgement via safety bus
Bit 18 ☐	Reserved		
Bit 19 ☑	RMS		▸ Repair mode
Bit 20 ☑	SREF Start		▸ Safe referencing
Bit 21 ☑	SREF Load		▸ Safe referencing
Bit 22 ☑	PDSS		▸ Position-dependent speed
Bit 23 ☑	SSE		▸ Emergency stop function
Bit 24 ☑	SD-Out1		▸ Safe output
Bit 25 ☐	Reserved		
Bit 26 ☐	Reserved		
Bit 27 ☐	Reserved		
Bit 28 ☐	Reserved		
Bit 29 ☐	Reserved		
Bit 30 ☐	Reserved		
Bit 31 ☐	Reserved		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15115

Parameter | Name: **C15115 | S bus: Control data display**			Data type: BITFIELD_32 Index: $9460_d = 24F4_h$
Display of the safety bus control data after being filtered via C15113. ▸ Safety bus			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	STO		▸ Safe torque off
Bit 1	SS1		▸ Safe stop 1
Bit 2	SS2		▸ Safe stop 2
Bit 3	SLS1		▸ Safely limited speed 1
Bit 4	SLS2		▸ Safely limited speed 2
Bit 5	SLS3		▸ Safely limited speed 3
Bit 6	SLS4		▸ Safely limited speed 4
Bit 7	SDIpos		▸ Safe positive direction of movement
Bit 8	SDIneg		▸ Safe negative direction of movement
Bit 9	ES		▸ Safe enable switch
Bit 10	SLI		▸ Safely limited increment
Bit 11	OMS		▸ Safe operation mode selector
Bit 12	SLP1		▸ Safely limited position 1
Bit 13	SLP2		▸ Safely limited position 2
Bit 14	SLP3		▸ Safely limited position 3
Bit 15	SLP4		▸ Safely limited position 4
Bit 16	AIS		Restart acknowledgement via safety bus
Bit 17	AIE		Error acknowledgement via safety bus
Bit 18	Reserved		
Bit 19	RMS		▸ Repair mode
Bit 20	SREF Start		▸ Safe referencing
Bit 21	SREF Load		▸ Safe referencing
Bit 22	PDSS		▸ Position-dependent speed
Bit 23	SSE		▸ Emergency stop function
Bit 24	SD-Out1		▸ Safe output
Bit 25	Reserved		
Bit 26	Reserved		
Bit 27	Reserved		
Bit 28	Reserved		
Bit 29	Reserved		
Bit 30	Reserved		
Bit 31	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15120

Parameter | Name: **C15120 | FSoE Slave Command**			Data type: UNSIGNED_8 Index: $9455_d = 24EF_h$
Display range (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15121

Parameter | Name: **C15121 | FSoE Slave Connection ID**			Data type: UNSIGNED_16 Index: $9454_d = 24EE_h$
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15122

Parameter | Name: **C15122 | FSoE Slave CRC**			Data type: UNSIGNED_16 Index: $9453_d = 24ED_h$
Display range (min. value | unit | max. value)			
0		65535	

Subcodes	Info
C15122/1	FSoE Slave CRC_0
C15122/2	FSoE Slave CRC_1
C15122/3	FSoE Slave CRC_2
C15122/4	FSoE Slave CRC_3
C15122/5	FSoE Slave CRC_4
C15122/6	FSoE Slave CRC_5
C15122/7	FSoE Slave CRC_6
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C15123

Parameter | Name: **C15123 | FSoE Master Command**			Data type: UNSIGNED_8 Index: $9452_d = 24EC_h$
Display range (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15124

Parameter | Name: **C15124 | FSoE Master Connection ID**			Data type: UNSIGNED_16 Index: $9451_d = 24EB_h$
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15125

Parameter | Name: **C15125 | FSoE Master CRC**			Data type: UNSIGNED_16 Index: $9450_d = 24EA_h$
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C15125/1			FSoE Master CRC_0
C15125/2			FSoE Master CRC_1
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15126

Parameter | Name: **C15126 | FSoE Version**	Data type: VISIBLE_STRING Index: $9449_d = 24E9_h$
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15127

Parameter | Name: **C15127 | FSoE Watchdog Time**			Data type: UNSIGNED_16 Index: $9448_d = 24E8_h$
Display range (min. value | unit | max. value)			
30	ms	5000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15128

Parameter | Name: **C15128 | FSoE Connection Type**		Data type: UNSIGNED_16 Index: $9447_d = 24E7_h$
Selection list (read only)		**Info**
0	Master Connection	
1	Slave Connection	A slave connection is possible only.
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15129

Parameter | Name: **C15129 | FSoE Com Parameter Length**			Data type: UNSIGNED_16 Index: $9446_d = 24E6_h$
Display range (min. value | unit | max. value)			
2		2	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15130

Parameter | Name: **C15130 | FSoE Appl Parameter Length**			Data type: UNSIGNED_16 Index: $9445_d = 24E5_h$
Display of the supported FSoE application parameters with the length "0". No application parameters are supported.			
Display range (min. value | unit | max. value)			
0		0	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15135

Parameter | Name: **C15135 | FSoE Connection State**		Data type: UNSIGNED_16 Index: $9440_d = 24E0_h$
Selection list (read only)		**Info**
0	Reset	
1	Session	
2	Connection	
3	Parameter	
4	Data	
5	Failsafe	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15140

Parameter | Name: **C15140 | S bus control bits**	Data type: UNSIGNED_8 Index: $9435_d = 24DB_h$
This code is used device-internally and must not be written by the user side!	

C15141

Parameter | Name: **C15141 | status bits**	Data type: UNSIGNED_8 Index: $9434_d = 24DA_h$
This code is used device-internally and must not be written by the user side!	

C15200

Parameter | Name: **C15200 | OMS: Stop function**		Data type: UNSIGNED_8 Index: $9375_d = 249F_h$
Selection of the stop function during special operation ▸ Operation mode selection		
Selection list (Lenze setting printed in bold)		**Info**
0	**STO**	▸ Safe torque off
1	SS1	▸ Safe stop 1
2	SS2	▸ Safe stop 2
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15201

Parameter | Name: **C15201 | OMS: Motion function**		Data type: UNSIGNED_8 Index: $9374_d = 249E_h$
Selection of the motion function during special operation ▸ Operation mode selection		
Selection list (Lenze setting printed in bold)		**Info**
3	SLS1	▸ Safely limited speed 1
4	SLS2	▸ Safely limited speed 2
5	SLS3	▸ Safely limited speed 3
6	SLS4	▸ Safely limited speed 4
11	**Free traversing**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15202

Parameter | Name: **C15202 | OMS: OMS: Function at LOW level**	Data type: UNSIGNED_8 Index: $9373_d = 249D_h$

⚠ Danger!
If the operation mode selector is implemented via a safe input, the operating mode for the LOW level must be selected carefully. According to the closed-circuit principle, there must not arise any additional danger from normal or special operation in the corresponding application.
For detailed information, please see the manual for the safety module.

▸ Safe operation mode selector

Selection list (Lenze setting printed in bold)		Info
0	**Normal operation**	▸ Operation mode selection
1	Special operation	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C15203

Parameter | Name: **C15203 | SLI: increment in special operation**	Data type: UNSIGNED_32 Index: $9372_d = 249C_h$

Number of increments for safely limited increment.
• Value "0" deactivates the SLI function.

▸ Operation mode selection

Setting range (min. value | unit | max. value)			Lenze setting
0	Incr.	2147483647	**1 inc.**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C15204

Parameter | Name: **C15204 | SLI: maximum change in position**	Data type: UNSIGNED_32 Index: $9371_d = 249B_h$

Value of the maximum position change while SLI has been active.

▸ Operation mode selection

Display range (min. value | unit | max. value)		
0	Incr.	2147483647

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C15205

Parameter | Name: **C15205 | SSE: Emergency stop function**	Data type: UNSIGNED_8 Index: $9370_d = 249A_h$

Selection of the stop function for emergency stop.

▸ Emergency stop function (SSE)

Selection list (Lenze setting printed in bold)		Info
0	**STO**	▸ Safe torque off
1	SS1	▸ Safe stop 1

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C15210

Parameter | Name: **C15210 | RMS: Stop function**		Data type: UNSIGNED_8 Index: $9365_d = 2495_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**STO**	
1	SS1	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15300

Parameter | Name: **C15300 | Restart behaviour**			Data type: UNSIGNED_8 Index: $9275_d = 243B_h$
Setting of the restart behaviour after deactivation of the STO, SS1, SS2 and SOS standstill function. ▸ Safe stop			
Selection list			
0	Acknowledged restart		
1	Automatic restart		
Subcodes	**Lenze setting**		**Info**
C15300/1	0: Acknowledged restart		Restart - STO, SS1
C15300/2	0: Acknowledged restart		Restart - SS2, SOS
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15305

Parameter | Name: **C15305 | SS1, SS2: Stopping time**			Data type: UNSIGNED_16 Index: $9270_d = 2436_h$
Stopping time for the SS1 and SS2 safety functions. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15306

Parameter | Name: **C15306 | SS1 mode**		Data type: UNSIGNED_8 Index: $9269_d = 2435_h$
Selection whether STO is already activated after reaching n=0 when SS1 is executed or only after the parameterised stopping time. ▸ Safe stop 1 (SS1)		
Selection list (Lenze setting printed in bold)		
0	**STO after stopping time**	
1	STO at n=0	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15307

Parameter | Name: **C15307 | SS1: delay of STO after n=0**			Data type: UNSIGNED_16 Index: $9268_d = 2434_h$
Delay time after detection of n=0 until activation of STO. • Only relevant if "SS1 mode" = "STO with n=0" and operation with encoder system. ▸ Safe stop 1 (SS1)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15308

Parameter | Name: **C15308 | SS2 mode**		Data type: UNSIGNED_8 Index: $9267_d = 2433_h$
Selection whether SOS is already activated after reaching n=0 when SS2 is executed or only after the parameterised stopping time. ▸ Safe stop 2 (SS2)		
Selection list (Lenze setting printed in bold)		
0	**SOS after stopping time**	
1	SOS ati n=0	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15310

Parameter | Name: **C15310 | Tolerance window (n=0)**			Data type: UNSIGNED_16 Index: $9265_d = 2431_h$
Tolerance window for zero speed. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15311

Parameter | Name: **C15311 | SOS: Tolerance window (Delta p=0)**			Data type: UNSIGNED_32 Index: $9264_d = 2430_h$
Safely monitored tolerance margin for zero position change. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15312

Parameter | Name: **C15312 | SOS: Maximum position change**			Data type: UNSIGNED_32 Index: $9263_d = 242F_h$
Value of the maximum position change while SOS has been active. ▸ Safe stop			
Display range (min. value | unit | max. value)			
0	Incr.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15315

Parameter | Name: **C15315 | SS1, SS2: Ramp monitoring**			Data type: UNSIGNED_8 Index: $9260_d = 242C_h$
Selection for whether the deceleration ramp is to be monitored when SS1 and SS2 are executed. ▸ Safe stop			
Selection list (Lenze setting printed in bold)			**Info**
0	No ramp monitoring		
1	**Ramp monitoring activated**		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15316

Parameter | Name: **C15316 | SS1, SS2: Ramp - S-ramp time**			Data type: UNSIGNED_8 Index: $9259_d = 242B_h$
S-ramp time of the deceleration ramp for SS1 and SS2 if no linear ramp is used. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	100	**0 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15317

Parameter | Name: **C15317 | SS1, SS2: rel start offset ramp**			Data type: UNSIGNED_8 Index: $9258_d = 242A_h$
Speed offset for the start of ramp monitoring. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	100	**0 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15318

Parameter | Name: **C15318 | SS1, SS2: abs start offset ramp**			Data type: UNSIGNED_16 Index: $9257_d = 2429_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15319

Parameter | Name: **C15319 | SS1, SS2: ramp offset mode**		Data type: UNSIGNED_8 Index: $9256_d = 2428_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**Relative**	
1	Absolute	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15320

Parameter | Name: **C15320 | SMS: Maximum speed Nmax**			Data type: UNSIGNED_16 Index: $9255_d = 2427_h$
Activation of the SMS function and selection of the maximum speed. • The setting Nmax = 0 deactivates the function. ▸ Safe maximum speed (SMS)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**1 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15321

Parameter | Name: **C15321 | SMS: Reaction (n>Nmax)**	Data type: UNSIGNED_8 Index: $9254_d = 2426_h$
Reaction to exceeding the set maximum speed Nmax. ▸ Safe maximum speed (SMS)	
Selection list (Lenze setting printed in bold)	**Info**
0 STO	▸ Safe torque off
1 SS1	▸ Safe stop 1
2 SS2	▸ Safe stop 2
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer	Scaling factor: 1

C15325

Parameter | Name: **C15325 | SLI: increment in normal operation**			Data type: UNSIGNED_32 Index: $9250_d = 2422_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	2147483647	**1 inc.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15330

Parameter | Name: **C15330 | SLS: Limited speed Nlim**			Data type: UNSIGNED_16 Index: $9245_d = 241D_h$
Setting of the safely limited speed. ▸ Safely limited speed (SLS)			
Setting range (min. value | unit | max. value)			
0	rpm	16000	
Subcodes	**Lenze setting**		**Info**
C15330/1	0 rpm		SLS1: Limited speed Nlim1
C15330/2	0 rpm		SLS2: limited speed Nlim2
C15330/3	0 rpm		SLS3: limited speed Nlim3
C15330/4	0 rpm		SLS4: limited speed Nlim4
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15331

Parameter | Name: **C15331 | SLS: Braking time Nlim**			Data type: UNSIGNED_16 Index: $9244_d = 241C_h$
Safely monitored time for braking the drive below the limited speed set in C15330. ▸ Safely limited speed (SLS)			
Setting range (min. value | unit | max. value)			
0	ms	30000	
Subcodes	**Lenze setting**		**Info**
C15331/1	0 ms		SLS1: Braking time Nlim1
C15331/2	0 ms		SLS2: braking time Nlim2
C15331/3	0 ms		SLS3: braking time Nlim3
C15331/4	0 ms		SLS4: braking time Nlim4
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15332

Parameter | Name: **C15332 | SLS: Reaction (n>Nlim)**		Data type: UNSIGNED_8 Index: $9243_d = 241B_h$
Response carried out in the safety module when the limited speed is exceeded. ▸ Safely limited speed (SLS)		
Selection list		**Info**
0	STO	▸ Safe torque off
1	SS1	▸ Safe stop 1
2	SS2	▸ Safe stop 2
Subcodes	**Lenze setting**	**Info**
C15332/1	1: SS1	SLS1: Response (n>Nlim1)
C15332/2	1: SS1	SLS2: response (n>Nlim2)
C15332/3	1: SS1	SLS3: response (n>Nlim3)
C15332/4	1: SS1	SLS4: response (n>Nlim4)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15333

Parameter | Name: **C15333 | SLS: Permissible direction of movement**		Data type: UNSIGNED_8 Index: $9242_d = 241A_h$
Permissible direction of movement when monitoring SLS. ▸ Safely limited speed (SLS)		
Selection list		
0	Both directions enabled	
1	Positive direction enabled	
2	Negative direction enabled	
Subcodes	**Lenze setting**	**Info**
C15333/1	0: Both directions enabled	SLS1: Permissible direction of movement
C15333/2	0: Both directions enabled	SLS2: Permissible direction of movement
C15333/3	0: Both directions enabled	SLS3: Permissible direction of movement
C15333/4	0: Both directions enabled	SLS4: Permissible direction of movement
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15340

Parameter | Name: **C15340 | SDI: Normal operation monitoring**		Data type: UNSIGNED_8 Index: $9235_d = 2413_h$
Setting of the direction monitoring of the motor during normal operation. ▸ Safe direction (SDI)		
Selection list (Lenze setting printed in bold)		
0	**Both directions enabled**	
1	Positive direction enabled	
2	Negative direction enabled	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15341

Parameter | Name: **C15341 | SDI: Delay time**			Data type: UNSIGNED_16 Index: $9234_d = 2412_h$
Safely monitored time from activation up to switching on of the SDIpos/SDIneg monitoring. ▸ Safe direction (SDI)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15342

Parameter | Name: **C15342 | SDI: Tolerance threshold**			Data type: UNSIGNED_32 Index: $9233_d = 2411_h$
Setting of the tolerance threshold by how many increments the motor may move in the direction locked by SDI. ▸ Safe direction (SDI)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15343

Parameter | Name: **C15343 | SDI: Error response**		Data type: UNSIGNED_8 Index: $9232_d = 2410_h$
Response to a violation of the permissible direction of movement of the motor. ▸ Safe direction (SDI)		
Selection list (Lenze setting printed in bold)		**Info**
0	STO	▸ Safe torque off
1	**SS1**	▸ Safe stop 1
2	SS2	▸ Safe stop 2
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15344

Parameter | Name: **C15344 | SDI: Maximum position change**			Data type: UNSIGNED_32 Index: $9231_d = 240F_h$
Maximum position change in the locked direction when SDI is active. ▸ Safe direction (SDI)			
Display range (min. value | unit | max. value)			
0	Incr.	2147483647	
Subcodes			**Info**
C15344/1			SDIpos: Maximum position change
C15344/2			SDIneg: Maximum position change
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15350

Parameter | Name: **C15350 | SLS, SMS: Max. response time**			Data type: UNSIGNED_16 Index: $9225_d = 2409_h$
Maximum time after a speed exceedance has been detected, after which the speed has to fall below the limit. ▸ Safely limited speed (SLS)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**5000 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15360

Parameter | Name: **C15360 | SLP: lower position limit**			Data type: UNSIGNED_32 Index: $9215_d = 23FF_h$
Setting range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes	**Lenze setting**		**Info**
C15360/1	0 incr.		SLP1: Lower position limit
C15360/2	0 incr.		SLP2: Lower position limit
C15360/3	0 incr.		SLP3: Lower position limit
C15360/4	0 incr.		SLP4: Lower position limit
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15361

Parameter | Name: **C15361 | SLP: upper position limit**			Data type: UNSIGNED_32 Index: $9214_d = 23FE_h$
Setting range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes	**Lenze setting**		**Info**
C15361/1	0 incr.		SLP1: upper position limit
C15361/2	0 incr.		SLP2: upper position limit
C15361/3	0 incr.		SLP3: upper position limit
C15361/4	0 incr.		SLP4: upper position limit
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15362

Parameter | Name: **C15362 | SLP: error response**			Data type: UNSIGNED_8 Index: $9213_d = 23FD_h$
Selection list			**Info**
0	STO		
1	SS1		
2	SS2		
Subcodes	**Lenze setting**		**Info**
C15362/1	1: SS1		SLP1: error response
C15362/2	1: SS1		SLP2: error response
C15362/3	1: SS1		SLP3: error response
C15362/4	1: SS1		SLP4: error response
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15365

Parameter | Name: **C15365 | SCA: lower position limit**			Data type: UNSIGNED_32 Index: $9210_d = 23FA_h$
Setting range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes	**Lenze setting**		**Info**
C15365/1	0 incr.		SCA1: lower position limit
C15365/2	0 incr.		SCA2: lower position limit

C15365/4	0 incr.		SCA4: lower position limit
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15366

Parameter | Name: **C15366 | SCA: upper position limit**			Data type: UNSIGNED_32 Index: $9209_d = 23F9_h$
Setting range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes	**Lenze setting**		**Info**
C15366/1	0 incr.		SCA1: upper position limit
C15366/2	0 incr.		SCA2: upper position limit
C15366/3	0 incr.		SCA3: upper position limit
C15366/4	0 incr.		SCA4: upper position limit
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15370

Parameter | Name: **C15370 | PDSS: lower position limit**			Data type: UNSIGNED_32 Index: $9205_d = 23F5_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15371

Parameter | Name: **C15371 | PDSS: upper position limit**			Data type: UNSIGNED_32 Index: $9204_d = 23F4_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15372

Parameter | Name: **C15372 | PDSS: lower SCS limit**			Data type: UNSIGNED_32 Index: $9203_d = 23F3_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15373

Parameter | Name: **C15373 | PDSS: upper SCS limit**			Data type: UNSIGNED_32 Index: $9202_d = 23F2_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15374

Parameter | Name: **C15374 | PDSS: SCS from the lower limit**			Data type: UNSIGNED_16 Index: $9201_d = 23F1_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15375

Parameter | Name: **C15375 | PDSS: SCS from the upper limit**			Data type: UNSIGNED_16 Index: $9200_d = 23F0_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15376

Parameter | Name: **C15376 | PDSS: max. speed**			Data type: UNSIGNED_16 Index: $9199_d = 23EF_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**0 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15377

Parameter | Name: **C15377 | PDSS: max. deceleration of lower limit**			Data type: UNSIGNED_16 Index: $9198_d = 23EE_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	min-1/s	32000	**0 min-1/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15378

Parameter | Name: **C15378 | PDSS: Max. deceleration of upper limit**			Data type: UNSIGNED_16 Index: $9197_d = 23ED_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	min-1/s	32000	**0 min-1/s**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15379

Parameter | Name: **C15379 | PDSS: diag. pos. input source**		Data type: UNSIGNED_8 Index: $9196_d = 23EC_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**Deactivated**	
1	PDSS-Diag-In an SD-In	
2	Ref-In an SD-In	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15380

Parameter | Name: **C15380 | PDSS: detection of the diagnostic position**		Data type: UNSIGNED_8 Index: $9195_d = 23EB_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**LOW level**	
1	HIGH level	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15381

Parameter | Name: **C15381 | PDSS: lower diagnostic position**			Data type: UNSIGNED_32 Index: $9194_d = 23EA_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15382

Parameter | Name: **C15382 | PDSS: upper diagnostic position**			Data type: UNSIGNED_32 Index: $9193_d = 23E9_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15383

Parameter | Name: **C15383 | PDSS: tolerance of diagnostic position**			Data type: UNSIGNED_32 Index: $9192_d = 23E8_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15384

Parameter | Name: **C15384 | PDSS: slip comp. in the end range**		Data type: UNSIGNED_8 Index: $9191_d = 23E7_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**Deactivated**	
1	Activated	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15385

Parameter | Name: **C15385 | PDSS: permanent activation**		Data type: UNSIGNED_8 Index: $9190_d = 23E6_h$
Selection list (Lenze setting printed in bold)		**Info**
0	**On request**	
1	Activated	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15387

Parameter | Name: **C15387 | PDSS: error response**		Data type: UNSIGNED_8 Index: $9188_d = 23E4_h$
Selection list (Lenze setting printed in bold)		**Info**
0	STO	
1	**SS1**	
2	SS2	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15388

Parameter | Name: **C15388 | PDSS: curr. difference of diag. pos.**			Data type: INTEGER_32 Index: $9187_d = 23E3_h$
Display range (min. value | unit | max. value)			
-2147483648	Incr.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15389

Parameter | Name: **C15389 | PDSS: curr. speed monitored**			Data type: INTEGER_16 Index: $9186_d = 23E2_h$
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15400

Parameter | Name: **C15400 | Motor encoder system**		Data type: UNSIGNED_8 Index: $9175_d = 23D7_h$
Selection of the connected encoder system. ▸ Encoder system		
Selection list (Lenze setting printed in bold)		**Info**
0	No motor encoder	
1	**Sin-cos encoder**	"Sin-cos encoder" in this connection stands for the entries "Sine/cosine encoder", "absolute value encoder (Hiperface)", and "absolute value encoder (EnDat)" of code C00422 of the Servo Drives 9400 HighLine.
2	Resolver	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15401

Parameter | Name: **C15401 | Motor encoder status**		Data type: UNSIGNED_8 Index: $9174_d = 23D6_h$
Status of the encoder evaluation. ▸ Encoder system		
Selection list (read only)		**Info**
0	Valid	Encoder data is valid
1	Error	Encoder data are invalid
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15402

Parameter | Name: **C15402 | Actual speed - n_safe**			Data type: INTEGER_16 Index: $9173_d = 23D5_h$
Display of the current speed calculated by the safety module. ▸ Encoder system			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15403

Parameter | Name: **C15403 | Actual position value p_safe**			Data type: UNSIGNED_32 Index: $9172_d = 23D4_h$
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15405

Parameter | Name: **C15405 | Internal actual speed value**			Data type: INTEGER_16 Index: $9170_d = 23D2_h$
Internal actual speed values of the SM302. ▸ Safe speed measurement and position detection			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
Subcodes			**Info**
C15405/1			Internal actual speed value nSM determined from the motor position.
C15405/2			Internal actual speed value nGG determined from the position data of the standard device.
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15408

Parameter | Name: **C15408 | Curr. position difference pSM-pGG**			Data type: INTEGER_32 Index: $9167_d = 23CF_h$
Display range (min. value | unit | max. value)			
-2147483648	Incr.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15409

Parameter | Name: **C15409 | Motor mounting direction**		Data type: UNSIGNED_8 Index: $9166_d = 23CE_h$
Setting of the motor mounting direction. ▸ Encoder system		
Selection list (Lenze setting printed in bold)		
0	**Motor rotating CW**	
1	Motor rotating CCW	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15410

Parameter | Name: **C15410 | Response time of encoder monitoring**		Data type: UNSIGNED_8 Index: $9165_d = 23CD_h$
Response time of encoder monitoring. ▸ Encoder system		
Selection list (Lenze setting printed in bold)		
0	**12ms**	
10	50ms	
20	100 ms	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15411

Parameter | Name: **C15411 | Speed comparison tolerance**			Data type: UNSIGNED_16 Index: $9164_d = 23CC_h$
Parameterisable tolerance of speed comparison in the safety module. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**20 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15412

Parameter | Name: **C15412 | Tolerance of position comparison**			Data type: UNSIGNED_32 Index: $9163_d = 23CB_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	1024000	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15420

Parameter | Name: **C15420 | Sin/cos encoder PPR**			Data type: UNSIGNED_16 Index: $9155_d = 23C3_h$
PPR of the sin/cos encoder used. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
1		16384	**1**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15430

Parameter | Name: **C15430 | Number of resolver pole pairs**			Data type: UNSIGNED_8 Index: $9145_d = 23B9_h$
Number of pole pairs of the resolver used as motor encoder system. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
1		10	**1**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15500

Parameter | Name: **C15500 | Position encoder system**		Data type: UNSIGNED_8 Index: $9075_d = 2373_h$
Setting of the connected position encoder system. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		
0	**No position encoder**	
1	Analog encoder (sin/cos/TTL)	
2	Digital encoder (SSI/bus)	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15501

Parameter | Name: **C15501 | Position encoder gearbox factor**			Data type: UNSIGNED_16 Index: $9074_d = 2372_h$
Setting of the gearbox factor between motor and position encoder. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
20	%	65535	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15502

Parameter | Name: **C15502 | Position encoder mounting direction**		Data type: UNSIGNED_8 Index: $9073_d = 2371_h$
Setting of the mounting direction of the position encoder referred to the motor encoder. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		
0	**As motor encoder**	
1	Inverse to motor encoder	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15540

Parameter | Name: **C15540 | Maximum compensated slip**			Data type: UNSIGNED_32 Index: $9035_d = 234B_h$
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15550

Parameter | Name: **C15550 | SREF: SREF_Start input source**		Data type: UNSIGNED_8 Index: $9025_d = 2341_h$
The input signal for starting the homing process must be parameterised. The signal can • be transmitted to the safety module via a local reference input (Ref-InA), or • via a bit in the safety bus.		
Selection list (Lenze setting printed in bold)		**Info**
0	**Homing deactivated**	
1	S bus	
2	Ref-InA to SD-In	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15551

Parameter | Name: **C15551 | SREF: Ref-InA edge trigger**		Data type: UNSIGNED_8 Index: $9024_d = 2340_h$
The edge evaluation for the local Ref-InA reference input can be parameterised on HIGH or LOW edge.		
Selection list (Lenze setting printed in bold)		**Info**
0	**Rising edge**	Safe referencing (SREF): use this setting for applications only involving one position switch.
1	Falling edge	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15552

Parameter | Name: **C15552 | SREF: SREF_Load input source**			Data type: UNSIGNED_8 Index: $9023_d = 233F_h$
The input signal for setting the home mark must be parameterised. The signal can • be transmitted to the safety module via a local Ref-InB reference input, or • via a bit in the safety bus, or • via the encoder zero pulse.			
Selection list (Lenze setting printed in bold)			**Info**
0	**Homing deactivated**		
1	S bus		
3	Ref-InB to SD-In		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15553

Parameter | Name: **C15553 | SREF: Ref-InB edge trigger**			Data type: UNSIGNED_8 Index: $9022_d = 233E_h$
The edge evaluation for the Ref-InB reference input can be parameterised on HIGH or LOW edge.			
Selection list (Lenze setting printed in bold)			**Info**
0	**Rising edge**		
1	Falling edge		Safe referencing (SREF): use this setting for applications only involving one position switch.
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15554

Parameter | Name: **C15554 | SREF: time-out**			Data type: UNSIGNED_16 Index: $9021_d = 233D_h$
The home mark parameterised must be detected within this monitoring time that follows "SREF_Start".			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15555

Parameter | Name: **C15555 | SREF: home position**			Data type: UNSIGNED_32 Index: $9020_d = 233C_h$
The home position parameterised specifies the absolute reference point for the SLP, SCA, and PDSS safety functions.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	4294967295	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15556

Parameter | Name: **C15556 | SREF: restart condition**			Data type: UNSIGNED_8 Index: $9019_d = 233B_h$
Selection for the restart behaviour relating to the reference status after mains switching: • No homing required. The home position and the last absolute position value are loaded from a power-failure-proof memory. • When loading the reference values from the internal memory of Servo Drives 9400 it has to be ensured that the drive cannot change its position whilst it is switched off. • During the execution time, a "Mini-homing process" with a restricted motion mode, e.g. SLS must be carried out. The "SREF available" signal remains deleted until the "Mini-homing process" is carried out. Only with successful plausibility of the current absolute position, the "SREF available" signal is set. • Another homing process must be carried out.			
Selection list (Lenze setting printed in bold)			**Info**
0	**Homing required**		
1	Load reference saved		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15557

Parameter | Name: **C15557 | SREF: tolerance of starting position**			Data type: UNSIGNED_32 Index: $9018_d = 233A_h$
For a restart after mains switching, this tolerance window makes the absolute position saved last available without having to carry out another homing process.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15558

Parameter | Name: **C15558 | SREF: SLS homing**		Data type: UNSIGNED_8 Index: $9017_d = 2339_h$
Selection list (Lenze setting printed in bold)		**Info**
3	**SLS1**	
4	SLS2	
5	SLS3	
6	SLS4	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15559

Parameter | Name: **C15559 | SREF: delete reference**		Data type: UNSIGNED_8 Index: $9016_d = 2338_h$
This parameter is used for deleting a reference that is already available, in order to be able to carry out a new homing process.		
Selection list (Lenze setting printed in bold)		**Info**
0	**No response**	
21	Delete reference	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☑ No transfer		Scaling factor: 1

C15560

Parameter | Name: **C15560 | SREF: status**		Data type: UNSIGNED_8 Index: $9015_d = 2337_h$
Selection list (read only)		**Info**
0	No reference	
1	SREF active	
2	SREF available	
3	Mini-reference active	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15561

Parameter | Name: **C15561 | SREF: Saved position**			Data type: UNSIGNED_32 Index: $9014_d = 2336_h$
Safe position saved at the last switch-off.			
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15800

Parameter | Name: **C15800 | Current error type**		Data type: UNSIGNED_8 Index: $8775_d = 2247_h$
Type of the currently pending error.		
Selection list (read only)		
0	No error	
1	Warning	
2	Trouble	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15801

Parameter | Name: **C15801 | Error history**			Data type: UNSIGNED_16 Index: $8774_d = 2246_h$
List with internal error numbers for service operations. Please forward error history to the Lenze Service on request. **Note:** The universally valid error messages of the safety module are entered in code C00168 and in the logbook of the inverter. Details relating to this are described in the "Error messages" chapter.

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15810

Parameter | Name: **C15810 | Service code**			Data type: BITFIELD_32 Index: $8765_d = 223D_h$
Display of internal control words.			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	STO		▸ Safe torque off
Bit 1	SS1		▸ Safe stop 1
Bit 2	SS2		▸ Safe stop 2
Bit 3	SLS1		▸ Safely limited speed 1
Bit 4	SLS2		▸ Safely limited speed 2
Bit 5	SLS3		▸ Safely limited speed 3
Bit 6	SLS4		▸ Safely limited speed 4
Bit 7	SDIpos		▸ Safe positive direction of movement
Bit 8	SDIneg		▸ Safe negative direction of movement
Bit 9	ES		▸ Safe enable switch

Parameter | Name: **C15810 | Service code**		Data type: BITFIELD_32 Index: $8765_d = 223D_h$
Bit 10	SLI	
Bit 11	OMS	▸ Safe operation mode selector
Bit 12	SLP1	
Bit 13	SLP2	
Bit 14	SLP3	
Bit 15	SLP4	
Bit 16	AIS_SBUS	Restart acknowledgement via safety bus
Bit 17	AIE_SBUS	Error acknowledgement via safety bus
Bit 18	Reserved	
Bit 19	RMS	
Bit 20	SREF Start	
Bit 21	SREF Load	
Bit 22	PDSS	
Bit 23	SSE	▸ Emergency stop function

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15815

Parameter | Name: **C15815 | Status of LEDs**			Data type: UNSIGNED_16 Index: $8760_d = 2238_h$
Status display of the module LEDs.			
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15820

Parameter | Name: **C15820 | Internal actual position value**			Data type: UNSIGNED_32 Index: $8755_d = 2233_h$
Display of internal position values.			
Display range (min. value | unit | max. value)			
0	Incr.	4294967295	
Subcodes			**Info**
C15820/1			Internal actual position value pSM
C15820/2			Internal actual position value pGG
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15821

Parameter | Name: **C15821 | SS1, SS2: curr. ramp speed**			Data type: INTEGER_16 Index: $8754_d = 2232_h$
Currently monitored speed value of ramp monitoring. • Displayed value only valid if SS1 or SS2 are active with ramp monitoring.			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15822

Parameter | Name: **C15822 | SS1, SS2: min. ramp diff.**			Data type: INTEGER_16 Index: $8753_d = 2231_h$
Minimum difference between actual speed value and monitored ramp. • The value is maintained until a ramp monitoring is restarted.			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15890

Parameter | Name: **C15890 | Current time**			Data type: UNSIGNED_32 Index: $8685_d = 21ED_h$
Relative time for use in the logbook. ▸ Logbook function in the SM302			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15891

Parameter | Name: **C15891 | Log function**		Data type: UNSIGNED_8 Index: $8684_d = 21EC_h$
Setting of the logging response (trigger condition). ▸ Logbook function in the SM302		
Selection list (Lenze setting printed in bold)		**Info**
0	**Logging active**	Logging always active
1	Logging stopped	Logging switched off.
2	Stop logging in the event of an error	Logging is stopped when an error occurs.
3	Stop logging in the case of STO	Logging is stopped when STO occurs.
4	Stop logging in the case of SS1	Logging is stopped when SS1 occurs.
5	Stop logging in the case of SS2	Logging is stopped when SS2 occurs.
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C15892

Parameter | Name: **C15892 | Log time**			Data type: UNSIGNED_32 Index: $8683_d = 21EB_h$
Time of the log entry. ▸ Logbook function in the SM302			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C15892/1			Log time n
C15892/2			Log time n-1

C15892/10			Log time n-9
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C15893

Parameter | Name: **C15893 | Log status**		Data type: UNSIGNED_64 Index: $8682_d = 21EA_h$
Logged status. ▸ Logbook function in the SM302		
Display range		
Value is bit-coded:		**Info**
Bit 0	STO via SD-In	STO was triggered via a safe input.
Bit 1	STO via S-bus	STO was triggered via the safety bus.
Bit 2	STO by error	STO was triggered by an error.
Bit 3	Reserved	
Bit 4	SS1 via SD-In	SS1 was triggered via a safe input.
Bit 5	SS1 via S-bus	SS1 was triggered via the safety bus.
Bit 6	SS1 by error	SS1 was triggered by an error.
Bit 7	Reserved	
Bit 8	SS2 via SD-In	SS2 was triggered via a safe input.
Bit 9	SS2 via S-bus	SS2 was triggered via the safety bus.
Bit 10	SS2 by error	SS2 was triggered by an error.
Bit 11	Reserved	
Bit 12	SLS1 via SD-In	SLS1 was triggered via a safe input.
Bit 13	SLS1 via S-bus	SLS1 was triggered via the safety bus.
Bit 14	SLS1 via OMS	SLS1 was triggered via the operating mode changeover.
Bit 15	Reserved	
Bit 16	SLS2 via SD-In	SLS2 was triggered via a safe input.
Bit 17	SLS2 via S-bus	SLS2 was triggered via the safety bus.
Bit 18	SLS2 via OMS	SLS2 was triggered via the operating mode changeover.
Bit 19	Reserved	
Bit 20	SLS3 via SD-In	SLS3 was triggered via a safe input.
Bit 21	SLS3 via S-bus	SLS3 was triggered via the safety bus.
Bit 22	SLS3 via OMS	SLS3 was triggered via the operating mode changeover.
Bit 23	Reserved	
Bit 24	SLS4 via SD-In	SLS4 was triggered via a safe input.
Bit 25	SLS4 via S-bus	SLS4 was triggered via the safety bus.
Bit 26	SLS4 via OMS	SLS4 was triggered via the operating mode changeover.
Bit 27	Reserved	
Bit 28	SDIpos via SD-In	SDIpos was triggered via a safe input.
Bit 29	SDIpos via S-bus	SDIpos was triggered via the safety bus.
Bit 30	SDIpos via SLS	SDIpos was triggered in combination with SLS.
Bit 31	SDIpos in normal operation	SDIpos was triggered during normal operation.
Bit 32	SDIneg via SD-In	SDIneg was triggered via a safe input.
Bit 33	SDIneg via S-bus	SDIneg was triggered via the safety bus.
Bit 34	SDIneg via SLS	SDIneg was triggered in combination with SLS.
Bit 35	SDIneg in normal operation	SDIneg was triggered during normal operation.
Bit 36	SLI active	SLI was triggered during special operation.
Bit 37	Reserved	

Parameter | Name: **C15893 | Log status**		Data type: UNSIGNED_64 Index: $8682_d = 21EA_h$
Bit 38	Reserved	
Bit 39	Reserved	
Bit 40	Special operation via SD-In	Special operation was triggered via a safe input.
Bit 41	Special operation via S-bus	Special operation was triggered via the safety bus.
Bit 42	Reserved	
Bit 43	Reserved	
Bit 44	ES via SD-In	ES was triggered via a safe input.
Bit 45	ES via S-bus	ES was triggered via the safety bus.
Bit 46	Reserved	
Bit 47	Reserved	
Bit 48	FailSafeValues via control word	Safe substitute values on the safety bus were activated via the control word.
Bit 49	FailSafeValues by error	Safe substitute values on the safety bus were activated by an error.
Bit 50	Reserved	
Bit 51	Reserved	
Bit 52	SD-In1 active	The safe input SD-In1 was switched on.
Bit 53	SD-In2 active	The safe input SD-In2 was switched on.
Bit 54	SD-In3 active	The safe input SD-In3 was switched on.
Bit 55	SD-In4 active	The safe input SD-In4 was switched on.
Bit 56	Reserved	
Bit 57	Reserved

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15900

Parameter | Name: **C15900 | Firmware product type**	Data type: VISIBLE_STRING Index: $8675_d = 21E3_h$
Display of the product type (E94AFAE).	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15901

Parameter | Name: **C15901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: $8674_d = 21E2_h$
Display of the compilation date.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15902

Parameter | Name: **C15902 | Firmware version**	Data type: VISIBLE_STRING Index: $8673_d = 21E1_h$
Software version of the firmware, e.g.: "V1.0".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

5.2 Table of attributes

The table of attributes contains information required for safe communication with Servo Drives 9400 via parameters.

Note!

Safety-relevant parameters with write access can only be transmitted to the safety module by safe parameter setting with the »Engineer«.

▸ Sending safe data (📖 94)

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes bit-coded
			BITFIELD_32	4 bytes bit-coded
			BITFIELD_64	8 bytes bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes with sign
			INTEGER_64	8 bytes with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes without sign
			UNSIGNED_64	8 bytes without sign
			VISIBLE_STRING	ASCII string
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 ≡ no decimal positions 10 ≡ 1 decimal position 100 ≡ 2 decimal positions 1000 ≡ 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted (by safe parameter setting with the »Engineer«)	
	CINH	Controller inhibit required	☑ Writing is only possible if the controller is inhibited

6 Error messages

Note!

This chapter adds error messages for the SM302 safety module to the error list in the online documentation for Servo Drives 9400.

Tip!

General information with regard to diagnostics & fault analysis and to error messages can be found in the Servo Drives 9400 online documentation.

Short overview of error messages for the safety module (A-Z)

hex	dec	Error message	Response (Lenze setting)	can be set in
0x012f00c3	19857603	3.3V voltage error	Warning	-
0x012f00c2	19857602	5V voltage error	Warning	-
0x012f00c1	19857601	6V voltage error	Warning	-
0x012f006d	19857517	CAS: Hardware or discrepancy error	Warning	-
0x012f006c	19857516	CAS: Circulation time exceeded	Warning	-
0x012f0039	19857465	Deactivated SD-In1 = high	Warning	-
0x012f003a	19857466	Deactivated SD-In2 = high	Warning	-
0x012f003b	19857467	Deactivated SD-In3 = high	Warning	-
0x012f003c	19857468	Deactivated SD-In4 = high	Warning	-
0x012f00a5	19857573	Safety parameter set defect	Warning	-
0x012f0045	19857477	F_CRC_Length error	Information	-
0x012f0041	19857473	F_Dest_Add = 0 or FFFFhex	Information	-
0x012f0040	19857472	F_Dest_Add unequal F-address	Information	-
0x012f0044	19857476	F_SIL exceeds technical SIL	Information	-
0x012f0042	19857474	F_Source_Add = 0 or FFFFhex	Information	-
0x012f0043	19857475	F_WD_Time = 0 msec	Information	-
0x012f0023	19857443	F_WD_Time exceeded	Information	-
0x012f0031	19857457	Discrepancy error / functional test - SD-In1	Warning	-
0x012f0032	19857458	Discrepancy error / functional test - SD-In2	Warning	-
0x012f0033	19857459	Discrepancy error / functional test - SD-In3	Warning	-
0x012f0034	19857460	Discrepancy error / functional test - SD-In4	Warning	-
0x012f0027	19857447	F-parameter error	Information	-
0x012f005d	19857501	Error - internal disconnecting path	Warning	-
0x012f0051	19857489	Error - SD-Inx / CLx	Warning	-
0x012f0052	19857490	Error - SD-Inx / CLx	Warning	-
0x012f0046	19857478	Incorrect F-parameter version	Information	-
0x012f00ea	19857642	FSoE passivated	Information	-
0x012f00e3	19857635	FSoE: CRC error	Information	-
0x012f00eb	19857643	FSoE: data exchange exited	Information	-
0x012f00e1	19857633	FSoE: unknown command	Information	-
0x012f00e0	19857632	FSoE: unexpected command	Information	-
0x012f00e9	19857641	FSoE: invalid application parameter data	Information	-
0x012f00e8	19857640	FSoE: invalid application parameter length	Information	-
0x012f00e2	19857634	FSoE: invalid connection ID	Information	-
0x012f00e7	19857639	FSoE: invalid communication parameter data	Information	-

hex	dec	Error message	Response (Lenze setting)	can be set in
0x012f00e6	19857638	FSoE: invalid communication parameter length	Information	-
0x012f00e5	19857637	FSoE: invalid slave address	Information	-
0x012f00e4	19857636	FSoE: watchdog expired	Information	-
0x012f0036	19857462	Internal error - AIE	Warning	-
0x012f0035	19857461	Internal error - AIS	Warning	-

0x012f00b4	19857588	Tolerance of position comparison exceeded	Warning	-
0x012f00b3	19857587	Tolerance of starting position exceeded	Warning	-
0x012f00a3	19857571	Different safety parameter sets	Warning	-

Internal error, STO activated [0x012f0001]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	1

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	Remedy
Internal error, STO activated.	Replace safety module. Contact Lenze.

Internal error, SS1 activated [0x012f0002]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	2

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	Remedy
Internal error, SS1 activated	Replace safety module. Contact Lenze.

Internal error, SS2 activated [0x012f0003]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	3

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error, SS2 activated	Replace safety module. Contact Lenze.

Communication error - standard device [0x012f0010]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	16

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Communication between the standard device and the safety module has been interrupted. Standard device has been switched off.	Ensure operation in the specified voltage limits.

Synchronisation error - standard device [0x012f0011]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	17

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty synchronisation with standard device.	Please contact Lenze.

Safety address invalid (0 or 0xFFFF) [0x012f0021]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	33

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Invalid effective safety address. • Only for SM300	• Check safety address in the configuration software of the control system. • Check DIP switches on the SM300 safety module. • Check safety address in the safe parameterisation.

PROFIsafe communication error [0x012f0022]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	34

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
PROFIsafe data processing has detected a communication error.	Check cabling between the communication module and the control system.

F_WD_Time exceeded [0x012f0023]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	35

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
PROFIsafe monitoring time exceeded.	• Check program runtime of safety program. • Increase monitoring time *F_WD_Time*.

PROFIsafe passivated [0x012f0024]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	36

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe data processing. PROFIsafe node is passivated.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

PROFIsafe has left data exchange [0x012f0025]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	37

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe data processing. PROFIsafe has left data exchange.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

PROFIsafe - invalid data [0x012f0026]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	38

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe data processing. PROFIsafe user data area has no valid data.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

F-parameter error [0x012f0027]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	39

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe parameterisation phase. Wrong parameterisation of F-PLC.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

Discrepancy error or functional test SD-In1 [0x012f0031]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	49

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In1.	• Check safe parameters for SD-In1. • Check sensor at SD-In1.

Discrepancy error or functional test SD-In2 [0x012f0032]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	50

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In2.	• Check safe parameters for SD-In2. • Check sensor at SD-In2.

Discrepancy error or functional test SD-In3 [0x012f0033]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	51

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In3.	• Check safe parameters for SD-In3. • Check sensor at SD-In3.

Discrepancy error or functional test SD-In4 [0x012f0034]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	52

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In4.	• Check safe parameters for SD-In4. • Check sensor at SD-In4.

Internal error - AIS [0x012f0035]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	53

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at acknowledgement input AIS.	Replace safety module.

Internal error - AIE [0x012f0036]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	54

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at acknowledgement input AIE.	Replace safety module.

Internal error - module switch [0x012f0037]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	55

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at module acknowledgement input.	Replace safety module.

Deactivated SD-In1 = high [0x012f0039]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	57

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

Deactivated SD-In2 = high [0x012f003a]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	58

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

Deactivated SD-In3 = high [0x012f003b]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	59

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

Deactivated SD-In4 = high [0x012f003c]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	60

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

F_Dest_Add unequal F address [0x012f0040]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	64

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety address *F_Dest_Add* of the control system does not correspond to the F address in the safety module.	Adapt the safety address in the control configuration to the address in the safety module.

F_Dest_Add = 0 or FFFFhex [0x012f0041]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	65

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety address *F_Dest_Add* in the control system is invalid (0 or $FFFF_{hex}$).	Select a valid value for the safety address data in the control configuration.

F_Source_Add = 0 or FFFFhex [0x012f0042]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	66

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety address *F_Source_Add* in the control system is invalid (0 or $FFFF_{hex}$).	Select a valid value for the safety address data in the control configuration.

F_WD_Time is 0 msec [0x012f0043]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	67

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The monitoring time *F_WD_Time* of the control system is set to 0 ms.	Select a permissible value for the monitoring time *F_WD_Time*.

F_SIL exceeds technical SIL [0x012f0044]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	68

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The parameterised SIL setting in the control system exceeds the technically possible SIL of the safety module.	Adapt the parameterised SIL setting in the control system to the safety module used.

F_CRC_Length error [0x012f0045]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	69

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The data length of the *F_CRC* of the control system is faulty.	Check the safety parameters in the control system.

F parameter version is incorrect [0x012f0046]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	70

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The F parameter version is incorrect and not supported by the safety module.	Select a permissible F parameter version in the control system.

PROFIsafe CRC1 error [0x012f0047]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	71

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
PROFIsafe-CRC1 error. Current F parameter CRC is faulty.	• Check F parameter CRC (CRC1) in the control system. • Check GSD file.

Reserved (PROFIsafe standard) [0x012f0048]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	72

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
--	--

Reserved (PROFIsafe standard) [0x012f0049]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	73

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
--	--

Reserved (PROFIsafe standard) [0x012f004a]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	74

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
--	--

Error - SD-Inx / CLx [0x012f0051]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	81

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error at a safe input (hardware error).	Replace safety module.

Error - SD-Inx / CLx [0x012f0052]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	82

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error at an SD-Inx input or the CLx clock outputs. Only valid for the SM300 safety module!	Check wiring at the SM300 safety module.

Short circuit - SD-Out [0x012f0059]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	89

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error at output SD-Out. Only valid for the SM300 safety module!	Check wiring at the SM300 safety module.

Error - internal disconnecting path [0x012f005d]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	93

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error of safe switch-off logic.	Replace safety module. Contact Lenze.

Test pulse error - internal disconnecting path [0x012f005e]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	94

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error of safe switch-off logic.	Replace safety module. Contact Lenze.

SS1/SS2: Stopping time exceeded [0x012f0061]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	97

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has not reached the parameterised zero-speed threshold within the stop time.	• Increase SS1/SS2 stop time. • Reduce delay time in drive.

SLS1: Nlim1 exceeded [0x012f0062]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	98

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS1).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS2: Nlim2 exceeded [0x012f0063]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	99

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS2).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS3: Nlim3 exceeded [0x012f0064]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	100

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS3).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS4: Nlim4 exceeded [0x012f0065]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	101

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS4).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS/SMS: Error stop not executed [0x012f0066]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	102

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS1-4) or the maximum speed (SMS) and not responded adequately within the maximum response time.	• Adapt the speed-dependent parameters in the drive. • Increase parameter for the maximum response time.

SDIpos: Wrong direction [0x012f0067]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	103

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the positive monitored direction (SDIpos).	• Adapt controller parameterisation. • Increase SDI tolerance threshold.

SDIneg: Wrong direction [0x012f0068]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	104

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the negative monitored direction (SDIneg).	• Adapt controller parameterisation. • Increase SDI tolerance threshold.

SMS: Nmax exceeded [0x012f0069]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	105

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the monitored maximum speed (SMS.	• Limit maximum speed in drive. • Adapt parameterisation value.

SOS: Tolerance limit exceeded [0x012f006a]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	106

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded a tolerance limit for the SOS function.	• Adapt tolerance limits or increase distance to the parameterised limits. • Adapt response time of encoder monitoring.

No encoder system configured [0x012f006b]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	107

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
A speed- or position-based safety function is tried to be carried out without an encoder having been configured.	Configuration of an encoder system valid for safety-related applications.

CAS: Circulation time exceeded [0x012f006c]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	108

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The maximum time between the activation and feedback of cascading has been exceeded.	• Input delay for SD-In4 must be parameterised lower than or equal to 10 ms. • Check wiring between the cascaded modules.

CAS: Hardware or discrepancy error [0x012f006d]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	109

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The cascading output has not been deactivated by the hardware quickly enough, or there is a discrepancy at the cascading input.	• Check wiring between the cascaded modules. • Replace safety module.

SS1/SS2: Speed ramp exceeded [0x012f006e]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	110

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The monitoring of the speed ramp is activated. When the SS1/SS2 stop function is executed, the deceleration of the speed ramp is monitored. If the monitoring limits are exceeded, an error is reported.	• Adapt ramp monitoring parameters in the safety module. • Adapt (quickstop) ramp parameters in the application. • Deactivate ramp monitoring in the safety module.

SLI: Safely limited increment exceeded [0x012f006f]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	111

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The safely limited increment is monitored in the "special operation" operating mode. The increment parameterised was exceeded.	• Adapt "SLI: Safely limited increment" parameter. • Limit increments in the application. • Deactivate monitoring of the safely limited increment.

SLP1: position range exited [0x012f0071]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	113

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exited the SLP1 position range.	Adapt parameters for absolute position limits or increase the distance to the position limits within the application.

SLP2: position range exited [0x012f0072]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	114

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exited the SLP2 position range.	Adapt parameters for absolute position limits or increase the distance to the position limits within the application.

SLP3: position range exited [0x012f0073]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	115

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exited the SLP3 position range.	Adapt parameters for absolute position limits or increase the distance to the position limits within the application.

SLP4: position range exited [0x012f0074]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	116

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exited the SLP4 position range.	Adapt parameters for absolute position limits or increase the distance to the position limits within the application.

SLP: no valid reference [0x012f0075]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	117

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
SLP has been requested without a valid reference.	The safe absolute home position has been deleted or has not been set yet. Evaluate SREF status in C15560 and carry out homing.

PDSS: no valid reference [0x012f0076]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	118

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
PDSS has been requested without a valid reference.	The safe absolute home position has been deleted or has not been set yet. Evaluate SREF status in C15560 and carry out homing.

PDSS: speed exceeded [0x012f0077]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	119

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the speed currently permissible in PDSS.	Check safety parameters for PDSS envelope curve and adapt them, if necessary. Reduce speeds in the application and increase distance to the envelope curve.

PDSS: SCS creeping speed [0x012f0078]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	120

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the creeping speed permissible in SCS.	Check safety parameters for PDSS envelope curve and adapt them, if necessary. Reduce speeds in the application and increase distance to the envelope curve.

PDSS: no diagnostic mark detected in expected position [0x012f0079]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	121

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
No diagnostic mark has been detected in the diagnostic position parameterised in PDSS.	Check parameters of the diagnostic mark and adapt them, if necessary. Check function and correct position of the diagnostic sensors.

PDSS: diagnostic mark detected in invalid position [0x012f007a]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	122

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
A diagnostic mark has been detected in an invalid position.	Check parameter setting of the diagnostic mark and adapt it, if necessary. Check diagnostic sensors with regard to their correct position.

Stuck at High SD-Out1, channel A [0x012f0080]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	128

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of output SD-Out1 cannot be deactivated.	Check wiring at the output SD-Out1 for short circuit.

Stuck at Low SD-Out1, channel A [0x012f0081]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	129

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of output SD-Out1 cannot be activated.	Check supply voltage and wiring for the safe output.

Stuck at High SD-Out1, channel B [0x012f0082]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	130

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of output SD-Out1 cannot be deactivated.	Check wiring at the output SD-Out1 for short circuit.

Stuck at Low SD-Out1, channel B [0x012f0083]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	131

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of output SD-Out1 cannot be activated.	Check supply voltage and wiring for the safe output.

Stuck at High at SD-In1, channel A [0x012f0090]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	144

Response (Lenze setting printed in bold)

☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In1 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In1, channel B [0x012f0091]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	145

Response (Lenze setting printed in bold)

☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In1 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In2, channel A [0x012f0092]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	146

Response (Lenze setting printed in bold)

☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In2 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In2, channel B [0x012f0093]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	147

Response (Lenze setting printed in bold)

☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In2 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In3, channel A [0x012f0094]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	148

Response (Lenze setting printed in bold)

☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In3 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In3, channel B [0x012f0095]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	149

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In3 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In4, channel A [0x012f0096]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	150

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In4 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In4, channel B [0x012f0097]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	151

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In4 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

New parameter set deleted [0x012f00a0]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	160

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The parameter set has been deleted via the safe parameterisation in the Engineer.	--

New safe parameter set loaded [0x012f00a1]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	161

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
New parameter set has been loaded via the safe parameterisation in the Engineer or by actuating the module button at the safety module.	--

Memory module - parameter set access error [0x012f00a2]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	162

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
An error has been detected when accessing the safe parameter set in the memory module.	Carry out a general reset. Transfer the safe parameter set into the safety module.

Different parameter sets [0x012f00a3]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	163

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Different parameter sets on the memory module and on the safety module.	Transfer the safe parameter set via the Engineer into the safety module. Parameter set acceptance from the memory module using the module button at the safety module.

No safe parameter set safety module [0x012f00a4]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	164

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Safety module has no parameter set.	Transfer safe parameter set via Engineer into safety module.

Defective parameter set safety module [0x012f00a5]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	165

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Parameter set on safety module is defective.	Transfer safe parameter set via Engineer into safety module.

Memory module - parameter set format error [0x012f00a6]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	166

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
A format error has been detected in the parameter set of the memory module.	Recreate the parameter set format using the "General reset" function and transfer the parameter set via the Engineer into the safety module.

Parameter set plausibility error [0x012f00a7]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	167

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The set parameters are not plausible with regard to each other.	Select the parameter set in the Engineer. Call the plausibility check and transfer the parameter set via the Engineer into the safety module.

Safety parameter set communication error [0x012f00a8]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	168

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A communication error has occurred when loading the parameter set.	• Check whether memory module and safety module have been installed correctly. • Repeat parameter set transfer.

Module ID unequal effective safety address [0x012f00a9]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	169

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The module ID in the parameter set does not correspond to the effective safety address.	Adjust module ID, safety address and DIP switch for setting the safety address.

SREF: time-out [0x012f00b0]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	176

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The time-out between SREF_Start and SREF_Load has been exceeded.	Check parameter setting of the time-out value and adapt it, if necessary. Check parameter setting of the edge evaluation for SREF_Start and SREF_Load. Reference mode: check whether SREF_Load signal is triggered after activation of SREF_Start.

SREF: reference deleted [0x012f00b1]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	177

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safe reference has been deleted.	The acknowledgement of an error after the violation of a parameterised absolute position difference may result in the loss of the reference. Check and if necessary, adapt the parameters for position differences between the motor encoder and the position encoder. Manual deletion of the reference has been requested via C15559.

Maximum slip exceeded [0x012f00b2]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	178

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The maximum slip has been exceeded.	Check and if necessary, replace / maintain drive components that are prone to wear. Evaluate slip monitoring in C15001 and reference / maintain the system in time when level 3 is reached.

Tolerance of starting position exceeded [0x012f00b3]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	179

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The tolerance limit of the starting position has been exceeded.	Do not move drive components in deenergised state, or secure them using suitable measures (e.g. apply motor brake).

Tolerance of position comparison exceeded [0x012f00b4]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	180

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The tolerance limit parameterised in C15412 between pSM and pGG has been exceeded.	Check gearbox factor and mounting position in the safe parameter setting. Check and if necessary, replace / maintain drive components that are prone to wear.

Reference voltage error [0x012f00c0]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	192

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the reference voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

6V voltage error [0x012f00c1]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	193

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the 6 V voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

5V voltage error [0x012f00c2]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	194

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the 5 V-reference voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

3.3V voltage error [0x012f00c3]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	195

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the 2.6 V voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

Safe speed invalid [0x012f00d0]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	208

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
It is not possible to detect a safe speed.	• Check encoder systems used. • Check communication between the drive and the safety module.

SSM: Encoder error [0x012f00d1]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	209

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring via encoder.	Check configuration and connection of the encoder used.

SSM: Resolver error [0x012f00d2]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	210

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring via resolver.	Check configuration and connection of the encoder used.

SSM: Standard device data error [0x012f00d3]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	211

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring. The data transferred by the standard device is faulty.	Please contact Lenze.

SSM: Speed comparison error [0x012f00d4]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	212

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The difference between the speed calculated internally and the speed values of the standard device exceeds the parameterised limit.	• Check configuration of the encoder system/s and gearbox factor. • Check tolerance value for the speed comparison • Set code C00100 in the 9400 to "16" if a digital position encoder is used.

SSM: Synchronisation error [0x012f00d5]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	213

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring: Faulty synchronisation between the standard device and the safety module.	Please contact Lenze.

SSM: Wrong PDO version [0x012f00d6]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	214

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring: PDO version of data protocol is incompatible.	The use of the SM302 parameter set format in Servo Drives 9400 requires the following software versions: • Servo Drives 9400 HighLine from software version 13.xx onwards • Servo Drives 9400 PLC from software version 07.xx onwards

FSoE: unexpected command [0x012f00e0]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	224

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Unexpected FSoE command received.	-

FSoE: unknown command [0x012f00e1]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	225

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Unknown FSoE command received.	-

FSoE: invalid connection ID [0x012f00e2]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	226

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
FSoE frame with invalid connection ID received.	-

FSoE: CRC error [0x012f00e3]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	227

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
CRC in FSoE frame is erroneous.	Observe notes for an EMC-compliant system installation. Check configuration of the FSoE nodes.

FSoE: watchdog expired [0x012f00e4]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	228

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
FSoE monitoring time exceeded.	Check execution time in the FSoE master's control program and increase time for FSoE watchdog, if necessary.

FSoE: invalid slave address [0x012f00e5]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	229

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The slave address transferred by the FSoE master does not comply with the address set in the slave.	Check parameters of the FSoE address in the FSoE master and in the parameter setting of the safety module.

FSoE: invalid communication parameter length [0x012f00e6]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	230

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The communication parameters' length transferred by the master does not comply with the length expected.	Check setting of the communication parameters.

FSoE: invalid communication parameter data [0x012f00e7]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	231

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Invalid communication parameter data received.	Check setting of the communication parameters.

FSoE: invalid application parameter length [0x012f00e8]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	232

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The application parameters' length transferred by the master does not comply with the length expected.	Check setting of the communication parameters.

FSoE: invalid application parameter data [0x012f00e9]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	233

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Invalid communication parameter data received.	Check setting of the communication parameters.

FSoE passivated [0x012f00ea]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	234

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Stack processing has passivated the FSoE data.	Check FSoE nodes.

FSoE: data exchange exited [0x012f00eb]

Module ID (decimal)	**Error ID** (decimal)
303: SM302 safety module	235

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
FSoE has exited the process data exchange.	Check FSoE nodes.

1 About this documentation

This documentation contains information on how to parameterise & configure the SM301 safety module.

Note!

This documentation supplements the manual for the safety module and the documentation for the controller.

The manual for the safety module contains safety instructions which must be observed!

Target group

This documentation addresses to persons who want to parameterise, configure, and diagnose an SM301 safety module attached to the Servo Drives 9400 using the L-force »Engineer« engineering software.

Information regarding the validity

The information in this documentation applies to:

Safety module	Type designation	From hardware version	From software version
SM301	E94AYAE	VA	1.00

This safety module can be used together with the following standard devices:

Product series	Type designation	From hardware version	From software version
Servo Drives 9400	E94AxxExxxx	VA	1.49

- The use of the safety module in version 1.3 with parameter set version 1.3 and support of the 2-encoder concept requires standard devices of the 9400 product series from nameplate inscription:

Product series	Type designation	From hardware version	From software version
Servo Drives 9400	E94AxHExxxx	VA	07.xx
Servo Drives 9400	E94AxPExxxx	2A	02.xx

- The use of the safety module in version 1.4 with parameter set version 1.4 and support of the resolver as motor encoder requires standard devices of the 9400 product series from nameplate inscription:

Product series	Type designation	From hardware version	From software version
Servo Drives 9400	E94AxHExxxx	VA	08.xx
Servo Drives 9400	E94AxPExxxx	2A	02.xx

Tip!

Information and tools regarding the Lenze products can be found in the Internet:

http://www.Lenze.com → Download

1.1 Document history

Version			Description
2.4	12/2020	TD05	Supplements
2.3	11/2013	TD05	Supplements and conversion to new layout
2.2	10/2011	TD05	Supplements
2.1	09/2010	TD05	Extended by new functions for SM301 V1.4
2.0	09/2009	TD05	New edition due to reorganisation of the company Extended by new functions for SM301 V1.3
1.3	10/2007	TD05	Extended by new functions for SM301 V1.2
1.2	04/2007	TD05	Extended by new functions for SM301 V1.1
1.1	10/2006	TD05	Error corrections
1.0	09/2006	TD05	First edition for SM301 V1.0

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Spelling of numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Text		
Version information	Blue text colour	All information that applies to from a certain software version of the drive onwards are marked accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze PC software »Engineer«...
Window	*italics*	The *Message* window ... / The *Options* dialog box...
Variable names		By setting *bEnable* to TRUE...
Control element	**bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If the execution of a function requires several commands, the individual commands are separated by an arrow: Select **File→Open** to...
Shortcut	**<bold>**	Press **<F1>** to open the online help.
		If a command requires a combination of keys, a "+" is placed between the key symbols: Use **<Shift>+<ESC>** to...
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse-click in this online documentation.
Icons		
Page reference	(📖 6)	Optically highlighted reference to another page. In this online documentation activated via mouse-click.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning	
Engineering tools	Software solutions for easy engineering in all project stages	
		»EASY Navigator« – provides a good guide to the user • All convenient Lenze engineering tools at a glance • Tools can be selected quickly • The clear structure simplifies the engineering process from the start
		»Engineer« – multi-device engineering • For all products in our L-force portfolio • Practical user interface • Graphic interfaces make it easy to navigate • Can be applied in every phase of a project (project planning, commissioning, production) • Parameter setting and configuration
Code	"Container" for one or several parameters used for controller parameter setting or monitoring.	
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3").	
Function block	A function block (FB) can be compared with an integrated circuit that contains a specific control logic and delivers one or several values when being executed. • An instance (reproduction, copy) of the function block is always inserted in the circuit. • It is also possible to insert several instances of a function block in a circuit. • Each instance has an unequivocal identifier (the instance name) and a processing number which defines the position at which the function block is calculated during the task cycle.	
System block	System blocks provide interfaces to basic functions and hardware of the controller in the function block editor of the »Engineer« (e.g. to the digital inputs). • System blocks cannot be instanced in contrast to function blocks.	

1.4 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Introduction

Drive-based safety with L-force | 9400

The controllers of the L-force | 9400 range can be equipped with a safety module. The functional range of the safety module types varies in order to optimally implement different applications.

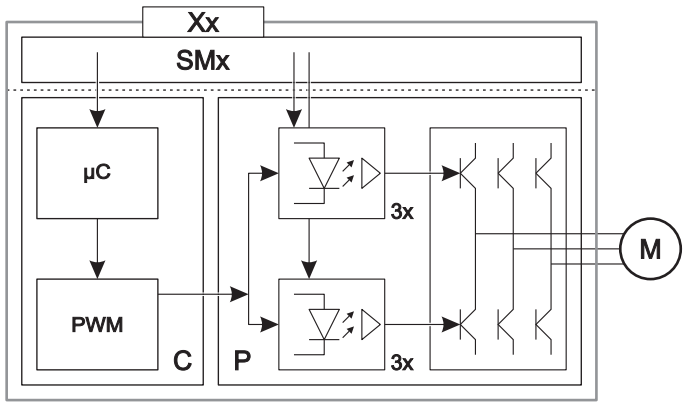
"Integrated safety technology" stands for user-related safety functions that are applicable to the protection of persons working with machines and the machine protection.

The motion functions are still executed by the controller. The safety module monitors the safe compliance with the limit values and provides the safe inputs and outputs. When the limit values are exceeded, the safety module starts the control functions in accordance with EN 60204-1 directly in the controller.

The safety functions are suitable for applications in accordance with IEC 61508 up to SIL 3 and meet, depending on the module, the requirements of EN ISO 13849-1 up to control category 4 and Performance Level (PL) "e".

2.1 Terms and abbreviations used in drive-based safety

Abbreviation	Meaning
9400	Lenze servo controller
EC_STO	Error class stop 0
EC_SS1	Error class stop 1
EC_SS2	Error class stop 2
EC_FS	Error class fail-safe
Cat.	Category in accordance with EN 954-1
OSSD	Output Signal Switching Device, tested signal output
PS	PROFIsafe
PWM	Pulse width modulation
SD-In	Safe input ("Safe Digital Input")
SD-Out	Safe output ("Safe Digital Output")
SIL	Safety Integrity Level in accordance with IEC 61508
SM	Safety module
Optocoupler supply	Supply of optocouplers to control the power drivers
PELV	Protective Extra Low Voltage
SELV	Safety Extra Low Voltage
OFF state	Signal state of the sensors when they are activated or respond.
ON state	Signal state of the sensors in normal operation
PM	P/N switched signal paths
PP	P/P switched signal paths
GSD	File with device-specific data for establishing PROFIBUS communication
GSDML	File with device-specific data for establishing PROFINET communication.
AIS	Restart acknowledgement ("Acknowledge In Stop")
AIE	Error acknowledgement ("Acknowledge In Error")



Abbreviation	Safety function
SDI	Safe direction
SLI	Safely limited increment
SLS	Safely limited speed
SOS	Safe operating stop
SS1	Safe stop 1
SS2	Safe stop 2
SSM	Safe speed monitor
STO	Safe torque off • Formerly: safe standstill
SMS	Safe maximum speed
SSE	Safe stop emergency
ES	Enable switch
OMS	Operation mode selector

2.2 Function mode of the safety module

Disconnecting paths

The transmission of the pulse width modulation is safely (dis-)connected by the safety module. Hence the power drivers do not create a rotating field. The motor is safely switched to torqueless operation (STO).

Disconnecting paths of the safety module

SMx	Safety module
Xx	Input / output terminal
C	Control section
µC	Microcontroller
PWM	Pulse width modulation
P	Power section
M	Motor

Safety state

When the controller is switched off by a safety module, it is changed to the "Safe torque off active" status

- "Drive is torqueless" (0x00750003) is entered in the logbook.
- In C00183, "Safe torque off active" is displayed.

Fail-safe state

Note!

If internal errors of the safety module are detected, the motor is safely switched to torqueless operation (fail-safe state).

2.3 Functional range of SM301 (short overview)

SM301 V1.0

The SM301 V1.0 safety module provides the following functions:

- Safe torque off (STO)
- Safe stop 1 (SS1)
- Safe stop 2 (SS2)
  - based on EN 61800-5-2 / SOS is speed-monitored
- Safe stop emergency
- Safe operating stop (SOS)
  - based on EN 61800-5-2 / SOS is speed-monitored
- Safe maximum speed (SMS)
- Safely limited speed 1 (SLS1)
- Enable switch (ES)
- Operation mode selector (OMS)
- Safe speed monitor (SSM)
- Safe monitor (safe output SD-Out1)
- Connection of safety sensors
- Safe parameter setting
- Safety bus connection (PROFIsafe via PROFIBUS)

SM301 V1.1

The SM301 V1.1 safety module additionally provides the following functions:

- Safely limited speed 2 (SLS2)
- Safely limited speed 3 (SLS3)
- Safely limited speed 4 (SLS4)
- Safe cascading (CAS) via SD-In4/SD-Out1
- Safety bus connection (PROFIsafe via PROFIBUS/PROFINET)

SM301 V1.2

The SM301 V1.2 safety module additionally provides the following functions:

- Parameterisable response time for encoder monitoring

SM301 V1.3

The SM301 V1.3 safety module additionally provides the following functions:

- Safe operating stop (SOS)
  - in accordance with EN 61800-5-2 / SOS is position-monitored
- Safe direction (SDI)
- Safe speed and position detection with resolver when using a motor encoder and an additional position encoder (two-encoder concept)

SM301 V1.4

The SM301 V1.4 safety module additionally provides the following functions:

- Safely limited increment (SLI)
- Safely monitored deceleration ramp for SS1/SS2
- Safe speed and position detection with resolver as motor encoder without additional position encoder

All pieces of information valid for only one or from one specific version is marked correspondingly in this documentation.

2.4 Integration into the application

When a safety function is requested, the safety technology activates the corresponding safe monitoring function. The only standstill function executed directly is the "safe torque off" (STO) function. All other safety functions require a controller action which is safely monitored.

Note!

To effect the corresponding action (e.g. braking to standstill, holding the standstill position), the application engineer has to provide an appropriate interconnection in the application.

System block "LS_SafetyModuleInterface"

The **LS_SafetyModuleInterface** system block in the function block editor of the »Engineer« serves to transmit the control and status information from the safety module to the application.

- For controllers of the "9400 ServoPLC" series, the **SMI_SafetyModuleInterface** system block in the control configuration of the »PLC Designer« provides the interface for the safety module. The contents of this interface are conform to the description for the **LS_SafetyModuleInterface** system block

System block "LS_Limiter"/basic function "Limiter"

Moreover, the **LS_Limiter** system block, which contains the basic function "Limiter", is available in the function block editor to integrate the safety system in the application.

- For one thing, the basic function "Limiter" provides a parameterisation interface in »Engineer« for a comfortable setting of limit positions, limited speeds, and limit values, and for another it enables the drive to be braked specifically **after request** through the safety module.
- If the basic function "Limiter" is to act directly on a request by the safety module, the *LIM_dwControl* input of the **LS_Limiter** system block must be connected to the *SMI_dwControl* output of the **LS_SafetyModuleInterface** system block.

Basic workflow

1. Activation of the safety function on the safety module (e. g. SS1 - safe stop 1).
   → Monitoring starts.
2. The safety module informs the controller via a control word that the safety function has been activated.
3. The application evaluates the control word and starts the required motion sequence (e.g. braking).

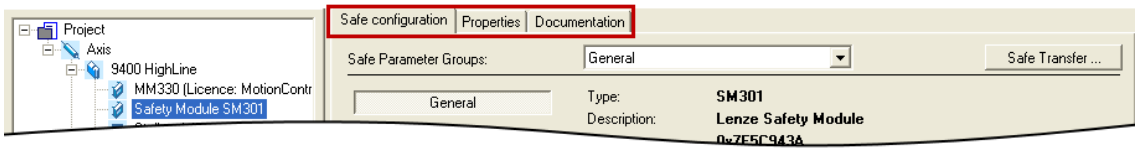
Note!

If communication to the controller is interrupted, e.g. by switching off the controller, the safety module responds as follows:

- Fault stop with STO is activated.
- "Warning" error message is transmitted.
- The LED "ME" is blinking.

The required fault acknowledgement (AIE) is possible via terminal or safety bus.

Further information can be found in the chapter "Error management". (📖 22)



2.5 Parameter setting & configuration

Note!

Safety-relevant parameters can only be transmitted to the safety module via safe parameter setting with the »Engineer«.

The parameter set is stored in the memory module and in the safety module with a unique module ID which must comply to the effective safety address in the safety module.

If you select the SM301 safety module in the *Project view* of the »Engineer«, the following tabs are available in the *Operating range*:

Tab	Info
Safe configuration	Via the *Safe configuration* tab, the SM301 safety module can be safely configured. ▸ Safe configuration (📖 25)
Product features	The *Properties* tab displays general information for the safety module, e.g. product name, order number, and version.
Documentation	The *Documentation* tab serves to add notes and electronic documents to the safety module. • Detailed information on adding documentations can be found in the »Engineer« documentation in the chapter "Project structure".

Safe parameter transfer

By clicking **Safe transfer** on the *Safe configuration* tab, the *Safe transfer* dialog box opens which provides the functions for the safe parameter transfer. ▸ Safe parameter transfer (📖 65)

Service status

If you request the "Send safe data to device" function in the *Safe transfer* dialog box via the **Send** button, the safety module changes to the "Service status" which is required for a safe parameter setting. ▸ Sending safe data (📖 66)

The service status means:

- Normal stop is active and the drive is safely switched to torqueless operation (STO). ▸ Safe stop (📖 41)
- The safe inputs are evaluated as OFF state.
- The safe output was set to OFF state.
- Communication via safety bus is - if possible - active, but passivated.

Note!

- The service status is also active if the parameter set in the memory module does not comply to the parameter set in the safety module during the initialisation.
- The service status can be exited by reinitialising the safety module, i.e. communication via the safety bus is interrupted.

Supported interfaces for a safe parameter setting

A safe parameter setting with the »Engineer« from version 1.4 is supported via the following interfaces:

- Diagnostic interface X6 (with E94AZCUS diagnostic USB adapter)
- Ethernet (E94AYCEN communication module)
- System bus (CAN on board / E94AYCCA communication module)

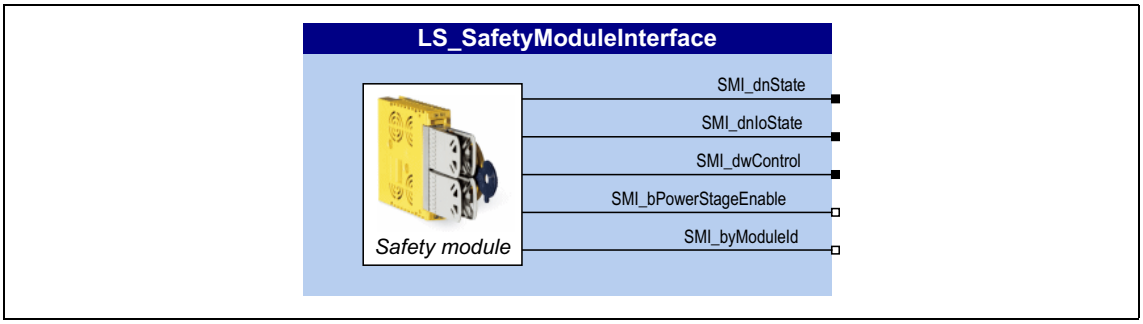
2.5.1 Required settings in the controller

Note!

When communicating online via a bus system it may happen that several users access one and the same drive at the same time and edit the safe parameter set.

After transferring the safe parameters, it must be checked whether the check sums (CRC) of the parameter set, memory module, and the safety module comply to each other in the *Safe Transfer* dialog box.

Since safe parameter access through several users cannot be technically avoided at present, organisational measures are required to ensure the consistency of the safe parameters.



The safety module expected by the application and the controller is selected in C00214.

- In »Engineer« this setting is carried out automatically by assigning the device modules to the controller, i.e. »Engineer« automatically sets C00214 according to the safety module selected.
- If the safety module set in C00214 does not comply to the plugged-in safety module type, an error (fault) is triggered. The error can only be eliminated by mains switching.

Parameter | Name: **C00214 | Required safety module**		Data type: UNSIGNED_8 Index: $24361_d = 5F29_h$
Setting of the expected safety module		
Selection list		
1	SM0	
2	SM100	
4	SM300	
5	**SM301**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ COM ☐ MOT		

2.5.2 "LS_SafetyModuleInterface" system block

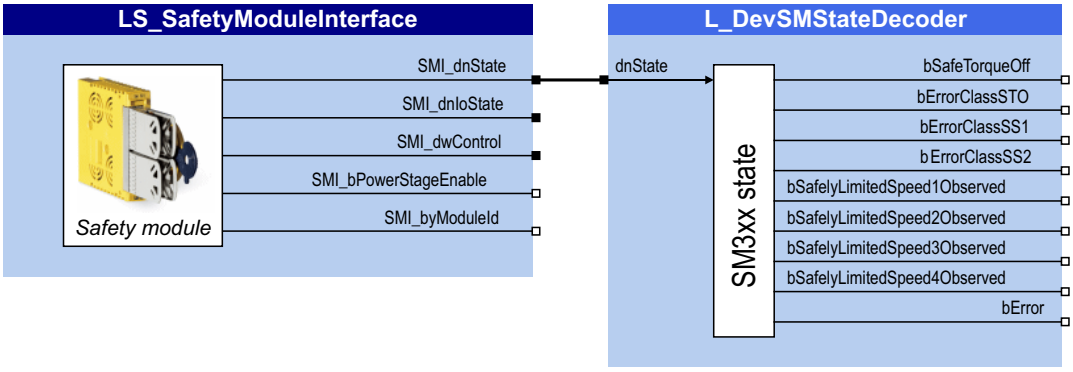
The **LS_SafetyModuleInterface** system block is the interface to the safety module in the function block editor of the »Engineer«.

Outputs

Output Data type	Value/meaning
SMI_dnState DINT	Bit coded status information from the safety module ▸ Status information (📖 18)
SMI_dnIoState DINT	Bit coded I/O status information from the safety module ▸ I/O status information (📖 19)
SMI_dwControl DWORD	Bit coded control information from the safety module ▸ Control information (📖 20)
SMI_bPowerStageEnable BOOL	Status signal "Inverter enable" TRUE: Inverter is enabled by the safety module.
SMI_byModuleId BYTE	ID of the safety module available in the controller

2.5.2.1 Status information

Via the bit-coded status signal *SMI_dnState* of the SB **LS_SafetyModuleInterface** the SM301 safety module transmits the status of safety functions to the application.



Bit coding of the status signal SMI_dnState		
Bit	**Name**	**Meaning**
0	STO	Safe torque off (STO) function is active. • The drive is safely switched to torqueless operation.
3	EC_STO	Error stop category 0: Function Safe torque off (STO) is active.
4	EC_SS1	Error stop category 1: Function Safe stop 1 (SS1) is active.
5	EC_SS2	Error stop category 2: Function Safe stop 2 (SS2) is active.
8	SLS1 monitored	Safely limited speed 1 is activated and observed.
9	SLS2 monitored *	Safely limited speed 2 is activated and observed.
10	SLS3 monitored *	Safely limited speed 3 is activated and observed.
11	SLS4 monitored *	Safely limited speed 4 is activated and observed.
12	SDIpos monitored **	Safe positive direction (SDIpos) is activated and observed.
13	SDIneg monitored **	Safe negative direction (SDIneg) is activated and observed.
14	Fault active	SM301 safety module in error status (trouble or warning).

* From SM301 V1.1 ** From SM301 V1.3
Bits not listed are reserved for future extensions!

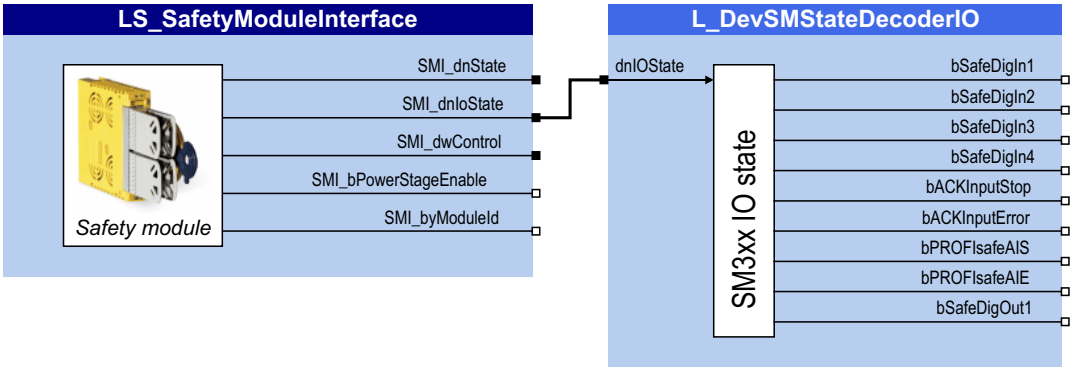
Tip!

For decoding the status signal into individual boolean status signals, simply connect the output *SMI_dnState* to the **L_DevSMStateDecoder** FB which is available in the function library from V2.0.

Note:
This connection example only shows the status signals of the FB **L_DevSMStateDecoder** supported by SM301 V1.1.

[2-1] Example: Decoding of the SMI_dnState status signal into individual boolean status signals

2.5.2.2 I/O status information



Via the bit-coded status signal *SMI_dnIoState* of the SB **LS_SafetyModuleInterface** the SM301 safety module transmits the status of the safe inputs and the safe output to the application:

Bit coding of the SMI_dnIoState status signal		
Bit	**Name**	**Meaning**
0	SD-In1	Sensor input 1 in ON state.
1	SD-In2	Sensor input 2 in ON state.
2	SD-In3	Sensor input 3 in ON state.
3	SD-In4	Sensor input 4 in ON state.
5	AIS	Restart is acknowledged via terminal (negative edge: 1↘0).
6	AIE	Error is acknowledged via terminal (negative edge: 1↘0).
8	PS_AIS	Restart is acknowledged via safety bus (positive edge: 0↗1).
9	PS_AIE	Error is acknowledged via safety bus (positive edge: 0↗1).
12	SD-Out1	Safe output 1 (feedback output) in the ON state.
Bits not listed are reserved for future extensions!		

Tip!

For decoding the status signal into individual boolean status signals, simply connect the output *SMI_dnIoState* to the **L_DevSMStateDecoderIO** FB which is available in the function library from V2.0.

Note:
This connection example only shows the status signals of the FB **L_DevSMStateDecoderIO** supported by SM301 V1.1.

[2-2] Example: Decoding of the SMI_dnIoState status signal into individual boolean status signals

2.5.2.3 Control information

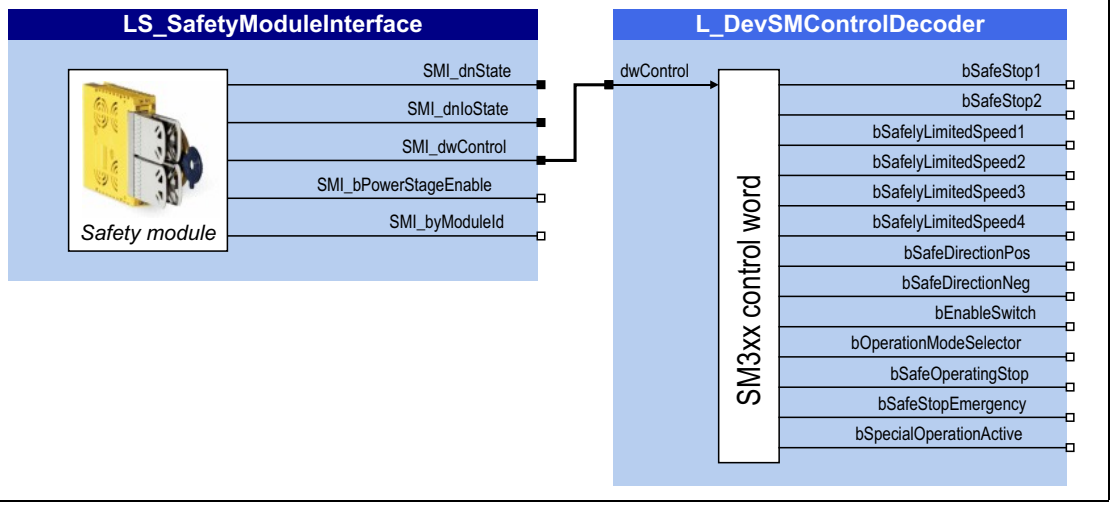
Via the bit-coded control signal *SMI_dwControl* of the SB **LS_SafetyModuleInterface** the SM301 safety module transmits information about requested/active safety functions to the application.

- Several safety functions can be requested/active at the same time.

Bit coding of the SMI_dwControl status signal		
Bit	**Name**	**Meaning**
1	SS1 active	Safe stop 1 (SS1) function is active. • After the parameterised stopping time has elapsed, bit 0 of the status signal *SMI_dnState* (STO active) is set.
2	SS2 active	Safe stop 2 (SS2) function is active. • After the parameterised stopping time has elapsed, bit 16 (SOS monitored) is set.
3	SLS1 active	Safely limited speed 1 (SLS1) function is active. • After the parameterised braking time Nlim1 has elapsed, bit 8 of the status signal *SMI_dnState* (SLS1 monitored) is set additionally.
4	SLS2 active *	Safely limited speed 2 (SLS2) function is active. • After the parameterised braking time Nlim2 has elapsed, bit 9 of the status signal *SMI_dnState* (SLS2 monitored) is set additionally.
5	SLS3 active *	Safely limited speed 3 (SLS3) function is active. • After the parameterised braking time Nlim3 has elapsed, bit 10 of the status signal *SMI_dnState* (SLS3 monitored) is set additionally.
6	SLS4 active *	Safely limited speed 4 (SLS4) function is active. • After the parameterised braking time Nlim4 has elapsed, bit 11 of the status signal *SMI_dnState* (SLS4 monitored) is set additionally.
7	SDIpos active **	Function Safe positive direction (SDIpos) is active. • After the parameterised SDI delay time has elapsed, bit 12 of the status signal *SMI_dnState* (SDIpos monitored) is set additionally.
8	SDIneg active **	Function Safe negative direction (SDIneg) is active. • After the parameterised SDI delay time has elapsed, bit 13 of the status signal *SMI_dnState* (SDIneg monitored) is set additionally.
9	ES active	Enable switch (ES) function for motion functions in special operation is active.
10	SLI is active ***	"Safely limited increment (SLI)" function is active.
11	OMS	Operation mode selector (OMS) function for special operation is requested.
16	SOS active	"Safe operating stop" (SOS) function is active. • The safe operating stop is monitored. • The function will be active after the function Safe stop 2 (SS2) has ended.
23	SSE active	Emergency stop function (SSE) is active. • Depending on the parameterisation of the emergency stop function, bit 1 (SS1 active) or bit 0 of the status signal *SMI_dnState* (STO active) is set after the function has ended.
29	OMS active *	Special operation is active.

* From SM301 V1.1 ** From SM301 V1.3 *** From SM301 V1.4
Bits not listed are reserved for future extensions!

Note!



To effect the corresponding action (e.g. braking to standstill, holding the standstill position), the application engineer has to provide an appropriate interconnection in the application.

- To integrate the basic function "Limiter", the output *SMI_dwControl* is to be connected to the input *LIM_dwControl* of the **LS_Limiter** system block.

Tip!

For decoding/coding the control signal, the function blocks **L_DevSMControlDecoder** and **L_DevSMControlEncoder** are available in the function library from V2.0.

Note:
This connection example only shows the control signals of the FB **L_DevSMControlDecoder** supported by SM301 V1.3.

[2-3] Example: Decoding of the SMI_dwControl control signal into individual boolean control signals

2.5.3 "SMI_SafetyModuleInterface" system block for 9400 ServoPLC

For controllers of the "9400 ServoPLC" series the **SMI_SafetyModuleInterface** system block in the control configuration of the »PLC Designer« provides the interface for the safety module.

System variable Data type	Value/meaning
SMI_dnState DINT	Bit coded status information from the safety module ▸ Status information (📖 18)
SMI_dnIoState DINT	Bit coded I/O status information from the safety module ▸ I/O status information (📖 19)
SMI_dwControl DWORD	Bit coded control information from the safety module ▸ Control information (📖 20)
SMI_bPowerStageEnable BOOL	Status signal "Inverter enable" TRUE: Inverter is enabled by the safety module.
SMI_byModuleId BYTE	ID of the safety module available in the controller

The descriptions in the previous chapter "LS_SafetyModuleInterface" system block apply to this system block in the same way.

2.6 Error management

Error messages of the safety module

For a description of all error messages of the safety module and their causes & possible remedies, please see the chapter "Error messages". (📖 106)

Error states

Detected errors or maloperation of the drive are assigned to error states with definite responses. The response can be co-ordinated with the whole drive via the error states.

Features	Error status		
	System fault	Trouble	Warning
Event	Fatal internal error	Fault	Monitoring function
LED "ME"	On	Blinking	Flashing
Status of safety module	Lockout (CPU stopped)	Error status	Normal operation
The control category in accordance with EN 13849-1...	... has been exited		... has not been exited
Response	The motor is safely switched to torqueless operation via STO immediately	The motor is safely switched to torqueless operation via STO or shut down via SS1 immediately (parameterisable)	
Acknowledgement after event has been eliminated	Switching the 24 V supply at the safety module off and then on again	• Error acknowledgement (AIE) via terminal X82.2 (positive signal pulse with a signal duration of 0.3 ... 10 s) • Error acknowledgement (AIE) via safety bus (bit "PS_AIE") • Switching the 24 V supply at the safety module off and then on again	

Note!

If the system error still occurs after switching the 24 V supply, please contact the Lenze service!

Error in PROFIsafe communication

If errors in the PROFIsafe communication occur, the PROFIsafe driver passivates the data. After PROFIsafe communication has been reinitialised, the drive is automatically enabled again unless a standstill function is selected.

Events which cause an error status are sent as a diagnostic telegram via PROFIBUS. From V1.1 onwards, PROFINET is also supported.

2.6.1 Logbook function in the controller

The logbook function integrated in the controller records important events in the system in chronological order, including error states of the safety module.

Tip!

When an online connection has been established, the logbook can be displayed in the »Engineer« via the **Logbook** button on the **Diagnostics** tab for the controller.

Detailed information on the logbook can be found in the online help for the controller.

2.6.2 Logbook function in the SM301

From SM301 V1.4

For purposes of diagnostics, a simple logbook with ten entries is implemented in the SM301. Changes with regard to the request of safety functions in the SM301 are logged. The bit coded log status created in a 2-ms cycle serves as a basis for the logbook. A logbook entry is generated when the log status has changed.

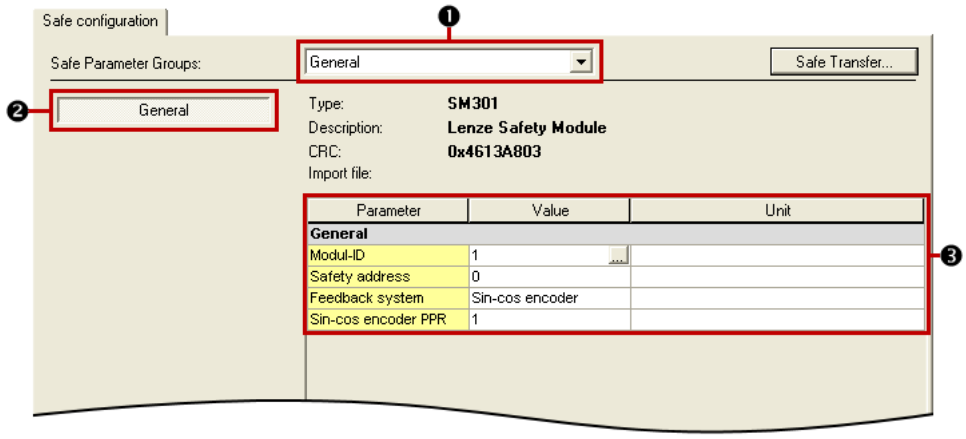
- The logbook function can be controlled via the "Log function" parameter (C15891).
  - The parameter can be written without using the parameter setting interface.
  - Possible settings:

Selection list		Info
0	**Logging active**	The logbook function is permanently active (Lenze setting). • When this value is written, all logbook entries are deleted.
1	Logging stopped	The logging of further entries is stopped.
2	Stop logging in the event of an error	Logbook entries are logged until an error occurs (bit 31 in C15000 set). • When this value is written, all logbook entries are deleted.
3	Stop logging in the case of STO	Logbook entries are logged until Safe torque off (STO) is triggered (bit 0 in C15000 set). • When this value is written, all logbook entries are deleted.
4	Stop logging in the case of SS1	Logbook entries are logged until Safe stop 1 (SS1) is triggered (bit 1 in C15000 set). • When this value is written, all logbook entries are deleted.
5	Stop logging in the case of SS2	Logbook entries are logged until Safe stop 2 (SS2) is triggered (bit 2 in C15000 set). • When this value is written, all logbook entries are deleted.

- A logbook entry consists of the two corresponding subcodes of parameters "Log time" (C15892) and "Log status" (C15893).

Short overview of the relevant parameters:

Parameter	Info	Lenze setting	
C15890	Current time	-	ms
C15891	Log function	Logging active	
C15892/1...10	Log time • Time of the entry in milliseconds since switch-on of the module supply.	-	ms
C15893/1...10	Log status • Status (bit coded) at the time displayed in C15892/1...10.	-	
Highlighted in grey = display parameter			



Note!

Before the display parameters of the logbook are read out for purposes of diagnostics, the logbook function should be stopped by selecting "1: Logging stopped" in C15891, in order to avoid inconsistencies.

3 Safe configuration

The SM301 safety module can be safely configured in the »Engineer« on the *Safe configuration* tab for the SM301 safety module

The parameters of the safety module are divided into different groups according to their functions.

- A group is selected via the **Parameter groups** ❶ list field.
- For a better overview, some parameter groups are divided again into functional subgroups which can be selected via the buttons ❷ on the left.
- In the parameter list ❸ all parameters of the parameter group/subgroup selected are displayed.
  - The **Value** field serves to change the corresponding parameter value.
    ▸ Changing parameter settings (📖 26)
  - The context menu (right mouse button) provides functions for the import/export of the parameter settings.
    ▸ Importing/exporting parameter settings (📖 27)

Tip!

If you place the mouse pointer on a parameter, further information on the parameter will be displayed in a pop-up window.

If you select the entry "All parameters" in the **Parameter groups** list field, all parameters of the safety module are displayed on the tab.

The **File→Print** command in the »Engineer« *menu bar* serves to print all parameter settings of the safety module for the purpose of documentation.

3.1 Changing parameter settings

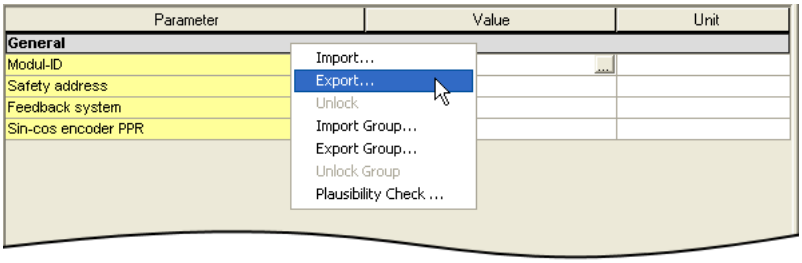
Note!

Changed parameters of the safety module are not automatically transmitted to the device, even if an online connection has been established!

The parameter set for the safety module is only safely transmitted when clicking the **Send** button in the *Safe transfer* dialog box!

▸ Sending safe data (📖 66)

How to change a parameter setting:



1. Select the parameter to be altered from the list.
2. Enter the new value in the **Value** column, or select it from the options defined.
   - Invalid or impermissible values are "red" in the input field.
   - A selection from the list field may cause a deactivation of parameters which are now irrelevant due to the selection (marked by a grey background colour).
3. Press the **<Return key>** or click into another box to accept the changed value.
   - You can reject the entry by pressing the **<Esc>** key.

Tip!

The parameter settings of the safety module can also be displayed in the »Engineer« parameter list (*All parameters tab* → **Safety module SM301**) category and on the keypad. Changes, however, are only possible via the *Safe configuration* tab!

3.2 Importing/exporting parameter settings

For transmitting/copying the parameter settings of the safety module to other safety modules, the import/export functions can be used which are available in the parameter list via the *Context menu* (right mouse button).

Command in the context menu	Info
Import...	Import all parameter settings from the file. • Only compatible files are offered for the import.
Export...	Export all parameter settings to the file.
Unlock	Unlock imported parameter settings. • After the "Import" function has been executed, the imported parameter settings are protected against change by the user. Only an explicit unlocking enables a change again.
Import group...	Import parameter settings of a group from a file. • Only possible when selecting a parameter group. • Only compatible files are offered for the import.
Export group...	Export parameter settings of a group to a file. • Only possible when selecting a parameter group.
Unlock group	Unlock imported parameter settings of a group. • After the "Import group" function has been executed, the imported parameter settings are protected against change by the user. Only an explicit unlocking enables a change again.

3.3 Plausibility check

Before transmitting the parameter set to the safety module, a plausibility check always takes place.

Note!

Only a plausible parameter set can be transmitted to the safety module using the "Send safe data" function!

With the **Plausibility check...** command in the *Context menu* (right mouse button) of the parameter list you can start the plausibility check manually to check the changes made in the parameter settings with regard to plausibility.

- After the plausibility check a status message indicates whether the plausibility check was successful.
- If the plausibility check failed, the status message contains the parameters with implausible settings.

3.4 Compatibility mode

The functional range of the SM301 safety module which can be parameterised in the »Engineer« via the *Safe configuration* tab depends on the version of the safety module selected for the controller via the *Insert device module* dialog box.

Existing projects created e.g. with an SM301 V1.0 safety module can also be downloaded into a controller with a plugged-in SM301 V1.1 safety module. In this example, the functional range which can be parameterised via the *Safe configuration* tab corresponds to the one of the SM301 V1.0 safety module (V1.0 compatibility mode).

Tip!

C15016 displays the parameter set version of the safety module.

3.5 Protection of the safe parameters by project-related password entry

This function is available from »Engineer« HighLevel V2.14!

The »Engineer« provides a password protection which serves to protect the parameter setting of the higher-order safety functions from alterations in the project for the device series 8400 and 9400.

The password...

- ...can be set on the *Protection* tab when the project root element has been selected in the project tree.
- ...is only valid inside the project (no transmission to the controller or safety module). If a password is stored in the project and this project is used, the safe parameters can only be edited after the password has been entered.

How to activate the protection of the save parameters:

1. Select the project root element in the project tree.
2. Assign the desired password on the *Protection* tab.
   - After the password has been set, the safe parameters (tab *Safe configuration*, safe parameters) of all included devices can only be edited inside the project after the corresponding password has been entered.

3.6 General parameters

Short overview of "General" parameter group:

Parameter	Info	Lenze setting
-	Module ID	1
C15111	Safety address	0
C15400	Encoder system (designation up to V1.2)	Sin-cos encoder
	Motor encoder system (designation from V1.3)	
C15409	Motor mounting direction **	Motor rotating CW
C15420	Sin-cos encoder - number of increments	1
C15430	Number of pole pairs of resolver *	1
C15500	Position encoder system *	No position encoder
C15501	Position encoder gearbox factor *	100 %
C15502	Position encoder mounting direction *	Like motor encoder

* From SM301 V1.3 ** From SM301 V1.4

Module ID

Unique identification (1 ... 65534) for the safe device.

Safety address

The safety address serves as a unique identification of the SM301 safety module in systems with several drives.

▸ Setting of the safety address (📖 30)

Motor encoder system

Selection of the motor encoder system for a safe speed measurement.

▸ Safe speed measurement and position detection (📖 31)

Motor mounting direction

Via the setting of the motor mounting direction, information regarding the sign is taken into consideration during the calculation of the safe position and speed measurement.

Sin-cos encoder - number of increments

Number of increments of the sin/cos encoder used for safe speed measurement if "Sin/cos encoder" is selected as encoder system.

▸ Safe speed measurement and position detection (📖 31)

3.6.1 Setting of the safety address

The safety address can be set via the DIP switch of the safety module or via the "safety address" parameter (C15111).

Note!

- The DIP switch in the left housing side of the safety module can only be set if the safety module is not plugged into the controller.
- The setting of the safety address via parameter setting is only possible if the safety address "0" is set with the DIP switch. Otherwise the safety address set via the DIP switch is used.
- The safety address "0" is not permissible!

Setting via DIP switch

- The DIP switch serves to set addresses in the range of 0 ... 1023:

DIP switch	Labelling									
	1	2	3	4	5	6	7	8	9	0
Value of the address bit	1	2	4	8	16	32	64	128	256	512

- Changes of the safety address via the DIP switch are only activated when the 24 V supply is switched on.
- C15101 displays the safety address set with the DIP switch.

Setting via parameter setting

- Via the parameter "safety address" (C15111) addresses in the range of 0 ... 65534 can be set.

Effective safety address

The effective safety address is the result of the setting via DIP switch or parameter setting.

- The effective safety address must match the module ID assigned in the safe parameter set.
- If "PROFIsafe" has been selected as safety bus, the effective safety address is accepted simultaneously as the PROFIsafe target address. This address must match the corresponding configuration of the safety PLC.

Tip!

C15112 displays the effective safety address.

3.6.2 Safe speed measurement and position detection

For safe speed measurement a sin/cos encoder must be connected to terminal X8 (Sub-D) at the controller.

From SM301 V1.3, you can alternatively connect a two-encoder system consisting of a motor and a position encoder. When a two-encoder system is selected, a resolver can be used as motor encoder.

From SM301 V1.4 you can carry out the safe speed and position detection via a resolver without the use of an additional position encoder. For this, connect the resolver to terminal X7.

Safe speed measurement - properties		Explanations
Max. speed	±16000 rpm	Restriction for the use of a resolver: ±(10000 rpm/number of resolver pole pairs)
Response time encoder monitoring	≥ 12 ms *	Time required to detect faults caused by continuous signal errors at the encoder interface.
		* From SM301 V1.2: The response time can be parameterised via C15410. * From SM301 V1.4: If the resolver is used as a motor encoder without an additional position encoder, the response time ≥ 50 ms has to be set.
Error response	Error stop (STO)	
Tolerance threshold of speed comparison	20 min-1 **	The speed measured by the standard device and the speed measured by the safety module are checked for plausibility. • Up to SM301 V1.2, the maximum deviation (after approx. 2 seconds of filtering) is fixedly set to the limit value of 20 rpm. • The filter time of approx. 2 s is part of the diagnostics function and irrespective of the response time.
		* From SM301 V1.3: The tolerance threshold can be parameterised under C15411. **Important:** Select the tolerance threshold as low as possible. If a speed/position information does not come in during operation, the diagnostics function must be able to detect this. So, the parameterised tolerance threshold must be exceeded during operation for at least more than 2 seconds to ensure the two-channel encoder information transfer. Selecting the tolerance threshold too low may lead to a restricted plant availability.

Note!

It is necessary to assess the minimum response time required for the respective system.

A longer response time results in a higher system availability if, for instance, short-time, process-related speed steps occur at safe operational stop during setting-up operation.

The following speed-dependent functions require information from the safe speed measurement:

- Ramp monitoring (SS1/SS2) (📖 48)
- Safe stop 2 (SS2) (📖 46)
- Safe operating stop (SOS)
  - up to SM301 V1.2 in accordance with EN 61800-5-2 / SOS is speed-monitored
- Safe maximum speed (SMS) (📖 51)
- Safely limited speed (SLS) (📖 52)
- Safe speed monitor (SSM)

The following position-dependent functions require information from the safe position detection:

- Safe operating stop (SOS)
  - in accordance with EN 61800-5-2 standard / SOS is position-monitored (from SM301 V1.3)
- Safe direction (SDI) (📖 58)
- Safely limited increment (SLI)

Note!

The speed-dependent functions must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly.

Stop!

Malfunctions due to slip, shaft fractures, etc.

Due to slip, shaft fractures, etc. between the motor and the encoder system, the safe speed measurement is faulty.

Possible consequences:

- The speed-dependent functions are executed incorrectly.

Protective measures:

- Prevent malfunctions by constructive measures.
- Use motors and encoder systems with guaranteed qualities. Your Lenze contact person will inform you about suitable systems.
- This must also be observed in the event of service for the motor or encoder system.

Scaling of position values

The safety module stores the motor encoder and, if necessary, the position encoder position as 32-bit values. The lower-order 16 bits contain the fraction of a motor revolution and the higher-order 16 bits contain the multiple of a motor revolution.

Example	Calculation		Result (hex)
¼ motor revolution	65536 / 4	= 16384	0x0000'4000
½ motor revolution	65536 / 2	= 32768	0x0000'8000
1 motor revolution	1 * 65536	= 65536	0x0001'0000
2 motor revolutions	2 * 65536	= 131072	0x0002'0000
2½ motor revolutions	2 * 65536 + 65536 / 2	= 163840	0x0002'8000

3.7 Safe inputs

General information

The following applies to the sensors of the SM301, version VA 1.00:

- The sensor type and function can be parameterised.
- A local evaluation is carried out if a corresponding parameter setting has been made.
- If a safety bus is activated, the sensor signals are sent as status information to the master control.
- Deactivated sensor inputs must not be connected. The status of a non-connected input is in the OFF state.
- If a signal is detected at a deactivated sensor input during initialisation, the drive remains inhibited (STO).
- Faulty inputs are evaluated as OFF state.

The following applies to SM301 from V1.1:

If the "Safe cascading" safety function is active, the safe SD-In4 input is used as a cascading input and can no longer be used as a universal input. For the cascading function, the SD-In4 input must be parameterised as an active input for the "emergency stop" function. ▸ Cascading (CAS) (📖 57)

Note!

Make sure that an internal contact function test is carried out at the safe inputs:

- Safe input in the ON state
  - A LOW level at one channel puts the input in the OFF state. The discrepancy monitoring starts simultaneously.
  - A LOW level must be detected at both channels within the discrepancy time, otherwise a discrepancy error will be reported.
  - To be able to confirm the discrepancy error, a LOW level must be detected before at both channels.
- Safe input in the OFF state
  - A HIGH level at one channel starts the discrepancy monitoring.
  - A HIGH level must be detected at both channels within the discrepancy time, otherwise a discrepancy error will be reported.
  - To be able to confirm the discrepancy error, a HIGH level must be detected before at both channels.

Tip!

Detailed information on the contact function test, the connection of passive/active sensors and example circuits can be found in the manual for the safety module.

Short overview of "Safe inputs" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15030/1...4	SD-In1...4 sensor type	Input deactivated	
C15031/1...4	SD-In1...4 sensor function	Free assignment	
C15032/1...4	SD-In1...4 free assignment	STO	
C15033/1...4	SD-In1...4 discrepancy time	10	ms
C15034/1...4	SD-In1...4 input delay	0	ms

Sensor type/sensor function

The sensor type and function can be parameterised.

Note!

If an error (e.g. a discrepancy error) occurs at a safe input to which the "operation mode selector" sensor function is assigned, the corresponding input is valued as OFF state.

- By this, normal operation is activated up to SM301 V1.2.
- From SM301 V1.3 the operating mode in the case of LOW level at the safe input can be parameterised via C15202.
- The "Module Error ME" LED blinks, STO is not tripped.
- Special operation can only be selected again if the error has been eliminated and acknowledged.

Tip!

Detailed information on sensor inputs, active and passive sensors can be found in the manual for the safety module.

Free assignment

If "Free assignment" has been selected as sensor function, the safety function selected via this parameter is assigned to the safe input. The following safety functions can be selected:

- Safe torque off (STO) (📖 44)
- Safe stop 1 (SS1) (📖 45)
- Safe stop 2 (SS2) (📖 46)
- Safely limited speed (SLS) (📖 52)
- Safe direction (SDI) (from SM301 V1.3) (📖 58)

Note!

If "No function" has been selected, no safety function is assigned to the safe input. The functional test and monitoring of the discrepancy time remain active and the status of the input is transmitted to the control via the safety bus (if parameterised).

Discrepancy time

Maximum time for which both channels of a safe input may have non-equivalent states without the safety system detecting an error.

Input delay

Time between the recognition of the signal change and the effective evaluation of an input signal. As a result, multiple and short signal changes due to contact bounce of the components are not taken into account.

3.8 Safe output

General information

Via the safe output O1A/O1B information can be output to a higher-level unit (e.g. safety PLC) or external switching elements (actuators) can be controlled.

- The 24V supply of the safety module and the safe output must be provided by safely separated power supply units. In order to keep the circuits electrically isolated, separate voltage supplies are required.
- The status of the safe output is controlled by two ways:
  - Directly by the safety module through a corresponding setting of the parameters "SD-Out1 switching condition" and "SD-Out1 logic function".
  - Via the PROFIsafe output data in connection with the parameterised "SD-Out1 logic function".
- The safe output is PP switching, i.e. two plus channels are switched.

The following applies to SM301 from V1.1:

If the "Safe cascading" safety function is active, the safe SD-Out1 output is used as cascading output and cannot be parameterised as a universal feedback output. ▸ Cascading (CAS) (📖 57)

Stop!

In case of polarity reversal of the supply voltage of the safe outputs, we recommend an immediate replacement of the module, as there is a risk of increased unavailability due to damage to protective elements.

Note!

The safe output is tested cyclically in the ON state by a short LOW switching.

- When selecting the downstream control elements, ensure that the test pulses are not detected as LOW signals.
- These errors are detected immediately and set the output to the OFF state.
  - Short circuit to supply voltage.
  - In the ON state: Short circuit between the output signals.
  - In the ON state: Missing 24-V supply voltage at terminal 24O is detected as "Stuck-at-Low" error.
- These errors are not detected:
  - In the OFF state: Short circuit between the output signals.

Tip!

Detailed information on the functional test by means of test pulses and example circuits can be found in the manual for the safety module.

Short overview of the "Safe output" parameter group:

Parameter	Info	Lenze setting
C15051/1 C15052/1	SD-Out1 switching condition: STO active	Not evaluated
	SD-Out1 switching condition: SS1 active	Not evaluated
	SD-Out1 switching condition: SS2 active	Not evaluated

C15055/1	SD-Out1 logic function	OR

* From SM301 V1.1 ** From SM301 V1.3 *** From SM301 V1.4

SD-Out1 switching condition

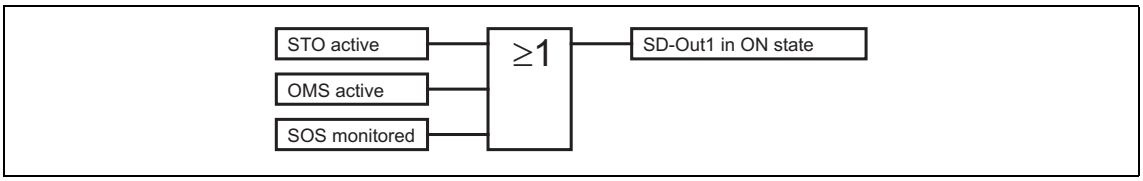
Configuration of the switching conditions that are to be assigned to the safe output.

- Several switching conditions can be simultaneously assigned to the safe output.
- For each switching condition it can be individually set whether it is to be evaluated with a positive or negative logic.
- In order to assign one or several conditions to the safe output, simply change the settings for these conditions from "Not evaluated" to "Positive logic" or "Negative logic".
- The "SD-Out1" bit of the PROFIsafe output data is included in the evaluation via the selected logic function. The evaluation for this bit can be deactivated via the parameters "S bus: Configuration" and "S bus: Filter control data".

SD-Out1 logic function

Selection of the logic operation (OR or AND) for the switching conditions to be evaluated.

Tip!



- Case studies with regard to the parameter setting of the safe output can be found in the following subchapters.
- C15060 displays the output image of the safety module.

3.8.1 Case study 1: "Safety door"

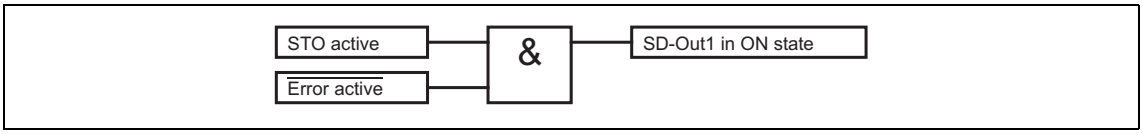
Switching condition

The following switching condition is to be implemented for the safe output SD-Out1:

- Opening the safety door is permitted (SD-Out1 in ON state) if
  - the power supply for the motor is safely interrupted (STO active)
  - **OR** special operation is active (OMS active)
  - **OR** the safe operating stop is active and monitored (SOS monitored).

[3-1] Logic operation for "Safety door" case study

Required parameter setting for SD-Out1



1. Set the following switching conditions to "Positive logic":
   - STO is active
   - OMS active
   - SOS monitored
2. Set all other switching conditions to "Not evaluated".
3. Set logic function to "OR".
4. If a safety bus has been parameterised:
   - The "SD-Out1" bit of the safety control is considered in the ORing.
   - Hide the "SD-Out1" bit via the "S bus: Filter control data" parameter to suppress this access.

3.8.2 Case study 2: "Signalling"

Switching condition

The following switching condition is to be implemented for the safe output SD-Out1:

- Safe signalling is carried out (SD-Out1 in ON state) if
  - the power supply for the motor is safely interrupted (STO active)
  - **AND NO** error is active ($\overline{\text{Error active}}$).

[3-2] Logic operation for case study "Signalling"

Required parameter setting for SD-Out1

1. Set the following switching condition to "Positive logic":
   - STO is active
2. Set the following switching condition to "Negative logic":
   - Fault active
3. Set all other switching conditions to "Not evaluated".
4. Set logic function to "AND".
5. If a safety bus has been parameterised:
   - The "SD-Out1" bit of the safety control is considered in the ANDing.
   - Hide the "SD-Out1" bit via the "S bus: Filter control data" parameter to suppress this access.

3.9 Safety functions

The parameterisable safety functions are divided into five functional subgroups:

- Safe stop
- Safe speed limitation (📖 50)
- Operation mode selection (📖 54)
- Cascading (CAS) (from SM301 V1.1) (📖 57)
- Safe direction (from SM301 V1.3) (📖 58)

3.9.1 Safe stop

General information

The stop functions are divided according to the tripping reason:

- Standard stop (simple stop)
  - Tripping by a safe input with the parameterised functions STO, SS1, or SS2*.
  - Tripping by activating the bits STO, SS1 or SS2* via the safety bus.
  - In special operation (OMS) the standard stop can be avoided by confirming it with the enable switch (ES).
- Emergency stop
  - Tripping by a safe input with the parameterised function SSE.
  - Tripping by activating the bit SSE via the safety bus.
  - STO or SS1 can be set as the function to be executed via the parameter "SSE: Emergency stop function".
  - In special operation (OMS) the emergency stop cannot be avoided.
- Error stop
  - Tripping as response to an error.
  - In special operation (OMS) the error stop cannot be avoided.

* Based on EN 61800-5-2 / SOS is speed-monitored (up to SM301 V1.2) and
based on the EN 61800-5-2 standard / SOS is position-monitored (from SM301 V1.3)

Short overview of "Safety functions → Safe stop" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15205	SSE: Emergency stop function	STO	
C15300/1	Restart behaviour - STO, SS1	Acknowledged restart	
C15300/2	Restart behaviour - SS2, SOS	Acknowledged restart	
C15305	SS1, SS2: Stopping time	0	ms
C15306	SS1 mode *	STO after stopping time	
C15307	SS1: STO delay after n=0 *	0	ms
C15308	SS2 mode *	SOS after stopping time	
C15310	Speed window (n=0)	0	rpm
C15311	SOS: Tolerance margin (delta p=0) *	0	Incr.
C15315	SS1, SS2: Ramp monitoring **	Ramp monitoring activated	
C15316	SS1, SS2: Ramp - S-ramp time **	0	%
C15317	SS1, SS2: Ramp - start-offset **	0	%

* From SM301 V1.3 ** From SM301 V1.4

3.9.1.1 Priorisation

Stop functions with priority influence the process of already started subordinated functions.

1. Safe torque off (STO)
   - The STO function has the highest priority and thus takes priority over all other functions. Functions already started (e.g. SS1 or SS2) are cancelled and the drive is switched off.
2. Safe stop 1 (SS1)
   - The SS1 function has priority over SS2. Taking the stopping time set for SS1 and SS2 and for the SS1 mode (from SM301 V1.3) into consideration, the drive is switched to torque-free operation.
3. Monitoring functions
   - The monitoring functions have the same priorities. They can also be executed parallel to the stop function.

3.9.1.2 Restart behaviour

The restart behaviour of the drive after a stop function has been executed can be set via the following parameters:

- "Restart behaviour - STO, SS1" (C15300/1)
- "Restart behaviour - SS2, SOS" (C15300/2)

Danger!

If the request for the safety function is cancelled, the drive can restart automatically.

In the case of an automatic restart, you have to provide external measures which ensure that the drive only restarts after a confirmation (EN 60204).

Restart behaviour in the case of the "Acknowledged restart" setting

- After a standard stop the restart must be acknowledged (AIS) via terminal or safety bus.
- After an error stop, the error must be acknowledged first (AIE), before the restart is acknowledged with AIS.

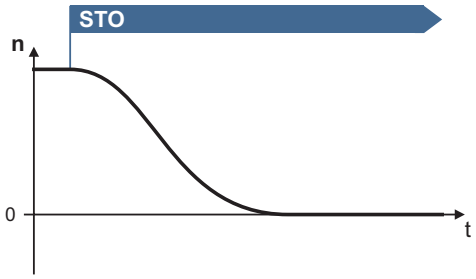
Acknowledgement	via terminal	via safety bus
AIS	X82.3 or X82.4 (Positive signal pulse with a signal duration of 0.3 ... 10 s)	PROFIsafe bit "PS_AIS" (positive edge) ▸ Safety bus (📖 59)
AIE	X82.2 (Positive signal pulse with a signal duration of 0.3 ... 10 s)	PROFIsafe bit "PS_AIE" (positive edge) ▸ Safety bus (📖 59)

Note!

The restart behaviour after an emergency stop corresponds to the restart behaviour parameterised for the STO/SS1 stop function.

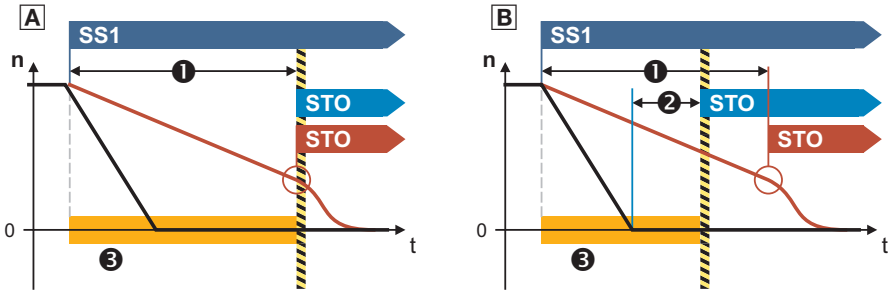
Restart behaviour in the case of the "Automatic restart" setting

The higher-level control must ensure that the drive only restarts after an acknowledgement. The stop status of the drive is reported to the higher-level control via bit STO or SOS.



The following applies to SM301 from V1.1:

If the "Safe cascading" safety function is active, an automatic restart after STO is not permissible. The plausibility check rejects such a setting. ▸ Cascading (CAS) (📖 57)



3.9.1.3 Emergency stop function (SSE)

Safe Stop Emergency / SSE		
Description	The emergency stop function starts STO or SS1, depending on the setting of the "SSE: emergency stop function" parameter.	
	• In special operation the emergency stop cannot be avoided. • Connect the emergency stop buttons, which must not be overruled by special operation, to the emergency stop function. For this purpose, parameterise the safe input as "emergency stop" (C15031).	
Parameter	C15205	SSE: Emergency stop function • Selection of the function to be performed (STO or SS1).
Activation	How to activate the function: • A data telegram with a corresponding content is sent to the controller via the safety bus. ▸ Safety bus (📖 59) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 34)	

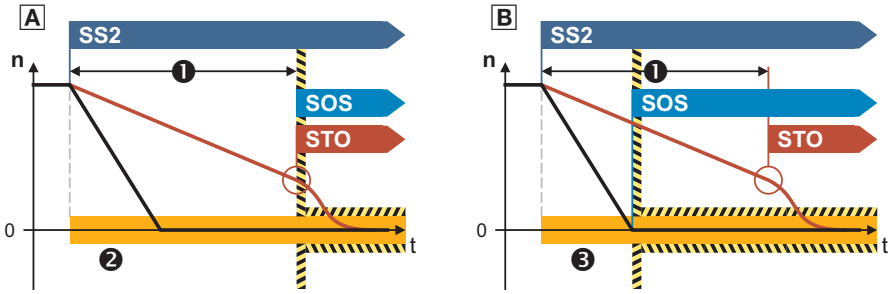
3.9.1.4 Safe torque off (STO)

Safe Torque Off / STO (corresponds to a "Stop 0" in accordance with EN 60204)	
Description	By using this function the power supply for the motor is safely interrupted immediately. The motor cannot generate a torque and thus no dangerous motions of the drive.
	• Additional measures are required against movements caused by external forces, e.g. mechanical brakes. • The restart behaviour can be set. ▸ Restart behaviour (📖 43)
Priority	Priority function: none Subordinated function: SS1, SS2
Function	
Parameter	Function sequence and error response have no adjustable parameters.
Activation	How to activate the function: • A data telegram with a corresponding content is sent to the controller via the safety bus. ▸ Safety bus (📖 59) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 34) • As response to the error stop request. • As response to the emergency stop request.

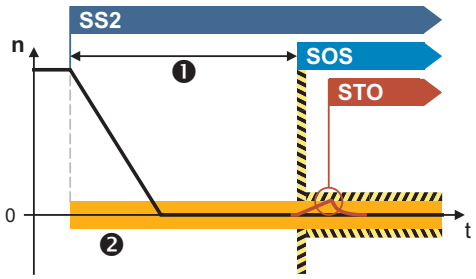
3.9.1.5 Safe stop 1 (SS1)

Safe Stop **1** / SS1 (corresponds to a "Stop1" according to EN 60204)			
Description	The safety module monitors whether the drive has reached the set tolerance margin (n=0) within the parameterised stopping time and, depending on the parameterised SS1 mode, after the stopping time has elapsed or after falling below the tolerance margin (n=0), switches the drive to torque-free operation via the STO safety function.		
	• From SM301 V1.4 additionally the deceleration ramp for the SS1 stop function can be parameterised and monitored. ▸ Ramp monitoring (SS1/SS2) (📖 48) • The drive must be braked to standstill through the application! • The speed is calculated from the encoder data. ▸ Safe speed measurement and position detection (📖 31) • In SS1 mode "STO with n=0", you can use the parameter "STO delay after n=0" to set a waiting time which determines when the STO status is adopted. • Without an encoder, the function evaluates the speed status n=0 of the controller. In this case the stopping time monitored by the safety module must be 0.5 s longer than the stopping time parameterised on the controller. • Additional measures are required against movements caused by external forces, e.g. mechanical brakes. The application time of a brake must be considered when determining the stopping time. • A restart is only possible after the stopping time has elapsed completely. This does not apply to special operation. ▸ Restart behaviour (📖 43)		
Priority	Priority function: STO Subordinated function: SS2		
Function	 From SM301 V1.3, function B (STO with n=0) can be selected as SS1 mode.		
Parameter		C15306	SS1 mode: A STO after stopping time B STO with n=0
	❶	C15305	SS1, SS2: Stopping time
	❷	C15307	SS1: STO delay after n=0
	❸	C15310	Speed window (n=0)
Activation	How to activate the function: • A data telegram with a corresponding content is sent to the controller via the safety bus. ▸ Safety bus (📖 59) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 34) • As response to the error stop request. • As response to the emergency stop request.		
Normal behaviour	When the stopping time has elapsed or after falling below the tolerance margin (n=0), a standard stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.		
Error behaviour	If standstill has not been reached when the stopping time has elapsed, or if the deceleration ramp parameterised was exceeded during the Ramp monitoring was activated, an error message is triggered and an error stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.		

3.9.1.6 Safe stop 2 (SS2)



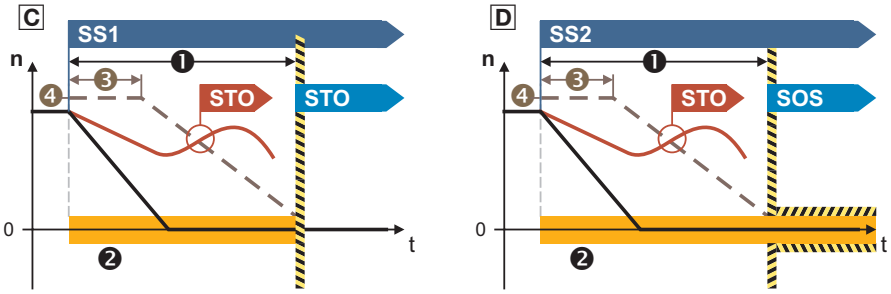
Note!



When the stopping time has elapsed, the safe stop 2 (SS2) function switches to the safe operating stop (SOS). This function has been implemented in the SM301 up to version V1.2 in the form of speed range monitoring.

- This means that the SOS function and, consequently, also the SS2 function have not been implemented in accordance with the IEC 61800-5-2 standard, which clearly requires the monitoring of a position window in section 4.2.3.1.

From SM301 V1.3



- position-window monitoring has been implemented.
- it is possible to change to the safe operating stop before the stopping time has elapsed as soon as the standstill has been identified. This behaviour can be parameterised.

Safe Stop 2 / SS2 (corresponds to a "Stop 2" in accordance with EN 60204)			
Description	The safety module monitors whether the drive has reached the set tolerance margin (n=0) within the parameterised stopping time and, depending on the parameterised SS2 mode, after the stopping time has elapsed or after falling below the tolerance margin (n=0), activates the monitoring of the safe operating stop (SOS). In the safe operational stop the drive is not switched to torque-free operation but all control functions remain active and the position reached must be maintained actively.		
	• From SM301 V1.4 additionally the deceleration ramp for the SS2 stop function can be parameterised and monitored. ▸ Ramp monitoring (SS1/SS2) (📖 48) • The application must ensure that the drive is braked to standstill and the position is maintained! • The speed and the position data are calculated from the encoder data. ▸ Safe speed measurement and position detection (📖 31) • Without an encoder the function cannot be used. • Additional measures are required against movements caused by external forces, e.g. mechanical brakes. The application time of a brake must be considered when determining the stopping time. • A restart is only possible after the stopping time has elapsed completely. This does not apply to special operation. ▸ Restart behaviour (📖 43)		
Priority	Priority functions: STO, SS1		
Function	 From SM301 V1.3, function B (SOS with n=0) can be selected as SS2 mode.		
Parameter		C15308	SS2 mode: A SOS after stopping time B SOS with n=0
	❶	C15305	SS1, SS2: Stopping time
	❷	C15310	Speed window (n=0)
	❸	C15311	SOS: Tolerance margin (delta p=0) *

Safe **S**top **2** / SS2 (corresponds to a "Stop 2" in accordance with EN 60204)	
Activation	How to activate the function: • A data telegram with a corresponding content is sent to the controller via the safety bus. ▸ Safety bus (📖 59) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 34) • As response to the error stop request.
ℹ	In the SOS state, relative position changes are added and compared with the permissible value in the parameter "Tolerance margin delta p=0". • When the SOS state is left, the maximum relative position change is displayed in the parameter C15312. • When the SOS state is requested again, the sum of the last position changes is reset to zero. **Example:** The "SS2 active" state and the "SOS active" state are interrupted by an STO request. If the STO request is reset, the status immediately changes to SOS. This leads to a reset of the current position deviation to p=0.
Normal behaviour	When the stopping time has elapsed or after falling below the tolerance margin (n=0), the monitoring of the safe operating stop (SOS) becomes active.
Error behaviour	If standstill has not been reached when the stopping time has elapsed, or if the deceleration ramp parameterised was exceeded during the Ramp monitoring was activated, an error message is triggered and an error stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.
	Safe operating stop (SOS) in final state: If the speed gets out off the set tolerance margin (n=0 or delta p=0) during a safe operational stop, an error message is generated and an error stop starts. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive. 

3.9.1.7 Ramp monitoring (SS1/SS2)

From SM301 V1.4

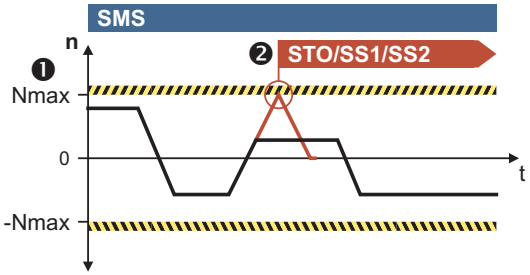
Ramp monitoring (SS1/SS2)			
Description	The SS1 and SS2 stop functions monitor whether the drive has reached the set tolerance window (n=0) within the stopping time parameterised. From SM301 V1.4 additionally the deceleration ramp for the SS1 and SS2 stop functions can be parameterised and monitored. By monitoring the deceleration process, safety can be increased. The longer the deceleration times due to high moments of inertia are, the more important is ramp monitoring, in order to still be able to ensure acceptable safety margins.		
	• The application must ensure that the drive is braked to standstill and the position is maintained! • The safe speed evaluation is a precondition for safe ramp monitoring, i. e. an encoder system has to be parameterised in the safety module. ▸ Safe speed measurement and position detection (📖 31) • If ramp monitoring is activated, the starting value of the ramp and the S-ramp time have to be preselected as a percentage value. • The starting value refers to the current speed value at the time of the SS1/SS2 request. • Via the S-ramp time, the starting time of the deceleration ramp is delayed to take a potential S-ramp smoothing into consideration.		
Function	 Safe ramp monitoring for SS1 (C) and SS2 (D)		
Parameter	❶	C15305	SS1, SS2: Stopping time
	❷	C15310	Speed window (n=0)
		C15315	SS1, SS2: Ramp monitoring
	❸	C15316	SS1, SS2: Ramp S-ramp time
	❹	C15317	SS1, SS2: Ramp offset start
Activation	How to activate the function: • The ramp monitoring function has to be activated via parameter C15315. • If the SS1/SS2 stop function is requested, a monitoring ramp is calculated and is layed on the current speed characteristic.		
	• The parameterisation of the monitoring ramp in the safety module has to take the parameters of the deceleration ramp from the application into consideration. • On the basis of the actual speed, a parameterisable percentage proportion (0 ... 30 %) is added to the actual speed as start offset and is considered as a constant starting value. • In the Lenze setting of the start offset (C15317) the tolerance window (n=0) is considered as the offset. • The monitoring ramp is only started after an internal deceleration time has elapsed, which is generated depending on the "SS1, SS2: S-ramp time" and "SS1, SS2: Stopping time"parameters: • The "SS1, SS2: S-ramp time" parameter is scaled linearly from 10 ... 30 % to the stopping time: 0 % S-ramp time ≡ 10 % deceleration 100 % S-ramp time ≡ 30 % deceleration • In the Lenze setting of the S-ramp time, the deceleration time is 10 % of the stopping time set. • In the SM301 the same value as in the standard device can be set for the S-ramp time.		

Ramp monitoring (SS1/SS2)	
Normal behaviour	During the stopping time elapses, or before the tolerance window (n=0) is reached, the speed ramp parameterised is not exceeded. Afterwards there is the transition to the STO or SOS stop function parameterised.
Error behaviour	If the current speed exceeds the parametersed speed ramp within the stopping time or before the tolerance window (n=0) is reached, an error message is triggered and an error stop is activated. • The power supply for the motor is safely interrupted immediately (STO). The motor cannot generate a torque and thus no dangerous movements of the drive.

3.9.2 Safe speed limitation

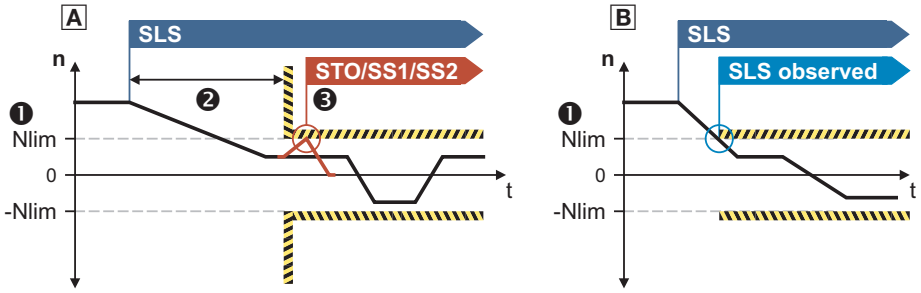
The SM301 supports the safe monitoring of a maximum speed (SMS), which is active for all operating states. Furthermore the monitoring of a safely limited speed (SLS1) can be activated via a safe input or the safety bus.

From SM301 V1.1 onwards, the following safety functions are additionally supported:



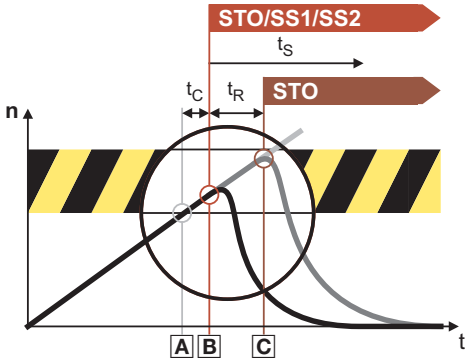
- Safely limited speed 2 (SLS2)
- Safely limited speed 3 (SLS3)
- Safely limited speed 4 (SLS4)

Short overview of "Safety functions ➞ Safe speed" parameter group:



Parameter	Info	Lenze setting	
		Value	Unit
C15320	SMS: Max. speed Nmax	1	rpm
C15321	SMS: Reaction (n>Nmax)	SS1	
C15330/1	SLS1: Limited speed Nlim1	0	rpm
C15331/1	SLS1: Braking time Nlim1	0	ms
C15332/1	SLS1: Response (n>Nlim1)	SS1	
C15333/1	SLS1: Perm. direction of movement ***	Both directions enabled	
C15330/2	SLS2: Limited speed Nlim2 *	0	rpm
C15331/2	SLS2: Braking time Nlim2 *	0	ms
C15332/2	SLS2: Reaction (n>Nlim2) *	SS1	
C15333/2	SLS2: Perm. direction of movement ***	Both directions enabled	
C15330/3	SLS3: Limited speed Nlim3 *	0	rpm
C15331/3	SLS3: Braking time Nlim3 *	0	ms
C15332/3	SLS3: Reaction (n>Nlim3) *	SS1	
C15333/3	SLS3: Perm. direction of movement ***	Both directions enabled	
C15330/4	SLS4: Limited speed Nlim4 *	0	rpm
C15331/4	SLS4: Braking time Nlim4 *	0	ms
C15332/4	SLS4: Reaction (n>Nlim4) *	SS1	
C15333/4	SLS4: Perm. direction of movement ***	Both directions enabled	
C15350	SLS, SMS: Max. response time	0	ms
C15410	Response time encoder monitoring **	12	ms
C15411	Speed comparison tolerance ***	20	rpm

* From SM301 V1.1 ** From SM301 V1.2 *** From SM301 V1.3



3.9.2.1 Safe maximum speed (SMS)

Safe **M**aximum **S**peed / SMS			
Description	The safety module monitors the adjusted safe maximum speed of the motor.		
	The function can only be activated by parameter setting. • See parameter "SMS: Maximum speed Nmax". • The function must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly.		
Function			
Parameter	❶	C15320	SMS: Max. speed Nmax • A value > 0 activates the function, a value = 0 deactivates the function.
	❷	C15321	SMS: Reaction (n>Nmax) • Selection of the function to be executed (STO, SS1 or SS2) if monitoring responds.
		C15350	SLS, SMS: Max. response time • If in the event of an error the speed is still outside the limit values after the response time has elapsed, STO is tripped immediately. • Detailed information can be found in the chapter "Error analysis for the functions SMS and SLS". (📖 53)
Activate	How to activate the function: • Set the parameter "SMS: Maximum speed Nmax" > 0.		
Error behaviour	If the speed exceeds the set maximum speed Nmax, an error message is generated and an error stop is started with the function set in the parameter "SMS: Reaction (n>Nmax)" (STO, SS1 or SS2).		

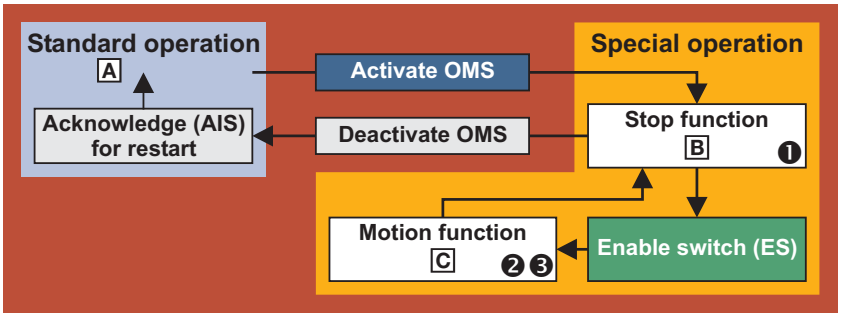
3.9.2.2 Safely limited speed (SLS)

Safely-Limited Speed / SLS			
Description	When the value has fallen below the parameterised speed limit Nlim or, at the latest, after the adjustable braking time has elapsed, the safety module monitors that the set limited speed Nlim is not exceeded.		
	• The drive must be braked to the limited speed through the application! • For operation within the limit values the "SLS1...4 monitored" status is set (C15000). • The status can be assigned to the safe output as a safe speed monitor. ▸ Safe output (📖 37) • The status can also be reported via the safety bus. • The function must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly. • The limited speeds SLS2 ... SLS4 are available from SM301 V1.1! • From SM301 V1.3 you can set both the limited speed and, in addition, the permissible direction of movement via a parameter. • When the direction monitoring SDIxxx is combined with the SLSx function, the delay times must be adapted to each other. The braking time Nlim then starts at the same time as the SDI delay time.		
Function	 Function B (monitoring is active before the braking time has elapsed) only from SM301 V1.3		
Parameter	❶	C15330/1...4	SLS1...4: Limited speed Nlim
	❷	C15331/1...4	SLS1...4: Braking time Nlim
	❸	C15332/1...4	SLS1...4: Reaction (n>Nlim) • Selection of the function to be executed (STO, SS1 or SS2) if monitoring responds.
		C15333/1...4	SLS1...4: Perm. direction of movement
		C15350	SLS, SMS: Max. response time • If in the event of an error the speed is still outside the limit values after the response time has elapsed, STO is tripped immediately. • Detailed information can be found in the chapter "Error analysis for the functions SMS and SLS". (📖 53)
Activation	How to activate the function: • A data telegram with a corresponding content is sent to the controller via the safety bus. ▸ Safety bus (📖 59) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 34)		
Error behaviour	If the speed exceeds the set limited speed Nlim in the monitored state, an error message is generated and an error stop is triggered with the function set in the parameter "SLS1...4: Reaction (n>Nlim)" (STO, SS1 or SS2).		

3.9.2.3 Error analysis for the functions SMS and SLS

Error analysis	
	The speed values are evaluated and checked for plausibility in a cycle of 2 ms. The following illustration shows the process from the moment the error occurred. 
	A Occurrence of the error event • The speed exceeds the limit value parameterised for SMS or SLS.
	B Detection of the error event • After the internal response time t_C of max. one evaluation cycle has elapsed, the parameterised function (STO, SS1 or SS2) is started as the error response. • With the parameterised function SS1 or SS2, the stopping time t_S set for SS1/SS2 is added to the internal response time, until STO is started in the event of an error.
	C Response instance in the case of continuous exceedance • By parameterising the maximum response time t_R (C15350), continuous exceedance of the limit values can be avoided. • If the speed is outside the limit values even after the response time t_R has elapsed, STO is started immediately.
	In the event of an error, the set limited speed will be exceeded. In order to evaluate the risk for the system, you must calculate the amount of the maximum exceedance. The following must be taken into account: • Internal response time • Application-specific response time • Application-specific maximum acceleration

3.9.3 Operation mode selection



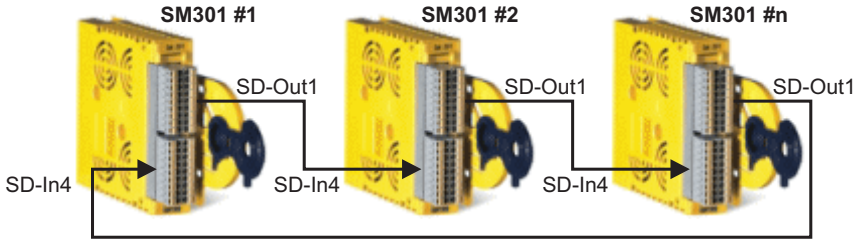
Short overview of "Safety functions → Operation mode selection" parameter group:

Parameter	Info	Lenze setting	
		Value	Unit
C15200	OMS: Stop function	STO	
C15201	OMS: Motion function	SLS1	
C15202	OMS: Function at LOW level *	Normal operation	
C15203	Safely limited increment **	1	Incr.

* From SM301 V1.3 ** From SM301 V1.4

3.9.3.1 Operation mode selector (OMS)

Operation **M**ode **S**elector / OMS	
Description	This function serves to switch between normal operation and "special operation" of the drive.
	• Special operation enables the overriding of a standard stop (STO, SS1 and SS2) by release through the enable switch. ▸ Enable switch (ES) (📖 56) • From SM301 V1.4: The monitoring function of the safely limited increment is active as soon as a value > 0 has been entered in C15203. The setting "0" deactivates the SLI monitoring function. • The monitoring function parameterised is automatically activated with the transition to special operation. A motion function other than "traverse freely" at the same time is monitoring function in special operation.
	OMS: Function at LOW level If the operation mode selector is implemented via a safe input, the operating mode for the LOW level is to be selected with care (from SM301 V1.3). According to the closed-circuit principle, no additional danger must be caused by normal or special operation in the corresponding application. For detailed information, please see the manual for the safety module.
Preconditions	• A safe input must be parameterised and interconnected as an operation mode selector. You can only connect and parameterise one operation mode selector. The OMS bit of the safety bus must be deactivated (C15113). When a safe input is used, the LOW level function must be set depending on the application (from SM301 V1.3). • Special operation can also be selected via the safety bus with the OMS bit unless a safety input is set as an operation mode selector. • The plausibility check rejects ambiguous settings until you have parameterised them correctly.



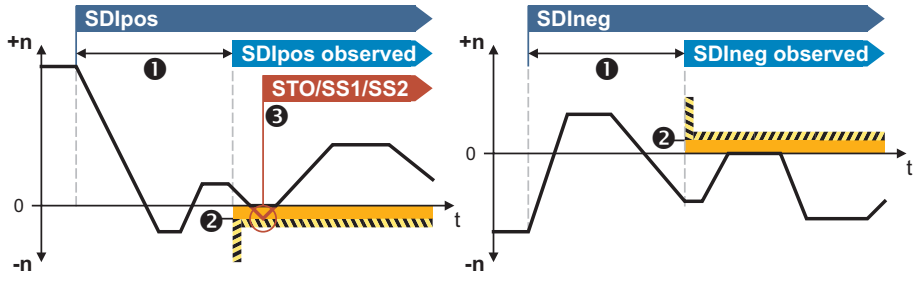
<table>
<tr><th colspan="4">Operation Mode Selector / OMS</th></tr>
<tr><td>Function</td><td colspan="3"> 
</td></tr>
<tr><td></td><td>A</td><td colspan="2">Basic status of normal operation</td></tr>
<tr><td></td><td>B</td><td colspan="2">If special operation is requested, the stop function (STO, SS1 or SS2) parameterised for special operation is started.</td></tr>
<tr><td></td><td>C</td><td colspan="2">Via enable through the enable switch, the motion function (SLS or free traversing) parameterised for special operation is possible. Furthermore the SLI monitoring function (safely limited increment) can be switched on for the motion function parameterised.</td></tr>
<tr><td>Parameter</td><td>❶</td><td>C15200</td><td>OMS: Stop function</td></tr>
<tr><td></td><td>❷</td><td>C15201</td><td>OMS: Motion function
• The "Free traversing" setting must be suitable for the application!</td></tr>
<tr><td></td><td></td><td>C15202</td><td>OMS: Function at LOW level</td></tr>
<tr><td></td><td>❸</td><td>C15203</td><td>Safely limited increment</td></tr>
<tr><td>Requesting the special operation</td><td colspan="3">How to request the special operation:
• "ON state" at a safe input to which the "operation mode selector" function has been assigned by parameter setting. ▸ Safe inputs (📖 34)
• Only if no safe input is used, the function can be activated via the safety bus by sending a data telegram with a corresponding content to the controller.</td></tr>
<tr><td>⚠</td><td colspan="3">If the OMS bit is received via the safety bus, the value 0 (normal operation) is adopted in the case of passivation. In special applications (e.g. safety door requests OMS, i.e. open safety door = special operation), this must not lead to a dangerous state through an automatic restart!</td></tr>
<tr><td>Deactivating special operation</td><td colspan="3">A change-over from special operation to normal operation is only possible when the drive is at standstill (stop function STO, SS1 or SS2 active).
• For a restart, the restart must be acknowledged (AIS) via terminal or safety bus.
• The automatic restart is not permitted. If the "Automatic restart" is parameterised, this must be prevented by special measures, e.g. programming in the master control.</td></tr>
<tr><td>Error behaviour</td><td colspan="3">• The monitoring functions SMS and SLS can be activated in both operating modes and trigger the parameterised stop function in the event of a error.
• If the SLI monitoring function is active, exceeding the position window activates the parameterised stop function for special operation.
• The emergency stop function can be triggered in both operating modes.</td></tr>
</table>

3.9.3.2 Enable switch (ES)

Enable **S**witch / ES	
Description	This function enables overriding of the standard stop functions STO, SS1 and SS2 during special operation.
	A release via the enable switch activates the parameterised motion function during special operation and the drive can be traversed. The stopping times assigned to the stop functions are directly deactivated/stopped.
Preconditions	• A safe input must be parameterised and interconnected as an enable switch. You can only connect and parameterise one enable switch. The ES bit of the safety bus must be deactivated (C15113). • The confirmation can also be selected via the safety bus using the ES bit unless a safe input is set as an enable switch. • Special operation must be activated. ▸ Operation mode selector (OMS) (📖 54) • The plausibility check rejects ambiguous settings until you have parameterised them correctly.
Activation	How to activate the function: • "ON state" at a safe input to which the "enable switch" function has been assigned by parameter setting. ▸ Safe inputs (📖 34) • Only if no safe input is used, the function can be activated via the safety bus by sending a data telegram with a corresponding content to the controller.

3.9.4 Cascading (CAS)

From SM301 V1.1



Cascading / CAS		
Description	This function enables the synchronised shutdown of an entire drive system.	
	• The function can only be activated via parameter setting. See parameter "CAS: Cascading". • When the function is active: • The safe SD-In4 input is used as a cascading input and can no longer be used as universal input. • The safe SD-Out1 output is used as a cascading output and can no longer be parameterised as universal feedback output. • An emergency stop function (SSE) tripped by cascading cannot be overridden by the Enable switch (ES) during special operation. • The cascade triggers with every STO, independently of which safety module has the STO status and for what reason. • All safety modules of the cascade can only be enabled if all cascading inputs (SD-In4) are in the OFF state.	
Preconditions	• The SD-In4 input must be parameterised as an active input for the "emergency stop" function and the input delay for SD-In4 must be ≤ 10 ms. ▸ Safe inputs (📖 34) • Via the "SSE: Emergency stop function" parameter, STO must be parameterised as the emergency stop function to be executed. ▸ Emergency stop function (SSE) (📖 44) • The restart behaviour following the execution of the STO/SS1 stop function must be parameterised to "acknowledged restart". ▸ Restart behaviour (📖 43) • The control of the SD-Out1 output via a parameterised safety bus must be inhibited. ▸ Safety bus (📖 59) • The plausibility check rejects other settings until you have parameterised them correctly. • In the cascade connection, you can only change from the SS2/SOS stop function to the confirmation during special operation. The STO/SS1 stop function would always trigger the interconnection and a confirmation would thus not be possible.	
Principle		
Parameter	C15035	CAS: Cascading
	C15036	CAS: Stop delay • Display of the time that passes between switching of the SD-Out1 output to the OFF state and the detection of the OFF state at the SD-In4 input. This information can be helpful when commissioning/maintaining the system. • If "0 ms" is displayed after a stop, another safety module has triggered the stop via the cascade. • The time that passes until the next system acknowledgement is displayed.
Activate	How to activate the function: • Set "CAS: Cascading" parameter to "cascading with SD-In4".	

Tip!

Detailed information on cascade wiring can be found in the manual for the safety module.

3.9.5 Safe direction (SDI)

From SM301 V1.3

Safe Direction / SDI			
Description	This function allows you to monitor a direction. The safety module monitors whether the drive reaches the set direction in the parameterised delay time and, after the delay time has elapsed, indicates that the direction is monitored. In the monitoring phase, a tolerance threshold ensures that the drive does not leave the permissible direction.		
	• The direction must be observed by the application! • For operation within the limit values the "SDIpos/SDIneg monitored" status is set (C15000). • The status can be assigned to the safe output. ▸ Safe output (📖 37) • The status can also be reported via the safety bus. • The function must not be parameterised if "No encoder system" is set. The plausibility check rejects such implausible settings until they have been parameterised correctly.		
Preconditions	The safe directions SDIpos and SDIneg are available from SM301 V1.3.		
Function			
Parameter		C15340	SDI: Normal operation monitoring
	❶	C15341	SDI: Delay time
	❷	C15342	SDI: Tolerance threshold
	❸	C15343	SDI: Error response
	If the SDI delay time (C15341) is parameterised higher than zero, either the "SDIxxx monitored" response must be evaluated (safety bus or safe output) or the risk analysis must show that the delay does not represent a danger. This must e.g. be considered for the calculation of the safety distance.		
Activation	How to activate the function: • A data telegram with a corresponding content is sent to the controller via the safety bus. ▸ Safety bus (📖 59) • "OFF state" at a safe input which has been assigned to the function by parameter setting. ▸ Safe inputs (📖 34) • For normal operation, the safe direction can be fixedly set via a safe parameter. • The safe direction can be combined with the safely-limited speed SLS.		
Error behaviour	If the SDI tolerance threshold for the set SDIpos/SDIneg direction is exceeded after the SDI delay time has elapsed an error message is activated and an error stop with the function set in the "SDI: Error response" parameter (STO, SS1 or SS2) is triggered.		

3.10 Safety bus

The safety module provides parameterisable interfaces for standardised safety bus systems. By selecting the bus system, the corresponding parameters are made available.

Short overview of "Safety bus" parameter group:

Parameter	Info		Lenze setting
C15100	S-bus: configuration		No safety bus
C15113	S bus: Filter control data (bit-coded):		
	Bit 0	STO	Passing through
	Bit 1	SS1	Passing through
	Bit 2	SS2	Passing through
	Bit 3	SLS1	Passing through
	Bit 4	SLS2 *	Passing through
	Bit 5	SLS3 *	Passing through
	Bit 6	SLS4 *	Passing through
	Bit 7	SDIpos **	Passing through
	Bit 8	SDIneg **	Passing through
	Bit 9	ES	Passing through
	Bit 11	OMS	Passing through
	Bit 16	PS_AIS	Passing through
	Bit 17	PS_AIE	Passing through
	Bit 23	SSE	Passing through
	Bit 24	SD-Out1	Passing through

* From SM301 V1.1 ** From SM301 V1.3
Bits not listed are reserved for future extensions!

S-bus: configuration

Selection of the safety bus system used. Communication modes that are currently being supported:

- Operation without safety bus
- Operation with PROFIsafe protocol via PROFIBUS
- Operation with PROFIsafe protocol via PROFINET

S bus: Filter control data

Unused functions in the control data of the safety bus must be set to "Inhibit" via this parameter. Then, these functions cannot be activated anymore via the safety bus independently of the transmitted control data.

3.10.1 PROFIsafe connection

Preconditions

The SM301 safety module supports the transmission of safe information via the PROFIsafe protocol according to the specification "PROFIsafe - Profile for Safety Technology", version 2.0, of the PROFIBUS user organisation (PNO). The controller transmits the PROFIsafe information to the safety module for safe evaluation.

PROFIsafe connection	Required communication module	Setting "S bus: Configuration" (C15100)
PROFIBUS	E94AYCPM (PROFIBUS-DP) From software version V1.00	PROFIsafe / PROFIBUS
PROFINET (From SM301 V1.1)	E94AYCER (PROFINET) From software version V0.70	PROFIsafe / PROFINET

Note!

Operation with PROFIsafe via PROFINET is only permissible according to the "PROFIsafe-Profile for Safety Technology" specification, version 2.x!

Addressing

In order that a data telegram reaches the correct device, a unique PROFIsafe target address is required. If "PROFIsafe" has been selected as safety bus, the safety address is accepted simultaneously as the PROFIsafe target address. This address must match the corresponding configuration of the safety PLC.

▸ Setting of the safety address (📖 30)

PROFIsafe frame

Note!

The PROFIsafe data is sent in the first slot of a PROFIBUS data telegram or in the second slot of a PROFINET data telegram. This must be observed for the hardware configuration of the safety PLC!

The PROFINET data telegram is supported from SM301 V1.1!

PROFIBUS data telegram			
header	Slot 1	Slot 2	Trailer
	PROFIsafe message	Data	

PROFINET data telegram (From SM301 V1.1)			
header	Slot 1	Slot 2	Trailer
	Data	**PROFIsafe message**	

PROFIsafe message

One bit of the PROFIsafe data is always used to control specific safety functions.

- The structure of the PROFIsafe data is described in the PROFIsafe profile.
- The length of the PROFIsafe message in the SM301 is 8 bytes (fix).

PROFIsafe message - V1 mode								
	Bit offset							
Byte offset	7	6	5	4	3	2	1	0
0	PROFIsafe process data (PROFIsafe output data/PROFIsafe input data)							
1								
2								
3								
4	Control byte or status byte							
5	Consecutive number							
6	CRC2 (Signature originating from PROFIsafe process data and PROFIsafe parameters)							
7								

PROFIsafe message - V2 mode (From SM301 V1.1)								
	Bit offset							
Byte offset	7	6	5	4	3	2	1	0
0	PROFIsafe process data (PROFIsafe output data/PROFIsafe input data)							
1								
2								
3								
4	Control byte or status byte							
5	CRC2 (Signature originating from PROFIsafe process data, PROFIsafe parameters and the consecutive number)							
6								
7								

- In the following subchapters, the meaning of the PROFIsafe process data is separately described for PROFIsafe output data and PROFIsafe input data.

Tip!

Detailed information on the PROFIsafe message can be found in the manual for the safety module and in the PROFIBUS or PROFINET communication manual (PROFINET is supported from SM301 V1.1).

3.10.1.1 PROFIsafe output data

The PROFIsafe output data (control data) is transmitted from the control to the safety module.

Bit	Name	Value	Meaning
0	STO	0	The STO function is activated.
1	SS1	0	The SS1 function is activated.
2	SS2	0	The SS2 function is activated.
3	SLS1	0	The SLS1 function is activated.
4	SLS2 *	0	The SLS2 function is activated.
5	SLS3 *	0	The SLS3 function is activated.
6	SLS4 *	0	The SLS4 function is activated.
7	SDIpos **	0	The SDIpos function is activated.
8	SDIneg **	0	The SDIneg function is activated.
9	ES	1	Confirmation is active: During special operation ➞ motion functions are possible.
11	OMS	0	Normal operation
		1	Special operation
16	PS_AIS	0↗1	Activate restart acknowledgement. The bit must be set for at least one PROFIsafe cycle.
17	PS_AIE	0↗1	Activation of error acknowledgement. The bit must be set for at least one PROFIsafe cycle.
23	SSE	0	The SSE function is activated.
24	SD-Out1	0	The SD-Out1 output is set to ON state.

* From SM301 V1.1 ** From SM301 V1.3
Unlisted bits are reserved for future extensions and must be transmitted with "0"!

Unused functions in the control data must be set to "Inhibit" via the parameter "S bus: Filter control data" (C15113). Then, these functions cannot be activated anymore via the safety bus independently of the transmitted control data.

From SM301 V1.2:

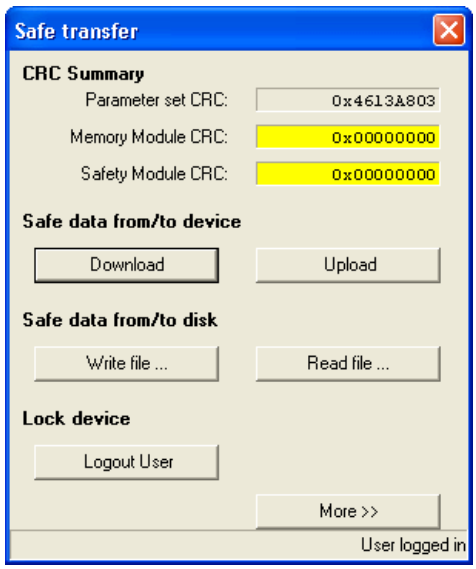
The parameter "S-bus: display control data" (C15115) displays the control data filtered via C15113.

3.10.1.2 PROFIsafe input data

The PROFIsafe input data (status information) is transmitted from the safety module to the control.

Bit	Name	Value	Meaning
0	STO is active	1	The STO function is active and the drive is safely switched to torqueless operation • This bit is also set by SS1 after the stopping time has elapsed.
1	SS1 active	1	The SS1 function is active. • At the end of the function the bit 0 (STO active) is set.
2	SS2 active	1	The SS2 function is active. • At the end of the function bit 16 (SOS monitored) is set.
3	SLS1 active	1	The SLS1 function is active. • After the Nlim1 braking time has elapsed, bit 17 (SLS1 monitored) is set in addition.
4	SLS2 active *	1	The SLS2 function is active. • After the Nlim2 braking time has elapsed, bit 18 (SLS2 monitored) is set in addition.
5	SLS3 active *	1	The SLS3 function is active. • After the Nlim3 braking time has elapsed, bit 19 (SLS3 monitored) is set in addition.
6	SLS4 active *	1	The SDIpos function is active. • After the Nlim4 braking time has elapsed, bit 20 (SLS4 monitored) is set in addition.
7	SDIpos active **	1	The SDIpos function is active. • After the delay time has elapsed, bit 21 (SDIpos monitored) is set in addition.
8	SDIneg active **	1	The SDIneg function is active. • After the delay time has elapsed, bit 22 (SDIneg monitored) is set in addition.
9	ES active	1	ES function is active during special operation: Motion function
		0	ES function is not active during special operation: Stop function
10	SLI is active ***	1	The SLI function is active.
11	OMS	1	Special operation via safe input or safety bus is requested.
16	SOS active	1	The SOS function is active, i.e. the safe operating stop is monitored.
17	SLS1 monitored	1	The SLS1 function is active, i.e. the compliance with the limited speed 1 is monitored.
18	SLS2 monitored *	1	The SLS2 function is active, i.e. the compliance with the limited speed 2 is monitored.
19	SLS3 monitored *	1	The SLS3 function is active, i.e. the compliance with the limited speed 3 is monitored.
20	SLS4 monitored *	1	The SLS4 function is active, i.e. the compliance with the limited speed 4 is monitored.
21	SDIpos monitored **	1	The SDIpos function is active, i.e. the compliance with the safe direction SDIpos is monitored.
22	SDIneg monitored **	1	The SDIneg function is active, i.e. the compliance with the safe direction SDIneg is monitored.
23	SSE active	1	The SSE function is active. • When the emergency stop function STO is parameterised, bit 0 (STO active) is set as well. • When the emergency stop function SS1 is parameterised, first bit 1 (SS1 active) is set and at the end of the function bit 0 (STO active) is set.
24	SD-In1	1	Sensor at I1A and I1B: Channels A and B are in ON state.

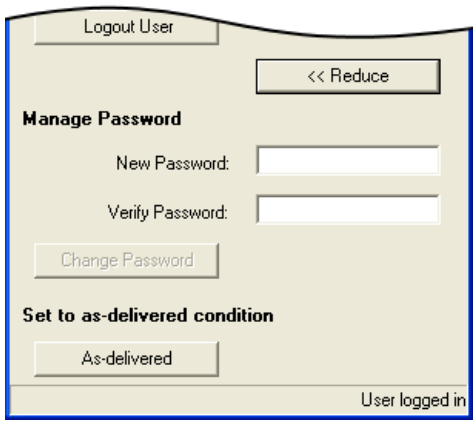
* From SM301 V1.1 ** From SM301 V1.3 *** From SM301 V1.4
Unlisted bits are reserved for future extensions and must be transmitted with "0"!



Bit	Name	Value	Meaning
25	SD-In2	1	Sensor at I2A and I2B: Channels A and B are in ON state.
26	SD-In3	1	Sensor at I3A and I3B: Channels A and B are in ON state.
27	SD-In4	1	Sensor at I4A and I4B: Channels A and B are in ON state.
29	OMS active *	1	The OMS function is active: Special operation. • In contrast to bit 11 (OMS), this bit remains set until the special operation is cancelled and the change-over to normal operation has taken place via the stop function.
		0	The OMS function is not active: Normal operation.
31	Fault active	1	Error status is active (fault or warning).

* From SM301 V1.1 ** From SM301 V1.3 *** From SM301 V1.4
Unlisted bits are reserved for future extensions and must be transmitted with "0"!

4 Safe parameter transfer



The functions for a safe parameter transfer are available in the *Safe transfer* dialog box.

The *Safe transfer* dialog box is opened via the **Safe transfer** button on the *Safe configuration* tab for the SM301 safety module.

By clicking the **More >>** button in the *Safe transfer* dialog box, the functions for password management and general reset are displayed in addition.

Clicking the button now labelled with **<< Reduce** hides these functions again.

Note!

To execute the functions for a safe parameter transfer, you have to enter a device password!

When the memory module is used for the first time together with the safety module, the required password file for the safe parameter transfer is not yet available in the memory module and the error message "Reading of the password file failed" is displayed. In this case a general reset of the device is required!

With a general reset, the safe parameter set is deleted in the memory module and in the safety module and the required password file is created in the memory module. After this, the safety module must be re-parameterised. ▸ General reset of the device (📖 69)

4.1 Sending safe data

After the SM301 safety module has been completely parameterised via the *Safe configuration* tab, the parameter set can be safely transmitted to the device using this function.

Note!

This function serves to overwrite the current parameter settings of the safety module with the settings in the »Engineer«!

Before the parameter set is transferred to the safety module, always a plausibility check is carried out. Only a plausible parameter set can be transmitted to the safety module!

The following applies to SM301 from V1.2:

Before the safe parameter set is transferred, the module ID is checked. If the module ID defined in the parameter set does not correspond to the module ID saved in the safety module, a confirmation prompt appears in order to prevent an unintended change of the module ID through parameter setting.

- If - after having checked the module IDs - you answer the confirmation prompt with **Yes**, the module ID defined in the parameter set is stored in the non-volatile memory of the safety module.
- C15017 displays the module ID stored in the safety module at the last parameter set transfer.
- The module ID stored in the safety module also remains available after a general reset.

How to download the parameter set:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the *Safe transfer* dialog box and click **Send**.
   - A confirmation prompt appears asking whether the parameter is really to be transmitted to the device.
3. Answer the confirmation prompt with **Yes** to continue the action.

   If you are not yet registered as user, first the *Password entry* dialog box is displayed.
4. Enter the device password and confirm with **OK**.
   - Unless an individual password has been defined, enter the standard password which is indicated in the manual for the safety module.
   - After the password has been entered, you are registered as user for a period of 30 minutes. Within this period, the password does not need to be entered again for calling a password-protected function if the online connection to the device remains established without any interruptions.

   After the registration, the parameter set is transmitted to the device, and a status message displays whether the action was successful.
5. Confirm the status message with **OK**.

Note!

After the parameter set has been transmitted, make a check of the item designation and a check/acceptance of the safety functions!

Detailed information on the check/acceptance can be found in the manual for the safety module in the "Acceptance" chapter.

4.2 Read safe data from device

Note!

This function serves to overwrite the parameter settings in the »Engineer« with the current settings of the safety module!

Only a valid parameter set can be read back from the safety module.

How to upload the parameter set:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the *Safe transfer* dialog box and click **Upload**.
   - A confirmation prompt appears asking whether the parameter is really to be uploaded from the device.
3. Answer the confirmation prompt with **Yes** to continue the action.

   If you are not yet registered as user, first the *Password entry* dialog box is displayed.
4. Enter the device password and confirm with **OK**.
   - Unless an individual password has been defined, enter the standard password which is indicated in the manual for the safety module.
   - After the password has been entered, you are registered as user for a period of 30 minutes. Within this period, the password does not need to be entered again for calling a password-protected function if the online connection to the device remains established without any interruptions.

   After the registration, the parameter set is uploaded from the device, and a status message displays whether the action was successful.
5. Confirm the status message with **OK**.

4.3 Write parameter set into file

How to write the parameter set into a file:

1. Go to the *Safe transfer* dialog box and click **Write file**.
   - The *Safe parameter set* dialog box is displayed.
2. Select the directory from the **Save in** list field, in which the file is to be saved.
3. Enter a file name into the **File name** input field.
4. Click the **Save** button.
   - The current parameter settings are saved in the selected parameter set file (*.bin) and the *Save parameter set* dialog box is closed.
   - After this, a status message displays whether the action could be carried out successfully.
5. Confirm the status message with **OK**.

4.4 Read parameter set out of file

Note!

This function serves to overwrite the parameter settings in the »Engineer« with the settings of the selected parameter set file (*.bin)!

How to read the parameter set out of the file:

1. Go to the *Safe transfer* dialog box and click **Read file**.
   - A confirmation prompt appears asking whether the data is really to be uploaded and the parameter settings in the »Engineer« are to be overwritten.
2. Answer the confirmation prompt with **Yes** to continue the action.
   - The *Read parameter set* dialog box is displayed.
3. Select the directory which contains the file to be read from the **Search in** list field.
4. Enter the name of the file to be read in the **File name** input field.
5. Click **Open**.
   - The current parameter settings are overwritten with the settings of the selected parameter set file (*.bin) and the *Open parameter set* dialog box is closed.
   - After this, a status message displays whether the action could be carried out successfully.
6. Confirm the status message with **OK**.

4.5 General reset of the device

A general reset is, among other things, required for initialising the memory module if the controller (with the memory module) is used together with an SM301 safety module for the first time.

Note!

This function serves to reset safety data in the memory module.

- The safe parameter set in the memory module and in the safety module is deleted.
- The password file required for the safe parameter transfer is re-created in the memory module. By this the individual device password defined before is reset to the standard password.
- Afterwards the safety module must be re-parameterised.
- The module ID stored in the safety module remains available.

How to execute a general reset of the device:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the advanced *Safe transfer* dialog box and click **General reset**.
   - The *Standard password entry* dialog box is displayed.
3. Enter the standard password and confirm with **OK**.
   - The standard password can be found in the manual for the safety module.

   The general reset is executed and then a status message displays whether the action could be carried out successfully.
4. Confirm the status message with **OK**.

4.6 Password management

For a safe parameter transfer, the device password must be entered.

- For initial commissioning, use the standard password as the device password, which is given in the manual for the safety module.
- The **Change Password** function serves to define an individual device password.

Note!

After the password has been entered, you are registered as user for a period of 30 minutes.

- Within this period, the password does not need to be entered again for calling a password-protected function if the online connection to the device remains established without any interruptions.
- The registration status is displayed at the bottom right side of the *Safe transfer* dialog box.
- Click the **Logout User** button to log out before the 30 minutes have elapsed.

Change Password

This function serves to define an individual device password.

How to change the device password:

1. Unless there is an online connection, establish an online connection to the device.
2. Go to the advanced *Safe transfer* dialog box and enter the new password into the **New Password** input field.
   - The password must have at least 6 characters.
3. For verifying the new password re-enter it into the **Verify Password** input field.
   - Only if this input matches the input in the **New Password** input field, the password can be changed.
4. Click the **Change Password** button.

   If you are not yet registered as user, first the *Password entry* dialog box is displayed.
5. Enter the device password and confirm with **OK**.
   - Unless an individual password has been defined, enter the standard password which is indicated in the manual for the safety module.

   After log-on the password is changed and then a status message displays whether the action could be carried out successfully.
6. Confirm the status message with **OK**.

5 Parameter reference

Note!

This chapter supplements the parameter list and the table of attributes provided in the online documentation for the controller by parameters of the SM301 safety module.

Tip!

General information on parameters can be found in the online documentation for the controller.

5.1 Parameter list

This chapter lists all parameters of the SM301 safety module in numerically ascending order.

Note!

Parameter settings are only possible via the *Safe configuration* tab for the safety module!

▸ Safe configuration (📖 25)

Only read access is possible to the parameters of the safety module via the »Engineer« parameter list (*All parameters tab* ➞ **Safety module SM301 category**) and the keypad!

C00214

Parameter | Name: **C00214 | Required safety module**		Data type: UNSIGNED_8 Index: $24361_d = 5F29_h$
Setting of the expected safety module. • If a safety module is detected which does not match this setting, an error (fault) is triggered. The error can only be eliminated by switching the mains.		
Selection list (Lenze setting printed in bold)		
1	**SM0**	
2	SM100	
4	SM300	
5	SM301	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ COM ☐ MOT		

C15000

Parameter | Name: **C15000 | Status of safety functions**			Data type: BITFIELD_32 Index: $9575_d = 2567_h$
Bit-coded status word of the safety functions			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	STO is active		▸ Safe torque off
Bit 1	SS1 active		▸ Safe stop 1
Bit 2	SS2 active		▸ Safe stop 2
Bit 3	SLS1 active		▸ Safely limited speed 1
Bit 4	SLS2 active		▸ Safely limited speed 2 (from V1.1)
Bit 5	SLS3 active		▸ Safely limited speed 3 (from V1.1)
Bit 6	SLS4 active		▸ Safely limited speed 4 (from V1.1)
Bit 7	SDIpos active		▸ Safe positive direction (from V1.3)
Bit 8	SDIneg active		▸ Safe negative direction (from V1.3)
Bit 9	ES active		▸ Safe enable switch
Bit 10	SLI active		▸ Safely limited increment (from V1.4)
Bit 11	OMS		▸ Safe operation mode selector
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
Bit 16	SOS monitored		Safe operating stop is monitored.
Bit 17	SLS1 monitored		Safely limited speed 1 is monitored.
Bit 18	SLS2 monitored		Safely limited speed 2 is monitored (from V1.1)
Bit 19	SLS3 monitored		Safely limited speed 3 is monitored (from V1.1)
Bit 20	SLS4 monitored		Safely limited speed 4 is monitored (from V1.1)
Bit 21	SDIpos monitored		Safe positive direction is monitored (from V1.3)
Bit 22	SDIneg monitored		Safe negative direction is monitored (from V1.3)
Bit 23	SSE active		▸ Emergency stop function
Bit 24	SD-In1 active		▸ Safe inputs
Bit 25	SD-In2 active		▸ Safe inputs
Bit 26	SD-In3 active		▸ Safe inputs
Bit 27	SD-In4 active		▸ Safe inputs
Bit 28	Reserved		
Bit 29	OMS active		▸ Safe operation mode selector (from V1.1)
Bit 30	Reserved		
Bit 31	Fault active		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15003

Parameter | Name: **C15003 | Command status**			Data type: UNSIGNED_16 Index: $9572_d = 2564_h$
Status of the current command. • The command is repeated in the high byte. • In the low byte the status is displayed: 0x00: No command 0x01: Command executed 0x02: Password invalid 0x03: Command in process 0x04: Command not known 0x05: Command error			
Display range (min. value | unit | max. value)			
0		2309	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15010

Parameter | Name: **C15010 | Parameter set status**		Data type: UNSIGNED_8 Index: $9565_d = 255D_h$
Status of the parameter set.		
Selection list (read only)		
0	No parameter set	
1	Parameter set valid	
2	Read error - memory module	
3	Unequal parameter set	
4	CRC error	
5	Version error	
6	Format error	
7	Plausibility error	
8	Assignment error	
9	Local read error	
10	GG communication error	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15011

Parameter | Name: **C15011 | Parameter CRC**			Data type: UNSIGNED_32 Index: $9564_d = 255C_h$
Parameter checksum (CRC = Cyclic Redundancy Code).			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Info**
C15011/1			CRC safety module
C15011/2			CRC memory module
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15013

Parameter | Name: **C15013 | Parameter set creation time**			Data type: UNSIGNED_64 Index: $9562_d = 255A_h$
Time of parameter set creation.			
Display range (min. value | unit | max. value)			
0		2^{64}-1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15014

Parameter | Name: **C15014 | Time of RTC parameter setting**	Data type: VISIBLE_STRING Index: $9561_d = 2559_h$
Time of acceptance of the parameter set from the memory module as value of the real-time clock (RTC).	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15015

Parameter | Name: **C15015 | Time of sec. parameter setting**			Data type: UNSIGNED_32 Index: $9560_d = 2558_h$
Time of acceptance of the parameter set from the memory module as value of the power-on time meter from the controller.			
Display range (min. value | unit | max. value)			
0	s	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15016

Parameter | Name: **C15016 | Parameter set version**		Data type: UNSIGNED_8 Index: $9559_d = 2557_h$
From V1.1 Display of the parameter set version available in the safety module.		
Selection list (read only)		**Info**
0	No current parameter set	
1	Parameter set V1.0	
2	Parameter set V1.1	
3	Parameter set V1.2	From V1.2
4	Parameter set V1.3	From V1.3
5	Parameter set V1.4	From V1.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15017

Parameter | Name: **C15017 | Stored module ID**			Data type: UNSIGNED_16 Index: $9558_d = 2556_h$
From V1.2			
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15030

Parameter | Name: **C15030 | SD-In sensor type**		Data type: UNSIGNED_8 Index: $9545_d = 2549_h$
Configuration of sensor types which are connected to the safe inputs. ▸ Safe inputs		
Selection list		
0	Input deactivated	
1	Passive sensor	
2	Active sensor	
Subcodes	**Lenze setting**	**Info**
C15030/1	0: Input is deactivated	SD-In1 sensor type
C15030/2	0: Input is deactivated	SD-In2 sensor type
C15030/3	0: Input is deactivated	SD-In3 sensor type
C15030/4	0: Input is deactivated	SD-In4 sensor type
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	Scaling factor: 1	

C15031

Parameter | Name: **C15031 | SD-In sensor function**		Data type: UNSIGNED_8 Index: $9544_d = 2548_h$
Function configuration of the safe inputs. • The "operation mode selector" and "enable switch" functions each may only be assigned to one of the four safe inputs. ▸ Safe inputs		
Selection list		**Info**
0	Free assignment	Safety function set in C15032.
1	Emergency stop	▸ Emergency stop function (SSE)
2	Operation mode selector	▸ Safe operation mode selector (OMS)
3	Enable switch	▸ Safe enable switch (ES)
Subcodes	**Lenze setting**	**Info**
C15031/1	0: Free assignment	SD-In1 sensor function
C15031/2	0: Free assignment	SD-In2 sensor function
C15031/3	0: Free assignment	SD-In3 sensor function
C15031/4	0: Free assignment	SD-In4 sensor function
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	Scaling factor: 1	

C15032

Parameter | Name: **C15032 | SD-In free assignment**		Data type: UNSIGNED_8 Index: $9543_d = 2547_h$
Assignment of a safety function to a safe input. • Only possible if the sensor function "Free assignment" is set for the safe input in C15031. ▸ Safe inputs		
Selection list		**Info**
0	STO	▸ Safe torque off
1	SS1	▸ Safe stop 1
2	SS2	▸ Safe stop 2
3	SLS1	▸ Safely limited speed 1
4	SLS2	▸ Safely limited speed 2 (from V1.1)
5	SLS3	▸ Safely limited speed 3 (from V1.1)
6	SLS4	▸ Safely limited speed 4 (from V1.1)
7	SDIpos	▸ Safe positive direction (from V1.3)
8	SDIneg	▸ Safe negative direction (from V1.3)
9	No response	No (local) safety function assigned. • Function test and monitoring of the discrepancy time are active. • The status of the input is transferred to the control via the safety bus (if parameterised).
Subcodes	**Lenze setting**	**Info**
C15032/1	0: STO	SD-In1 free assignment
C15032/2	0: STO	SD-In2 free assignment
C15032/3	0: STO	SD-In3 free assignment
C15032/4	0: STO	SD-In4 free assignment
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15033

Parameter | Name: **C15033 | SD-In discrepancy time**			Data type: UNSIGNED_16 Index: $9542_d = 2546_h$
Maximum time for which both channels of a safe input may have non-equivalent states without the safety system detecting an error. ▸ Safe inputs			
Setting range (min. value | unit | max. value)			
0	ms	30000	
Subcodes	**Lenze setting**		**Info**
C15033/1	10 ms		SD-In1 discrepancy time
C15033/2	10 ms		SD-In2 discrepancy time
C15033/3	10 ms		SD-In3 discrepancy time
C15033/4	10 ms		SD-In4 discrepancy time
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15034

Parameter | Name: **C15034 | SD-In input delay**			Data type: UNSIGNED_8 Index: $9541_d = 2545_h$
Time between the recognition of the signal change and the effective evaluation of an input signal. As a result, multiple and short signal changes due to contact bounce of the components are not taken into account. ▸ Safe inputs			
Setting range (min. value | unit | max. value)			
0	ms	100	

Subcodes	Lenze setting	Info
C15034/1	0 ms	SD-In1 input delay
C15034/2	0 ms	SD-In2 input delay
C15034/3	0 ms	SD-In3 input delay
C15034/4	0 ms	SD-In4 input delay

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15035

Parameter | Name: **C15035 | CAS: Cascading**	Data type: UNSIGNED_8 Index: $9540_d = 2544_h$
From V1.1 Activation of the cascading function. Use of SD-In4 as cascading input and SD-Out1 as cascading output. ▸ Safe cascading	
Selection list (Lenze setting printed in bold)	
0	**No cascading**
4	Cascading with SD-In4

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15036

Parameter | Name: **C15036 | CAS: Stop delay**			Data type: UNSIGNED_16 Index: $9539_d = 2543_h$
From V1.1 Delay between setting and receiving the stop signal via cascading. ▸ Safe cascading			
Display range (min. value | unit | max. value)			
0	ms	65535	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15040

Parameter | Name: **C15040 | Input image**			Data type: BITFIELD_32 Index: $9535_d = 253F_h$
Input image of the external module inputs of the safety module, displayed according to channels.			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	SD-In1 channel A		▸ Safe inputs
Bit 1	SD-In1 channel B		▸ Safe inputs
Bit 2	SD-In2 channel A		▸ Safe inputs
Bit 3	SD-In2 channel B		▸ Safe inputs
Bit 4	SD-In3 channel A		▸ Safe inputs
Bit 5	SD-In3 channel B		▸ Safe inputs
Bit 6	SD-In4 channel A		▸ Safe inputs
Bit 7	SD-In4 channel B		▸ Safe inputs
Bit 8	Reserved		
Bit 9	Reserved		
Bit 10	Reserved		
Bit 11	Reserved		
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
Bit 16	AIE		AIE input (error acknowledgement)
Bit 17	AIS		AIS input (restart acknowledgement)
Bit 18	Module switch		Module switch in housing front (acception of parameter set)
Bit 19	Reserved		
Bit 20	Reserved		
Bit 21	Reserved		
Bit 22	Reserved		
Bit 23	Reserved		
Bit 24	Reserved

Bit 28	Reserved		
Bit 29	Reserved		
Bit 30	Reserved		
Bit 31	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15051

Parameter | Name: **C15051 | SD-Out switching condition**		Data type: BITFIELD_32 Index: $9524_d = 2534_h$
Bit-coded selection of the conditions for switching the safe output. ▸ Safe output		
Setting range		
0x00000000		0xFFFFFFFF
Value is bit-coded: (☑ = bit set)		**Info**
Bit 0 ☐	STO is active	▸ Safe torque off
Bit 1 ☐	STO active - neg. logic	▸ Safe torque off
Bit 2 ☐	SS1 active	▸ Safe stop 1
Bit 3 ☐	SS1 active - neg. logic	▸ Safe stop 1
Bit 4 ☐	SS2 active	▸ Safe stop 2
Bit 5 ☐	SS2 active - neg. logic	▸ Safe stop 2
Bit 6 ☐	SLS1 active	▸ Safely limited speed 1
Bit 7 ☐	SLS1 active - neg. logic	▸ Safely limited speed 1
Bit 8 ☐	SLS2 active	▸ Safely limited speed 2 (from V1.1)
Bit 9 ☐	SLS2 active - neg. logic	▸ Safely limited speed 2 (from V1.1)
Bit 10 ☐	SLS3 active	▸ Safely limited speed 3 (from V1.1)
Bit 11 ☐	SLS3 active - neg. logic	▸ Safely limited speed 3 (from V1.1)
Bit 12 ☐	SLS4 active	▸ Safely limited speed 4 (from V1.1)
Bit 13 ☐	SLS4 active - neg. logic	▸ Safely limited speed 4 (from V1.1)
Bit 14 ☐	SDIpos active	▸ Safe positive direction (from V1.3)
Bit 15 ☐	SDIpos active neg. logic	▸ Safe positive direction (from V1.3)
Bit 16 ☐	SDIneg active	▸ Safe negative direction (from V1.3)
Bit 17 ☐	SDIneg active neg. logic	▸ Safe negative direction (from V1.3)
Bit 18 ☐	ES active	▸ Safe enable switch
Bit 19 ☐	ES active - neg. logic	▸ Safe enable switch
Bit 20 ☐	SLI active	▸ Safely limited increment (from V1.4)
Bit 21 ☐	SLI active - neg. logic	▸ Safely limited increment (from V1.4)
Bit 22 ☐	OMS	▸ Safe operation mode selector
Bit 23 ☐	OMS neg. logic	▸ Safe operation mode selector

Subcodes	**Lenze setting**	**Info**
C15051/1	0x00000000	SD-Out1 switching condition
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15052

Parameter | Name: **C15052 | SD-Out switching condition**		Data type: BITFIELD_32 Index: $9523_d = 2533_h$
Bit-coded selection of the conditions for switching the safe output. ▸ Safe output		
Setting range		
0x00000000		0xFFFFFFFF
Value is bit-coded: (☑ = bit set)		**Info**
Bit 0 ☐	SOS monitored	Safe operating stop is monitored.
Bit 1 ☐	SOS monitored - neg. logic	Safe operating stop is not monitored.
Bit 2 ☐	SLS1 monitored	Safely limited speed 1 is monitored.
Bit 3 ☐	SLS1 monitored - neg. logic	Safely limited speed 1 is not monitored.
Bit 4 ☐	SLS2 monitored	Safely limited speed 2 is monitored (from V1.1)
Bit 5 ☐	SLS2 monitored - neg. logic	Safely limited speed 2 is not monitored.(from V1.1)
Bit 6 ☐	SLS3 monitored	Safely limited speed 3 is monitored (from V1.1)
Bit 7 ☐	SLS3 monitored - neg. logic	Safely limited speed 3 is not monitored (from V1.1)
Bit 8 ☐	SLS4 monitored	Safely limited speed 4 is monitored (from V1.1)
Bit 9 ☐	SLS4 monitored - neg. logic	Safely limited speed 4 is not monitored (from V1.1)
Bit 10 ☐	SDIpos monitored	Safe positive direction is monitored (from V1.3)
Bit 11 ☐	SDIpos observed neg. logic	Safe positive direction is not monitored (from V1.3)
Bit 12 ☐	SDIneg monitored	Safe negative direction is monitored (from V1.3)
Bit 13 ☐	SDIneg observed neg. logic	Safe negative direction is not monitored (from V1.3)
Bit 14 ☐	SSE active	▸ Emergency stop function
Bit 15 ☐	SSE active - neg. logic	▸ Emergency stop function
Bit 16 ☐	SD-In1 active	▸ Safe inputs
Bit 17 ☐	SD-In1 active - neg. logic	▸ Safe inputs
Bit 18 ☐	SD-In2 active	▸ Safe inputs

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15055

Parameter | Name: **C15055 | SD-Out logic function**		Data type: UNSIGNED_8 Index: $9520_d = 2530_h$
Selection of the logic operation for the switching conditions to be evaluated. ▸ Safe output		
Selection list		
0	OR	
1	AND	
Subcodes	**Lenze setting**	**Info**
C15055/1	0: OR	SD-Out1 logic function
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	Scaling factor: 1	

C15060

Parameter | Name: **C15060 | Output image**		Data type: BITFIELD_16 Index: $9515_d = 252B_h$
Output image of the feedbacks from the safety module, displayed according to channels.		
Display range		
0x0000	0xFFFF	
Value is bit-coded:		**Info**
Bit 0	SD-Out1 channel A	▸ Safe output
Bit 1	SD-Out1 channel B	▸ Safe output
Bit 2	Reserved

Bit 15	Reserved	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15100

Parameter | Name: **C15100 | S bus: Configuration**			Data type: UNSIGNED_8 Index: $9475_d = 2503_h$
Configuration of the safe bus system. ▸ Safety bus			
Selection list (Lenze setting printed in bold)			**Info**
0	**No safety bus**		
1	PROFIsafe / PROFIBUS		
2	PROFIsafe / PROFINET		From V1.1
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15101

Parameter | Name: **C15101 | Current DIP switch display**			Data type: UNSIGNED_16 Index: $9474_d = 2502_h$
Display of the DIP-switch setting (safety address) on the safety module. ▸ Safety address			
Display range (min. value | unit | max. value)			
0		1023	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15111

Parameter | Name: **C15111 | Safety address**			Data type: UNSIGNED_16 Index: $9464_d = 24F8_h$
Safety address in the safety module. ▸ Safety address			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		65534	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15112

Parameter | Name: **C15112 | Effective safety address**			Data type: UNSIGNED_16 Index: $9463_d = 24F7_h$
Effectively used safety address in the safety module. ▸ Safety address			
Display range (min. value | unit | max. value)			
1		65534	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15113

Parameter | Name: **C15113 | S bus: Filter control data**			Data type: BITFIELD_32 Index: $9462_d = 24F6_h$
Bit-coded selection of the active bits in the safety bus control data. ▸ Safety bus			
Setting range			**Lenze setting**
0x00000000		0xFFFFFFFF	**0x01830BFF** (decimal: 25365503)
Value is bit-coded: (☑ = bit set)			**Info**
Bit 0 ☑	STO		▸ Safe torque off
Bit 1 ☑	SS1		▸ Safe stop 1
Bit 2 ☑	SS2		▸ Safe stop 2
Bit 3 ☑	SLS1		▸ Safely limited speed 1
Bit 4 ☑	SLS2		▸ Safely limited speed 2 (from V1.1)
Bit 5 ☑	SLS3		▸ Safely limited speed 3 (from V1.1)
Bit 6 ☑	SLS4		▸ Safely limited speed 4 (from V1.1)
Bit 7 ☑	SDIpos		▸ Safe positive direction (from V1.3)
Bit 8 ☑	SDIneg		▸ Safe negative direction (from V1.3)
Bit 9 ☑	ES		▸ Safe enable switch
Bit 10 ☐	Reserved		
Bit 11 ☑	OMS		▸ Safe operation mode selector
Bit 12 ☐	Reserved		
Bit 13 ☐	Reserved		
Bit 14 ☐	Reserved		
Bit 15 ☐	Reserved		
Bit 16 ☑	PS_AIS		Restart acknowledgement via safety bus

Bit 28 ☐	Reserved		
Bit 29 ☐	Reserved		
Bit 30 ☐	Reserved		
Bit 31 ☐	Reserved		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15115

Parameter | Name: **C15115 | S bus: Control data display**			Data type: BITFIELD_32 Index: $9460_d = 24F4_h$
From V1.2 Display of the safety bus control data after being filtered via C15113. ▸ Safety bus			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	STO		▸ Safe torque off
Bit 1	SS1		▸ Safe stop 1
Bit 2	SS2		▸ Safe stop 2
Bit 3	SLS1		▸ Safely limited speed 1
Bit 4	SLS2		▸ Safely limited speed 2 (from V1.1)
Bit 5	SLS3		▸ Safely limited speed 3 (from V1.1)
Bit 6	SLS4		▸ Safely limited speed 4 (from V1.1)
Bit 7	SDIpos		▸ Safe positive direction (from V1.3)
Bit 8	SDIneg		▸ Safe negative direction (from V1.3)
Bit 9	ES		▸ Safe enable switch
Bit 10	Reserved		
Bit 11	OMS		▸ Safe operation mode selector
Bit 12	Reserved		
Bit 13	Reserved		
Bit 14	Reserved		
Bit 15	Reserved		
Bit 16	PS_AIS		Restart acknowledgement via safety bus
Bit 17	PS_AIE		Error acknowledgement via safety bus
Bit 18	Reserved		
Bit 19	Reserved		
Bit 20	Reserved		
Bit 21	Reserved		
Bit 22	Reserved		
Bit 23	SSE		▸ Emergency stop function
Bit 24	SD-Out1		▸ Safe output
Bit 25	Reserved		
Bit 26	Reserved		
Bit 27	Reserved		
Bit 28	Reserved		
Bit 29	Reserved		
Bit 30	Reserved		
Bit 31	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			

C15200

Parameter | Name: **C15200 | OMS: Stop function**			Data type: UNSIGNED_8 Index: $9375_d = 249F_h$
Selection of the stop function during special operation. ▸ Operation mode selection			
Selection list (Lenze setting printed in bold)			**Info**
0	**STO**		▸ Safe torque off
1	SS1		▸ Safe stop 1
2	SS2		▸ Safe stop 2
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15201

Parameter | Name: **C15201 | OMS: Motion function**			Data type: UNSIGNED_8 Index: $9374_d = 249E_h$
Selection of the motion function during special operation. ▸ Operation mode selection			
Selection list (Lenze setting printed in bold)			**Info**
3	SLS1		▸ Safely limited speed 1
4	SLS2		▸ Safely limited speed 2 (from V1.1)
5	SLS3		▸ Safely limited speed 3 (from V1.1)
6	SLS4		▸ Safely limited speed 4 (from V1.1)
11	**Free traversing**		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15202

Parameter | Name: **C15202 | OMS: Function at LOW level**			Data type: UNSIGNED_8 Index: $9373_d = 249D_h$
From V1.3 ⚠ **Danger!** If the operation mode selector is implemented via a safe input, the operating mode for the LOW level must be selected carefully. According to the closed-circuit principle, there must not arise any additional danger from normal or special operation in the corresponding application. For detailed information, please see the manual for the safety module. ▸ Safe operation mode selector			
Selection list (Lenze setting printed in bold)			**Info**
0	**Normal operation**		▸ Operation mode selection
1	Special operation		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15203

Parameter | Name: **C15203 | SLI: Safely limited increment**			Data type: UNSIGNED_32 Index: $9372_d = 249C_h$
From V1.4 Number of increments for safely limited increment. • Value "0" deactivates the SLI function. ▸ Operation mode selection			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	2147483647	**1 inc.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15204

Parameter | Name: **C15204 | SLI: Value of position change**			Data type: UNSIGNED_32 Index: $9371_d = 249B_h$
From V1.4 Value of the maximum position change while SLI has been active. ▸ Operation mode selection			
Display range (min. value | unit | max. value)			
0	Incr.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15205

Parameter | Name: **C15205 | SSE: Emergency stop function**		Data type: UNSIGNED_8 Index: $9370_d = 249A_h$
Selection of the stop function for emergency stop. ▸ Emergency stop function (SSE)		
Selection list (Lenze setting printed in bold)		**Info**
0	**STO**	▸ Safe torque off
1	SS1	▸ Safe stop 1
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15300

Parameter | Name: **C15300 | Restart behaviour**		Data type: UNSIGNED_8 Index: $9275_d = 243B_h$
Setting of the restart behaviour after deactivation of the STO, SS1, SS2 and SOS standstill function. ▸ Safe stop		
Selection list		
0	Acknowledged restart	
1	Automatic restart	
Subcodes	**Lenze setting**	**Info**
C15300/1	0: Acknowledged restart	Restart - STO, SS1
C15300/2	0: Acknowledged restart	Restart - SS2, SOS
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15305

Parameter | Name: **C15305 | SS1, SS2: Stopping time**			Data type: UNSIGNED_16 Index: $9270_d = 2436_h$
Stopping time for the SS1 and SS2 safety functions. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15306

Parameter | Name: **C15306 | SS1 mode**	Data type: UNSIGNED_8 Index: $9269_d = 2435_h$
From V1.3 Selection whether STO is already activated after reaching n=0 when SS1 is executed or only after the parameterised stopping time. ▸ Safe stop 1 (SS1)	

Selection list (Lenze setting printed in bold)	
0	**STO after stopping time**
1	STO when n=0

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15307

Parameter | Name: **C15307 | SS1: STO delay after n=0**	Data type: UNSIGNED_16 Index: $9268_d = 2434_h$
From V1.3 Delay time after detection of n=0 until activation of STO. • Only relevant if "SS1 mode" = "STO with n=0" and operation with encoder system. ▸ Safe stop 1 (SS1)	

Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15308

Parameter | Name: **C15308 | SS2 mode**	Data type: UNSIGNED_8 Index: $9267_d = 2433_h$
From V1.3 Selection whether SOS is already activated after reaching n=0 when SS2 is executed or only after the parameterised stopping time. ▸ Safe stop 2 (SS2)	

Selection list (Lenze setting printed in bold)	
0	**SOS after stopping time**
1	SOS when n=0

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15310

Parameter | Name: **C15310 | Speed window (n=0)**	Data type: UNSIGNED_16 Index: $9265_d = 2431_h$
Tolerance window for zero speed. ▸ Safe stop	

Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**0 rpm**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer Scaling factor: 1

C15311

Parameter | Name: **C15311 | SOS: Tolerance margin (delta p=0)**			Data type: UNSIGNED_32 Index: $9264_d = 2430_h$
From V1.3 Safely monitored tolerance margin for zero position change. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15312

Parameter | Name: **C15312 | SOS: Maximum position change**			Data type: UNSIGNED_32 Index: $9263_d = 242F_h$
From V1.3 Value of the maximum position change while SOS has been active. ▸ Safe stop			
Display range (min. value | unit | max. value)			
0	Incr.	2147483647	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15315

Parameter | Name: **C15315 | SS1, SS2: Ramp monitoring**		Data type: UNSIGNED_8 Index: $9260_d = 242C_h$
From V1.4 Selection for whether the deceleration ramp is to be monitored when SS1 and SS2 are executed. ▸ Safe stop		
Selection list (Lenze setting printed in bold)		**Info**
0	No ramp monitoring	
1	**Ramp monitoring activated**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15316

Parameter | Name: **C15316 | SS1, SS2: Ramp - S-ramp time**			Data type: UNSIGNED_8 Index: $9259_d = 242B_h$
From V1.4 S-ramp time of the deceleration ramp for SS1 and SS2 if no linear ramp is used. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	100	**0 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15317

Parameter | Name: **C15317 | SS1, SS2: Ramp - start-offset**			Data type: UNSIGNED_8 Index: $9258_d = 242A_h$
From V1.4 Speed offset for the start of ramp monitoring. ▸ Safe stop			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	%	30	**0 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15320

Parameter | Name: **C15320 | SMS: Maximum speed Nmax**			Data type: UNSIGNED_16 Index: $9255_d = 2427_h$
Activation of the SMS function and selection of the maximum speed. • The setting Nmax = 0 deactivates the function. ▸ Safe maximum speed (SMS)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**1 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15321

Parameter | Name: **C15321 | SMS: Reaction (n>Nmax)**		Data type: UNSIGNED_8 Index: $9254_d = 2426_h$
Reaction to exceeding the set maximum speed Nmax. ▸ Safe maximum speed (SMS)		
Selection list (Lenze setting printed in bold)		**Info**
0	STO	▸ Safe torque off
1	**SS1**	▸ Safe stop 1
2	SS2	▸ Safe stop 2
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15330

Parameter | Name: **C15330 | SLS: Limited speed Nlim**			Data type: UNSIGNED_16 Index: $9245_d = 241D_h$
Setting of the safely limited speed. ▸ Safely limited speed (SLS)			
Setting range (min. value | unit | max. value)			
0	rpm	16000	
Subcodes	**Lenze setting**		**Info**
C15330/1	0 rpm		SLS1: Limited speed Nlim1
C15330/2	0 rpm		SLS2: Limited speed Nlim2 (from V1.1)
C15330/3	0 rpm		SLS3: Limited speed Nlim3 (from V1.1)
C15330/4	0 rpm		SLS4: Limited speed Nlim4 (from V1.1)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15331

Parameter | Name: **C15331 | SLS: Braking time Nlim**			Data type: UNSIGNED_16 Index: $9244_d = 241C_h$
Safely monitored time for braking the drive below the limited speed set in C15330. ▸ Safely limited speed (SLS)			
Setting range (min. value | unit | max. value)			
0	ms	30000	
Subcodes	**Lenze setting**		**Info**
C15331/1	0 ms		SLS1: Braking time Nlim1
C15331/2	0 ms		SLS2: Braking time Nlim2 (from V1.1)
C15331/3	0 ms		SLS3: Braking time Nlim3 (from V1.1)
C15331/4	0 ms		SLS4: Braking time Nlim4 (from V1.1)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15332

Parameter | Name: **C15332 | SLS: Reaction (n>Nlim)**		Data type: UNSIGNED_8 Index: $9243_d = 241B_h$
Response carried out in the safety module when the limited speed is exceeded. ▸ Safely limited speed (SLS)		
Selection list		**Info**
0	STO	▸ Safe torque off
1	SS1	▸ Safe stop 1
2	SS2	▸ Safe stop 2
Subcodes	**Lenze setting**	**Info**
C15332/1	1: SS1	SLS1: Response (n>Nlim1)
C15332/2	1: SS1	SLS2: Response (n>Nlim2) (from V1.1)
C15332/3	1: SS1	SLS3: Response (n>Nlim3) (from V1.1)
C15332/4	1: SS1	SLS4: Response (n>Nlim4) (from V1.1)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15333

Parameter | Name: **C15333 | SLS: Permissible direction of movement**		Data type: UNSIGNED_8 Index: $9242_d = 241A_h$
From V1.3 Permissible direction of movement when monitoring SLS. ▸ Safely limited speed (SLS)		
Selection list		
0	Both directions enabled	
1	Positive direction enabled	
2	Negative direction enabled	
Subcodes	**Lenze setting**	**Info**
C15333/1	0: Both directions enabled	SLS1: Permissible direction of movement
C15333/2	0: Both directions enabled	SLS2: Permissible direction of movement
C15333/3	0: Both directions enabled	SLS3: Permissible direction of movement
C15333/4	0: Both directions enabled	SLS4: Permissible direction of movement
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15340

Parameter | Name: **C15340 | SDI: Normal operation monitoring**		Data type: UNSIGNED_8 Index: $9235_d = 2413_h$
From V1.3 Setting of the direction monitoring of the motor during normal operation. ▸ Safe direction (SDI)		
Selection list (Lenze setting printed in bold)		
0	**Both directions enabled**	
1	Positive direction enabled	
2	Negative direction enabled	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15341

Parameter | Name: **C15341 | SDI: Delay time**			Data type: UNSIGNED_16 Index: $9234_d = 2412_h$
From V1.3 Safely monitored time from activation up to switching on of the SDIpos/SDIneg monitoring. ▸ Safe direction (SDI)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15342

Parameter | Name: **C15342 | SDI: Tolerance threshold**			Data type: UNSIGNED_32 Index: $9233_d = 2411_h$
From V1.3 Setting of the tolerance threshold by how many increments the motor may move in the direction locked by SDI. ▸ Safe direction (SDI)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Incr.	327680	**0 incr.**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15343

Parameter | Name: **C15343 | SDI: Error response**		Data type: UNSIGNED_8 Index: $9232_d = 2410_h$
From V1.3 Response to a violation of the permissible direction of movement of the motor. ▸ Safe direction (SDI)		
Selection list (Lenze setting printed in bold)		**Info**
0	STO	▸ Safe torque off
1	**SS1**	▸ Safe stop 1
2	SS2	▸ Safe stop 2
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15344

Parameter | Name: **C15344 | SDI: Maximum position change**			Data type: UNSIGNED_32 Index: $9231_d = 240F_h$
From V1.3 Maximum position change in the locked direction when SDI is active. ▸ Safe direction (SDI)			
Display range (min. value | unit | max. value)			
0	Incr.	2147483647	
Subcodes			**Info**
C15344/1			SDIpos: Maximum position change
C15344/2			SDIneg: Maximum position change
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15350

Parameter | Name: **C15350 | SLS, SMS: Max. response time**			Data type: UNSIGNED_16 Index: $9225_d = 2409_h$
Maximum time after a speed exceedance has been detected, after which the speed has to fall below the limit. ▸ Safely limited speed (SLS)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	30000	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15400

Parameter | Name: **C15400 | Motor encoder system**		Data type: UNSIGNED_8 Index: $9175_d = 23D7_h$
Selection of the connected encoder system. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		**Info**
0	No motor encoder	
1	**Sin-cos encoder**	"Sin-cos encoder" in this connection stands for the entries "Sine/cosine encoder", "absolute value encoder (Hiperface)", and "absolute value encoder (EnDat)" of code C00422 of the 9400 standard device.
2	Resolver	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15401

Parameter | Name: **C15401 | Motor encoder status**		Data type: UNSIGNED_8 Index: $9174_d = 23D6_h$
Status of the encoder evaluation. ▸ Safe speed measurement and position detection		
Selection list (read only)		**Info**
0	Valid	Encoder data is valid
1	Fault	Encoder data are invalid
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15402

Parameter | Name: **C15402 | Actual speed - n_safe**			Data type: INTEGER_16 Index: $9173_d = 23D5_h$
Display of the current speed calculated by the safety module. ▸ Safe speed measurement and position detection			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15405

Parameter | Name: **C15405 | Internal actual speed value**			Data type: INTEGER_16 Index: $9170_d = 23D2_h$
From V1.4 Internal actual speed values of the SM301. ▸ Safe speed measurement and position detection			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
Subcodes			**Info**
C15405/1			Internal actual speed value nSM determined from the motor position.
C15405/2			Internal actual speed value nGG determined from the position data of the standard device.
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15409

Parameter | Name: **C15409 | Motor mounting direction**		Data type: UNSIGNED_8 Index: $9166_d = 23CE_h$
From V1.4 Setting of the motor mounting direction. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		
0	**Motor rotating CW**	
1	Motor rotating CCW	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15410

Parameter | Name: **C15410 | Response time of encoder monitoring**		Data type: UNSIGNED_8 Index: $9165_d = 23CD_h$
From V1.2 Response time of encoder monitoring. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		
0	**12ms**	
10	50ms	
20	100 ms	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15411

Parameter | Name: **C15411 | Speed comparison tolerance**			Data type: UNSIGNED_16 Index: $9164_d = 23CC_h$
From V1.3 Parameterisable tolerance of speed comparison in the safety module. • See note in chapter "Safe speed measurement and position detection". ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	rpm	16000	**20 rpm**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15420

Parameter | Name: **C15420 | Sin/cos encoder PPR**			Data type: UNSIGNED_16 Index: $9155_d = 23C3_h$
PPR of the sin/cos encoder used. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
1		16384	**1**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15430

Parameter | Name: **C15430 | Number of resolver pole pairs**			Data type: UNSIGNED_8 Index: $9145_d = 23B9_h$
From V1.3 Number of pole pairs of the resolver used as motor encoder system. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
1		10	**1**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15500

Parameter | Name: **C15500 | Position encoder system**		Data type: UNSIGNED_8 Index: $9075_d = 2373_h$
From V1.3 Setting of the connected position encoder system. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		
0	**No position encoder**	
1	Analog encoder (sin/cos/TTL)	
2	Digital encoder (SSI/bus)	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15501

Parameter | Name: **C15501 | Position encoder gearbox factor**			Data type: UNSIGNED_16 Index: $9074_d = 2372_h$
From V1.3 Setting of the gearbox factor between motor and position encoder. ▸ Safe speed measurement and position detection			
Setting range (min. value | unit | max. value)			**Lenze setting**
20	%	50000	**100 %**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15502

Parameter | Name: **C15502 | Position encoder mounting direction**		Data type: UNSIGNED_8 Index: $9073_d = 2371_h$
From V1.3 Setting of the mounting direction of the position encoder referred to the motor encoder. ▸ Safe speed measurement and position detection		
Selection list (Lenze setting printed in bold)		
0	**Like motor encoder**	
1	Inverse to motor encoder	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15800

Parameter | Name: **C15800 | Current error type**		Data type: UNSIGNED_8 Index: $8775_d = 2247_h$
Type of the currently pending error.		
Selection list (read only)		
0	No error	
1	Warning	
2	Trouble	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15801

Parameter | Name: **C15801 | Error history**			Data type: UNSIGNED_16 Index: $8774_d = 2246_h$
List with internal error numbers for service operations. Please forward error history to the Lenze Service on request. **Note:** The universally valid error messages of the safety module are entered in code C00168 and in the logbook of the controller. Details relating to this are described in the "Error messages" chapter.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C15801/1			Error history 1
C15801/2			Error history 2
C15801/3			Error history 3
C15801/4			Error history 4
C15801/5			Error history 5
C15801/6			Error history 6
C15801/7			Error history 7
C15801/8			Error history 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15805

Parameter | Name: **C15805 | Service code**			Data type: UNSIGNED_32 Index: $8770_d = 2242_h$
Display of information if parameter set was not successfully checked for plausibility.			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Info**
C15805/1			Service code
C15805/2			Service code
C15805/3			Service code
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15810

Parameter | Name: **C15810 | Service code**			Data type: BITFIELD_32 Index: $8765_d = 223D_h$
Display of internal control words.			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			**Info**
Bit 0	STO		▸ Safe torque off
Bit 1	SS1		▸ Safe stop 1
Bit 2	SS2		▸ Safe stop 2
Bit 3	SLS1		▸ Safely limited speed 1
Bit 4	SLS2		▸ Safely limited speed 2 (from V1.1)
Bit 5	SLS3		▸ Safely limited speed 3 (from V1.1)
Bit 6	SLS4		▸ Safely limited speed 4 (from V1.1)

Parameter | Name: **C15810 | Service code**		Data type: BITFIELD_32 Index: $8765_d = 223D_h$
Bit 7	SDIpos	▸ Safe positive direction (from V1.3)
Bit 8	SDIneg	▸ Safe negative direction (from V1.3)
Bit 9	ES	▸ Safe enable switch
Bit 10	Reserved	
Bit 11	OMS	▸ Safe operation mode selector
Bit 12	Reserved	
Bit 13	Reserved	
Bit 14	Reserved	
Bit 15	Reserved	
Bit 16	PS_AIS	Restart acknowledgement via safety bus
Bit 17	PS_AIE	Error acknowledgement via safety bus
Bit 18	Reserved	
Bit 19	Reserved	
Bit 20	Reserved	
Bit 21	Reserved	
Bit 22	Reserved	
Bit 23	SSE	▸ Emergency stop function
Bit 24	SD-Out1	▸ Safe output
Bit 25	Reserved	
Bit 26	Reserved	
Bit 27	Reserved	
Bit 28	Reserved	
Bit 29	Reserved	
Bit 30	Reserved	
Bit 31	Reserved	

Subcodes	**Info**

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer

C15815

Parameter | Name: **C15815 | Service code**			Data type: UNSIGNED_16 Index: $8760_d = 2238_h$
Status display of the module LEDs.			
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15820

Parameter | Name: **C15820 | Internal actual position value**			Data type: INTEGER_32 Index: $8755_d = 2233_h$
Display of internal position values.			
Display range (min. value | unit | max. value)			
-2147483648	Incr.	2147483647	
Subcodes			**Info**
C15820/1			Internal actual position value pSM
C15820/2			Internal actual position value pGG
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15821

Parameter | Name: **C15821 | Service code**			Data type: INTEGER_16 Index: $8754_d = 2232_h$
Currently monitored speed value of the ramp monitoring. • Displayed value only valid if SS1 or SS2 are active with ramp monitoring.			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15822

Parameter | Name: **C15822 | Service code**			Data type: INTEGER_16 Index: $8753_d = 2231_h$
Minimum difference between actual speed value and monitored ramp. • The value is maintained until a ramp monitoring is restarted.			
Display range (min. value | unit | max. value)			
-16000	rpm	16000	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15890

Parameter | Name: **C15890 | Current time**			Data type: UNSIGNED_32 Index: $8685_d = 21ED_h$
From V1.4 Relative time for use in the logbook. ▸ Logbook function in the SM301			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15891

Parameter | Name: **C15891 | Log function**		Data type: UNSIGNED_8 Index: $8684_d = 21EC_h$
From V1.4 Setting of the logging response (trigger condition). ▸ Logbook function in the SM301		
Selection list (Lenze setting printed in bold)		**Info**
0	**Logging active**	Logging always active
1	Logging stopped	Logging switched off.
2	Stop logging in the event of an error	Logging is stopped when an error occurs.
3	Stop logging in the case of STO	Logging is stopped when STO occurs.
4	Stop logging in the case of SS1	Logging is stopped when SS1 occurs.
5	Stop logging in the case of SS2	Logging is stopped when SS2 occurs.
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		Scaling factor: 1

C15892

Parameter | Name: **C15892 | Log time**			Data type: UNSIGNED_32 Index: $8683_d = 21EB_h$
From V1.4 Time of the log entry. ▸ Logbook function in the SM301			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C15892/1			Log time n
C15892/2			Log time n-1
C15892/3			Log time n-2
C15892/4			Log time n-3
C15892/5			Log time n-4
C15892/6			Log time n-5
C15892/7			Log time n-6
C15892/8			Log time n-7
C15892/9			Log time n-8
C15892/10			Log time n-9
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer			Scaling factor: 1

C15893

Parameter | Name: **C15893 | Log status**		Data type: BITFIELD_64 Index: $8682_d = 21EA_h$
From V1.4 Logged status. ▸ Logbook function in the SM301		
Value is bit-coded:		**Info**
Bit 0	STO via SD-In	STO was triggered via a safe input.
Bit 1	STO via S-bus	STO was triggered via the safety bus.
Bit 2	STO by error	STO was triggered by an error.
Bit 3	Reserved	
Bit 4	SS1 via SD-In	SS1 was triggered via a safe input.
Bit 5	SS1 via S-bus	SS1 was triggered via the safety bus.
Bit 6	SS1 by error	SS1 was triggered by an error.
Bit 7	Reserved	
Bit 8	SS2 via SD-In	SS2 was triggered via a safe input.
Bit 9	SS2 via S-bus	SS2 was triggered via the safety bus.
Bit 10	SS2 by error	SS2 was triggered by an error.
Bit 11	Reserved	
Bit 12	SLS1 via SD-In	SLS1 was triggered via a safe input.
Bit 13	SLS1 via S-bus	SLS1 was triggered via the safety bus.
Bit 14	SLS1 via OMS	SLS1 was triggered via the operating mode changeover.
Bit 15	Reserved	
Bit 16	SLS2 via SD-In	SLS2 was triggered via a safe input.
Bit 17	SLS2 via S-bus	SLS2 was triggered via the safety bus.
Bit 18	SLS2 via OMS	SLS2 was triggered via the operating mode changeover.
Bit 19	Reserved	
Bit 20	SLS3 via SD-In	SLS3 was triggered via a safe input.
Bit 21	SLS3 via S-bus	SLS3 was triggered via the safety bus.
Bit 22	SLS3 via OMS	SLS3 was triggered via the operating mode changeover.
Bit 23	Reserved	
Bit 24	SLS4 via SD-In	SLS4 was triggered via a safe input.
Bit 25	SLS4 via S-bus	SLS4 was triggered via the safety bus.
Bit 26	SLS4 via OMS	SLS4 was triggered via the operating mode changeover.
Bit 27	Reserved	
Bit 28	SDIpos via SD-In	SDIpos was triggered via a safe input.
Bit 29	SDIpos via S-bus	SDIpos was triggered via the safety bus.
Bit 30	SDIpos via SLS	SDIpos was triggered in combination with SLS.
Bit 31	SDIpos in normal operation	SDIpos was triggered during normal operation.
Bit 32	SDIneg via SD-In	SDIneg was triggered via a safe input.
Bit 33	SDIneg via S-bus	SDIneg was triggered via the safety bus.
Bit 34	SDIneg via SLS	SDIneg was triggered in combination with SLS.
Bit 35	SDIneg in normal operation	SDIneg was triggered during normal operation.
Bit 36	SLI active	SLI was triggered during special operation.
Bit 37	Reserved	
Bit 38	Reserved	

Parameter | Name: **C15893 | Log status**		Data type: BITFIELD_64 Index: $8682_d = 21EA_h$
Bit 39	Reserved	
Bit 40	Special operation via SD-In	Special operation was triggered via a safe input.
Bit 41	Special operation via S-bus	Special operation was triggered via the safety bus.
Bit 42	Reserved	
Bit 43	Reserved	
Bit 44	ES via SD-In	ES was triggered via a safe input.
Bit 45	ES via S-bus	ES was triggered via the safety bus.
Bit 46	Reserved	
Bit 47	Reserved	
Bit 48	FailSafeValues via control word	Safe substitute values on the safety bus were activated via the control word.
Bit 49	FailSafeValues by error	Safe substitute values on the safety bus were activated by an error.
Bit 50	Reserved	
Bit 51	Reserved	
Bit 52	SD-In1 active	The safe input SD-In1 was switched on.
Bit 53	SD-In2 active	The safe input SD-In2 was switched on.
Bit 54	SD-In3 active	The safe input SD-In3 was switched on.
Bit 55	SD-In4 active	The safe input SD-In4 was switched on.
Bit 56	Reserved	
Bit 57	Reserved	
Bit 58	Reserved	
Bit 59	Reserved	
Bit 60	Reserved	
Bit 61	Reserved	
Bit 62	Reserved	
Bit 63	Reserved

C15893/10		Log status n-9
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C15900

Parameter | Name: **C15900 | Firmware product type**	Data type: VISIBLE_STRING Index: $8675_d = 21E3_h$
Display of the product type (E94AFAE).	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15901

Parameter | Name: **C15901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: $8674_d = 21E2_h$
Display of the compilation date.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C15902

Parameter | Name: **C15902 | Firmware version**	Data type: VISIBLE_STRING Index: $8673_d = 21E1_h$
Software version of the firmware, e.g.: "V1.0".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

5.2 Table of attributes

The table of attributes contains information required for communication with the inverter via parameters.

Note!

Safety-relevant parameters with write access can only be transmitted to the safety module by safe parameter setting with the »Engineer«.

▸ Sending safe data (📖 66)

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes bit-coded
			BITFIELD_32	4 bytes bit-coded
			BITFIELD_64	8 bytes bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes with sign
			INTEGER_64	8 bytes with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes without sign
			UNSIGNED_64	8 bytes without sign
			VISIBLE_STRING	ASCII string
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 ≡ no decimal positions 10 ≡ 1 decimal position 100 ≡ 2 decimal positions 1000 ≡ 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted (by safe parameter setting with the »Engineer«)	
	CINH	Controller inhibit required	☑ Writing is only possible if the controller is inhibited

6 Error messages

Note!

This chapter adds error messages for the SM301 safety module to the error list in the online documentation for the controller.

Tip!

General information on diagnostics & fault analysis and error messages can be found in the online documentation for the controller.

Short overview of errror messages for the safety module (A-Z)

hex	dec	Error message	Response (Lenze setting)
0x012f00c2	19857602	5V voltage error	Warning
0x012f00c1	19857601	6V voltage error	Warning
0x012f006c	19857516	CAS: Circulation time exceeded	Warning
0x012f006d	19857517	CAS: Hardware or discrepancy error	Warning
0x012f0010	19857424	Communication error - standard device	Warning
0x012f0039	19857465	Deactivated SD-In1 = high	Warning
0x012f003a	19857466	Deactivated SD-In2 = high	Warning
0x012f003b	19857467	Deactivated SD-In3 = high	Warning
0x012f003c	19857468	Deactivated SD-In4 = high	Warning
0x012f00a3	19857571	Different safety parameter sets	Warning
0x012f0031	19857457	Discrepancy error / functional test - SD-In1	Warning
0x012f0032	19857458	Discrepancy error / functional test - SD-In2	Warning
0x012f0033	19857459	Discrepancy error / functional test - SD-In3	Warning
0x012f0034	19857460	Discrepancy error / functional test - SD-In4	Warning
0x012f005d	19857501	Error - internal disconnecting path	Warning
0x012f0051	19857489	Error - SD-Inx / CLx	Warning
0x012f0052	19857490	Error - SD-Inx / CLx	Warning
0x012f00c3	19857603	Error 2.6V voltage	Warning
0x012f0045	19857477	F_CRC_Length error	Information
0x012f0041	19857473	F_Dest_Add = 0 or FFFFhex	Information
0x012f0040	19857472	F_Dest_Add unequal F-address	Information
0x012f0044	19857476	F_SIL exceeds technical SIL	Information
0x012f0042	19857474	F_Source_Add = 0 or FFFFhex	Information
0x012f0043	19857475	F_WD_Time = 0 msec	Information
0x012f0023	19857443	F_WD_Time exceeded	Information
0x012f0027	19857447	F-parameter error	Information
0x012f0046	19857478	Incorrect F-parameter version	Information
0x012f0036	19857462	Internal error - AIE	Warning
0x012f0035	19857461	Internal error - AIS	Warning
0x012f0037	19857463	Internal error - module switch	Warning
0x012f0002	19857410	Internal error, SS1 activated	Warning
0x012f0003	19857411	Internal error, SS2 activated	Warning
0x012f0001	19857409	Internal error, STO activated	Warning
0x012f00a2	19857570	Memory module - parameter set access error	Warning
0x012f00a6	19857574	Memory module safety parameter set format error	Warning

hex	dec	Error message	Response (Lenze setting)
0x012f00a9	19857577	Module ID unequal effective safety address	Warning
0x012f00a0	19857568	New parameter set deleted	Information
0x012f00a1	19857569	New safety parameter set loaded	Information
0x012f006b	19857515	No encoder system configured	Warning
0x012f00a4	19857572	No safe parameter set for safety module	Warning
0x012f00a8	19857576	Parameter set communicaton error	Information
0x012f00a7	19857575	Parameter set plausibility error	Warning
0x012f0022	19857442	PROFIsafe - communication error	Information
0x012f0026	19857446	PROFIsafe - invalid data	Information
0x012f0047	19857479	PROFIsafe CRC1 error	Information
0x012f0025	19857445	PROFIsafe has left data exchange	Information
0x012f0024	19857444	PROFIsafe passivated	Information
0x012f00c0	19857600	Reference voltage error	Warning
0x012f0048	19857480	Reserved (PROFIsafe standard)	Information
0x012f0049	19857481	Reserved (PROFIsafe standard)	Information
0x012f004a	19857482	Reserved (PROFIsafe standard)	Information
0x012f00d0	19857616	Safe speed invalid	Warning
0x012f0021	19857441	Safety address invalid (0 or FFFFhex)	Warning
0x012f00a5	19857573	Safety parameter set defect	Warning
0x012f0068	19857512	SDIneg: Wrong direction	Warning
0x012f0067	19857511	SDIpos: Wrong direction	Warning
0x012f0059	19857497	Short circuit / cross-circuit - SD-Out	Warning
0x012f006f	19857519	SLI: Safely limited increment exceeded	Warning
0x012f0066	19857510	SLS/SMS: Error stop not executed	Warning
0x012f0062	19857506	SLS1: Nlim1 exceeded	Warning
0x012f0063	19857507	SLS2: Nlim2 exceeded	Warning
0x012f0064	19857508	SLS3: Nlim3 exceeded	Warning
0x012f0065	19857509	SLS4: Nlim4 exceeded	Warning
0x012f0069	19857513	SMS: Nmax exceeded	Warning
0x012f006a	19857514	SOS: Tolerance limit exceeded	Warning
0x012f006e	19857518	SS1/SS2: Speed ramp exceeded	Warning
0x012f0061	19857505	SS1/SS2: Stopping time exceeded	Warning
0x012f00d1	19857617	SSM: Encoder error	Warning
0x012f00d3	19857619	SSM: Error - standard device data	Warning
0x012f00d2	19857618	SSM: Resolver error	Warning
0x012f00d4	19857620	SSM: Speed comparison error	Warning
0x012f00d5	19857621	SSM: Synchronisation error	Warning
0x012f00d6	19857622	SSM: Wrong PDO version	Warning
0x012f0090	19857552	Stuck at High at SD-In1, channel A	Warning
0x012f0091	19857553	Stuck at High at SD-In1, channel B	Warning
0x012f0092	19857554	Stuck at High at SD-In2, channel A	Warning
0x012f0093	19857555	Stuck at High at SD-In2, channel B	Warning
0x012f0094	19857556	Stuck at High at SD-In3, channel A	Warning
0x012f0095	19857557	Stuck at High at SD-In3, channel B	Warning
0x012f0096	19857558	Stuck at High at SD-In4, channel A	Warning
0x012f0097	19857559	Stuck at High at SD-In4, channel B	Warning
0x012f0080	19857536	Stuck at High SD-Out1, channel A	Warning
0x012f0082	19857538	Stuck at High SD-Out1, channel B	Warning
0x012f0081	19857537	Stuck at Low SD-Out1, channel A	Warning
0x012f0083	19857539	Stuck at Low SD-Out1, channel B	Warning
0x012f0011	19857425	Synchronisation error - standard device	Information
0x012f005e	19857502	Test pulse error - internal disconnecting path	Warning

Internal error, STO activated [0x012f0001]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	1

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error, STO activated.	Replace safety module. Contact Lenze.

Internal error, SS1 activated [0x012f0002]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	2

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error, SS1 activated	Replace safety module. Contact Lenze.

Internal error, SS2 activated [0x012f0003]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	3

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error, SS2 activated	Replace safety module. Contact Lenze.

Communication error - standard device [0x012f0010]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	16

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Communication between the standard device and the safety module has been interrupted. Standard device has been switched off.	Ensure operation in the specified voltage limits.

Synchronisation error - standard device [0x012f0011]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	17

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
Faulty synchronisation with standard device.	Please contact Lenze.

Safety address invalid (0 or 0xFFFF) [0x012f0021]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	33

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Invalid effective safety address. • Only for SM300	• Check safety address in the configuration software of the control system. • Check DIP switches on the SM300 safety module. • Check safety address in the safe parameterisation.

PROFIsafe communication error [0x012f0022]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	34

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
PROFIsafe data processing has detected a communication error.	Check cabling between the communication module and the control system.

F_WD_Time exceeded [0x012f0023]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	35

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
PROFIsafe monitoring time exceeded.	• Check program runtime of safety program. • Increase monitoring time *F_WD_Time*.

PROFIsafe passivated [0x012f0024]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	36

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe data processing. PROFIsafe node is passivated.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

PROFIsafe has left data exchange [0x012f0025]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	37

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe data processing. PROFIsafe has left data exchange.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

PROFIsafe - invalid data [0x012f0026]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	38

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe data processing. PROFIsafe user data area has no valid data.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

F-parameter error [0x012f0027]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	39

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A fault has occurred in the PROFIsafe parameterisation phase. Wrong parameterisation of F-PLC.	• Check communication module, bus connection and control program. • Read out fault memory of control system.

Discrepancy error or functional test SD-In1 [0x012f0031]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	49

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In1.	• Check safe parameters for SD-In1. • Check sensor at SD-In1.

Discrepancy error or functional test SD-In2 [0x012f0032]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	50

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In2.	• Check safe parameters for SD-In2. • Check sensor at SD-In2.

Discrepancy error or functional test SD-In3 [0x012f0033]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	51

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In3.	• Check safe parameters for SD-In3. • Check sensor at SD-In3.

Discrepancy error or functional test SD-In4 [0x012f0034]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	52

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at two-channel safe input SD-In4.	• Check safe parameters for SD-In4. • Check sensor at SD-In4.

Internal error - AIS [0x012f0035]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	53

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at acknowledgement input AIS.	Replace safety module.

Internal error - AIE [0x012f0036]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	54

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at acknowledgement input AIE.	Replace safety module.

Internal error - module switch [0x012f0037]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	55

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Signal error at module acknowledgement input.	Replace safety module.

Deactivated SD-In1 = high [0x012f0039]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	57

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

Deactivated SD-In2 = high [0x012f003a]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	58

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

Deactivated SD-In3 = high [0x012f003b]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	59

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

Deactivated SD-In4 = high [0x012f003c]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	60

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Initialisation/parameterisation error: Deactivated input in ON state.	Check connection diagram and parameterisation.

F_Dest_Add unequal F address [0x012f0040]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	64

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety address *F_Dest_Add* of the control system does not correspond to the F address in the safety module.	Adapt the safety address in the control configuration to the address in the safety module.

F_Dest_Add = 0 or FFFFhex [0x012f0041]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	65

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety address *F_Dest_Add* in the control system is invalid (0 or $FFFF_{hex}$).	Select a valid value for the safety address data in the control configuration.

F_Source_Add = 0 or FFFFhex [0x012f0042]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	66

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The safety address *F_Source_Add* in the control system is invalid (0 or $FFFF_{hex}$).	Select a valid value for the safety address data in the control configuration.

F_WD_Time is 0 msec [0x012f0043]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	67

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The monitoring time *F_WD_Time* of the control system is set to 0 ms.	Select a permissible value for the monitoring time *F_WD_Time*.

F_SIL exceeds technical SIL [0x012f0044]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	68

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The parameterised SIL setting in the control system exceeds the technically possible SIL of the safety module.	Adapt the parameterised SIL setting in the control system to the safety module used.

F_CRC_Length error [0x012f0045]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	69

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The data length of the *F_CRC* of the control system is faulty.	Check the safety parameters in the control system.

F parameter version is incorrect [0x012f0046]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	70

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The F parameter version is incorrect and not supported by the safety module.	Select a permissible F parameter version in the control system.

PROFIsafe CRC1 error [0x012f0047]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	71

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
PROFIsafe-CRC1 error. Current F parameter CRC is faulty.	• Check F parameter CRC (CRC1) in the control system. • Check GSD file.

Reserved (PROFIsafe standard) [0x012f0048]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	72

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
--	--

Reserved (PROFIsafe standard) [0x012f0049]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	73

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
--	--

Reserved (PROFIsafe standard) [0x012f004a]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	74

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
--	--

Error - SD-Inx / CLx [0x012f0051]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	81

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error at a safe input (hardware error).	Replace safety module.

Error - SD-Inx / CLx [0x012f0052]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	82

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error at an SD-Inx input or the CLx clock outputs. Only valid for the SM300 safety module!	Check wiring at the SM300 safety module.

Short circuit - SD-Out [0x012f0059]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	89

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error at output SD-Out. Only valid for the SM300 safety module!	Check wiring at the SM300 safety module.

Error - internal disconnecting path [0x012f005d]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	93

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error of safe switch-off logic.	Replace safety module. Contact Lenze.

Test pulse error - internal disconnecting path [0x012f005e]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	94

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Internal error of safe switch-off logic.	Replace safety module. Contact Lenze.

SS1/SS2: Stopping time exceeded [0x012f0061]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	97

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has not reached the parameterised zero-speed threshold within the stop time.	• Increase SS1/SS2 stop time. • Reduce delay time in drive.

SLS1: Nlim1 exceeded [0x012f0062]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	98

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS1).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS2: Nlim2 exceeded [0x012f0063]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	99

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS2).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS3: Nlim3 exceeded [0x012f0064]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	100

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS3).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS4: Nlim4 exceeded [0x012f0065]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	101

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS4).	• Adapt the speed-dependent parameters in the drive. • Increase speed threshold Nlim.

SLS/SMS: Error stop not executed [0x012f0066]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	102

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the limited speed (SLS1-4) or the maximum speed (SMS) and not responded adequately within the maximum response time.	• Adapt the speed-dependent parameters in the drive. • Increase parameter for the maximum response time.

SDIpos: Wrong direction [0x012f0067]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	103

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the positive monitored direction (SDIpos).	• Adapt controller parameterisation. • Increase SDI tolerance threshold.

SDIneg: Wrong direction [0x012f0068]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	104

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the negative monitored direction (SDIneg).	• Adapt controller parameterisation. • Increase SDI tolerance threshold.

SMS: Nmax exceeded [0x012f0069]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	105

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded the monitored maximum speed (SMS.	• Limit maximum speed in drive. • Adapt parameterisation value.

SOS: Tolerance limit exceeded [0x012f006a]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	106

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The drive has exceeded a tolerance limit for the SOS function.	• Adapt tolerance limits or increase distance to the parameterised limits. • Adapt response time of encoder monitoring.

No encoder system configured [0x012f006b]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	107

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
A speed- or position-based safety function is tried to be carried out without an encoder having been configured.	Configuration of an encoder system valid for safety-related applications.

CAS: Circulation time exceeded [0x012f006c]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	108

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The maximum time between the activation and feedback of cascading has been exceeded.	• Input delay for SD-In4 must be parameterised lower than or equal to 10 ms. • Check wiring between the cascaded modules.

CAS: Hardware or discrepancy error [0x012f006d]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	109

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The cascading output has not been deactivated by the hardware quickly enough, or there is a discrepancy at the cascading input.	• Check wiring between the cascaded modules. • Replace safety module.

SS1/SS2: Speed ramp exceeded [0x012f006e]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	110

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The monitoring of the speed ramp is activated. When the SS1/SS2 stop function is executed, the deceleration of the speed ramp is monitored. If the monitoring limits are exceeded, an error is reported.	• Adapt ramp monitoring parameters in the safety module. • Adapt (quickstop) ramp parameters in the application. • Deactivate ramp monitoring in the safety module.

SLI: Safely limited increment exceeded [0x012f006f]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	111

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The safely limited increment is monitored in the "special operation" operating mode. The increment parameterised was exceeded.	• Adapt "SLI: Safely limited increment" parameter. • Limit increments in the application. • Deactivate monitoring of the safely limited increment.

Stuck at High SD-Out1, channel A [0x012f0080]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	128

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of output SD-Out1 cannot be deactivated.	Check wiring at the output SD-Out1 for short circuit.

Stuck at Low SD-Out1, channel A [0x012f0081]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	129

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of output SD-Out1 cannot be activated.	Check supply voltage and wiring for the safe output.

Stuck at High SD-Out1, channel B [0x012f0082]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	130

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of output SD-Out1 cannot be deactivated.	Check wiring at the output SD-Out1 for short circuit.

Stuck at Low SD-Out1, channel B [0x012f0083]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	131

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of output SD-Out1 cannot be activated.	Check supply voltage and wiring for the safe output.

Stuck at High at SD-In1, channel A [0x012f0090]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	144

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In1 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In1, channel B [0x012f0091]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	145

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In1 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In2, channel A [0x012f0092]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	146

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In2 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In2, channel B [0x012f0093]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	147

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In2 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In3, channel A [0x012f0094]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	148

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In3 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In3, channel B [0x012f0095]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	149

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In3 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In4, channel A [0x012f0096]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	150

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel A of input SD-In4 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

Stuck at High at SD-In4, channel B [0x012f0097]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	151

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Channel B of input SD-In4 cannot be deactivated.	• Check wiring at the safe input for short circuit. • Check configuration for the safe input.

New parameter set deleted [0x012f00a0]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	160

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
The parameter set has been deleted via the safe parameterisaiton in the Engineer.	--

New safe parameter set loaded [0x012f00a1]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	161

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
New parameter set has been loaded via the safe parameterisation in the Engineer or by actuating the module button at the safety module.	--

Memory module - parameter set access error [0x012f00a2]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	162

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
An error has been detected when accessing the safe parameter set in the memory module.	Carry out a general reset. Transfer the safe parameter set into the safety module.

Different parameter sets [0x012f00a3]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	163

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Different parameter sets on the memory module and on the safety module.	Transfer the safe parameter set via the Engineer into the safety module. Parameter set acceptance from the memory module using the module button at the safety module.

No safe parameter set safety module [0x012f00a4]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	164

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Safety module has no parameter set.	Transfer safe parameter set via Engineer into safety module.

Defective parameter set safety module [0x012f00a5]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	165

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Parameter set on safety module is defective.	Transfer safe parameter set via Engineer into safety module.

Memory module - parameter set format error [0x012f00a6]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	166

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
A format error has been detected in the parameter set of the memory module.	Recreate the parameter set format using the "General reset" function and transfer the parameter set via the Engineer into the safety module.

Parameter set plausibility error [0x012f00a7]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	167

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The set parameters are not plausible with regard to each other.	Select the parameter set in the Engineer. Call the plausibility check and transfer the parameter set via the Engineer into the safety module.

Safety parameter set communicaton error [0x012f00a8]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	168

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**

Cause	**Remedy**
A communication error has occurred when loading the parameter set.	• Check whether memory module and safety module have been installed correctly. • Repeat parameter set transfer.

Module ID unequal effective safety address [0x012f00a9]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	169

Response (Lenze setting printed in bold)
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The module ID in the parameter set does not correspond to the effective safety address.	Adjust module ID, safety address and DIP switch for setting the safety address.

Reference voltage error [0x012f00c0]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	192

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the reference voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

6V voltage error [0x012f00c1]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	193

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the 6 V voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

5V voltage error [0x012f00c2]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	194

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the 5 V-reference voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

2.6V voltage error [0x012f00c3]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	195

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
The threshold value of the 2.6 V voltage in the safety module has been exceeded or fallen below the limit value.	Replace safety module.

Safe speed invalid [0x012f00d0]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	208

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
It is not possible to detect a safe speed.	• Check encoder systems used. • Check communication between the drive and the safety module.

SSM: Encoder error [0x012f00d1]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	209

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring via encoder.	Check configuration and connection of the encoder used.

SSM: Resolver error [0x012f00d2]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	210

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	**Remedy**
Error in safe speed monitoring via resolver.	Check configuration and connection of the encoder used.

Note: The use of the safety module in version 1.4 with parameter set version 1.4 and support of the resolver as motor encoder requires standard devices of the 9400 product series from nameplate inscription:

Product series	Type designation	From hardware version	From software version
Servo Drives 9400	E94AxHExxxx	VA	08.xx
Servo Drives 9400	E94AxPExxxx	2A	02.xx

SSM: Standard device data error [0x012f00d3]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	211

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	Remedy
Error in safe speed monitoring. The data transferred by the standard device is faulty.	Please contact Lenze.

SSM: Speed comparison error [0x012f00d4]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	212

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	Remedy
The difference between the speed calculated internally and the speed values of the standard device exceeds the parameterised limit.	• Check configuration of the encoder system/s and gearbox factor. • Check tolerance value for the speed comparison (from SM301 V1.3). • Set code C00100 in the 9400 to "16" if a digital position encoder is used.

SSM: Synchronisation error [0x012f00d5]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	213

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	Remedy
Error in safe speed monitoring: Faulty synchronisation between the standard device and the safety module.	Please contact Lenze.

SSM: Wrong PDO version [0x012f00d6]

Module ID (decimal)	**Error ID** (decimal)
303: SM301 safety module	214

Response (Lenze setting printed in bold)
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information

Cause	Remedy
Error in safe speed monitoring: PDO version of data protocol is incompatible.	The SM301 V1.3 parameter set format requires operating system version 07.00.xx.xx or higher in the standard device.

1 About this documentation

Contents

This documentation solely contains descriptions for the E94AYCCA communication module (CANopen®).

Note!

This documentation supplements the **Mounting Instructions** supplied with the communication module and the **"Servo Drives 9400" hardware manual**.

The Mounting Instructions contain safety instructions which must be observed!

The product features and functions of the communication module are described in detail.

Examples illustrate typical applications.

This documentation also contains ...

- safety instructions that must be observed;
- key technical data relating to the communication module;
- information about the versions of the Lenze standard devices to be used;
- notes on troubleshooting and fault elimination.

The theoretical concepts are only explained to the level of detail required to understand the function of the communication module.

This documentation does not describe any software provided by other manufacturers. No warranty can be given for corresponding data provided in this documentation. For information about how to use the software, please refer to the host (PLC, master) documents.

All product names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information about the CAN/CANopen bus system can be found on the website of the CAN user organisation CiA® (CAN in Automation):

www.can-cia.org

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the field devices and the software version of the Engineering tools installed (e.g. »Engineer«), the screenshots in this documentation may deviate from the actual screens shown.

Target group

This documentation is intended for people involved in configuring, installing, commissioning, and maintaining the networking and remote maintenance of a machine.

Tip!

Current documentation and software updates for Lenze products can be found in the ”Download” area at:

www.Lenze.com

Validity information

The information in this documentation applies to the following devices:

Extension module	Type designation	From hardware version	From software version
CANopen communication manual	E94AYCCA	VA	01.00

1.1 Document history

Version			Description
1.0	08/2006	TD17	First edition
2.0	04/2008	TD17	General revision
3.0	02/2011	TD17	General revision
4.0	11/2011	TD17	Assignment of the 9-pin Sub-D plug connector corrected. ▸ System bus (CANopen) connection (📖 26)
5.0	06/2012	TD17	General revision

1.2 Conventions used

This documentation uses the following conventions to distinguish different types of information:

Information type	Display	Examples/notes
Spelling of numbers		
Decimal	Standard spelling	Example: 1234
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Decimal separator	Point	The decimal point is generally used. For example: 1234.56
Text		
Program name	» «	PC software Example: Lenze »Engineer«
Control element	**Bold**	The **OK** button... / the **copy** command... / the **Properties** tab... / the **Name** input field...
Sequence of menu commands		If the execution of a command requires several commands in succession, the individual commands are separated by an arrow: Select the **File→Open** command to...
Hyperlink	Underlined	Optically highlighted reference to another subject which is activated with a mouse-click.
Symbols		
Page reference	(📖 9)	Optically highlighted reference to another page which is activated with a mouse-click.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning
CAN	CAN (Controller Area Network) is an asynchronous, serial fieldbus system.
CANopen®	CANopen® is a communication protocol based on CAN. CANopen® is a trademark and patented technology, licensed by the CAN user organisation CiA® (CAN in Automation e. V.), www.can-cia.org.
System bus (CAN/CANopen)	The Servo Drives 9400 system bus (CANopen) is an advancement of the 9300 controller series' system bus (CAN). ▸ Features (📖 15)
Standard device Controller	Lenze controller of the "Servo Drives 9400" product series, with which the communication module can be used. ▸ Application as directed (📖 14)
Module Interface module Communication module	Accessories and extension modules such as communication modules, distributed terminals, operator and input devices (HMIs) as well as external controls and control systems
»Engineer« »PLC Designer«	Lenze PC software which supports you during the "Engineering" process (parameterisation, diagnostics, and configuration) throughout the whole life cycle, i. e. from planning to maintenance of the machine commissioned.
Code	Parameter by means of which you can parameterise or monitor the controller. In everyday language, the term is also referred to as "index".
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3"). In everyday language, the term is also referred to as "subindex".
Lenze setting Basic setting	Default settings for the device.
PDO	Process data object (process data communication)
SDO	Service data object (parameter data communication)
HW	Hardware
SW	Software
PLC	Programmable Logic Controller
Host Control	CAN master
Node Bus node	Components of a CAN network (PLC, controller, etc.)
Node address	Unique ID for addressing the individual components of a CAN network
I-1600.20	CANopen index (hexadecimal representation) • In the example: index 0x1600, subindex 0x20

Note!

Some of the terms used derive from the CANopen protocol. These terms are not listed here.

1.4 Notes used

The following pictographs and signal words are used in this documentation to indicate dangers and important information:

Safety instructions

Structure of the safety instructions:

Pictograph and signal word!

(characterise the type and severity of danger)

Note

(describes the danger and provides information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure troublefree operation
	**Tip!**	Useful tip for simple handling
		Reference to another documentation

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

Disregarding the following basic safety measures may lead to severe personal injury and damage to material assets.

- Lenze drive and automation components ...
  - may only be used as directed.
    - Application as directed (📖 14)
  - must never be commissioned if they display any signs of damage.
  - must never be modified technically.
  - must never be commissioned if they are not fully mounted.
  - must never be operated without the required covers.
  - can have live, moving and rotating parts during and after operation, depending on their degree of protection. Surfaces can be hot.
- For Lenze drive components ...
  - only use approved accessories.
  - only use genuine spare parts supplied by the manufacturer of the product.
- Observe all the specifications contained in the enclosed and corresponding documentation.
  - This is a precondition for ensuring safe, trouble-free operation and for making use of the stated product features.
    - Features (📖 15)
  - The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

- All works on and with Lenze drive and automation components may only be carried out by qualified personnel. According to IEC 60364 and CENELEC HD 384 these are persons who ...
  - are familiar with installing, mounting, commissioning, and operating the product.
  - have the qualifications necessary for their occupation.
  - know and are able to apply all regulations for the prevention of accidents, directives and laws that apply to the location of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated in accordance with EN 61800-5-1 in every control cabinet ("SELV"/"PELV").
- Only use cables that meet the given specifications.
  ▸ Specification of the bus cable (📖 27)

Documentation of the standard device, control system, and plant/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes stated in this manual.

2.3 Residual hazards

Protection of persons

- If Servo Drives 9400 are used on a corner grounded system with a rated mains voltage ≥ 400V, external measures need to be implemented to provide reliable protection against accidental contact.
  ▸ Protective insulation (📖 20)

Device protection

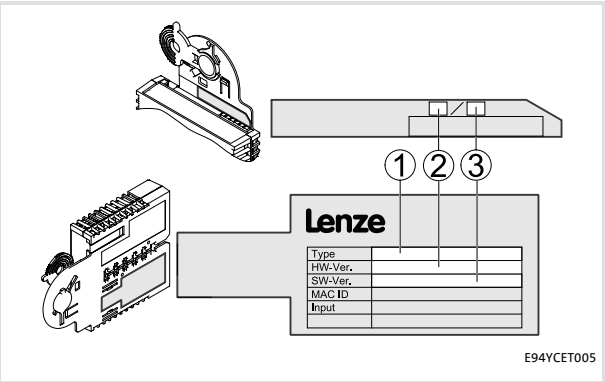
- The communication module contains electronic components that can be damaged or destroyed by electrostatic discharge.
  ▸ Installation (📖 24)

3 Product description

3.1 Application as directed

The communication module ...

- is an accessory module which can be used with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxx	VA	01.30
Servo Drives 9400 PLC	E94AxPExxxx	VA	01.00
Servo Drives 9400 regenerative power supply module	E94ARNxxxx	VA	01.00

- is an item of equipment intended for use in industrial power systems.
- may only be operated under the operating conditions specified in this documentation.
- may only be used in CAN networks.

Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and the hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

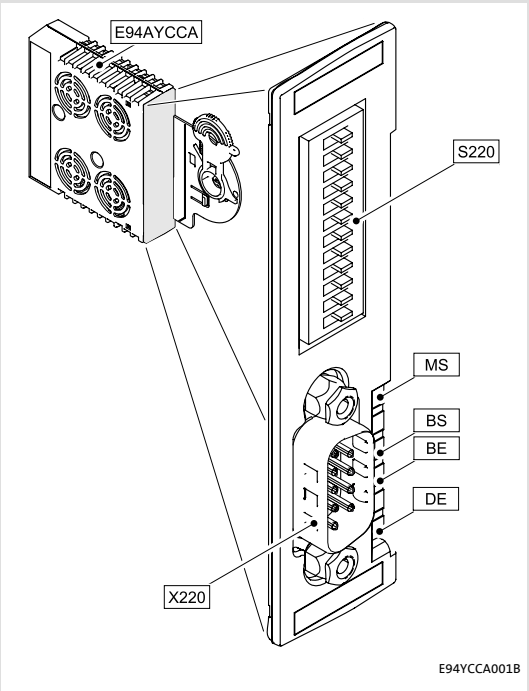
1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: extension module
- C Module type: communication module
- CA CANopen

2 Hardware version (HW)

3 Software version (SW)

3.3 Features

For many years the system bus (CAN) based on the CANopen communication profile has been integrated in Lenze controllers. Due to the lower number of data objects available, the functionality and compatibility of the old system bus are lower as compared with CANopen. For parameter setting, two parameter data channels are always available to the user while CANopen provides only one active parameter data channel (along with the possibility to establish further channels).



The system bus (CANopen) of the Servo Drives 9400 is an advancement of the 9300 controller series' system bus (CAN).

The communication module E94AYCCA (CANopen) provides the following features:

- Interface module for the system bus (CANopen), connectable to the expansion slots of Servo Drives 9400
- Internal voltage supply of the communication module via the Servo Drive 9400.
- Full compatibility according to CANopen DS301, V4.02
- Support of the NMT master/slave function "node guarding" (DS301,V4.02)
- Support of the NMT slave function "heartbeat" (DS301,V4.02)
- No restrictions regarding the selection of node addresses
- Number of parameterisable server and client SDO channels:
  - max. 10 channels with 1 ... 8 bytes
- Number of parameterisable PDO channels:
  - max. 4 Transmit-PDOs (TPDOs) with 1 ... 8 bytes
  - max. 4 Receive-PDOs (RPDOs) with 1 ... 8 bytes
- All PDO channels are functionally equivalent.
- Monitoring of the RPDOs for data reception
- Telegram counters for SDOs and PDOs
- Bus status diagnostics
- Boot-up telegram generation
- Emergency telegram generation
- Reset node telegram generation (with master configuration)
- Sync telegram generation and response to sync telegrams:
  - Transmit/receive data
  - Synchronisation of the device-internal time base
- Abort codes
- All CAN functions parameterisable via codes
- Object directory (all mandatory functions, optional functions, indexes)

3.4 Terminals and interfaces

- 9-pin Sub-D plug connector for system bus connection (CANopen)
- DIP switches for ...
  - setting the CAN node address
  - setting the baud rate
- Front LEDs for diagnosing the ...
  - voltage supply of the communication module;
  - connection to the standard device;
  - CANopen state machine and error states;
  - physical CAN connection.

[3-2] E94AYCCA communication module (CANopen)

X220 9-pin Sub-D plug connector for the ...
▸ System bus (CANopen) connection (📖 26)

S220 DIP switches for ...
- setting the CAN node address
- setting the baud rate

▸ Possible settings via DIP switches (📖 33)

BE
DE
▸ LED status displays (📖 86)

4 Technical data

4.1 General data and operating conditions

Field	Values
Order designation	E94AYCCA
Communication profile	CANopen (DS301, V4.02)
Communication medium	CAN cable according to ISO 11898-2
Network topology	Line terminated on both sides (e.g. termination with Lenze system connector EWZ0046)
Adjustable node addresses	1 ... 127 Adjustable via DIP switches or code C13350 / C14350.
Max. number of nodes	127
Baud rates [kbps]	• 10 • 20 • 50 • 125 • 250 • 500 • 800 • 1000 Adjustable via DIP switches or code C13351 / C14351.
Process data	• max. 4 TPDOs with 1 ... 8 bytes • max. 4 RPDOs with 1 ... 8 bytes
Parameter data	Max. 10 client and server SDO channels with 1 ... 8 bytes
Transfer mode for TPDOs	• With change of data • Time-controlled, 1 to x ms • After the reception of 1 to 240 sync telegrams
Voltage supply	Internal voltage supply of the communication module via the Servo Drive 9400.
Conformities, approvals	• CE • UL

"Servo Drives 9400" hardware manual

Here you can find the **ambient conditions** and data regarding the **electromagnetic compatibility (EMC)** which also apply to the communication module.

4.2 Supported protocols

Category	Protocol
Standard PDO protocols	PDO write PDO read
SDO protocols	SDO download SDO download initiate SDO download segment
	SDO upload SDO upload initiate SDO upload segment
	SDO abort transfer
	SDO block download SDO block download initiate SDO block download end
	SDO block upload SDO block upload initiate SDO block upload end
NMT protocols	Start remote node (master and slave)
	Stop remote node (slave)
	Enter pre-operational (slave)
	Reset node (slave and local device)
	Reset communication (slave)
Monitoring protocols	Node guarding (master and slave)
	Heartbeat (heartbeat producer and heartbeat consumer)

4.3 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

The communication times in the CAN network depend on the ...

- processing time in the device;
- telegram runtime (baud rate/telegram length);
- bus load (especially if the bus is loaded with PDOs and SDOs at a low baud rate).

Servo Drives 9400 processing time

There are no interdependencies between parameter data and process data.

- Parameter data:
  - For controller-internal parameters: approx. 30 ms ± 20 ms tolerance (typically)
  - For some codes the processing time can be longer.
- Process data are transported in real time.

4.4 Protective insulation

Danger!

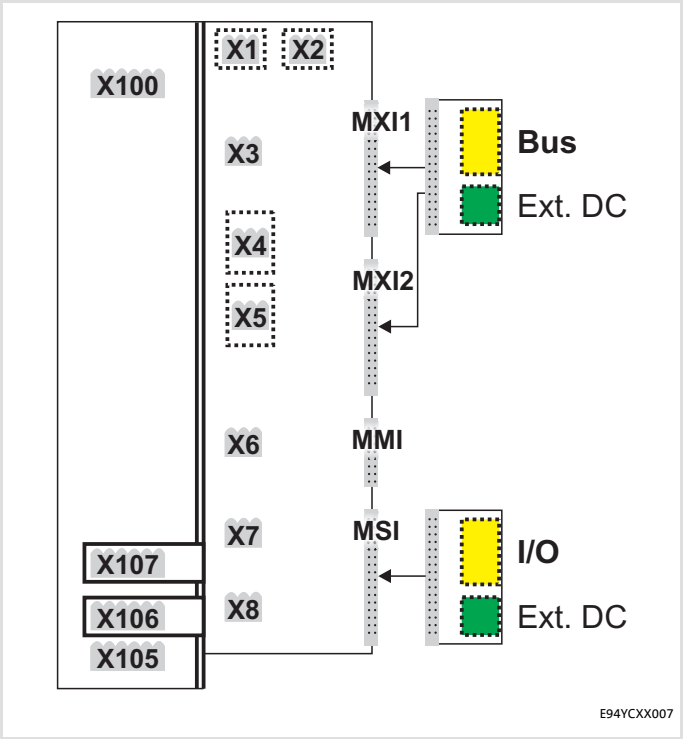
Dangerous electrical voltage

If Servo Drives 9400 are used on a corner grounded system with a rated mains voltage ≥ 400 V, external measures need to be implemented to provide reliable protection against accidental contact.

Possible consequences:

- Death or serious injury

Protective measures:



- If protection against accidental contact is required for the control terminals of the controller and the connections of the plugged device modules, ...
  - there must be a double isolating distance.
  - the components to be connected must be provided with a second isolating distance.

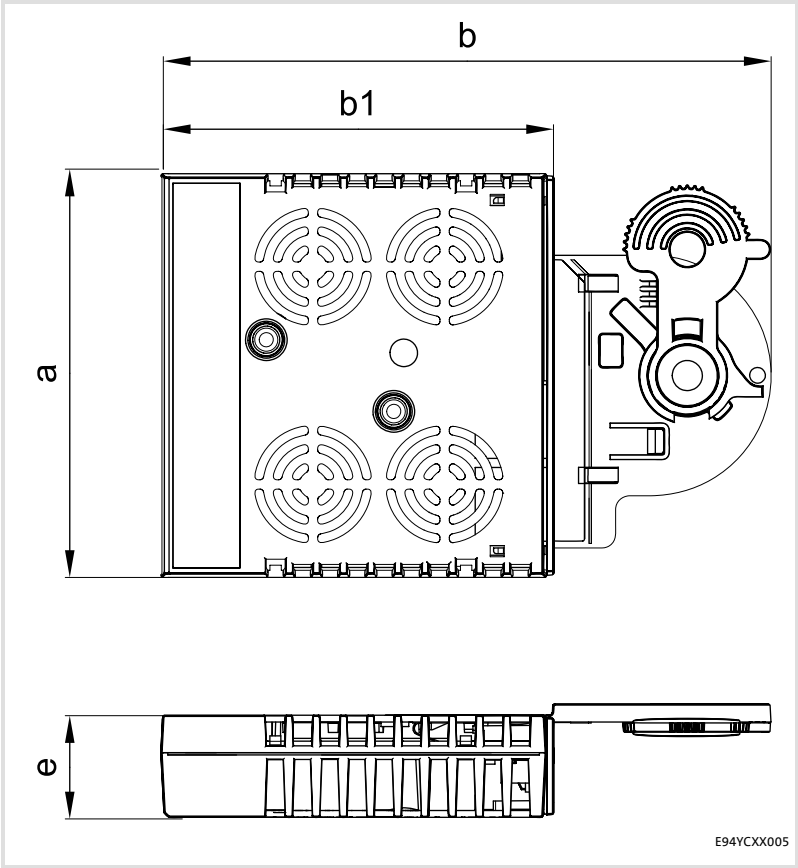
Note!

The available protective insulation in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

The illustration below ...

- shows the arrangement of the terminal strips and the separate potential areas of the controller.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation according to EN61800-5-1



Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (only Single Drive)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example

Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

- ▶ The separate potential area with the better protective insulation is decisive.
  - – The separate potential area of the bus terminal of the device module has a "basic insulation".
  - – The separate potential area of the mains terminal has a "reinforced insulation".
- ▶ Result: The insulation between the X100 mains terminal and the bus terminal is of the "reinforced insulation" type.

4.5 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

5 Installation

Stop!

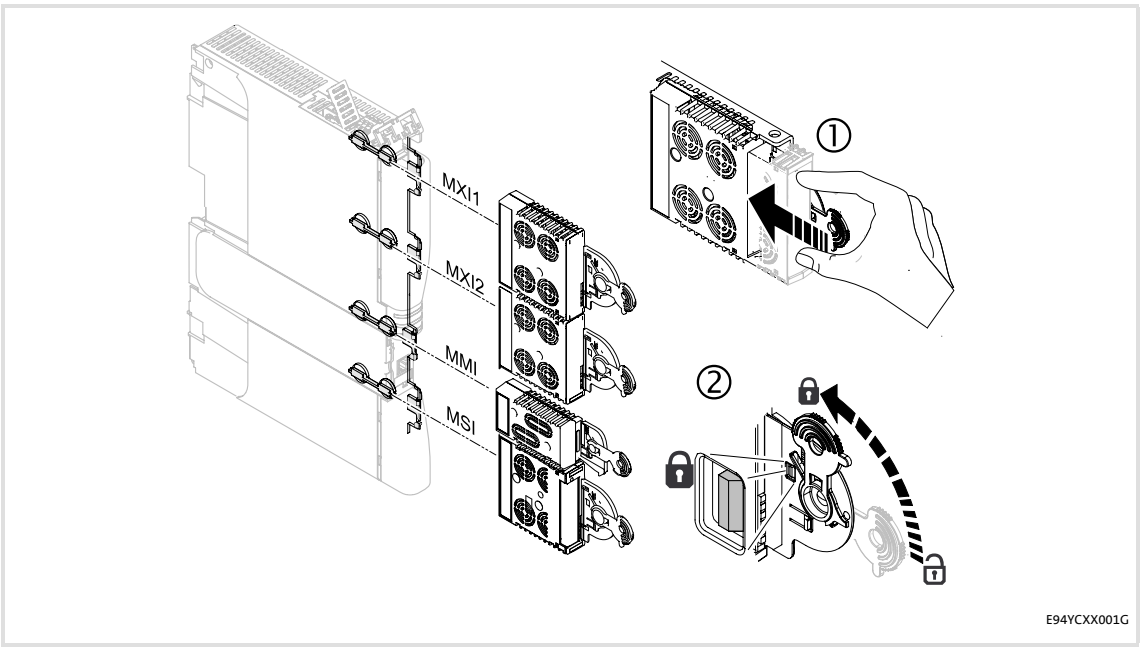
Electrostatic discharge

Electronic components in the communication module can be damaged or destroyed by electrostatic discharge.

Possible consequences:

- The communication module is defective.
- Fieldbus communication is faulty or not possible.

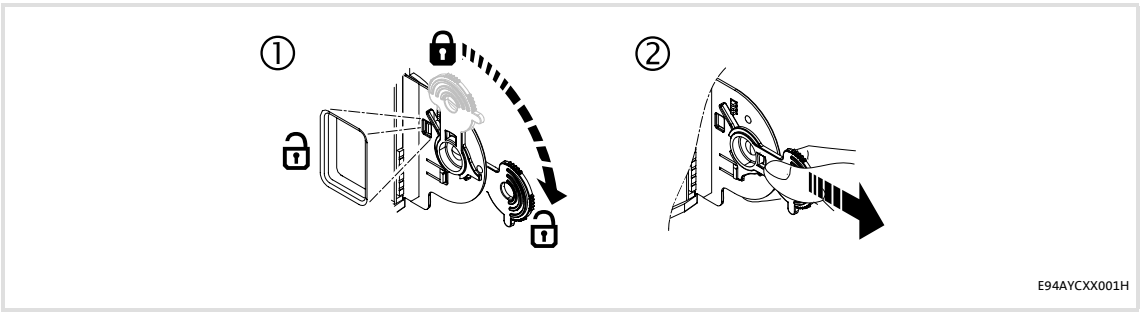
Protective measures



- Before touching the module, make sure that you are free of electrostatic charge.

5.1 Mechanical installation

Note!

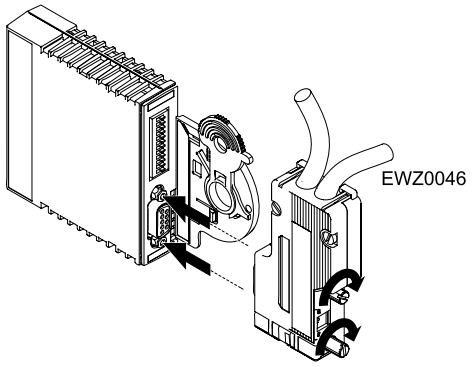


- Only one communication module E94AYCCA (CANopen) may be inserted per Servo Drive 9400.
- The slot used (MX1 or MX2) can be selected freely.

5.1.1 Mounting

[5-1] Mounting

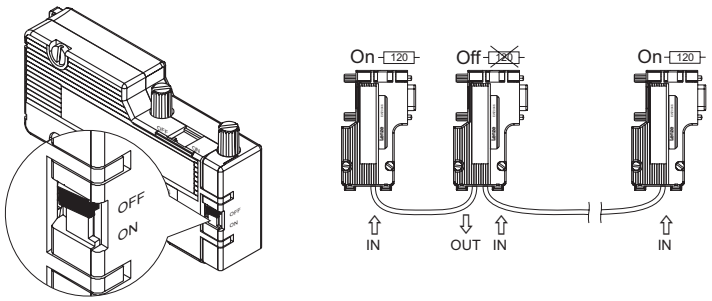
5.1.2 Dismounting



[5-2] Dismounting

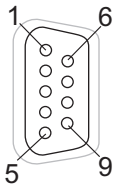
5.2 Electrical installation

Documentation of the standard device, control system, and plant/machine



Observe the notes and wiring instructions stated.

5.2.1 System bus (CANopen) connection



E94YCCA002A

- The system bus (CANopen) must be terminated with resistors (120 Ω) between CAN-low and CAN-high.
- The Lenze system connector EWZ0046 with integrated terminating resistor complies with the DS102-1 recommendation of the CAN user organisation CiA. The system connector is not contained in the scope of supply of the communication module.

2181FEW004

Assignment of the 9-pin Sub-D plug connector

View	Pin	Assignment
	1	-
	2	CAN-LOW
	3	CAN-GND
	4	-
	5	-
	6	-
	7	CAN-HIGH
	8	-
	9	-

5.2.2 Specification of the bus cable

We recommend the use of CAN cables according to ISO 11898-2:

CAN cable according to ISO 11898-2	
Cable type	Twisted in pairs with shield
Impedance	120 Ω (95 ... 140 Ω)
Cable resistance/cross-section Cable length ≤ 300 m: Cable length 301 ... 1000 m:	 ≤ 70 mΩ/m / 0.25 ... 0.34 mm^2 (AWG22) ≤ 40 mΩ/m / 0.5 mm^2 (AWG20)
Signal propagation delay	≤ 5 ns/m

5.2.3 Bus cable length

Note!

- It is absolutely necessary to comply with the permissible cable lengths.
- If the total cable lengths of the CAN nodes differ for the same baud rate, the smaller value must be used to determine the max. cable length.
- Observe the reduction of the total cable length due to the signal delay of the repeater. ▸ Checking the use of repeaters (📖 30)

5.2.3.1 Total cable length

The baud rate also determines the total cable length.

Baud rate [kbps]	Max. bus length [m]
10	8075
20	4012
50	1575
125	600
250	275
500	112
800	38
1000	12

5.2.3.2 Segment cable length

The segment cable length is determined by the cable cross-section used and by the number of nodes. Repeaters divide the total cable length into segments. If no repeaters are used, the segment cable length is identical to the total cable length.

Max. number of nodes per segment	**Cable cross-section** (can be interpolated)			
	0.25 mm² **(AWG 24)**	**0.50 mm²** **(AWG 21)**	**0.75 mm²** **(AWG 19)**	**1.00 mm²** **(AWG 18)**
2	240 m	430 m	650 m	940 m
5	230 m	420 m	640 m	920 m
10	230 m	410 m	620 m	900 m
20	210 m	390 m	580 m	850 m
32	200 m	360 m	550 m	800 m
63	170 m	310 m	470 m	690 m
100	150 m	270 m	410 m	600 m

Example: selection help

Given	
Total cable length to be implemented	200 m
Number of nodes	63

Results	
Max. possible baud rate	250 kbps (derived from table Total cable length (📖 28))
Cable cross-section required (interpolated)	0.30 mm² (AWG23) (derived from the table Segment cable length (📖 29))
Cable cross-section of standard CAN cable	0.34 mm² (AWG22) ▸ Specification of the bus cable (📖 27)

5.2.3.3 Checking the use of repeaters

Compare the values derived from tables Total cable length (📖 28) and Segment cable length (📖 29).

- If the sum of the segment cable lengths is smaller than the total cable length to be implemented, either repeaters must be used or the cable cross-section must be increased.
- If the use of repeaters reduces the max. possible total cable length so much that it is smaller than the total cable length to be implemented, then the cable cross-section must be increased or less repeaters must be used or the baud rate must be decreased.
- The use of a further repeater is recommended as ...
  - service interface
    Advantage: trouble-free connection during bus operation is possible.
  - calibration interface
    Advantage: the calibration/programming unit remains electrically isolated.

Example

Given	
Total cable length to be implemented	450 m
Number of nodes	32
Cable cross-section	0.50 mm^2 (AWG 20)
Baud rate	125 kbps
Repeater used	Lenze repeater EMF2176IB
Reduction of the max. total cable length per repeater (EMF2176IB)	30 m

Results	
Max. possible total cable length	600 m (see table Total cable length (📖 28))
Max. segment cable length	360 m (see table Segment cable length (📖 29))
Comparison	The max. segment cable length is smaller than the total cable length to be implemented.
Conclusion	A repeater must be installed at the determined max. segment cable length of 360 m.

Results with 1 repeater	
Max. possible total cable length	570 m (Reduction of the Total cable length (📖 28) by 30 m)
Sum of the segment cable lengths	720 m
Comparison	Both the possible total cable length and the segment cable lengths are larger than the total cable length to be implemented.
Conclusion	1 repeater is sufficient to implement the total cable length of 450 m.

5.2.4 Voltage supply

- The communication module is only internally supplied with voltage via the standard device.
- If the standard device fails, data transfer between the communication module and other CAN nodes is interrupted.

6 Commissioning

During commissioning, the controller receives system-specific data, e.g. motor parameters, operating parameters, responses, and parameters for the fieldbus communication. In case of Lenze devices, this is done via codes.

The codes for the controller and for the communication are saved as a non-volatile data set in the memory module.

In addition to codes for the configuration, there are codes for diagnosing and monitoring the nodes.

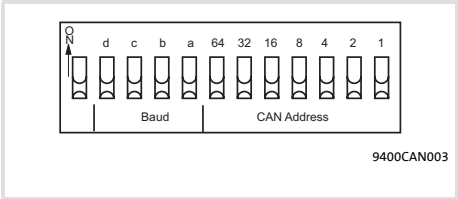
Note!

When parameterising the communication module, please note that the code number depends on the slot of the Servo Drive 9400 which the communication module is plugged into.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  ▸ Parameters of the communication module for slot MXI1 (📖 107)
- C**14**nnn for slot MXI2
  ▸ Parameters of the communication module for slot MXI2 (📖 128)

Furthermore, the Communication-relevant parameters of the standard device (📖 101) must be set.



6.1 Before initial switch-on

Stop!

Before switching on the controller for the first time, check ...

- the entire wiring with regard to completeness, earth fault and short circuit.
- whether the bus system is terminated by a bus terminating resistor at the physically first and last node.
  ▸ System bus (CANopen) connection (📖 26)

6.2 Possible settings via DIP switches

[6-1] DIP switch

The front DIP switches can be used to set:

- address (switches 1 ... 64)
- baud rate (switches a ... d)

Lenze setting: all switches OFF

6.2.1 Setting the node address

- If several CAN nodes are interconnected, their node addresses must differ from each other.
- The node address can be set with the DIP switches **1 ... 64** or via the »Engineer« (code C13350 / C14350).
- Valid address range: 1 ... 127

	Node address determined by ...	
	DIP switch	**C13350 / 14350**
Prerequisite	At least one switch **1 ... 64 = ON**	Switches **1 ... 64 = OFF**

The labelling on the package corresponds to the values of the individual DIP switches for determining the node address.

DIP switch	**64**	**32**	**16**	**8**	**4**	**2**	**1**
Switch position	OFF	OFF	**ON**	OFF	**ON**	**ON**	**ON**
Value	0	0	16	0	4	2	1
Node address	**= Sum of the values = 16 + 4 + 2 + 1 = 23** ▸ DIP switch positions for setting the CAN node address (📖 178)						

Note!

Switch the voltage supply of the communication module off and then on again to activate altered settings.

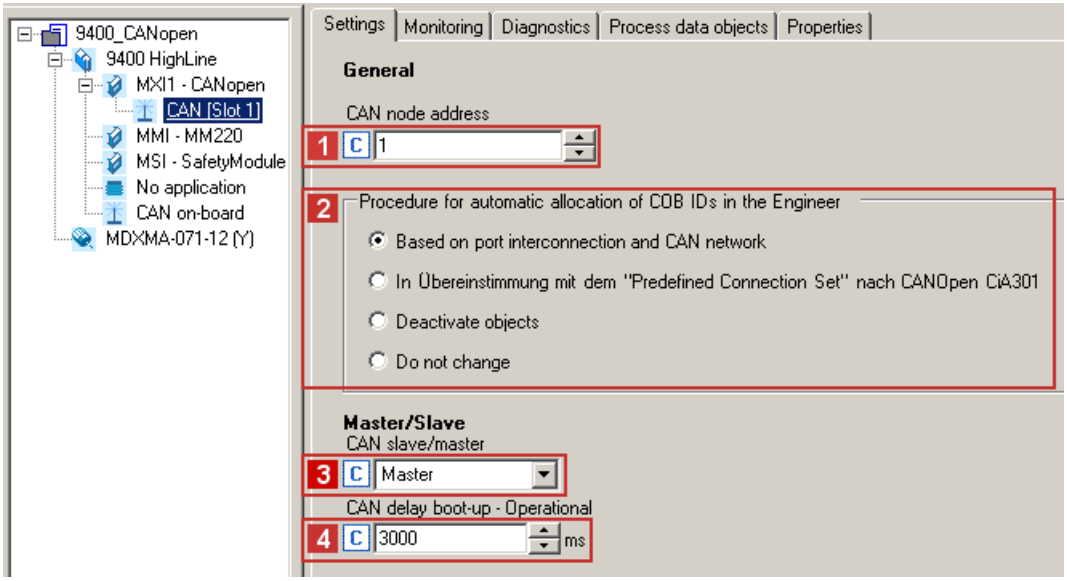
Tip!

The node address resulting from the DIP switch setting applied at last mains power-up is indicated under C13349/1 / C14349/1.

6.2.2 Setting the baud rate

- The baud rate can be set with the DIP switches **a** ... **d** or via the »Engineer« (code C13351 / C14351).
- If several CAN nodes are interconnected, their baud rates must be identical.

Switch positions				Baud rate
d	c	b	a	
OFF	**ON**	**ON**	OFF	10 kbps
OFF	**ON**	OFF	**ON**	20 kbps
OFF	OFF	**ON**	**ON**	50 kbps
OFF	OFF	**ON**	OFF	125 kbps
OFF	OFF	OFF	**ON**	250 kbps
OFF	OFF	OFF	OFF	500 kbps
ON	**ON**	**ON**	OFF	800 kbps
OFF	**ON**	OFF	OFF	1000 kbps
OFF	**ON**	**ON**	**ON**	Automatic detection



Note!

Switch the voltage supply of the standard device off and then on again to activate altered settings.

Tip!

The baud rate resulting from the DIP switch setting applied at last mains power-up is indicated under C13349/2 / C14349/2.

6.3 Settings in the »Engineer«

Go to the **Settings** tab to ...

- set the 1 node address (C13350 / C14350).
  - Setting the node address (📖 33)
- select the 2 procedure for automatic allocation of the COB-IDs in the »Engineer«.
- configure the CAN node as a 3 master or slave (C13352 / C14352).
- display 4 the time that must elapse after mains power-up before the CAN NMT master transmits the "Start remote node" telegram via the system bus (CANopen) (C13378 / C14378).

6.4 Initial switch-on

Documentation of Servo Drive 9400

Observe the safety instructions and residual hazards stated.

Note!

Establishing communication

When the communication module is externally supplied, the standard device must also be switched on for establishing communication.

After communication has been established, communication of the externally supplied module is independent of the on/off state of the standard device.

Activating changed settings

In order to activate changed settings ...

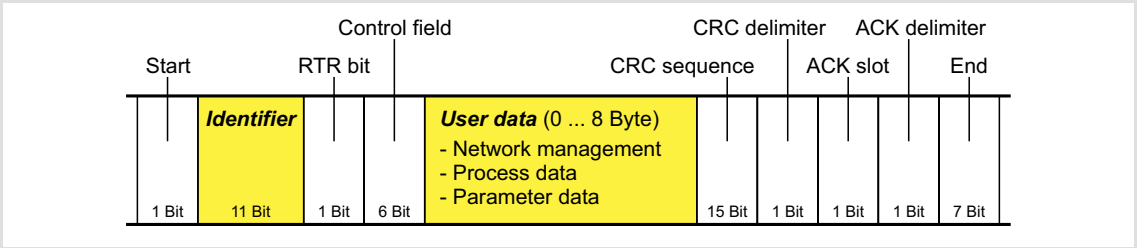
- execute device command "11: Save start parameters" via standard device code **C00002** and ...
- then execute a "CAN reset node" on the node using **C00002 = 92** or switch off and on again the voltage supply of the communication module.

Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes not wanted or even impermissible that the drive restarts.

In the Lenze setting of the Servo Drives 9400, the restart protection is activated.

Via the standard device code **C00142** ("Auto restart after mains connection") you can set the restart behaviour of the controller:



- **C00142 = "0: Inhibited"** (Lenze setting)
  - The controller remains inhibited (even if the fault is no longer active).
  - The drive starts up in a controlled manner by explicit controller enable: LOW-HIGH edge at digital input X5/RFR.
- **C00142 = "1: Enabled"**
  - An uncontrolled restart of the drive is possible.

7 Data transfer

Via the CANopen interface, process data and parameter values can be exchanged between the CAN nodes. In addition, the interface enables the connection of further modules such as distributed terminals, operator and input devices (HMIs), or external controls and control systems.

The interface transfers CAN objects following the CANopen communication profile (DS301, V4.02)) developed by the umbrella organisation of CiA (CAN in Automation) in conformity with the CAL (CAN Application Layer).

7.1 Structure of the CAN data telegram

[7-1] Basic structure of the CAN telegram

The identifier and the user data are described in detail in the following subchapters. The other signals refer to the transfer characteristics of the CAN telegram that are not described in this documentation.

Tip!

For further information please refer to the website of the CiA (CAN in Automation) user organisation:

www.can-cia.org

7.1.1 Identifier

The principle of the CAN communication is based on a message-oriented data exchange between a transmitter and many receivers. All nodes can transmit and receive quasi-simultaneously.

The identifier, also called "COB-ID" (Communication Object Identifier), is used to control which node is to receive a transmitted message. In addition to the addressing, the identifier contains information on the priority of the message and the type of the user data.

The identifier consists of a basic identifier and the node address of the node to be addressed:

Identifier (COB-ID) = basic identifier + node address (node ID)

Exception: For process data, heartbeat and emergency objects as well as network management and sync telegrams, the identifier can be assigned freely by the user (either manually or automatically by a network configurator) or is firmly allocated.

Node address (node ID)

For the purpose of unique identification, a node address, also referred to as node ID, in the valid address range (1 ... 127) is to be assigned to each node within the CAN network.

- A node address may not be assigned more than once within a network.
- The node address can be configured with the DIP switches of the communication module or with code C13350 / C14350.
  - Setting the node address (📖 33)

Identifier assignment

The system bus (CANopen) is message-oriented and not node-oriented. Each message has a unique identification, the identifier. In the case of CANopen, a node-orientation is achieved by the fact that for each message there is only one sender.

- The basic identifiers for network management (NMT) and sync as well as the basic SDO channel (SDO1) are specified in the CANopen protocol and cannot be changed.
- In the Lenze setting, the basic identifiers of the PDOs are preset according to the "Predefined Connection Set" of DS301, V4.02. They can be changed via parameters/ indexes if required.
  - Identifiers of the process data objects (📖 46)

Object		Direction		Basic identifier	
		from the device	to the device	dec	hex
Network management (NMT)				0	0
Sync				128	80
Emergency		●		128	80
PDO1 (Process data channel 1)	TPDO1	●		384	180
	RPDO1		●	512	200
PDO2 (Process data channel 2)	TPDO2	●		640	280
	RPDO2		●	768	300
PDO3 (Process data channel 3)	TPDO3	●		896	380
	RPDO3		●	1024	400
PDO4 (Process data channel 4)	TPDO4	●		1152	480
	RPDO4		●	1280	500
SDO1 (Basic SDO channel)		●		1408	580
			●	1536	600

			●	1600	640
Node guarding, heartbeat		●		1792	700

7.1.2 User data

All nodes communicate with each other by exchanging data telegrams via the system bus (CANopen). The user data area of the CAN telegram contains network management data, parameter data or process data:

Network management data

(NMT data)

- Control information on start, stop, reset, etc. of communication to certain or all nodes of the CAN network.

Process data

(PDOs – Process Data Objects)

- Process data are transferred via the process data channel.
- The controller can be controlled using process data.
- Process data are not saved in the controller.
- Process data are transferred between the host and the nodes to ensure a continuous exchange of current input and output data.
- Process data usually are unscaled/scalable raw data
- Process data are, for instance, setpoints and actual values.

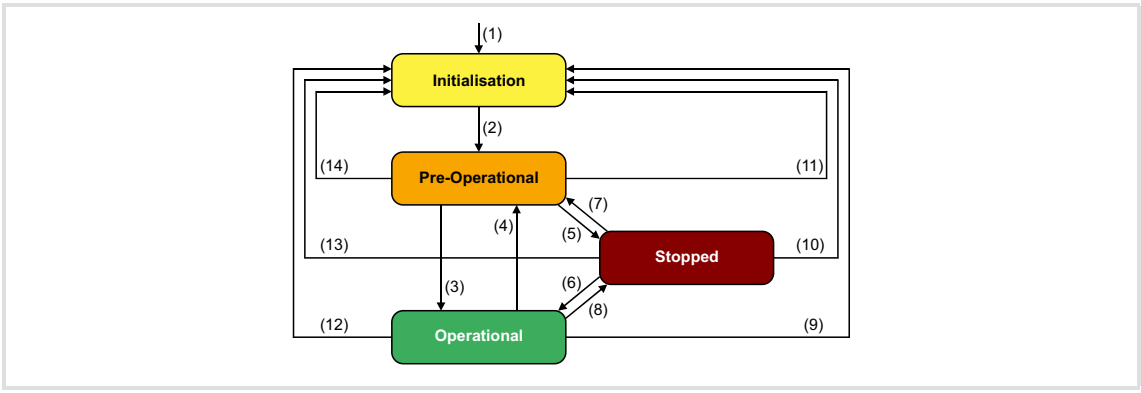
Parameter data

(SDOs – Service Data Objects)

- Parameter data are the CANopen indexes or, in the case of Lenze devices, the codes.
- The parameters are, for instance, set for the initial system set-up during commissioning or when material is changed on the production machine.
- Parameter data are transmitted as SDOs via the parameter data channel. They are acknowledged by the receiver, i.e. the sender receives a feedback about the transmission being successful or not.
- The parameter data channel enables access to all Lenze parameters (codes) and CANopen indexes.
- Parameter changes are automatically saved in the controller until the mains is switched.
- In general, the parameter transfer is not time-critical.
- Parameter data are, for instance, operating parameters, diagnostic information and motor data.

7.2 Communication phases / network management

Regarding communication via the system bus (CANopen), the drive distinguishes between the following states:



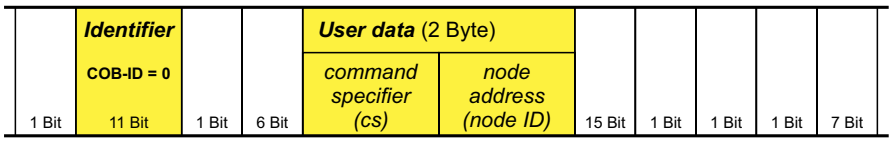
Status	Explanation
"Initialisation" (Initialisation)	After power-up, initialisation is executed. • During this phase, the controller does not take part in the data transfer on the system bus (CANopen). • All CAN-relevant parameters are written with their standard values again. • After initialisation has been completed, the controller is automatically set to the "pre-operational" status.
"Pre-operational" (before being ready for operation)	Parameter data can be received, process data is ignored.
"Operational" (ready for operation)	Parameter data and process data can be received!
"Stopped" (Stopped)	Only network management telegrams can be received.

Communication object	Initialisation	Pre-operational	Operational	Stopped
PDO			●	
SDO		●	●	
Sync		●	●	
Emergency		●	●	
Boot-up	●			
Network management (NMT)		●	●	●

Tip!

In every state, the initialisation can be re-executed partly or completely by transmitting appropriate network management telegrams.

7.2.1 State transitions



[7-2] NMT state transitions in the CAN network

Transition	NMT command	State after change	Effect on process and parameter data after state change
(1)	-	Initialisation	Initialisation starts automatically when the mains is switched on. • During initialisation, the controller does not take part in the data transfer. • After initialisation has been completed, the node sends a boot-up message with an individual identifier and automatically changes to the "pre-operational" status.
(2)	-	Pre-operational	In this phase, the master determines the way in which the node(s) takes/take part in the communication.
	From here, the states are changed over by the master for the entire network. • A target address contained in the NMT command specifies the receiver(s). • If the 9400 controller has been configured as a CAN master, the state automatically changes to "operational" after a waiting time (C13378 / C14378) has expired, and the NMT command 0x0100 ("Start remote node") is sent to all nodes. • Data can only be exchanged via process data objects if the state is "Operational".		
(3), (6)	0x01 xx Start Remote Node	Operational	Network management, sync and emergency telegrams as well as process data (PDO) and parameter data (SDO) are active. Optional: When the state is changed, event and time-controlled process data (PDOs) will be sent once.
(4), (7)	0x80 xx Enter Pre-Operational	Pre-operational	Network management, sync and emergency telegrams as well as parameter data (SDO) are active.
(5), (8)	0x02 xx Stop Remote Node	Stopped	Only network management telegrams can be received.
(9), (10), (11)	0x81 xx Reset node	Initialisation	Initialisation of all CAN-relevant parameters (DS301, V4.02) with the stored values.
(12), (13), (14)	0x82 xx Reset communication		Initialisation of all CAN-relevant parameters (DS301, V4.02) with the stored values.
	Meaning of the node address in the NMT command: • xx = 0x00: With this assignment, all nodes are addressed by the telegram (broadcast telegram). The state can be changed for all nodes at the same time. • xx = Node-ID: If a node address is indicated, the state will only be changed for the node addressed.		

7.2.2 Network management telegram (NMT)

The telegram for the network management contains the identifier "0" and the command included in the user data, which consists of the command byte and the node address.

[7-3] Network management telegram for changing the communication phases

Command specifier (cs)		NMT command
dec	hex	
1	0x01	Start Remote Node
2	0x02	Stop Remote Node
128	0x80	Enter Pre-Operational
129	0x81	Reset node
130	0x82	Reset communication

The changeover of the communication phases is carried out by one node, the CAN master, for the entire network. The role of the CAN master can also assumed by the drive controller.

▸ Parameterising the controller as a CAN master (📖 44)

Example:

Data can only be exchanged via the process data objects in the "Operational" state. To change all nodes on the bus from "Pre-Operational" to "Operational" via the CAN master, the following identifiers and user data must be set as follows in the transmit telegram:

- Identifier: 0x00 (network management)
- User data: 0x0100 (NMT command "Start Remote Node" to all nodes)

7.2.3 Parameterising the controller as a CAN master

If the initialisation of the system bus (CANopen) and the state change from "pre-operational" to" operational" is not carried out by a higher-level control system, the controller can be defined to be a "quasi" master to take over this task.

The controller can be configured to be a CAN master in C13352 / C14352.

- As a CAN master, the controller sets all nodes connected to the bus (broadcast telegram) to the "operational" communication state using the "Start remote node" NMT telegram. Only this communication state enables a data exchange via the process data objects.
- In C13378 / C14378, a delay time can be set. This delay time must elapse after mains switching before the controller transmits the "Start remote node" NMT telegram on the system bus (CANopen).

Parameter	Information	Lenze setting	
		Value	Unit
C13352 / C14352	CAN slave/master	Slave	
C13378 / C14378	CAN delay boot-up - Operational	3000	ms

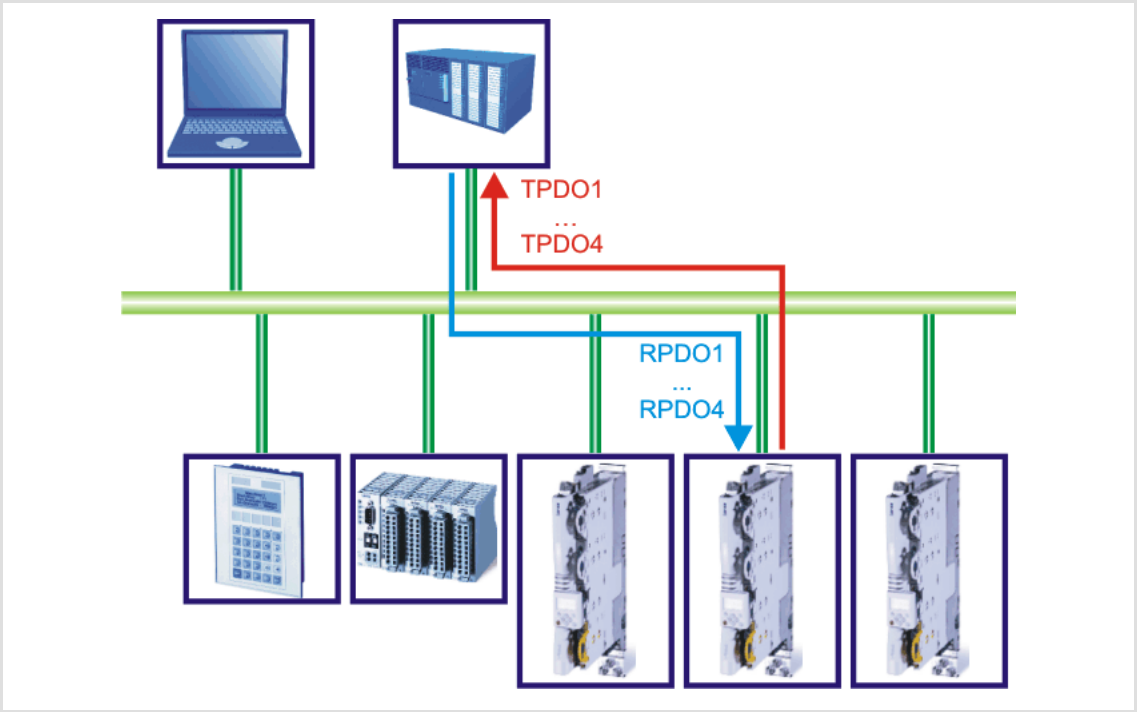
Note!

Changing the master/slave operation in C13352 / C14352 will only be effective

- after switching the mains power of the controller off and then on again

or

- by sending the NMT telegram "Reset Node" or "Reset Communication" to the controller.



As an alternative to the "Reset node" NMT telegram, the device command **C00002 = "92: CAN module: reset node"** can be used to reinitialise the CAN-specific device parameters.

Tip!

The master functionality is only required for the initialisation phase of the drive system.

8 Process data transfer

[8-1] PDO data transfer from / to the higher-level host system

For the transfer of process data, four separated process data channels (PDO1 ... PDO4) are available.

Definitions

- Process data telegrams between the host and the devices are distinguished as follows:
  - Process data telegrams to the device (RPDO)
  - Process data telegrams from the device (TPDO)
- The CANopen process data objects are designated as seen from the node's view:
  - Receive PDO (RPDOx): process data object received by a node
  - Transmit PDO (TPDOx): process data object transmitted by a node

Note!

Data can only be exchanged via the process data objects if the state is "Operational".

▸ Communication phases / network management (📖 41)

8.1 Identifiers of the process data objects

In the Lenze setting, the identifier for the process data objects PDO1 ... PDO4 results from a basic identifier and the node address set in C13350 / C14350:

Identifier (COB-ID) = basic identifier + node address (node ID)

- In the Lenze setting, the basic identifiers of the PDOs are preset according to the "Predefined Connection Set" of DS301, V4.02.
- The identifiers for the PDOs can be set individually via the Lenze codes and CANopen indexes listed in the following table. Thus, you can also set an identifier independently of the node address for certain PDOs.

Process data object		Basic identifier		Individual setting	
		dec	hex	Lenze code	CANopen index
PDO1	RPDO1	512	0x200	C13321/1 C14321/1	I-1400/1
	TPDO1	384	0x180	C13320/1 C14320/1	I-1800/1
PDO2	RPDO2	768	0x300	C13321/2 C14321/2	I-1401/1
	TPDO2	640	0x280	C13320/2 C14320/2	I-1801/1
PDO3	RPDO3	1024	0x400	C13321/3 C14321/3	I-1402/1
	TPDO3	896	0x380	C13320/3 C14320/3	I-1802/1
PDO4	RPDO4	1280	0x500	C13321/4 C14321/4	I-1403/1
	TPDO4	1152	0x480	C13320/4 C14320/4	I-1803/1

Note!

When the node address has been changed (C13350 / C14350) and then "Reset node" (C00002 = 92) has been executed, the subcodes of C13320 / C14320 and C13321 / C14321 are automatically reset to the identifiers resulting from the respective basic identifier and the node address set.

Tip!

The "Predefined Connection Set" can be re-established anytime using the following device commands of **C00002**:

- "93: CAN on board: Pred.Connect.Set" for CAN on board
- "94: CAN module: Pred.Connect.Set" for communication module E94AYCCA

8.2 Transmission type

The process data objects are transmitted in an event-controlled or time-controlled way.

- **Event-controlled:** The PDO is sent if a special device-internal event has occurred, for instance, when the data contents of the TPDO have changed or when a transmission cycle time has elapsed.
- **Synchronous:** A TPDO (or RPDO) is transmitted (or received) after the device has received a sync telegram (with identifier 0x80).
- **Cyclically:** The PDOs are transmitted in fixed time intervals after the transmission cycle time has elapsed.

The table shows that combinations of logic operations (AND, OR) are also possible between the different transmission modes:

Transmission type	PDO transmission			Logic operation
	cyclic	synchronous	event-controlled	
0		●	●	AND
1 ... 240		●		-
254, 255	●		●	OR

Transmission type	Description
0	The PDO is transmitted at every sync in an event-controlled manner (e. g. by means of a bit change within the PDO).
1 ... 240	**SYNC (with response)** • Selection n = 1: The PDO is transmitted with every sync. • Selection 1 < n ≤ 240: The PDO is transmitted with every n-th sync.
254, 255	**Event-controlled (with mask) with cyclic overlay** If this value is entered, the PDO transmission is event-controlled or cyclic. (Note: The values "254" and "255" have the same meaning). For cyclic overlay, a cycle time must be set for the respective PDO. In this case, cyclic transmission takes place in addition to event-controlled transmission (e.g. through a bit change in the PDO).

The communication parameters (as e.g. transmission mode and cycle time) can be freely adjusted for any PDO and independent of the settings of other PDOs:

Parameter	Information	Lenze setting	
		Value	Unit
C13322/1...4 C14322/1...4	CAN TPDOx Tx mode	254	
C13323/1...4 C14323/1...4	CAN RPDOx Rx mode	254	
C13324/1...4 C14324/1...4	CAN TPDOx delay time	0	1/10 ms
C13356/1...4 C14356/1...4	CAN TPDOx cycle time	0	ms

Tip!

The setting can also be made via the following CANopen objects:

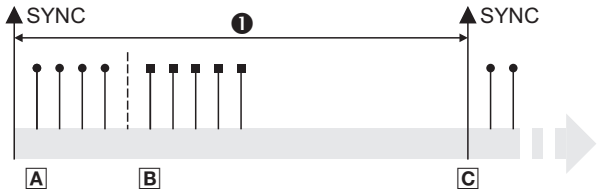
- I-1400 ... I-1403: Communication parameters for RPDO1 ... RPDO4
- I-1800 ... I-1803: Communication parameters for TPDO1 ... TPDO4

8.3 Masking of the TPDOs for event control

For TPDO1 ... TPDO4, a mask can be parameterised for every byte. In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.

- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

Short overview: Parameters for masking the TPDOs



Parameter	Information	Lenze setting
C13311/1...8 C14311/1...8	CAN TPDO1 mask byte x	0x00
C13312/1...8 C14312/1...8	CAN TPDO2 mask byte x	0x00
C13313/1...8 C14313/1...8	CAN TPDO3 mask byte x	0x00
C13314/1...8 C14314/1...8	CAN TPDO4 mask byte x	0x00

8.4 Synchronisation of PDOs via sync telegram

In case of cyclic transmission, one or several PDOs are transmitted or received at fixed time intervals. For synchronising the cyclic process data, an additional special telegram, the sync telegram, is used.

- The sync telegram is the trigger point for the transmission of process data from the frequency inverters to the master and for the acceptance of process data from the master by the slaves.
- For sync-controlled process data processing, the sync telegram must be generated accordingly.
- The response to a sync telegram is determined by the transmission type selected.
  - Transmission type (📖 47)

General procedure

1 Sync cycle time (C01121)

[8-2] Sync telegram

A. After the sync telegram has been received, the slaves send the synchronous process data to the master (TPDOs). The master reads them as process input data.

B. When the sending process has been completed, the slaves (RPDOs) receive the process output data (from the master).
   – All other telegrams (e.g. parameters or the event-controlled process data) are accepted acyclically by the slaves after the transmission has been completed successfully.
   – The acyclic data are not shown in figure [8-2] They must be considered when the cycle time is dimensioned.

C. The data in the slave is accepted with the next sync telegram if the Rx mode is set to 1 ... 240. When the Rx mode is set to 254 or 255 the data is accepted in the next device cycle independent of the sync telegram.

8.4.1 Parameter setting

Short overview: Parameters for synchronisation via sync telegram

Parameter	Information	Lenze setting		Assignment	
		Value	Unit	Sync Master	Sync Slave
C13367 C14367	CAN SYNC Rx identifier	128			●
C13368 C14368	CAN SYNC Tx identifier	128		●	
C00369/1	CAN SYNC transmit cycle time	0	ms	●	
C01120	Sync source	Off			●
C01121	Sync cycle time	1000	µs		●
C01122	Sync phase position	400	µs		●
C01123	Sync tolerance	0	µs		●
C01124	Sync-PLL increment	109	ns		●
C01130	Sync application cycle	1000	µs		●

Sync source

C01120 is used to select the source of the synchronisation signals. Basically, only one source can synchronise the node.

Sync cycle time

Time with which the internal phase-locking loop (PLL) expects the synchronisation signals. The time must be set in C01121 in accordance with the cycle of the synchronisation source selected in C01120.

Note!

For synchronisation via the system bus (CANopen), only integer multiples of 1000 µs should be set in C01121.

Example: For the system bus (CANopen), the interval between two synchronisation signals has been set to 2 ms. If the system bus (CANopen) is to be used as synchronisation source, a sync cycle time of 2000 µs must be set in C01121.

Sync phase position

The phase position defines the zero point of time for the application relating to the synchronisation signal (bus cycle). Since PDO processing is integrated in the system part of the application, the instant of the PDO acceptance also changes if the phase position is changed.

- If 0 is set, the application is started together with the synchronisation signal.
- If a value > 0 is set, the application starts by the set time interval before the synchronisation signal arrives (the phase position acts negatively).

Example: If the phase position is set to 400 µs, the system part of the application starts 400 µs before the synchronisation signal arrives.

Note!

From Servo Drive 9400 software version V3.0:

The effect of the sync phase position can be influenced by the application cycle set in C01130. For the Lenze setting of C01130, the behaviour remains as before.

Sync tolerance

Time slot for monitoring the synchronisation signal via the **LS_SyncInput** system block.

- If the last synchronisation signal has been within this time slot around the expected value, the *SYNC_bSyncInsideWindow* output of the **LS_SyncInput** system block is set to TRUE.
- This setting does not affect the synchronisation process.

Sync-PLL increment

If the cycle times of the synchronisation signal and the phase-locking loop (PLL) differ from each other, the setting in C01124 defines the increment with which the phase-locking loop can be readjusted.

- If the system bus (CANopen) is used as synchronisation source, the recommended time increment for deviations is 109 ns (Lenze setting).

Sync application cycle

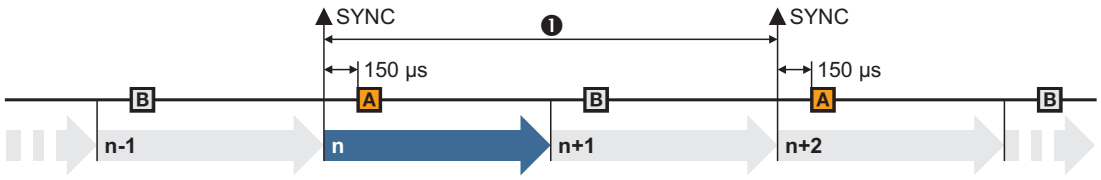
This parameter influences the effect of the sync phase position (C01122) with regard to the instant of acceptance of the synchronous PDOs by the application or the instant of transmission of the synchronous PDOs to the system bus (CANopen).

For Servo Drive 9400 software versions lower than V3.0 the following applies:

- The sync application cycle is permanently set to 1000 µs.
- The resulting PDO delay can be calculated with the following formula taking into consideration an internal processing time of 150 s:
  PDO delay= (sync cycle time - sync phase position + 150 µs) modulo 1000

From Servo Drive 9400 software version V3.0 the following applies:

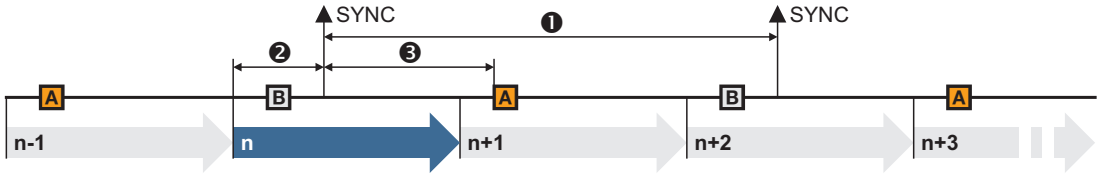
- The sync application cycle can be set in C01130. The value set is automatically rounded down to full 1000 µs.
- The resulting PDO delay can be calculated with the following formula, taking an internal processing time of 150 s into consideration:
  PDO delay= (sync cycle time - sync phase position + 150 µs) modulo C01130



Note!

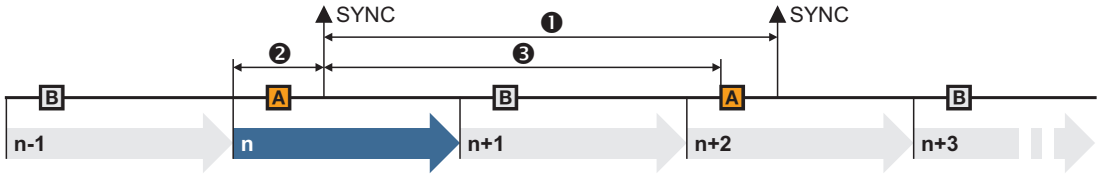
If the sync application cycle in C01130 is set higher than the sync cycle time (C01121), the response is undefined. The same applies if the sync phase position (C01122) is set higher than the sync cycle time (C01121).

In these cases, usually no synchronous PDOs are transmitted via the system bus (CANopen) anymore.



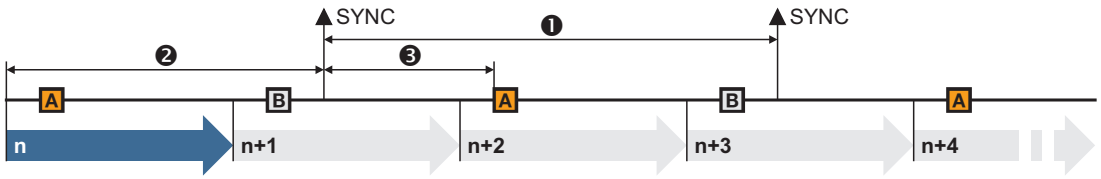
8.4.2 Effect of C01130 on the sync phase position

Example 1:



1	Sync cycle time (C01121)	= 2000 µs
	Sync phase position (C01122)	= 0 µs
	Sync application cycle (C01130)	= 1000 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

Example 2:



1	Sync cycle time (C01121)	= 2000 µs
2	Sync phase position (C01122)	= 400 µs
	Sync application cycle (C01130)	= 1000 µs
3	PDO delay	= (C01121 - C01122 + 150 µs) modulo C01130 = 750 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

Example 3:

1	Sync cycle time (C01121)	= 2000 µs
2	Sync phase position (C01122)	= 400 µs
	Sync application cycle (C01130)	= 2000 µs
3	PDO delay	= (C01121 - C01122 + 150 µs) modulo C01130 = 1750 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

Example 4:

1	Sync cycle time (C01121)	= 2000 µs
2	Sync phase position (C01122)	= 1400 µs
	Sync application cycle (C01130)	= 1000 µs
3	PDO delay	= (C01121 - C01122 + 150 µs) modulo C01130 = 750 µs
A	Instant of acceptance/transmission of synchronous PDOs	
B	Inactive instant of acceptance	
n	Device cycle	

8.5 PDO mapping

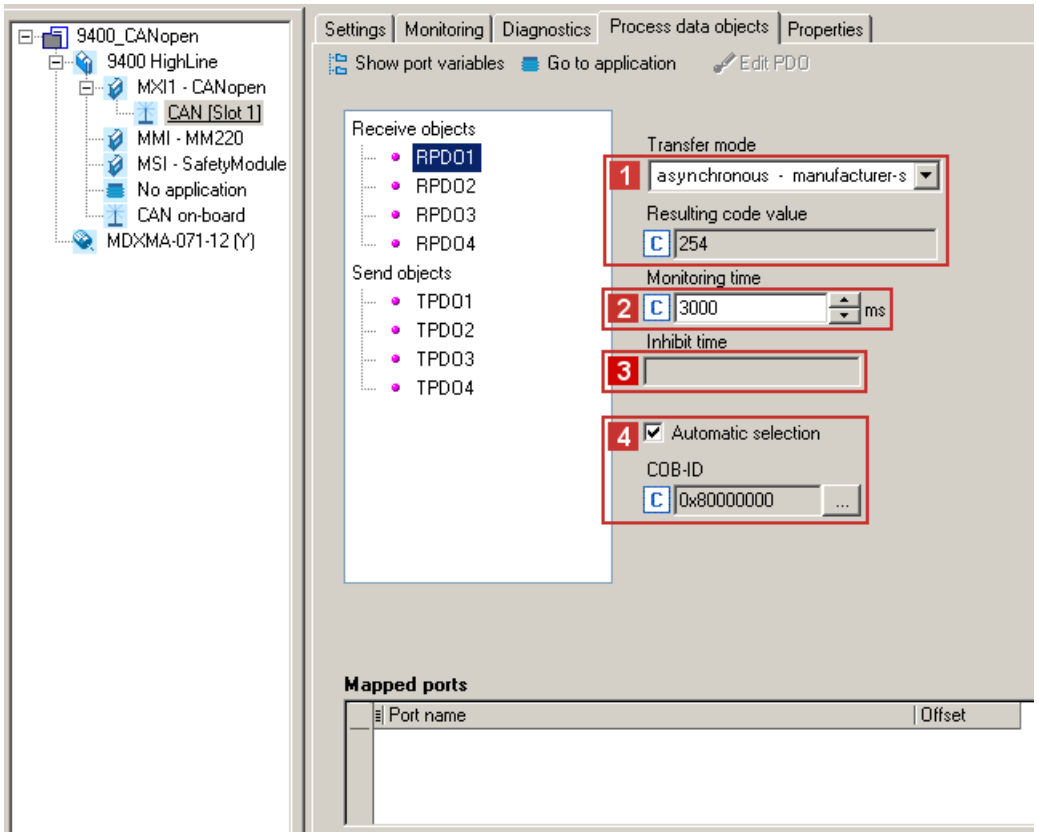
With Servo Drives 9400 HighLine, you can map the process data individually. For this purpose, the »Engineer« provides a port configurator.

Note!

The port mapping is no configuration that can be carried out online for the Servo Drive 9400. For this purpose, an update of the »Engineer« project and a subsequent download of the application is always required.

The »Engineer« screenshots illustrated in the following are only examples of the setting sequence and the resulting screens displayed.

Depending on the software version of the controller and the version of the »Engineer« software installed, the screenshots in this documentation may differ from the actual »Engineer« screens.



Implementing PDO mapping with the »Engineer«

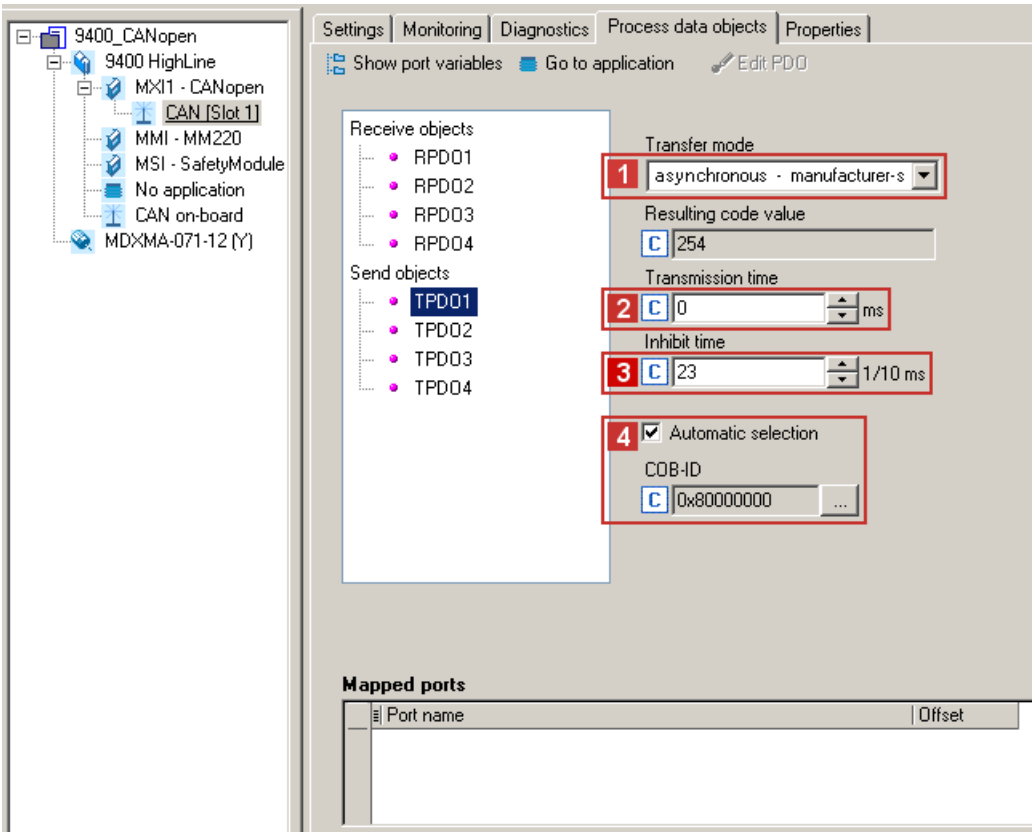
Example

A project to be created in the »Engineer« consists of a master drive (master) and a slave drive (slave). Among other things, for instance PDOs are to be exchanged between the two drives via the system bus (CANopen). In the following, the parameterisation of the master drive is described.

1. On the **Process data objects** tab, the parameters for the receive objects (RPDO1 ... RPDO4) and transmit objects (TPDO1 ... TPDO4) can be set.

Settings for receive objects (RPDO1 ... RPDO4)

1 Transfer mode of RPDOx (C13323/1...4 / C14323/1...4)



2 Monitoring time for RPDOx (C13357/1...4 / C14357/1...4)

- If a different value than "0" is entered, the RPDO is expected after the time set has elapsed.
- If the RPDO is not received within the monitoring time, an error response parameterised under C13591/1...4 / C14591/1...4 is initiated.

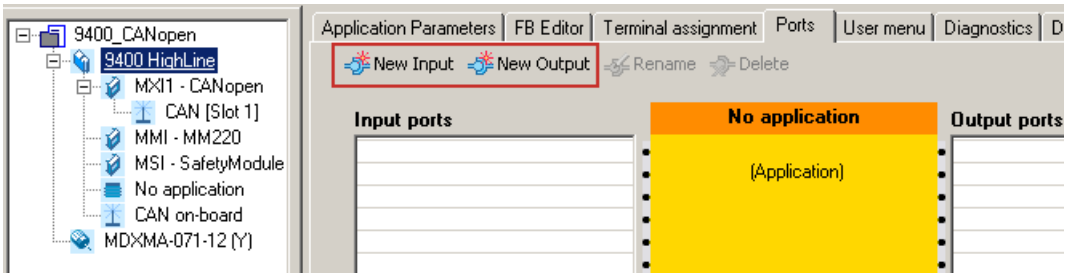
3 The inhibit time is not relevant for receive objects.

4 Display/setting of the RPDOx COB-ID (C13321/1...4 / C14321/1...4)

Settings for transmit objects (TPDO1 ... TPDO4)

1 Transfer mode of TPDOx (C13322/1...4 / C14322/1...4)

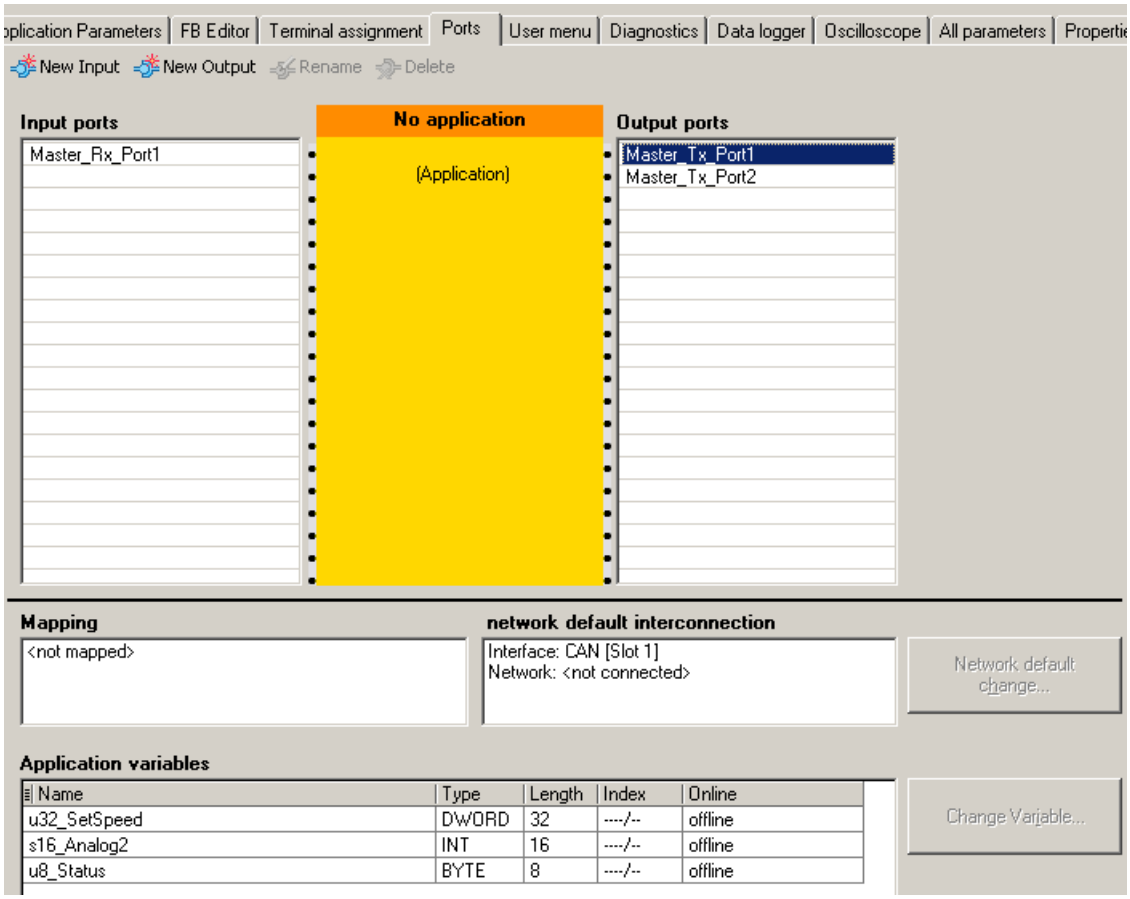
2 Transfer time of TPDOx (C13356/1...4 / C14356/1...4)



- If a different value than "0" is entered, the TPDO is transmitted without further consideration of the transport type after the time set has elapsed.

3 Inhibit time/delay time for TPDOx (C13324/1...4 / C14324/1...4)

- Minimum time between the transmission of two identical TPDOs.

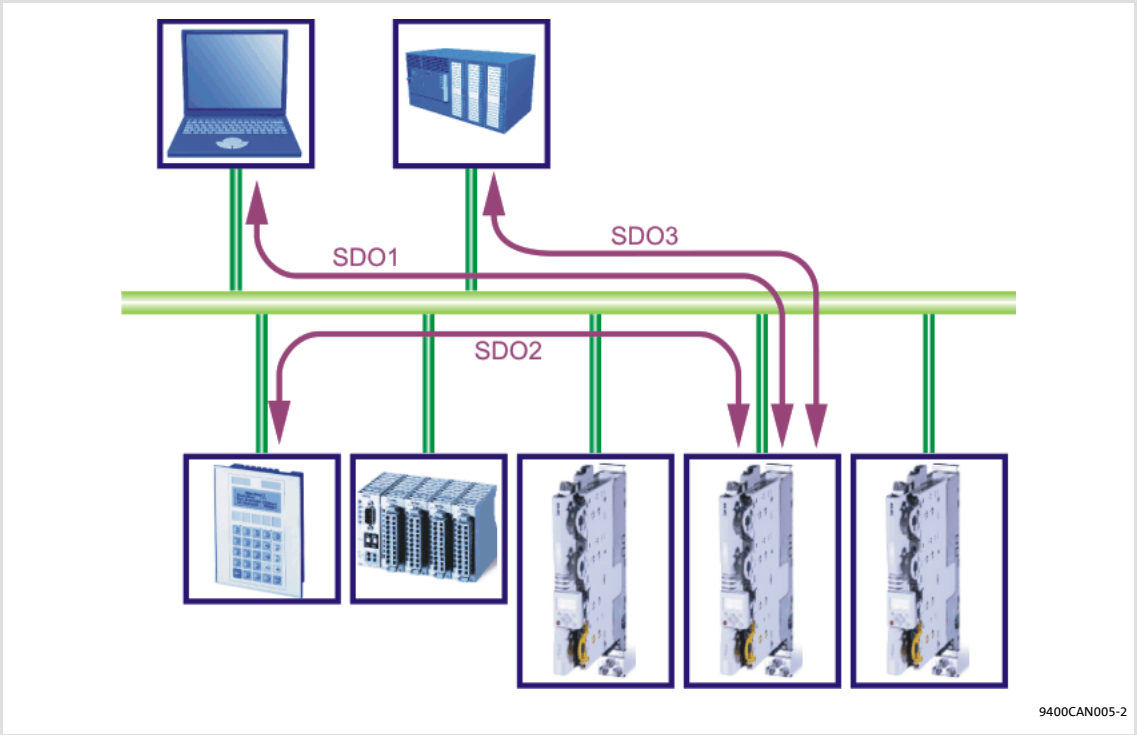


4 Display/setting of the TPDOx COB-ID (C13320/1...4 / C14320/1...4)

2. On the **Ports** tab, *input ports* and *output ports* can be created using the **New Input** and **New Output** buttons.

In the example, two *output ports* and one *input port* have been created for the master drive (master).

- A port exactly corresponds to a PDO object.
- For each port, *element variables* have been defined.



The following *element variables* are transmitted via TPDO1 (*Master_Tx_Port1*):

- u32_SetSpeed, type DWORD, 32 bits
- s16_Analog2, type INTEGER, 16 bits
- u8_Status, type BYTE, 8 bits

3. The application can be downloaded to the Servo Drive 9400 with the menu command **Online→Transfer application to device**.

   When all PDOs have been programmed and the application has been completed, it can be downloaded to the Servo Drive 9400. All CAN parameters will be transferred according to the settings made in the »Engineer« project.

9 Parameter data transfer

[9-1] Parameter data transfer via available parameter data channels

Parameters are values stored in codes on Lenze controllers.

Ten separate parameter data channels are available for parameter setting, enabling the simultaneous connection of several devices for configuration.

Parameter data are transmitted via the system bus (CANopen) as SDOs ("Service Data Objects") and acknowledged by the receiver. The SDO enables read and write access to the object directory. Indexes (e.g. I-1000) ensure access to device parameters and functions included in the object directory. To transfer SDOs, the information contained in the user data must comply with the CAN-SDO protocol.

9.1 Identifiers of the parameter data objects

In the Lenze setting, the identifier for the parameter data objects SDO1 ... SDO10 results from a basic identifier and the node address set in C13350 / C14350:

Identifier (COB-ID) = basic identifier + node address (node ID)

▶ In the Lenze setting, the basic identifiers of the SDOs are preset according to the "Predefined Connection Set" of DS301, V4.02:

Parameter data object	Direction		Basic identifier	
	from the device	to the device	dec	hex
SDO1 (Parameter data channel 1)	●		1408	580
		●	1536	600
SDO2 ... 10 (Parameter data channel 2 ... 10)	●	●	Deactivated	
Node guarding, heartbeat	●		1792	700
Boot-up	●		1792	700

Note!

Please observe that the parameter data channels 2 ... 10 are deactivated in the Lenze setting.

The procedure for activating these parameter data channels is explained in the description for parameters C13372 / C14372 to C13374 / C14374 or in the description for the implemented CANopen object I-120x.

▸ Example (📖 166)

9.2 User data

Structure of the user data of the parameter data telegram

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	Low byte	High byte		Low word		High word	
				Low byte	High byte	Low byte	High byte

Note!

User data are displayed in the Motorola format.

▸ Examples for a parameter data telegram (📖 69)

The following subchapters describe the user data in detail.

9.2.1 Command

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	Low byte	High byte		Low word		High word	
				Low byte	High byte	Low byte	High byte

The following commands can be transmitted or received for writing and reading the parameters:

Command	1st byte		Data length	Information
	hex	dec		
Write request	0x23	35	4 bytes	Writing a parameter to the controller.
	0x2B	43	2 bytes	
	0x2F	47	1 byte	
	0x21	33	Block	
Write response	0x60	96	4 bytes	Acknowledgement by the controller regarding a write request.
Read request	0x40	64	4 bytes	Reading a parameter from the controller.
Read response	0x43	67	4 bytes	Response from the controller to a read request with the current parameter value.
	0x4B	75	2 bytes	
	0x4F	79	1 byte	
	0x41	65	Block	
Error response	0x80	128	4 bytes	Response from the controller when the read/write request could not be executed correctly. ▸ Error messages (📖 67)

In detail, the command byte contains the following information:

Command	1st byte							
	Command specifier (cs)			Toggle (t)	Length*		e	s
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Write request	0	0	1	0	0/1	0/1	1	1
Write response	0	1	1	0	0	0	0	0
Read request	0	1	0	0	0	0	0	0
Read response	0	1	0	0	0/1	0/1	1	1
Error response	1	0	0	0	0	0	0	0

*Bit coding of the length: 00 = 4 bytes, 01 = 3 bytes, 10 = 2 bytes, 11 = 1 bytes
e: expedited (shortened block service)
s: segmented (normal block service)

Tip!

Further commands are defined in the CANopen specification DS301, V4.02 (e.g. segmented transfer).

9.2.2 Addressing through index and subindex

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	Low byte	High byte		Low word		High word	
				Low byte	High byte	Low byte	High byte

A parameter (Lenze code) is addressed according to the following formula:
Index = 24575 - (Lenze code number)

Example

The parameter **C00011** (motor reference speed) is to be addressed.

Calculation:

- Index:
  - Decimal: 24575 - 11 = 24564
  - Hexadecimal: 0x5FFF - 0xB = 0x5FF4
- Subindex: 0x00 (subindex 0, since the parameter has no subcodes.)

Entries:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	0xF4	0x5F	0x00				

9.2.3 Data 1 ... data 4

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
	Low byte	High byte		Low word		High word	
				Low byte	High byte	Low byte	High byte

A maximum of 4 bytes is available for parameter value entries. The bytes are assigned as follows, depending on the data format:

5th byte	6th byte	7th byte	8th byte
Parameter value (1 byte)	0x00	0x00	0x00
Parameter value (2 bytes)		0x00	0x00
Low byte	High byte		
Parameter value (4 bytes)			
Low word		High word	
Low byte	High byte	Low byte	High byte

Note!

The Table of attributes (📖 149) contains a scaling factor for Lenze parameters in the "factor" column. The scaling factor is important for the transfer of parameter values which are represented with one or several decimal positions in the parameter list.

When the scaling factor is > 1, the value must be multiplied by the scaling factor before being transmitted to be able to transmit the value as an integer. On the SDO client side, the integer must by divided by the scaling factor again to obtain the original value with decimal positions.

Example

For a code with the scaling factor "100" and the data format U32 the value "123.45" is to be transmitted.

Calculation:

- Value to be transmitted = scaling factor x value
- Data $_{(1 \ldots 4)}$ = 100 x 123.45 = 12345 (0x00 00 30 39)

Entries:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
				0x39	0x30	0x00	0x00

9.2.4 Error messages

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Error code			
0x80 (128)	Low byte	High byte		Low word		High word	
				Low byte	High byte	Low byte	High byte

In case of an error, the addressed node generates a telegram with the "Error Response" (0x80) command.

- The telegram contains the index and subindex of the code in which an error has occurred.
- Bytes 5 ... 8 contain the error code.
  - The error codes are standardised in accordance with DS301, V4.02.
  - The representation of the error codes is reversed to the read direction (see the following example).

Example

The representation of the error code "0x06040041" in bytes 5 ... 8:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Command	Index		Subindex	Error code			
				0x41	0x00	0x04	0x06

Error codes

Error code	Explanation
0x0503 0000	Toggle bit not changed.
0x0504 0000	SDO protocol expired.
0x0504 0001	Invalid or unknown client/server command specifier.
0x0504 0002	Invalid block size (block mode only).
0x0504 0003	Invalid processing number (block mode only).
0x0504 0004	CRC error (block mode only).
0x0504 0005	Memory does not suffice.
0x0601 0000	Object access not supported.
0x0601 0001	Attempted read access to a writable only object.
0x0601 0002	Attempted write access to a readable only object.
0x0602 0000	Object not listed in object directory.
0x0604 0041	Object not mapped to PDO.
0x0604 0042	Number and length of objects to be transferred longer than PDO length.
0x0604 0043	General parameter incompatibility.
0x0604 0047	General internal device incompatibility.
0x0606 0000	Access denied because of hardware error.
0x0607 0010	Unsuitable data type (unsuitable service parameter length).
0x0607 0012	Unsuitable data type (service parameter length exceeded).
0x0607 0013	Unsuitable data type (service parameter length too short).
0x0609 0011	Subindex does not exist.
0x0609 0030	Parameter value range exceeded.
0x0609 0031	Parameter values too high.
0x0609 0032	Parameter values too low.
0x0609 0036	Maximum value falls below minimum value.
0x0800 0000	General error.
0x0800 0020	Data cannot be transferred/stored for application.
0x0800 0021	Data cannot be transferred/stored for application due to local control.
0x0800 0022	Data cannot be transferred/stored for application due to current device status.
0x0800 0023	Dynamic generation of object directory not successful or no object directory available (e.g. object directory generated from file, generation not possible because of a file error).

9.3 Examples for a parameter data telegram

9.3.1 Reading parameters

Task: The heatsink temperature of 43 °C (code **C00061**, data format INTEGER32, scaling factor 1) is to be read from the controller with node address "5".

Telegram to drive

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0605	0x40	0xC2	0x5F	0x00	0x00	0x00	0x00	0x00

Explanations of the telegram to the drive	
Identifier	= 1536 + node address = 1536 + 5 = 1541 = 0x0605 (1536 = basic identifier SDO1 to the controller)
Command	= 0x40 = "Read Request" (read request of a parameter from the controller)
Index	= 24575 - code number = 24575 - 61 = 24514 = 0x5FC2
Subindex	= 0 (code **C00061** has no subcodes)

Response telegram from drive (if data have been transmitted correctly)

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0585	0x43	0xC2	0x5F	0x00	0x2B	0x00	0x00	0x00

Explanations of the telegram from the drive	
Identifier	= 1408 + node address = 1408 + 5 = 1413 = 0x0585 (1408 = basic identifier SDO1 from the controller)
Command	= 0x43 = "Read Response" (response to read request with current value)
Index	as in telegram to the drive
Subindex	
Data 1 ... 4	= 0x0000002B = 43 [°C]

9.3.2 Writing parameters

Task: The rated current of the connected motor with I_{rated} = 10.2 A (code **C00088**) is to be entered in the controller with node address "2".

Telegram to drive

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0602	0x23	0xA7	0x5F	0x00	0x66	0x00	0x00	0x00

Explanations of the telegram to the drive	
Identifier	= 1536 + node address = 1536 + 2 = 1538 = 0x0602 (1536 = basic identifier SDO1 to the controller)
Command	= 0x23 = "Write Request" (write request of a parameter to the controller)
Index	= 24575 - code number = 24575 - 88 = 24487 = 0x5FA7
Subindex	= 0 (code **C00088** has no subcodes)
Data 1 ... 4	= 10.2 x 10 = 102 = 0x00000066 (Value for motor current, data type U32; display factor 1/10)

Response telegram from drive (if data have been transmitted correctly)

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x0582	0x60	0xA7	0x5F	0x00	0x00	0x00	0x00	0x00

Explanations of the telegram from the drive	
Identifier	= 1408 + node address = 1408 + 2 = 1410 = 0x0582 (1408 = basic identifier SDO1 from the controller)
Command	= 0x60 = "Write Response" (acknowledgement of the write access from the controller)
Index	as in telegram to the drive
Subindex	

9.3.3 Reading block parameters

Task: The firmware version (code **C00099**) is to be read from the parameter set of the controller with node address "12". The firmware version has a length of 11 ASCII characters and is transmitted as a block parameter. In each block, the data width from the 2nd to the 8th byte within the user data is occupied.

Telegram 1 to the drive: read request

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x060C	0x40	0x9C	0x5F	0x00	0x00	0x00	0x00	0x00

Explanations of the telegram to the drive	
Identifier	= 1536 + node address = 1536 + 12 = 1548 = 0x060C (1536 = basic identifier SDO1 to the controller)
Command	= 0x40 = "Read Request" (read request of a parameter from the controller)
Index	= 24575 - code number = 24575 - 99 = 24476 = 0x5F9C
Subindex	= 0 (code **C00099** has no subcodes)

Response telegram 1 from the drive: Data of the block length (11 characters)

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Index		Subindex	Data 1	Data 2	Data 3	Data 4
0x058C	0x41	0x9C	0x5F	0x00	0x0B	0x00	0x00	0x00

Explanations of the telegram from the drive	
Identifier	= 1408 + node address = 1408 + 12 = 1420 = 0x058C (1408 = basic identifier SDO1 from the controller)
Command	= 0x41 = "Read Response" (response is a block telegram)
Index	as in telegram to the drive
Subindex	
Data 1 ... 4	= 0x0000000B = data length of 11 characters in ASCI format

Telegram 2 to the drive: Request of the 1st data block

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x060C	0x60	0x00	0x00	0x00	0x00	0x00	0x00	0x00

Explanations of the telegram to the drive	
Command	= 0x60 = "Read Segment Request" (request: read data block) • Bit 4 = 0 (toggle bit)
	Influence of the toggle bit to the request command The individual blocks are toggled successively, i.e. first the request with command "0x60" is effected (= 011**0***0000_{bin}), then command "0x70" (= 011**1***0000_{bin}), then "0x60" again, etc. * Toggle bit

Response telegram 2 from the drive: Send 1st data block

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x058C	0x00	0x30	0x31	0x2E	0x30	0x30	0x2E	0x30
		0_{asc}	1_{asc}	$_{asc}$	0_{asc}	0_{asc}	$_{asc}$	0_{asc}

Explanations of the telegram to the drive	
Command	= 0x00 = $0000\,0000_{bin}$ • Bit 4 = 0 (toggle bit)
	Influence of the toggle bit to the transmission command • The first response of the controller in the command byte is "0x000**0***0000_{bin}" if bytes 2 ... 8 are completely occupied by data and further telegrams are following. • The second response of the controller in the command byte is "0x000**1***0000_{bin}" if bytes 2 ... 8 are completely occupied by data and further telegrams are following, etc. * Toggle bit
Data 1 ... 7	= "01.00.0" (ASCII representation)

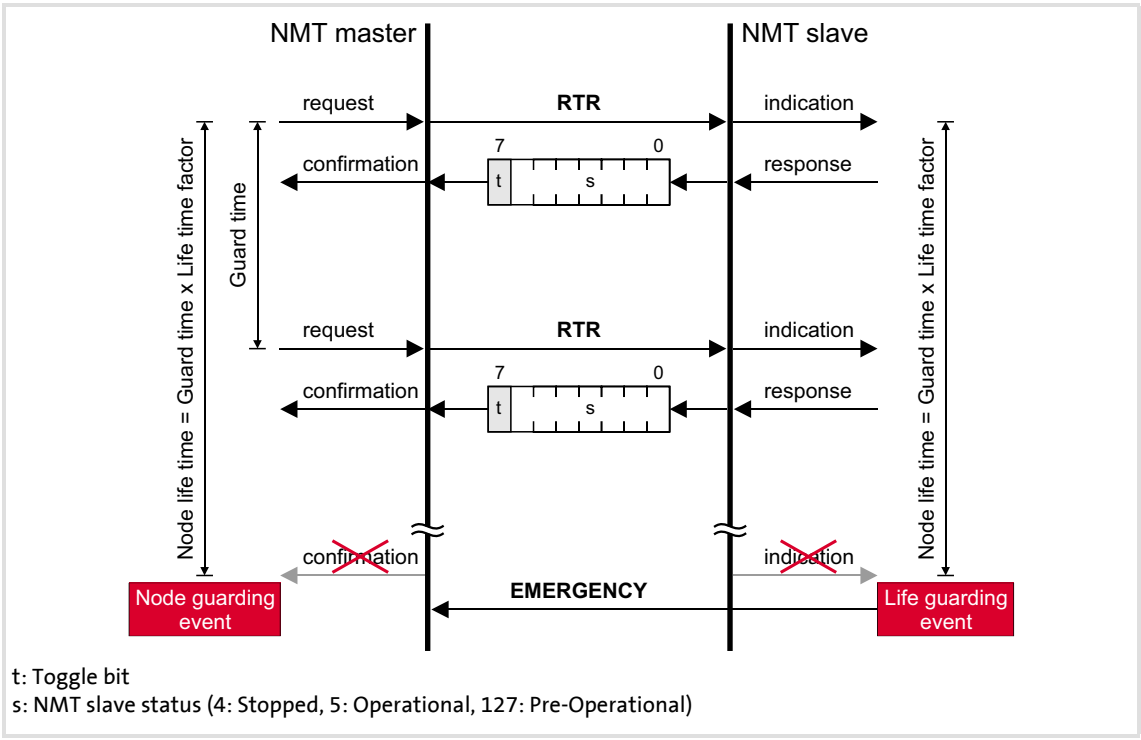
Telegram 3 to the drive: Request of the 2nd data block

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x060C	0x70	0x00	0x00	0x00	0x00	0x00	0x00	0x00

Explanations of the telegram 3 to the drive	
Command	= 0x70 = "Read Segment Request" (request: read data block) • Bit 4 = 1 (toggle bit)

Response telegram 3 from the drive: Send 2nd data block with end identifier

Identifier	User data							
	1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
	Command	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7
0x058C	0x17	0x30	0x2E	0x30	0x30	0x00	0x00	0x00
		0_{asc}	$._{asc}$	0_{asc}	0_{asc}	-	-	-



Explanations of the telegram 3 from the drive	
Command	= 0x17 = 00010111_{bin}: • Bit 0 = 1 (end of transmission) • Bit 1 ... bit 3 = 011_{bin} (3 bytes do not contain any data) • Bit 4 = 1 (toggle bit)
	Influence of the end bit and the residual data length on the transmission command • The end of transmission is reported by the set end bit 0. • By means of bit 1 ... 3, the number of bytes which do not contain data anymore is announced. * Toggle bit
Data 1 ... 7	= "0.00" (ASCII representation) The result of the data block transfer is: "01.00.00.00"

10 Monitoring

10.1 Node guarding protocol

In a CAN network, the node guarding protocol serves to monitor the connection between the NMT master and the NMT slave(s). If the controller was parameterised as NMT master, it can monitor up to 32 NMT slaves.

General procedure

t: Toggle bit
s: NMT slave status (4: Stopped, 5: Operational, 127: Pre-Operational)

[10-1] Node guarding protocol

1. The NMT master within cyclic time intervals sends a data telegram to the NMT slave, which is referred to as "Remote Transmission Request" (RTR).
2. The NMT slave then returns a response telegram ("Response") to the NMT master.

10.1.1 Telegram structure

RTR telegram

- The RTR telegram from the NMT master has the following identifiers:
  Identifier (COB-ID) = 1792 + node address of the NMT slave
- The RTR telegram does not contain any user data.
- The RTR bit in the arbitration field of the RTR telegram is set to the valency LOW (dominant level).

Response telegram

- The response telegram from the requested NMT slave has the same identifier as the RTR telegram received by the NMT master.
- The user data (1 byte) contains the NMT slave status and the toggle bit (see the following description).

NMT slave state (s)

NMT slave status		Data							
Communication status	Decimal value (s)	(t)	NMT slave state (s)						
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Stopped	4	0/1	0	0	0	0	1	0	0
Operational	5	0/1	0	0	0	0	1	0	1
Pre-operational	127	0/1	1	1	1	1	1	1	1

Toggle bit (t)

- The toggle bit (t) in the response telegram has the value "0" when the node guarding protocol is activated for the first time.
- The toggle bit (t) must change its value with each response.

Note!

The toggle bit is monitored by the NMT master.

If a telegram is received with a toggle bit value that has not changed compared to the previously received telegram, it will be treated as if it were not received, i.e. the monitoring time is not reset and elapses further.

The toggle bit can only be reset to the value "0" by the "Reset Communication" telegram of the NMT master.

10.1.2 Parameter setting

Short overview of parameters for the "Node Guarding" monitoring function:

Parameter	Information	Lenze setting		Assignment	
		Value	Unit	Master	Slave
C13382 / C14382	CAN guard time	0	ms		●
C13383 / C14383	CAN life time factor	0			●
C13386 / C14386	CAN node guarding	0x00000000		●	
C13387 / C14387	CAN node guarding activity	-		●	
C13388 / C14388	CAN node guarding status	-		●	
C13612 / C14612	Resp. CAN node guarding error	No response		●	
C13614 / C14614	Resp. CAN life guarding error	No response			●
C13625 / C14625	CAN behaviour in the case of error	Pre-operational state		●	●

Highlighted in grey = display parameter

Guard time

The time interval with which the NMT master transmits the RTR telegram is the guard time.

- For each NMT slave to be monitored an individual time interval can be set.
- The RTR telegram prompts the NMT slave to send its current status.

Node life time

The node life time is the product of the guard time and the life time factor:
node life time = guard time x life time factor

- "Life time factor" and "Guard time" have to be known to the NMT master. For this, the values from the NMT slave are read at each reboot, or defined values are sent to the NMT slave at each reboot.
- It is possible to select a different "node life time" for each NMT slave to be monitored.

OK status

The status of the connection is ok (OK status) if within the "Node life time"

- the NMT slave has received an RTR telegram from the NMT master and
- the NMT master has received a correct response from the requested NMT slave.

In the OK status the monitoring times for the NMT master and the NMT slave are reset and the node guarding protocol is continued.

Life guarding event

The "life guarding event" is triggered in the NMT slave if the slave has not received an RTR telegram from the NMT master within the node life time:

- In the Lenze setting, the NMT slave changes from the "Operational" communication status into the "Pre-Operational" communication status.
  - C13625 / C14625 or the I-1029 object can be used to set another status change.
- An emergency telegram with the emergency error code 0x8130 is transmitted to the NMT master.
- The response parameterised in C13614 / C14614 is executed (Lenze setting: "No response").

Note!

The "Life Guarding Event" can only be triggered in the NMT slave if at least one RTR telegram has been received successfully from the NMT master.

Node guarding event

The "node guarding event" is triggered in the NMT master if the master has not received any response to its RTR telegram from the requested NMT slave within the node life time or if the toggle bit in the response telegram has not changed within the node life time.

- In the Lenze setting, the NMT master changes from the "Operational" communication status into the "Pre-Operational" communication status.
  - C13625 / C14625 or the I-1029 object can be used to set another status change.
- The response parameterised in C13612/1...32 / C14612/1...32 is executed (Lenze setting: "No response"). For each monitored node, an individual NMT master response can be set.

Note!

The "Node Guarding Event" can only be triggered in the NMT master if at least one response has been received successfully from the requested NMT slave.

10.1.3 Commissioning example

Task

A Servo Drive 9400 configured as NMT master (node 1) is to monitor another Servo Drive 9400 (node 2).

- The node guarding telegram is to be transmitted from the NMT master to the NMT slave in intervals of 1 s:
  - Guard time = 1000 ms
- The node life time is to amount to 5 seconds:
  - Node life time = guard time (1000 ms) x life time factor (5)
- If an error occurs, an error response is to be activated both in the NMT master and the NMT slave.

Parameter setting of the NMT master (node 1)

1. Set heartbeat producer time (C13381 / C14381) to 0 ms to deactivate the heartbeat monitoring (node guarding and heartbeat must not be used simultaneously on a CANopen device).
2. Configure controller as NMT master: Set C13352 / C14352 = "1: Master".
3. Set guard time (C13382 / C14382) to 0 ms (slave parameter).
4. Set life time factor (C13383 / C14383) to 0 (slave parameter).
5. Configure monitoring for node guarding in C13386 / C14386.
   - The value to be entered into a free subcode (1 ... 32) is "0x050203E8".
     It consists of the following:

Bit 31 ... bit 24 **Life time factor**	Bit 23 ... bit 16 **Node address of slave**	Bit 15 ... bit 0 **Guard time**
0x05	**0x02**	**1000 [ms] = 0x03E8**

6. Go to C13612/1...32 / C14612/1...32 and set the respective response required for the monitoring functions parameterised under C13386/1...32 / C14386/1...32. This response will be executed if a node guarding event occurs in the NMT master.

Tip!

- C13387 / C14387 displays the activity of each monitoring function parameterised under C13386/1...32 / C14386/1...32 in a bit-coded manner.
- C13388/1...32 / C14388/1...32 display the node guarding status of the monitored NMT slaves.
- C13625 / C14625 serves to set which state change is to occur in the NMT master in the case of a node guarding event.

Parameterise NMT slave (node 2)

1. Adapt the life time factor and guard time settings of the NMT slave to the settings applied to the NMT master under C13386 / C14386:
   – Set guard time (C13382 / C14382) to 1000 ms.
   – Set life time factor (C13383 / C14383) to 5.
2. Go to C13614 / C14614 and set the response to be executed in the NMT slave in the case of a life guarding event.

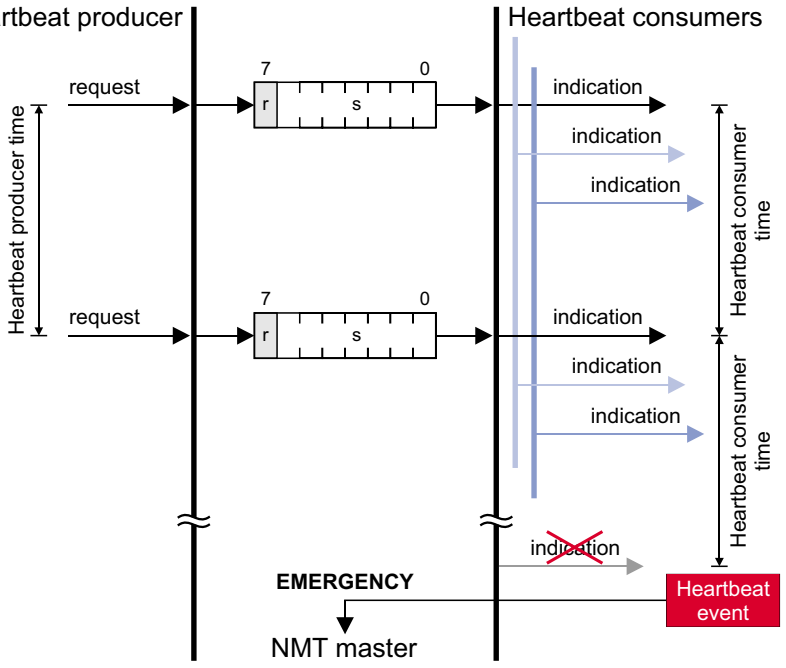
Tip!

C13625 / C14625 serves to set which state change is to occur in the NMT slave in the case of a life guarding event.

Node guarding telegrams

- Remote Transmission Request:
  The RTR telegram from the NMT master has the following identifiers:
  Identifier (COB-ID) = 1792 + node address of slave = 1792 + 2 = 1794 = 0x702
- Remote Transmission Response:
  The response telegram from the NMT slave has the same identifier and the "operational" NMT slave state in the user data (s = 5).

Telegram structure (📖 75)



10.2 Heartbeat protocol

The heartbeat protocol can be used as an alternative to the node guarding protocol for monitoring nodes within a CAN network. Unlike node guarding, this monitoring does not require a polling by means of an RTR telegram (Remote Transmission Request) from the NMT master.

Note!

Heartbeat and node guarding protocols must not be used simultaneously on a CANopen device. If the heartbeat producer time is set > 0 ms, the heartbeat protocol is used.

General procedure

r: reserved (always 0)
s: status of the producer (0: Boot-up, 4: Stopped, 5: Operational, 127: Pre-Operational)

[10-2] Heartbeat protocol

1. A heartbeat producer cyclically sends a heartbeat telegram to one or several heartbeat consumers.
2. One or several consumers monitor the regular arrival of the heartbeat telegram.

10.2.1 Telegram structure

- The heartbeat telegram from the producer has the following identifier:
  Identifier (COB-ID) = 1792 + node address of the producer
- The user data (1 byte) contain the status (s) of the producer:

Heartbeat producer status		Data							
Communication status	Decimal value (s)	(r)	Producer status (s)						
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Boot-up	0	0	0	0	0	0	0	0	0
Stopped	4	0	0	0	0	0	1	0	0
Operational	5	0	0	0	0	0	1	0	1
Pre-operational	127	0	1	1	1	1	1	1	1

10.2.2 Parameter setting

Short overview of the parameters for the "Heartbeat" monitoring function:

Parameter	Information	Lenze setting		Assignment	
		Value	Unit	Consumer	Producer
C13346 / C14346	CAN heartbeat activity	-		●	
C13347 / C14347	CAN heartbeat status	-		●	
C13381 / C14381	CAN heartbeat producer time	0	ms		●
C13385 / C14385	CAN heartbeat consumer time	0x00000000		●	
C13613 / C14613	Resp. to CAN heartbeat error	No response		●	
C13625 / C14625	CAN behaviour in the case of error	Pre-operational state		●	●
Highlighted in grey = display parameter					

Heartbeat producer time

Time interval for the transmission of the heartbeat telegram to one or several consumers.

- Can be parameterised in C13381 / C14381 or via the I-1017 object. The parameterised time is rounded down to an integer multiple of 5 ms.
- The heartbeat telegram is automatically transmitted as soon as a time > 0 ms is set.

Note!

Heartbeat and node guarding protocols must not be used simultaneously on a CANopen device. If the heartbeat producer time is set > 0 ms, the heartbeat protocol is used.

Heartbeat consumer time

Monitoring time for the node (producer) to be monitored.

- Can be parameterised in C13385/1...32 / C14385/1...32 or via the I-1016 object.
- The parameterised time is rounded down to an integer multiple of 5 ms and must have a higher value than the heartbeat producer time of the node to be monitored.
- A consumer can monitor up to 32 producers.

Heartbeat event

The "heartbeat event" is triggered in the consumer if the consumer has not received a heartbeat telegram from the producer within the heartbeat consumer time:

- In the Lenze setting, the consumer changes from the "Operational" communication status into the "Pre-Operational" communication status.
  - C13625 / C14625 or the I-1029 object can be used to set another status change.
- An emergency telegram with the emergency error code 0x8130 is transmitted to the NMT master.
- The response parameterised for the respective producer under C13613/1...32 / C14613/1...32 is executed (Lenze setting: "No response").

Note!

The heartbeat monitoring starts when the first heartbeat telegram of a monitored producer has been successfully received and the "pre-operational" NMT status has been assumed.

The boot-up telegram counts as the first heartbeat telegram!

10.2.3 Commissioning example

Task

A Servo Drive 9400 configured as heartbeat consumer (node 2) is to monitor another Servo Drive 9400 (heartbeat producer; node 1).

- The heartbeat producer is to transmit every 10 seconds a heartbeat telegram to the heartbeat consumer.
- The heartbeat consumer monitors the arrival of the heartbeat telegram. In case of an error, a response is to take place.

Parameter setting of the heartbeat producer (node 1)

1. Set heartbeat producer time (C13381 / C14381) to 10 ms.

Parameter setting of the heartbeat consumer (node 2)

1. Configure heartbeat monitoring in C13385 / C14385.
   - Note: The heartbeat consumer time must be higher than the heartbeat producer time set in C13381 / C14381 for the node to be monitored.
   - The value to be entered into a free subcode (1 ... 32) is "0x0001000F". It consists of the following:

Bit 31 ... bit 24 **Reserved**	Bit 23 ... bit 16 **Node address of the producer**	Bit 15 ... bit 0 **Heartbeat consumer time** (integer multiple of 5 ms)
0x00	**0x01**	**15 [ms] = 0x000F**

2. Go to C13613/1...32 / C14613/1...32 and set the respective response required for the monitoring functions parameterised under C13385/1...32 / C14385/1...32. This response will be executed if a heartbeat event occurs in the consumer.

Tip!

- C13346 / C14346 displays the activity of each monitoring function parameterised under C13385/1...32 / C14385/1...32 in a bit-coded manner.
- C13347/1...32 / C14347/1...32 display the heartbeat state of the monitored nodes.
- C13625 / C14625 serves to set which state change is to occur in the case of a heartbeat event.

Heartbeat telegram

The heartbeat telegram from the producer has the following identifier:

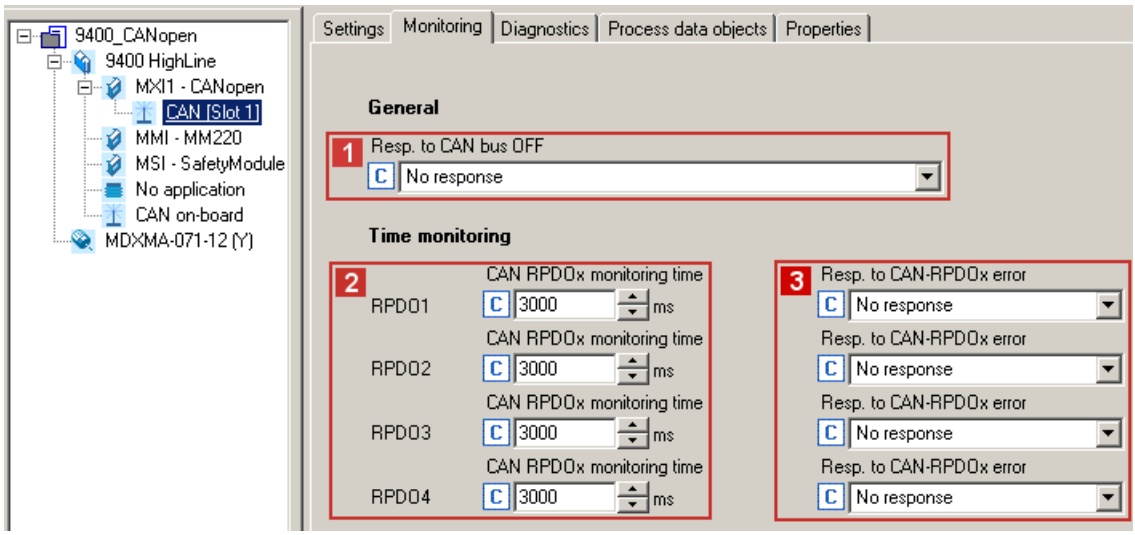
Identifier (COB-ID) = 1792 + producer node address = 1792 + 1 = 1793 = 0x701

10.3 Emergency telegram

If the error status changes due to the occurrence or elimination of an internal device error, an emergency telegram with the following structure is sent once to the NMT master:

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Emergency error code		Error register	Manufacturer-specific error message				
Low byte	High byte	I-1001	0x00 (reserved)	Low word		High word	
				Low byte	High byte	Low byte	High byte
See table below			• With emergency error code "0x1000: Lenze error number" (value displayed in **C00168**) • With all other emergency error codes, the value "0" is entered here.				

Emergency error code	Error register	Cause
0x0000	0xxx	One of several errors eliminated
	0x00	Single error eliminated (no more errors)
0x1000	0x01	Generic error • In the standard device, an error has occurred with the error response "Fault", "Trouble", "Quick stop by trouble", "Warning", "Warning locked" or "System fault". • Error message is the Lenze error number (**C00168**). • For error cause see error description (**C00166**).
0x3100	0x01	Supply voltage of standard device faulty or failed
0x8100	0x11	Communication error (warning)
0x8130	0x11	Life guarding error or heartbeat error
0x8150	0x11	Collision of identifiers (COB-IDs): An identifier parameterised for reception is also used for transmission.
0x8210	0x11	PDO length is shorter than the expected PDO length
0x8220	0x11	PDO length is longer than the expected PDO length
0x8700	0x11	Sync telegram monitoring



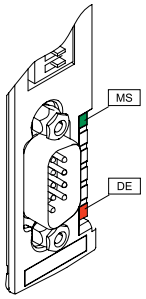
Example

1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte
Emergency error code		Error register	Manufacturer-specific error message				
0x00	0x10	0x01	0x00 (reserved)	0x1B	0x00	0x7B	0x00
Generic error				Lenze error message "0x007B001B: Encoder wire breakage". Corresponding "error-free" message: value "0x00000000"			

Tip!

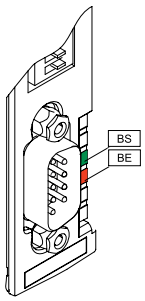
A detailed description can be gathered from the CANopen specification DS301, V4.02.

10.4 Settings in the »Engineer«



Go to the **Monitoring** tab to ...

- ▶ set the 1 response for the CAN node changing to the "bus OFF" state (C13959 / C14595).
- ▶ set the 2 monitoring time for RPDOx (C13357/1...4 / C14357/1...4).
  - – If a different value than "0" is entered, the RPDO is expected after the time set has elapsed.
  - – If the RPDO is not received within the monitoring time, an error response parameterised under 3 C13591/1...4 / C14591/1...4 is initiated.

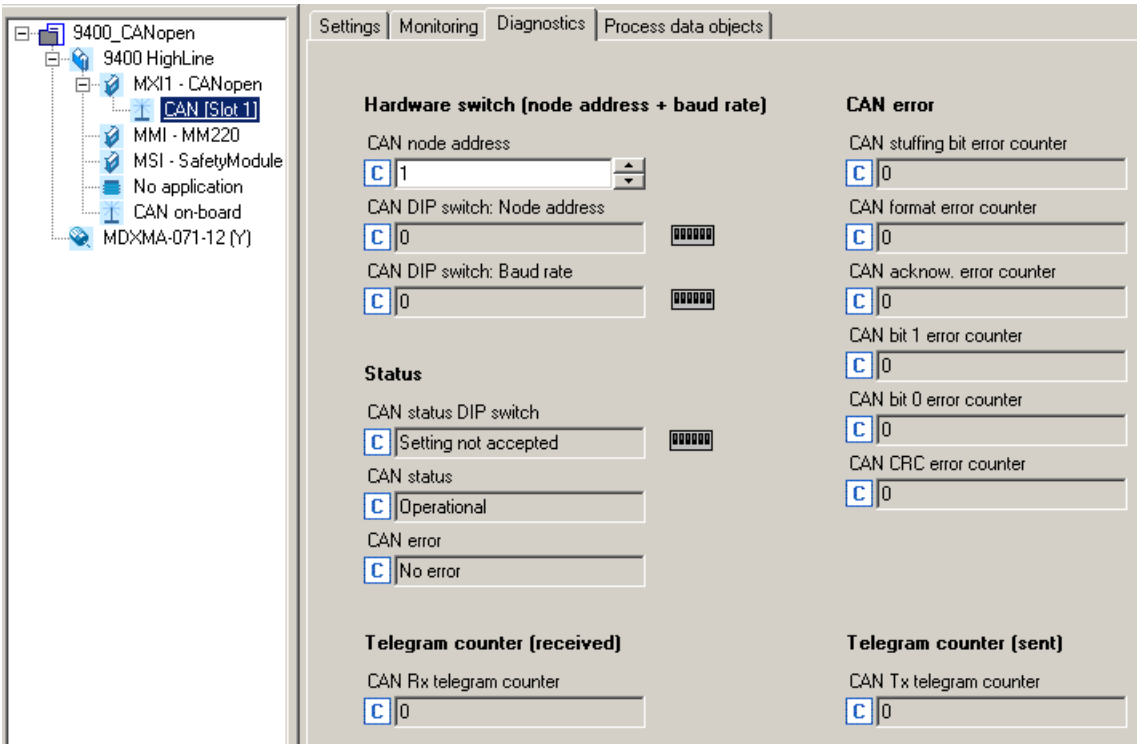


11 Diagnostics

11.1 LED status displays

Status displays MS and DE

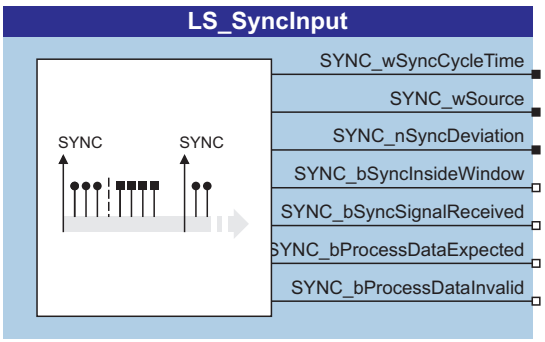
LEDs	Status	Description
 E94YCCA001E	MS (green) on	The communication module is supplied with voltage.
	DE (red) on	The communication module is not accepted by the standard device (see notes in the documentation for the standard device).



Status displays BS and BE (connection status to the system bus (CANopen))

LEDs	Description	
 E94YCCA001D	BS (green)	CANopen status
	BE (red)	CANopen error

LED status display		Meaning	
BS (green)	**BE** (red)	**CANopen status**	**CANopen error**
BE lit only		-	**Bus off**
BS and **BE** flickering		Automatic detection of the baud rate is active.	
BS blinking every 0.2 s | **BE** is off		**Pre-operational**	-
BS blinking every 0.2 s | **BE** blinking once, 1 s off			**Warning limit reached**
BS blinking every 0.2 s | **BE** blinking twice, 1 s off			**Node guard event**
BS lit only		**Operational**	-
BS lit | **BE** blinking once, 1 s off			**Warning limit reached**
BS lit | **BE** blinking twice, 1 s off			**Node guard event**
BS lit | **BE** blinking three times, 1 s off			**Sync message error**
BS blinking every 1 s | **BE** is off		**Stopped**	-
BS blinking every 1 s | **BE** blinking once, 1 s off			**Warning limit reached**
BS blinking every 1 s | **BE** blinking twice, 1 s off			**Node guard event**



11.2 Diagnostics with the »Engineer«

In the »Engineer«, diagnostic information for CAN is provided on the **Diagnostics** tab.

LS_SyncInput system block

In the »FB Editor«, the **LS_SyncInput** system block provides status information for the received sync telegram.

Software manual/»Engineer« online help for Servo Drive 9400

Here you can find detailed information on the **LS_SyncInput** system block.

12 Error messages

This chapter supplements the error list in the software manual and the »Engineer« online help for the Servo Drive 9400 with the error messages of the communication module.

Software manual/»Engineer« online help for Servo Drive 9400

Here you can find general information on diagnostics & fault analysis and on error messages.

12.1 Short overview of the CANopen error messages

The following table lists all error messages of the communication module in the numerical order of the error numbers. In addition, the preset error response and – where available – the parameter for setting the error response are indicated.

Tip!

When you click the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Designation	Response (Lenze setting)	Can be set in
hex	dec			
0x008c0017	9175063	MXI1: CAN module is missing or is incompatible	Fault	-
0x008c0018	9175064	MXI2: CAN module is missing or is incompatible	Fault	-
0x009d0000	10289152	CAN module (MXI1): bus-off	Information	C13595
0x009d0001	10289153	CAN module (MXI1): invalid node address 0	Warning	-
0x009d0002	10289154	CAN module (MXI1): basic configuration invalid	Warning locked	-

12.2 Possible causes and remedies

This chapter includes a list of all error messages of the communication module in numerically ascending order of the error number. Possible causes and remedies as well as responses to error messages are described in detail.

▸ Short overview of the CANopen error messages (📖 89)

MXI1: CAN module is missing or is incompatible [0x008c0017]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The CANopen communication module in module slot MXI1 is incompatible with the application.	Use a communication module supported by the application.

MXI2: CAN module is missing or is incompatible [0x008c0018]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The CANopen communication module in module slot MXI2 is incompatible with the application.	Use a communication module supported by the application.

CAN module (MXI1): bus-off [0x009d0000]

Response (Lenze setting printed in bold)	**Setting:** C13595 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	Remedy
CANopen communication module in MXI1: "bus-off" status • Cable defect (e. g. loose contact) • Too many faulty telegrams received. • Two CAN nodes have the same node address.	• Eliminate fault in the ambience (e. g. EMC). • Eliminate loose contact, tighten adapter. • Assign different node addresses. ▸ Setting the node address (📖 33)

CAN module (MXI1): invalid node address 0 [0x009d0001]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: initialisation error • The hardware allocation of the node address was selected via DIP switches and the DIP switches of the node address are all set to "0". • Instead of the impermissible node address 0, node address 1 is used.	• Set a different node address than "0" and carry out mains switching. ▸ Setting the node address (📖 33)

CAN module (MXI1): basic configuration invalid [0x009d0002]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: configuration error • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI1): heartbeat error index 1 ... 32 [0x009e0000 ... 0x009e001f]

Response (Lenze setting printed in bold)	**Setting:** C13613/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: cyclic node monitoring • The CAN node has not received a heartbeat telegram from node 1 ... 32 within the time defined.	• Reactivate CAN node by mains switching, restart of the controller (C00002 = 11000) or "Reset node" (C00002 = 92). • Parameterise heartbeat producer monitoring time again or switch off monitoring. • Reset possibly active error status. **Tip:** Before switching the mains and restarting the controller, save the current parameter set (C00002 = 11). ▸ Heartbeat protocol (📖 80)

CAN module (MXI1): life guarding error [0x009e0020]

Response (Lenze setting printed in bold)	**Setting:** C13614 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: cyclic node monitoring • Slave response: The maximum time between two node guarding telegrams (RTR) from the master has been exceeded.	Parameterise life guarding monitoring time again or switch it off. ▸ Node guarding protocol (📖 74)

CAN module (MXI1): NMT slave configuration faulty [0x009e0021]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: on the CAN slave a configuration error has occurred in the network management. • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project. • Node guarding or heartbeat parameterised incorrectly.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI1): emergency configuration faulty [0x009f0000]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: CAN emergency configuration is faulty. • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI1): node guarding error 1 ... 32 [0x00a00000 ... 0x00a0001f]

Response (Lenze setting printed in bold)	**Setting:** C13612/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: cyclic node monitoring • The CAN master has not received a response to a node guarding telegram (RTR) by the node 1 ... 32 within the time defined.	• Reactivate CAN node by mains switching, restart of the controller (C00002 = 11000) or "Reset node" (C00002 = 92). • Parameterise node guarding monitoring time again or switch off the monitoring. • Reset possibly active error status. **Tip:** Before switching the mains and restarting the controller, save the current parameter set (C00002 = 11). ▸ Node guarding protocol (📖 74)

CAN module (MXI1): NMT master configuration faulty [0x00a00020]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: on the CAN master a configuration error has occurred in the network management. • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project. • Node guarding or heartbeat parameterised incorrectly.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI1) RPDO1: telegram not received or faulty [0x00a10000]

Response (Lenze setting printed in bold)	**Setting:** C13591/1 / C14591/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: CAN-IN1 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO2: telegram not received or faulty [0x00a10001]

Response (Lenze setting printed in bold) **Setting:** C13591/2 / C14591/2 (☑ Adjustable response)

☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information

Cause	Remedy
CANopen communication module in MXI1: CAN-IN2 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO3: telegram not received or faulty [0x00a10002]

Response (Lenze setting printed in bold) **Setting:** C13591/3 / C14591/3 (☑ Adjustable response)

☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information

Cause	Remedy
CANopen communication module in MXI1: CAN-IN3 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO4: telegram not received or faulty [0x00a10003]

Response (Lenze setting printed in bold) **Setting:** C13591/4 / C14591/4 (☑ Adjustable response)

☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information

Cause	Remedy
CANopen communication module in MXI1: CAN-IN4 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO5: telegram not received or faulty [0x00a10004]

Response (Lenze setting printed in bold) **Setting:** C13591/5 / C14591/5 (☑ Adjustable response)

☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information

Cause	Remedy
CANopen communication module in MXI1: CAN-IN5 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO6: telegram not received or faulty [0x00a10005]

Response (Lenze setting printed in bold) **Setting:** C13591/6 / C14591/6 (☑ Adjustable response)

☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information

Cause	Remedy
CANopen communication module in MXI1: CAN-IN6 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO7: telegram not received or faulty [0x00a10006]

Response (Lenze setting printed in bold)	**Setting:** C13591/7 / C14591/7 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: CAN-IN7 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) RPDO8: telegram not received or faulty [0x00a10007]

Response (Lenze setting printed in bold)	**Setting:** C13591/8 / C14591/8 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI1: CAN-IN8 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI1) PDO manager: configuration faulty [0x00a10008]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: CAN-PDO configuration error • Erroneous project download. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project. • Mapping variables have incorrect CANopen indexes according to DS405.	• Repeat download. • Correct CAN settings in the project and have project regenerated.

CAN module (MXI1) SDO server: configuration faulty [0x00a20000]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: a configuration error has occurred in the CAN-SDO server. • Erroneous project download. • Invalid SDO server settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download. • Correct CAN settings in the project and have project regenerated.

CAN module (MXI1) SDO client: configuration faulty [0x00a30000]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI1: a configuration error has occurred in the CAN-SDO client. • Erroneous project download. • Invalid SDO client settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2): bus-off [0x00ac0000]

Response (Lenze setting printed in bold)	**Setting:** C14595 (☑ Adjustable response)
☑ None ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☒ **Information**	

Cause	Remedy
CANopen communication module in MXI2: "bus-off" status • Cable defect (e. g. loose contact) • Too many faulty telegrams received. • Two CAN nodes have the same node address.	• Eliminate fault in the ambience (e. g. EMC). • Eliminate loose contact, tighten adapter. • Assign different node addresses. ▸ Setting the node address (📖 33)

CAN module (MXI2): invalid node address 0 [0x00ac0001]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: initialisation error • The hardware allocation of the node address was selected via DIP switches and the DIP switches of the node address are all set to "0". • Instead of the impermissible node address 0, node address 1 is used.	• Set a different node address than "0" and carry out mains switching. ▸ Setting the node address (📖 33)

CAN module (MXI2): basic configuration invalid [0x00ac0002]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: configuration error • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2): heartbeat error index 1 ... 32 [0x00ad0000 ... 0x00ad001f]

Response (Lenze setting printed in bold)	**Setting:** C14613/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: cyclic node monitoring • The CAN node has not received a heartbeat telegram from node 1 ... 32 within the time defined.	• Reactivate CAN node by mains switching, restart of the controller (C00002 = 11000) or "Reset node" (C00002 = 92). • Parameterise heartbeat producer monitoring time again or switch off monitoring. • Reset possibly active error status. **Tip:** Before switching the mains and restarting the controller, save the current parameter set (C00002 = 11). ▸ Heartbeat protocol (📖 80)

CAN module (MXI2): life guarding error [0x00ad0020]

Response (Lenze setting printed in bold)	**Setting:** C14614 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: cyclic node monitoring • Slave response: The maximum time between two node guarding telegrams (RTR) from the master has been exceeded.	Parameterise life guarding monitoring time again or switch it off. ▸ Node guarding protocol (📖 74)

CAN module (MXI2): NMT slave configuration faulty [0x00ad0021]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: on the CAN slave a configuration error has occurred in the network management. • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project. • Node guarding or heartbeat parameterised incorrectly.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2): emergency configuration faulty [0x00ae0000]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN emergency configuration is faulty. • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2): node guarding error 1 ... 32 [0x00af0000 ... 0x00af001f]

Response (Lenze setting printed in bold)	**Setting:** C14612/1...32 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: cyclic node monitoring • The CAN master has not received a response to a node guarding telegram (RTR) by the node 1 ... 32 within the time defined.	• Reactivate CAN node by mains switching, restart of the controller (C00002 = 11000) or "Reset node" (C00002 = 92). • Parameterise node guarding monitoring time again or switch off the monitoring. • Reset possibly active error status. **Tip:** Before switching the mains and restarting the controller, save the current parameter set (C00002 = 11). ▸ Node guarding protocol (📖 74)

CAN module (MXI2): NMT master configuration faulty [0x00af0020]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: on the CAN master a configuration error has occurred in the network management. • Faulty download of an »Engineer« or »PLC Designer« project. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project. • Node guarding or heartbeat parameterised incorrectly.	• Repeat download • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2) RPDO1: telegram not received or faulty [0x00b00000]

Response (Lenze setting printed in bold)	**Setting:** C14591/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN1 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO2: telegram not received or faulty [0x00b00001]

Response (Lenze setting printed in bold)	**Setting:** C14591/2 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN2 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO3: telegram not received or faulty [0x00b00002]

Response (Lenze setting printed in bold)	Setting: C14591/3 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN3 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO4: telegram not received or faulty [0x00b00003]

Response (Lenze setting printed in bold)	Setting: C14591/4 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN4 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO5: telegram not received or faulty [0x00b00004]

Response (Lenze setting printed in bold)	Setting: C14591/5 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN5 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO6: telegram not received or faulty [0x00b00005]

Response (Lenze setting printed in bold)	Setting: C14591/6 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN6 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO7: telegram not received or faulty [0x00b00006]

Response (Lenze setting printed in bold)	Setting: C14591/7 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN7 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) RPDO8: telegram not received or faulty [0x00b00007]

Response (Lenze setting printed in bold)	**Setting:** C14591/8 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☑ Warning ☑ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-IN8 error • PDO telegram length incorrect. • Error during transmission. • PDO time monitoring has been triggered.	• Set correct telegram length for the CAN master (transmitter). • Eliminate fault in the ambience (e. g. EMC). • Set different time monitoring or switch off time monitoring.

CAN module (MXI2) PDO manager: configuration faulty [0x00b00008]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: CAN-PDO configuration error • Erroneous project download. • Invalid CAN settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project. • Mapping variables have incorrect CANopen indexes according to DS405.	• Repeat download. • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2) SDO server: configuration faulty [0x00b10000]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: a configuration error has occurred in the CAN-SDO server. • Erroneous project download. • Invalid SDO server settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download. • Correct CAN settings in the project and have project regenerated.

CAN module (MXI2) SDO client: configuration faulty [0x00b20000]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
CANopen communication module in MXI2: a configuration error has occurred in the CAN-SDO client. • Erroneous project download. • Invalid SDO client settings according to DS301, V4.02 carried out in the »Engineer« or »PLC Designer« project.	• Repeat download • Correct CAN settings in the project and have project regenerated.

13 Parameter reference

This chapter supplements the parameter list and the table of attributes in the software manual and the »Engineer« online help for the Servo Drive 9400 by the parameters of the E94AYCCA communication module (CANopen).

Software manual/»Engineer« online help for Servo Drive 9400

Here you will find general information about parameters.

13.1 Communication-relevant parameters of the standard device

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00369

Parameter | Name:
C00369 | CAN sync transmission cycle time

Data type: UNSIGNED_16
Index: $11206_d = 2BC6_h$

Cycle within which the sync master is to send sync telegrams.
- With "0 ms" (Lenze setting), no sync telegrams are created.
- Mapping of the CANopen object I-1006 (see DS301, V4.02).

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)		
0	ms	65535

Subcodes	Lenze setting	Information
C00369/1	0 ms	Transmission cycle time for CAN on board
C00369/2	0 ms	Transmission cycle time for CAN module in MXI1/MXI2
C00369/3	0 ms	No function

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00615

Parameter | Name:
C00615 | Resp. to imp. device config.

Data type: UNSIGNED_32
Index: $23960_d = 5D98_h$

Selection of response to impermissible device configuration

Selection list	
1	Fault
3	Quick stop by trouble
4	Warning locked
6	Information
0	No response

Subcodes	Lenze setting	Information
C00615/1	0: No response	Reserved
C00615/2	1: Fault	Resp. to imperm. module in MXI1
C00615/3	1: Fault	Resp. to imperm. module in MXI2
C00615/4	0: No response	Reserved
C00615/5	0: No response	Reserved

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00636

Parameter | Name:
C00636 | Resp. to new module in MXI1

Data type: UNSIGNED_32
Index: $23939_d = 5D83_h$

Selection of the response to a new extension module being inserted into module slot MXI1.

Selection list (Lenze setting printed in bold)	
1	Fault
6	Information
5	Warning
4	**Warning locked**
3	Quick stop by trouble
0	No response

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C00637

Parameter | Name:
C00637 | Resp. to new module in MXI2

Data type: UNSIGNED_32
Index: $23939_d = 5D83_h$

Selection of the response to a new extension module being inserted into module slot MXI2.

Selection list (Lenze setting printed in bold)	
1	Fault
6	Information
5	Warning
4	**Warning locked**
3	Quick stop by trouble
0	No response

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C01120

Parameter | Name:
C01120 | Sync source

Data type: UNSIGNED_8
Index: $23455_d = 5B9F_h$

Selection of the source for the synchronisation signals.
- The drive can only be synchronised by one source.

Note:
Select "2: CAN module" for the CANopen communication module (E94AYCCA).
▸ Synchronisation of PDOs via sync telegram (📖 50)

Selection list (Lenze setting printed in bold)	
0	**Off**
1	CAN on board
2	CAN module
4	Module in MXI1
5	Module in MXI2
6	Digital input 1
7	Digital input 2
8	Digital input 3
9	Digital input 4
10	Digital input 5
11	Digital input 6
12	Digital input 7
13	Digital input 8

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C01121

Parameter | Name:
C01121 | Sync cycle time

Data type: UNSIGNED_32
Index: $23454_d = 5B9E_h$

Time interval at which the phase control loop (PLL) in the controller expects the synchronisation signals.
- The time interval set must correspond to the cycle of the synchronisation source.

Note:
For synchronisation via the system bus (CANopen), only integer multiples of 1000 µs should be set.
Example: For the system bus, the interval between two synchronisation signals is set to 2 ms. If the system bus is to be used as the synchronisation source, a synchronisation cycle of 2000 µs must be set in C01121.
▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
250	µs	20000	**1000 µs**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C01122

Parameter | Name:
C01122 | Sync phase position

Data type: UNSIGNED_32
Index: $23453_d = 5B9D_h$

The phase position defines the zero point of time for the application relating to the synchronisation signal (bus cycle). Since PDO processing is integrated in the system part of the application, the instant of the PDO acceptance also changes if the phase position is changed.

- If 0 is set, the application is started together with the synchronisation signal.
- If a value > 0 is set, the application starts by the set time interval before the synchronisation signal arrives (the phase position acts negatively).

Example:
If the phase position is set to 400 µs, the system part of the application starts 400 µs before the synchronisation signal arrives.

From software version V3.0:
The effect of the sync phase position can be influenced by the application cycle set in C01130. For the Lenze setting of C01130, the behaviour remains as before.

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
0	µs	64000	**400 µs**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C01123

Parameter | Name:
C01123 | Sync tolerance

Data type: UNSIGNED_32
Index: $23452_d = 5B9C_h$

Time slot for monitoring the synchronisation signal via the **LS_SyncInput** system block

- If the last synchronisation signal has been within this time slot around the expected value, the *SYNC_bSyncInsideWindow* output of the **LS_SyncInput** system block is set to TRUE.
- This setting does not affect the synchronisation process.

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
0	µs	1000	**0 µs**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C01124

Parameter | Name:
C01124 | Sync-PLL increment

Data type: UNSIGNED_8
Index: $23451_d = 5B9B_h$

When the cycle times of the synchronisation signal and the phase control loop (PLL) differ, this setting defines the increment to be used to readjust the phase control loop.

- If the system bus (CANopen) is used as synchronisation source, the recommended time increment for deviations is 109 ns.

▸ Synchronisation of PDOs via sync telegram (📖 50)

Selection list (Lenze setting printed in bold)	
1	7 ns
2	15 ns
3	23 ns
4	31 ns
5	39 ns
6	46 ns
7	54 ns
8	62 ns
9	70 ns
10	78 ns
11	85 ns
12	93 ns
13	101 ns
14	**109 ns**
15	117 ns
16	125 ns
17	132 ns
18	140 ns
19	148 ns
20	156 ns
21	164 ns
22	171 ns
23	179 ns
24	187 ns
25	195 ns
26	203 ns
27	210 ns

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C01130

Parameter | Name:
C01130 | CAN SYNC application cycle

Data type: UNSIGNED_16
Index: $23445_d = 5B95_h$

From software version V3.0

This parameter influences the effect of the sync phase position (C01122) with regard to the instant of acceptance of the synchronous PDOs by the application or the instant of transmission of the synchronous PDOs to the system bus (CANopen).

- The resulting PDO delay can be calculated with the following formula, taking an internal processing time of 150 µs into consideration: PDO delay = (C01121 - C01122 + 150 µs) modulo C01130
- For the Lenze setting, the behaviour remains as before; the sync phase position (C01122) is always calculated "modulo 1000".
- The set value is automatically rounded down to multiples of 1000 µs.

▸ Effect of C01130 on the sync phase position (📖 54)

Note: Setting the application cycle to a higher value than the sync cycle time (C01121) results in an undefined response. The same applies if the value set for the sync phase position (C01122) is higher than the sync cycle time (C01121). In this case, the drive usually cannot send synchronous PDOs on the system bus anymore.

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
1000	µs	65000	**1000 µs**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer | Scaling factor: 1

Note!

The standard device codes **C01501** and **C01502** are not effective when using the CANopen communication module.

13.2 Parameters of the communication module for slot MXI1

In this chapter, the parameters of the E94AYCCA communication module (CANopen) for slot MXI1 of the Servo Drive 9400 are listed in numerically ascending order.

C13311

Parameter | Name:
C13311 | CAN TPDO1 mask byte x

Data type: BITFIELD_8
Index: $11264_d = 2C00_h$

For each byte of the TPDO1 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C13311/1	0x00	Mask for byte 1 ... byte 8 of TPDO1
...		
C13311/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13312

Parameter | Name:
C13312 | CAN TPDO2 mask byte x

Data type: BITFIELD_8
Index: $11263_d = 2BFF_h$

For each byte of the TPDO2 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C13312/1	0x00	Mask for byte 1 ... byte 8 of TPDO2
...		
C13312/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13313

Parameter | Name:
C13313 | CAN TPDO3 mask byte x

Data type: BITFIELD_8
Index: $11262_d = 2BFE_h$

For each byte of the TPDO3 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

▸ Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C13313/1	0x00	Mask for byte 1 ... byte 8 of TPDO3
...		
C13313/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13314

Parameter | Name:
C13314 | CAN TPDO4 mask byte x

Data type: BITFIELD_8
Index: $11261_d = 2BFD_h$

For each byte of the TPDO4 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

▸ Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C13314/1	0x00	Mask for byte 1 ... byte 8 of TPDO4
...		
C13314/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13320

Parameter | Name:
C13320 | CAN TPDOx identifier

Data type: BITFIELD_32
Index: $11255_d = 2BF7_h$

Identifier for TPDO1 ... TPDO4
- If bit 31 is set (0x8nnnnnnn), the TPDO is deactivated.
- The basic setting is according to the "Predefined Connection Set".
- Mapping of the CANopen objects I-1800/1 ... I-1803/1 (see DS301, V4.02).

▸ Identifiers of the process data objects (📖 46)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: PDO invalid
...	...	
Bit 31	PDO invalid	

Subcodes	Lenze setting	Information
C13320/1	0x00000181	Identifier TPDO1 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x180 + node address is set by default.
C13320/2	0x00000281	Identifier TPDO2 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x280 + node address is set by default.
C13320/3	0x00000381	Identifier TPDO3 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x380 + node address is set by default.
C13320/4	0x00000481	Identifier TPDO4 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x480 + node address is set by default.

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13321

Parameter | Name:
C13321 | CAN RPDOx identifier

Data type: BITFIELD_32
Index: $11254_d = 2BF6_h$

Identifier for RPDO1 ... RPDO4
- If bit 31 is set (0x8nnnnnnn), the RPDO is deactivated.
- The basic setting is according to the "Predefined Connection Set".
- Mapping of the CANopen objects I-1400/1 ... I-1403/1 (see DS301, V4.02).

▸ Identifiers of the process data objects (📖 46)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: PDO invalid
...	...	
Bit 31	PDO invalid	

Subcodes	Lenze setting	Information
C13321/1	0x00000201	Identifier RPDO1 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x200 + node address is set by default.
C13321/2	0x00000301	Identifier RPDO2 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x300 + node address is set by default.
C13321/3	0x00000401	Identifier RPDO3 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x400 + node address is set by default.
C13321/4	0x00000501	Identifier RPDO4 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x500 + node address is set by default.

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13322

Parameter | Name:
C13322 | CAN TPDOx Tx mode

Data type: UNSIGNED_8
Index: $11253_d = 2BF5_h$

TPDO transmission type according to DS301, V4.02
- The types 0 (acyclic sync), 1-240 (cyclic sync), 254 (event-controlled manufacturer-specific), 255 (event-controlled device-profile-specific) are supported.
- The basic setting for all PDOs is the event-controlled setting "254".
- Mapping of the CANopen objects I-1800/2 ... I-1803/2 (see DS301, V4.02).

▸ Transmission type (📖 47)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Information
C13322/1	254	Transmission mode for TPDO1 ... TPDO4
...		
C13322/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13323

Parameter | Name:
C13323 | CAN RPDOx Rx mode

Data type: UNSIGNED_8
Index: $11252_d = 2BF4_h$

RPDO transmission type according to DS301, V4.02
- For the RPDO serves as monitoring setting in the case of sync-controlled PDOs.
- The types 0 (acyclic sync), 1-240 (cyclic sync), 254 (event-controlled manufacturer-specific), 255 (event-controlled device-profile-specific) are supported.
- The basic setting for all PDOs is the event-controlled setting "254".
- Mapping of the CANopen objects I-1400/2 ... I-1403/2 (see DS301, V4.02).

▸ Transmission type (📖 47)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Information
C13323/1	254	Transmission mode for RPDO1 ... RPDO4
...		
C13323/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13324

Parameter | Name:
C13324 | CAN TPDOx delay time

Data type: UNSIGNED_16
Index: $11251_d = 2BF3_h$

TPDO inhibit time according to DS301, V4.02
- Minimum time between the transmission of two identical TPDOs.
- The time is entered in 1/10 ms and automatically rounded to full milliseconds by the code.
- Mapping of the CANopen objects I-1800/3 ... I-1803/3 (see DS301, V4.02).

Setting range (min. value | unit | max. value)		
0	1/10 ms	65535

Subcodes	Lenze setting	Information
C13324/1	0 1/10 ms	Delay time for TPDO1 ... TPDO4
...		
C13324/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13343

Parameter | Name:
C13343 | CAN TPDO counter

Data type: UNSIGNED_32
Index: $11232_d = 2BE0_h$

Counter for TPDO1 ... TPDO4

Display range (min. value | unit | max. value)		
0		4294967295

Subcodes	Information
C13343/1	
...	
C13343/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13344

Parameter | Name: **C13344 | CAN RPDO counter**			Data type: UNSIGNED_32 Index: $11231_d = 2BDF_h$
Counter for RPDO1 ... RPDO4			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Information**
C13344/1			
...			
C13344/4			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C13345

Parameter | Name: **C13345 | CAN error**		Data type: UNSIGNED_8 Index: $11230_d = 2BDE_h$
Display of the active CAN network error		
Selection list (read only)		
0	No error	
1	Guard Event	
2	Warning	
3	Bus off	
4	Sync telegram error	
6	CAN controller overflow	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C13346

Parameter | Name: **C13346 | CAN heartbeat activity**			Data type: BITFIELD_32 Index: $11229_d = 2BDD_h$
▸ Heartbeat protocol (📖 80)			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			
Bit 0	Heartbeat node 1		
...	...		
Bit 31	Heartbeat node 32		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C13347

Parameter | Name:
C13347 | CAN heartbeat status

Data type: UNSIGNED_8
Index: $11228_d = 2BDC_h$

Status of node 1 ... 32
▸ Heartbeat protocol (📖 80)

Selection list (read only)	
0	Unknown
4	Stopped
5	Operational
127	Pre-operational

Subcodes	Information
C13347/1	
...	
C13347/32	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C13348

Parameter | Name:
C13348 | CAN status DIP switch

Data type: UNSIGNED_8
Index: $11227_d = 2BDB_h$

- The value "1" means that the CAN DIP switches have been recognised during power-on and a valid baud rate and node address have been set.
- The value "0" means that either no CAN DIP switch or no valid setting has been recognised or that the setting has been overwritten by code C13350 or C13351.

Selection list (read only)		Information
0	Setting not accepted	
1	Setting accepted	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C13349

Parameter | Name:
C13349 | CAN setting of DIP switch

Data type: UNSIGNED_8
Index: $11226_d = 2BDA_h$

CAN DIP switch setting during last power-on
▸ Possible settings via DIP switches (📖 33)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Information
C13349/1	Node address
C13349/2	Baud rate: 0: 500 kbps 1: 250 kbps 2: 125 kbps 3: 50 kbps 4: 1 Mbps 5: 20 kbps 6: 10 kbit/s 14: 800 kbps 255: Automatic detection

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C13350

Parameter | Name:
C13350 | CAN node address

Data type: UNSIGNED_8
Index: $11225_d = 2BD9_h$

- A change in the node address is only effective after a "Reset node" (C00002 = 92).
- The basic server channel RX/TX is automatically provided by the node address (C13372 and C13373; both subcode 1).

▸ Setting the node address (📖 33)

Setting range (min. value | unit | max. value)			Lenze setting
1		127	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13351

Parameter | Name:
C13351 | CAN baud rate

Data type: UNSIGNED_8
Index: $11224_d = 2BD8_h$

A change in the baud rate is only effective after a "Reset node" (C00002 = 92).

▸ Setting the baud rate (📖 34)

Selection list (Lenze setting printed in bold)	
0	**500 kbps**
1	250 kbps
2	125 kbps
3	50 kbps
4	1 Mbps
5	20 kbps
6	10 kbps
8	Reserved
9	Reserved
10	Reserved
11	Reserved
12	Reserved
13	Reserved
14	800 kbps
15	Reserved
255	Automatic detection

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13352

Parameter | Name:
C13352 | CAN slave/master

Data type: UNSIGNED_8
Index: $11223_d = 2BD7_h$

If "1" is entered and saved, the drive will start as a CAN master after mains switching.

Selection list (Lenze setting printed in bold)	
0	**Slave**
1	Master

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13356

Parameter | Name:
C13356 | CAN TPDOx cycle time

Data type: UNSIGNED_16
Index: $11219_d = 2BD3_h$

TPDO event time according to DS301, V4.02

- If a different value than "0" is entered, the TPDO is transmitted without further consideration of the transport type after the time set has elapsed.
- Mapping of the CANopen objects I-1800/5 ... I-1803/5 (see DS301, 4.02).

Setting range (min. value | unit | max. value)		
0	ms	65535

Subcodes	Lenze setting	Information
C13356/1	0 ms	Cycle time for TPDO1 ... TPDO4
...		
C13356/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13357

Parameter | Name:
C13357 | CAN RPDOx monitoring time

Data type: UNSIGNED_16
Index: $11218_d = 2BD2_h$

Mapping of the RPDO event time (see DS301, V4.02)

- If a different value than "0" is entered, the RPDO is expected after the time set has elapsed.
- If the RPDO is not received within the expected time, an error message parameterisable under C13591/1...4 can be triggered.

Setting range (min. value | unit | max. value)		
0	ms	65535

Subcodes	Lenze setting	Information
C13357/1	3000 ms	Monitoring time for RPDO1 ... RPDO4
...		
C13357/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13359

Parameter | Name:
C13359 | CAN status

Data type: UNSIGNED_8
Index: $11216_d = 2BD0_h$

Display of the current CAN network status

Selection list (read only)	
0	Operational
1	Pre-operational
4	Boot-up
5	Stopped
7	Reset
8	Initialisation
9	Unknown
10	Baud rate autom. detected

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13360

Parameter | Name:
C13360 | CAN telegram and error counter

Data type: UNSIGNED_16
Index: $11215_d = 2BCF_h$

- After mains connection, all counters start with "0".
- After the maximum value has been reached, it is started with "0" again.

Display range (min. value | unit | max. value)		
0		65535

Subcodes	Information
C13360/1	Stuffing bit error counter • More than five identical bits have been detected.
C13360/2	Format error counter • CAN frame has not been observed.
C13360/3	Acknowledge error counter • No node has confirmed the telegram.
C13360/4	Bit1 error counter • "1" should be sent after bus arbitration, but "0" was read.
C13360/5	Bit0 error counter • "0" should be sent after bus arbitration, but "1" was read.
C13360/6	CRC error counter • Checksum check has indicated an error.
C13360/7	Tx telegram counter • Telegrams received without errors.
C13360/8	Rx telegram counter • Telegrams sent without errors.

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13361

Parameter | Name:
C13361 | CAN bus load

Data type: UNSIGNED_32
Index: $11214_d = 2BCE_h$

The display of the node peak load (subcodes 4 ... 6) can be reset by mains switching or via a "Reset node" command (C00002 = 92).

Display range (min. value | unit | max. value)		
0	%	100

Subcodes	Information
C13361/1	Current node load in Tx direction
C13361/2	Current node load in Rx direction
C13361/3	Current node load by faulty telegrams
C13361/4	Node peak load in Tx direction
C13361/5	Node peak load in Rx direction
C13361/6	Node peak load by faulty telegrams

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13367

Parameter | Name:
C13367 | CAN sync Rx identifier

Data type: UNSIGNED_32
Index: $11208_d = 2BC8_h$

Identifier with which the sync slave is to receive sync telegrams.
- Mapping of the CANopen object I-1005 (see DS301, V4.02).

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
0		2047	**128**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C13368

Parameter | Name:
C13368 | CAN sync Tx identifier

Data type: UNSIGNED_32
Index: $11207_d = 2BC7_h$

Identifier with which the sync master is to send sync telegrams.
- Mapping of the CANopen object I-1005 (see DS301, V4.02).

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
0		2047	**128**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C13372

Parameter | Name:
C13372 | CAN SDO server Rx identifier

Data type: BITFIELD_32
Index: $11203_d = 2BC3_h$

Identifier with which the corresponding SDO server can be reached.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO server is deactivated.
- Mapping of the CANopen objects I-1200/1 ... I-1209/1 (see DS301, V4.02).

▸ Identifiers of the parameter data objects (📖 62)

Setting range			
0x00000000		0xFFFFFFFF	

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C13372/1	0x00000601	SDO server channel 1 RX • Subcode 1 contains the basic SDO channel. According to DS301, V4.02 it can neither be changed nor deactivated. Writing this subcode has no effect. • The value in subcode 1 results from the node address (C13350) + 0x600.
C13372/2	0x80000000	SDO server channel 2 RX
...	...	...
C13372/10	0x80000000	SDO server channel 10 RX

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C13373

Parameter | Name:
C13373 | CAN SDO server Tx identifier

Data type: BITFIELD_32
Index: $11202_d = 2BC2_h$

Identifier with which the corresponding SDO server can carry out transmissions.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO server is deactivated.
- Mapping of the CANopen objects I-1200/2 ... I-1209/2 (see DS301, V4.02).

▸ Identifiers of the parameter data objects (📖 62)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C13373/1	0x00000581	SDO server channel 1 TX • Subcode 1 contains the basic SDO channel. According to DS301, V4.02 it can neither be changed nor deactivated. Writing this subcode has no effect. • The value in subcode 1 results from the node address (C13350) + 0x580.
C13373/2	0x80000000	SDO server channel 2 TX
...	...	...
C13373/10	0x80000000	SDO server channel 10 TX

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13374

Parameter | Name:
C13374 | CAN SDO client node address

Data type: UNSIGNED_8
Index: $11201_d = 2BC1_h$

Node address of the client assigned to this server (see DS301, V4.02).

Setting range (min. value | unit | max. value)		
1		127

Subcodes	Lenze setting	Information
C13374/1	1	SDO server channel 1 remote client node address • Subcode 1 contains the basic SDO channel. According to DS301, V4.02 it does not have this entry. Writing this subcode has no effect. • The value of subindex 1 is 0.
C13374/2	1	SDO server channel 2 remote client node address
...	...	...
C13374/10	1	SDO server channel 10 remote client node address

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13375

Parameter | Name:
C13375 | CAN SDO client Rx identifier

Data type: BITFIELD_32
Index: $11200_d = 2BC0_h$

Identifier with which the corresponding SDO client can be reached.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO client channel is deactivated (see DS301, V4.02).
- The client channels need not be parameterised right now. Their functionality will only be required when using the gateway services.

▸ Identifiers of the parameter data objects (📖 62)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C13375/1	0x80000000	SDO client channel 1 RX ... 10 RX
...		
C13375/10		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13376

Parameter | Name:
C13376 | CAN SDO client Tx identifier

Data type: BITFIELD_32
Index: $11199_d = 2BBF_h$

Identifier with which the corresponding SDO client can carry out transmissions.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO client channel is deactivated (see DS301, V4.02).
- The client channels need not be parameterised right now. Their functionality will only be required when using the gateway services.

▸ Identifiers of the parameter data objects (📖 62)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C13376/1	0x80000000	SDO client channel 1 TX ... 10 TX
...		
C13376/10		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13377

Parameter | Name:
C13377 | CAN SDO server node address

Data type: UNSIGNED_8
Index: $11198_d = 2BBE_h$

Node address of the server with which this client communicates via the client channel selected.
- An activation of the client functionality is not required.
- An entry is required so that the CAN-SDO client channel can be activated (see DS301, V4.02).

Setting range (min. value | unit | max. value)		
1		127

Subcodes	Lenze setting	Information
C13377/1	1	Remote server node address for SDO client channel 1 ... 10
...		
C13377/10		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13378

Parameter | Name:
C13378 | CAN delay boot-up - Operational

Data type: UNSIGNED_16
Index: $11197_d = 2BBD_h$

Time that has to elapse after mains switching before the CAN NMT master transmits the "Start remote node" telegram on the bus.
- This time is only used after mains switching if the master bit is activated (C13352).

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**3000 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13381

Parameter | Name:
C13381 | CAN Heartbeat Producer Time

Data type: UNSIGNED_16
Index: $11194_d = 2BBA_h$

Time interval for the transmission of the heartbeat telegram to one or several consumers.
- The parameterised time is rounded down to an integer multiple of 5 ms.
- The heartbeat telegram is transmitted automatically as soon as a time > 0 ms is set. The monitoring function "Node Guarding" is deactivated in this case.
- Mapping of the CANopen object I-1017 (see DS301, V4.02).

▸ Heartbeat protocol (📖 80)

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13382

Parameter | Name:
C13382 | CAN Guard Time

Data type: UNSIGNED_16
Index: $11193_d = 2BB9_h$

- After the guard time (set here) multiplied with the life time factor (C13383), a node guarding telegram must have arrived.
- Mapping of the CANopen object I-100C (see DS301, V4.02).

▸ Node guarding protocol (📖 74)

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13383

Parameter | Name:
C13383 | CAN Life Time Factor

Data type: UNSIGNED_8
Index: $11192_d = 2BB8_h$

- The life time factor multiplied with the guard time (C13382) is the time within which a node guarding telegram must have arrived.
- Mapping of the CANopen object I-100D (see DS301, V4.02).

▸ Node guarding protocol (📖 74)

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13385

Parameter | Name:
C13385 | CAN Heartbeat Consumer Time

Data type: BITFIELD_32
Index: $11190_d = 2BB6_h$

The 32 subcodes represent the nodes which are to be monitored via heartbeat.

- Each bit-coded subcode entry contains the expected heartbeat time and the node ID (node address) from which the heartbeat telegram is expected.
- The parameterised time is rounded down to an integer multiple of 5 ms and must have a higher value than the heartbeat producer time (C13381) of the node to be monitored.
- The response to a missing heartbeat telegram can be parameterised in C13613.
- Mapping of the CANopen object I-1016 (see DS301, V4.02).

▸ Heartbeat protocol (📖 80)

Setting range			
0x00000000		0xFFFFFFFF	

Value is bit-coded:		Information
Bit 0	Heartbeat time bit 0	• Bit 0 ... 15: Heartbeat time • Bit 16 ... 23: Node address • Bit 24 ... 31: Reserved
...	...	
Bit 31	Reserved	

Subcodes	Lenze setting	Information
C13385/1	0x00000000	Monitoring entry 1 ... 32
...		
C13385/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13386

Parameter | Name:
C13386 | CAN Node Guarding

Data type: BITFIELD_32
Index: $11189_d = 2BB5_h$

These 32 subcodes represent the nodes which are to be monitored by the master via node guarding.
- Each bit-coded subcode entry contains the guard time (C13382), the life time factor (C13383) and the node address (C13350) from which the node guarding telegram is expected.
- The response to a missing node guarding response can be parameterised in C13612.

▸ Node guarding protocol (📖 74)

Setting range			
0x00000000		0xFFFFFFFF	

Value is bit-coded:		Information
Bit 0	Guard time bit 0	• Bit 0 ... 15: Guard time • Bit 16 ... 23: Node address • Bit 24 ... 31: Life time factor
...	...	
Bit 31	Lifetime factor bit 7	

Subcodes	Lenze setting	Information
C13386/1	0x00000000	Monitoring entry 1 ... 32
...		
C13386/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13387

Parameter | Name:
C13387 | CAN Node Guarding Activity

Data type: BITFIELD_32
Index: $11188_d = 2BB4_h$

▸ Node guarding protocol (📖 74)

Display range		
0x00000000		0xFFFFFFFF

Value is bit-coded:	
Bit 0	Node guarding of node 1
...	...
Bit 31	Node guarding of node 32

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13388

Parameter | Name:
C13388 | CAN node guarding status

Data type: UNSIGNED_8
Index: $11187_d = 2BB3_h$

Node guarding status of node 1 ... 32

▸ Node guarding protocol (📖 74)

Selection list (read only)	
0	Unknown
4	Stopped
5	Operational
127	Pre-operational

Subcodes	Information
C13388/1	
...	
C13388/32	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13390

Parameter | Name: **C13390 | CAN Error Register (DS301V402)**			Data type: BITFIELD_8 Index: $11185_d = 2BB1_h$
Mapping of the CANopen object I-1001 (see DS301, V4.02)			
Display range			
0x00		0xFF	
Value is bit-coded:			**Information**
Bit 0	Generic error		Currently only bits 0 and 4 contain the corresponding information.
Bit 1	Current error (not used)		
Bit 2	Voltage error (not used)		
Bit 3	Temperature error (not used)		
Bit 4	Communication error		
Bit 5	Dev. prof. spec. err (not used)		
Bit 6	Reserved		
Bit 7	Manuf. spec. error (not used)		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C13391

Parameter | Name: **C13391 | CAN Emergency Object**			Data type: BITFIELD_32 Index: $11184_d = 2BB0_h$
Identifier of the emergency telegram • If bit 31 of this code is set (0x8nnnnnnn), the generation of emergency telegrams is deactivated. • Mapping of the CANopen object I-1014 (see DS301, V4.02). ▸ Emergency telegram (📖 84)			
Setting range			**Lenze setting**
0x00000000		0xFFFFFFFF	**0x00000081** (decimal: 129)
Value is bit-coded: (☑ = bit set)			**Information**
Bit 0 ☑	COB-ID bit 0		
Bit 1 ☐	COB-ID bit 1		
Bit 2 ☐	COB-ID bit 2		
Bit 3 ☐	COB-ID bit 3		
Bit 4 ☐	COB-ID bit 4		
Bit 5 ☐	COB-ID bit 5		
Bit 6 ☐	COB-ID bit 6		
Bit 7 ☑	COB-ID bit 7		
Bit 8 ☐	COB-ID bit 8		
Bit 9 ☐	COB-ID bit 9		
Bit 10 ☐	COB-ID bit 10		
Bit 11 ☐	Reserved		
...	...		
Bit 30 ☐	Reserved		
Bit 31 ☐	Emergency inactive/active		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C13392

Parameter | Name:
C13392 | CAN emergency delay time

Data type: UNSIGNED_16
Index: $11183_d = 2BAF_h$

Minimum time that has to elapse between two successive emergency telegrams.
- If "0" is set, checking of the inhibit time is deactivated.
- The time is entered in 1/10 ms. The code automatically rounds the entries down to the preceding full millisecond.
- Mapping of the CANopen object I-1015 (see DS301, V4.02).

▸ Emergency telegram (📖 84)

Setting range (min. value | unit | max. value)			Lenze setting
0		65535	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13393

Parameter | Name:
C13393 | CAN result - bus scan

Data type: UNSIGNED_8
Index: $11182_d = 2BAE_h$

Result of a CAN bus scan previously carried out (C00002 = 96).
- The subcode number 1 ... 128 corresponds to the node address 1 ... 128.

Display range (min. value | unit | max. value)			
0		1	

Subcodes	Information
C13393/1	Result of the CAN bus scan for node address 1 ... 128 • The value "1" means that a device with the corresponding node address has been found.
...	
C13393/128	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13394

Parameter | Name:
C13394 | CAN predefined error field (DS301V402)

Data type: UNSIGNED_32
Index: $24181_d = 5E75_h$

Predefined error field according to DS301, V4.02

Display range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Information
C13394/1	
...	
C13394/10	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13591

Parameter | Name:
C13591 | Resp. to CAN-RPDOx error

Data type: UNSIGNED_8
Index: $10984_d = 2AE8_h$

Response if the corresponding CAN RPDO has not been received within the configured time (C13357/1...4 / C14357/1...4) or with the configured sync.

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	No response

Subcodes	Lenze setting	Information
C13591/1	0: No response	Response to the absence of RPDO1 ... RPDO4
...		
C13591/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13595

Parameter | Name:
C13595 | Resp. to CAN bus OFF

Data type: UNSIGNED_8
Index: $10980_d = 2AE4_h$

Response if CAN node switches to the bus-off state.

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	**No response**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13612

Parameter | Name:
C13612 | Resp. to CAN node guarding error

Data type: UNSIGNED_8
Index: $10963_d = 2AD3_h$

Response of master if the corresponding node guarding response is missing.
▸ Node guarding protocol (📖 74)

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	No response

Subcodes	Lenze setting	Information
C13612/1	0: No response	Response to the absence of the node guarding response for monitoring entry 1 ... 32
...		
C13612/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13613

Parameter | Name:
C13613 | Resp. to CAN heartbeat error

Data type: UNSIGNED_8
Index: $10962_d = 2AD2_h$

Response if the corresponding heartbeat telegram is missing.
▸ Heartbeat protocol (📖 80)

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	No response

Subcodes	Lenze setting	Information
C13613/1	0: No response	Response to the absence of the heartbeat telegram for monitoring entry 1 ... 32
...		
C13613/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13614

Parameter | Name:
C13614 | Resp. to CAN life guarding error

Data type: UNSIGNED_8
Index: $10961_d = 2AD1_h$

Response of slave if node guarding request is missing.
▸ Node guarding protocol (📖 74)

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	**No response**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C13625

Parameter | Name:
C13625 | CAN behaviour in case of fault

Data type: UNSIGNED_8
Index: $10950_d = 2AC6_h$

Mapping of the CANopen object I-1029 (see DS301, V4.02)

Selection list (Lenze setting printed in bold)	
0	**Pre-operational state**
1	No state change
2	Stopped state

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

13.3 Parameters of the communication module for slot MXI2

In this chapter, the parameters of the E94AYCCA communication module (CANopen) for slot MXI2 of the Servo Drive 9400 are listed in numerically ascending order.

C14311

Parameter | Name:
C14311 | CAN TPDO1 mask byte x

Data type: BITFIELD_8
Index: $11264_d = 2C00_h$

For each byte of the TPDO1 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

▸ Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C14311/1	0x00	Mask for byte 1 ... byte 8 of TPDO1
...		
C14311/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14312

Parameter | Name:
C14312 | CAN TPDO2 mask byte x

Data type: BITFIELD_8
Index: $11263_d = 2BFF_h$

For each byte of the TPDO2 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

▸ Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C14312/1	0x00	Mask for byte 1 ... byte 8 of TPDO2
...		
C14312/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14313

Parameter | Name:
C14313 | CAN TPDO3 mask byte x

Data type: BITFIELD_8
Index: $11262_d = 2BFE_h$

For each byte of the TPDO3 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

▸ Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C14313/1	0x00	Mask for byte 1 ... byte 8 of TPDO3
...		
C14313/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14314

Parameter | Name:
C14314 | CAN TPDO4 mask byte x

Data type: BITFIELD_8
Index: $11261_d = 2BFD_h$

For each byte of the TPDO4 a mask can be parameterised in the corresponding subcode.
- In case of event-controlled transmission of a PDO, only the masked bits are used for the event control.
- Mask "0x0" means that no bit of the corresponding byte triggers the transmission.
- Mask "0xff" means that each bit of the corresponding byte can trigger the transmission.

▸ Masking of the TPDOs for event control (📖 49)

Setting range		
0x00		0xFF

Value is bit-coded:	
Bit 0	Mask bit 0
...	...
Bit 7	Mask bit 7

Subcodes	Lenze setting	Information
C14314/1	0x00	Mask for byte 1 ... byte 8 of TPDO4
...		
C14314/8		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14320

Parameter | Name:
C14320 | CAN TPDOx identifier

Data type: BITFIELD_32
Index: $11255_d = 2BF7_h$

Identifier for TPDO1 ... TPDO4
- If bit 31 is set (0x8nnnnnnn), the TPDO is deactivated.
- The basic setting is according to the "Predefined Connection Set".
- Mapping of the CANopen objects I-1800/1 ... I-1803/1 (see DS301, V4.02).

▸ Identifiers of the process data objects (📖 46)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: PDO invalid
...	...	
Bit 31	PDO invalid	

Subcodes	Lenze setting	Information
C14320/1	0x00000181	Identifier TPDO1 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x180 + node address is set by default.
C14320/2	0x00000281	Identifier TPDO2 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x280 + node address is set by default.
C14320/3	0x00000381	Identifier TPDO3 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x380 + node address is set by default.
C14320/4	0x00000481	Identifier TPDO4 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x480 + node address is set by default.

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14321

Parameter | Name:
C14321 | CAN RPDOx identifier

Data type: BITFIELD_32
Index: $11254_d = 2BF6_h$

Identifier for RPDO1 ... RPDO4
- If bit 31 is set (0x8nnnnnnn), the RPDO is deactivated.
- The basic setting is according to the "Predefined Connection Set".
- Mapping of the CANopen objects I-1400/1 ... I-1403/1 (see DS301, V4.02).

▸ Identifiers of the process data objects (📖 46)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: PDO invalid
...	...	
Bit 31	PDO invalid	

Subcodes	Lenze setting	Information
C14321/1	0x00000201	Identifier RPDO1 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x200 + node address is set by default.
C14321/2	0x00000301	Identifier RPDO2 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x300 + node address is set by default.
C14321/3	0x00000401	Identifier RPDO3 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x400 + node address is set by default.
C14321/4	0x00000501	Identifier RPDO4 • After changing the node address and executing "Reset node" (C00002 = 92), here the value 0x500 + node address is set by default.

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14322

Parameter | Name:
C14322 | CAN TPDOx Tx mode

Data type: UNSIGNED_8
Index: $11253_d = 2BF5_h$

TPDO transmission type according to DS301, V4.02
- Types 0 (acyclic sync), 1-240 (cyclic sync), 254 (event-controlled manufacturer-specific), 255 (event-controlled device-profile-specific) are supported.
- The basic PDO setting is "254" (event-controlled).
- Mapping of the CANopen objects I-1800/2 ... I-1803/2 (see DS301, V4.02).

▸ Transmission type (📖 47)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Information
C14322/1	254	Transmission mode for TPDO1 ... TPDO4
...		
C14322/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14323

Parameter | Name:
C14323 | CAN RPDOx Rx mode

Data type: UNSIGNED_8
Index: $11252_d = 2BF4_h$

RPDO transmission type according to DS301, V4.02
- For the RPDO serves as monitoring setting in the case of sync-controlled PDOs.
- Types 0 (acyclic sync), 1-240 (cyclic sync), 254 (event-controlled manufacturer-specific), 255 (event-controlled device-profile-specific) are supported.
- The basic PDO setting is "254" (event-controlled).
- Mapping of the CANopen objects I-1400/2 ... I-1403/2 (see DS301, V4.02).

▸ Transmission type (📖 47)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Information
C14323/1	254	Transmission mode for RPDO1 ... RPDO4
...		
C14323/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14324

Parameter | Name:
C14324 | CAN TPDOx delay time

Data type: UNSIGNED_16
Index: $11251_d = 2BF3_h$

TPDO inhibit time according to DS301, V4.02
- Minimum time between the transmission of two identical TPDOs.
- The time is entered in 1/10 ms and automatically rounded to full milliseconds by the code.
- Mapping of the CANopen objects I-1800/3 ... I-1803/3 (see DS301, V4.02).
