C14324/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14343

Parameter | Name:
C14343 | CAN TPDO counter

Data type: UNSIGNED_32
Index: $11232_d = 2BE0_h$

Counter for TPDO1 ... TPDO4

Display range (min. value | unit | max. value)		
0		4294967295

Subcodes	Information
C14343/1	
...	
C14343/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14344

Parameter | Name: **C14344 | CAN RPDO counter**			Data type: UNSIGNED_32 Index: $11231_d = 2BDF_h$
Counter for RPDO1 ... RPDO4			
Display range (min. value | unit | max. value)			
0		4294967295	
Subcodes			**Information**
C14344/1			
...			
C14344/4			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C14345

Parameter | Name: **C14345 | CAN error**		Data type: UNSIGNED_8 Index: $11230_d = 2BDE_h$
Display of the active CAN network error		
Selection list (read only)		
0	No error	
1	Guard Event	
2	Warning	
3	Bus off	
4	Sync telegram error	
6	CAN controller overflow	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer		Scaling factor: 1

C14346

Parameter | Name: **C14346 | CAN heartbeat activity**			Data type: BITFIELD_32 Index: $11229_d = 2BDD_h$
▸ Heartbeat protocol (📖 80)			
Display range			
0x00000000		0xFFFFFFFF	
Value is bit-coded:			
Bit 0	Heartbeat node 1		
...	...		
Bit 31	Heartbeat node 32		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C14347

Parameter | Name:
C14347 | CAN heartbeat status

Data type: UNSIGNED_8
Index: $11228_d = 2BDC_h$

Status of node 1 ... 32
▸ Heartbeat protocol (📖 80)

Selection list (read only)	
0	Unknown
4	Stopped
5	Operational
127	Pre-operational

Subcodes	Information
C14347/1	
...	
C14347/32	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14348

Parameter | Name:
C14348 | CAN status DIP switch

Data type: UNSIGNED_8
Index: $11227_d = 2BDB_h$

- The value "1" means that the CAN DIP switches have been recognised during power-on and a valid baud rate and node address have been set.
- The value "0" means that either no CAN DIP switch or no valid setting has been recognised or that the setting has been overwritten by code C14350 or C14351.

Selection list (read only)		Information
0	Setting not accepted	
1	Setting accepted	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14349

Parameter | Name:
C14349 | CAN setting of DIP switch

Data type: UNSIGNED_8
Index: $11226_d = 2BDA_h$

CAN DIP switch setting during last power-on
▸ Possible settings via DIP switches (📖 33)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Information
C14349/1	Node address
C14349/2	Baud rate: 0: 500 kbps 1: 250 kbps 2: 125 kbps 3: 50 kbps 4: 1 Mbps 5: 20 kbps 6: 10 kbit/s 14: 800 kbps 255: Automatic detection

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14350

Parameter | Name:
C14350 | CAN node address

Data type: UNSIGNED_8
Index: $11225_d = 2BD9_h$

- A change in the node address is only effective after a "Reset node" (C00002 = 92).
- The basic server channel RX/TX is automatically provided by the node address (C14372 and C14373; both subcode 1).

▸ Setting the node address (📖 33)

Setting range (min. value | unit | max. value)			Lenze setting
1		127	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14351

Parameter | Name:
C14351 | CAN baud rate

Data type: UNSIGNED_8
Index: $11224_d = 2BD8_h$

A change in the baud rate is only effective after a "Reset node" (C00002 = 92).

▸ Setting the baud rate (📖 34)

Selection list (Lenze setting printed in bold)

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14352

Parameter | Name:
C14352 | CAN slave/master

Data type: UNSIGNED_8
Index: $11223_d = 2BD7_h$

If "1" is entered and saved, the drive will start as a CAN master after mains switching.

Selection list (Lenze setting printed in bold)	
0	**Slave**
1	Master

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14356

Parameter | Name:
C14356 | CAN TPDOx cycle time

Data type: UNSIGNED_16
Index: $11219_d = 2BD3_h$

TPDO event time according to DS301, V4.02
- If a different value than "0" is entered, the TPDO is transmitted without further consideration of the transport type after the time set has elapsed.
- Mapping of the CANopen objects I-1800/5 ... I-1803/5 (see DS301, 4.02).

Setting range (min. value | unit | max. value)		
0	ms	65535

Subcodes	Lenze setting	Information
C14356/1	0 ms	Cycle time for TPDO1 ... TPDO4
...		
C14356/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14357

Parameter | Name:
C14357 | CAN RPDOx monitoring time

Data type: UNSIGNED_16
Index: $11218_d = 2BD2_h$

Mapping of the RPDO event time (see DS301, V4.02)
- If a different value than "0" is entered, the RPDO is expected after the time set has elapsed.
- If the RPDO is not received within the expected time, an error message parameterisable under C14591/1...4 can be triggered.

Setting range (min. value | unit | max. value)		
0	ms	65535

Subcodes	Lenze setting	Information
C14357/1	3000 ms	Monitoring time for RPDO1 ... RPDO4
...		
C14357/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14359

Parameter | Name:
C14359 | CAN status

Data type: UNSIGNED_8
Index: $11216_d = 2BD0_h$

Display of the current CAN network status

Selection list (read only)	
0	Operational
1	Pre-operational
4	Boot-up
5	Stopped
7	Reset
8	Initialisation
9	Unknown
10	Baud rate autom. detected

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14360

Parameter | Name:
C14360 | CAN telegram and error counter

Data type: UNSIGNED_16
Index: $11215_d = 2BCF_h$

- After mains connection, all counters start with "0".
- After the maximum value has been reached, it is started with "0" again.

Display range (min. value | unit | max. value)		
0		65535

Subcodes	Information
C14360/1	Stuffing bit error counter • More than five identical bits have been detected.
C14360/2	Format error counter • CAN frame has not been observed.
C14360/3	Acknowledge error counter • No node has confirmed the telegram.
C14360/4	Bit1 error counter • "1" should be sent after bus arbitration, but "0" was read.
C14360/5	Bit0 error counter • "0" should be sent after bus arbitration, but "1" was read.
C14360/6	CRC error counter • Checksum check has indicated an error.
C14360/7	Tx telegram counter • Telegrams received without errors.
C14360/8	Rx telegram counter • Telegrams sent without errors.

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14361

Parameter | Name:
C14361 | CAN bus load

Data type: UNSIGNED_32
Index: $11214_d = 2BCE_h$

The display of the node peak load (subcodes 4 ... 6) can be reset by mains switching or via a "Reset node" command (C00002 = 92).

Display range (min. value | unit | max. value)		
0	%	100

Subcodes	Information
C14361/1	Current node load in Tx direction
C14361/2	Current node load in Rx direction
C14361/3	Current node load by faulty telegrams
C14361/4	Node peak load in Tx direction
C14361/5	Node peak load in Rx direction
C14361/6	Node peak load by faulty telegrams

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14367

Parameter | Name:
C14367 | CAN SYNC Rx identifier

Data type: UNSIGNED_32
Index: $11208_d = 2BC8_h$

Identifier with which the sync slave is to receive sync telegrams.
- Mapping of the CANopen object I-1005 (see DS301, V4.02).

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
0		2047	**128**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C14368

Parameter | Name:
C14368 | CAN SYNC Tx identifier

Data type: UNSIGNED_32
Index: $11207_d = 2BC7_h$

Identifier with which the sync master is to send sync telegrams.
- Mapping of the CANopen object I-1005 (see DS301, V4.02).

▸ Synchronisation of PDOs via sync telegram (📖 50)

Setting range (min. value | unit | max. value)			Lenze setting
0		2047	**128**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C14372

Parameter | Name:
C14372 | CAN SDO server Rx identifier

Data type: BITFIELD_32
Index: $11203_d = 2BC3_h$

Identifier with which the corresponding SDO server can be reached.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO server is deactivated.
- Mapping of the CANopen objects I-1200/1 ... I-1209/1 (see DS301, V4.02).

▸ Identifiers of the parameter data objects (📖 62)

Setting range			
0x00000000		0xFFFFFFFF	

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C14372/1	0x00000601	SDO server channel 1 RX • Subcode 1 contains the basic SDO channel. According to DS301, V4.02 it can neither be changed nor deactivated. Writing this subcode has no effect. • The value in subcode 1 results from the node address (C14350) + 0x600.
C14372/2	0x80000000	SDO server channel 2 RX
...	...	...
C14372/10	0x80000000	SDO server channel 10 RX

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer — Scaling factor: 1

C14373

Parameter | Name:
C14373 | CAN SDO server Tx identifier

Data type: BITFIELD_32
Index: $11202_d = 2BC2_h$

Identifier with which the corresponding SDO server can carry out transmissions.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO server is deactivated.
- Mapping of the CANopen objects I-1200/2 ... I-1209/2 (see DS301, V4.02).

▸ Identifiers of the parameter data objects (📖 62)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C14373/1	0x00000581	SDO server channel 1 TX • Subcode 1 contains the basic SDO channel. According to DS301, V4.02 it can neither be changed nor deactivated. Writing this subcode has no effect. • The value in subcode 1 results from the node address (C14350) + 0x580.
C14373/2	0x80000000	SDO server channel 2 TX
...	...	...
C14373/10	0x80000000	SDO server channel 10 TX

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14374

Parameter | Name:
C14374 | CAN SDO client node address

Data type: UNSIGNED_8
Index: $11201_d = 2BC1_h$

Node address of the client assigned to this server (see DS301, V4.02).

Setting range (min. value | unit | max. value)		
1		127

Subcodes	Lenze setting	Information
C14374/1	1	SDO server channel 1 remote client node address • Subcode 1 contains the basic SDO channel. According to DS301, V4.02 it does not have this entry. Writing this subcode has no effect. • The value of subindex 1 is 0.
C14374/2	1	SDO server channel 2 remote client node address
...	...	...
C14374/10	1	SDO server channel 10 remote client node address

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14375

Parameter | Name:
C14375 | CAN SDO client Rx identifier

Data type: BITFIELD_32
Index: $11200_d = 2BC0_h$

Identifier with which the corresponding SDO client can be reached.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO client channel is deactivated (see DS301, V4.02).
- The client channels need not be parameterised right now. Their functionality will only be required when using the gateway services.

Identifiers of the parameter data objects (📖 62)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C14375/1	0x80000000	SDO client channel 1 RX ... 10 RX
...		
C14375/10		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14376

Parameter | Name:
C14376 | CAN SDO client Tx identifier

Data type: BITFIELD_32
Index: $11199_d = 2BBF_h$

Identifier with which the corresponding SDO client can carry out transmissions.
- If bit 31 is set (0x8nnnnnnn), the corresponding SDO client channel is deactivated (see DS301, V4.02).
- The client channels need not be parameterised right now. Their functionality will only be required when using the gateway services.

Identifiers of the parameter data objects (📖 62)

Setting range		
0x00000000		0xFFFFFFFF

Value is bit-coded:		Information
Bit 0	COB-ID bit 0	• Bit 0 ... 10: COB-ID • Bit 11 ... 30: Reserved • Bit 31: SDO invalid
...	...	
Bit 31	SDO invalid	

Subcodes	Lenze setting	Information
C14376/1	0x80000000	SDO client channel 1 TX ... 10 TX
...		
C14376/10		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14377

Parameter | Name:
C14377 | CAN SDO server node address

Data type: UNSIGNED_8
Index: $11198_d = 2BBE_h$

Node address of the server with which this client communicates via the client channel selected.
- An activation of the client functionality is not required.
- An entry is required so that the CAN-SDO client channel can be activated (see DS301, V4.02).

Setting range (min. value | unit | max. value)		
1		127

Subcodes	Lenze setting	Information
C14377/1	1	Remote server node address for SDO client channel 1 ... 10
...		
C14377/10		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14378

Parameter | Name:
C14378 | CAN delay boot-up - Operational

Data type: UNSIGNED_16
Index: $11197_d = 2BBD_h$

Time that has to elapse after mains switching before the CAN NMT master transmits the "Start remote node" telegram on the bus.
- This time is only used after mains switching if the master bit is activated (C14352).

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**3000 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14381

Parameter | Name:
C14381 | CAN Heartbeat Producer Time

Data type: UNSIGNED_16
Index: $11194_d = 2BBA_h$

Time interval for the transmission of the heartbeat telegram to one or several consumers.
- The parameterised time is rounded down to an integer multiple of 5 ms.
- The heartbeat telegram is transmitted automatically as soon as a time > 0 ms is set. The monitoring function "Node Guarding" is deactivated in this case.
- Mapping of the CANopen object I-1017 (see DS301, V4.02).

▸ Heartbeat protocol (📖 80)

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14382

Parameter | Name:
C14382 | CAN Guard Time

Data type: UNSIGNED_16
Index: $11193_d = 2BB9_h$

- After the guard time (set here) multiplied with the life time factor (C14383), a node guarding telegram must have arrived.
- Mapping of the CANopen object I-100C (see DS301, V4.02).

▸ Node guarding protocol (📖 74)

Setting range (min. value | unit | max. value)			Lenze setting
0	ms	65535	**0 ms**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14383

Parameter | Name:
C14383 | CAN Life Time Factor

Data type: UNSIGNED_8
Index: $11192_d = 2BB8_h$

- The life time factor multiplied with the guard time (C14382) is the time within which a node guarding telegram must have arrived.
- Mapping of the CANopen object I-100D (see DS301, V4.02).

▸ Node guarding protocol (📖 74)

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14385

Parameter | Name:
C14385 | CAN Heartbeat Consumer Time

Data type: BITFIELD_32
Index: $11190_d = 2BB6_h$

The 32 subcodes represent the nodes which are to be monitored via heartbeat.

- Each bit-coded subcode entry contains the expected heartbeat time and the node ID (node address) from which the heartbeat telegram is expected.
- The parameterised time is rounded down to an integer multiple of 5 ms and must have a higher value than the heartbeat producer time (C14381) of the node to be monitored.
- The response to a missing heartbeat telegram can be parameterised in C14613.
- Mapping of the CANopen object I-1016 (see DS301, V4.02).

▸ Heartbeat protocol (📖 80)

Setting range			
0x00000000		0xFFFFFFFF	

Value is bit-coded:		Information
Bit 0	Heartbeat time bit 0	• Bit 0 ... 15: Heartbeat time • Bit 16 ... 23: Node address • Bit 24 ... 31: Reserved
...	...	
Bit 31	Reserved	

Subcodes	Lenze setting	Information
C14385/1	0x00000000	Monitoring entry 1 ... 32
...		
C14385/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14386

Parameter | Name:
C14386 | CAN Node Guarding

Data type: BITFIELD_32
Index: $11189_d = 2BB5_h$

These 32 subcodes represent the nodes which are to be monitored by the master via node guarding.

- Each bit-coded subcode entry contains the guard time (C14382), the life time factor (C14383), and the node address (C14350) from which the node guarding telegram is expected.
- The response to a missing node guarding response can be parameterised in C14612.

▸ Node guarding protocol (📖 74)

Setting range			
0x00000000		0xFFFFFFFF	

Value is bit-coded:		Information
Bit 0	Guard time bit 0	• Bit 0 ... 15: Guard time • Bit 16 ... 23: Node address • Bit 24 ... 31: Life time factor
...	...	
Bit 31	Lifetime factor bit 7	

Subcodes	Lenze setting	Information
C14386/1	0x00000000	Monitoring entry 1 ... 32
...		
C14386/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14387

Parameter | Name:
C14387 | CAN Node Guarding Activity

Data type: BITFIELD_32
Index: $11188_d = 2BB4_h$

▸ Node guarding protocol (📖 74)

Display range		
0x00000000		0xFFFFFFFF

Value is bit-coded:	
Bit 0	Node guarding of node 1
...	...
Bit 31	Node guarding of node 32

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14388

Parameter | Name:
C14388 | CAN node guarding status

Data type: UNSIGNED_8
Index: $11187_d = 2BB3_h$

Node guarding status of node 1 ... 32

▸ Node guarding protocol (📖 74)

Selection list (read only)	
0	Unknown
4	Stopped
5	Operational
127	Pre-operational

Subcodes	Information
C14388/1	
...	
C14388/32	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14390

Parameter | Name: **C14390 | CAN Error Register (DS301V402)**			Data type: BITFIELD_8 Index: $11185_d = 2BB1_h$
Mapping of the CANopen object I-1001 (see DS301, V4.02)			
Display range			
0x00		0xFF	
Value is bit-coded:			**Information**
Bit 0	Generic error		Currently only bits 0 and 4 contain the corresponding information.
Bit 1	Current error (not used)		
Bit 2	Voltage error (not used)		
Bit 3	Temperature error (not used)		
Bit 4	Communication error		
Bit 5	Dev. prof. spec. err (not used)		
Bit 6	Reserved		
Bit 7	Manuf. spec. error (not used)		
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C14391

Parameter | Name: **C14391 | CAN Emergency Object**			Data type: BITFIELD_32 Index: $11184_d = 2BB0_h$
Identifier of the emergency telegram • If bit 31 of this code is set (0x8nnnnnnn), the generation of emergency telegrams is deactivated. • Mapping of the CANopen object I-1014 (see DS301, V4.02). ▸ Emergency telegram (📖 84)			
Setting range			**Lenze setting**
0x00000000		0xFFFFFFFF	**0x00000081** (decimal: 129)
Value is bit-coded: (☑ = bit set)			**Information**
Bit 0 ☑	COB-ID bit 0		
Bit 1 ☐	COB-ID bit 1		
Bit 2 ☐	COB-ID bit 2		
Bit 3 ☐	COB-ID bit 3		
Bit 4 ☐	COB-ID bit 4		
Bit 5 ☐	COB-ID bit 5		
Bit 6 ☐	COB-ID bit 6		
Bit 7 ☑	COB-ID bit 7		
Bit 8 ☐	COB-ID bit 8		
Bit 9 ☐	COB-ID bit 9		
Bit 10 ☐	COB-ID bit 10		
Bit 11 ☐	Reserved		
...	...		
Bit 30 ☐	Reserved		
Bit 31 ☐	Emergency inactive/active		
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer			Scaling factor: 1

C14392

Parameter | Name:
C14392 | CAN emergency delay time

Data type: UNSIGNED_16
Index: $11183_d = 2BAF_h$

Minimum time that has to elapse between two successive emergency telegrams.
- If "0" is set, checking of the inhibit time is deactivated.
- The time is entered in 1/10 ms. The code automatically rounds the entries down to the preceding full millisecond.
- Mapping of the CANopen object I-1015 (see DS301, V4.02).

▸ Emergency telegram (📖 84)

Setting range (min. value | unit | max. value)			Lenze setting
0		65535	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14393

Parameter | Name:
C14393 | CAN result - bus scan

Data type: UNSIGNED_8
Index: $11182_d = 2BAE_h$

Result of a CAN bus scan previously carried out (C00002 = 96).
- The subcode number 1 ... 128 corresponds to the node address 1 ... 128.

Display range (min. value | unit | max. value)			
0		1	

Subcodes	Information
C14393/1	Result of the CAN bus scan for node address 1 ... 128 • The value "1" means that a device with the corresponding node address has been found.
...	
C14393/128	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14394

Parameter | Name:
C14394 | CAN predefined error field (DS301V402)

Data type: UNSIGNED_32
Index: $24181_d = 5E75_h$

Predefined error field according to DS301, V4.02

Display range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Information
C14394/1	
...	
C14394/10	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14591

Parameter | Name: **C14591 | Resp. to CAN-RPDOx error**	Data type: UNSIGNED_8 Index: $10984_d = 2AE8_h$

Response if the corresponding CAN RPDO has not been received within the configured time (C13357/1...4 / C14357/1...4) or with the configured sync.

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	No response

Subcodes	Lenze setting	Information
C14591/1	0: No response	Response to the absence of RPDO1 ... RPDO4
...		
C14591/4		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14595

Parameter | Name: **C14595 | Resp. to CAN bus OFF**	Data type: UNSIGNED_8 Index: $10980_d = 2AE4_h$

Response if CAN node switches to the bus-off state.

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	**No response**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14612

Parameter | Name: **C14612 | Resp. to CAN node guarding error**	Data type: UNSIGNED_8 Index: $10963_d = 2AD3_h$

Response of master if the corresponding node guarding response is missing.
▸ Node guarding protocol (📖 74)

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	No response

Subcodes	Lenze setting	Information
C14612/1	0: No response	Response to the absence of the node guarding response for monitoring entry 1 ... 32
...		
C14612/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14613

Parameter | Name: **C14613 | Resp. to CAN heartbeat error**	Data type: UNSIGNED_8 Index: $10962_d = 2AD2_h$

Response if the corresponding heartbeat telegram is missing.
▸ Heartbeat protocol (📖 80)

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	No response

Subcodes	Lenze setting	Information
C14613/1	0: No response	Response to the absence of the heartbeat telegram for monitoring entry 1 ... 32
...		
C14613/32		

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14614

Parameter | Name: **C14614 | Resp. to CAN life guarding error**	Data type: UNSIGNED_8 Index: 10961_d = $2AD1_h$

Response of slave if node guarding request is missing.
▸ Node guarding protocol (📖 74)

Selection list (Lenze setting printed in bold)	
1	Fault
2	Trouble
3	Quick stop by trouble
4	Warning locked
5	Warning
6	Information
0	**No response**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

C14625

Parameter | Name: **C14625 | CAN behaviour in case of fault**	Data type: UNSIGNED_8 Index: 10950_d = $2AC6_h$

Mapping of the CANopen object I-1029 (see DS301, V4.02)

Selection list (Lenze setting printed in bold)	
0	**Pre-operational state**
1	No state change
2	Stopped state

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer Scaling factor: 1

13.4 Table of attributes

The table of attributes contains information required for communicating with the controller via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter designation	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index by which the parameter is addressed. The subindex of array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Only required for access via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes, with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte, without sign
			UNSIGNED_16	2 bytes, without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit (CINH) required	☑ Writing possible in the case of controller inhibit (CINH) only

14 Implemented CANopen objects

Lenze devices can be parameterised with Lenze codes and with manufacturer-independent "CANopen objects". For a completely CANopen-conform communication only the CANopen objects may be used for parameter setting. The CANopen objects described in this chapter are defined in the CANopen specification DS301, V4.02.

Many CANopen objects can be mapped to Lenze codes. In the following table, the related Lenze codes are listed in the column "Relationship to Lenze code".

Note!

Some of the terms used here derive from the CANopen protocol.

Overview of the CANopen indexes and their relationship to Lenze codes

CANopen object			Relationship to Lenze code
Index	Subindex	Name	
I-1000	0	Device type	-
I-1001	0	Error register	C13390 / C14390
I-1003	Pre-defined error field		
	0	Number of errors	-
	1 ... 10	Standard error field	-
I-1005	0	COB-ID SYNC message	C13367 / C14367
			C13368 / C13368
I-1006	0	Communication cycle period	C00369
I-100C	0	Guard time	C13382 / C14382
I-100D	0	Life time factor	C13383 / C14383
I-1010	Store parameters		
	0	Highest subindex supported	-
	1	Save all parameters	-
I-1011	Restore default parameters		
	0	Highest subindex supported	-
	1	restore all default parameters	-
I-1014	0	COB-ID EMCY	C13391 / C14391
I-1015	0	Inhibit time EMCY	C13392 / C14392
I-1016	Consumer heartbeat time		
	0	Highest subindex supported	-
	1 ... 32	Consumer heartbeat time	C13385/1...32 / C14385/1...32
I-1017	0	Producer heartbeat time	C13381 / C14381
I-1018	Identity object		
	0	Highest subindex supported	-
	1	Vendor ID	-
	2	Product code	-
	3	Revision number	-
	4	Serial number	-

CANopen object			Relationship to Lenze code
Index	Subindex	Name	
I-1029	Error behaviour		
	0	Highest subindex supported	-
	1	Communication error	C13625 / C14625
I-1200	SDO1 server parameter		
	0	Highest subindex supported	-
	1	COB-ID client –> server (rx)	C13372/1 / C14372/1
	2	COB-ID server –> client (tx)	C13373/1 / C14373/1
I-1201 ... I-1209	SDO2 ... SDO10 server parameter		
	0	Highest subindex supported	-
	1	COB-ID client –> server (rx)	C13372/2...10 / C14372/2...10
	2	COB-ID server –> client (tx)	C13373/2...10 / C14373/2...10
	3	Node-ID of the SDO client	-
I-1400 ... I-1403	RPDO1 ... RPDO4 communication parameter		
	0	Highest subindex supported	-
	1	COB-ID used by RPDO	C13321/1...4 / C14321/1...4
	2	Transmission type	C13323/1...4 / C14323/1...4
	3	Inhibit time	-
	4	Compatibility entry	-
	5	Event timer	-
I-1600 ... I-1603	RPDO1 ... RPDO4 mapping parameter		
	0	Number of mapped application objects in PDO	-
	1 ... 8	Application object 1 ... 8	-
I-1800 ... I-1803	TPDO1 ... TDDO4 communication parameter		
	0	Highest subindex supported	-
	1	COB-ID used by TPDO	C13320/1...4 / C14320/1...4
	2	Transmission type	C13322/1...4 / C14322/1...4
	3	Inhibit time	C13324/1...4 / C14324/1...4
	4	Reserved	-
	5	Event timer	C13356/1...4 / C14356/1...4
I-1A00 ... I-1A03	TPDO1 ... TDDO4 mapping parameter		
	0	Number of mapped application objects in PDO	-
	1 ... 8	Application object 1 ... 8	-

I-1000 - Device type

Index **I-1000**	Name: **Device type**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: Device type	0	0		4294967295	ro	U32

This object specifies the profile for this device. Furthermore, additional information defined in the device profile itself can be stored here.

8th byte	7th byte	6th byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
High word		Low word	
High byte	Low byte	High byte	Low byte
Additional information		**Device profile number**	

[14-1] Data telegram assignment

I-1001 - Error register

Index: **I-1001**	Name: **Error register**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: Error register	-	0		255	ro	U8

Error register

- This object is related to the Lenze code C13390 / C14390.
- The error status in the data byte (U8) is bit coded (see the following table). Currently only bit 0 and bit 4 in the data byte contain the corresponding information.

Bit	Meaning if bit is set:
Bit 0	Generic error
Bit 1	Current error (not used)
Bit 2	Voltage error (not used)
Bit 3	Temperature error (not used)
Bit 4	Communication error
Bit 5	Device profile spec. error (not used)
Bit 6	Reserved
Bit 7	Manufacturer-specific error (not used)

I-1003 - Pre-defined error field

Index: I-1003	Name: Pre-defined error field					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Number of errors	0	0		255	rw	U8
1 ... 10: Standard error field	-	0		4294967295	ro	U32

Error history

This object indicates that an error has occurred in the communication module and in the standard device.

Subindex	Meaning
0	Number of the error messages stored
1 ... 10	Display of the error list The error messages (U32) consist of a 16-bit error code and a 16-bit manufacturer-specific information field.

Note!

The values in the "standard error field" under subindexes 1 ... 10 will be deleted if the subindex "number of recorded errors" is overwritten with the value "0".

Emergency error code	Cause	Entry in the error register (I-1001)
0x0000	One of several errors eliminated	0xxx
	Elimination of an individual error (afterwards error-free state)	0x00
0x1000	Standard device is in error status (error response "Trouble", "Message", "Warning", "Fault", "Quick stop by trouble" or "System fault")	0x01
0x3100	Supply voltage of standard device faulty or failed	0x01
0x8100	Communication error (warning)	0x11
0x8130	Life guard error or heartbeat error	0x11
0x8150	Collision of COB-IDs: an ID parameterised for reception also is used for transmission.	0x11
0x8210	PDO length is shorter than the expected PDO length	0x11
0x8220	PDO length is longer than the expected PDO length	0x11
0x8700	Sync telegram monitoring	0x11

I-1005 - COB-ID SYNC message

Index:	Name:					
I-1005	**COB-ID SYNC message**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: COB-ID SYNC message	0x0000 0080 or 0x8000 0080	0		4294967295	rw	U32

This object serves to activate the creation of sync telegrams and write the value of the identifier.

▶ This object is related to the Lenze codes C13367 / C14367 and C13368 / C14368.

Creating sync telegrams

To create sync telegrams, bit 30 (see below) must be set to "1". The interval of the sync telegrams can be set with the object I-1006.

Writing identifiers

For the reception of PDOs, the value 0x80 is entered in the 11-bit identifier in the Lenze setting (and according to DS301, V4.02). This means that all modules are by default set to the same sync telegram.

▶ If sync telegrams are only to be received by specific communication modules, their identifiers can be entered with a value of up to and including 0x07FF.

▶ The identifier may only be changed if the communication module does not transmit a sync telegram (bit 30 = "0").

▶ How to change the identifier:
- Deactivate identifier (set bit 30 to "0").
- Change identifier.
- Activate identifier (set bit 30 to "1").

8th byte		7th byte	6th byte	5th byte
Data 4		**Data 3**	**Data 2**	**Data 1**
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
x	**0/1**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported - bit 11 ... bit 29 must be set to "0".				

[14-2] Data telegram assignment

I-1006 - Communication cycle period

Index: I-1006	Name: Communication cycle period					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Communication cycle period	0 µs	0	µs	65535000	rw	U32

Setting the sync telegram cycle time.

- A cycle time can be defined with the entry "1000" or an integer multiple of it.
- With "0 µs" (Lenze setting), no sync telegrams are created.
- This object is related to the Lenze code C00369.

I-100C - Guard time

Index: I-100C	Name: Guard time					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Guard time	0 ms	0	ms	65535	rw	U16

Monitoring time for node guarding. ▸ Node guarding protocol (📖 74)

- Time within the NMT slave expects the RTRs from the NMTmaster.
- The node life time is the product of the guard time and the life time factor:
  Node Life Time = Guard Time (I-100C) **x Life Time Factor** (I-100D)
- The "life guarding event" occurs in the NMT slave if the slave has not been triggered by the NMT master through an RTR within the node life time.
- With "0 ms" (Lenze setting), monitoring is not supported by the slave.
- This object is related to the Lenze code C13382 / C14382.

I-100D

Index: I-100D	Name: Life time factor					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Life time factor	0	0		255	rw	U8

Life Time Factor for node guarding. ▸ Node guarding protocol (📖 74)

- The node life time is the product of the guard time and the life time factor:
  Node Life Time = Guard Time (I-100C) **x Life Time Factor** (I-100D)
- The "life guarding event" occurs in the NMT slave if the slave has not been triggered by the NMT master through an RTR within the node life time.
- With "0" (Lenze setting), monitoring is not supported by the slave.
- This object is related to the Lenze code C13383 / C14383.

I-1010 - Store parameters

Index: **I-1010**	Name: **Store parameters**				
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	1	- (only read access)			ro	U32
1: Save all parameters	-	0		4294967295	rw	U32

Save parameters with mains failure protection.

- Corresponds to the device command **C00002 = "11: Save start parameters"**.
- This command serves to save the current parameter settings of the active application with mains failure protection in the memory module of the controller.

Subindex	Meaning	
	Read	**Write**
0	Max. supported subindex: 1	- (A write attempt triggers the error message 0x06010002.)
1	Reading memory functions of all parameters.	Save parameters with mains failure protection.

Read subindex 1

8th byte	7th byte	6th byte	5th byte	
Data 4	**Data 3**	**Data 2**	**Data 1**	
Bit 31 ... bit 2			Bit 1	Bit 0
0			**0**/1	0/**1**

[14-3] Assignment of the data telegram (read access)

Bit	Meaning	
Bit 0	0	No saving of parameters on command.
	1	Saving of parameters on command (Lenze).
Bit 1	0	No automatic saving of parameters (Lenze).
	1	Automatic saving of parameters.

Write subindex 1

In addition to the index and subindex, the telegram data must also include the "save" signature (ASCII characters; ISO 8859) so that the parameters are stored.

- Writing with a wrong identifier causes a response according to CANopen specification DS301, V4.02.

8th byte	7th byte	6th byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
"e" = 0x65	**"v" = 0x76**	**"a" = 0x61**	**"s" = 0x73**

[14-4] Assignment of the data telegram (write access)

I-1011 - Restore default parameters

Index: I-1011	Name: Restore default parameters					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	1	- (only read access)			ro	U32
1: restore all default parameters	-	0		4294967295	rw	U32

Load Lenze setting.

- Corresponds to the device command **C00002 = "0: Load Lenze setting"**.
- This command serves to reset the parameters of the active application to the Lenze setting which is stored in the firmware.

Subindex	Meaning	
	Read	Write
0	Max. supported subindex: 1	- (A write attempt triggers the error message 0x06010002.)
1	Loading of all parameters possible.	Load Lenze setting.

Read subindex 1

8th byte	7th byte	6th byte	5th byte	
Data 4	Data 3	Data 2	Data 1	
Bit 31 ... bit 1				Bit 0
0				0/**1**

[14-5] Assignment of the data telegram (read)

Bit	Setting	
Bit 0	0	Parameters cannot be loaded.
	1	Parameters can be loaded (Lenze).

Write subindex 1

In addition to the index and subindex, the telegram data must include the "load" signature (ASCII characters; ISO 8859) so that the Lenze setting can be loaded.

- Writing with a wrong identifier causes a response according to the CANopen specification DS301, V4.02.

8th byte	7th byte	6th byte	5th byte
Data 4	Data 3	Data 2	Data 1
"d" = 0x64	**"a" = 0x61**	**"o" = 0x6F**	**"l" = 0x6C**

[14-6] Assignment of the data telegram (write)

I-1014 - COB-ID EMCY

Index: I-1014	Name: COB-ID EMCY					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: COB-ID EMCY	0x80+Node-ID	0		4294967295	rw	U32

If a communication error or an internal error of the communication module or the controller occurs or is acknowledged (e. g. "trouble"), an error message is sent via the system bus (CANopen). For each error, the telegram is transmitted once. This function can be activated or deactivated by means of bit 31.

▶ This object is related to the Lenze code C13391 / C14391.

8th byte		7th byte	6th byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported - bit 11 ... bit 29 must be set to "0".				

[14-7] Data telegram assignment

Bit	Setting	
Bit 31	0	Emergency object valid.
	1	Emergency object invalid.

Note!

The identifier can only be changed in the "Emergency object invalid" status (bit 31 = 1).

I-1015 - Inhibit time EMCY

Index: I-1015	Name: Inhibit time EMCY					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: inhibit time EMCY	0	0	0.1 ms	65535	rw	U32

Time which must elapse after an error message (I-1014) has been transmitted, before further error messages can be sent via the system bus (CANopen).

▶ The entered value multiplied by "0.1" gives the delay time in [ms]. The values are automatically rounded up to whole values in [ms].

▶ This object is related to the Lenze code C13392 / C14392.

I-1016 - Consumer heartbeat time

Index: I-1016	Name: Consumer heartbeat time					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	32	- (only read access)			ro	U32
1 ... 32: consumer heartbeat time	0	0		4294967295	rw	U32

Monitoring time for the nodes 1 ... 32 to be monitored via heartbeat. ▸ Node guarding protocol (📖 74)

▶ The parameterised time is rounded down to an integer multiple of 5 ms and must have a higher value than the heartbeat producer time of the node to be monitored.

Subindex	Meaning	Lenze code
0	Number of nodes to be monitored	
1 ... 32	Node-ID and heartbeat time of the node 1 ... 32 to be monitored	C13385/1...32 C14385/1...32

8th byte	7th byte	6th byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
Bit 31 ... bit 24	Bit 23 ... bit 16	Bit 15 ... bit 0	
0 (reserved)	**Node ID**	**Heartbeat time** in [ms]	

[14-8] Data telegram assignment

I-1017 - Producer heartbeat time

Index: I-1017	Name: Producer heartbeat time					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: Producer heartbeat time	0	0	ms	65535	rw	U32

Time interval for the transmission of the heartbeat telegram to one or several consumers. ▸ Node guarding protocol (📖 74)

▶ The parameterised time is rounded down to an integer multiple of 5 ms.

▶ The heartbeat telegram is transmitted automatically as soon as a time > 0 ms is set. In this case, the node guarding monitoring function is deactivated.

▶ This object is related to the Lenze code C13381 / C14381.

I-1018 - Identity object

Index: **I-1018**	Name: **Identity object**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	see below	0		4294967295	ro	U32
1: Vendor ID						
2: Product code						
3: Revision number						
4: Serial number						

Subindex	Meaning	
1	Manufacturer identification number • The identification number allocated to Lenze by the "CAN in Automation e. V." organisation is "0x0000003B".	
2	Product code	
	0x94001	9400 StateLine
	0x94002	9400 HighLine / ServoPLC
	0x94004	9400 regenerative power supply module
3	Main version and subversion of the firmware	
4	Serial number	

I-1029 - Error behaviour

Index: **I-1029**	Name: **Error behaviour**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	1	- (only read access)			ro	U8
1: Communication error	0	0		2	rw	U8

This object serves to set the communication status to which the controller is to change after a bus-off, a node/life guarding event or a heartbeat event.

Subindex	Meaning		Lenze code
1	Status change after bus off, node/life guarding event or heartbeat event:		C13625 / C14625
	0	State change from "Operational" to "Pre-operational"	
	1	No state change	
	2	State change to "Stopped"	

I-1200 - SDO1 server parameter

Index: **I-1200**	Name: **SDO1 server parameter**					
Subindex	Default setting	Display range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	2	2		2	ro	U8
1: COB-ID client -> server (Rx)	Node ID + 0x600	0		4294967295	ro	U32
2: COB-ID server -> client (Tx)	Node ID + 0x580	0		4294967295	ro	U32

Identifier for the SDO server channel 1 (basic SDO channel).

▶ The basic SDO channel can neither be changed nor deactivated according to DS301, V4.02.

Subindex	Meaning
1	Receive identifier specification • For SDO server channel 1: node address (C13350 / C14350) + 0x600
2	Send identifier specification • For SDO server channel 1: node address (C13350 / C14350) + 0x580

8th byte		7th byte	6th byte	5th byte
Data 4		**Data 3**	**Data 2**	**Data 1**
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0	**0**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported - bit 11 ... bit 29 must be set to "0".				

[14-9] Data telegram assignment

I-1201 - SDO2 server parameter

Index: I-1201	Name: SDO2 server parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	3	- (only read access)			ro	U8
1: COB-ID client -> server (Rx)	0x80000000	0		4294967295	rw	U32
2: COB-ID server -> client (Tx)	0x80000000	0		4294967295	rw	U32
3: Node-ID of the SDO client	1 ... 127	- (only read access)			ro	U32

Setting of the identifiers for the SDO server channel 2.

- The server SDO parameter is only valid if the bit 31 is set to "0" for both transmission directions (subindex 1 and 2).
- In the Lenze setting, the SDO server channels 2 ... 10 are deactivated (bit 31 = "1").
- The identifier may only be changed if the SDO is invalid (bit 31 = "1").

Subindex	Meaning
1	Receive identifier specification
2	Send identifier specification
3	Node address of the client

8th byte		7th byte	6th byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0**	**Extended identifier***		**11-bit identifier**
* The extended identifier is not supported - bit 11 ... bit 29 must be set to "0".				

[14-10] Data telegram assignment

Bit	Setting	
Bit 31	0	SDO valid.
	1	SDO invalid.

How to change the identifier:

1. Deactivate identifier (set bit 31 to "1").
2. Change identifier.
3. Activate identifier (set bit 31 to "0").

Example

The parameter data channel 2 of the controller with the node address 4 is to be activated.

- For this purpose, bit 31 in the subindexes 1 and 2 of the I-1201 object must be set to the value "0" (≡ "SDO valid").
- Both "Write request" commands must be transmitted from the master to the nodes via the basic SDO channel.

Calculation of the identifiers

- Identifier (COB-ID) = basic identifier + node address (node ID)
- Basic identifier SDO2 from the master to the drive: 1600 (0x640)
  → identifier = 0x640 + 0x4 = 0x644
- Basic identifier SDO2 from the drive to the master: 1472 (0x5C0)
  → identifier = 0x5C0 + 0x4 = 0x5C4

Resulting data (data 1 ... data 4)

8th byte		7th byte	6th byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0	0	Extended identifier = 0		11-bit identifier = 0x644

1: COB-ID used by RPDO	0x200 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	-	- (for RPDOs unused)			rw	U16
4: compatibility entry	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	-	- (for RPDOs unused)			rw	U16

Communication parameter for the reception of process data via RPDO1

Subindex	Meaning	Lenze code
1	Identifier RPDO1 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x200 + node ID	C13321/1 / C14321/1
2	RPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13323/1 / C14323/1

8th byte		7th byte	6th byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0/1**	**Extended identifier***		**11-bit identifier**

* The extended identifier is not supported - bit 11 ... bit 29 must be set to "0".

[14-15] Data telegram assignment

Bit	Setting	
Bit 30	0	RTR to this PDO possible (cannot be set).
	1	RTR to this PDO not possible (Lenze).
Bit 31	0	PDO active.
	1	PDO inactive.

How to change the identifier:

1. Deactivate identifier (set bit 31 to "1").
2. Change identifier.
3. Activate identifier (set bit 31 to "0").

I-1401 - RPDO2 communication parameter

Index: I-1401	Name: RPDO2 communication parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by RPDO	0x300 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	-	- (for RPDOs unused)			rw	U16
4: compatibility entry	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	-	- (for RPDOs unused)			rw	U16

Communication parameter for the reception of process data via RPDO2

Subindex	Meaning	Lenze code
1	Identifier RPDO2 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x300 + node ID	C13321/2 / C14321/2
2	RPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13323/2 / C14323/2

▶ For assignment of the data telegram see object I-1400.

I-1402 - RPDO3 communication parameter

Index: I-1402	Name: RPDO3 communication parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by RPDO	0x400 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	-	- (for RPDOs unused)			rw	U16
4: compatibility entry	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	-	- (for RPDOs unused)			rw	U16

Communication parameter for the reception of process data via RPDO3

Subindex	Meaning	Lenze code
1	Identifier RPDO3 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x400 + node ID	C13321/3 / C14321/3
2	RPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13323/3 / C14323/3

▶ For assignment of the data telegram see object I-1400.

I-1403 - RPDO4 communication parameter

Index: I-1403	Name: RPDO4 communication parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by RPDO	0x500 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	-	- (for RPDOs unused)			rw	U16
4: compatibility entry	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	-	- (for RPDOs unused)			rw	U16

Communication parameter for the reception of process data via RPDO4

Subindex	Meaning	Lenze code
1	Identifier RPDO4 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x500 + node ID	C13321/4 / C14321/4
2	RPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13323/4 / C14323/4

▶ For assignment of the data telegram see object I-1400.

I-1600 - RPDO1 mapping parameter

Index: I-1600	Name: RPDO1 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to receive parameter data as RPDO1.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO1

8th byte	7th byte	6th byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
Bit 31 ... bit 16		Bit 15 ... bit 8	Bit 7 ... bit 0
Index		**Subindex**	**Length**

[14-16] Data telegram assignment

IEC 61131 process data words are mapped. Only whole bytes can be mapped (the granularity of the mapping entries is 1 byte).

I-1601 - RPDO2 mapping parameter

Index: I-1601	Name: RPDO2 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to receive parameter data as RPDO2.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO2

▶ For assignment of the data telegram see object I-1600.

I-1602 - RPDO3 mapping parameter

Index: I-1602	Name: RPDO3 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to receive parameter data as RPDO3.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO3

▶ For assignment of the data telegram see object I-1600.

I-1603 - RPDO4 mapping parameter

Index: I-1603	Name: RPDO4 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to receive parameter data as RPDO4.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO4

▶ For assignment of the data telegram see object I-1600.

I-1800 - TPDO1 communication parameter

Index: I-1800	Name: TPDO1 communication parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by TPDO	0x180 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	0 ms	0	0.1 ms	65535	rw	U16
4: reserved	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	0 ms	0	ms	65535	rw	U16

Communication parameter for the transmission of process data via TPDO1

Subindex	Meaning	Lenze code
1	Identifier TPDO1 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x180 + node ID	C13320/1 / C14320/1
2	TPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13322/1 / C14322/1
3	Minimum time between the transmission of two identical TPDOs (see DS301, V4.02).	C13324/1 / C14324/1
5	Cycle time with which the PDOs are transmitted with the transmission type "254".	C13356/1 / C14356/1

8th byte		7th byte	6th byte	5th byte
Data 4		Data 3	Data 2	Data 1
Bit 31	Bit 30	Bit 29 ... bit 11		Bit 10 ... bit 0
0/1	**0/1**	**Extended identifier***		**11-bit identifier**

* The extended identifier is not supported - bit 11 ... bit 29 must be set to "0".

[14-17] Data telegram assignment

Bit	Setting	
Bit 30	0	RTR to this PDO possible (Lenze).
	1	RTR to this PDO not possible (cannot be set).
Bit 31	0	PDO active.
	1	PDO inactive.

How to change the identifier:

1. Deactivate identifier (set bit 31 to "1").
2. Change identifier.
3. Activate identifier (set bit 31 to "0").

Subindex 3 - inhibit time

The delay time can only be changed if the PDO is inactive (subindex 1, bit 31 = 1). The entered value multiplied by 0.1 results in the delay time in [ms]. The calculated delay time is always rounded down to an inter value.

Example:

- Value entered: 26
- Calculated time = 26 * 0.1 [ms] = 2.6 [ms] → delay time = 2 [ms}

I-1801 - TPDO2 communication parameter

Index: **I-1801**	Name: **TPDO2 communication parameter**					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by TPDO	0x280 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	0 ms	0	0.1 ms	65535	rw	U16
4: reserved	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	0 ms	0	ms	65535	rw	U16

Communication parameter for the transmission of process data via TPDO2

Subindex	Meaning	Lenze code
1	Identifier TPDO2 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x280 + node ID	C13320/2 / C14320/2
2	TPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13322/2 / C14322/2
3	Minimum time between the transmission of two identical TPDOs (see DS301, V4.02).	C13324/2 / C14324/2
5	Cycle time with which the PDOs are transmitted with the transmission type "254".	C13356/2 / C14356/2

- For assignment of the data telegram see object I-1800.

I-1802 - TPDO3 communication parameter

Index: I-1802	Name: TPDO3 communication parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by TPDO	0x380 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	0 ms	0	0.1 ms	65535	rw	U16
4: reserved	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	0 ms	0	ms	65535	rw	U16

Communication parameter for the transmission of process data via TPDO3

Subindex	Meaning	Lenze code
1	Identifier TPDO3 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x380 + node ID	C13320/3 / C14320/3
2	TPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13322/3 / C14322/3
3	Minimum time between the transmission of two identical TPDOs (see DS301, V4.02).	C13324/3 / C14324/3
5	Cycle time with which the PDOs are transmitted with the transmission type "254".	C13356/3 / C14356/3

▶ For assignment of the data telegram see object I-1800.

I-1803 - TPDO4 communication parameter

Index: I-1803	Name: TPDO4 communication parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: highest subindex supported	5	- (only read access)			ro	U8
1: COB-ID used by TPDO	0x480 + node ID	0		4294967295	rw	U32
2: transmission type	254	0		255	rw	U8
3: inhibit time	0 ms	0	0.1 ms	65535	rw	U16
4: reserved	-	- (reserved, write or read access results in error message 0x06090011)			rw	U8
5: event timer	0 ms	0	ms	65535	rw	U16

Communication parameter for the transmission of process data via TPDO4

Subindex	Meaning	Lenze code
1	Identifier TPDO4 • The basic setting is according to the "Predefined Connection Set": Identifier = 0x480 + node ID	C13320/4 / C14320/4
2	TPDO transmission type according to DS301, V4.02 ▸ Transmission type (📖 47)	C13322/4 / C14322/4
3	Minimum time between the transmission of two identical TPDOs (see DS301, V4.02).	C13324/4 / C14324/4
5	Cycle time with which the PDOs are transmitted with the transmission type "254".	C13356/4 / C14356/4

▶ For assignment of the data telegram see object I-1800.

I-1A00 - TPDO1 mapping parameter

Index: I-1A00	Name: TPDO1 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to transmit parameter data as TPDO1.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entry 1 ... 8 for TPDO1

8th byte	7th byte	6th byte	5th byte
Data 4	**Data 3**	**Data 2**	**Data 1**
Bit 31 ... bit 16		Bit 15 ... bit 8	Bit 7 ... bit 0
Index		**Subindex**	**Length**

[14-18] Data telegram assignment

IEC 61131 process data words are mapped. Only whole bytes can be mapped (the granularity of the mapping entries is 1 byte).

I-1A01 - TPDO2 mapping parameter

Index: I-1A01	Name: TPDO2 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to transmit parameter data as TPDO2.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO2

▶ For assignment of the data telegram see object I-1A00.

I-1A02 - TPDO3 mapping parameter

Index: I-1A02	Name: TPDO3 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type
0: number of mapped application objects in PDO	0	0		8	rw	U8
1 ... 8: application object 1 ... 8	0	0		4294967295	rw	U32

This object serves to transmit parameter data as TPDO3.

Subindex	Meaning
0	Number of mapped objects
1 ... 8	Mapping entries 1 ... 8 for RPDO4

▶ For assignment of the data telegram see object I-1A00.

I-1A03 - TPDO4 mapping parameter

Index: I-1A03	Name: TPDO4 mapping parameter					
Subindex	Default setting	Setting range (min. value | unit | max. value)			Access	Data type

1 About this documentation

This documentation only contains descriptions of the E94AYCDN (DeviceNet™) communication module.

Note!

This documentation supplements the **mounting instructions** supplied with the communication module and the **Servo Drives 9400 hardware manual**.

The mounting instructions contain safety instructions that must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical concepts are only explained to the level of detail required to understand the function of the communication module.

This documentation does not describe the software of another manufacturer. No guarantee can be given for corresponding information in this documentation. Information on the use of the software can be found in the documents for the host (PLC, scanner).

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information on DeviceNet can be found on the website of the user organisation ODVA (Open DeviceNet Vendor Association):

www.odva.org

Target group

This documentation is intended for all persons who plan, install, commission and maintain the networking and remote servicing of a machine.

Tip!

Current documentation and software updates for Lenze products can be found in the download area at:

www.lenze.com

Validity information

The information in this documentation applies to the following devices:

Extension module	Type designation	From hardware version	From software version
Communication module DeviceNet	E94AYCDN	VA	01.00

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and the software version of the installed engineering tools (e.g. »Engineer«), the screenshots in this documentation may differ from the screen representation.

1.1 Document history

Version			Description
1.0	04/2008	TD17	Field test version
2.0	06/2008	TD17	First edition
3.0	11/2008	TD17	General revision
4.0	01/2013	TD17	• Update for C13861 / C14861 (module status) and C13862 / C14862 (network status) • New layout
5.0	02/2014	TD17	General updates

1.2 Conventions used

This documentation uses the following conventions to distinguish different types of information:

Type of information	Identification	Examples/notes
Numbers		
Decimal	Standard notation	Example: 1234
Decimal separator	Point	In general, the decimal point is used. Example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Text colour blue	All pieces of information that only apply to or from a specific software version of the device are highlighted accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze PC software »Engineer«...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If several successive commands are required for executing a function, the individual commands are separated from each other by an arrow: Select the command **File → Open** to...
Hyperlink	Underlined	Optically highlighted reference to another topic. Can be activated with a mouse-click in this online documentation.
Icons		
Page reference	(📖 8)	Optically highlighted reference to another page. Can be activated with a mouse-click in this online documentation.
Step-by-step instructions		Step-by-step instructions are marked by a pictograph.

1.3 Terminology used

Term	Meaning
Drive	Lenze inverters of the "Servo Drives 9400" product series
Standard device	
Code	Parameter which serves to parameterise and monitor the drive. In normal usage, the term is usually referred to as "Index".
Subcode	If a code contains several parameters, they are stored in so-called "subcodes". This manual uses a slash "/" as a separator between code and subcode (e.g. "C00118/3"). In normal usage, the term is also referred to as "Subindex".
CoS	**C**hange **o**f **S**tate CoS nodes always transmit their data if the data status changes.
Device	DeviceNet slave
DeviceNet	DeviceNet™ is a fieldbus system based on CAN (Controller Area Network). DeviceNet™ is a trademark and patented technology, licensed by the user organisation ODVA (Open DeviceNet Vendor Association), USA.
»Engineer«	PC software from Lenze which supports you during engineering (parameterisation, diagnostics, and configuration) throughout the entire life cycle, i.e. from planning to maintenance of the commissioned machine.
Explicit messages	Parameter data
HW	Hardware
Host	DeviceNet master
Scanner	
Lenze setting	Setting with which the device is preconfigured ex works.
»RSLogix 5000«	Programming and development software by Rockwell for hosts (PLCs, scanners) in DeviceNet networks (e.g. Allen Bradley Logix control systems).
SW	Software

1.4 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and suggests how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of damage to material assets** Reference to a possible danger that may result in damage to material assets if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to other documentation

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety instructions and application notes

Danger!

Disregarding the following basic safety measures may lead to severe personal injury and damage to material assets.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 12)
- must never be commissioned if they display signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- can have live, moving or rotating parts during and after operation, depending on their degree of protection. Surfaces can be hot.

The following applies to Lenze drive components ...

- Only use permissible accessories.
- Only use original manufacturer spare parts.

Observe all the specifications contained in the enclosed and related documentation.

- This is the precondition for safe and trouble-free operation and for obtaining the product features specified.
  ▸ Product features (📖 13)
- The procedural notes and circuit details described in this document are only proposals. It is up to the user to check whether they can be adapted to the particular applications. Lenze does not take any responsibility for the suitability of the procedures and circuit proposals described.

All work with or on Lenze drive components and automation components must be carried out only by qualified specialist personnel. According to IEC 60364 or CENELEC HD 384, these are persons ...

- who are familiar with the installation, mounting, commissioning, and operation of the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be firmly connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated in accordance with EN 61800-5-1 in every control cabinet (SELV/PELV).
- Only use cables that meet the listed specifications.
  ▸ Specification of the bus cable (📖 25)
- Connect a bus terminating resistor of 120 Ω each to the first and last node of the DeviceNet line.
  ▸ Wiring of the DeviceNet (📖 22)
- Connect the shield at the voltage supply together with the "V-" connection to GND once. For this purpose, use the centre point of the DeviceNet line, if possible.
- Connect the shield of the DeviceNet cable for each node only to the SHIELD connection of the plug connector.

Documentation relating to the standard device, host (PLC, scanner), system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage of ≥ 400V, protection against accidental contact is not ensured without external measures.
▸ Protective insulation (📖 16)

Device protection

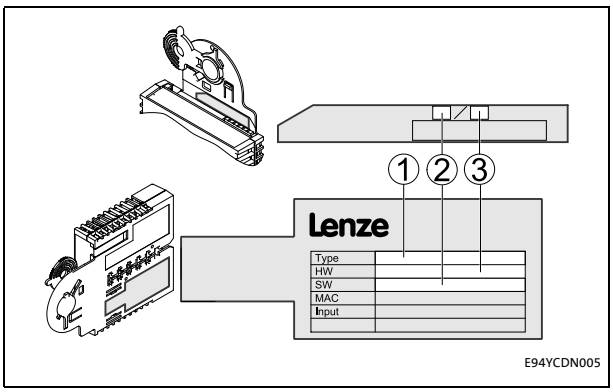
The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 20)

3 Product description

3.1 Application as directed

The communication module ...

- is an accessory module which can be used in conjunction with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHxxxx	1A	01.50
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in DeviceNet networks.

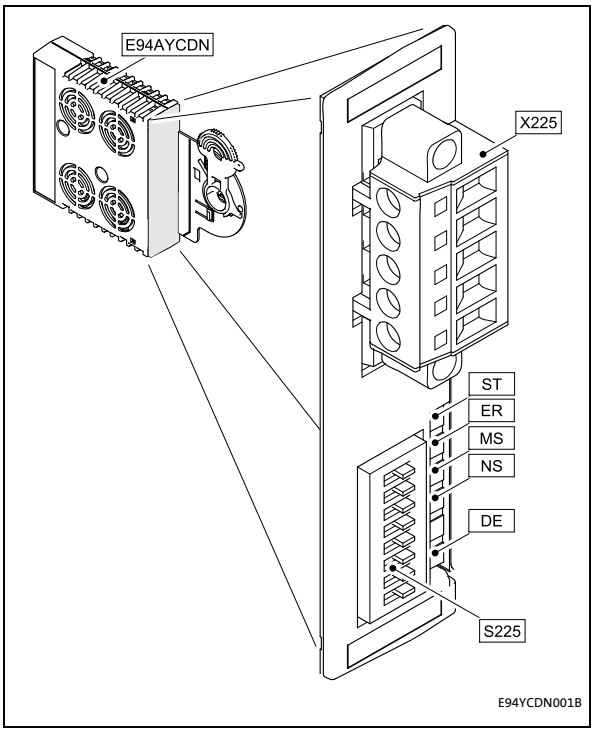
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: extension module
- C Module type: communication module
- DN DeviceNet



2 Hardware version (HW)

3 Software version (SW)

3.3 Product features

- Interface module for connecting the DeviceNet communication system to the expansion slots of Servo Drives 9400
- External voltage supply via the fieldbus
- "Group 2 Only Server (Device)" functionality
- Access to all Lenze parameters
- The MAC ID and baud rate (125, 250 and 500 kbps) can be set via the DIP switches on the front
- Can be easily connected due to pluggable terminal strip with double screw connection for thick/thin cables
- Up to 32 I/O data words (16 bits/word) per direction can be exchanged.
- Support of the services:
  - Poll Messages I/O
  - Cyclic I/O
  - Change of State (CoS) I/O
  - Explicit messages
  - Device Heartbeat Message

3.4 Equipment

[3-2] E94AYCDN communication module (DeviceNet)

X225 5-pole plug connector with screw connection
- Wiring of the DeviceNet (📖 22)
- DeviceNet connection (📖 24)
- Voltage supply (📖 29)

ST LED status displays for diagnostic purposes
ER
MS
NS
DE
- LED status displays (📖 41)

S225 DIP switches for setting the station address (MAC ID) and baud rate
- Possible settings via DIP switch (📖 32)

4 Technical data

4.1 General data and operating conditions

Area	Values
Order designation	E94AYCDN
Communication profile	DeviceNet
Interface	5-pole plug connector with screw connection
Communication medium	EN 11898
Network topology	Line terminated at both ends (R = 120 Ω)
Number of nodes	Max. 64
Max. cable length	500 m (dependent on the selected baud rate and the cable type used)
DeviceNet nodes	Slave
Vendor ID	445 (0x1BD)
Device type	0 (generic device)
Product code	9400 (0x24B8)
Baud rate	125, 250, 500 kbps (adjustable via DIP switch)
Voltage supply	External supply via the 5-pole plug connector V+ : U = 24 V DC, I_{max} = 170 mA V- : reference potential for external voltage supply
Conformities , approvals	• CE • UL (see also hardware manual)

Servo Drives 9400 hardware manual

Here you can find the **ambient conditions** and information on the **electromagnetic compatibility (EMC)** which also apply to the communication module.

4.2 Protective insulation

Danger!

Dangerous voltage

If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

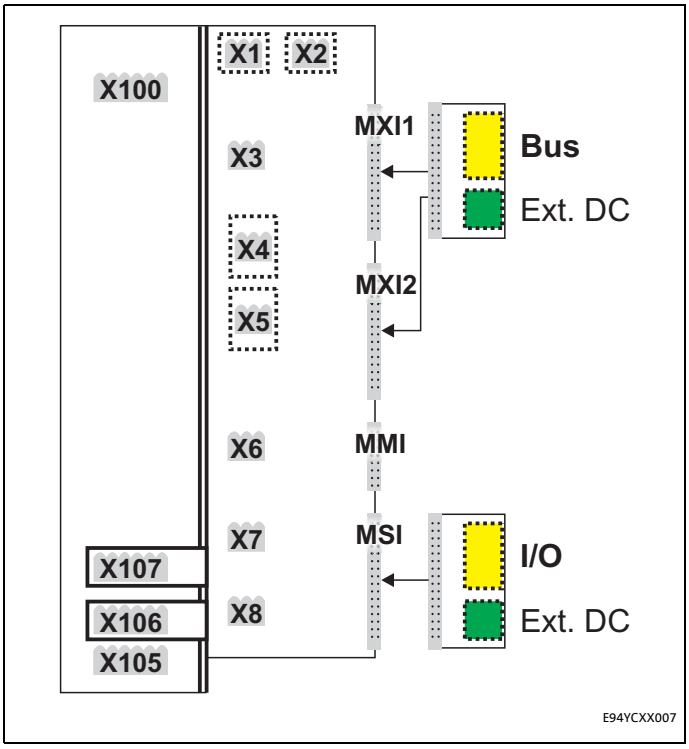
Possible consequences:

Death or severe injury

Protective measures:

If protection against accidental contact is required for the control terminals of the drive and the connections of the plugged-in device modules, ...

- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.



Note!

The available protective insulation in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the drive.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation to EN61800-5-1

Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (only Single Drive)	X1	CAN on board 9400
	+UG, -UG	X2	Statebus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (only Single Drive)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Storage module
		MSI	Safety module

Example

Which type of protective insulation is there between the bus terminal of the device module on slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is a "reinforced insulation".

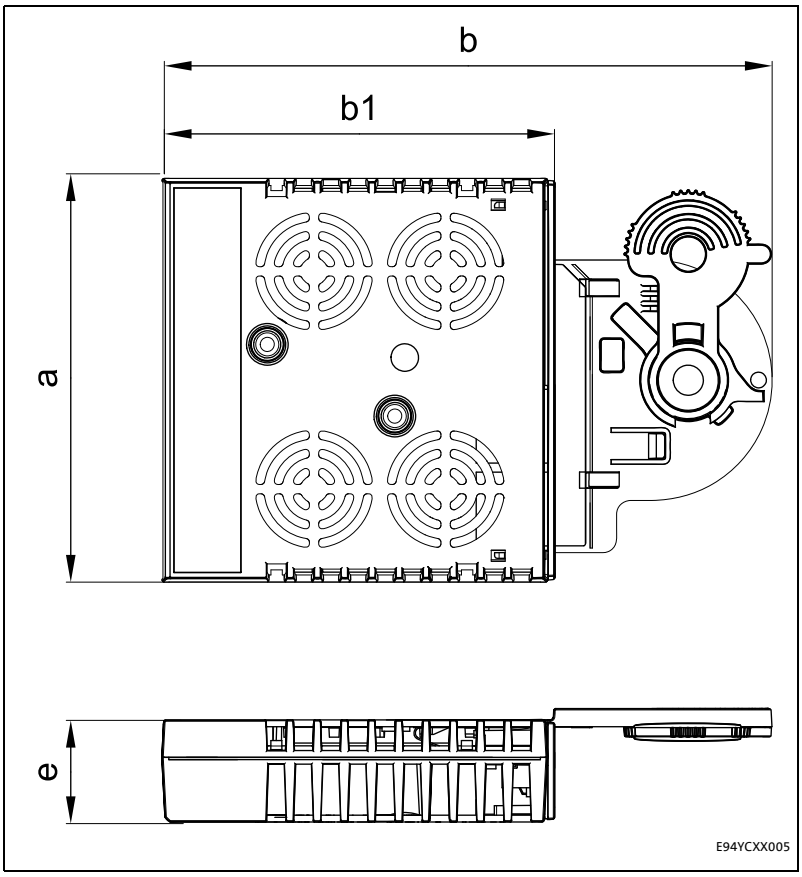
4.3 Protocol data

Area	Values
Process data words	1 ... 32 words (16 bits/word)
Supported services	• Reset • Get_Attribute_Single • Set_Attribute_Single • Allocate_Master/Slave_Connection_Set • Release_Group_2_Identifier_Set

4.4 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

The communication times in an DeviceNet network depend on the ...



- Processing time inside the drive;
- telegram runtime (baud rate / telegram length).

Processing time inside the drive

There are no interconnections between parameter data and process data.

Data	Processing time
Process data	Approx. 2 ms + 1 ms tolerance + runtime of the technology applications used
Parameter data	Approx. 30 ms + a tolerance of 20 ms (typically) For some codes the processing time can be longer (see reference manual/ »Engineer« online help for the Servo Drive 9400).

4.5 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

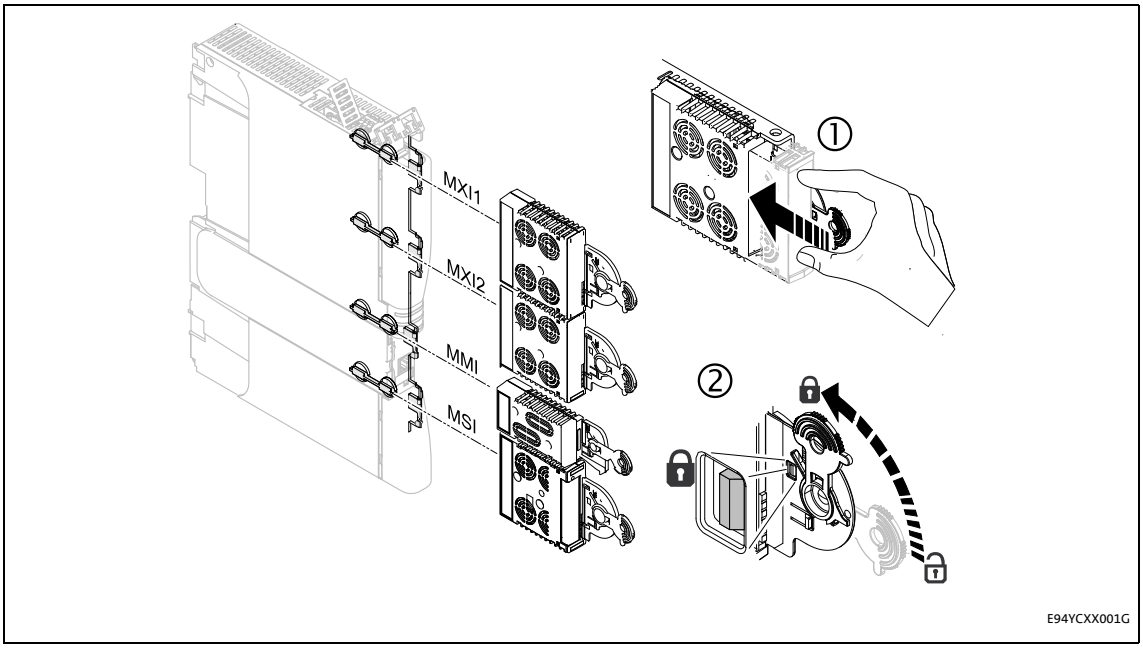
5 Installation

Stop!

Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

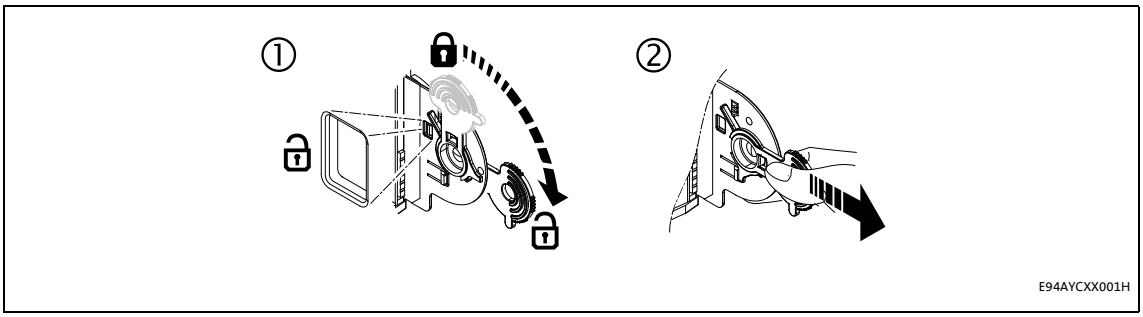
Possible consequences



- The communication module is defective.
- Fieldbus communication is not possible or faulty.

Protective measures

Free yourself from any electrostatic charge before you touch the module.



5.1 Mechanical installation

5.1.1 Mounting

[5-1] Mounting

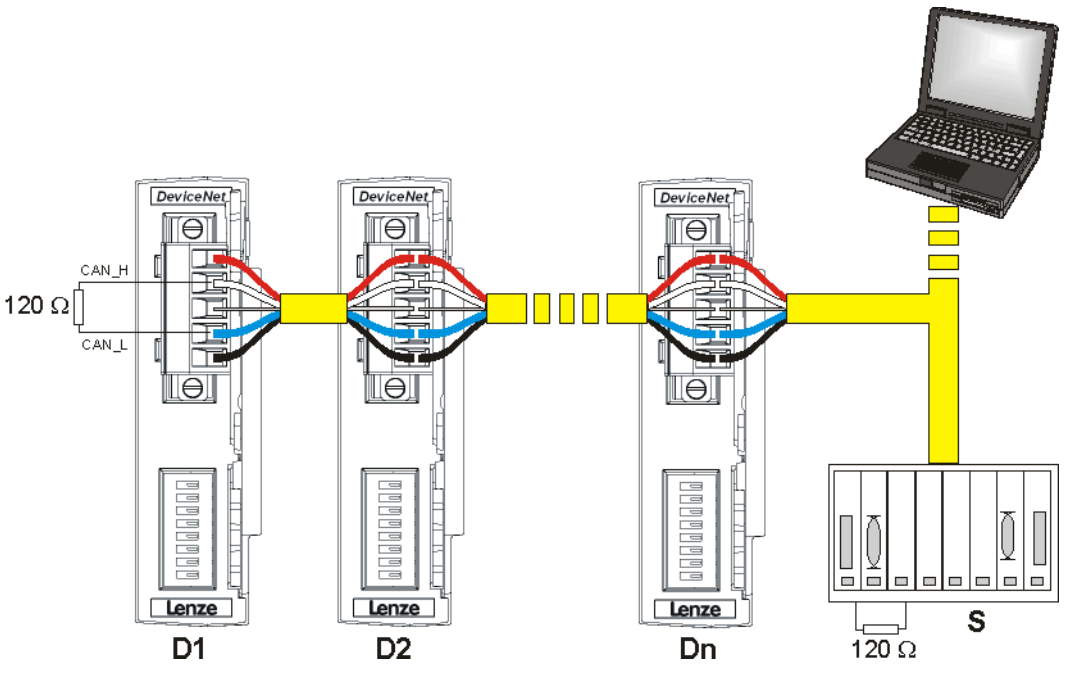
5.1.2 Dismounting

[5-2] Dismounting

5.2 Electrical installation

Documentation relating to the standard device, host (PLC, scanner), system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring of the DeviceNet

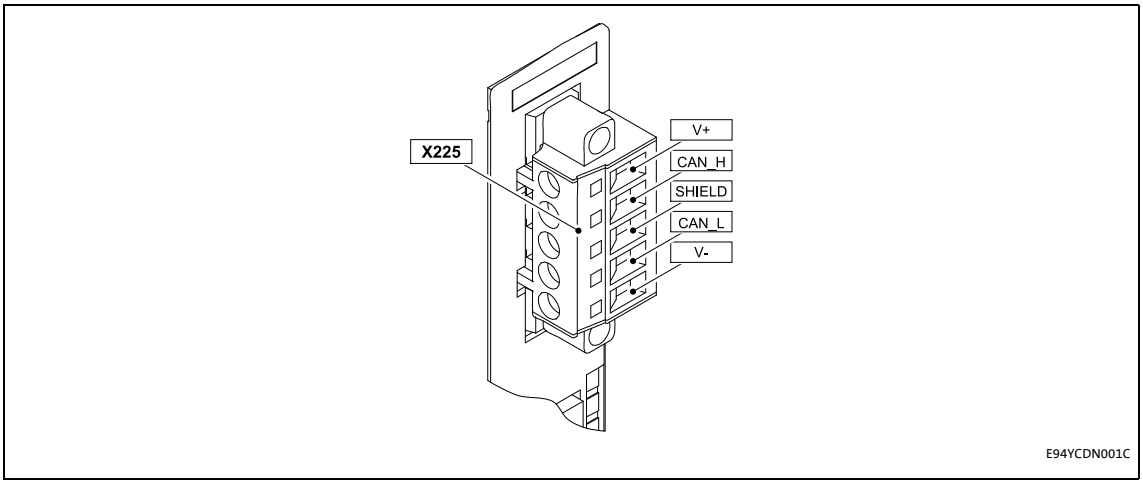
For communication with the scanner and all further components, Servo Drives 9400 have to be assembled with communication modules.

A DeviceNet line can have a maximum number of 64 nodes. The nodes include ...

- the scanner;
- the connected drives (devices);
- all other components which take part in communication.

For integrating the communication modules in the DeviceNet line, a PC/laptop with installed configuration software (e. g. »RSNetWorx«) is required. The PC/laptop solely serves to the configuration and diagnostics and therefore is not a DeviceNet node.

D1 ... n: Devices 1 ... n
S: scanner (e.g. PLC, IPC)



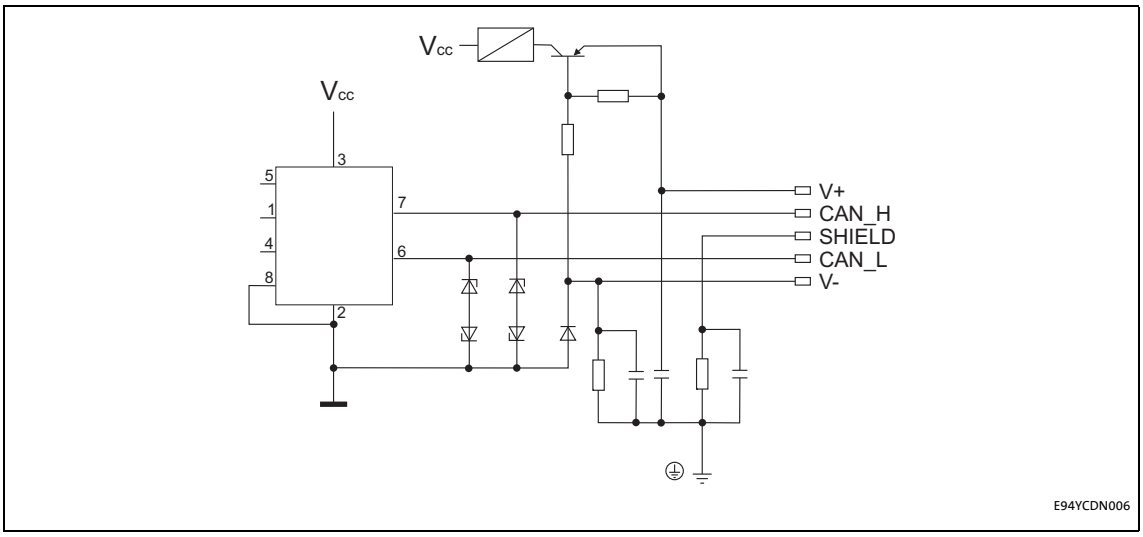
[5-3] DeviceNet line

Note!

- Connect a bus terminating resistor of 120 Ω each to the first and the last node of the DeviceNet line.
- Connect the shield at the voltage supply together with the "V-" connection to GND once. For this purpose, use the centre point of the DeviceNet line, if possible.
- Connect the shield of the DeviceNet cable for each node only to the SHIELD connection of the plug connector.

5.2.2 DeviceNet connection

The bus connection of the communication module is effected via the 5-pole plug connector with double screw connection (X225).



[5-4] 5-pole plug connector with double screw connection

Plug connector assignment (X225)

Terminal	Cable colour	Description
V+	red	External voltage supply • U = 24 V DC • I_{max} = 170 mA
CAN_H	White	Data line / input for bus terminating resistor (120 Ω)
SHIELD		Shielding
CAN_L	Blue	Data line / input for bus terminating resistor (120 Ω)
V-	Black	Reference potential for external voltage supply

Internal wiring of the plug connector (X225)

[5-5] Internal wiring X225

5.2.3 Specification of the bus cable

The nodes of the bus system must be wired with a fieldbus cable - a DeviceNet thick or thin cable - according to the DeviceNet specifications (DeviceNet Adaption of CIP, Edition 1.1, Volume 3). DeviceNet thick and thin cables for instance are manufactured by Belden Inc., Lapp, C&M Corp., and Madison Cable Corp.

Note!

If you do not wish to use a thick or thin cable, the cable used must meet the requirements given in the DeviceNet specifications.

A cable that does not meet the requirements given in the DeviceNet specifications must not be used!

Properties of the thick cable according to the DeviceNet specifications

General properties	
Arrangement	Two shielded, symmetrical cables, common axis with drain wire in the centre
Overall shielding	Coverage: 65 percent AWG 36, or at least 0.12 mm tinned copper braid (individually tinned)
Drain wire	At least copper 18; at least 19 cores (individually tinned)
Outer diameter	10.41 mm (min.) ... 12.45 mm (max.)
Roundness	A radius deviation must not exceed 15 percent of one half of the outer diameter
Cable sheath labelling	Vendor name, part number and additional labelling
DC resistor specification (braid, wrapping, discharge)	5.74 Ω/km (nominally up to 20°C)
Certifications (U.S. and Canada)	NEC (UL), CL2/CL3 (minimum)
Bend radius	20 x the diameter (installation) / 7 x the diameter (fixed)
Ambient temperature during operation	-20 ... +60°C at 8 A; linear current derating to zero at 80°C
Storage temperature	-40 ... +85°C
Pull tension	max. 845.5 N

Data line properties	
Wire pair	At least copper 18; at least 19 cores (individually tinned)
Insulation diameter	3.81 mm (nominal)
Colours	Light blue / white
Pair windings / m	Approx. 10
Shielding per wire pair	2000/1000, Al/Mylar, Al side outside, w/shorting fold (pull tension)
Impedance	120 Ω +/- 10 % (at 1 MHz)
Capacity between conductors	39.37 pF/m at 1 kHz (nominal)
Capacity between a conductor and another which is connected to the shield	78.74 pF/m at 1 kHz (nominal)
Capacitive unbalance	3937 pF/km at 1 kHz (nominal)
DC resistor specification at 20°C	max. 22.64 Ω/km
Damping	max. 0.43 dB/100 m at 125 kHz max. 0.82 dB/100 m at 500 kHz max. 1.31 dB/100 m at 1 MHz

Voltage conduction properties	
Wire pair	At least copper 15; at least 19 cores (individually tinned)
Insulation diameter	2.49 mm (nominal)
Colours	Red / black
Pair windings / m	Approx. 10
Shielding per wire pair	1000/1000, Al/Mylar, Al side outside, w/shorting fold (pull tension)
DC resistor specification at 20°C	max. 11.81 Ω/km

Properties of the thin cable according to the DeviceNet specifications

General properties	
Arrangement	Two shielded, symmetrical cables, common axis with drain wire in the centre
Overall shielding	Coverage: 65 percent AWG 36, or at least 0.12 mm tinned copper braid (individually tinned)
Drain wire	At least copper 22; at least 19 cores (individually tinned)
Outer diameter	6.096 mm (minimum) ... 7.112 mm (maximum)
Roundness	A radius deviation must not exceed 20 percent of one half of the outer diameter
Cable sheath labelling	Vendor name, part number and additional labelling
DC resistor specification (braid, wrapping, discharge)	10.5 Ω/km (nominally at 20°C)
Certifications (U.S. and Canada)	NEC (UL), CL2 (minimum)
Bend radius	20 x the diameter (installation) / 7 x the diameter (fixed)
Ambient temperature during operation	-20 ... +70°C at 1.5 A; linear current derating to zero at 80°C
Storage temperature	-40 ... +85°C
Pull tension	289.23 N (maximum)

Data line properties	
Insulation diameter	1.96 mm (nominal)
Wire pair	At least copper 24; at least 19 cores (individually tinned)
Colours	Light blue / white
Pair windings / m	Approx. 16
Shielding per wire pair	1000/1000, Al/Mylar, Al side outside, w/shorting fold (pull tension)
Impedance	120 Ω +/- 10 % (at 1 MHz)
Runtime	4.46 ns/m (maximum)
Capacity between conductors	39.37 pF/m at 1 kHz (nominal)
Capacity between a conductor and another which is connected to the shield	78.74 pF/m at 1 kHz (nominal)
Capacitive unbalance	Max. 3.94 pF/km at 1 kHz
DC resistor specification at 20°C	max. 91.86 Ω/km
Damping	max. 0.95 dB/100 m at 125 kHz 1.64 dB/100 m at 500 kHz (maximum) 2.30 dB/100 m at 1 MHz (maximum)

Voltage conduction properties	
Wire pair	At least copper 22; at least 19 cores (individually tinned)
Insulation diameter	1.4 mm (nominal)
Colours	Red / black
Pair windings / m	Approx. 16
Shielding per wire pair	1000/1000, Al/Mylar, Al side outside, w/shorting fold (pull tension)
DC resistor specification at 20°C	57.41 Ω/km (maximum)

5.2.4 Bus cable length

The following bus cable lengths are possible depending on the baud rate and the cable type used (thick cable/thin cable):

Baud rate [kbps]	Bus cable lengths [m]	
	Thick cable	Thin cable
125	500	
250	250	100
500	100	

If both thick and thin cables are used, the maximum cable lengths depending on the baud rate can be determined as follows:

Baud rate [kbps]	Max. bus cable length
125	500 m = L_{thick} + 5 L_{thin}
250	250 m = L_{thick} + 2.5 L_{thin}
500	100 m = L_{thick} + L_{thin}
L_{thick}: Length of the thick cable L_{thin} : Length of the thin cable	

Note!

Select the baud rate which depends on the data volume, cycle time, and number of nodes just high enough to suit your application.

5.2.5 Voltage supply

The communication module is externally supplied with voltage at the 5-pole plug connector (X225) via the DeviceNet line.

Note!

Use a safely separated power supply unit (SELV/PELV) in accordance with EN 61800-5-1.

- The communication module always requires an external voltage supply.
- Communication with a standard device that is separated from the mains is not possible.

Terminal data (X225)

Terminal	Cable colour	Description
V+	red	External voltage supply • U = 24 V DC • I_{max} = 170 mA
V-	Black	Reference potential for external voltage supply

Area	Values	
Electrical connection	Plug connector with double screw connection	
Possible connections	rigid:	
		2.5 mm² (AWG 14)
	flexible:	
		without wire end ferrule 2.5 mm² (AWG 14)
		with wire end ferrule, without plastic sleeve 2.5 mm² (AWG 14)
		with wire end ferrule, with plastic sleeve 2.5 mm² (AWG 14)
Tightening torque	0.5 ... 0.6 Nm (4.4 ... 5.3 lb-in)	
Bare end	7 mm	

6 Commissioning

During commissioning, system-related data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined in the drive. For Lenze devices, this is done by means of codes.

The codes of the drive and communication are saved non-volatilely as a data set in the memory module.

In addition to codes for the configuration, there are codes for diagnosing and monitoring the nodes.

Note!

When parameterising the communication module, please note that the code number depends on the slot of the standard device which the communication module is plugged into.

The first two digits of the code number specify the slot:

- C**13**nnn for slot MXI1
  - Parameters of the communication module for the MXI1 slot (📖 50)
- C**14**nnn for slot MXI2
  - Parameters of the communication module for the MXI2 slot (📖 57)

Furthermore set Communication-relevant parameters of the standard device (📖 48).

6.1 Before initial switch-on

Stop!

Before switching on the standard device with the communication module for the first time, check ...

- the entire cabling for completeness, short circuit and earth fault.
- whether the bus system is terminated at the first and last physical node by means of a bus terminating resistor (120 Ω).

6.2 Configuring the host (PLC, scanner)

For communication with the communication module, the host (PLC, scanner) must be configured first.

Configuration for device control

For the configuration of DeviceNet, the EDS file of the communication module has to be imported via the configuration software (e.g. »RSNetWorx« Rockwell software).

The EDS file **E94AYCDN_Vxxx.eds** required for configuration can be found in the download area at:

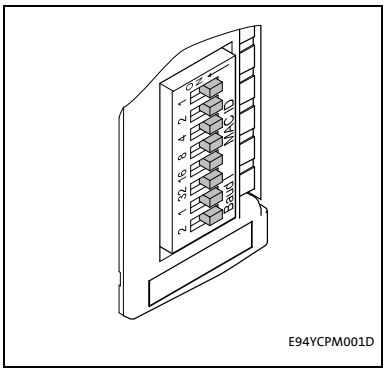
www.lenze.com

Specifying the user data length

Note!

The direction of the flow of information must be observed!

- Consumed I/O data: process data from the scanner to the drive (device)
- Produced I/O data: process data from the drive (device) to the scanner



The Servo Drives 9400 support the configuration of max. 32 process data words (max. 64 bytes) per direction.

The user data length for consumed and produced I/O data can vary.

The user data lengths (number of process data) must be set and stored via the »Engineer« or the scanner (Lenze Class (0x66 / 102) (📖 75)):

User data length for consumed I/O data	User data length for produced I/O data
Setting via the »Engineer« using C13883 / C14883	Setting via the »Engineer« using C13884 / C14884
The length of the ports mapped into the receipt PDO results from the Configuring I/O data (PDO mapping) (📖 36) and is displayed in C13854/1 / C14854/1. If this length does not correspond to the user length data of the consumed I/O data from C13883 / C14883, the DeviceNet: Consumed I/O data length is contradictory [0x00C88211] (📖 46) error message will be generated and entered as a warning in the logbook of the standard device when the I/O connection is established.	The length of the ports mapped into the transmission PDO results from the Configuring I/O data (PDO mapping) (📖 36) and is displayed in C13855/1 / C14855/1. If this length does not correspond to the user length data of the produced I/O data from C13884 / C14884, the DeviceNet: Produced I/O data length is contradictory [0x00C88212] (📖 46) error message will be generated and entered as a warning in the logbook of the standard device when the I/O connection is established.

6.3 Possible settings via DIP switch

[6-1] DIP switch

The following can be set via the DIP switch on the front:

- Station address
  Range: MAC ID
  Switches: 1 ... 32
- Baud rate
  Range: Baud
  Switches: 1 and 2

Lenze setting: all switches OFF

6.3.1 Setting the station address (MAC ID)

- The station address is set via the switches 1 ... 32 (MAC ID).
- The housing labelling corresponds to the binary values of the individual switches for determining the station address.
- Valid address range: 0 ... 63
- The current address setting is displayed in C13864 / C14864.

Example: Setting of station address 23

Switch (MAC ID)	32	16	8	4	2	1
Switch status	OFF	**ON**	OFF	**ON**	**ON**	**ON**
Value	0	16	0	4	2	1
Station address	**= sum of the values = 16 + 4 + 2 + 1 = 23**					

▸ DIP switch positions for setting the station address (📖 83)

6.3.2 Setting the baud rate

The baud rate is set via the switches 1 and 2 (Baud).

Switch (Baud)		Baud rate
2	1	
OFF	OFF	125 kbps
OFF	**ON**	250 kbps
ON	OFF	500 kbps
ON	**ON**	No function / switch status is not supported.

The current baud rate setting is displayed in C13863 / C14863.

6.4 Initial switch-on

Documentation for the standard device

Observe the safety instructions and information on residual hazards contained in this documentation.

Note!

Establishing communication

When the communication module is externally supplied, the standard device must also be switched on to establish communication.

After communication has been established, communication of the externally supplied module is independent of the switching status of the standard device.

Activating changed setting

In order to activate any changed settings, ...

- execute the device command "11: Save start parameter" via the standard device code **C00002** and ...
- then execute a "reset node" of the node or switch off and then on again the voltage supply of the communication module.

Protection against uncontrolled restart

Following a fault (short-term mains failure, for example), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

The restart behaviour of the drive can be set via **C00142** ("auto restart after mains connection"):

C00142 = "0: Inhibited" (Lenze setting)

- The drive remains inhibited (even if the fault is no longer active).
- A controlled restart of the drive is effected by explicit drive enable: LOW/HIGH edge at the digital input X5/RFR.

C00142 = 1: Enabled

- An uncontrolled restart of the drive is possible.

7 Data transfer

7.1 Communication channels

The Telegram types (📖 35) are assigned to the communication channels according to their time-critical behaviour:

The process data channel transmits I/O data.

- The drive is controlled by means of the I/O data.
- The host (PLC, scanner) can directly access the I/O data. In the PLC, the data are, for instance, directly stored in the I/O area.
- I/O data are not stored in the drive (device).
- I/O data are transmitted cyclically between the host and the drives (permanent exchange of current input and output data).

The parameter data channel transmits explicit messages.

- The parameter data channel provides access to all Lenze codes.
- Parameter changes must be stored via code C00002 code of the Servo Drives 9400.

7.2 Telegram types

The "I/O data" (process data) and "Explicit Messages (parameter data) telegram types are transmitted between the host (PLC, scanner) and the drives (devices).

7.2.1 I/O data (process data)

I/O data are transmitted or received according to the producer/consumer principle. There is one transmitter and no receiver or an optional number of receivers.

- Consumed I/O data: process data from the scanner to the drive (device)
- Produced I/O data: process data from the drive (device) to the scanner

▸ Assembly Class (0x04 / 4) (📖 69)

The following transmission modes are supported:

- Poll I/O data:
  The polling command which is transmitted by the scanner includes output data for the device. The device then transmits its input data to the scanner. The polling response can also be regarded as an acknowledgement.
- Cyclic I/O data:
  The scanner and the device use cyclic I/O data to generate their data independently of each other, which are then transmitted depending on a timer. The value of the timer must be set by the user.
- Change of State (CoS) I/O data:
  This I/O data type is a special case of cyclic I/O data. CoS nodes always transmit their data if the state of the data changes.

▸ Connection Class (0x05 / 5) (📖 70)

7.2.2 Explicit messages (parameter data)

Explicit messages serve to configure and parameterise the individual devices of the DeviceNet.

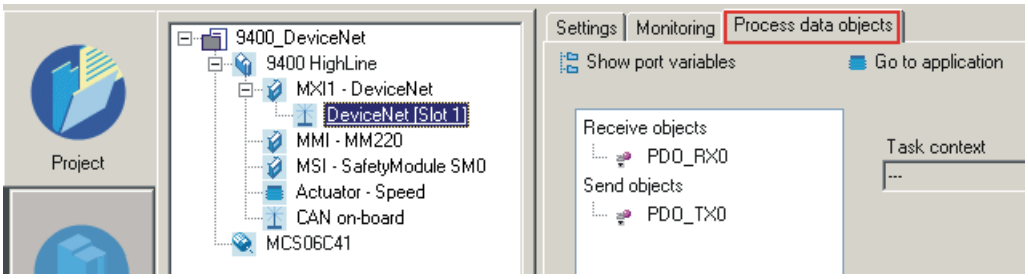
Two nodes have a client/server relationship:
The client transmits a job (request). The server receives this job and tries to accomplish it. The server then transmits the requested data (positive response) or an error message (negative response).

▸ Connection Class (0x05 / 5) (📖 70)

7.2.3 Device Heartbeat Message

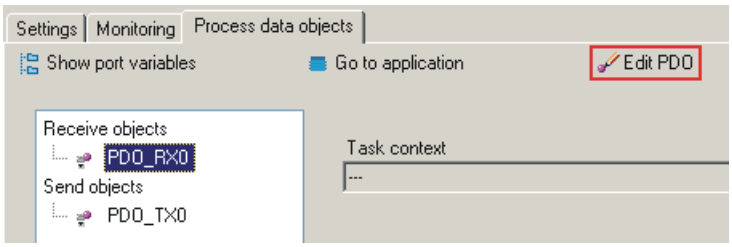
Within a configurable time interval, the device transmits its own device state to the bus via the Device Heartbeat Message. The Device Heartbeat Message can be configured via the DeviceNet object Identity Class (0x01 / 1) (📖 67) - instance 1, attribute 10.

Adjustable time interval: 1 ... 255 ms



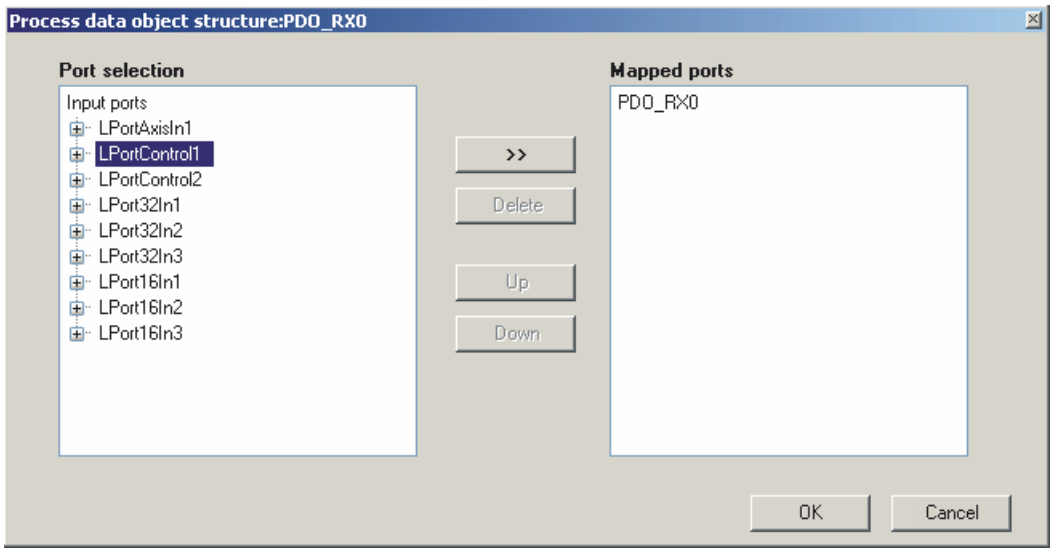
7.3 Configuring I/O data (PDO mapping)

For Servo Drives 9400 HighLine, the I/O data can be arranged individually (mapping). For this purpose, the »Engineer« provides a port configurator.



The following example describes the steps required for the Servo Drive 9400 HighLine to implement I/O data communication with a host (PLC, scanner) during which a control/status word and a 32-bit setpoint/actual value is exchanged, respectively.

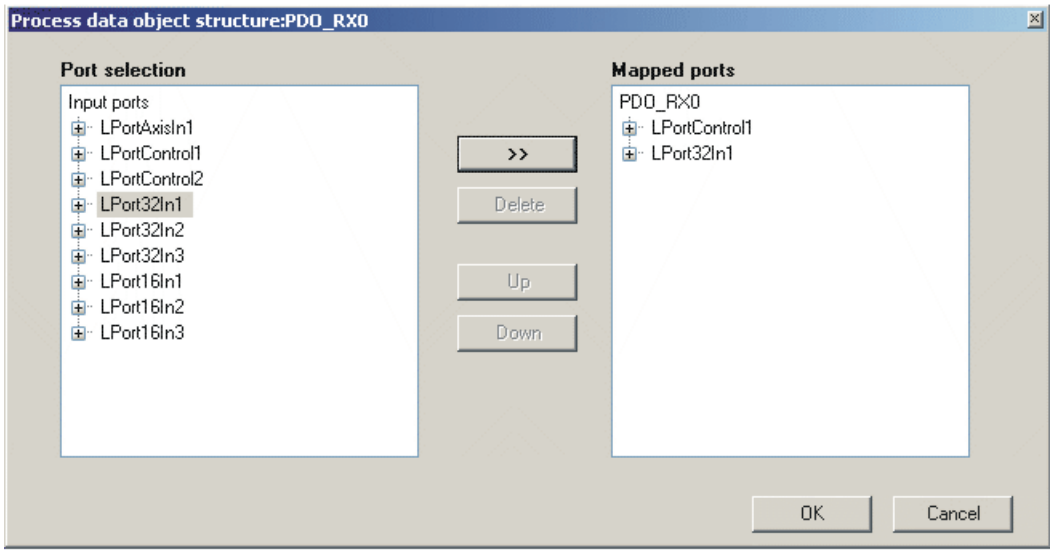
How to set the PDO mapping with the »Engineer«:



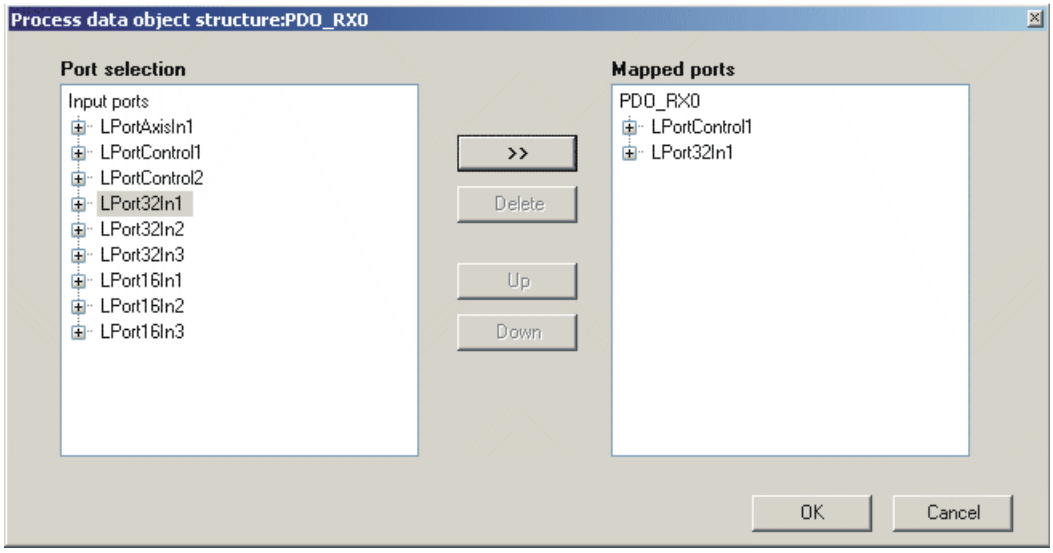
1. The I/O data mapping to the port variables is executed in the »Engineer« under the **Process data objects** tab of the corresponding fieldbus communication module:

2. Select the **PDO_RX0** receive object:

3. Click the **Edit PDO** button. The selection window **Process data object structure: PDO_RX0** will open:



Here you can transfer the individual ports from the **Port Selection** list to the "PDO_RX0" receive PDO by clicking the **>>** button.



The **Up** and **Down** buttons serve to shift the sequence of the ports within the PDOs.

Note

Port mapping is no configuration that can be carried out online for the Servo Drive 9400 HighLine. The »Engineer« project must always be updated and the application must always be downloaded afterwards.

The following example shows the mapping of the ports "LPortControl1" and "Lport32In1" into the reception PDO "PDO_RX0" and the mapping of the ports "LPortStatus1" and "LPort32Out1" into the transmission PDO "PDO_TX0":

4. Confirm the selection with **OK**.
5. Repeat the steps 2. to 4. for the transmit object **PDO_TX0**.
6. Then link the ports to application signals in the technology application selected.

   If the »FB Editor« is not enabled, this action can be carried out in the multiplexer codes (> C03000).

   If the »FB-Editor« is enabled, the multiplexer codes (> C03000) are no longer available. In this case, the interconnection must be executed directly in the »FB Editor«.

8 Monitoring

8.1 Interruption of the DeviceNet communication

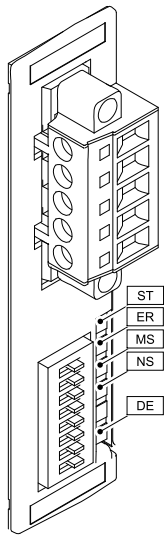
An interruption of the DeviceNet communication, e.g. by a cable break or a failure of the host (PLC, scanner), is detected by the communication module.

Responses to communication faults can be set in the DeviceNet object Lenze Class (0x65 / 101) (📖 74) or under the **Monitoring** tab:

Settings		Description
1	**Idle Mode**	The scanner does not transmit any I/O data if it is in idle state. If the device (communication module) is in the idle state, the response parameterised here (C13880/1 / C14880/1) is activated in the drive.
2	**I/O connection timeout**	The data transmission of the poll or CoS/Cyclic I/O connections can be monitored by timeouts. The timeout values are configured within the Connection Class (0x05 / 5) (📖 70) - instance 2 (poll I/O) or instance 4 (CoS/Cyclic I/O), attribute 9. After the monitoring time has elapsed, the response parameterised here (C13880/2 / C14880/2) is activated in the drive.
3	**Communication error**	The device (communication module) automatically recognises communication faults. If a communication fault is active, the response parameterised here (C13880/3 / C14880/3) is activated in the drive.

8.2 Fault with regard to internal communication

The response to a communication error between the communication module and the standard device can be set via these codes:



- C01501 (module in slot MXI1)
- C01502 (module in slot MXI2).

9 Diagnostics

The LEDs on the front of the communication module are provided for the purpose of fault diagnostics.

Furthermore, you can query the current module status (C13861 / C14861) and the current network status (C13862 / C14862) via codes.

9.1 LED status displays

LED status display	Pos.	Colour/Status		Description
 E94YCDN007	**ST**	Green is lit		The communication module is supplied with voltage and has established a connection to the standard device.
		Green is blinking		The communication module is supplied with voltage, but has no connection to the basic device (basic device is either switched off, in the initialisation phase, or not available).
	ER	Red is lit		There is an error in the area of the communication module.
	MS	**green**	**red**	
		off	off	The communication module is not being supplied with voltage.
		off	on	The communication module is defective and must be replaced.
		off	blinking	The communication module has a fault that can be rectified.
		on	off	The communication module is working perfectly.
		blinking	off	The communication module has not been completely configured or the configuration is defective.
		blinking	blinking	The communication module is currently undergoing a self-test.
	NS	**green**	**red**	
		off	off	The communication module is not supplied with voltage via DeviceNet or the "Duplicate MAC ID" test has not been completed yet.
		off	on	The communication module cannot access the bus (e.g. "Duplicate MAC ID", bus off, invalid baud rate, etc.).
		off	blinking	The communication module has a fault that can be rectified.
		on	off	The communication module is working perfectly and has established a connection to the scanner.
		blinking	off	The communication module ... • is working correctly; • has performed the "Duplicate MAC ID" test; • has not been connected to the scanner yet.
		blinking	blinking	The communication module ... • is in an error status; • received a telegram to identify the faulty nodes (Identify Communication Faulted Request).
	DE	Red is lit		The communication module is not accepted by the standard device (see notes in the documentation for the standard device).

9.2 Polling the current module status

C13861 / C14861 shows the current module status of the DeviceNet node:

Value C13861/C14861	Module status	Description
0	Nonexistent	No online value available (communication module is offline).
1	Device Self Test	The communication module is currently undergoing a self-test.
2	Device Operational	The communication module is working perfectly.
3	Device in Standby	The communication module has not been completely configured yet or the configuration is incorrect.
4	Minor Fault	The communication module has a fault that can be rectified.
5	Unrecoverable Fault	The communication module is defective and must be replaced.

9.3 Polling the current network status

C13862 / C14862 shows the current network status of the DeviceNet node:

Value C13862/C14862	Module status	Description
0	Nonexistent	No online value available (communication module is offline).
1	Not online	• The communication module is not supplied with voltage via DeviceNet. • The Duplicate MAC ID test has not been completed yet.
2	Link OK	The communication module is working perfectly and has established a connection to the scanner.
3	Online / Not connected	The communication module • is working correctly; • has performed the Duplicate MAC ID test; • has not been connected to the scanner yet.
4	Minor Fault	The communication module has a fault that can be rectified.
5	Critical Link Failure	The communication module cannot access the fieldbus (e.g. Duplicate MAC ID, Bus Off, invalid baud rate etc.).

10 Error messages

This chapter supplements the error list in the reference manual and the »Engineer« online help for the Servo Drive 9400 by the error messages of the communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

10.1 Short overview of the DeviceNet error messages

The following table lists all DeviceNet error messages in the numerical order of the error numbers. Furthermore, the preset error response and – if available – the parameter for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Designation	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c85532	13129010	DeviceNet: Memory: Error when reading	6: Information	-
0x00c85533	13129011	DeviceNet: Memory: Error when writing	6: Information	-
0x00c86010	13131792	DeviceNet: Restart by watchdog reset	1: Fault	-
0x00c86011	13131793	DeviceNet: Internal error	1: Fault	-
0x00c86101	13132033	DeviceNet: Internal error	1: Fault	-
0x00c86110	13132048	DeviceNet: Internal mapping error	4: Warning locked	-
0x00c8641f	13132831	DeviceNet: Parameter set invalid	1: Fault	-
0x00c86420	13132832	DeviceNet: Error: Lenze setting loaded	1: Fault	-
0x00c88111	13140241	DeviceNet: Time-out I/O connection	0: No Response	C13880/2 / C14880/2
0x00c88112	13140242	DeviceNet: Explicit Message time-out	6: Information	-
0x00c88121	13140257	DeviceNet: Communication error	0: No Response	C13880/3 / C14880/3
0x00c88132	13140274	DeviceNet: Idle mode	0: No Response	C13880/1 / C14880/1
0x00c88141	13140289	DeviceNet: Online	6: Information	-
0x00c88211	13140497	DeviceNet: Consumed I/O data length inconsistent	5: Warning	-
0x00c88212	13140498	DeviceNet: Produced I/O data length inconsistent	5: Warning	-

10.2 Possible causes and remedies

This chapter lists all DeviceNet error messages in the numerical order of the error numbers. Possible causes and remedies as well as responses to the error messages are described in detail.

DeviceNet: Memory: Error when reading [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be read.	Send the module to Lenze and include a description of the error.

DeviceNet: Memory: Error when writing [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be written.	Send the module to Lenze and include a description of the error.

DeviceNet: Restart by watchdog reset [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ system fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Defective module	Send the module to Lenze and include a description of the error.

DeviceNet: Internal error [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ system fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Defective module	Send the module to Lenze and include a description of the error.

DeviceNet: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ system fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error	Send the module to Lenze and include a description of the error.

DeviceNet: Internal mapping error [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
More than 64 bytes have been mapped	Carry out Configuring I/O data (PDO mapping) (📖 36) again.

DeviceNet: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ system fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Download application again (including module).

DeviceNet: Error: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access to parameter set in memory module via standard device was not successful.	Download application again (including module).

DeviceNet: Idle mode [0x00c88132]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
The host (PLC, scanner) is in the "Program" mode (RUN bit in the Scanner Command Register has not been set).	Set the host (PLC, scanner) to "Run" mode.

DeviceNet: Timeout I/O Connection [0x00c88111]

Response (Lenze setting printed in bold)	**Setting:** C13880/2 / C14880/2 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
Timeout of the poll or CoS/Cyclic I/O connection	Check the Expected Packet Rate in class 5, instance 2 (Poll I/O)/instance 4 (CoS/Cyclic I/O), attribute 9

DeviceNet: Explicit Message Timeout [0x00c88112]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Time-out of the Explicit Message connection	Check the Expected Packet Rate in class 5, instance 1 (Explicit Message), attribute 9

DeviceNet: Communication error [0x00c88121]

Response (Lenze setting printed in bold)	**Setting:** C13880/3 / C14880/3 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
A communication error occurred	Check cables and terminals.

DeviceNet: Online [0x00c88141]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
The DeviceNet is online	-

DeviceNet: Consumed I/O data length is contradictory [0x00C88211]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
The number of consumed I/O data via DeviceNet does not correspond to the number configured by the standard device through port mapping (displayed in C13854/1 / C14854/1)	Check whether the differing data length is sufficient for the application. If required, adapt the port mapping or the data length of the I/O data consumed via C13883 / C14883).

DeviceNet: Produced I/O data length is contradictory [0x00C88212]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
The number of produced I/O data via DeviceNet does not correspond to the number configured by the standard device through port mapping (displayed in C13855/1 / C14855/1)	Check whether the differing data length is sufficient for the application. If required, adapt the port mapping or the data length of the I/O data produced via C13884 / C14884).

10.3 DeviceNet error messages

Code [hex]	Error designation	Description
0x00	SUCCESS	No fault
0x02	RESOURCE UNAVAILABLE	Resource required to perform the service not available.
0x03	INVALID PARAM VALUE	Invalid parameter value
0x08	SERVICE NOT SUPP	Service is not supported.
0x09	INVALID ATTRIB VALUE	Invalid attribute.
0x0B	ALREADY IN STATE	The object is already in the required state.
0x0C	OBJ STATE CONFLICT	The object cannot perform the service.
0x0E	ATTR NOT SETTABLE	The attribute is write-protected.
0x0F	PRIVILEGE VIOLATION	Access denied.
0x10	DEVICE STATE CONFLICT	The current state of the device prohibits performing the requested service.
0x11	REPLY DATA TOO LARGE	The response data are longer than the response buffer
0x13	NOT ENOUGH DATA	The data length is too short.
0x14	ATTRIBUTE NOT SUPP	The attribute is not supported.
0x15	TOO MUCH DATA	The data length is too long.
0x16	OBJECT DOES NOT EXIST	The device does not support the object.
0x17	FRAGMENTATION	The fragmentation for the requested service is currently not activated.
0x20	INVALID PARAMETER	Invalid parameter

11 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the reference manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCDN (DeviceNet) communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on parameters.

11.1 Communication-relevant parameters of the standard device

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device config.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response for an impermissible device configuration

3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

11.2 Parameters of the communication module for the MXI1 slot

In this chapter the parameters of the E94AYCDN communication module (DeviceNet) for slot MXI1 of the Servo Drive 9400 are listed in numerically ascending order.

C13231

Parameter | Name: **C13231 | Service code**			Data type: UNSIGNED_64 Index: 11344 = 0x2C50
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Subcodes	**Lenze setting**		**Info**
C13231/1	0		
...	0		
C13231/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13489

Parameter | Name: **C13489 | Service code**			Data type: UNSIGNED_8 Index: 11086 = 0x2B4E
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C13489/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13531

Parameter | Name: **C13531 | Service code**			Data type: UNSIGNED_64 Index: 11044 = 0x2B24
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Subcodes	**Lenze setting**		**Info**
C13531/1	0		
...	0		
C13531/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13789

Parameter | Name: **C13789 | Service code**			Data type: UNSIGNED_8 Index: 10786 = 0x2A22
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C13789/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13850

Parameter | Name: **C13850 | All words to scanner**			Data type: UNSIGNED_16 Index: 10725 = 0x29E5
Display of the process data words transferred from the communication module to the scanner. In the subcodes 1 to 32, all process data words to the scanner are displayed. However, only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13850/1			
...			
C13850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13851

Parameter | Name: **C13851 | All words from scanner**			Data type: UNSIGNED_16 Index: 10724 = 0x29E4
Display of the process data words transferred from the scanner to the communication module. In the subcodes 1 to 32, all process data words from the scanner are displayed. However, only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13851/1			
...			
C13851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13852

Parameter | Name: **C13852 | All words to the basic device**			Data type: UNSIGNED_16 Index: 10723 = 0x29E3
Display of the process data words 1 to 32 that are transferred from the communication module to the standard device. In the subcodes 1 to 32, all process data words from the communication module are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13852/1			
...			
C13852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13853

Parameter | Name: **C13853 | All words to the basic device**			Data type: UNSIGNED_16 Index: 10722 = 0x29E2
Display of the process data words 1 to 32 that are transferred from the standard device to the communication module. In the subcodes 1 to 32, all process data words from the standard device are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13853/1			
...			
C13853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13854

Parameter | Name: **C13854 | Length of ports mapped into receive PDO**			Data type: UNSIGNED_8 Index: 10721 = 0x29E1
Display of the total data length (in bytes) of the ports that have been mapped into the receive PDO.			
Display area (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13854/1			Length of ports mapped into receive PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13855

Parameter | Name: **C13855 | Length of ports mapped into send PDO**			Data type: UNSIGNED_8 Index: 10720 = 0x29E0
Display of the total data length (in bytes) of the ports that have been mapped into the send PDO.			
Display area (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13855/1			Length of ports mapped into send PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13861

Parameter | Name: **C13861 | Module state**		Data type: UNSIGNED_16 Index: 10714 = 0x29DA
Display of the current module state		
Selection list (read only)		**Info**
0	Nonexistent	No online value available (communication module is offline).
1	Device Self Test	The communication module is currently undergoing a self-test.
2	Device Operational	The communication module is working perfectly.
3	Device in Standby	The communication module has not been completely configured yet or the configuration is incorrect.
4	Minor Fault	The communication module has a fault that can be rectified.
5	Unrecoverable Fault	The communication module is defective and must be replaced.
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13862

Parameter | Name: **C13862 | Network status**		Data type: UNSIGNED_16 Index: 10713 = 0x29D9
Display of the current network status of the DeviceNet node		
Selection list (read only)		**Info**
0	Nonexistent	No online value available (communication module is offline).
1	Not online	• The communication module is not supplied with voltage via DeviceNet. • The Duplicate MAC ID test has not been completed yet.
2	Link OK	The communication module is working perfectly and has established a connection to the scanner.
3	Online / Not connected	The communication module • is working correctly; • has performed the Duplicate MAC ID test; • has not been connected to the scanner yet.
4	Minor Fault	The communication module has a fault that can be rectified.
5	Critical Link Failure	The communication module cannot access the fieldbus (e.g. Duplicate MAC ID, Bus Off, invalid baud rate etc.).
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13863

Parameter | Name: **C13863 | Baud rate**		Data type: UNSIGNED_8 Index: 10712 = 0x29D8
Display of the baud rate		
Selection list (read only)		
0	125.00 kbps	
1	250.00 kbps	
2	500.00 kbps	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13864

Parameter | Name: **C13864 | Active MAC ID**			Data type: UNSIGNED_8 Index: 10711 = 0x29D7
Display of the active MAC ID			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13880

Parameter | Name: **C13880 | Response in the case of comm. fault**		Data type: UNSIGNED_8 Index: 10695 = 0x29C7
Monitoring response in the case of communication fault A change in the monitoring response becomes immediately effective.		
Selection list		
0	No Response	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
Subcodes	**Lenze setting**	**Info**
C13880/1	0: No Response	Idle Mode
C13880/2	0: No Response	Timeout I/O connection
C13880/3	0: No Response	Communication error
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13883

Parameter | Name: **C13883 | Data length of consumed I/O data**			Data type: UNSIGNED_8 Index: 10692 = 0x29C4
Setting of the data length (in bytes) of the I/O data received by the device via DeviceNet. **Note:** • If the data length is changed, the DeviceNet scanner will be informed about this change (consumed data size). • If the data length is reduced, it must be checked before whether the intended data length is sufficient for the application. • If the data length of the consumed I/O data does not correspond to the length of the mapped ports which is specified by the drive via PDO mapping, the DeviceNet: Consumed I/O data length is contradictory [0x00C88211] (📖 46) error message is generated and entered as a warning into the logbook of the standard device. • If the number of consumed I/O data deviates from the Lenze setting (4 bytes), the "Automap on Add" function in the scanner configuration dialog of the »RSNetWorx« software has to be deactivated and the number of the process data words has to be adapted via the "Edit I/O parameters" button.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		64	**4**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13884

Parameter | Name: **C13884 | Data length of produced I/O data**			Data type: UNSIGNED_8 Index: 10691 = 0x29C3
Setting of the data length (in bytes) of the I/O data to be transmitted by the device via DeviceNet. **Note:** • If the data length is changed, the DeviceNet scanner will be informed about this change (produced data size). • If the data length is reduced, it must be checked before if the intended data length is sufficient for the application. • If the data length of the produced I/O data does not correspond to the length of the mapped ports which is specified by the drive via PDO mapping, the DeviceNet: Produced I/O data length is contradictory [0x00C88212] (📖 46) error message is generated and entered as a warning into the logbook of the standard device. • If the number of produced I/O data deviates from the Lenze setting (4 bytes), the "Automap on Add" function in the scanner configuration dialog of the »RSNetWorx« software has to be deactivated and the number of the process data words has to be adapted via the "Edit I/O parameters" button.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		64	**4**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13885

Parameter | Name: **C13885 | Delete process data**	Data type: UNSIGNED_8 Index: 10690 = 0x29C2
Setting of the process data which must be further processed by the drive to maintain internal communication if the current network status (C13862) is "Minor Fault" or "Critical Link Failure".	
Selection list (Lenze setting printed in bold)	
0	Use of the latest scanner I/O data
1	**I/O data are set to a value of '0'**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13900

Parameter | Name: **C13900 | Firmware: Product type**	Data type: VISIBLE_STRING Index: 10675 = 0x29B3
Display of the product type (string with a length of 8 bytes) The following identification code will be output: "E94AFCDN"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13901

Parameter | Name: **C13901 | Firmware: Compilation date**	Data type: VISIBLE_STRING Index: 10674 = 0x29B2
Display of the firmware compilation date (string with a length of 20 bytes) The date ("MMM DD YYYY") and time ("hh:mm:ss") will be provided, e.g. "Mar 21 2005 12:31:21".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13902

Parameter | Name: **C13902 | Firmware: Version**	Data type: VISIBLE_STRING Index: 10673 = 0x29B1
Display of the firmware version (string with a length of 5 bytes) The identification code will be output, e.g. "01.11".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13920

Parameter | Name: **C13920 | Display: DIP switch position**	Data type: UNSIGNED_8 Index: 10655 = 0x299F
Display of the current DIP switch position • The value displayed corresponds to the sum of the DIP switch values (MAC ID: 1 ... 32, baud: 1 and 2). • The active MAC ID is displayed in C13864. • The active baud rate is displayed in C13863. ▸ Possible settings via DIP switch (📖 32)	

Display area (min. value | unit | max. value)		
0		255

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

11.3 Parameters of the communication module for the MXI2 slot

In this chapter the parameters of the E94AYCDN communication module (DeviceNet) for slot MXI2 of the Servo Drive 9400 are listed in numerically ascending order.

C14231

Parameter | Name: **C14231 | Service code**			Data type: UNSIGNED_64 Index: 10344 = 0x2868
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Subcodes	**Lenze setting**		**Info**
C14231/1	0		
...	0		
C14231/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14489

Parameter | Name: **C14489 | Service code**			Data type: UNSIGNED_8 Index: 10086 = 0x2766
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C14489/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14531

Parameter | Name: **C14531 | Service code**			Data type: UNSIGNED_64 Index: 10044 = 0x273C
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Subcodes	**Lenze setting**		**Info**
C14531/1	0		
...	0		
C14531/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14789

Parameter | Name: **C14789 | Service code**			Data type: UNSIGNED_8 Index: 9786 = 0x263A
This code is ... • **used device-internally and may not be written by the user.** • **only displayed from »Engineer« version 2.9.**			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C14789/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14850

Parameter | Name: **C14850 | All words to scanner**			Data type: UNSIGNED_16 Index: 9725 = 0x25FD
Display of the process data words transferred from the communication module to the scanner. In the subcodes 1 to 32, all process data words to the scanner are displayed. However, only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14850/1			
...			
C14850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14851

Parameter | Name: **C14851 | All words from scanner**			Data type: UNSIGNED_16 Index: 9724 = 0x25FC
Display of the process data words transferred from the scanner to the communication module. In the subcodes 1 to 32, all process data words from the scanner are displayed. However, only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14851/1			
...			
C14851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14852

Parameter | Name: **C14852 | All words to standard device**			Data type: UNSIGNED_16 Index: 9723 = 0x25FB
Display of the process data words 1 to 32 that are transferred from the communication module to the standard device. In the subcodes 1 to 32, all process data words from the communication module are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14852/1			
...			
C14852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14853

Parameter | Name: **C14853 | All words from standard device**			Data type: UNSIGNED_16 Index: 9722 = 0x25FA
Display of the process data words 1 to 32 that are transferred from the standard device to the communication module. In the subcodes 1 to 32, all process data words from the standard device are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14853/1			
...			
C14853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14854

Parameter | Name: **C14854 | Length of ports mapped into receive PDO**			Data type: UNSIGNED_8 Index: 9721 = 0x25F9
Display of the total data length (in bytes) of the ports that have been mapped into the receive PDO.			
Display area (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14854/1			Length of ports mapped into receive PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14855

Parameter | Name: **C14855 | Length of ports mapped into send PDO**			Data type: UNSIGNED_8 Index: 9720 = 0x25F8
Display of the total data length (in bytes) of the ports that have been mapped into the send PDO.			
Display area (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14855/1			Length of ports mapped into send PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14861

Parameter | Name: **C14861 | Module state**		Data type: UNSIGNED_16 Index: 9714 = 0x25F2
Display of the current module state		
Selection list (read only)		**Info**
0	Nonexistent	No online value available (communication module is offline).
1	Device Self Test	The communication module is currently undergoing a self-test.
2	Device Operational	The communication module is working perfectly.
3	Device in Standby	The communication module has not been completely configured yet or the configuration is incorrect.
4	Minor Fault	The communication module has a fault that can be rectified.
5	Unrecoverable Fault	The communication module is defective and must be replaced.
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14862

Parameter | Name: **C14862 | Network status**		Data type: UNSIGNED_16 Index: 9713 = 0x25F1
Display of the current network status of the DeviceNet node		
Selection list (read only)		**Info**
0	Nonexistent	No online value available (communication module is offline).
1	Not online	• The communication module is not supplied with voltage via DeviceNet. • The Duplicate MAC ID test has not been completed yet.
2	Link OK	The communication module is working perfectly and has established a connection to the scanner.
3	Online / Not connected	The communication module • is working correctly; • has performed the Duplicate MAC ID test; • has not been connected to the scanner yet.
4	Minor Fault	The communication module has a fault that can be rectified.
5	Critical Link Failure	The communication module cannot access the fieldbus (e.g. Duplicate MAC ID, Bus Off, invalid baud rate etc.).
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14863

Parameter | Name: **C14863 | Baud rate**		Data type: UNSIGNED_8 Index: 9712 = 0x25F0
Display of the baud rate		
Selection list (read only)		
0	125.00 kbps	
1	250.00 kbps	
2	500.00 kbps	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14864

Parameter | Name: **C14864 | Active MAC ID**			Data type: UNSIGNED_8 Index: 9711 = 0x25EF
Display of the active MAC ID			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14880

Parameter | Name: **C14880 | Response in the case of comm. fault**		Data type: UNSIGNED_8 Index: 9695 = 0x25DF
Monitoring response in the case of communication fault A change in the monitoring response becomes immediately effective.		
Selection list		
0	No Response	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
Subcodes	**Lenze setting**	**Info**
C14880/1	0: No Response	Idle Mode
C14880/2	0: No Response	Timeout I/O connection
C14880/3	0: No Response	Communication error
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14883

Parameter | Name: **C14883 | Data length of I/O data consumed**			Data type: UNSIGNED_8 Index: 9692 = 0x25DC
Setting of the data length (in bytes) of the I/O data received by the device via DeviceNet. **Note:** • If the data length is changed, the DeviceNet scanner will be informed about this change (consumed data size). • If the data length is reduced, it must be checked before whether the intended data length is sufficient for the application. • If the data length of the consumed I/O data does not correspond to the length of the mapped ports which is specified by the drive via PDO mapping, the DeviceNet: Consumed I/O data length is contradictory [0x00C88211] (📖 46) error message is generated and entered as a warning into the logbook of the standard device. • If the number of consumed I/O data deviates from the Lenze setting (4 bytes), the "Automap on Add" function in the scanner configuration dialog of the »RSNetWorx« software has to be deactivated and the number of the process data words has to be adapted via the "Edit I/O parameters" button.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		64	**4**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14884

Parameter | Name: **C14884 | Data length of produced I/O data**			Data type: UNSIGNED_8 Index: 9691 = 0x25DB
Setting of the data length (in bytes) of the I/O data to be transmitted by the device via DeviceNet. **Note:** • If the data length is changed, the DeviceNet scanner will be informed about this change (produced data size). • If the data length is reduced, it must be checked before if the intended data length is sufficient for the application. • If the data length of the produced I/O data does not correspond to the length of the mapped ports which is specified by the drive via PDO mapping, the DeviceNet: Produced I/O data length is contradictory [0x00C88212] (📖 46) error message is generated and entered as a warning into the logbook of the standard device. • If the number of produced I/O data deviates from the Lenze setting (4 bytes), the "Automap on Add" function in the scanner configuration dialog of the »RSNetWorx« software has to be deactivated and the number of the process data words has to be adapted via the "Edit I/O parameters" button.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		64	**4**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14885

Parameter | Name: **C14885 | Delete process data**		Data type: UNSIGNED_8 Index: 9690 = 0x25DA
Setting of the process data which must be further processed by the drive to maintain internal communication if the current network status (C14862) is "Minor Fault" or "Critical Link Failure".		
Selection list (Lenze setting printed in bold)		
0	Use of the latest scanner I/O data	
1	**I/O data are set to a value of '0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14900

Parameter | Name: **C14900 | Firmware: Product type**	Data type: VISIBLE_STRING Index: 9675 = 0x25CB
Display of the product type (string with a length of 8 bytes) The following identification code will be output: "E94AFCDN"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14901

Parameter | Name: **C14901 | Firmware: Compilation date**	Data type: VISIBLE_STRING Index: 9674 = 0x25CA
Display of the firmware compilation date (string with a length of 20 bytes) The date ("MMM DD YYYY") and time ("hh:mm:ss") will be provided, e.g. "Mar 21 2005 12:31:21".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14902

Parameter | Name: **C14902 | Firmware: Version**	Data type: VISIBLE_STRING Index: 9673 = 0x25C9
Display of the firmware version (string with a length of 5 bytes) The identification code will be output, e.g. "01.11".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14920

Parameter | Name: **C14920 | Display: DIP switch position**			Data type: UNSIGNED_8 Index: 9655 = 0x25B7
Display of the current DIP switch position • The value displayed corresponds to the sum of the DIP switch values (MAC ID: 1 ... 32, baud: 1 and 2). • The active MAC ID is displayed in C14864. • The active baud rate is displayed in C14863. ▸ Possible settings via DIP switch (📖 32)			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

11.4 Table of attributes

The table of attributes contains information required for communicating with the drive via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte, without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit required	☑ Writing only possible in the case of controller inhibit	

Table of attributes

12 Implemented DeviceNet objects

A DeviceNet node can be seen as an accumulation of objects. An individual object is characterised by its class, its instances and attributes. Several services such as read and write services can be applied to these objects.

Overview of implemented objects

Object	Index		Description
	[hex]	[dec]	
Identity Class	0x01	1	Identification and general information relating to the device
DeviceNet Class	0x03	3	Settings for the DeviceNet communication
Assembly Class	0x04	4	Input/output data of the scanner
Connection Class	0x05	5	Connection settings: • Explicit messages • Poll I/O • CoS/cyclic I/O
Acknowledge Handler Class	0x2B	43	Feedback/confirmation settings
Lenze Class (manufacturer-specific class)	0x65	101	Setting of error responses to communication faults
	0x66	102	Setting of the data lengths for I/O data consumed and produced.
	0x67	103	I/O image of the data produced (process input data of the scanner)
	0x68	104	I/O image of the data consumed (process output data of the scanner)
	0x6E	110	Access to Lenze codes

12.1 Identity Class (0x01 / 1)

This object contains some information regarding the identification and general information relating to the device.

Instance 1

Attribute	Service(s)	Designation	Data type	Value
1	GET	Vendor ID	UINT	445 (0x1BD)
2	GET	Device Type	UINT	0 (generic)
3	GET	Product Code	UINT	9400 (0x24B8)
4	GET	Revision	Struct of	
		Major Revision	USINT	1 (0x01)
		Minor Revision	USINT	1 (0x01)
5	GET	Status	WORD	Depending on the current state of the communication module
6	GET	Serial number	UDINT	Individually for the respective communication module
7	GET	Product Name	SHORT_STRING	E94AYCDN
10 [1)]	GET / SET	Heartbeat interval	USINT	0 ... 255 s (0x0 ... 0xFF) Lenze setting: 0 s (0x0)

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Services

Service code	Designation	Description
0x05	Reset	Reset of the communication module
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.2 DeviceNet Class (0x03 / 3)

This object contains some information relating to the DeviceNet communication.

Instance 0

Attribute	Service(s)	Designation	Data type	Value
1	GET	Revision	UINT	2 (0x02)

Instance 1

Attribute	Service(s)	Designation	Data type	Value
1	GET	MAC ID	USINT	0 ... 63 (0x0 ... 0x3F)
2	GET	Baud rate	USINT	0 ... 2 (0x0 ... 0x02)
3	GET	BOI	BOOL	0
4	GET / SET	Bus-off counter	USINT	0 ... 255 (0x0 ... 0xFF)
5	GET	Allocation information	Struct of	
		Allocation choice byte	BYTE	0 ... 63 (0x0 ... 0x3F)
		Scanner MAC ID	USINT	0 ... 63 (0x0 ... 0x3F)
8	GET	MAC ID switch value	USINT	0 ... 63 (0x0 ... 0x3F)
9	GET	Baud rate switch value	USINT	0 ... 2 (0x0 ... 0x02)

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute
0x4B	Allocate_Master/ Slave_Connection_Set	Requires the application of the "Predefined Master/Slave Connection Set"
0x4C	Release_Group_2_Identifier _Set	Connections via the "Predefined Master/Slave Connection Set" are deleted.

12.3 Assembly Class (0x04 / 4)

This object contains some information relating to input and output data of the scanner.

Instance 768 ... 832 (scanner input data)

Attribute	Service(s)	Designation	Data type	Instance/value
3 [1)]	GET / SET	Data	Array of BYTE	Instance 768 (0x300): 0 bytes to the scanner
				Instance 769 (0x301): 1 byte to the scanner
				Instance 770 (0x302): 2 bytes to the scanner
				Instance 771 (0x303): 3 bytes to the scanner
				...
				Instance 832 (0x340): 64 bytes to the scanner

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Instance 833 ... 897 (scanner output data)

Attribute	Service(s)	Designation	Data type	Instance/value
3	GET / SET	Data	Array of BYTE	Instance 833 (0x341): 0 bytes from the scanner
				Instance 834 (0x342): 1 byte from the scanner
				Instance 835 (0x343): 2 bytes from the scanner
				Instance 836 (0x344): 3 bytes from the scanner
				...
				Instance 897 (0x381): 64 bytes from the scanner

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.4 Connection Class (0x05 / 5)

This object contains some information relating to connection settings:

- "Explicit Messages" (instance 1)
- "Poll I/O" (instance 2)
- "CoS/Cyclic I/O" (instance 4)

Instance 1 ("Explicit Messages" connection)

Attribute	Service(s)	Designation	Data type	Value
1	GET	state	USINT	Status of the object 0: Nonexistent 1: Configuring 2: Waiting for connection ID 3: Established 4: Timed Out 5: Deferred Delete
2	GET	instance_type	USINT	0 (Explicit Message)
3	GET	transportClass_trigger	BYTE	131 (0x83)
4	GET	produced_connection_id	UINT	Transmitting CAN identifier
5	GET	consumed_connection_id	UINT	Receiving CAN identifier
6	GET	initial_comm_characteristics	BYTE	33 (0x21)
7	GET	produced_connection_size	UINT	132 (0x84) Maximum amount of data produced
8	GET	consumed_connection_size	UINT	132 (0x84) Maximum amount of data consumed
9 **1)**	GET / SET	expected_packet_rate	UINT	Connection-dependent Lenze setting: 2500 ms (0x9C4)
10	-	Not in use	-	Not defined
11	-	Not in use	-	Not defined
12 **1)**	GET / SET	watchdog_timeout_action	USINT	Defines time-out treatment • 1 = Auto Delete (Lenze setting) • 3 = Deferred Delete
13	GET	produced_connection_path_length	UINT	0
14	GET	produced_connection_path	EPATH	-
15	GET	consumed_connection_path_length	UINT	0
16	GET	consumed_connection_path	EPATH	-
17	GET	production_inhibit_time	UINT	0

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Instance 2 ("Poll I/O" connection)

Attribute	Service(s)	Designation	Data type	Value
1	GET	state	USINT	Status of the object 0: Nonexistent 1: Configuring 2: Waiting for connection ID 3: Established 4: Timed Out 5: Deferred Delete
2	GET	instance_type	USINT	1 (0x01)
3	GET	transportClass_trigger	BYTE	128/130 (0x80/0x82)
4	GET	produced_connection_id	UINT	Transmitting CAN identifier
5	GET	consumed_connection_id	UINT	Receiving CAN identifier
6	GET	initial_comm_characteristics	BYTE	1 (0x01)
7	GET	produced_connection_size	UINT	Depending on the number of I/O data words
8	GET	consumed_connection_size	UINT	Depending on the number of I/O data words
9 **1)**	GET / SET	expected_packet_rate	UINT	Connection-dependent
10	-	Not in use	-	Not defined
11	-	Not in use	-	Not defined
12	GET	watchdog_timeout_action	USINT	Defines time-out treatment (0 = Transition to Timed Out)
13	GET	produced_connection_path_length	UINT	7 (0x07)
14	GET	produced_connection_path	EPATH	0x20, 0x67, 0x25, 0x01, 0x00, 0x30, 0x01
15	GET	consumed_connection_path_length	UINT	7 (0x07)
16	GET	consumed_connection_path	EPATH	0x20, 0x68, 0x25, 0x01, 0x00, 0x30, 0x01
17	GET	production_inhibit_time	UINT	0

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Instance 4 ("CoS/Cyclic I/O" connection)

Attribute	Service(s)	Designation	Data type	Value
1	GET	state	USINT	Status of the object 0: Nonexistent 1: Configuring 2: Waiting for connection ID 3: Established 4: Timed Out 5: Deferred Delete
2	GET	instance_type	USINT	1 (0x01)
3	GET	transportClass_trigger	BYTE	18/0 (0x12/0x00)
4	GET	produced_connection_id	UINT	Transmitting CAN identifier
5	GET	consumed_connection_id	UINT	Receiving CAN identifier
6	GET	initial_comm_characteristics	BYTE	1 (0x01)
7	GET	produced_connection_size	UINT	Depending on the number of I/O data words
8	GET	consumed_connection_size	UINT	0
9 **1)**	GET / SET	expected_packet_rate	UINT	Connection-dependent
10	-	Not in use	-	Not defined
11	-	Not in use	-	Not defined
12	GET	watchdog_timeout_action	USINT	Defines time-out treatment (0 = Transition to Timed Out)
13	GET	produced_connection_path_length	UINT	7 (0x07)
14	GET	produced_connection_path	EPATH	0x20, 0x67, 0x25, 0x01, 0x00, 0x30, 0x01
15	GET	consumed_connection_path_length	UINT	7 (0x07)
16	GET	consumed_connection_path	EPATH	0x20, 0x68, 0x25, 0x01, 0x00, 0x30, 0x01
17 **1)**	GET / SET	production_inhibit_time	UINT	0 ... 65535 ms (0x0 ... 0xFFFF) Lenze setting: 0 ms (Inhibit Time deactivated)

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Services

Service code	Designation	Description
0x05	Reset	• Resetting the watchdog timer • The communication between the scanner and the device changes to the "Established State"
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.5 Acknowledge Handler Class (0x2B / 43)

This object contains some information relating to feedbacks/confirmations:

Instance 1

Attribute	Service(s)	Designation	Data type	Value
1 **1)**	GET / SET	Acknowledge Timer	UINT	1 ... 65534 ms (0x0001 ... 0xFFFE) Lenze setting: 16 ms (0x10)
2	GET	Retry Limit	USINT	1 ms (0x01)
3	GET	CoS Producing Connection Instance	UINT	4 (0x04)

1) The device commands "Load Lenze setting", "Save start parameters", and "Load start parameters" do not have an effect on this attribute.

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.6 Lenze Class (0x65 / 101)

This object contains some information regarding responses to communication faults.

▸ Interruption of the DeviceNet communication (📖 39)

Instance 0

Attribute	Service(s)	Designation	Data type	Value
1	GET	Revision	UINT	1 (0x01)

Instance 1

Attribute	Service(s)	Designation	Data type	Value
1	GET / SET	Response to "Idle Mode"	USINT	Corresponds to the value in C13880/1 / C14880/1: 0 = no response 1 = error 3 = quick stop by trouble 4 = warning locked 6 = information
2	GET / SET	Response to communication errors	USINT	Corresponds to the value in C13880/3 / C14880/3: 0 = no response 1 = error 3 = quick stop by trouble 4 = warning locked 6 = information
4	GET / SET	Response to I/O timeout	USINT	Corresponds to the value in C13880/2 / C14880/2: 0 = no response 1 = error 3 = quick stop by trouble 4 = warning locked 6 = information

Note

The parameters of the "0x65" class are described in the EDS file and therefore can be set directly in the properties dialog of the DeviceNet nodes under "Parameters" via the »RSNetWorx« Rockwell software.

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.7 Lenze Class (0x66 / 102)

This object contains some information relating to data lengths of the I/O data consumed and produced.

- Consumed I/O data: process data from the scanner to the drive (device)
- Produced I/O data: process data from the drive (device) to the scanner

Instance 0

Attribute	Service(s)	Designation	Data type	Value
1	GET	Revision	UINT	1 (0x01)

Instance 1

Attribute	Service(s)	Designation	Data type	Value
2	GET / SET	Data length of the I/O data consumed	USINT	Corresponds to the value in C13883 / C14883: 0 ... 64 (0x00 ... 0x40)
3	GET / SET	Data length of produced I/O data	USINT	Corresponds to the value in C13884 / C14884: 0 ... 64 (0x00 ... 0x40)

Note

The parameters of the "0x66" class are described in the EDS file and therefore can be set directly in the properties dialog of the DeviceNet nodes under "Parameters" via the »RSNetWorx« Rockwell software.

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.8 Lenze Class (0x67 / 103)

This object contains some information relating to the I/O image of the data produced (process input data of the scanner).

Instance 0

Attribute	Service(s)	Designation	Data type	Value
1	GET	Revision	UINT	1 (0x01)

Instance 1

Attribute	Service(s)	Designation	Data type	Value
1	GET	I/O image of the data produced (process input data of the scanner)	USINT	Connection-dependent

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute

12.9 Lenze Class (0x68 / 104)

This object contains some information relating to the I/O image of the data consumed (process output data of the scanner).

Instance 0

Attribute	Service(s)	Designation	Data type	Value
1	GET	Revision	UINT	1 (0x01)

Instance 1

Attribute	Service(s)	Designation	Data type	Value
1	GET / SET	I/O image of the data consumed (process output data of the scanner)	USINT	Connection-dependent

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.10 Lenze Class (0x6E / 110)

This object contains some information regarding the access to Lenze codes.

Instance 0

Attribute	Service(s)	Designation	Data type	Value
1	GET	Revision	UINT	1 (0x01)

Instance (Lenze code)

Attribute	Service(s)	Designation	Data type	Value
Lenze subcode	GET / SET	Access to Lenze code (0x6E)	Data type of the Lenze code	Value of the Lenze code/ subcode

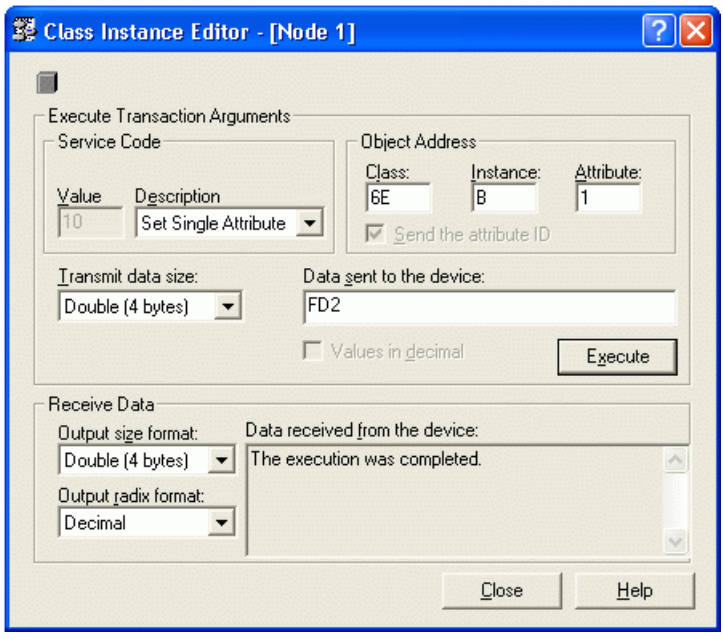
Note!

- If the corresponding Lenze code does not have a subcode, the value 1 must be entered in the attribute.
- A display code cannot be configured by the "SET" service.

Services

Service code	Designation	Description
0x0E	Get_Attribute_Single	Reading an attribute
0x10	Set_Attribute_Single	Writing an attribute

12.11 Examples for reading/writing with the »Class Instance Editor«



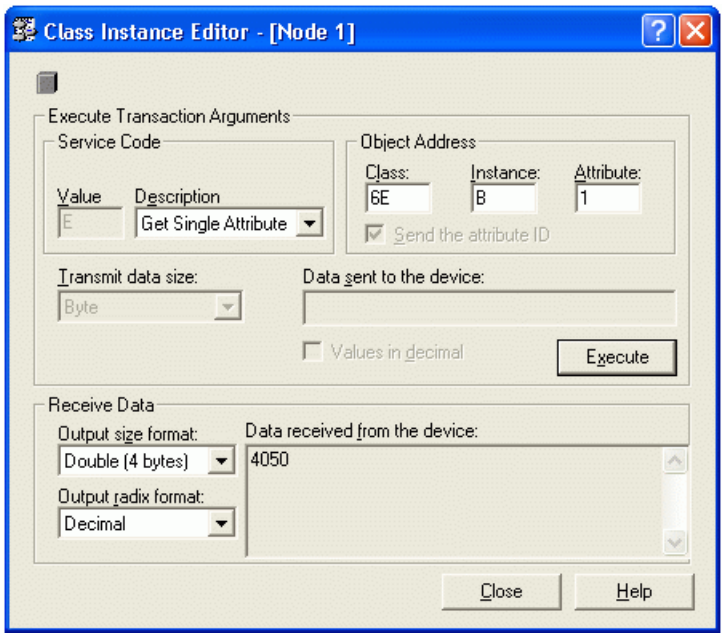
The »Class Instance Editor« is a function of the Rockwell software »RSNetWorx«.

12.11.1 Writing integer codes

The maximum speed (n_{max}) is to be set to 4500 rpm using code C00011.

Enter the following in the input fields of the »Class Instance Editor« (fig. [12-1]):

- Description: **Set Single Attribute** (write code)
- Class: **6E** (access to Lenze code)
- Instance: **B** (hex value of the code)
- Attribute: **1** (hex value of the subcode)
- ”Data sent to the device”:
  4500 = 4500 [min^{-1}] = **FD2** (speed as hex value)
- Transmit data size: **Double (4 bytes)**



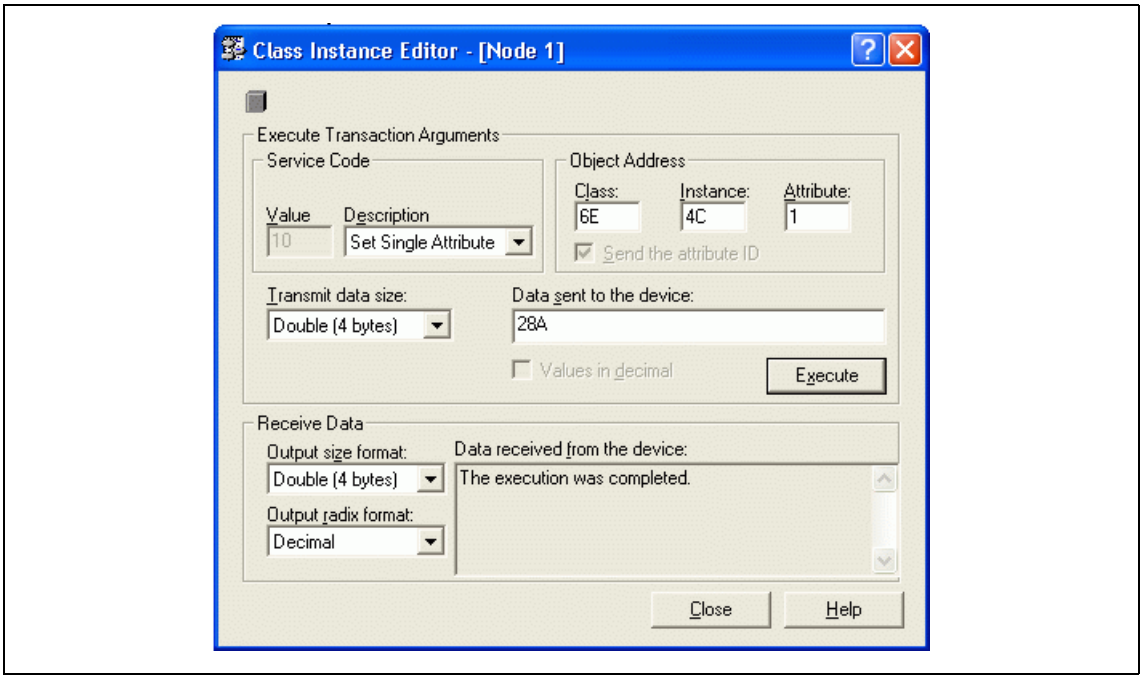
[12-1] »Class Instance Editor«: Writing integer codes

12.11.2 Reading integer codes

The maximum speed (n_{max}) is to be read from code C0011.

Enter the following in the input fields of the »Class Instance Editor« (fig. [12-2]):

- Description: **Get Single Attribute** (read code)
- Class: **6E** (access to Lenze code)
- Instance: **B** (hex value of the code)
- Attribute: **1** (hex value of the subcode)
- Output size format: **Double (4 bytes)**
- Output radix format: **Decimal**
- Read the decimal data that are returned:
  ”Data received from the device”: 4050 = 4050 [min^{-1}]



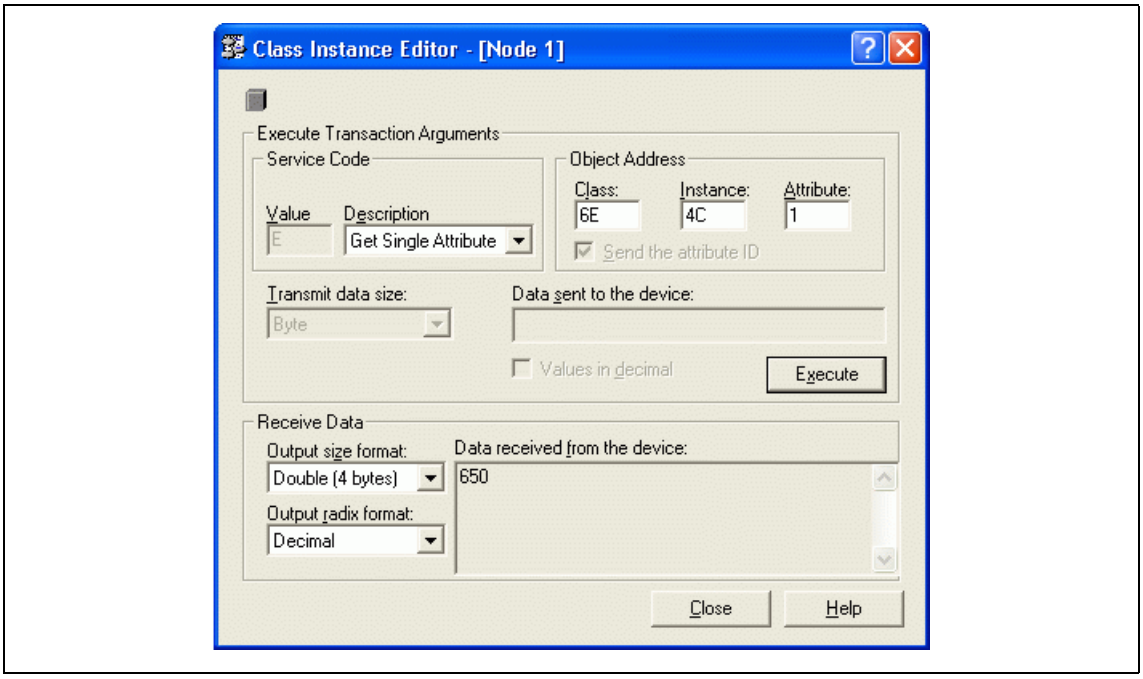
[12-2] »Class Instance Editor«: Reading integer codes

12.11.3 Writing codes with two decimal positions

The current controller reset time is to be set to 6.50 ms using code C00076.

Enter the following in the input fields of the »Class Instance Editor« (fig. [12-3]):

- Description: **Set Single Attribute** (write code)
- Class: **6E** (access to Lenze code)
- Instance: **4C** (hex value of the code)
- Attribute: **1** (hex value of the subcode)
- ”Data sent to the device”: **28A** = 650 → "6.50" is written.
- Transmit data size: **Double (4 bytes)**



[12-3] »Class Instance Editor«: Writing codes with two decimal positions

12.11.4 Reading codes with two decimal positions

The current controller reset time is to be read from code C00076.

Enter the following in the input fields of the »Class Instance Editor« (fig. [12-4]):

- Description: **Get Single Attribute** (read code)
- Class: **6E** (access to Lenze code)
- Instance: **4C** (hex value of the code)
- Attribute: **1** (hex value of the subcode)
- Output size format: **Double (4 bytes)**
- Output radix format: **Decimal**
- Read the decimal data that are returned:
  ”Data received from the device”: 650 → The code has the value "6.50" [ms].

[12-4] »Class Instance Editor«: Reading codes with two decimal positions

13 DIP switch positions for setting the station address

The station address results from the sum of the binary values of switches 1 ... 32.

The following table shows the switch positions for the valid address range 0 ... 63.

Station address (MAC ID	DIP switch					
	32	16	8	4	2	1
0	OFF	OFF	OFF	OFF	OFF	OFF
1	OFF	OFF	OFF	OFF	OFF	**ON**
2	OFF	OFF	OFF	OFF	**ON**	OFF
3	OFF	OFF	OFF	OFF	**ON**	**ON**
4	OFF	OFF	OFF	**ON**	OFF	OFF
5	OFF	OFF	OFF	**ON**	OFF	**ON**
6	OFF	OFF	OFF	**ON**	**ON**	OFF

1 About this documentation

Contents

This documentation only contains descriptions for the E94AYCET communication module (EtherCAT®).

Note!

This documentation supplements the **mounting instructions** supplied with the communication module and the **Servo Drives 9400 hardware manual**.

The mounting instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe any software provided by other manufacturers. No warranty can be given for corresponding data provided in this documentation. For information on how to use the software, please refer to the control system documents (Controller, EtherCAT master).

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information about EtherCAT can be found on the website of the EtherCAT Technology Group:

www.ethercat.org

Target group

This documentation addresses to persons who configure, install, commission, and maintain the networking and remote maintenance of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.lenze.com

Information regarding the validity

The information given in this documentation applies to the following devices:

Extension module	Type designation	From hardware version	From software version upwards
EtherCAT communication module	E94AYCET	VE	03.00

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and the software version of the engineering tools installed (e.g. »Engineer«, »TwinCAT«), the screenshots in this documentation may differ from the actual screen representation.

1.1 Document history

Version			Description
10.2	11/2018	TD06	Corrections in chapter • Application as directed (📖 12)
10.1	08/2016	TD17	Safety over EtherCAT® logo added. • Terminology used (📖 8)
10.0	05/2016	TD17	• Update for software version 04.00 • Safety over EtherCAT (📖 81) • Information if the SM302 safety module is used
9.0	02/2014	TD17	General updates
8.0	01/2013	TD17	• Update for C13861 / C14861 (bus status) • New layout
7.0	07/2012	TD17	• General revision • Information about the EtherCAT register "AL Status Code" (📖 60) supplemented. • Chapter EtherCAT ADS communication parameters in »TwinCAT« and »Engineer« (📖 46) supplemented.
6.0	03/2011	TD17	General revision
5.0	11/2010	TD17	• General revision • Update for software version 03.00
4.0	04/2010	TD17	General revision
3.0	11/2009	TD17	Amendment of the information on the fieldbus synchronisation and general revision
2.0	07/2009	TD17	General revision
1.0	04/2008	TD17	First edition

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Highlighting	Examples/notes
Spelling of numbers		
Decimal	Normal spelling	Example: 1234
Decimal separator	Point	The decimal point is always used. For example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Blue text colour	All information that applies to from a certain software version of the device onwards is marked accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze »Engineer« PC software...
Control element	**Bold**	The **OK** button... / the **Copy** command... / the **Characteristics** tab... / the **Name** input field...
Sequence of menu commands		If several commands are required in succession for executing a function, the single commands are separated by an arrow: Select the **File → Open** command to...
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse-click in this online documentation.
Icons		
Page reference	(📖 9)	Optically highlighted reference to another page. It is activated with a mouse-click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning
Inverters	Lenze inverters of the "Servo Drives 9400" product series
Standard device	
Code	Parameter which serves to parameterise and monitor the inverter. In normal usage, the term is usually referred to as "Index".
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3"). In everyday language, the term is also referred to as "subindex".
CoE	CANopen over EtherCAT
Controllers	EtherCAT master
Control system	
DC	"Distributed clocks" for EtherCAT synchronisation
»Engineer«	Lenze PC software which supports you during the "Engineering" process (parameterisation, diagnostics, and configuration) throughout the whole life cycle, i. e. from planning to maintenance of the machine commissioned.
»PLC Designer«	
ESI	"EtherCAT slave information" (device description file in XML format)
EtherCAT	EtherCAT® (**Ether**net for **C**ontroller and **A**utomation **T**echnology) is an Ethernet-based fieldbus system which fulfils the application profile for industrial real-time systems. EtherCAT® is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany.
Safety over EtherCAT	Safety over EtherCAT® is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany.
"Hot connect"	This feature makes it possible to remove and connect slave field devices during operation.
HW	Hardware
I-1600.8	CoE index (hexadecimal representation) In the example: index 0x1600, subindex 8
Lenze setting	Default settings of the device, preconfigured ex works.
Standard setting	
PDO	Process data object
SDO	Service data object
SW	Software
»TwinCAT«	Beckhoff PC software for EtherCAT configuration

1.4 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Structure of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another documentation

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

If the following basic safety measures are disregarded, severe injuries to persons and damage to material assets may result.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 12)
- must never be commissioned if they display any signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- during and after operation can have live, moving and rotating parts, depending on their degree of protection. Surfaces can be hot.

For Lenze drive components ...

- only use the accessories approved.
- only use genuine spare parts supplied by the manufacturer of the product.

observe all specifications contained in the enclosed documentation and related documentation.

- This is the precondition for safe and trouble-free operation and for obtaining the product features specified.
  ▸ Product features (📖 13)
- The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

All work with or on Lenze drive components and automation components must be carried out only by qualified specialist personnel. According to IEC 60364 or CENELEC HD 384, these are persons ...

- are familiar with installing, mounting, commissioning, and operating the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).
  ▸ External voltage supply (📖 29)
- A safety bus system (FSoE) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.
- Only use cables that meet the specifications listed.
  ▸ Ethernet cable specification (📖 27)

Documentation for the standard device, control system, system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.
▸ Protective insulation (📖 16)

Device protection

The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 22)

3 Product description

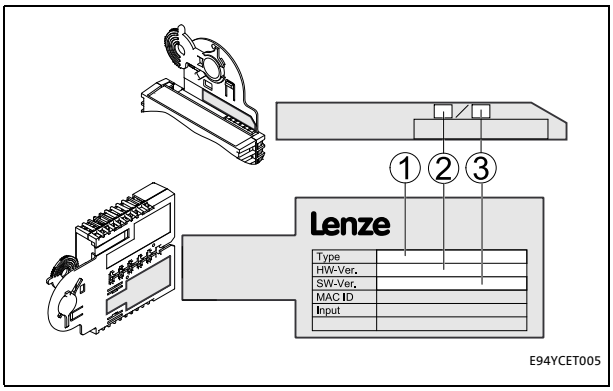
3.1 Application as directed

The communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:

Product series	Type designation	From hardware version	From software version upwards
Servo Drives 9400 HighLine	E94AxHxxxx	VA	01.51
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
regenerative power supply module commissioning guidelines	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- may only be used in EtherCAT networks.



Any other use shall be deemed inappropriate!

From SW version 04.00, it is possible to communicate via FSoE in connection with a **SM302** safety module:

Product series	Type designation	From hardware version	From software version upwards
SM302 safety module	E94AYAF	VA	1.0

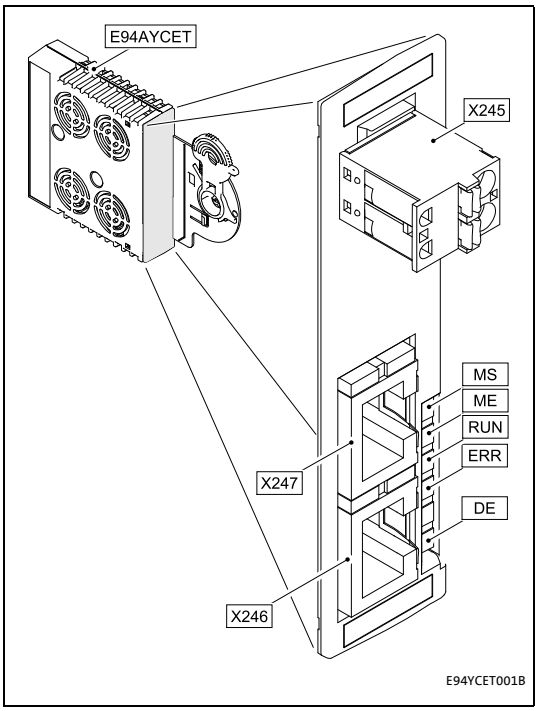
3.2 Identification

The type designation and the hardware and software versions of the communication module are indicated on the nameplate:

[3-1] Identification data

1 Type designation (type)

E94 Product series
A Version
Y Module identification: Extension module
C Module type: Communication module
ET EtherCAT



2 Hardware version (HW)

3 Software version (SW)

3.3 Product features

- Interface module for the EtherCAT communication system to be connected to the expansion slots of the Servo Drives 9400
- The communication module can either be supplied internally by the standard device or externally by a separate voltage source.
- The CANopen device profile CiA402 in connection with Servo Drives 9400 HighLine is available from software version 7.0.
- Supports the "Distributed Clocks" (DC) functionality for synchronisation via the fieldbus
- Cycle times:
  - 1 ms or an integer multiple of 1 ms
  - max. 15 ms if "Distributed Clocks" (DC) are used
- Up to 32 process data words (16 bits/word) per direction can be exchanged.
- PDO transfer with CoE (CANopen over EtherCAT)
- Access to all Lenze parameters with CoE (CANopen over EtherCAT)
- From SW version 04.00: Transmission of safe information via the FSoE protocol if the **SM302** safety module (E94AYAF) is used simultaneously

3.4 Terminals and interfaces

[3-2] E94AYCET communication module (EtherCAT)

X245 External voltage supply of the communication module
2-pin plug connector with spring connection
▸ External voltage supply (📖 29)

X246 EtherCAT input (IN)

X247 EtherCAT output (OUT)
- RJ45 sockets
- each with 2 LED status displays for diagnostics

▸ Network topology (📖 25)
▸ EtherCAT connection (📖 26)
▸ Status display at the RJ45 sockets (X246 / X247) (📖 89)

MS 5 LED status displays for diagnostics
ME ▸ Module status displays (📖 86)
RUN ▸ EtherCAT status displays (📖 87)
ERR
EN

4 Technical data

4.1 General data and operating conditions

Range	Values	
Order designation	E94AYCET	
Communication profile	EtherCAT	
Supported device profile and mailbox protocol	CANopen over EtherCAT (CoE)	
Safety over EtherCAT (from SW version 04.00)	Protocol according to the "ETG.5100" specification, version 1.2.0	
Communication medium	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e	
Interface for communication	RJ45: Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)	
Network topology	Line, switch	
Number of devices	Max. 65535 (in the entire network)	
Max. cable length between two EtherCAT devices	100 m (typical)	
Type of device	EtherCAT slave	
Vendor ID [hex]	0x3B	
Product ID	Depending on the standard device used and the selected technology application (see chapter Automatic device identification (📖 32)).	
Revision ID	Depending on the main software version of the communication module (see chapter Identification (📖 12)).	
Baud rate	100 Mbps, full duplex	
Cycle times	1 ms or an integer multiple of 1 ms, max. 15 ms if "Distributed clocks" (DC) are used	
Voltage supply	External supply via separate power supply unit +: U = 24 V DC (20.4 V - 0 % ... 28.8 V + 0 %), I = 130 mA -: reference potential for external voltage supply	
Conformities, approvals	CE	2004/108/EC, EMC Directive 2006/95/EC, Low-Voltage Directive
	EAC	Eurasian conformity TR CU: Technical Regulations of Customs Union
		TP TC 004/2011 (TR CU 004/2011) About the safety of low voltage equipment
		TP TC 020/2011 (TR CU 020/2011) Electromagnetic compatibility of technical means
	UL	UL 508C, Power Conversion Equipment (file no. E132659)

Hardware manual "Servo Drives 9400"

Here you can find the **ambient conditions** and data on the **electromagnetic compatibility (EMC)**, which also apply to the communication module.

4.2 Protective insulation

Danger!

Dangerous voltage

If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

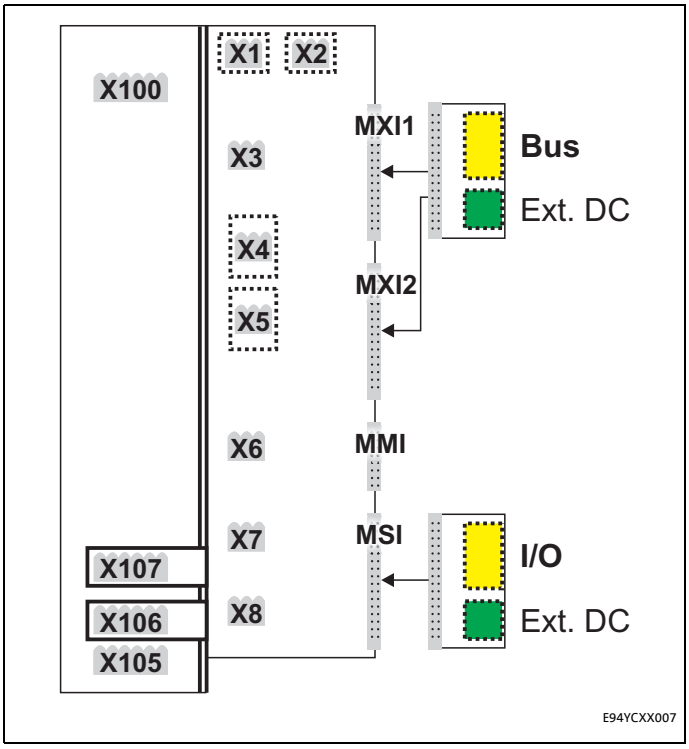
Possible consequences:

Death or severe injuries

Protective measures:

If protection against accidental contact is required for the control terminals of the inverter and the connections of the plugged device modules, ...

- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.



Note!

The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the inverter.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Terminal	Terminal strip	Terminal
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example

Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.3 Protocol data

Range	Values
Process data	1 ... 32 process data words for each direction (max. 64 bytes, 16 bits / word)
Parameter data (mailbox size for CoE transfer)	Max. 128 bytes
FSoE data if the SM302 safety module is used (from SW version 04.00)	Safety outputs: 11 bytes
	Safety inputs: 19 bytes

4.4 Communication time

Parameter data (SDO)

The communication time for parameter data is the time between the transmission of an SDO request and the arrival of the corresponding response.

The processing time in the inverter is approx. 30 ms + 20 ms tolerance (typical)

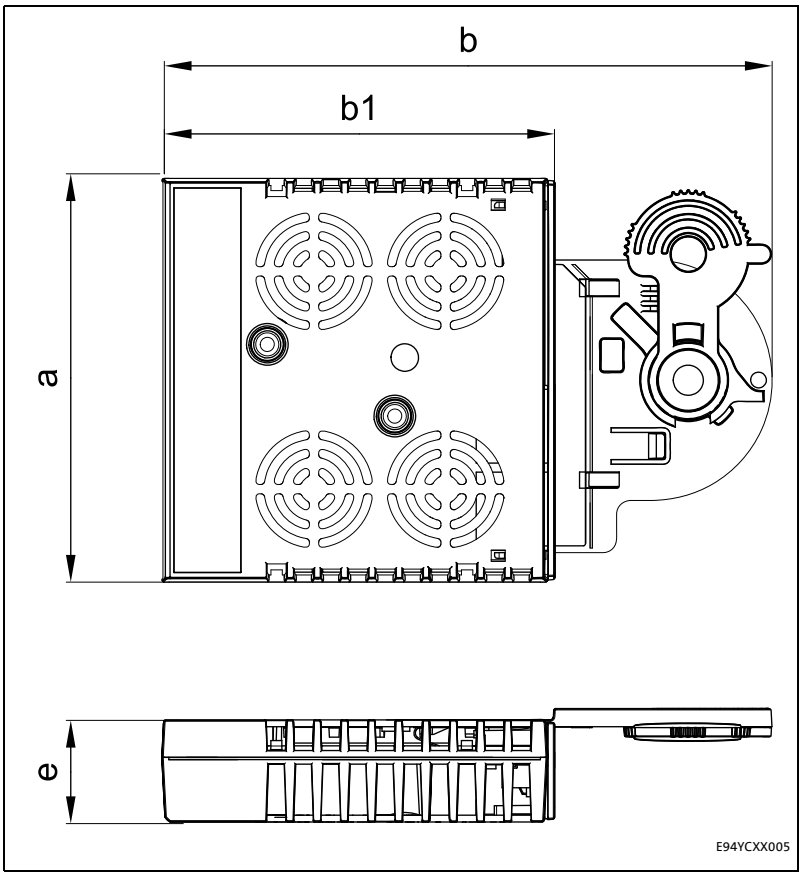
For some codes, the processing time may be longer (see reference manual/»Engineer« online help for the Servo Drive 9400).

Process data (PDO)

The communication time for process data is the time between the reception of a PDO with setpoints and the return of a PDO with the current actual values.

The communication times for process data depend on ...

- processing time in the inverter (interval time of the application task, process data mode);
- Runtime on the fieldbus (frame length, number of devices, PDO update time, instant of transmission of the EtherCAT telegram);
- Use of the "Distributed clocks" (DC) functionality for synchronised operation.
  ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)



The basic conditions mentioned above cause the following processing times for the process data in the inverter:

- DC use (synchronised operation):
  The processing time starts with the acceptance of the setpoints by the inverter with the Sync0 event (DC synchronisation cycle) and ends with the provision of the current actual values in the EtherCAT interface.
  Depending on the selected Process data mode (📖 40) (C13892 / C14892), the resulting processing times are as follows:
  - Deterministic mode: 2.1 ms + interval time of the application task
  - Optimised mode: 1.3 ms + interval time of the application task
- No DC use (non-synchronised operation):
  The processing time starts with the acceptance of the setpoints by the inverter at a time that is not synchronised with the EtherCAT master and ends with the provision of the current actual values in the EtherCAT interface.
  Hence, the following holds true for the processing time:
  1.3 ms + 1.0 ms (tolerance) + interval time of the application task

Documentation of the 9400 function library

Here you can find detailed information on how to set the interval time of the application task.

4.5 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

5 Installation

Stop!

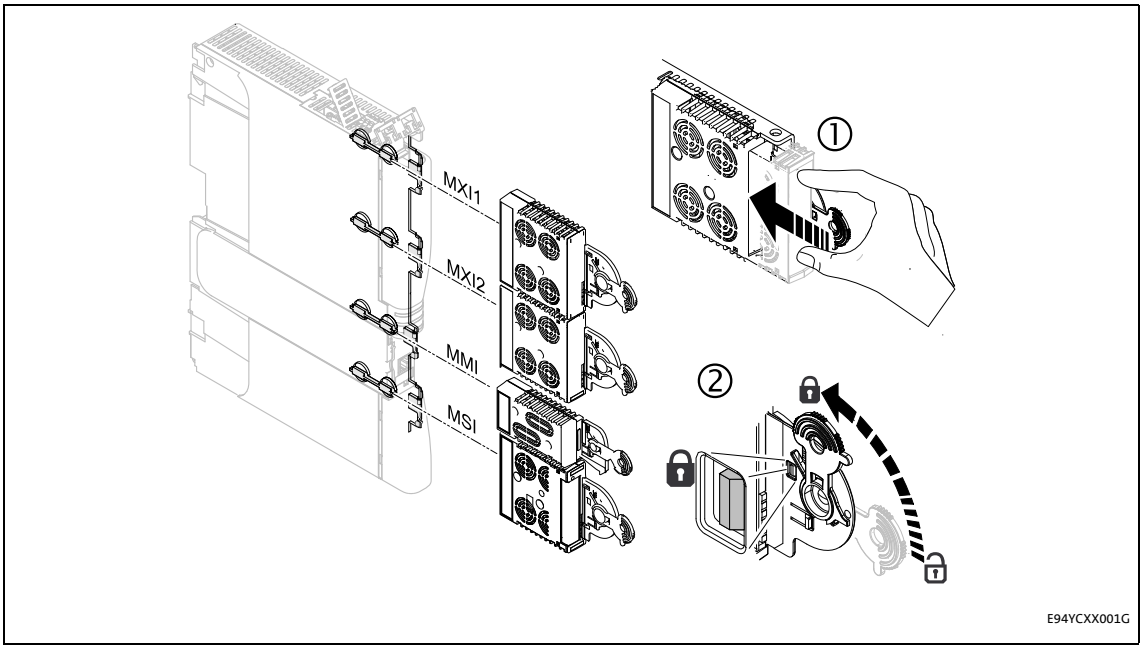
Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

Possible consequences:

- The communication module is defective.
- Fieldbus communication is not possible or faulty.

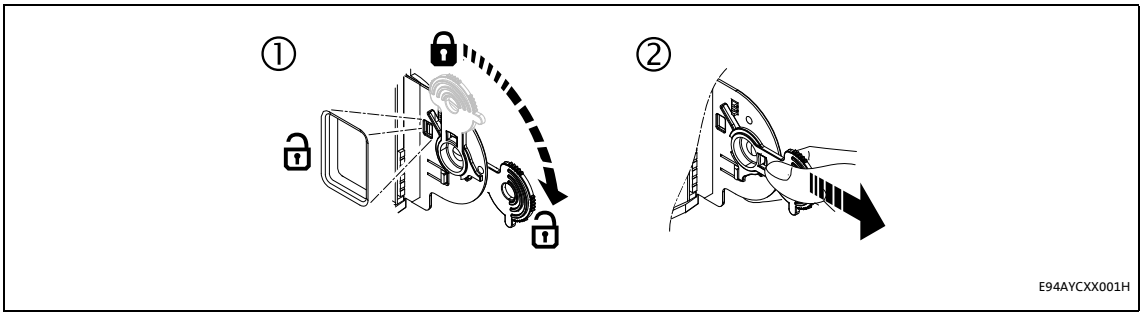
Protective measures:



Before touching the module, be sure that you are free of electrostatic charge.

5.1 Mechanical installation

5.1.1 Mounting



Note!

A safety bus system (FSoE) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

[5-1] Mounting

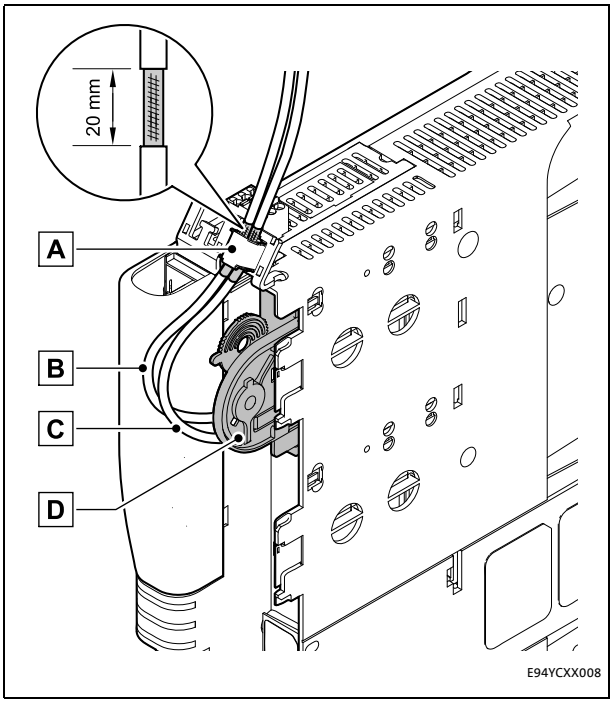
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation for the standard device, control system, system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring according to EMC guidelines

In typical systems, standard shielding is sufficient for Ethernet cables.

However, in environments with a very high level of interference, EMC resistance can be improved by additionally earthing the cable shield on both sides.

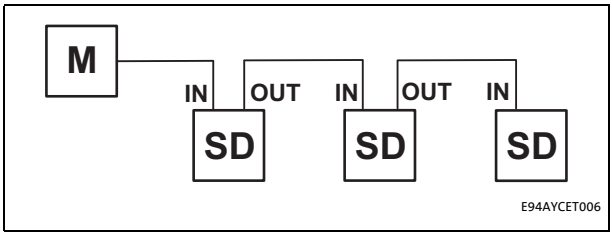
For this observe the following notes:

1. The distance between the additional earthing and the Ethernet plug depends on the module slot and is as follows:
   - approx. 10 cm for the upper slot (MXI1)
   - approx. 20 cm for the lower slot (MXI2)
2. Measure the appropriate distance along the cable and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Connect the cable shield to the shield sheet of the Servo Drive 9400.

A Connection to the shield sheet of the Servo Drive 9400

B Outgoing EtherCAT line at X247 (OUT)

C IncomingEtherCAT line at X246 (IN)



D Communication module in slot MXI1 of the Servo Drive 9400

[5-3] Wiring according to EMC guidelines

5.2.2 Network topology

An EtherCAT frame is sent through a pair of wires from the master to the slaves. The frame is forwarded from slave to slave until it has passed through all the devices. Finally, the last slave returns the frame to the master through a second pair of wires. In this way, EtherCAT always forms a logic ring topology, irrespective of the topology used.

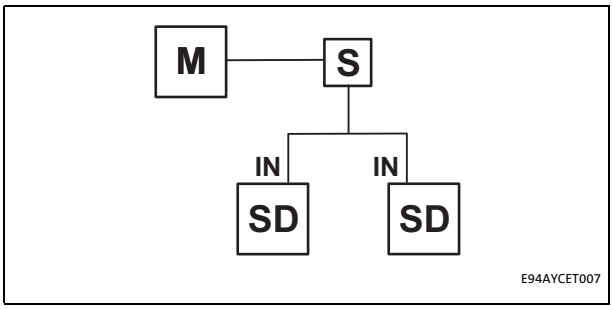
Line topology

M = master
SD = slave device

[5-4] Line topology

The devices are interconnected successively.

In order to ensure trouble-free operation, it is required to assign and wire the EtherCAT inputs (IN) and EtherCAT outputs (OUT) correctly.



The receiving line is plugged into socket X246 (IN), the forwarding line into socket X247 (OUT).

The direction of data transmission is from the master to the slaves.

Tip!

The termination of the last EtherCAT device is effected automatically by the slave.

Switch topology

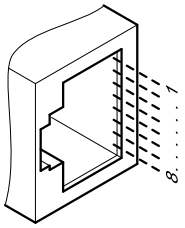
M = master
S = switch
SD = slave device

[5-5] Switch topology

The wiring can also be carried out in a star structure via an appropriate switch. For this, observe the additional runtimes.

5.2.3 EtherCAT connection

The EtherCAT connection is established via the RJ45 sockets **X246** (IN) and **X247** (OUT).



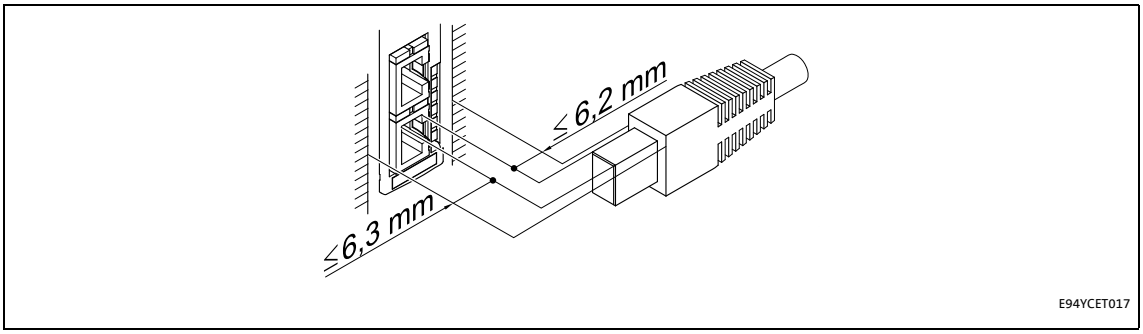
A standard Ethernet patch cable is suitable for connecting the communication module to the EtherCAT fieldbus.

▸ Ethernet cable specification (📖 27)

Note!

To prevent the RJ45 socket from being damaged, insert or remove the Ethernet cable connector straight (at a right angle) into or from the socket.

Pin assignment of the RJ45 sockets



RJ45 socket	Pin	Signal
 E94AYCXX004C	1	Tx +
	2	Tx -
	3	Rx +
	4	-
	5	-
	6	Rx -
	7	-
	8	-

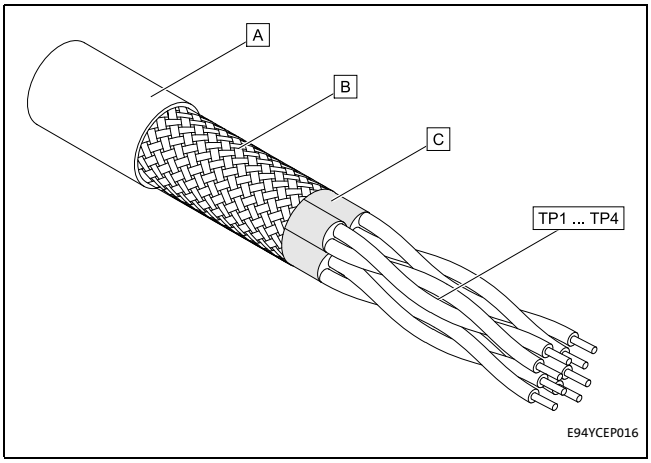
Tip!

The EtherCAT interfaces are provided with an auto MDIX function. This function adjusts the polarity of the RJ45 interfaces so that a connection can be established irrespective of the polarity of the opposite EtherCAT interface and irrespective of the type of cable used (standard patch cable or crossover cable).

Mounting clearance

When ordering and using your Ethernet cable, note the amount of free space available.

[5-6] Mounting clearance



5.2.4 Ethernet cable specification

Note!

Only use cables that meet the specifications listed.

Ethernet cable specification	
Ethernet standard	Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Cable type	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e
Damping	23.2 dB (for 100 MHz and 100 m each)
Crosstalk damping	24 dB (at 100 MHz and per 100 m)
Return loss	10 dB (per 100 m)
Surge impedance	100 Ω

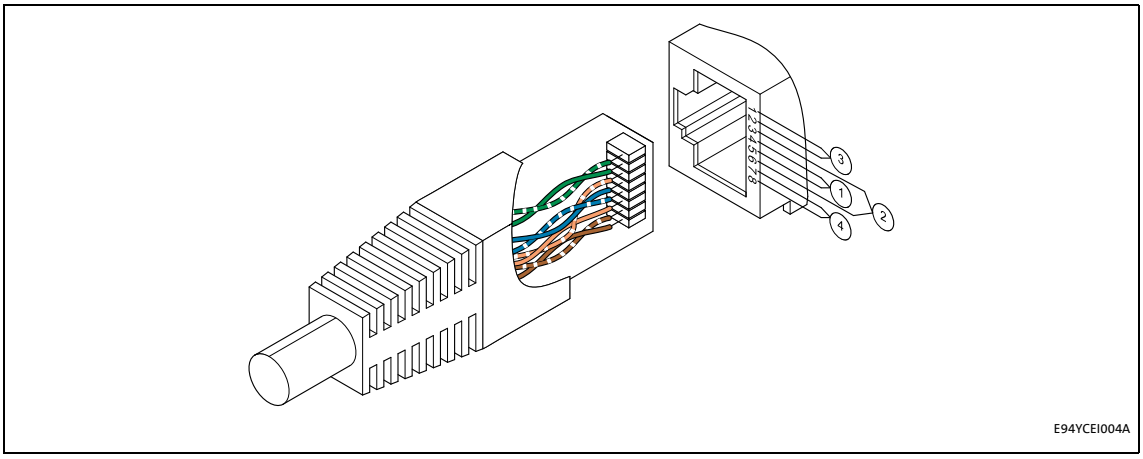
Structure of the Ethernet cable

A Cable insulation

B Braid

C Foil shielding

TP1 Twisted core pairs 1 ... 4
... ▸ Colour code of the Ethernet cable (📖 28)
TP4



[5-7] Structure of the Ethernet cable (S/FTP, CAT 5e)

Colour code of the Ethernet cable

Note!

Wiring and colour code are standardised in EIA/TIA 568A/568B.

In accordance with the industrial standard, the use of 4-pin Ethernet cables is permissible. The cable type only connects the assigned pins 1, 2, 3 and 6 to one another.

[5-8] Ethernet plug in accordance with EIA/TIA 568A/568B

Pair	Pin	Signal	EIA/TIA 568A	EIA/TIA 568B
3	1	Tx +	White / Green	White / Orange
	2	Tx -	Green	orange
2	3	Rx +	White / Orange	White / Green
1	4		blue	blue
	5		White / Blue	Blue / White
2	6	Rx -	orange	Green
4	7		White / Brown	White / Brown
	8		brown	brown

5.2.5 External voltage supply

The communication module can be supplied externally with voltage via separate supply cables at the 2-pole plug connector **X245**.

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).

External voltage supply of the communication module is required if the communication via the bus should be maintained when the supply of the standard device fails.

Access to parameters of a standard device disconnected from the mains is not possible.

Assignment of the X245 plug connector

Name	Description
+	U = 24 V DC (20.4 V -0 % ... 28.8 V +0 %) I = 130 mA
-	Reference potential for the external voltage supply

Terminal data

Range	Values	
Electrical connection	2-pole plug connector (spring connection/screw connection)	
Possible connections	Rigid:	
		1.5 mm^2 (AWG 16)
	Flexible:	
		Without wire end ferrule 1.5 mm^2 (AWG 16)
		With wire end ferrule, without plastic sleeve 1.5 mm^2 (AWG 16)
		With wire end ferrule, with plastic sleeve 0.5 mm^2 (AWG20)
Starting torque	0.5 ... 0.6 Nm / 4.4 ... 5.3 lb-in (only with screw connection)	
Stripping length	6 mm with screw connection	
	9 mm with spring connection	

6 Commissioning

During commissioning, plant-specific data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the inverter. Lenze devices use codes for this purpose.

The codes of the inverter and the communication module are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

Note!

When parameterising the communication module, please note that the code number depends on the slot of the Servo Drive 9400 into which the communication module is plugged.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  - Parameters of the communication module for slot MXI1 (📖 100)
- C**14**nnn for slot MXI2
  - Parameters of the communication module for slot MXI2 (📖 118)

You also have to set the Parameters of the standard device that are relevant to communication (📖 97).

6.1 Before initial switch-on

Stop!

Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Configuring the Controller (EtherCAT master)

The Controller (EtherCAT master) must be configured before communication with the communication module is possible.

In order to configure EtherCAT networks, you always need a configuration software for the Controller, e.g.:

- Lenze »PLC Designer«
- Beckhoff »TwinCAT«

These are software systems for the programming of control programs, EtherCAT configuration, real-time execution, and diagnostics.

The parameters of the communication module are stored in the internal configuration memory and can be used by the master for the device identification.

For device detection (fieldbus scan), the corresponding device descriptions of the Lenze device family are used.

"Controller-based Automation EtherCAT" communication manual

Here you'll find some detailed information relating to the EtherCAT configuration with the Lenze »PLC Designer«.

6.2.1 Installing device description files

The current XML device description files required for configuring the EtherCAT device can be found in the download area at:

www.lenze.com

The following device description file can be installed via the EtherCAT configuration software.

Device description file	Used for ...
Lenze_E94AYCET_V100_yymmdd.xml	SW version 01.01 of the E94AYCET communication module
Lenze_E94AYCET_IO_yyyymmdd.xml	From SW version 02.00 of the E94AYCET communication module in connection with Servo Drives 9400
Lenze_E94AYCET_MOTION_yyyymmdd.xml	From SW version 02.00 of the E94AYCET communication module in connection with the technology application "CiA402" and Servo Drives 9400

Wildcards in the file name	
yyyy	Year
mm	Month
dd	Day

6.2.2 Automatic device identification

For a faultless integration of the EtherCAT slaves into a master configuration it is necessary to select the correct Lenze device in the EtherCAT configuration software.

Each EtherCAT device is identified unambiguously by the configuration software by means of the product code (equal to the CoE object I-1018.2), the manufacturer's identification mark (0x3B), and the main software version of the communication module.

▸ Identification (📖 12)
▸ Communication objects (object directory) (📖 78)

In order that the configuration software selects the configuration specific for the EtherCAT device from the device description file, the product code is automatically set in the identity object according to the technology application selected in the inverter (code C00218) and is updated after the voltage supply is switched off/on or after every application download.

During initialisation, the product code is transferred to the EtherCAT master. On the basis of this identification, the master can accept the corresponding settings from the device description.

Product codes for Servo Drives 9400

The product code defines the following devices in the device description files, depending on the technology application selected in the Servo Drive 9400:

Product code [dec]									Meaning
9	4	0	0	2	3	x	x	x	Servo Drive 9400 HighLine
									Applications:
						0	0	0	Empty application (appl. ID 100000000)
						0	0	1	Actuating drive speed (appl. ID 100102101)
						0	0	2	Actuating drive torque (appl. ID 100202101)
						0	0	3	Electronic gearbox (appl. ID 100302202 /100302102)
						0	0	4	Synchronism with mark synchronisation (appl. ID 100402202 / 100402102)
						0	0	5	Table positioning (appl. ID 100502101)
						0	0	6	Positioning sequence control (appl. ID 100602103)
						1	0	1	CiA402 (appl. ID 110102102)
9	4	0	0	2	5	0	0	7	Servo Drive 9400 PLC with PLC application (appl. ID 100700204)
9	4	0	0	2	6	2	0	1	Servo Drive 9400 V/R (regenerative power supply module) with V/R application (appl. ID 120100101)

6.2.3 Configuring process data

Servo Drives 9400 support the configuration of max. 32 process data words (max. 64 bytes) per direction.

The process data configuration is determined during the initialisation phase of the master (PDO mapping).

The process data configuration is specifically predefined in the device description file for each application.

The process data length can be adapted by the user, if required.

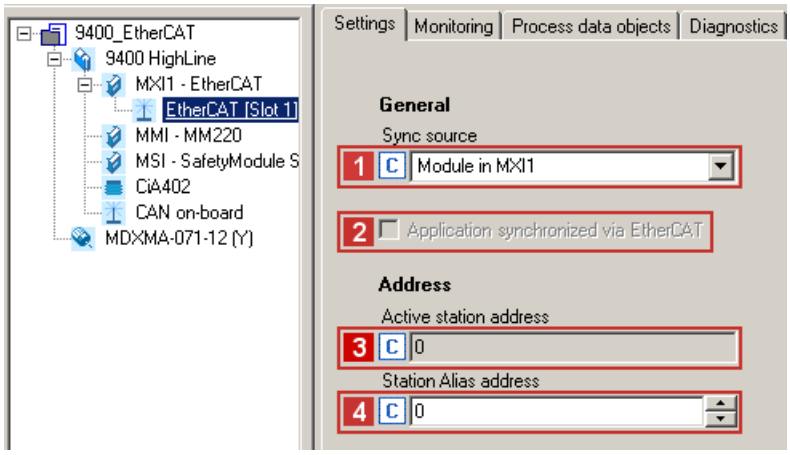
6.2.4 Configuring safety process data

Note!

A safety bus system (FSoE) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

From SW version 04.00 and with the use of an **SM302** safety module (E94AYAF), safety process data can be configured optionally in addition to the process data. The structure of the safety process data is predefined in the device description files and cannot be changed.

The safety process data are transmitted with the same cycle time as the process data (PDOs).



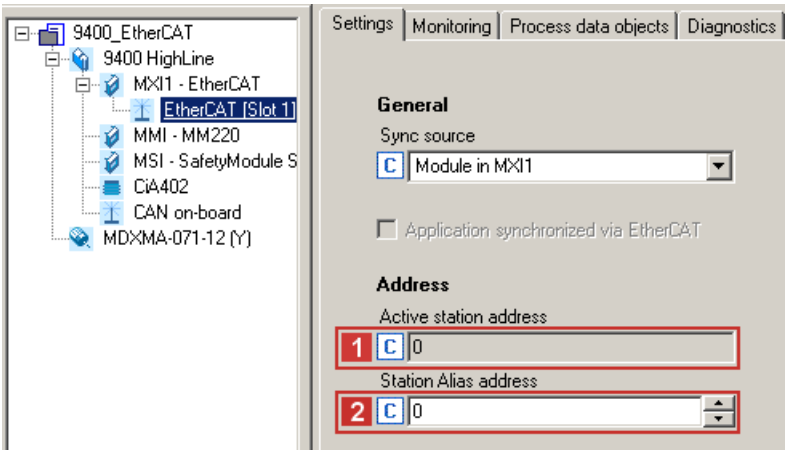
▸ Safety over EtherCAT (📖 81)
▸ FSoE mapping indices (📖 66)

6.2.5 Determining the cycle time

The process data objects (PDO) and the optional safety process data are transmitted cyclically between the EtherCAT master and the slaves (inverters).

The cycle time is set by means of the EtherCAT configuration software.

6.3 Settings in »Engineer«



Settings / display		Code
1	Selection of the **sync source** for DC synchronisation See also DC configuration in the Servo Drive 9400 (slave) (📖 38).	C01120
2	Display of the **status of synchronism of the Servo Drive 9400** Only if Synchronisation with "Distributed clocks" (DC) (📖 36) is used.	C13884 / C14884
3	Display of the **active station address** See also Address allocation (📖 35).	C13864 / C14864
4	Entry of the **station alias address** See also Address allocation (📖 35).	C13899 / C14899

6.4 Address allocation

The EtherCAT slaves are normally addressed via a fixed 16-bit address defined by the EtherCAT master. During start-up, the master assigns this address to each slave, depending on the physical order in the EtherCAT network. The address is not saved and is lost when the device is switched off.

In the »Engineer«, the address assigned is shown under the **Settings** tab in the 1 **Active station address** display field (C13864 / C14864).

Defining Explicit Device Identification

There are two ways to assign the slave to an identifier (station alias):

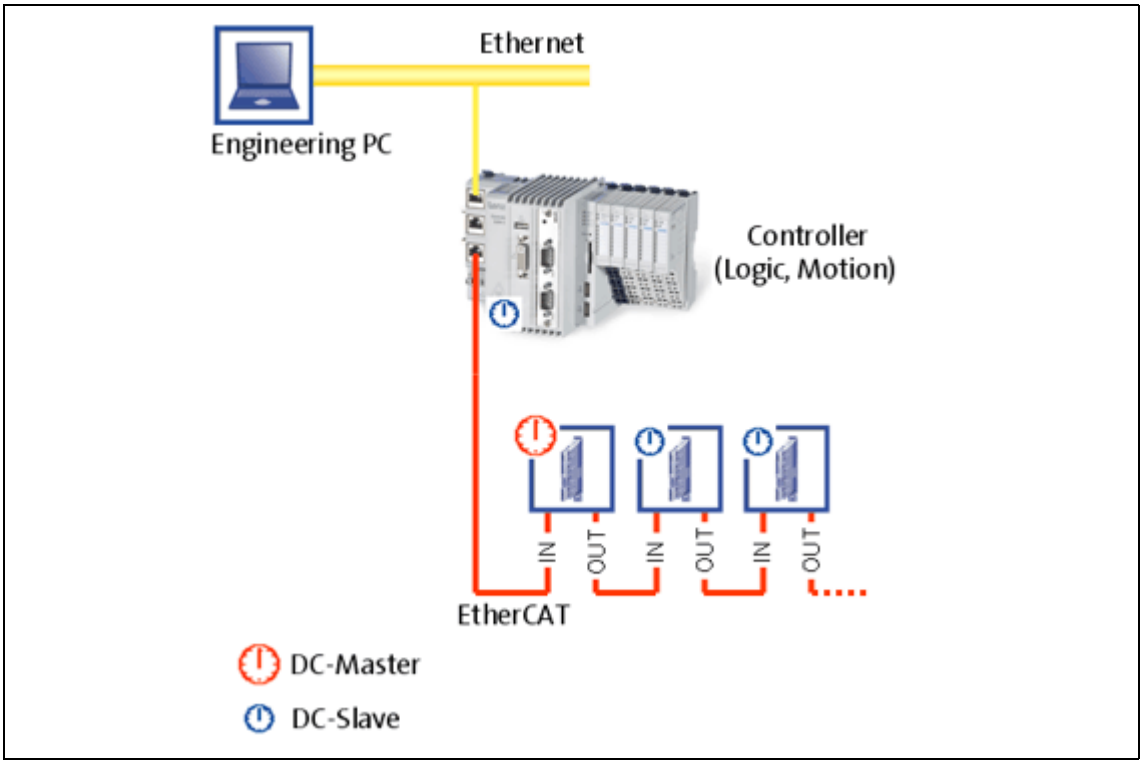
A. Via the EtherCAT master with the assignment of the "Configured Station Alias" (from SW version 04.00 of the communication module).

B. Via the 2 **Station alias address** input field.

Note!

- The station alias must only be set if the EtherCAT slave is part of a "hot connect" group or integrated in the modular machine configuration of Lenze.
- The station alias must be unambiguous and must only be assigned once within the EtherCAT network.
- Use the same station alias in the EtherCAT master and in the slave.

Valid address range: 0 ... 32767



- Address '0' means that no station alias is assigned.
- If the value is > ’0’, the address cannot be assigned by the EtherCAT master.
- Impermissible addresses are marked in red in the input field.
- The address is written to code C13899 / C14899.

6.5 Synchronisation with "Distributed clocks" (DC)

The "Distributed clocks" (DC) functionality enables exact time synchronisation for applications in which several axes perform a coordinated movement simultaneously. Data are incorporated synchronously with the PLC program. During DC synchronisation, all slaves are synchronised with a reference clock, the so-called "DC master".

Note!

- DC synchronisation is absolutely required for Motion applications.
- DC synchronisation can also be used for Logic applications.
- Not all slaves support the DC functionality.
- On order to be able to use the DC functionality, the first slave connected to the EtherCAT master (e.g. Lenze Controller) must have **DC master capability**.
  When further slaves are connected, DC-capable and non-DC-capable devices can be mixed.
- The first EtherCAT slave after the Lenze Controller must be the **DC master** that supplies the other EtherCAT devices (incl. the controller) with the exact time.

[6-1] Example: "Distributed clocks" in the EtherCAT bus system with Lenze Controller 3231 C

The DC synchronisation is set with the EtherCAT configuration software (e.g. »PLC Designer«, »TwinCAT«).

"Controller-based Automation EtherCAT" communication manual

Here you'll find some detailed information relating to the EtherCAT configuration with the Lenze »PLC Designer«.

6.5.1 DC configuration in the master

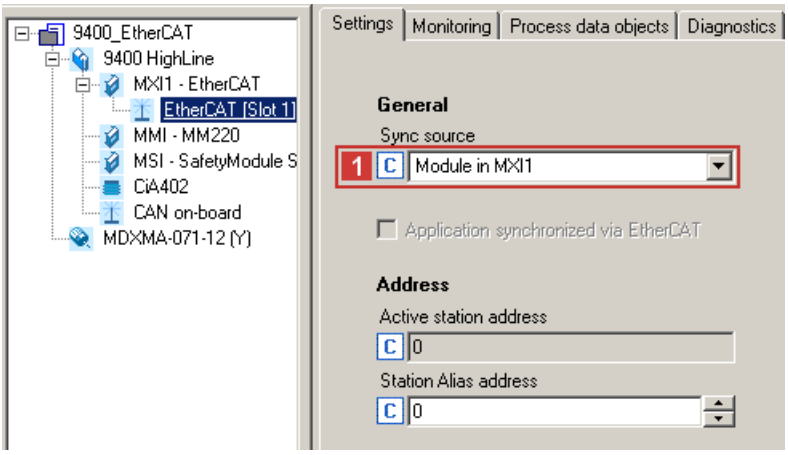
By default, the use of the DC synchronisation is deactivated in the device description (📖 31).

Parameterise the DC synchronisation in the EtherCAT configuration software (e.g. »PLC Designer«, »TwinCAT«).

Set the synchronisation cycle time in the master. It is mainly defined by the processing time of the master and the slaves.

Note!

The synchronisation cycle time ...
- must be an integer multiple of 1 ms;
- may be maximally 15 ms.



6.5.2 DC configuration in the Servo Drive 9400 (slave)

Note!

The settings of the parameters sync cycle time (C01121), sync phase position (C01122), sync tolerance (C01123) and sync PLL increment (C01124) common for the Lenze system bus (CAN) cannot be made for EtherCAT. These values are automatically calculated by the EtherCAT communication module and set internally in the inverter.

In order to be able to use the DC synchronisation in the Servo Drive 9400, go to the **Settings** tab in the 1 **Sync source** selection field and select the sync source (C01120):

- Selection **4**: Module in slot MXI1 of the Servo Drive 9400
- Selection **5**: Module in slot MXI2 of the Servo Drive 9400

6.5.3 Behaviour of the communication module during the start

Code C13883 / C14883 shows whether the DC synchronisation has been activated for the communication module.

If the DC synchronisation is used, the communication module only changes to the "Operational" state when the standard device has adapted its phase position to the DC signal. This process may take several seconds.

Note!

- If the communication module does not change to the "Operational" state, there might be an error in the configuration or in the EtherCAT wiring.
- The communication module compares the cycle time defined by the EtherCAT master to the internal processing time (1 ms) of the standard device. The synchronisation cycle time in the master must be identical with or an integer multiple of 1 ms.
- Furthermore it is checked whether the sync source selection in standard device code C01120 is correct.
- Further information can be found in the status information or emergency messages of the master.

The cycle time (in µs) set by the master on the fieldbus is displayed with code C13870 / C14870.

The state of the standard device synchronicity is displayed in code C13884 / C14884.

6.5.4 Process data mode

Code C13892 / C14892 serves to influence the internal PDO processing time of the actual values.

Deterministic mode (C13892 / C14892 = 1, Lenze setting)

In the deterministic mode, the actual values are copied to the EtherCAT interface with the next Sync0 event.

Optimised mode (C13892 / C14892 = 0)

In the optimised mode, the actual values are not copied to the EtherCAT interface with the next Sync0 event but already 320 µs after the last Sync0 event. Thus, the actual values are provided one cycle earlier in the EtherCAT interface.

Conditions for the optimised mode:

- The EtherCAT telegram generated by the master has a low jitter and is sent within a window of 320 µs after the Sync0 event and shortly before the next Sync0 event.
- The EtherCAT cycle time must be 1 ms.

Note!

- The process data mode is only evaluated with DC synchronisation.
- The setpoints are always processed with the Sync0 event.
- When Lenze EtherCAT controllers are used, we recommend setting the deterministic mode (C13892 / C14892 = 1).

6.6 Establishing an online connection with the »Engineer«

With the »Engineer« you can establish an online connection to the individual field devices.

When an online connection has been established, you can for instance carry out parameter settings directly in the field device or diagnose the field device.

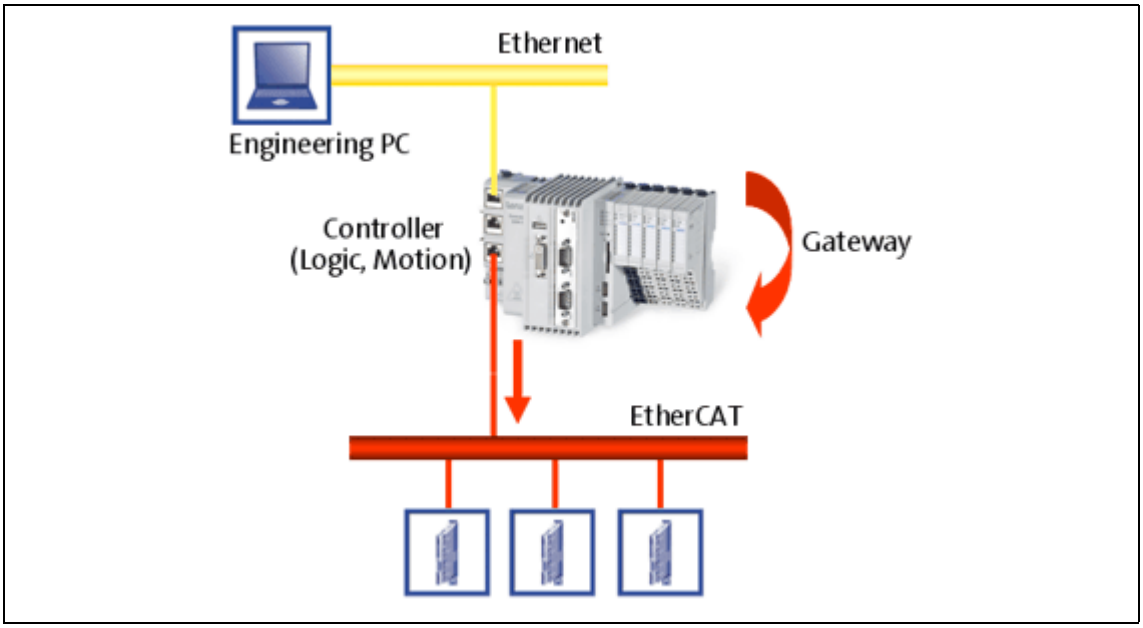
Stop!

If parameters in the »Engineer« are changed while the Engineer is connected online to the field device, the changes are directly accepted to the device!

Note!

To go online, the EtherCAT bus at least has to be in the "Pre-Operational" state.

The functions for establishing/cancelling an online connection in the »Engineer« can be executed via the **Online** menu:



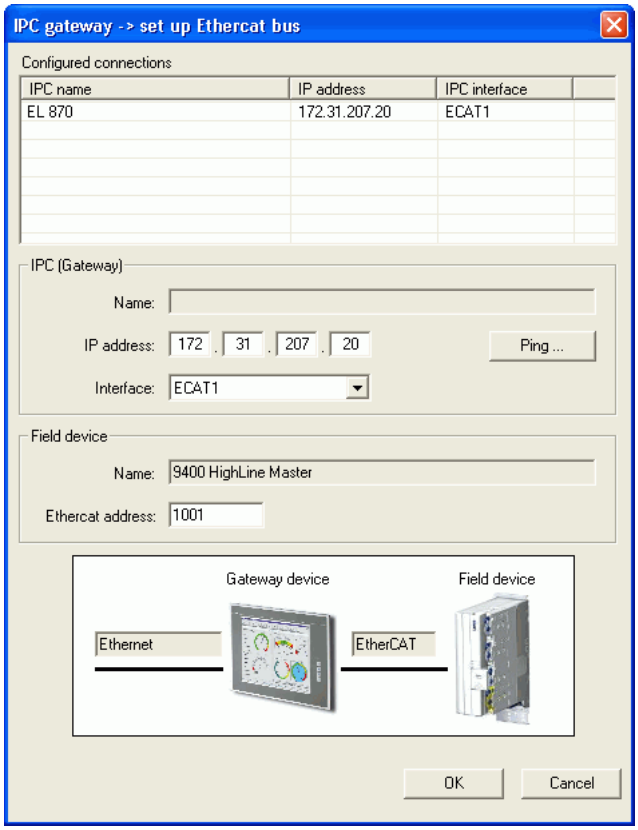
Menu command	Shortcut
Online → Go online	**<F4>**
Online → Set communication path and go online	
Configuring a bus connection: • Gateway Controller -> configure EtherCAT (📖 42) • Gateway Controller -> configure EtherCAT ADS (Beckhoff) (📖 44)	
Online → Go offline	**<Shift>+<F4>**

Documentation for the Lenze »Engineer«

Here you'll find further detailed information about how to establish an online connection.

6.6.1 Gateway Controller -> configure EtherCAT

The Lenze Controller provides a gateway function to establish an online connection to a field device via EtherCAT.

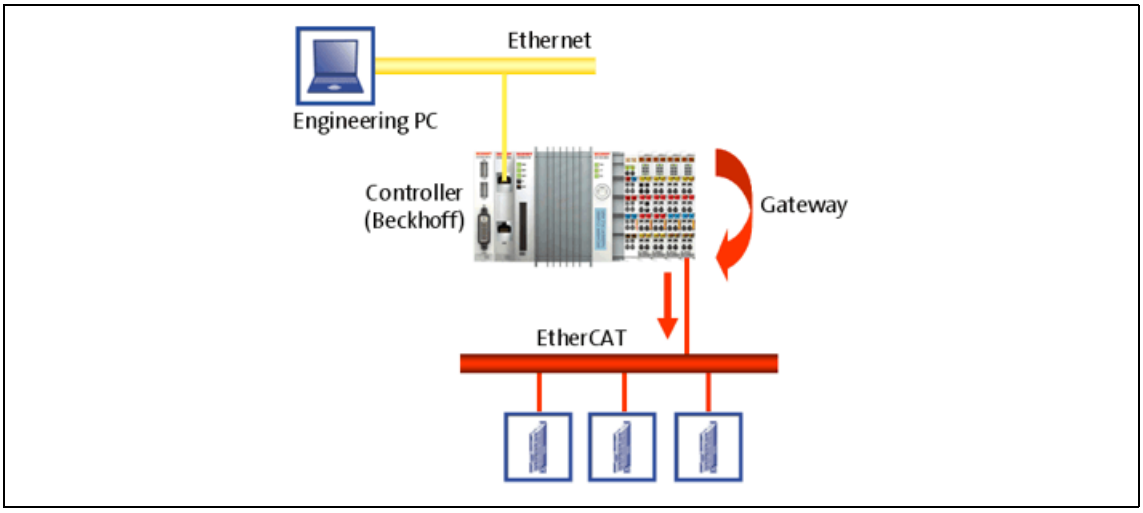


[6-2] Example: EtherCAT bus system with a Lenze Controller 3231 C as gateway

How to configure an online connection to a field device which is connected to the Lenze Controller via EtherCAT:

1. Go to the "Communication path" dialog box and select the entry "Gateway controller -> EtherCAT" from the "Bus connection" list field.
2. Click **Search/Enter...**.

   The "Gateway Controller -> Set up EtherCAT bus" dialog box is shown:



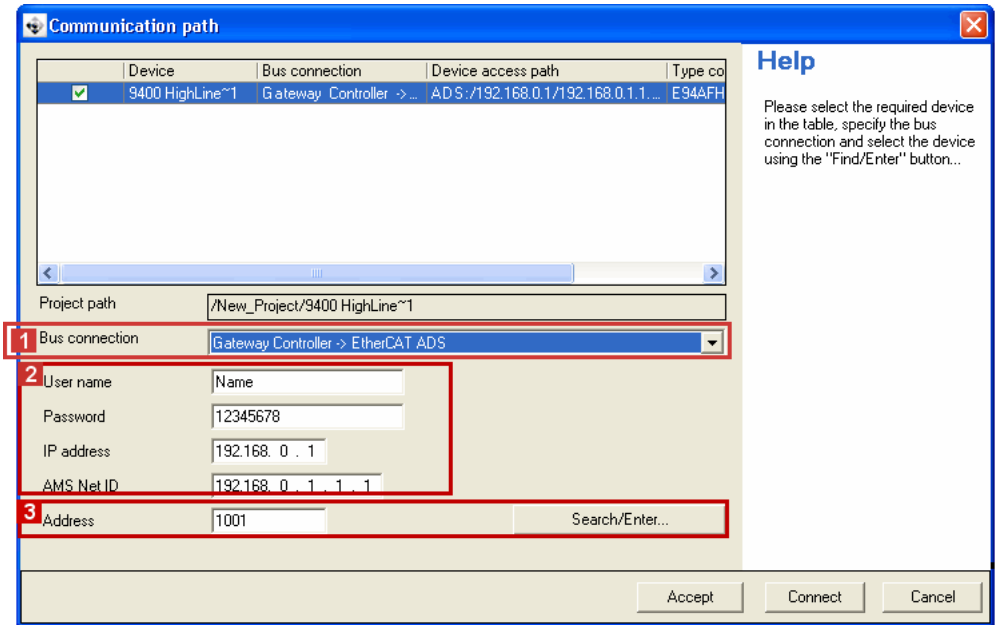
3. Enter the **IP address** of the controller.

   By clicking the **Ping** button, you can carry out a simple test which verifies whether a device can actually be reached via the IP address set.
4. Click **OK**.
   - The "Enter IP address" dialog box is closed.
   - In the **Device access path** column of the "Communication path" dialog box, the corresponding device access path is shown (e.g. "IPC:172_31_207_254.ECAT.ecat1.dev1001.").

6.6.2 Gateway Controller -> configure EtherCAT ADS (Beckhoff)

The **Gateway EtherCAT ADS** bus connection makes it possible to establish an online connection to a Lenze inverter that is connected to a Beckhoff Controller via EtherCAT (gateway function).

[6-3] Example: EtherCAT bus system with a Beckhoff Controller as Gateway



How to configure an online connection to a field device which is connected to a Beckhoff controller via EtherCAT:

1. Highlight the project root in the project.

   Alternatively: Create a new project or carry out a fieldbus scan.
2. Execute the menu command **Insert → Insert device detected online**.
3. Select **Gateway Controller -> EtherCAT ADS** as bus connection.
4. Configure access data:
   - Configure the access data applicable to the controller via the **Insert address** button.
   - The **Search** button initiates the Controller to display the fieldbus devices connected to the EtherCAT segment.

How to use the EtherCAT ADS communication path:

1. Highlight the desired inverter, to which a gateway connection via EtherCAT ADS is to be established, in the project tree.
2. Call the menu command **Online → Set communication path and go online**.

3. Select 1 **Gateway Controller -> EtherCAT ADS** as bus connection.
4. Enter the access data applicable to the controller in area 2.

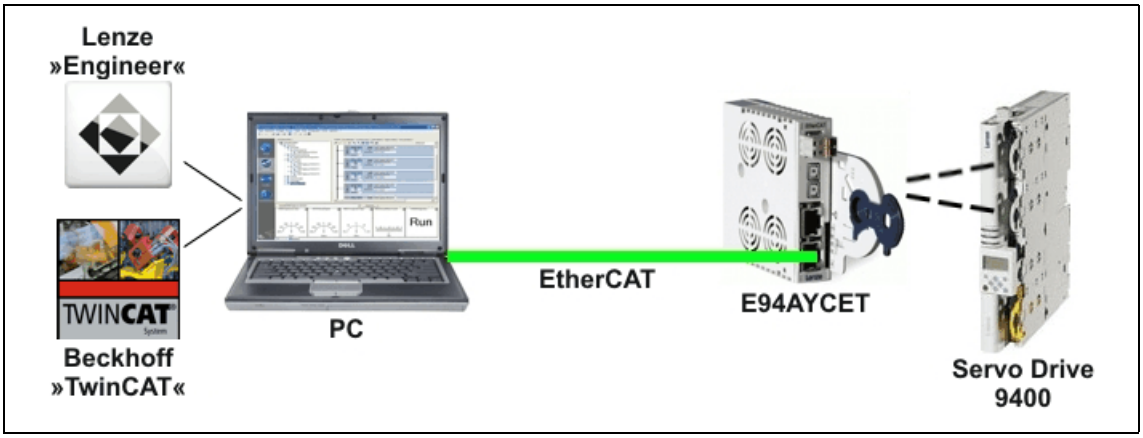
   Enter the user name, password, and the IP address and the AMS Net ID of the EtherCAT interface of the Controller.
5. In area 3, specify the EtherCAT address of the field device to which the online connection is to be established.

   Alternatively you can click the **Search/Enter** button which calls the "Select Device Access Path" dialog box. By this, the »Engineer« initiates the controller to display the devices detected on the EtherCAT segment.

Note!

If several PCs access a target device (slave) simultaneously under a Beckhoff control, superpositions cause sporadic transmission errors in the communication protocol.

Tip!



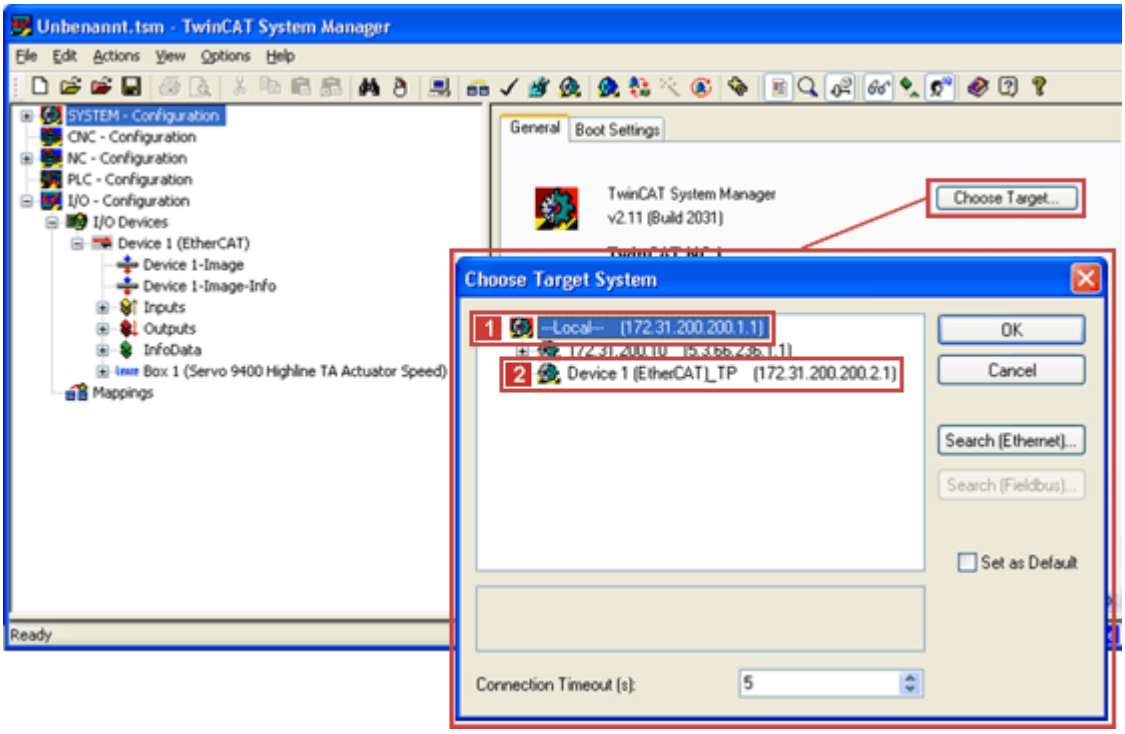
If you have installed »TwinCAT« V2 or V3 but no connection to the Beckhoff control has been prepared, use the »TwinCAT« system manager or the version-specific »TwinCAT« route tool (accessible via the »TwinCAT« tray icon) for creating the required ADS remote connection.

As "AMSNetId" select the "NetId" of the EtherCAT device (usually "a.b.c.d.**2.1**").

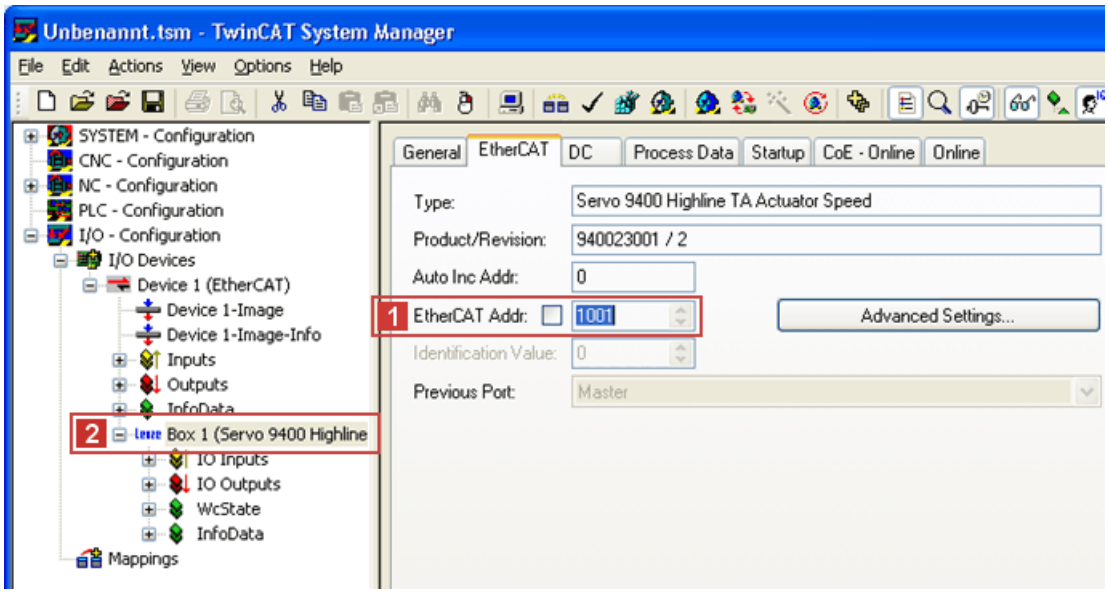
6.7 EtherCAT ADS communication parameters in »TwinCAT« and »Engineer«

In the following, two example structures are used to describe where you can find the EtherCAT ADS communication parameters in the Beckhoff »TwinCAT« and in the Lenze »Engineer«EtherCAT.

6.7.1 Example: Structure without a Beckhoff Controller

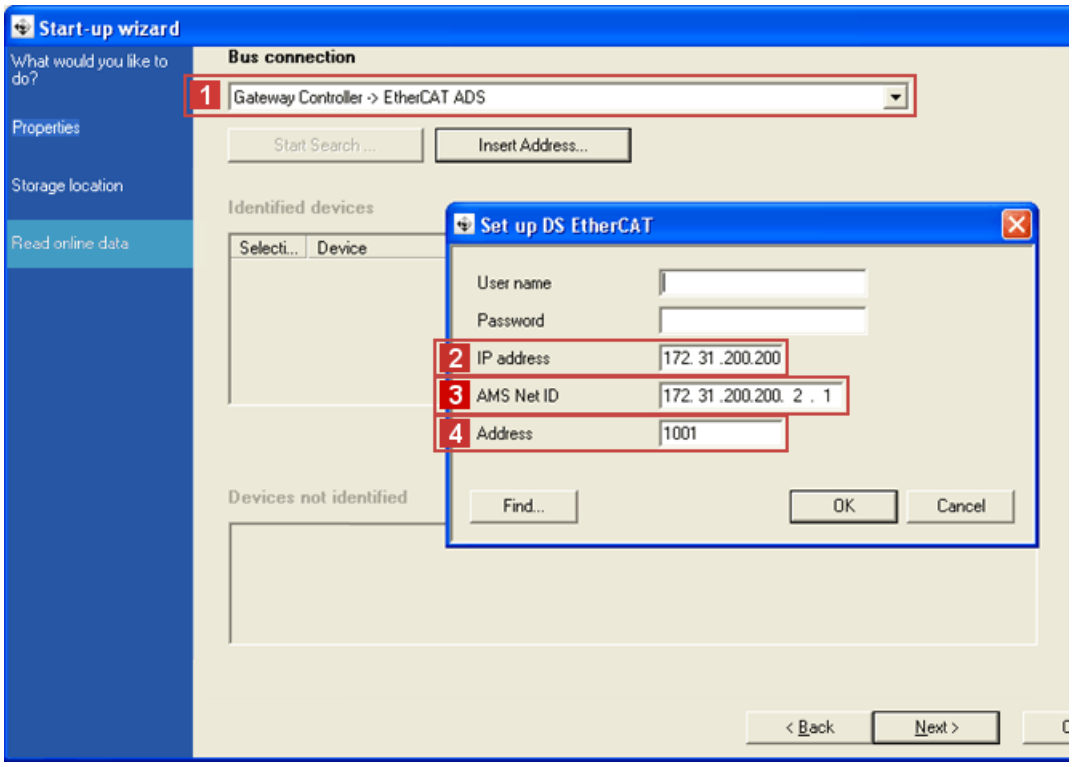


[6-4] Example: EtherCAT bus system without Beckhoff Controller



The Beckhoff Soft-PLC runs on the Microsoft Windows XP PC on which the Beckhoff »TwinCAT« and the Lenze »Engineer« are installed as well.

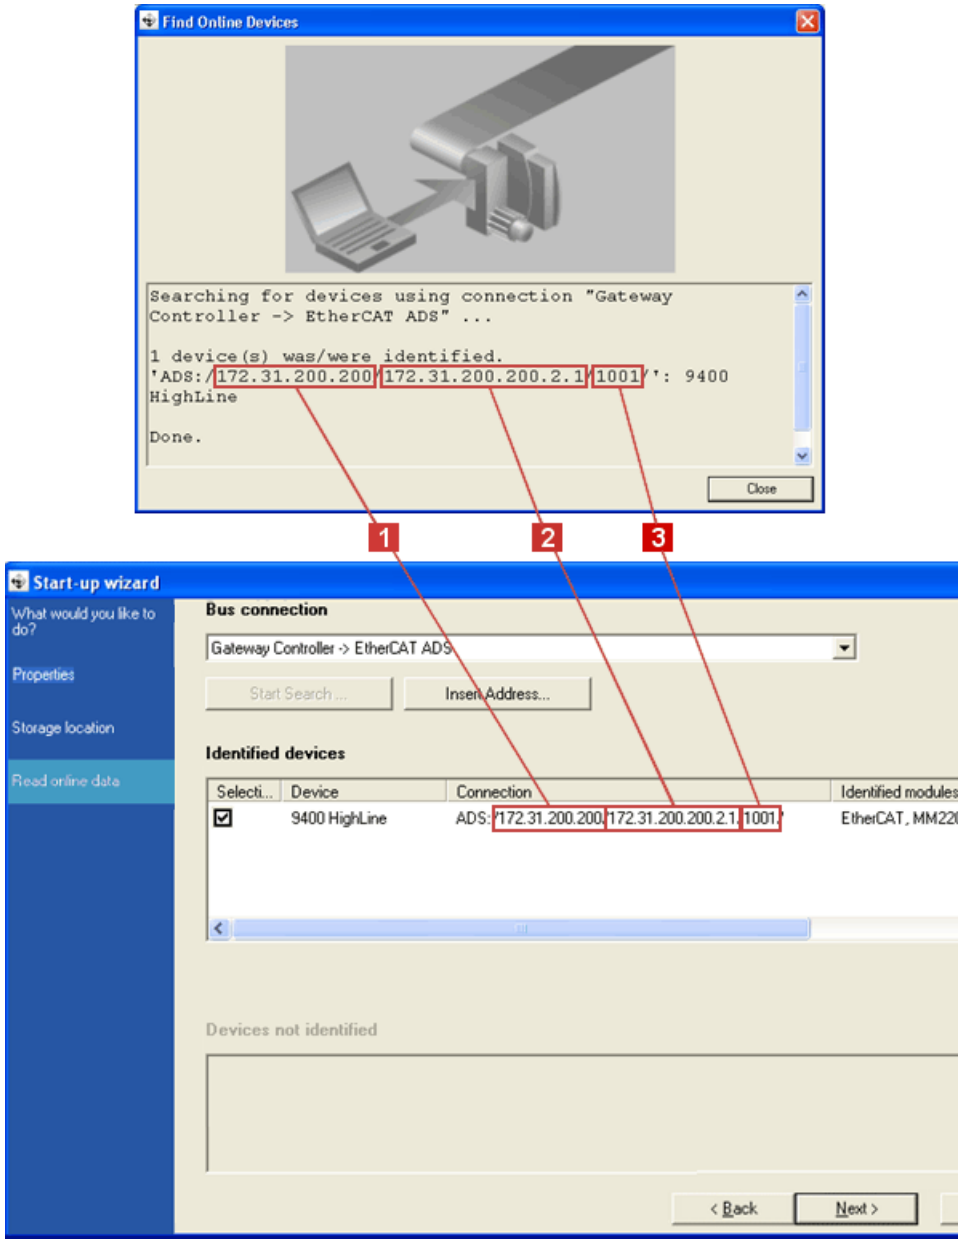
Display of the communication parameters in »TwinCAT«



The communication parameters 1 **IP address** (here '172.31.200.200') and 2 **EtherCAT Master Net ID** (here '172.31.200.200.2.1') can be found under the target system selection:

The EtherCAT 1 **Slave address** (here '1001') can be found under the **EtherCAT** tab of the 2 EtherCAT slave:

Online device identification in the »Engineer« start-up wizard



In the »Engineer« start-up wizard under the 1 **Gateway Controller -> EtherCAT ADS** bus connection, a field device was detected online:

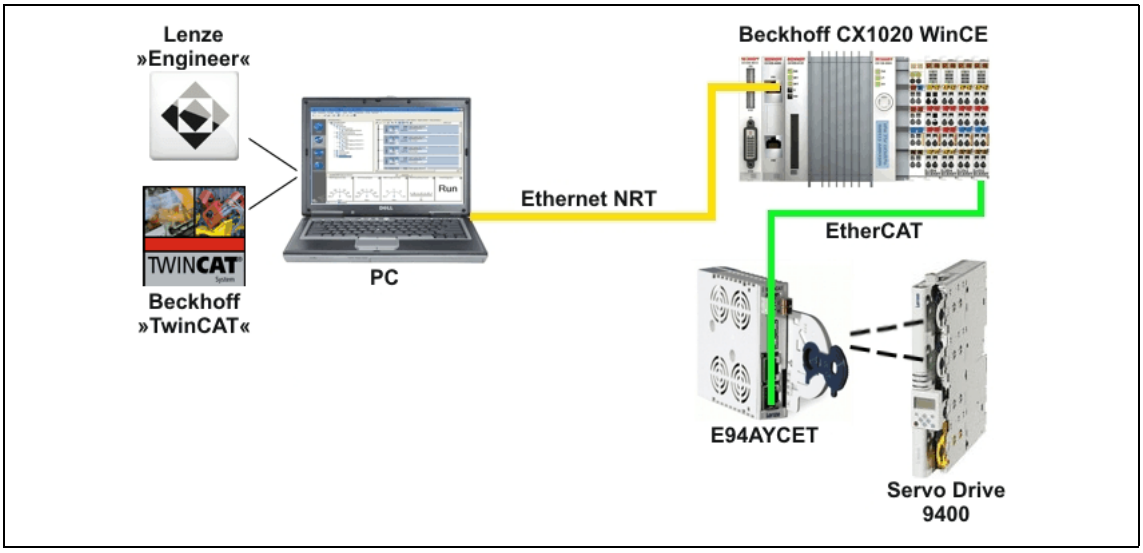
2 **IP address:** 172.31.200.200

3 **EtherCAT Net ID:** 172.31.200.200.2.1

4 **EtherCAT slave address:** 1001

Display of the identification of the field device detected in the »Engineer« start-up wizard:

1 **IP address:** 172.31.200.200



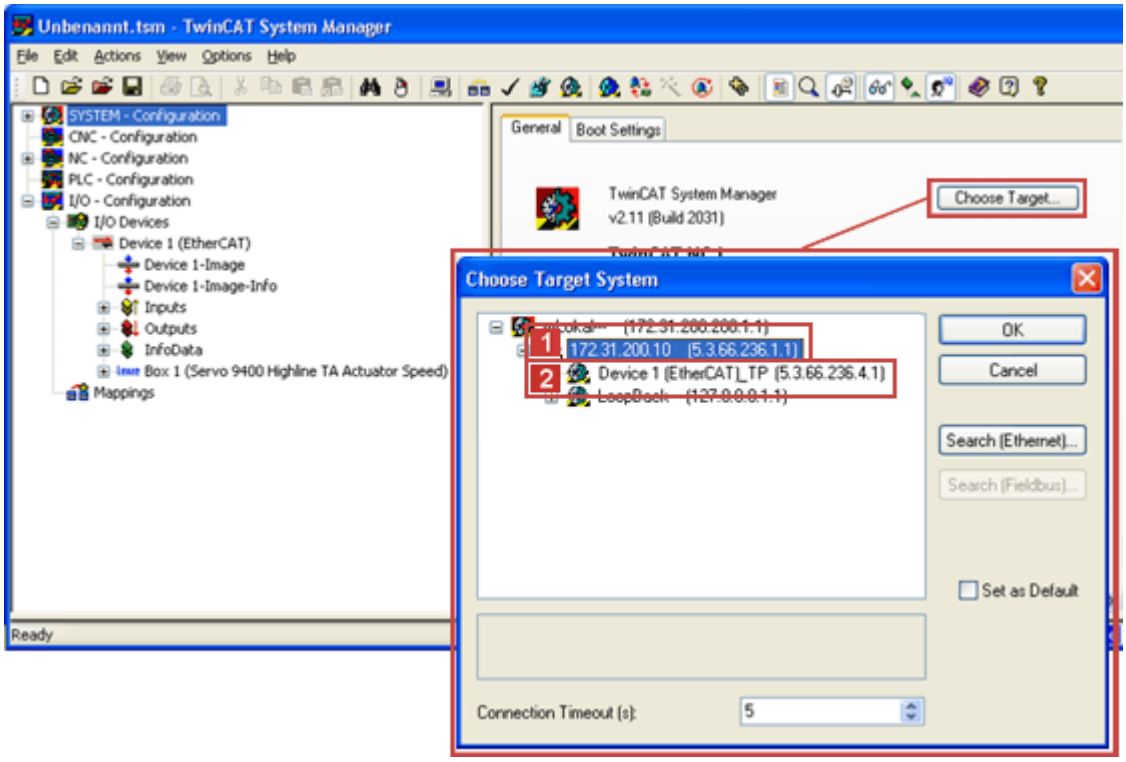
2 **EtherCAT Net ID:** 172.31.200.200.2.1

3 **EtherCAT slave address:** 1001

6.7.2 Example: Structure with a Beckhoff DIN rail IPC CX1020

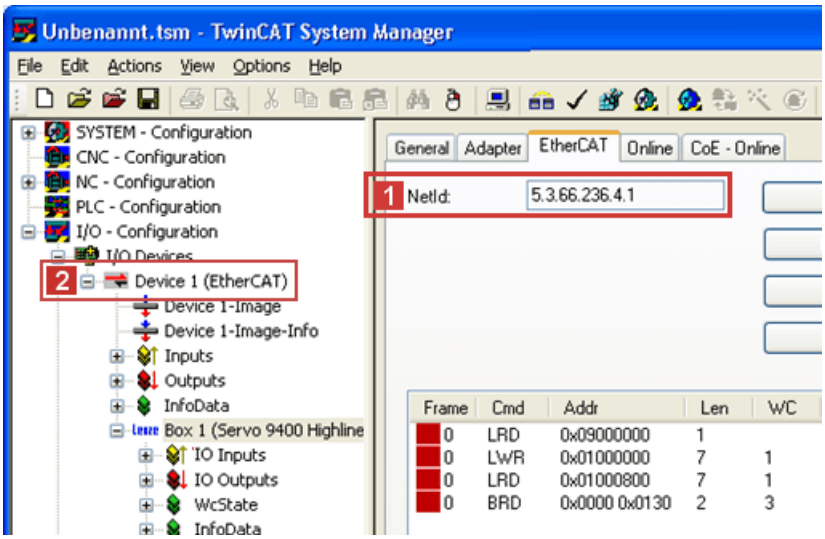
Note!

If several PCs access a target device under a Beckhoff control, superpositions cause sporadic transmission errors in the communication protocol.



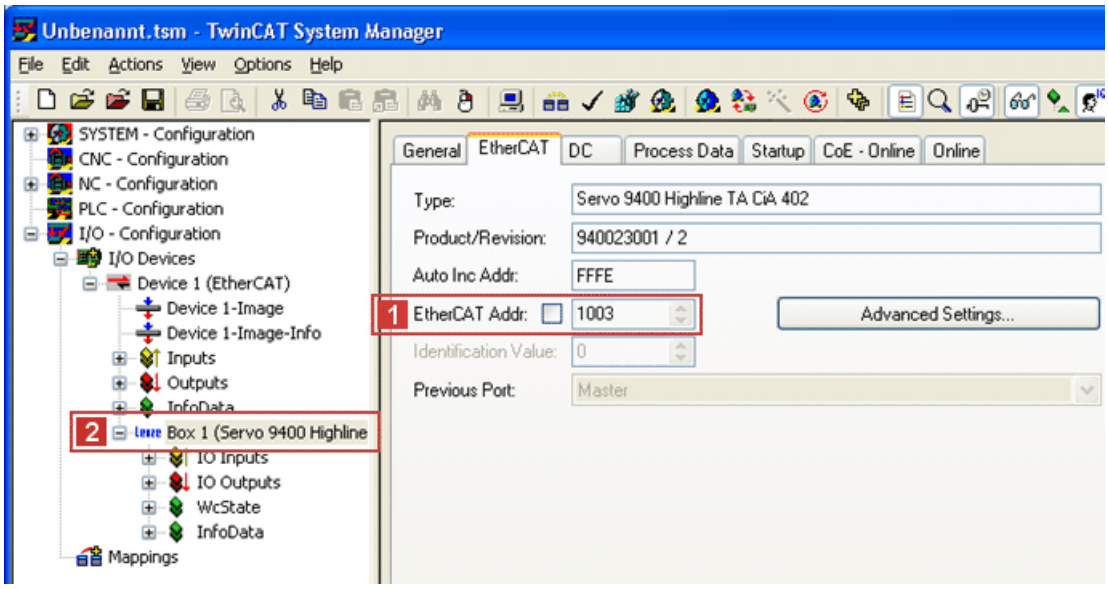
[6-5] Example: EtherCAT bus system with Beckhoff Controller

A Beckhoff DIN rail IPC with the Microsoft Windows CE operating system is used.

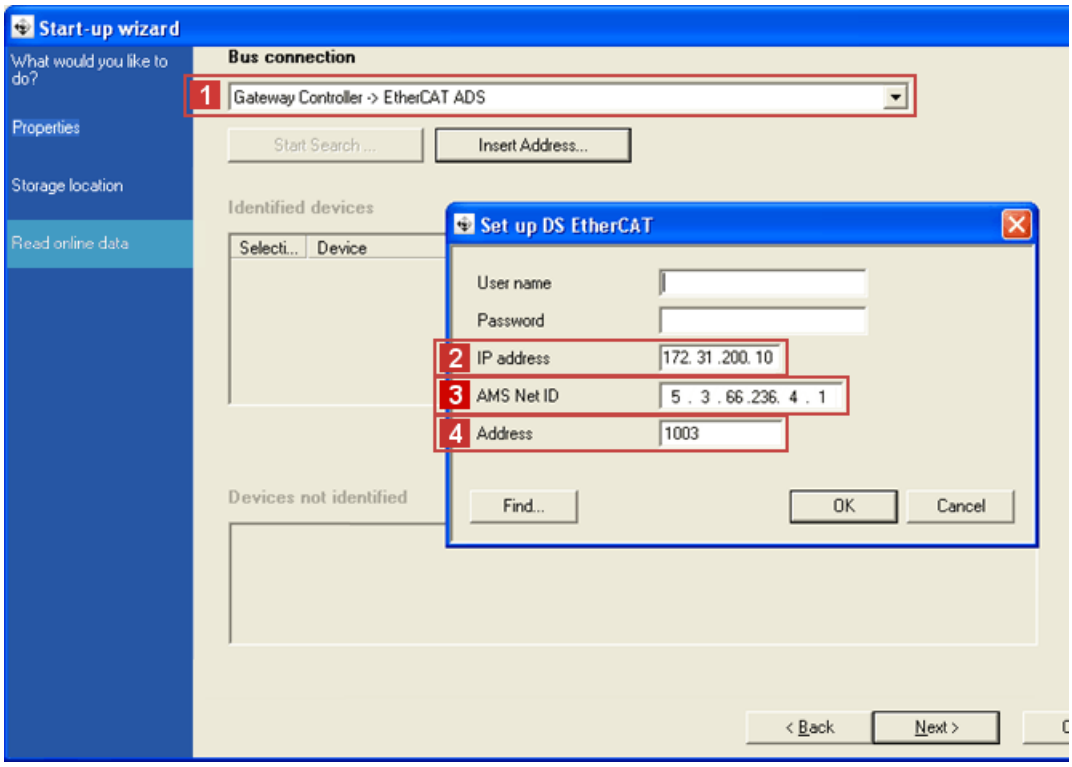


The Beckhoff »TwinCAT« and the Lenze »Engineer« are installed on a Windows XP PC.

Display of the communication parameters in »TwinCAT«



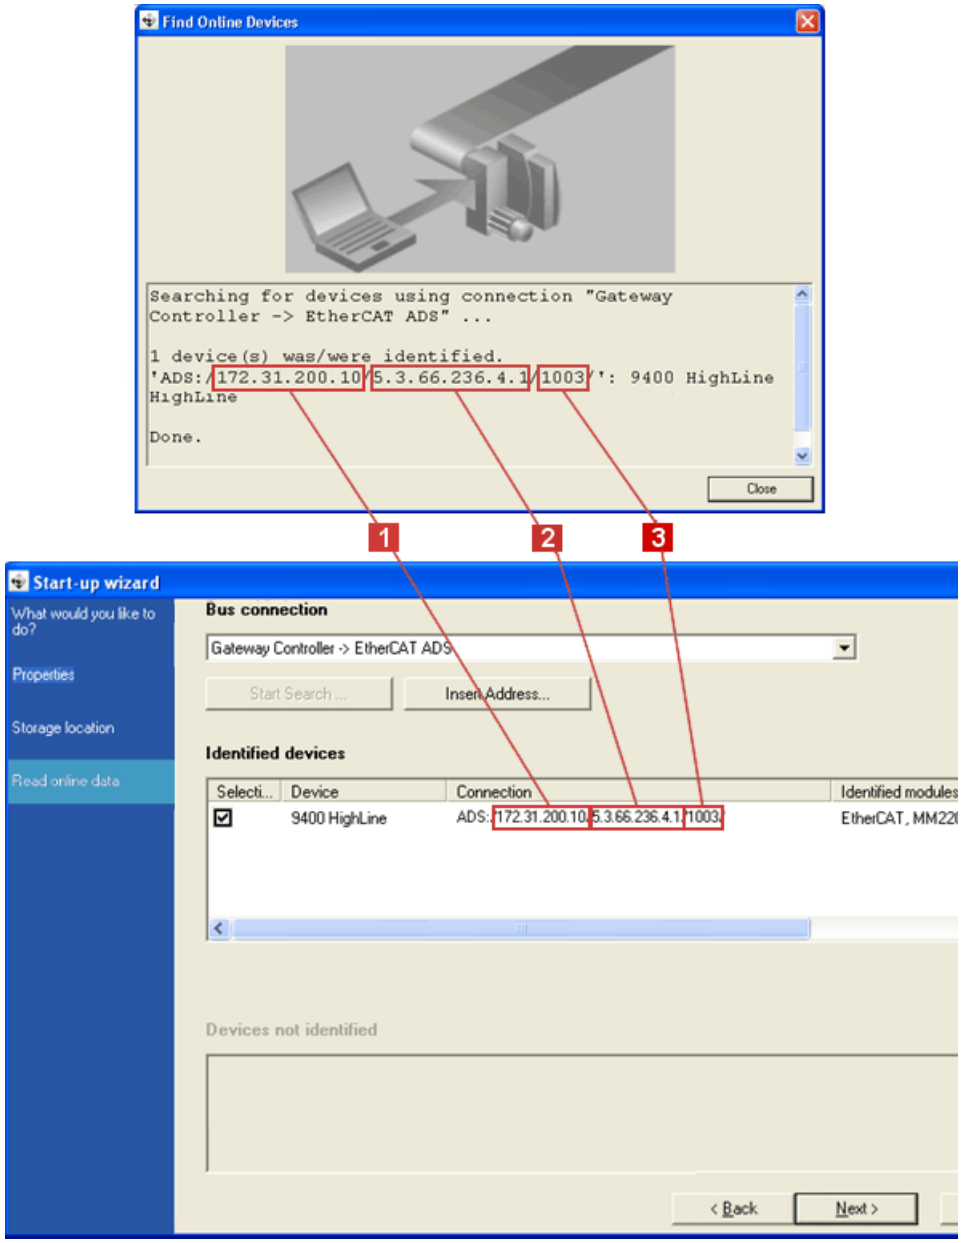
The communication parameters 1 **IP address** (here '172.31.200.10') and 2 **EtherCAT Master Net ID** (here '5.3.66.236.4.1') can be found under the target system selection:



The 1 **EtherCAT Master Net ID** (here '5.3.66.236.4.1') can also be found under the **EtherCAT** tab of the 2 EtherCAT master:

The EtherCAT 1 **slave address** (here '1003') can be found under the **EtherCAT** tab of the 2 EtherCAT slave:

Online device identification in the »Engineer« start-up wizard



In the »Engineer« start-up wizard under the 1 **Gateway Controller -> EtherCAT ADS** bus connection, a field device was detected online:

2 **IP address:** 172.31.200.10

3 **EtherCAT Net ID:** 5.3.66.236.4.1

4 **EtherCAT slave address:** 1003

Display of the identification of the field device detected in the »Engineer« start-up wizard:

1 **IP address:** 172.31.200.10

2 **EtherCAT Net ID:** 5.3.66.236.4.1

3 **EtherCAT slave address:** 1003

6.8 Initial switch-on

Documentation for the Servo Drive 9400

Observe the safety instructions and information on residual hazards.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

For further communication of the externally supplied module it is not relevant whether the standard device is switched on or not.

Activating changed settings

To activate changed settings ...

- execute the device command "11: Save start parameter" via the standard device code **C00002** and ...
- then reset the bus device or switch off and on again the voltage supply of the communication module.

Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

Via the standard device code **C00142** ("Auto restart after mains connection") you can set the restart behaviour of the inverter:

C00142 = "0: Inhibited" (Lenze setting)

- The inverter remains inhibited (even if the fault is no longer active).
- An explicit controller enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.

C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

7 Data transfer

Compared with conventional Ethernet, the collision-free transfer of telegrams on the fieldbus makes EtherCAT a real-time capable bus system.

Communication is always initiated by the EtherCAT master, e.g. a Lenze Controller. A telegram sent by the master passes through all EtherCAT slaves. The last slave of the communication chain sends the telegram back to the EtherCAT master. On the way back, the telegram is directly sent to the master, without being processed in the slaves.

EtherCAT transmits data in standard Ethernet frames. The EtherCAT devices only extract the data intended for them while the frame passes through the device. At the same time, output data are inserted into the frame while it passes through the device. Read and write accesses are only executed on a small section of the entire frame - the datagrams. Therefore, it is not necessary to receive the complete frame before it is processed. Each datagram is forwarded with a minimum delay.

EtherCAT transmits process data, parameter data, configuration data and diagnostic data between the EtherCAT master and the inverters (slaves) that are part of the fieldbus. The data is transmitted via corresponding communication channels depending on their time-critical behaviour (see Process data transfer (📖 61) / Parameter data transfer (📖 67)).

7.1 EtherCAT telegrams

An EtherCAT telegram is based on a standard Ethernet frame with the Ether type '0x88A4' and has the following structure:

Ethernet header			Ethernet data				FCS
48 bits	48 bits	16 bits	11 bits	1 bit	4 bits	48 ... 1498 bytes	32 bits
Destination	Source	Ether type	Frame header			Datagrams	
			Length	Reserved	Type		

Ethernet header

The Ethernet header contains the following information:

- Target address of the EtherCAT telelgram (destination)
- Source address of the EtherCAT telegram (source)
- Type of the EtherCAT telegram (Ether type = 0x88A4)

Ethernet data

The Ethernet data contain the following information:

- Length of the datagram within the EtherCAT telegram (length)
- One reserved bit (Reserved)
- Type of the datagrams within the EtherCAT frame (type)
- Datagrams

FCS

Checksum of the EtherCAT frame

7.2 EtherCAT datagrams

Read and write accesses are always only executed in one small section of the complete EtherCAT frame – the datagrams.

EtherCAT datagrams have the following structure:

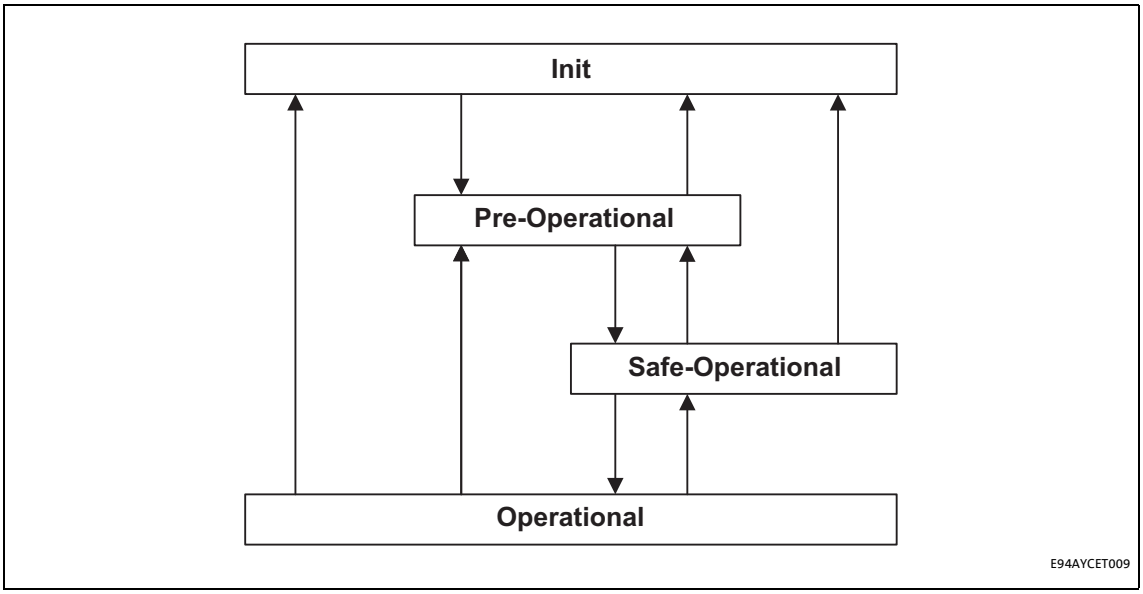
EtherCAT Command header	Data	WKC
10 bytes	Max. 1486 bytes	2 bytes

EtherCAT Command header

The EtherCAT command header contains the following information:

- Command to be executed
- Addressing information
- Length of the data area (Data)
- Interrupt field

Data



The data area contains the data of the command to be executed.

WKC (Working Counter)

The working counter is evaluated by the master for monitoring the execution of the command.

7.3 EtherCAT state machine

Before communication is possible via EtherCAT, the fieldbus passes through the EtherCAT state machine during start-up. The following illustration depicts the possible state changes from the point of view of an EtherCAT slave:

[7-1] EtherCAT state machine

Status	Description
Init	• Initialisation phase • No SDO/PDO communication with the slaves • Device can be detected by fieldbus scan
Pre-Operational	• The fieldbus is active. • SDO communication (mailbox communication) is possible. • No PDO communication
Safe-operational	• SDO communication (mailbox communication) is possible. • PDO communication: • The input data in the process image are updated. • The output data from the process image are not transferred to the slaves.
Operational	Normal operation: • SDO communication • PDO communication • Fieldbus synchronisation has been successful (if used)

Note!

- A fieldbus scan can be carried out during any EtherCAT status.
- SDO communication via the EtherCAT bus is only possible if at least the "Pre-Operational" state has been reached.

The current status of the EtherCAT state machine is shown in C13861 / C14861 and is indicated via the **RUN** LED.

Possible errors at the state transitions are shown in C13879 / C14879. Additionally, an error message is entered in the EtherCAT "AL state code" register (see below) .

- Diagnostics with the »Engineer« (📖 90)
- EtherCAT status displays (📖 87)

AL Status Code

Information about how the "AL Status Code" EtherCAT register (address 0x0134:0x0135) can be accessed can be found in the documentation of the EtherCAT master.

These error messages can be entered in the "AL Status Code" register:

AL Status Code [hex]	Description
0x0000	No error
0x0011	Invalid status change requested
0x0012	Unknown status requested
0x0013	"Bootstrap" status is not supported
0x0016	Invalid mailbox configuration "Pre-operational"
0x001A	Synchronisation error
0x001B	Sync manager watchdog
0x001D	Invalid output data configuration
0x001E	Invalid input data configuration
0x002B	Invalid input and output data
0x0030	Invalid configuration of DC synchronisation
0x9001	Firmware watchdog error
0x9002	Mapping error

8 Process data transfer

Process data are transmitted by means of EtherCAT datagrams (📖 58) via the process data channel.

Process data serve to control the Servo Drive 9400.

The transmission of process data is time-critical.

Process data are transferred cyclically between the Controller (EtherCAT master) and the inverters (slaves) (continuous exchange of current input and output data).

The master can directly access the process data. In the PLC for instance, the data are directly stored in the I/O area.

Up to 32 process data words (16 bits/word) per direction can be exchanged.

Process data are not saved in the Servo Drive 9400.

Process data are e.g. setpoints, actual values, control words, and status words.

8.1 Configuring process data (PDO mapping)

Stop!

No application must be downloaded in the "Safe-Operational" or "Operational" state, since the PDO mapping of the EtherCAT master may differ from the PDO mapping of the inverter (slave).

Individual setting of the PDO mapping via the Lenze »Engineer«

The PDO mapping must be set in the »Engineer« if ...

- the "empty application" has been selected in the basic device as a starting point for a technology application;
- own ports are created for a technology application of the standard device. (Only possible with activated application in the »FB Editor«.)

▸ Setting PDO mapping with the »Engineer« (📖 63)

Setting of the PDO mapping exclusively via the EtherCAT configuration software

Note!

In the »Engineer« "Process data object structure: PDO_RX0 / PDO_TX0" dialog, mapping is not displayed if it has been set exclusively through the EtherCAT-configuration software.

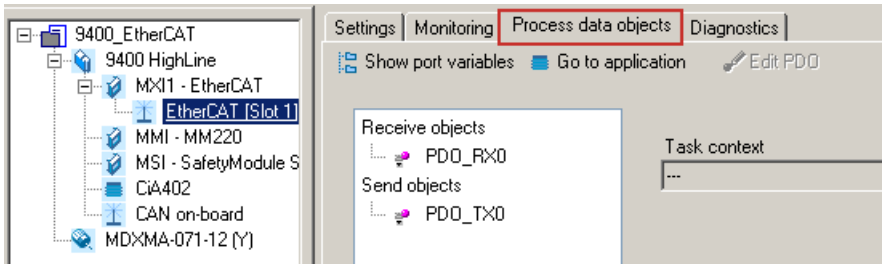
▸ Configuring the Controller (EtherCAT master) (📖 31)

The current mapping is entered in the mapping codes.

▸ Mapping indices and codes (📖 65)

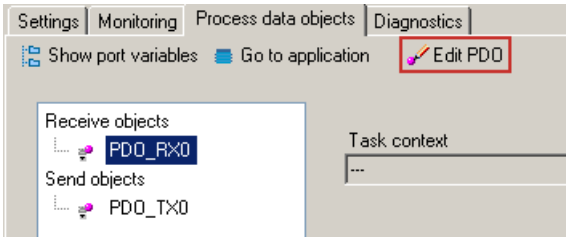
In order that the predefined PDO mapping from the device description file can be used, a standard technology application must be configured in the standard device. Moreover, the standard ports of the configured standard technology application must be used.

8.2 Setting PDO mapping with the »Engineer«



The Servo Drives 9400 enable the individual mapping of process data. For this purpose, the »Engineer« is provided with a port configurator.

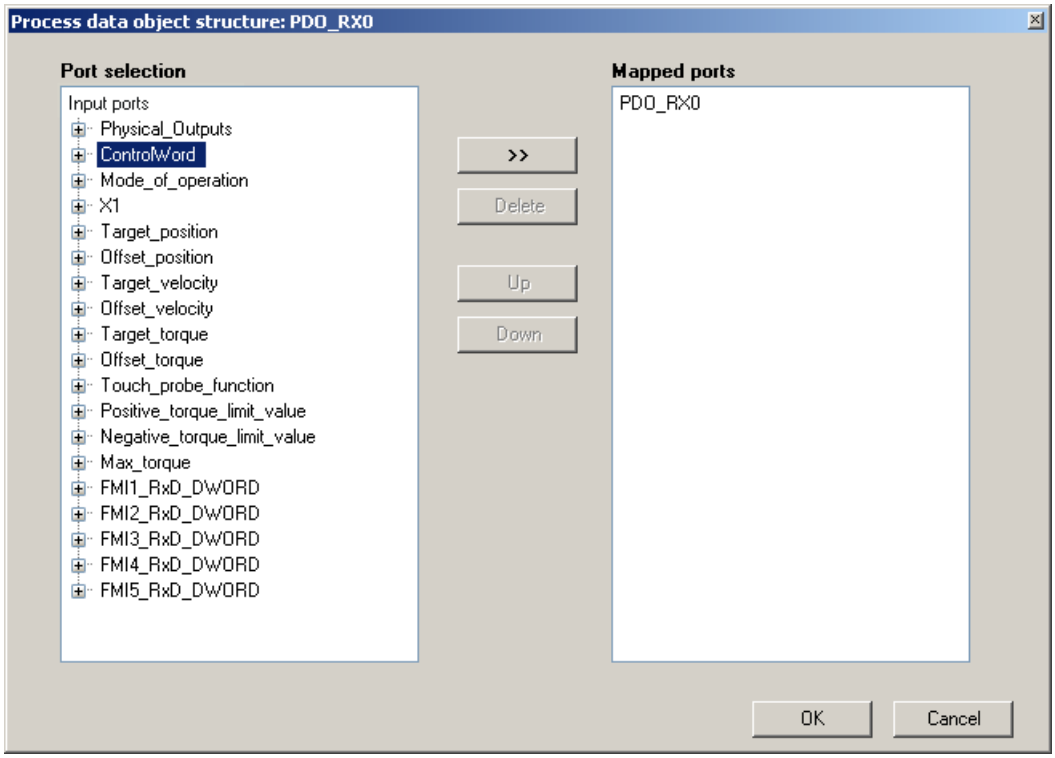
Note



The port mapping is not a configuration, which can be carried out online for the Servo Drive 9400 HighLine. For this purpose, the »Engineer« project must be updated and then the application must be downloaded.

How to set the PDO mapping with the »Engineer«:

1. The process data mapping to the port variables is executed in the »Engineer« under the **Process data objects** tab of the corresponding fieldbus communication module:



2. Select the receive object **PDO_RX0**:

3. Click the **Edit PDO** button.

   The selection window for editing the process data object is opened:

   Here you can transfer the individual ports from the **Port Selection** list to the "PDO_RX0" receive PDO by clicking the **>>** button.

   The **Up** and **Down** buttons serve to shift the sequence of the ports within the PDO.

4. Confirm the selection with **OK**.
5. Repeat the steps 2. to 4. for the transmit object **PDO_TX0**.
6. Now link the ports to the application signals in the selected technology application.

   Activate the »FB Editor« via the multiplexer codes (> C03000) if this has not been done yet.

   If the »FB Editor« is activated, the multiplexer codes (> C03000) are no longer available. In this case, you must carry out the interconnection directly in the »FB Editor«.

8.3 Mapping indices and codes

The settings caused by the previous steps result in mapping indices that are required for the configuration of the master and are stored as codes.

The mapping indices always show the currently valid PDO mapping for the inverter and are displayed on CoE objects 0x1600 (RPDOs) and 0x1A00 (TPDOs) on the EtherCAT.

10 mapping channels each are available for RPDOs and TPDOs. Only one channel at a time can be activated by the EtherCAT master.

Note!

- If the PDO mapping is set via the »Engineer«, the EtherCAT configuration software must load the mapping from the inverter in order that it can be written back to the controller when the network is started.
  This ensure that the mapping indices in the EtherCAT master and slave are identical.
- The mapping codes must not be modified by the user.

Slot in the Servo Drive 9400	Code	Correspondent CoE object	Description
MXI1	C13231 ... C13240	0x1600.01..0x20 ... 0x1609.01..0x20	Mapping entries RPDO-1 ... 10
	C13531 ... C13540	0xA100.01..0x20 ... 0xA109.01..0x20	Mapping entries TPDO-1 ... 10
	C13484	0x1C12.01	Active RPDO channel
	C13489/1 ... C13489/10	0x1600.00 ... 0x1609.00	Number of RPDO mapping entries RPDO-1 ... 10
	C13784	0x1C13.01	Active TPDO channel
	C13789/1 ... C13789/10	0x1A00.00 ... 0x1A09.00	Number of TPDO mapping entries TPDO-1 ... 10
MXI2	C14231 ... C13240	0x1600.01..0x20 ... 0x1609.01..0x20	Mapping entries RPDO-1 ... 10
	C14531 ... C14540	0xA100.01..0x20 ... 0xA109.01..0x20	Mapping entries TPDO-1 ... 10
	C14484	0x1C12.01	Active RPDO channel
	C14489/1 ... C14489/10	0x1600.00 ... 0x1609.00	Number of RPDO mapping entries RPDO-1 ... 10
	C14784	0x1C13.01	Active TPDO channel
	C14789/1 ... C14789/10	0x1A00.00 ... 0x1A09.00	Number of TPDO mapping entries TPDO-1 ... 10

8.3.1 Structure of the mapping codes

The mapping codes C13231 ... C13240 and C14231 ... C14240 have the following structure:

Octet offset	Name	Description
0 / 1	Index	Index of the object to be mapped
2	Subindex	Subindex of the object to be mapped
3	Reserved	
4 / 5	Offset	Offset regarding the PDO start in bits
6 / 7	Length	Length of the object to be mapped in bits

Example

In the RPDO channel 1, the index 0xA640.0x03 is transmitted with a length of 4 bytes from an offset of 20 bytes.

- Entry in the mapping code **C1x231/8**: 0x002000A00003A640

Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7
Index		Subindex	Reserved	Offset		Length	
0x40	0xA6	0x03	0x00	0xA0	0x00	0x20	0x00

- Correspondent entry in the CoE object **0x1600/8**: 0xA6400320

8.3.2 FSoE mapping indices

The FSoE mapping indices can be used from SW version 04.00 and show the PDO mapping for the safety PDOs. On the EtherCAT side, they are mapped onto the CoE objects **0x1700** (Safety RxPDO) and **0x1B00** (Safety TxPDO).

The FSoE mapping is activated by the configurator via the indices **0x1C12.02 = 0x1700** and **0x1C13.02 = 0x1B00**.

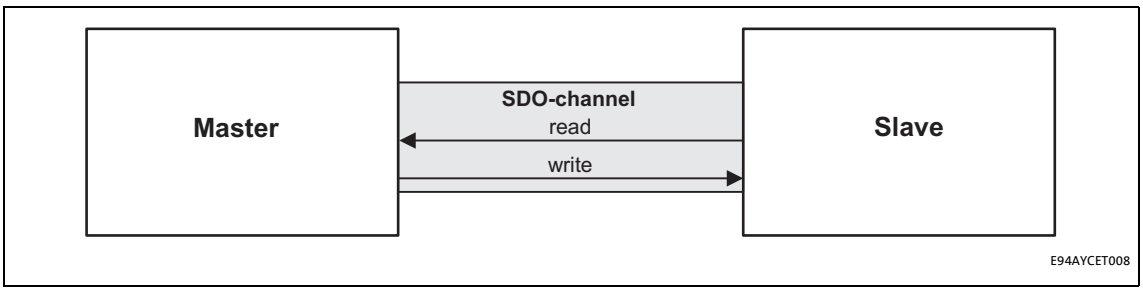
The FSoE mapping is only possible with the simultaneous use of a valid PDO mapping.

▸ Safety over EtherCAT (📖 81)

9 Parameter data transfer

Parameter data are transmitted via the fieldbus as so-called SDOs (Service Data Objects). The SDO services provide for the write and read access to the object directory.

The SDO channel provides for access to Communication objects (object directory) (📖 78) and Lenze codes with the CoE protocol.



If the "CiA402" technology application is used in the inverter, all CANopen CiA402 objects implemented can be accessed. (See documentation on the "CiA402" technology application in the reference manual/online help for the Servo Drive 9400.)

The transmission of parameter data is usually not time-critical.

Parameter data are, for instance, operating parameters, motor data, diagnostic information.

9.1 Establishing a connection between master and slave

Basically a master can always request parameter jobs from a slave if the slave is at least in the "Pre-operational" state.

[9-1] Data communication via the SDO channel

9.2 Reading and writing parameters

Parameters ...

- for instance are set for one-time system settings or if materials are changed within a machine;
- are transmitted with a low priority.

In the case of Lenze inverters, the parameters to be changed are contained in codes or in the case of the CANopen device profile "CiA402" as device profile objects.

Indexing of the Lenze codes

If they are accessed via a communication module, the codes of the inverter are addressed by the index.

The index for Lenze code numbers is in the manufacturer-specific area of the object directory between 8192 (0x2000) and 24575 (0x5FFF).

Conversion formula	
Index [dec]	**Index [hex]**
24575 - Lenze code	0x5FFF - Lenze code$_{hex}$

Example for C00002 (device commands)	
Index [dec]	**Index [hex]**
24575 - 2 = 24573	0x5FFF - 2 = 0x5FFD

Structure of a mailbox datagram

In a datagram, mailbox data are transferred within an EtherCAT telegram. The data area of the mailbox datagram has the following structure:

Mailbox header	CoE header	SDO control byte	Index	Subindex	Data	Data
6 bytes	2 bytes	1 byte	2 bytes	1 byte	4 bytes	1 ... n bytes

9.2.1 Reading parameters (SDO upload)

1. The master sends "Initiate Domain Upload Request".
2. The slave acknowledges the request with a positive response ("Initiate Domain Upload Response").
   In the event of an error the slave responds with "Abort Domain Transfer".

Note!

In the case of jobs for the inverter, please make sure that you convert the code into an index.

▸ Indexing of the Lenze codes (📖 68)

SDO Upload Request

Detailed breakdown of the data for an "SDO Upload Request":

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	Station address of the source if an EtherCAT master is the initiator. Station address of the target if an EtherCAT slave is the initiator.
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority ... 0x03: Highest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x02: SDO request
SDO	Reserved	BYTE	4 bits (0 ... 3)	0x00
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is read. 0x01: The complete object is read. (Currently not supported.)
	Command specifier		3 bits (5 ... 7)	0x02: Upload request
	Index	WORD	2 bytes	Index of the object
	Subindex	BYTE	1 byte	Subindex of the object 0x00 or 0x01 if "Complete access" = 0x01.
	Reserved	DWORD	4 bytes	0x00

SDO Upload Expedited Response

An "SDO Upload Expedited Response" is effected if the data length of the parameter data to be read is up to 4 bytes.

Detailed breakdown of the data for an "SDO Upload Expedited Response":

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	Station address of the source if an EtherCAT master is the initiator. Station address of the target if an EtherCAT slave is the initiator.
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority ... 0x03: Highest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x03: SDO response
SDO	Size indicator	BYTE	1 bit (0)	0x01: Size of the data in "Data set size"
	Transfer type		1 bit (1)	0x01: Expedited transfer
	Data set size		2 bits (2, 3)	0x00: 4 bytes of data 0x01: 3 bytes of data 0x02: 2 bytes of data 0x03: 1 byte of data
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is read. 0x01: The complete object is read. (Currently not supported.)
	Command specifier		3 bits (5 ... 7)	0x02: Upload response
	Index	WORD	2 bytes	Index of the object
	Subindex	BYTE	1 byte	Subindex of the object 0x00 or 0x01 if "Complete access" = 0x01.
	Data	DWORD	4 bytes	Data of the object

SDO Upload Expedited Response

An "SDO Upload Normal Response" is effected if the data length of the parameter data to be read ≥ is 4 bytes.

Detailed breakdown of the data for an "SDO Upload Normal Response":

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	n ≥ 0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	Station address of the source if an EtherCAT master is the initiator. Station address of the target if an EtherCAT slave is the initiator.
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority ... 0x03: Highest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits 0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x03: SDO response
SDO	Size indicator	BYTE	1 bit (0)	0x01
	Transfer type		1 bit (1)	0x00: Normal transfer
	Data set size		2 bits (2, 3)	0x00
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is read. 0x01: The complete object is read. (Currently not supported.)
	Command specifier		3 bits (5 ... 7)	0x02: Upload response
	Index	WORD	2 bytes	Index of the object
	Subindex	BYTE	1 byte	Subindex of the object 0x00 or 0x01 if "Complete access" = 0x01.
	Complete size	DWORD	4 bytes	Total data length of the object
	Data	BYTE	n - 10 bytes	Data of the object

Example

The response structure transferred to index 0x5FC2 (standard setting of C00061/0 (heatsink temperature) = 0x0000002B (43 °C)) in the case of an **Upload** contains the following data:

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	0x00
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x03: SDO response
SDO	Size indicator	BYTE	1 bit (0)	0x01: Length of the data in "Data set size"
	Transfer type		1 bit (1)	0x01: Expedited transfer
	Data set size		2 bits (2, 3)	0x00: 4 bytes of data
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is read.
	Command specifier		3 bits (5 ... 7)	0x02: Upload response
	Index	WORD	2 bytes	0xC2: Index low byte of the object 0x5F: Index high byte of the object
	Subindex	BYTE	1 byte	0x00
	Data	DWORD	4 bytes	0x0000002B

9.2.2 Writing parameters (SDO download)

1. The master sends "Initiate Domain Download Request".
2. The slave acknowledges the request with a positive response ("Initiate Domain Download Response").
   In the event of an error the slave responds with "Abort Domain Transfer".

Note!

In the case of jobs for the inverter, please make sure that you convert the code into an index.

▸ Indexing of the Lenze codes (📖 68)

SDO Download Expedited Request

An "SDO Download Expedited Request" is effected if the data length of the parameter data to be written is up to 4 bytes.

Detailed breakdown of the data for an "SDO Download Expedited Request":

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	Station address of the source if an EtherCAT master is the initiator. Station address of the target if an EtherCAT slave is the initiator.
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority ... 0x03: Highest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x02: SDO request
SDO	Size indicator	BYTE	1 bit (0)	0x01: Size of the data in "Data set size"
	Transfer type		1 bit (1)	0x01: Expedited transfer
	Data set size		2 bits (2, 3)	0x00: 4 bytes of data 0x01: 3 bytes of data 0x02: 2 bytes of data 0x03: 1 byte of data
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is written. 0x01: The complete object is written. (Currently not supported.)
	Command specifier		3 bits (5 ... 7)	0x01: Download request
	Index	WORD	2 bytes	Index of the object
	Subindex	BYTE	1 byte	Subindex of the object 0x00 or 0x01 if "Complete access" = 0x01.
	Data	DWORD	4 bytes	Data of the object

SDO Download Expedited Request

An "SDO Download Normal Request" is effected if the data length of the parameter data to be written ≥ is 4 bytes.

Detailed breakdown of the data for an "SDO Download Normal Request":

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	n ≥ 0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	Station address of the source if an EtherCAT master is the initiator. Station address of the target if an EtherCAT slave is the initiator.
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority ... 0x03: Highest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x02: SDO request
SDO	Size indicator	BYTE	1 bit (0)	0x01
	Transfer type		1 bit (1)	0x00: Normal transfer
	Data set size		2 bits (2, 3)	0x00
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is written. 0x01: The complete object is written. (Currently not supported.)
	Command specifier		3 bits (5 ... 7)	0x01: Download request
	Index	WORD	2 bytes	Index of the object
	Subindex	BYTE	1 byte	Subindex of the object 0x00 or 0x01 if "Complete access" = 0x01.
	Complete size	DWORD	4 bytes	Total data length of the object
	Data	BYTE	n - 10 bytes	Data of the object

SDO Download Response

Detailed breakdown of the data for an "SDO Download Response":

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	Station address of the source if an EtherCAT master is the initiator. Station address of the target if an EtherCAT slave is the initiator.
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority ... 0x03: Highest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x03: SDO response
SDO	Size indicator	BYTE	1 bit (0)	0x0
	Transfer type		1 bit (1)	0x0
	Data set size		2 bits (2, 3)	0x0
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is written. 0x01: The complete object is written. (Currently not supported.)
	Command specifier		3 bits (5 ... 7)	0x3: Download response
	Index	WORD	2 bytes	Index of the object
	Subindex	BYTE	1 byte	Subindex of the object 0x00 or 0x01 if "Complete access" = 0x01.
	Reserved	DWORD	4 bytes	0x00

Example

The request structure transferred in the case of a **Download** to the index 0x5FA7 (C00088/0, rated motor current I = 10.2 A) contains the following data:

SDO frame area	Data field	Data type / length		Value / description
Mailbox header	Length	WORD	2 bytes	0x0A: Length of the mailbox service data
	Address	WORD	2 bytes	0x00
	Channel	WORD	6 bits (0 ... 5)	0x00: Reserved
	Priority		2 bits (6, 7)	0x00: Lowest priority
	Type		4 bits (8 ... 11)	0x03: CANopen over EtherCAT (CoE)
	Reserved		4 bits (12 ... 15)	0x00
CANopen header	Number	WORD	9 bits (0 ... 8)	0x00
	Reserved		3 bits (9 ... 11)	0x00
	Service		4 bits (12 ... 15)	0x02: SDO request
SDO	Size indicator	BYTE	1 bit (0)	0x01: Size of the data in "Data set size"
	Transfer type		1 bit (1)	0x01: Expedited transfer
	Data set size		2 bits (2, 3)	0x00: 4 bytes of data
	Complete access		1 bit (4)	0x00: The entry addressed with index and subindex is written.
	Command specifier		3 bits (5 ... 7)	0x01: Download request
	Index	WORD	2 bytes	0xA7: Index low byte of the object 0x5F: Index high byte of the object
	Subindex	BYTE	1 byte	0x00: Subindex of the object
	Data	DWORD	4 bytes	0x00000066 (10.2 x 10 = 102)

***: from SW version 04.00 only available if FSoE is used

9.4 SDO abort codes (Abort codes)

If an SDO request is evaluated negatively, a corresponding error code is output.

Index [hex]	Description
0x00000000	No error
0x05030000	The status of the toggle bit has not changed
0x05040000	SDO protocol time-out
0x05040001	Invalid or unknown specification symbol for the client/server command
0x05040005	The space in the main memory is not sufficient.
0x06010000	Access to object not supported
0x06010001	Read access to a write-only object
0x06010002	Write access to a read-only object
0x06010004	Complete Access (is not supported)
0x06020000	An object does not exist in the object directory
0x06040041	An object cannot be entered/mapped in the PDO.
0x06040042	The number and/or length of the objects entered/mapped would exceed the PDO length.
0x06040043	General parameter incompatibility
0x06040047	General internal device incompatibility
0x06060000	Access has failed due to a fault in the hardware
0x06070010	The data type or the parameter length does not correspond
0x06070012	Incorrect data type (The parameter length is too large)
0x06070013	Incorrect data type (The parameter length is too small)
0x06090011	A subindex is not available
0x06090030	The value range for parameters is too great (only for write access)
0x06090031	The parameter value is too high
0x06090032	The parameter value is too low
0x06090036	The maximum value is lower than the minimum value
0x08000000	General error
0x08000020	Data cannot be transferred to the application or stored in the application
0x08000021	Due to local control, data cannot be transferred to the application or stored in the application
0x08000022	Due to the current device state, data cannot be transferred to the application or stored in the application
0x08000023	The dynamic generation of an object directory has failed, or no object directory is available.

10 Safety over EtherCAT

Note!

A safety bus system (FSoE) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

From SW version 04.00, FSoE (Fail Safe over EtherCAT) provides for transmission of safe information via the "Safety over EtherCAT" protocol according to the "ETG.5100" specification, version 1.2.0.

The FSoE data is configured within a safety PDO and sent in the same Sync unit as the standard PDOs.

One bit of the FSoE data is always used to control specific safety functions.

The structure of the FSoE data is specified and cannot be changed by the user.

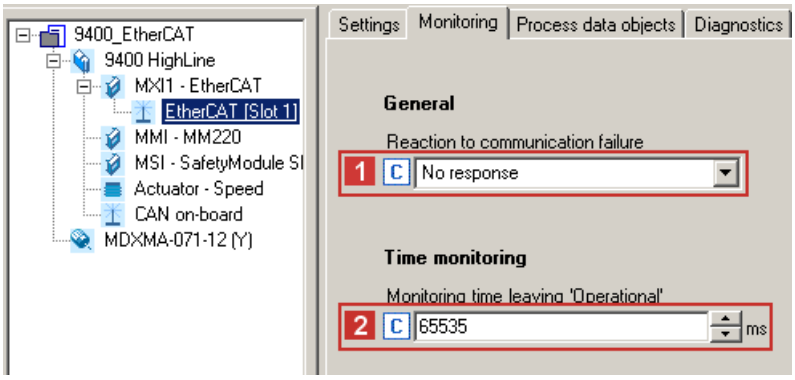
If the **SM302** safety module (E94AYAF) is used, the length of the ...

- safety outputs is permanently 11 bytes;
- safety inputs is permanently 19 bytes.

The Servo Drive 9400 forwards the FSoE data to the safety module for a safe evaluation.

▸ Configuring safety process data (📖 33)

Documentation for the SM302 safety module (E94AYAF)



Here you can find detailed information on the FSoE connection.

11 Monitoring

11.1 Interruption of EtherCAT communication

An interruption of the EtherCAT communication in the "Operational" state, e.g. due to cable break of failure of the EtherCAT master, is detected by the slave.

The response to an interrupted communication is triggered by settings in the **Monitoring** tab:

- During initialisation of the EtherCAT communication, the PDO watchdog monitoring time preset in the master (C13882 / C14882) is transmitted to the slave.
  If the slave does not receive any valid process data in the "Operational" state, the setting in C13885 / C14885 is taken as a basis for the process data.
  - Value ’0’: The data sent last by the master are used.
  - Value ’1’: PDOs are set to the value '0'.

  After the watchdog monitoring time has elapsed, the slave changes to the "Safe-Operational" state (see C13861 / C14861) and the green **RUN** LED is activated (see EtherCAT status displays (📖 87)).
  There is no response in the slave.
- In order that a response is triggered in the slave, you have to set a 1 **Reaction on communication failure** (C13880 / C14880).
- The response is delayed if you set an internal 2 **monitoring time** (C13881 / C14881) in addition.
  The monitoring time elapses as soon as the "Operational" state is exited. (See 1.).
  After the monitoring time has elapsed, the set response is executed with the error message "EtherCAT: Quit 'Operational' state [0x00c88131]" (📖 95).

11.2 Interruption of internal communication

The response in the case of a communication error between the communication module and the standard device can be set via codes C01501 (module in slot MXI1) and C01502 (module in slot MXI2).

An externally supplied communication module reports a connection abort to the standard device via an emergency telegram to the master and changes to the "Safe-operational" state.

11.3 Sync telegram failure detection

During the Synchronisation with "Distributed clocks" (DC) (📖 36), this monitoring mode checks whether an EtherCAT PDO telegram (Sync Manager 2 Event) has arrived between two signals.

For this purpose, the communication module comes with an internal EtherCAT telegram failure error counter. The telegram failure error counter is incremented by the value '3' in case of a telegram failure. For each PDO received correctly, the counter is decremented by '1'.

If the telegram failure error counter reaches a threshold, – adjustable via the EtherCAT master in the CoE object 0x10F1.2 – the state changes to "Safe-Operational" and the "Sync telegram failure [0x01bc8700]" error message is output.

In the standard setting, monitoring is deactivated (0x10F1.2 = 0). A sensible setting is a value > ’5’ in order that an error will only be triggered in the inverter when a second telegram fails.

An error response can be set via the code C13880/2 / C14880/2 ("0: No response" is preset here).

The application serves to detect telegram failures by evaluating the signals **SYNC_bProcessDataExpected** and **SYNC_bProcessDataInvalid** of the **LS_SyncInput** system block.

This monitoring can be used, for instance, for extrapolating the setpoints (position, speed and torque).

Tip!

The function blocks **L_SdInterExtrapolatePosition** or **L_SdInterExtrapolateAny** are available as extrapolation blocks.

The frame failure detection is implemented by default in the "CiA402" technology application.

11.4 EtherCAT synchronisation loss

The "Sync0" synchronisation signal serves to synchronise the start of the inverter application with the application of the EtherCAT master.

This synchronisation is monitored by the inverter in a permanent time slot.

If impermissible deviations of the synchronisation cycle time are detected within four successive cycles, the inverter generates the error message "EtherCAT: Sync loss detected with standard device [0x00c88132]" (📖 95).

The permissible jitter of the synchronisation cycle time is 10 µs.

Code C13884 / C14884 displays whether the Servo Drive 9400 is synchronised.

Tip!

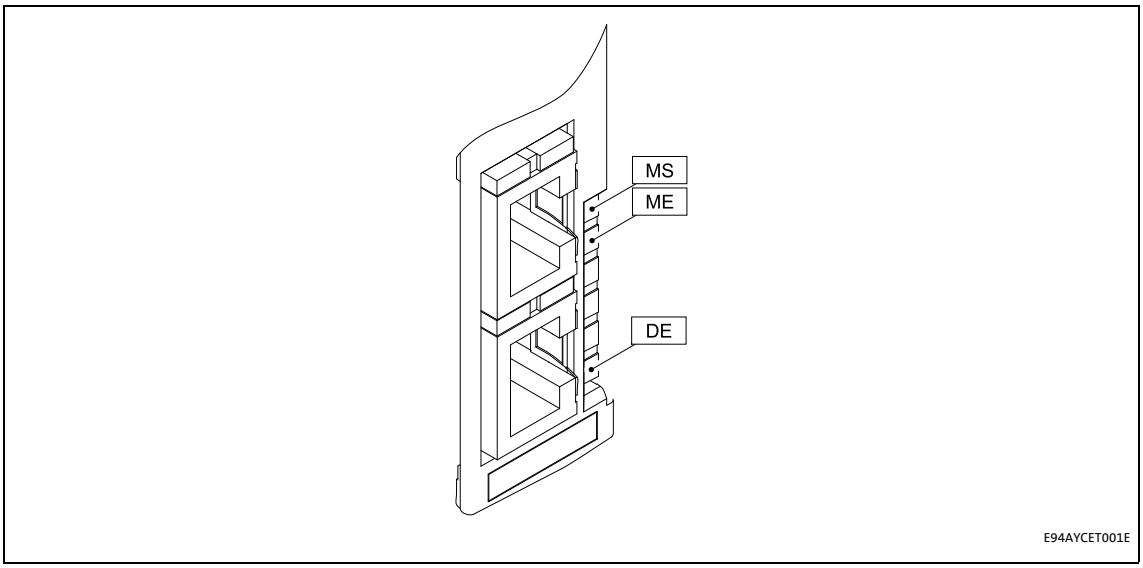
The synchronisation can be monitored in the application by the **LS_SyncInput** system block.

12 Diagnostics

For purposes of fault diagnostics, the communication module is provided with the LEDs on the front. Furthermore, you can carry out the Diagnostics with the »Engineer« (📖 90).

12.1 LED status displays

Note!



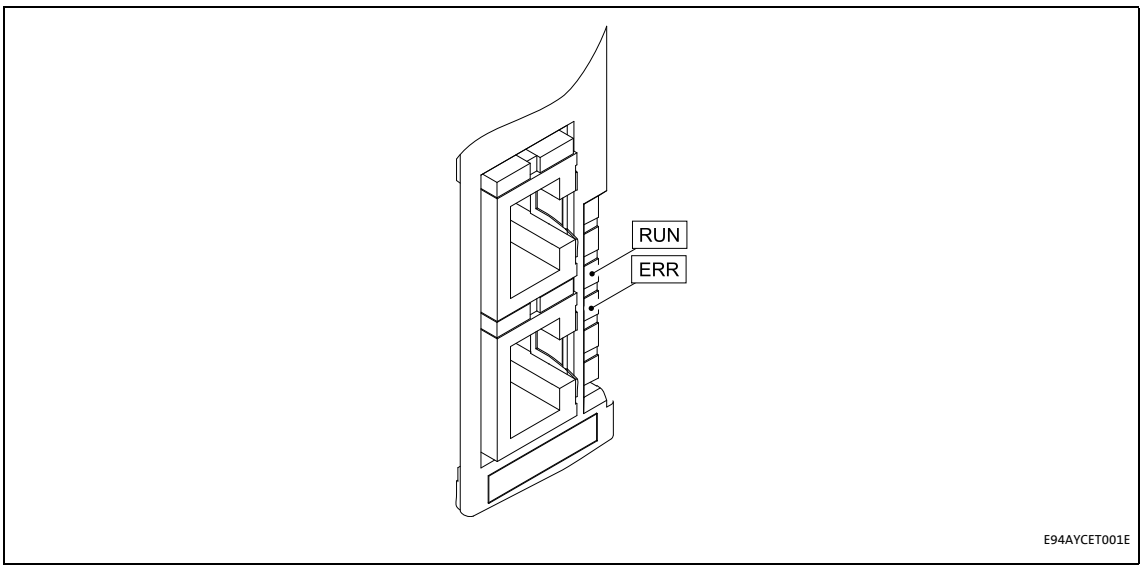
During normal operation ...
- only the LEDs **MS** (📖 86) and **BS** (📖 87) should be lit constantly.
- the green LED on the RJ45 sockets X246 /X247 must be lit or blinking (📖 89).

The following status displays can be differentiated:

- Module status displays (📖 86)
- EtherCAT status displays (📖 87)
- Status display at the RJ45 sockets (X246 / X247) (📖 89)

12.1.1 Module status displays

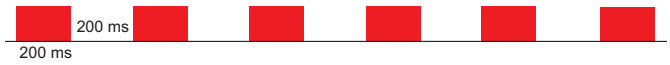
The module status displays are indicated by the LEDs **MS**, **ME** and **DE**.

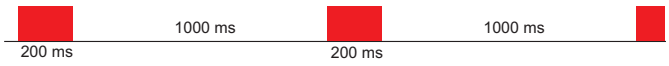


[12-1] Module status displays

Pos.	Colour	Status	Description
MS	Green	On	The communication module is supplied with voltage and is connected to the standard device.
		Blinking	200 ms 200 ms The communication module is supplied with voltage, but is not connected to the standard device. (Standard device is switched off, in the initialisation phase, or not available.)
ME	Red	On	An error has occurred in the communication module.
EN	Red	On	The communication module is not accepted by the basic device or the basic device is not active (see notes in the documentation relating to the basic device.)

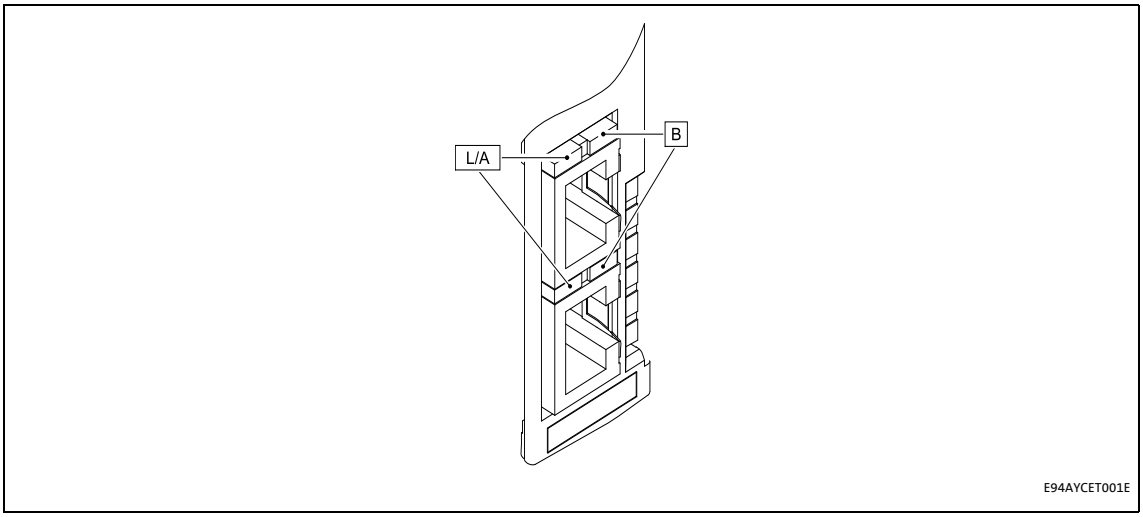
12.1.2 EtherCAT status displays





EtherCAT status displays are indicated by the LEDs **RUN** and **ERR**.

- The **RUN** LED shows the current state of the EtherCAT state machine (📖 59).
- The **ERR** LED shows the current EtherCAT error.



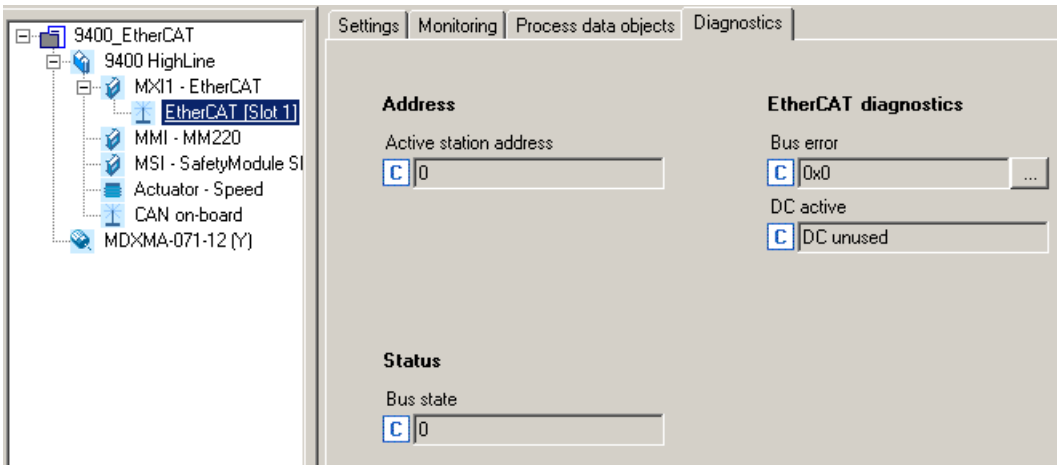
[12-2] EtherCAT status displays

LED	Colour	Status	Description
RUN	Green	Off	The communication module is not active on the fieldbus or is in the "Init" state.
		Blinking	 "Pre-operational" status is active: • Access to parameters and objects is possible. • No process data exchange.
		blinking once (single flash)	 "Safe-operational" status is active: • The data are not yet active in the standard device.
		On	 The communication module is in the "Operational" state.

LED	Colour	Status	Description
ERR	Red	Off	No error
		Blinking	 The configuration is invalid/faulty.
		blinking once (single flash)	 • A non requested state change has occurred. (The slave application has autonomously changed the EtherCAT status.) • Synchronisation error (The EtherCAT device automatically changes to the "Safe-operational" state.)
		blinking twice (double flash)	 An "Application Watchdog Timeout" or a "Sync Manager Watchdog Timeout" has occurred.

12.1.3 Status display at the RJ45 sockets (X246 / X247)

The physical status of the EtherCAT connection with the corresponding communication partner is displayed by the **L/A** (Link/Activity) LED.



[12-3] Status of the EtherCAT connection

LED	Colour	Status	Description
L/A	Green	On	 A physical EtherCAT connection is available.
		Flickers	 Data are being exchanged via EtherCAT.
B	Red	Off	This LED is not used.

12.2 Diagnostics with the »Engineer«

In the »Engineer«, the **Diagnostics** tab displays various pieces of EtherCAT diagnostic information.

12.3 Emergency requests / Emergency messages

Emergency messages are sent to the EtherCAT master once when the error status of the controller changes, i.e. ...

- when an error in the inverter or in the communication module occurs or
- when an internal error of the communication module is eliminated.

An "Emergency Request" on the fieldbus consists of the components "Mailbox Header", "CANopen Header" and the actual "Emergency Message":

Mailbox header	CANopen header	Emergency Message
6 bytes	2 bytes	8 bytes

The emergency message last sent by the Servo Drive 9400 is displayed in code C13867 / C14867.

Structure of the Emergency message

Example: Emergency message of the "EtherCAT error: Quit Operational state [0x00c88131]"

Byte 1	Byte2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Emergency Error code		Error Register (I-1001)	Reserved	Error code Servo Drive 9400 / E94AYCET			
Low byte	High byte	Low byte	High byte	Low word		High word	
				Low byte	High byte	Low byte	High byte
0x00	0x10	0x01	0x00	0x31	0x81	0xc8	0x00

- Bytes 1 and 2 display that an error is pending.
- Byte 3 display the contents of the error register (I-1001).
- Bytes 5 ... 8 contain the error code.

Reference manual/online help for the Servo Drive 9400

Here you will find detailed information on error codes.

13 Error messages

This chapter supplements the error list in the reference manual and the »Engineer« online help for the Servo Drive 9400 by the error messages of the E94AYCET (EtherCAT) communication module.

Reference manual/online help for the Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

13.1 Short overview of the EtherCAT error messages

The following table lists all EtherCAT error messages in numerical order of the error number. Furthermore the preset error response and – if available – the parameters for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Name	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c83100	13119744	EtherCAT: Connection to 9400 lost	No response	-
0x00c85114	13127956	EtherCAT: Internal supply voltage too low	Information	-
0x00c85531	13129009	EtherCAT: Memory: No access	Information	-
0x00c85532	13129010	EtherCAT: Memory: Error while reading	Information	-
0x00c85533	13129011	EtherCAT: Memory: Error while writing	Information	-
0x00c86010	13131792	EtherCAT: Restart after watchdog reset	Fault	-
0x00c86011	13131793	EtherCAT: Internal error	Fault	-
0x00c86100	13132032	EtherCAT: Internal error	Information	-
0x00c86101	13132033	EtherCAT: Internal error	Fault	-
0x00c86110	13132048	EtherCAT: Internal mapping error	Warning Locked	-
0x00c8641f	13132831	EtherCAT: Parameter set invalid	Fault	-
0x00c86420	13132832	EtherCAT: Error: Lenze setting loaded	Fault	-
0x00c86610	13133328	EtherCAT: Communication time-out with safety module (from SW version 04.00)	Warning Locked	
0x00c86612	13133330	EtherCAT: Initialisation error with safety module (from SW version 04.00)	Warning Locked	
0x00c88131	13140273	EtherCAT: Quit the 'Operational' status	No response	C13880/1 / C14880/1
0x00c88132	13140274	EtherCAT: Sync loss detected in standard device	Warning Locked	-
0x00c88700	13141760	EtherCAT: Sync telegram failure	No response	C13880/2 / C14880/2

13.2 Possible causes and remedies

This chapter lists all EtherCAT error messages in the numerical order of the error numbers. Possible causes and remedies as well as responses to the error messages are described in detail.

EtherCAT: Connection to 9400 lost [0x00c83100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☒ **None** ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The MXI communication to the Servo Drive 9400 is interrupted. • Servo Drive 9400 is switched off. • The communication module is not connected correctly at the MXI slot of the Servo Drive 9400.	• Switch on Servo Drive 9400. • Plug in the communication module correctly at the MXI slot of the Servo Drive 9400. • Send communication module and Servo Drive 9400 with error description to Lenze.

EtherCAT: Internal supply voltage too low [0x00c85114]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Voltage loss of the standard device	Check voltage supply.

EtherCAT: Memory: No access [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Access to memory was not possible.	Send communication module together with a description of the fault to Lenze.

EtherCAT: Memory: Error while reading [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be read.	Send communication module together with a description of the fault to Lenze.

EtherCAT: Memory: Error while writing [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be written.	Send communication module together with a description of the fault to Lenze.

EtherCAT: Restart by watchdog reset [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EtherCAT: Internal error [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EtherCAT: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Internal error.	If the error occurs permanently, please contact Lenze.

EtherCAT: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

EtherCAT: Internal mapping error [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The selected PDO mapping is invalid: • An object not supporting the required properties has been specified. • More than 64 bytes of data have been entered/ mapped.	Re-execute PDO mapping. ▸ Configuring process data (PDO mapping) (📖 62)

EtherCAT: Parameter set invalid [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Download application again (including module).

EtherCAT: Error: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access via standard device to the parameter set in the memory module failed.	Download application again (including module).

EtherCAT: Communication time-out with safety module [0x00c86610]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The communication to the SM30x safety module is disturbed.	Send communication module with error description to Lenze.

EtherCAT: Initialisation error with safety module [0x00c86612]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The communication to the SM30x safety module could not be initialised correctly.	Check if the SM30x safety module is plugged in and supplied with voltage

EtherCAT: Quit 'Operational' state [0x00c88131]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1 (☑ Configurable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
The EtherCAT data exchange was stopped in the "Operational" state. Also see the chapter "Interruption of EtherCAT communication" (📖 82).	• Check cables and terminals. • The master has to reset the device to the "Operational" status. (If required, check a pending emergency message first).

EtherCAT: Sync loss detected with standard device [0x00c88132]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
• The cycle time settings are faulty. • The task time setting of a linked PLC program is faulty. • EtherCAT master / DC master settings are incorrect. • The sync source setting is faulty.	• Check the cycle times. • Check the task time of a linked PLC program. • Check the EtherCAT master / DC master settings. • Check the settings of the standard device in C01120 (selection of the sync source).

EtherCAT: Sync telegram failure [0x00c88700]

Response (Lenze setting printed in bold)	**Setting:** C13880/2 / C14880/2 (☑ Configurable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
• EtherCAT-Sync0 signal has failed. • PDO sent or received too late as the instant of transmission of the EtherCAT frame by the master jitters too much.	• Check EtherCAT master configuration if the DC mode has been set. • Restart EtherCAT configuration. • Postpone PDO instant of reception via the user shift time. • Increase sync error counter monitoring limit (0x10F1.2).

14 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the reference manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCET (EtherCAT) communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on parameters.

14.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response to impermissible device configuration		
Selection list		
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No Response	Reserved
C00615/2	1: No Response	Resp. to imp. module in MXI1
C00615/3	1: No Response	Resp. to imp. module in MXI2
C00615/4	0: No Response	Reserved
C00615/5	0: No Response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response for the case where a new module has been plugged into slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**	Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response if a new module has been plugged into module slot 2 of the standard device.	
Selection list (Lenze setting printed in bold)	
1	Fault
6	Information
5	Warning
4	**Warning Locked**
3	Quick stop by trouble
0	No response
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C01120

Parameter | Name: **C01120 | Sync source**	Data type: UNSIGNED_8 Index: 23455 = 0x5B9F
Selection of the source for DC synchronisation signals. • Depending on the slot in the standard device, set the selection "4: Module in MXI1" or "5: Module in MXI2" for the communication module. • The drive can only be synchronised by one source. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)	
Selection list (Lenze setting printed in bold)	
0	**Off**
1	CAN on board
2	CAN module
4	Module in MXI1
5	Module in MXI2
6	Digital input 1
...	...
13	Digital input 8
☑ Read access ☑ Write access ☐ RSP ☐ PLC-STOP ☐ No transfer	Scaling factor: 1

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**	Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 1 and the standard device	
Selection list (Lenze setting printed in bold)	
0	**No response**
1	Fault
3	Quick stop by trouble
4	Warning Locked
5	Warning
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer	

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

14.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCET communication module (EtherCAT) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C13231

Parameter | Name: **C13231 | Mapping entries RPDO-1 (I-1600)**		Data type: UNSIGNED_64 Index: 11344 = 0x2C50
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the RPDO channel 1. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13231/1	0	1. Mapping entry RPDO-1 (I-1600.01)
...	0	...
C13231/32	0	32. Mapping entry RPDO-1 (I-1600.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13232

Parameter | Name: **C13232 | Mapping entries RPDO-2**		Data type: UNSIGNED_64 Index: 11343 = 0x2C4F
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the RPDO channel 2. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13232/1	0	1. Mapping entry RPDO-2 (I-1601.01)
...	0	...
C13232/32	0	32. Mapping entry RPDO-2 (I-1601.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13233

Parameter | Name: **C13233 | Mapping entries RPDO-3**	Data type: UNSIGNED_64 Index: 11342 = 0x2C4E

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 3.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13233/1	0	1. Mapping entry RPDO-3 (I-1602.01)
...	...	...
C13233/32	0	32. Mapping entry RPDO-3 (I-1602.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13234

Parameter | Name: **C13234 | Mapping entries RPDO-4**	Data type: UNSIGNED_64 Index: 11341 = 0x2C4D

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 4.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0

Subcodes	**Lenze setting**	**Info**
C13234/1	0	1. Mapping entry RPDO-4 (I-1603.01)
...	0	...
C13234/32	0	32. Mapping entry RPDO-4 (I-1603.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13235

Parameter | Name: **C13235 | Mapping entries RPDO-5**	Data type: UNSIGNED_64 Index: 11340 = 0x2C4C

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 5.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13235/1	0	1. Mapping entry RPDO-5 (I-1604.01)
...	...	...
C13235/32	0	32. Mapping entry RPDO-5 (I-1604.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13236

Parameter | Name: **C13236 | Mapping entries RPDO-6**	Data type: UNSIGNED_64 Index: 11339 = 0x2C4B

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 6.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13236/1	0	1. Mapping entry RPDO-6 (I-1605.01)
...	...	...
C13236/32	0	32. Mapping entry RPDO-6 (I-1605.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13237

Parameter | Name: **C13237 | Mapping entries RPDO-7**	Data type: UNSIGNED_64 Index: 11338 = 0x2C4A

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 7.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13237/1	0	1. Mapping entry RPDO-7 (I-1606.01)
...	...	...
C13237/32	0	32. Mapping entry RPDO-7 (I-1606.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13238

Parameter | Name: **C13238 | Mapping entries RPDO-8**	Data type: UNSIGNED_64 Index: 11337 = 0x2C49

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 8.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0

C13238/32	0	32. Mapping entry RPDO-8 (I-1607.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13239

Parameter | Name: **C13239 | Mapping entries RPDO-9**	Data type: UNSIGNED_64 Index: 11336 = 0x2C48

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 9.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0

Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13239/1	0	1. Mapping entry RPDO-9 (I-1608.01)
...	...	...
C13239/32	0	32. Mapping entry RPDO-9 (I-1608.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13240

Parameter | Name: **C13240 | Mapping entries RPDO-10**	Data type: UNSIGNED_64 Index: 11335 = 0x2C47

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 10.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63

C13240/1	0	1. Mapping entry RPDO-10 (I-1609.01)
...	0	...
C13240/32	0	32. Mapping entry RPDO-10 (I-1609.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13484

Parameter | Name: **C13484 | Active RPDO channel**			Data type: UNSIGNED_8 Index: 11091 = 0x2B53
This code is for device-internal use only and must not be written to by the user! Selection of the active RPDO channel			
Selection list			**Info**
0	No RPDO		
1	RPDO-1 (I-1600)		
...	...		
10	RPDO-10 (I-1609)		
Subcodes	**Lenze setting**		**Info**
C13484/1	1: RPDO-1 (I-1600)		Active RPDO channel
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13489

Parameter | Name: **C13489 | No. of RPDO mapping entries**			Data type: UNSIGNED_8 Index: 11086 = 0x2B4E
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 10 specify the number of valid mapping entries of the RPDO channels 1 ... 10 (valid subcodes in C13231 ... C13240).			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C13489/1	0		No. of mapping entries for RPDO-1
...	...		...
C13489/10	0		No. of mapping entries for RPDO-10
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13531

Parameter | Name: **C13531 | Mapping entries TPDO-1**			Data type: UNSIGNED_64 Index: 11044 = 0x2B24
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the TPDO channel 1. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)			
Value is bit-coded:			**Info**
Bit 0	Bit 0		
...	...		
Bit 63	Bit 63		
Subcodes	**Lenze setting**		**Info**
C13531/1	0		1. mapping entry TPDO-1 (I-1A00.01)
...	...		...
C13531/32	0		32. mapping entry TPDO-1 (I-1A00.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13532

Parameter | Name: **C13532 | Mapping entries TPDO-2**	Data type: UNSIGNED_64 Index: 11043 = 0x2B23

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 2.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13532/1	0	1. Mapping entry TPDO-2 (I-1A01.01)
...	...	...
C13532/32	0	32. Mapping entry TPDO-2 (I-1A01.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13533

Parameter | Name: **C13533 | Mapping entries TPDO-3**	Data type: UNSIGNED_64 Index: 11042 = 0x2B22

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 3.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13533/1	0	1. Mapping entry TPDO-3 (I-1A02.01)
...	...	...
C13533/32	0	32. Mapping entry TPDO-3 (I-1A02.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13534

Parameter | Name: **C13534 | Mapping entries TPDO-4**	Data type: UNSIGNED_64 Index: 11041 = 0x2B21

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 4.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13534/1	0	1. Mapping entry TPDO-4 (I-1A03.01)
...	...	...
C13534/32	0	32. Mapping entry TPDO-4 (I-1A03.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13535

Parameter | Name: **C13535 | Mapping entries TPDO-5**	Data type: UNSIGNED_64 Index: 11040 = 0x2B20

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 5.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13535/1	0	1. Mapping entry TPDO-5 (I-1A04.01)
...	...	...
C13535/32	0	32. Mapping entry TPDO-5 (I-1A04.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13536

Parameter | Name: **C13536 | Mapping entries TPDO-6**		Data type: UNSIGNED_64 Index: 11039 = 0x2B1F
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the TPDO channel 6. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13536/1	0	1. Mapping entry TPDO-6 (I-1A05.01)
...	...	...
C13536/32	0	32. Mapping entry TPDO-6 (I-1A05.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13537

Parameter | Name: **C13537 | Mapping entries TPDO-7**		Data type: UNSIGNED_64 Index: 11038 = 0x2B1E
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the TPDO channel 7. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13537/1	0	1. Mapping entry TPDO-7 (I-1A06.01)
...	0	...
C13537/32	0	32. Mapping entry TPDO-7 (I-1A06.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13538

Parameter | Name: **C13538 | Mapping entries TPDO-8**	Data type: UNSIGNED_64 Index: 11037 = 0x2B1D

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 8.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13538/1	0	1. Mapping entry TPDO-8 (I-1A07.01)
...	...	...
C13538/32	0	32. Mapping entry TPDO-8 (I-1A07.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13539

Parameter | Name: **C13539 | Mapping entries TPDO-9**	Data type: UNSIGNED_64 Index: 11036 = 0x2B1C

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 9.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13539/1	0	1. Mapping entry TPDO-9 (I-1A08.01)
...	...	...
C13539/32	0	32. Mapping entry TPDO-9 (I-1A08.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13540

Parameter | Name: **C13540 | Mapping entries TPDO-10**	Data type: UNSIGNED_64 Index: 11035 = 0x2B1B

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 10.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C13540/1	0	1. Mapping entry TPDO-10 (I-1A09.01)
...	...	...
C13540/32	0	32. Mapping entry TPDO-10 (I-1A09.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13784

Parameter | Name: **C13784 | Active TPDO channel**	Data type: UNSIGNED_8 Index: 10791 = 0x2A27

This code is for device-internal use only and must not be written to by the user!
Selection of the active TPDO channel

Selection list		Info
0	No TPDO	
1	TPDO-1 (I-1A00)	
...	...	
10	TPDO-10 (I-1A09)	
Subcodes	**Lenze setting**	**Info**
C13784/1	1: TPDO-1 (I-1A00)	Active TPDO channel

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13789

Parameter | Name: **C13789 | No. of TPDO mapping entries**	Data type: UNSIGNED_8 Index: 10786 = 0x2A22

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 10 specify the number of valid mapping entries of the TPDO channels 1 ... 10 (valid subcodes in C13531 ... C13540).

Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C13789/1	0		No. of mapping entries for TPDO-1
...	...		...
C13789/10	0		No. of mapping entries for TPDO-10

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13850

Parameter | Name: **C13850 | All words to master**			Data type: UNSIGNED_16 Index: 10725 = 0x29E5
Display of the process data words (subcodes 1 ... 32) which are transferred from the communication module to the master. Only those which are configured are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13850/1			
...			
C13850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13851

Parameter | Name: **C13851 | All words from master**			Data type: UNSIGNED_16 Index: 10724 = 0x29E4
Display of the process data words (subcodes 1 ... 32) which are transferred from the master to the communication module. Only those which are configured are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13851/1			
...			
C13851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13852

Parameter | Name: **C13852 | All words to standard device**			Data type: UNSIGNED_16 Index: 10723 = 0x29E3
Display of the process data words (subcodes 1 ... 32) which are transferred from the communication module to the standard device.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13852/1			
...			
C13852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13853

Parameter | Name: **C13853 | All words from standard device**			Data type: UNSIGNED_16 Index: 10722 = 0x29E2
Display of the process data words (subcodes 1 ... 32) which are transferred from the standard device to the communication module.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13853/1			
...			
C13853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13858

Parameter | Name: **C13858 | Safety-over-EtherCAT (FSoE) active**		Data type: UNSIGNED_8 Index: 10717 = 0x29DD
Available from SW version 04.00. Display of the activity of Safety over EtherCAT (📖 81)		
Selection list (read only)		**Info**
0	Not active	
1	Enable	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13859

Parameter | Name: **C13859 | Length of the configured input data**			Data type: UNSIGNED_8 Index: 10716 = 0x29DC
Available from SW version 04.00. Display of the length of the configured input data in bytes			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13859/1			TxPDO length
C13859/2			Safety-TxPDO length
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13860

Parameter | Name: **C13860 | Length of the configured output data**			Data type: UNSIGNED_8 Index: 10715 = 0x29DB
Available from SW version 04.00. Display of the length of the configured output data in bytes			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13859/1			RxPDO length
C13859/2			Safety-RxPDO length
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13861

Parameter | Name: **C13861 | Bus status**			Data type: UNSIGNED_16 Index: 10714 = 0x29DA
Display of the current bus status ▸ EtherCAT state machine (📖 59)			
Selection list (read only)			**Info**
0	Nonexistent		No online value available (communication module is offline).
1	Init		
2	Pre-Operational		
3	Bootstrap		Is not supported.
4	Safe-operational		
8	Operational		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13864

Parameter | Name: **C13864 | Active station address**			Data type: UNSIGNED_16 Index: 10711 = 0x29D7
Display of the station address allocated by the master			
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13867

Parameter | Name: **C13867 | Display: Most recent emergency data**			Data type: OCTET_STRING Index: 10708 = 0x29D4
Display of the emergency data last sent by the inverter (string with a length of 8 bytes). ▸ Emergency requests / Emergency messages (📖 91)			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13870

Parameter | Name: **C13870 | Cycle time display**			Data type: UNSIGNED_32 Index: 10705 = 0x29D1
Available from software version 03.00! Display of the synchronisation cycle time in µs set by the master. • This time is only valid if "Distributed clocks" (DC) are used. • If no DC is used, the time is displayed is "0". ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)			
Display range (min. value | unit | max. value)			
0	µs	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13879

Parameter | Name: **C13879 | Bus error**			Data type: UNSIGNED_32 Index: 10696 = 0x29C8
Bit-coded display of the bus error Additionally, an error message is entered in the EtherCAT register "AL Status Code" (📖 60).			
Value is bit-coded:			**Info**
Bit 0	General bus error		
Bit 1	Reserved		
...	...		
Bit 31	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13880

Parameter | Name: **C13880 | Resp. to communication failure**			Data type: UNSIGNED_8 Index: 10695 = 0x29C7
The set response will be executed if ... • a sync telegram failure has been detected or • the device detects that is no longer in the "Operational" state and the monitoring time (C13881) has elapsed.			
Selection list			
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**		**Info**
C13880/1	0: No Response		Resp. to Interruption of EtherCAT communication (📖 82)
C13880/2	0: No Response		Resp. to Sync telegram failure detection (📖 83) (available from SW version 04.00)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13881

Parameter | Name: **C13881 | Response time when exiting 'Operational'**			Data type: UNSIGNED_16 Index: 10694 = 0x29C6
If the "Operational" state is exited, the response parameterised with C13880 occurs after the time set here has elapsed. A change of monitoring will be effective immediately.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13882

Parameter | Name: **C13882 | Display of PDO watchdog time**			Data type: UNSIGNED_32 Index: 10693 = 0x29C5
Available from software version 03.00! Display of the PDO watchdog monitoring time defined in the master. During initialisation of the EtherCAT communication, the watchdog monitoring time is transmitted to the slave.			
Display range (min. value | unit | max. value)			
0	µs	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13883

Parameter | Name: **C13883 | DC active**		Data type: UNSIGNED_8 Index: 10692 = 0x29C4
The code displays if the DC synchronisation has been activated for the communication module. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)		
Selection list (read only)		**Info**
0	DC unused	
1	DC for synchronisation	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13884

Parameter | Name: **C13884 | Base device synchronisation status**		Data type: UNSIGNED_8 Index: 10691 = 0x29C3
Available from software version 03.00! The code displays whether the inverter is DC-synchronised. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)		
Selection list (read only)		**Info**
0	Not synchronised	
1	Synchronised	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13885

Parameter | Name: **C13885 | Clear process data**		Data type: UNSIGNED_8 Index: 10690 = 0x29C2
This code serves to set which process data the slave is to process for maintaining internal communication when the EtherCAT has exited the "Operational" state.		
Selection list (Lenze setting printed in bold)		**Info**
0	Use of most recent master PDOs	
1	**PDOs are set to the value 0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13887

Parameter | Name: **C13887 | Suppress emergency message in case of**			Data type: BITFIELD_8 Index: 10688 = 0x29C0
This code serves to prevent the emergency messages from being transmitted to the EtherCAT master. Here, errors of a certain type can be suppressed deliberately. Furthermore, all errors are entered in the logbook. A change will only be effective if no error number with the error type selected here is available in the standard device code **C00165**.			
Value is bit-coded:			**Info**
Bit 0	Fault		
Bit 1	Fault		
Bit 2	Quick stop by trouble		
Bit 3	Warning Locked		
Bit 4	Warning		
Bit 5	Information		
Bit 6	Reserved		
Bit 7	Reserved		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13892

Parameter | Name: **C13892 | Process data mode**		Data type: UNSIGNED_8 Index: 10683 = 0x29BB
Mode selection for a time optimisation of the process data transfer This code is only evaluated if "Distributed clocks" are used. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36) ▸ Process data mode (📖 40)		
Selection list (Lenze setting printed in bold)		**Info**
0	Optimised mode	This mode leads to a reduction of the dead time by one EtherCAT cycle. Preconditions: • The EtherCAT telegram generated by the master has a low jitter and is sent within a window of 320 µs after the Sync0 event and shortly before the next Sync0 event. • The EtherCAT cycle time must be 1 ms.
1	**Deterministic mode**	This mode is the standard mode. It does not support a time optimisation of the process data transfer. The actual values are copied to the EtherCAT interface with the next Sync0 event.
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13899

Parameter | Name: **C13899 | Station alias**			Data type: UNSIGNED_16 Index: 10676 = 0x29B4
This code serves to set a station alias. In order to use a station alias, you must select a value > "0". • The station alias must only be set if the device is part of a "hot connect" group. • The station alias must be unambiguous and must only be assigned once within the EtherCAT network. • Use the same station alias in the EtherCAT master and in the slave. ▸ Address allocation (📖 35)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		32767	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13900

Parameter | Name: **C13900 | Firmware: Product type**	Data type: VISIBLE_STRING Index: 10675 = 0x29B3
The code contains a string with a length of 8 bytes. The following identification code is output: "E94AFCET".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13901

Parameter | Name: **C13901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: 10674 = 0x29B2
The code contains a string with a length of 20 bytes. The creation date ("MM DD YYYY") and the time ("hh:mm:ss") of the software are output here. Example: "Mar 21 2005 12:31:21"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13902

Parameter | Name: **C13902 | Firmware version**	Data type: VISIBLE_STRING Index: 10673 = 0x29B1
The code contains a string with a length of 11 bytes. The firmware version is output here. Example: "02.00.00.36"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

14.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCET communication module (EtherCAT) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C14231

Parameter | Name: **C14231 | Mapping entries RPDO-1 (I-1600)**		Data type: UNSIGNED_64 Index: 10344 = 0x2868
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the RPDO channel 1. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14231/1	0	1. Mapping entry RPDO-1 (I-1600.01)
...	...	...
C14231/32	0	32. Mapping entry RPDO-1 (I-1600.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C14232

Parameter | Name: **C14232 | Mapping entries RPDO-2**		Data type: UNSIGNED_64 Index: 10343 = 0x2867
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the RPDO channel 2. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14232/1	0	1. Mapping entry RPDO-2 (I-1601.01)
...	...	...
C14232/32	0	32. Mapping entry RPDO-2 (I-1601.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C14233

Parameter | Name: **C14233 | Mapping entries RPDO-3**	Data type: UNSIGNED_64 Index: 10342 = 0x2866

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 3.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14233/1	0	1. Mapping entry RPDO-3 (I-1602.01)
...	...	...
C14233/32	0	32. Mapping entry RPDO-3 (I-1602.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14234

Parameter | Name: **C14234 | Mapping entries RPDO-4**	Data type: UNSIGNED_64 Index: 10341 = 0x2865

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 4.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14234/1	0	1. Mapping entry RPDO-4 (I-1603.01)
...	...	...
C14234/32	0	32. Mapping entry RPDO-4 (I-1603.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14235

Parameter | Name: **C14235 | Mapping entries RPDO-5**	Data type: UNSIGNED_64 Index: 10340 = 0x2864

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 5.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14235/1	0	1. Mapping entry RPDO-5 (I-1604.01)
...	...	...
C14235/32	0	32. Mapping entry RPDO-5 (I-1604.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14236

Parameter | Name: **C14236 | Mapping entries RPDO-6**	Data type: UNSIGNED_64 Index: 10339 = 0x2863

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 6.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14236/1	0	1. Mapping entry RPDO-6 (I-1605.01)
...	...	...
C14236/32	0	32. Mapping entry RPDO-6 (I-1605.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14237

Parameter | Name: **C14237 | Mapping entries RPDO-7**	Data type: UNSIGNED_64 Index: 10338 = 0x2862

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 7.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14237/1	0	1. Mapping entry RPDO-7 (I-1606.01)
...	...	...
C14237/32	0	32. Mapping entry RPDO-7 (I-1606.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14238

Parameter | Name: **C14238 | Mapping entries RPDO-8**	Data type: UNSIGNED_64 Index: 10337 = 0x2861

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 8.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14238/1	0	1. Mapping entry RPDO-8 (I-1607.01)
...	...	...
C14238/32	0	32. Mapping entry RPDO-8 (I-1607.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14239

Parameter | Name: **C14239 | Mapping entries RPDO-9**	Data type: UNSIGNED_64 Index: 10336 = 0x2860

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 9.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14239/1	0	1. Mapping entry RPDO-9 (I-1608.01)
...	...	...
C14239/32	0	32. Mapping entry RPDO-9 (I-1608.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14240

Parameter | Name: **C14240 | Mapping entries RPDO-10**	Data type: UNSIGNED_64 Index: 10335 = 0x285F

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the RPDO channel 10.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14240/1	0	1. Mapping entry RPDO-10 (I-1609.01)
...	...	...
C14240/32	0	32. Mapping entry RPDO-10 (I-1609.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14484

Parameter | Name: **C14484 | Active RPDO channel**		Data type: UNSIGNED_8 Index: 10091 = 0x276B
This code is for device-internal use only and must not be written to by the user! Selection of the active RPDO channel		
Selection list		**Info**
0	No RPDO	
1	RPDO-1 (I-1600)	
...	...	
10	RPDO-10 (I-1609)	
Subcodes	**Lenze setting**	**Info**
C14484/1	1: RPDO-1 (I-1600)	Active RPDO channel
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C14489

Parameter | Name: **C14489 | No. of RPDO mapping entries**			Data type: UNSIGNED_8 Index: 10086 = 0x2766
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 10 specify the number of valid mapping entries of RPDO channels 1 ... 10 (valid subcodes in C14231 ... C14240).			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C14489/1	0		No. of mapping entries for RPDO-1
...	0		...
C14489/10	0		No. of mapping entries for RPDO-10
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14531

Parameter | Name: **C14531 | Mapping entries TPDO-1**		Data type: UNSIGNED_64 Index: 10044 = 0x273C
This code is for device-internal use only and must not be written to by the user! Subcodes 1 ... 32 specify the mapping for the TPDO channel 1. • Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length. • The master must have the same mapping entries as the slave. ▸ Structure of the mapping codes (📖 66)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14531/1	0	1. mapping entry TPDO-1 (I-1A00.01)
...	...	...
C14531/32	0	32. mapping entry TPDO-1 (I-1A00.20)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C14532

Parameter | Name: **C14532 | Mapping entries TPDO-2**	Data type: UNSIGNED_64 Index: 10043 = 0x273B

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 2.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14532/1	0	1. Mapping entry TPDO-2 (I-1A01.01)
...	...	...
C14532/32	0	32. Mapping entry TPDO-2 (I-1A01.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14533

Parameter | Name: **C14533 | Mapping entries TPDO-3**	Data type: UNSIGNED_64 Index: 10042 = 0x273A

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 3.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14533/1	0	1. Mapping entry TPDO-3 (I-1A02.01)
...	...	...
C14533/32	0	32. Mapping entry TPDO-3 (I-1A02.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14534

Parameter | Name: **C14534 | Mapping entries TPDO-4**	Data type: UNSIGNED_64 Index: 10041 = 0x2739

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 4.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14534/1	0	1. Mapping entry TPDO-4 (I-1A03.01)
...	...	...
C14534/32	0	32. Mapping entry TPDO-4 (I-1A03.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14535

Parameter | Name: **C14535 | Mapping entries TPDO-5**	Data type: UNSIGNED_64 Index: 10040 = 0x2738

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 5.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14535/1	0	1. Mapping entry TPDO-5 (I-1A04.01)
...	...	...
C14535/32	0	32. Mapping entry TPDO-5 (I-1A04.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14536

Parameter | Name: **C14536 | Mapping entries TPDO-6**	Data type: UNSIGNED_64 Index: 10039 = 0x2737

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 6.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14536/1	0	1. Mapping entry TPDO-6 (I-1A05.01)
...	...	...
C14536/32	0	32. Mapping entry TPDO-6 (I-1A05.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14537

Parameter | Name: **C14537 | Mapping entries TPDO-7**	Data type: UNSIGNED_64 Index: 10038 = 0x2736

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 7.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14537/1	0	1. Mapping entry TPDO-7 (I-1A06.01)
...	...	...
C14537/32	0	32. Mapping entry TPDO-7 (I-1A06.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14538

Parameter | Name: **C14538 | Mapping entries TPDO-8**	Data type: UNSIGNED_64 Index: 10037 = 0x2735

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 8.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14538/1	0	1. Mapping entry TPDO-8 (I-1A07.01)
...	...	...
C14538/32	0	32. Mapping entry TPDO-8 (I-1A07.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14539

Parameter | Name: **C14539 | Mapping entries TPDO-9**	Data type: UNSIGNED_64 Index: 10036 = 0x2734

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 9.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14539/1	0	1. Mapping entry TPDO-9 (I-1A08.01)
...	...	...
C14539/32	0	32. Mapping entry TPDO-9 (I-1A08.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14540

Parameter | Name: **C14540 | Mapping entries TPDO-10**	Data type: UNSIGNED_64 Index: 10035 = 0x2733

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 32 specify the mapping for the TPDO channel 10.
- Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped to variables with a compatible data length.
- The master must have the same mapping entries as the slave.

▸ Structure of the mapping codes (📖 66)

Value is bit-coded:		Info
Bit 0	Bit 0	
...	...	
Bit 63	Bit 63	
Subcodes	**Lenze setting**	**Info**
C14540/1	0	1. Mapping entry TPDO-10 (I-1A09.01)
...	...	...
C14540/32	0	32. Mapping entry TPDO-10 (I-1A09.20)

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14784

Parameter | Name: **C14784 | Active TPDO channel**	Data type: UNSIGNED_8 Index: 9791 = 0x263F

This code is for device-internal use only and must not be written to by the user!
Selection of the active TPDO channel

Selection list		Info
0	No TPDO	
1	TPDO-1 (I-1A00)	
...	...	
10	TPDO-10 (I-1A09)	
Subcodes	**Lenze setting**	**Info**
C14784/1	1: TPDO-1 (I-1A00)	Active TPDO channel

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14789

Parameter | Name: **C14789 | No. of TPDO mapping entries**	Data type: UNSIGNED_8 Index: 9786 = 0x263A

This code is for device-internal use only and must not be written to by the user!
Subcodes 1 ... 10 specify the number of valid mapping entries of TPDO channels 1 ... 10 (valid subcodes in C14531 ... C14540).

Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C14789/1	0		No. of mapping entries for TPDO-1
...	...		...
C14789/10	0		No. of mapping entries for TPDO-10

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14850

Parameter | Name: **C14850 | All words to master**			Data type: UNSIGNED_16 Index: 9725 = 0x25FD
Display of the process data words (subcodes 1 ... 32) which are transferred from the communication module to the master. Only those which are configured are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14850/1			
...			
C14850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14851

Parameter | Name: **C14851 | All words from master**			Data type: UNSIGNED_16 Index: 9724 = 0x25FC
Display of the process data words (subcodes 1 ... 32) which are transferred from the master to the communication module. Only those which are configured are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14851/1			
...			
C14851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14852

Parameter | Name: **C14852 | All words to standard device**			Data type: UNSIGNED_16 Index: 9723 = 0x25FB
Display of the process data words (subcodes 1 ... 32) which are transferred from the communication module to the standard device.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14852/1			
...			
C14852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14853

Parameter | Name: **C14853 | All words from standard device**			Data type: UNSIGNED_16 Index: 9722 = 0x25FA
Display of the process data words (subcodes 1 ... 32) which are transferred from the standard device to the communication module.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14853/1			
...			
C14853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14858

Parameter | Name: **C14858 | Safety-over-EtherCAT (FSoE) active**		Data type: UNSIGNED_8 Index: 9717 = 0x25F5
Available from SW version 04.00. Display of the activity of Safety over EtherCAT (📖 81)		
Selection list (read only)		**Info**
0	Not active	
1	Enable	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14859

Parameter | Name: **C14859 | Length of the configured input data**			Data type: UNSIGNED_8 Index: 9716 = 0x25F4
Available from SW version 04.00. Display of the length of the configured input data in bytes			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14859/1			TxPDO length
C14859/2			Safety-TxPDO length
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14860

Parameter | Name: **C14860 | Length of the configured output data**			Data type: UNSIGNED_8 Index: 9715 = 0x25F3
Available from SW version 04.00. Display of the length of the configured output data in bytes			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13859/1			RxPDO length
C13859/2			Safety-RxPDO length
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14861

Parameter | Name: **C14861 | Bus status**			Data type: UNSIGNED_16 Index: 9714 = 0x25F2
Display of the current bus status ▸ EtherCAT state machine (📖 59)			
Selection list (read only)			**Info**
0	Nonexistent		No online value available (communication module is offline).
1	Init		
2	Pre-Operational		
3	Bootstrap		Is not supported.
4	Safe-operational		
8	Operational		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14864

Parameter | Name: **C14864 | Active station address**			Data type: UNSIGNED_16 Index: 9711 = 0x25EF
Display of the station address allocated by the master			
Display range (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14867

Parameter | Name: **C14867 | Display: Most recent emergency data**	Data type: OCTET_STRING Index: 9708 = 0x25EC
Display of the emergency data last sent by the inverter (string with a length of 8 bytes). ▸ Emergency requests / Emergency messages (📖 91)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14870

Parameter | Name: **C14870 | Cycle time display**			Data type: UNSIGNED_32 Index: 9705 = 0x25E9
Available from software version 03.00! Display of the synchronisation cycle time in µs set by the master. • This time is only valid if "Distributed clocks" (DC) are used. • If no DC is used, the time is displayed is "0". ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)			
Display range (min. value | unit | max. value)			
0	µs	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14879

Parameter | Name: **C14879 | Bus error**			Data type: UNSIGNED_32 Index: 9696 = 0x25E0
Bit-coded display of the bus error Additionally, an error message is entered in the EtherCAT register "AL Status Code" (📖 60).			
Value is bit-coded:			**Info**
Bit 0	General bus error		
Bit 1	Reserved		
...	...		
Bit 31	Reserved		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14880

Parameter | Name: **C14880 | Resp. to communication failure**			Data type: UNSIGNED_8 Index: 9695 = 0x25DF
The set response will be executed if ... • a sync telegram failure has been detected or • the device detects that is no longer in the "Operational" state and the monitoring time (C13881) has elapsed.			
Selection list			
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**		**Info**
C13880/1	0: No Response		Resp. to Interruption of EtherCAT communication (📖 82)
C14880/2	0: No Response		Resp. to Sync telegram failure detection (📖 83) (available from SW version 04.00)
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14881

Parameter | Name: **C14881 | Response time when exiting 'Operational'**			Data type: UNSIGNED_16 Index: 9694 = 0x25DE
If the "Operational" state is exited, the response parameterised with C14880 occurs after the time set here has elapsed. A change of monitoring will be effective immediately.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14882

Parameter | Name: **C14882 | Display of PDO watchdog time**			Data type: UNSIGNED_32 Index: 9693 = 0x25DD
Available from software version 03.00! Display of the PDO watchdog monitoring time defined in the master. During initialisation of the EtherCAT communication, the watchdog monitoring time is transmitted to the slave.			
Display range (min. value | unit | max. value)			
0	µs	4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14883

Parameter | Name: **C14883 | DC active**		Data type: UNSIGNED_8 Index: 9692 = 0x25DC
The code displays if the DC synchronisation has been activated for the communication module. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)		
Selection list (read only)		**Info**
0	DC unused	
1	DC for synchronisation	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14884

Parameter | Name: **C14884 | Base device synchronisation status**		Data type: UNSIGNED_8 Index: 9691 = 0x25DB
Available from software version 03.00! The code displays whether the inverter is DC-synchronised. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36)		
Selection list (read only)		**Info**
0	Not synchronised	
1	Synchronised	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14885

Parameter | Name: **C14885 | Clear process data**		Data type: UNSIGNED_8 Index: 9690 = 0x25DA
This code serves to set which process data the slave is to process for maintaining internal communication when the EtherCAT has exited the "Operational" state.		
Selection list (Lenze setting printed in bold)		**Info**
0	Use of most recent master PDOs	
1	**PDOs are set to the value 0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14887

Parameter | Name: **C14887 | Suppress emergency message in case of**		Data type: BITFIELD_8 Index: 9688 = 0x25D8
This code serves to prevent the emergency messages from being transmitted to the EtherCAT master. Here, errors of a certain type can be suppressed deliberately. Furthermore, all errors are entered in the logbook. A change will only be effective if no error number with the error type selected here is available in the standard device code **C00165**.		
Value is bit-coded:		**Info**
Bit 0	Fault	
Bit 1	Fault	
Bit 2	Quick stop by trouble	
Bit 3	Warning Locked	
Bit 4	Warning	
Bit 5	Information	
Bit 6	Reserved	
Bit 7	Reserved	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14892

Parameter | Name: **C14892 | Process data mode**		Data type: UNSIGNED_8 Index: 9683 = 0x25D3
Mode selection for a time optimisation of the process data transfer This code is only evaluated if "Distributed clocks" are used. ▸ Synchronisation with "Distributed clocks" (DC) (📖 36) ▸ Process data mode (📖 40)		
Selection list (Lenze setting printed in bold)		**Info**
0	Optimised mode	This mode leads to a reduction of the dead time by one EtherCAT cycle. Preconditions: • The EtherCAT telegram generated by the master has a low jitter and is sent within a window of 320 µs after the Sync0 event and shortly before the next Sync0 event. • The EtherCAT cycle time must be 1 ms.
1	**Deterministic mode**	This mode is the standard mode. It does not support a time optimisation of the process data transfer. The actual values are copied to the EtherCAT interface with the next Sync0 event.
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14899

Parameter | Name: **C14899 | Station alias**			Data type: UNSIGNED_16 Index: 9676 = 0x25CC
This code serves to set a station alias. In order to use a station alias, you must select a value > "0". • The station alias must only be set if the device is part of a "hot connect" group or integrated in the modular machine configuration of Lenze. • The station alias must be unambiguous and must only be assigned once within the EtherCAT network. • Use the same station alias in the EtherCAT master and in the slave. ▸ Address allocation (📖 35)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		32767	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14900

Parameter | Name: **C14900 | Firmware: Product type**	Data type: VISIBLE_STRING Index: 9675 = 0x25CB
The code contains a string with a length of 8 bytes. The following identification code is output: "E94AFCET".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14901

Parameter | Name: **C14901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: 9674 = 0x25CA
The code contains a string with a length of 20 bytes. The creation date ("MM DD YYYY") and the time ("hh:mm:ss") of the software are output here. Example: "Mar 21 2005 12:31:21"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14902

Parameter | Name: **C14902 | Firmware version**	Data type: VISIBLE_STRING Index: 9673 = 0x25C9
The code contains a string with a length of 11 bytes. The firmware version is output here. Example: "02.00.00.36"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

14.4 Table of attributes

The table of attributes contains information required for communication with the inverter via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 ≡ No decimal positions 10 ≡ 1 decimal position 100 ≡ 2 decimal positions 1000 ≡ 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit required	☑ Writing is only possible if controller inhibit is set	

Table of attributes

FEEDBACK

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

Perhaps we have not succeeded in achieving this objective in every respect. If you have suggestions for improvement, please e-mail us to:

feedback-docu@lenze.com

Thank you very much for your support.

1 About this documentation

Contents

The descriptions in this documentation only refer to the E94AYCEN communication module (Ethernet).

Note!

This documentation supplements the **mounting instructions** supplied with the communication module and the **Servo Drives 9400 hardware manual**.

The mounting instructions contain safety instructions that must be observed!

The features and functions of the Ethernet communication module are described in detail.

Examples illustrate typical applications.

This documentation furthermore contains:

- Safety instructions that must be observed
- The basic technical data of the communication module
- Information on versions of the Lenze standard devices to be used
- Notes on troubleshooting and fault elimination

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe the software of another manufacturer. No guarantee can be given for corresponding information in this documentation. Information on the use of the software can be found in the documents for the host system (PLC, scanner).

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the field devices and the software version of the installed engineering tools (»Engineer«, »Network Analyzer«), the screenshots in this documentation may differ from the screen representation.

Target group

This documentation addresses to persons who configure, install, commission, and maintain the networking and remote maintenance of a machine.

Tip!

Current documentation and software updates for Lenze products can be found in the download area at:

www.Lenze.com

Validity information

The information in this documentation applies to the following devices:

Extension module	Type designation	From hardware version	From software version
Ethernet communication module	E94AYCEN	VC	-

1.1 Document history

Version			Description
1.0	11/2004	TD06	First edition
2.0	03/2005	TD06	Description of the GCI protocol added
3.0	03/2005	TD06	Description of displays added
4.0	10/2006	TD06	General revision
5.0	11/2007	TD17	General revision and provision of the documentation in the form of the »Engineer« online help
6.0	11/2008	TD17	Revision for hardware version VC (2-port Ethernet)
7.0	06/2009	TD17	Update of the description for the configuration of the communication module with the »Engineer«.
8.0	07/2010	TD17	General revision
9.0	09/2012	TD17	• Revision of the telegram description in chapter Parameter data transfer (📖 38). • Parameter reference (📖 54) supplemented.

1.2 Conventions used

This documentation uses the following conventions to distinguish different types of information:

Type of information	Identification	Examples/notes
Numbers		
Decimal	Standard notation	Example: 1234
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Decimal separator	Point	In general, the decimal point is used. Example: 1234.56
Text		
Program name	» «	PC software Example: Lenze »Engineer«
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Hyperlink	Underlined	Optically highlighted reference to another topic. In this documentation activated via mouse-click.
Icons		
Page reference	(📖 8)	Optically highlighted reference to another page. In this documentation activated via mouse-click.
Step-by-step instructions		Step-by-step instructions are marked by a pictograph.

1.3 Terminology used

Term	Meaning
Drive	Lenze controllers of the "Servo Drives 9400" series
Standard device	
»Engineer«	Lenze PC software supporting you for the "Engineering" (parameterisation, diagnostics, and configuration) during the whole life cycle, i. e. from the design to the maintenance of the machine commissioned.
Code	Parameter which serves to parameterise and monitor the drive. In normal usage, the term is usually referred to as "Index".
Lenze setting	This setting is the default factory setting of the device.
Basic setting	
HW	Hardware
SW	Software
PLC	Programmable Logic Controller (PLC)
Use DHCP	Dynamic Host Configuration Protocol

1.4 Notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Pictograph and signal word!

(characterise the type and severity of danger)

Note

(describes the danger and suggests how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of damage to material assets** Reference to a possible danger that may result in damage to material assets if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to other documentation

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety instructions and application notes

Danger!

Disregarding the following basic safety measures may lead to severe personal injury and damage to material assets.

- Lenze drive and automation components ...
  - must only be used as directed.
    ▸ Application as directed (📖 13)
  - must never be commissioned if they display signs of damage.
  - must never be technically modified.
  - must never be commissioned if they are not fully mounted.
  - must never be operated without required covers.
  - can have live, moving or rotating parts during and after operation, depending on their degree of protection. Surfaces can be hot.
- The following applies to Lenze drive components ...
  - Only use permissible accessories.
  - Only use original manufacturer spare parts.
- Observe all the specifications contained in the enclosed and related documentation.
  - This is the precondition for safe and trouble-free operation and for achieving the product features specified.
    ▸ Product features (📖 14)
  - The procedural notes and circuit details described in this document are only proposals. It is up to the user to check whether they can be adapted to the particular applications. Lenze does not take any responsibility for the suitability of the procedures and circuit proposals described.

- All operations with and on Lenze drive and automation components may only be carried out by qualified personnel. In accordance with IEC 60364 or CENELEC HD 384 these are persons ...
  - who are familiar with the installation, mounting, commissioning, and operation of the product.
  - who have the corresponding qualifications for their work.
  - who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- Decouple your Ethernet house network from the system network for Ethernet-capable Lenze devices.
  ▸ Ethernet connection (📖 22)
- Only use cables that comply with the listed specifications.
  ▸ Specification of the Ethernet cable (📖 23)

Documentation for the standard device, control system, system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

- If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.
  ▸ Protective insulation (📖 16)

Device protection

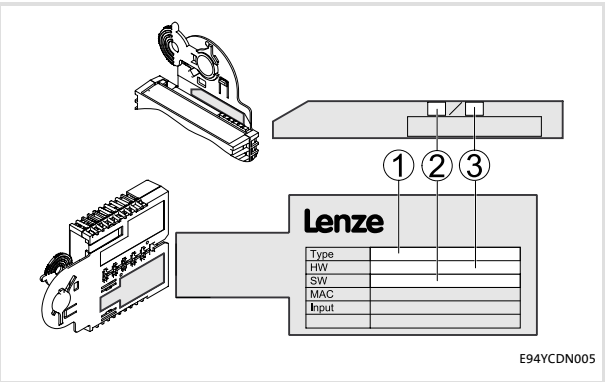
- The communication module contains electronic components that can be damaged or destroyed by electrostatic discharge.
  ▸ Installation (📖 19)

3 Product description

3.1 Application as directed

The Ethernet communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxxx	VB	01.50
Servo Drives 9400 PLC	E94AxPExxxx	VA	01.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in Ethernet networks.

Any other use shall be deemed inappropriate!

3.2 Identification

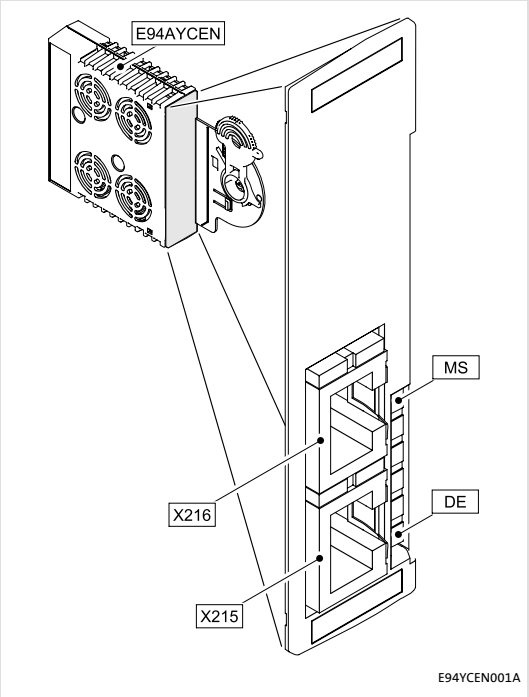
The type designation and hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

1 Type designation (type)

- E94 Product series
- A Version
- Y Module identification: Extension module
- C Module type: Communication module
- EN Ethernet

2 Hardware version (HW)



3 Software version (SW)

3.3 Product features

- Interface module for the Ethernet communication system, for attaching to the expansion slots of the Servo Drives 9400
- 2-port interface with integrated switch functionality
- Automatic setting of baud rate and transmission mode (auto-negotiation)
- Automatic detection of wiring errors and polarity reversal of data signals (auto-polarity)
- Automatic detection and (internal) swapping of data signals from receive paths and transmit paths (auto-crossing)
- Access to all Lenze parameters via the Lenze »Engineer«

3.4 Terminals and interfaces

- 2 RJ45 sockets for Ethernet connection
- Front LEDs for diagnosing the ...
  - Voltage supply of the communication module
  - Connection to the standard device
  - Ethernet connection
  - Ethernet activity

[3-2] Communication module E94AYCEN (Ethernet)

X215 Ethernet connections
X216
- RJ45 sockets
- Each with 2 LED status displays for diagnostics

▸ Ethernet connection (📖 22)
▸ Status display at X215 and X216 (📖 52)

MS 2 LED status displays for diagnostics
DE

▸ LED status displays (📖 52)

4 Technical data

4.1 General data and operating conditions

Area	Values
Order designation	E94AYCEN
Communication profile	GCI, based on TCP/IP
Communication medium	S/FTP (screened foiled twisted pair, ISO/IEC 11801 or EN 50173), CAT 5e
Interface	RJ45: Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Network topology	Line, star
Ethernet port	9410 (GCI)
Baud rate	• 10 Mbps • 100 Mbps
Transmission mode	Half duplex / full duplex
Switching method	Store and forward
Switch latency	125 µs at maximum telegram length
Voltage supply	The communication module is solely supplied with voltage by the standard device.
Conformities, approvals	• CE • UL

Servo Drives 9400 hardware manual

This manual contains data on **ambient conditions** and the **electromagnetic compatibility (EMC)** which also apply to the communication module.

4.2 Protective insulation

Danger!

Dangerous electrical voltage

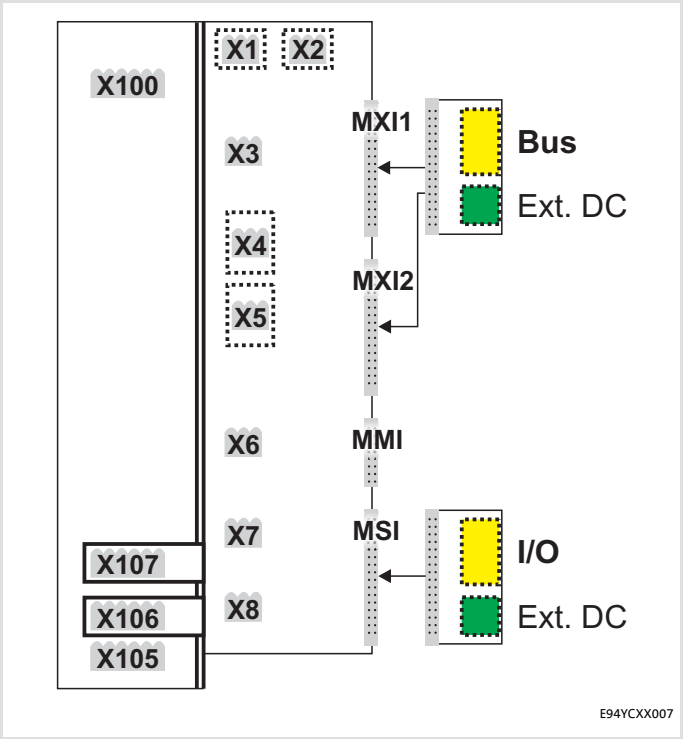
If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.

Possible consequences:

- Death or severe injuries

Protective measures:

- If protection against accidental contact is required for the control terminals of the drive and for the connections of the plugged-in device modules, ...
  - a double isolating distance must exist.
  - the components to be connected must be provided with the second isolating distance.



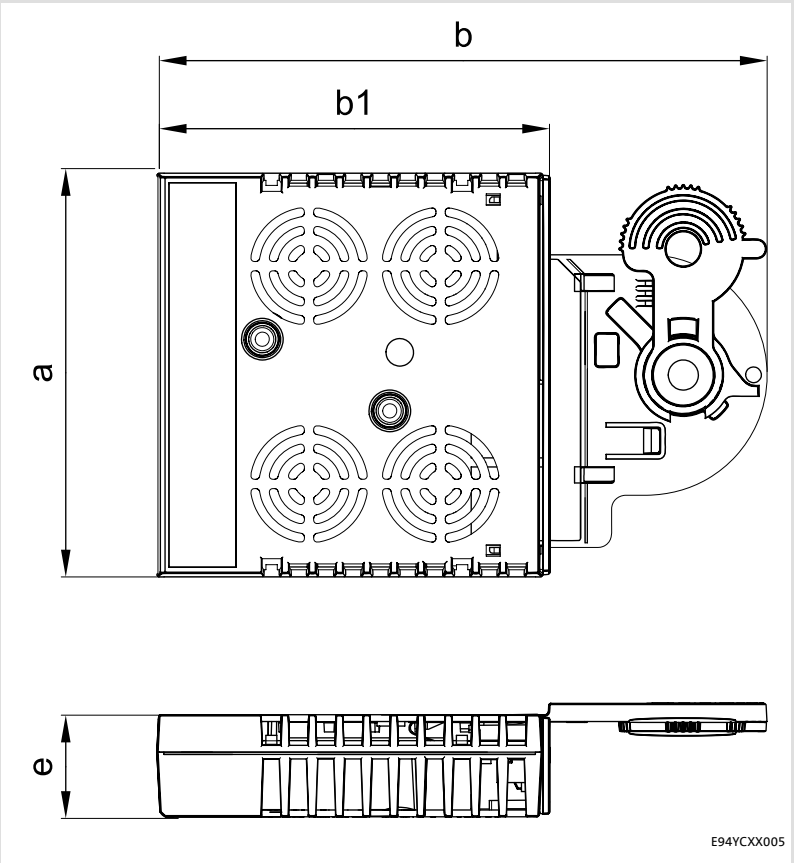
Note!

The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the drive.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1



Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	Statebus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example

Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

- ▶ The separate potential area with the better protective insulation is decisive.
  - – The separate potential area of the bus terminal of the device module has a "functional insulation".
  - – The separate potential area of the mains terminal has a "reinforced insulation".
- ▶ Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.3 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

5 Installation

Stop!

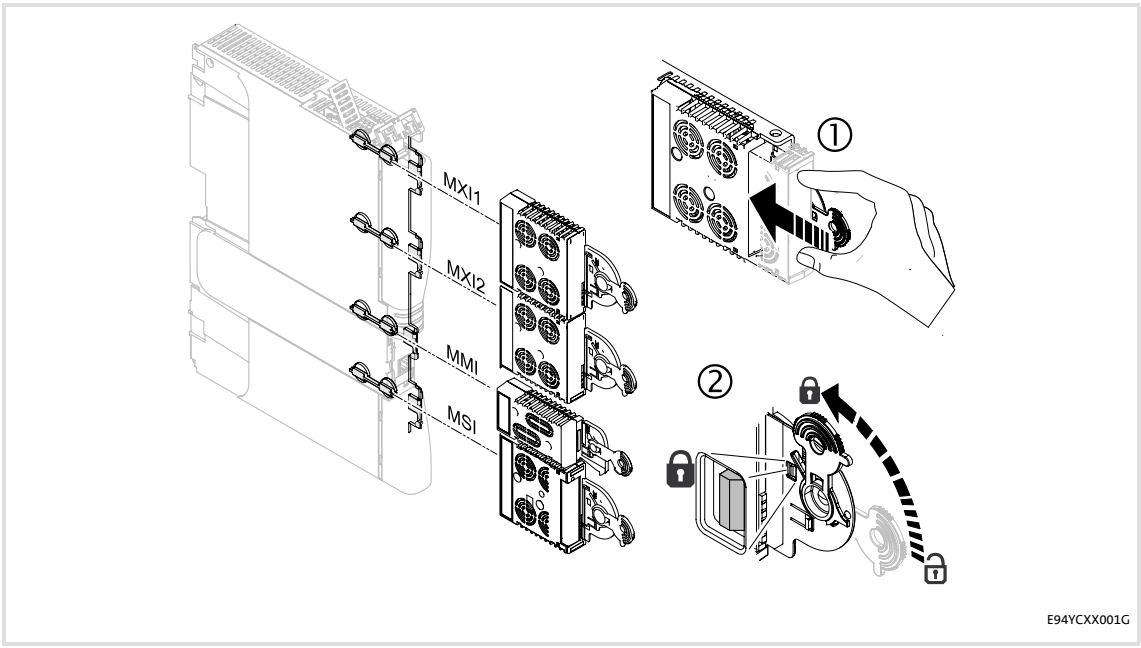
Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

Possible consequences:

- The communication module is damaged.
- Fieldbus communication is not possible or faulty.

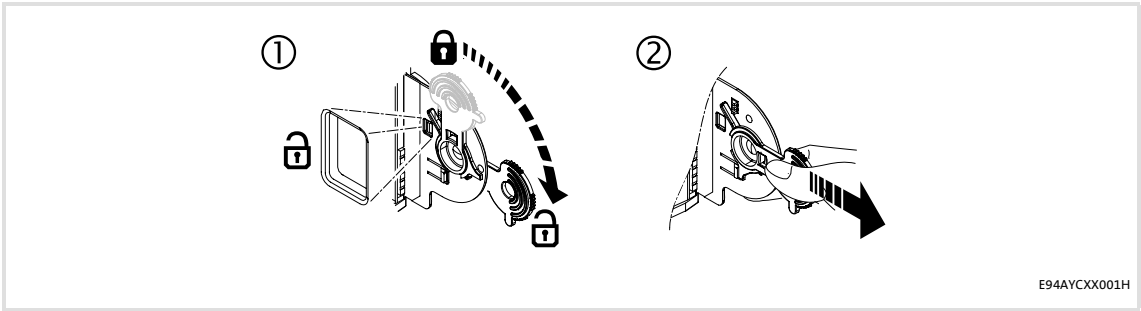
Protective measures



- Before touching the module, be sure that you are free of electrostatic charge.

5.1 Mechanical installation

Note!



Only one Ethernet module may be attached to a Servo Drive 9400, either in module slot MXI1 or MXI2.

5.1.1 Assembly

[5-1] Assembly

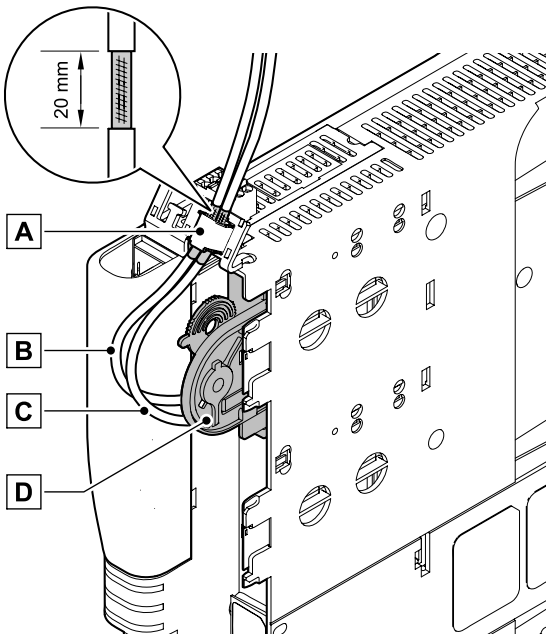
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation for the standard device, control system, system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 EMC-compliant wiring

In typical systems, standard shielding is sufficient for Ethernet cables.

However, in environments with a very high level of interference, EMC resistance can be improved by additionally earthing the cable shield on both sides.

For this observe the following notes:

1. The distance between the additional earthing and the Ethernet plug depends on the module slot and is as follows:
   – Approx. 10 cm for the upper slot (MXI1)
   – Approx. 20 cm for the lower slot (MXI2)
2. Measure the appropriate distance along the cable and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Fasten the cable shield onto the shield sheet of the Servo Drive 9400.

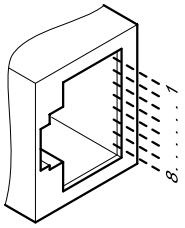
A Fastening on the shield sheet of the Servo Drive 9400

B Outgoing Ethernet cable at X216

C Incoming Ethernet cable at X215

D Communication module in slot MXI1 of the Servo Drive 9400

[5-3] EMC-compliant wiring



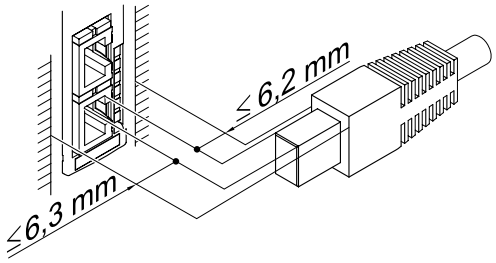
5.2.2 Ethernet connection

- The Ethernet connection is made via the RJ45 sockets **X215** and **X216**.
- You can use a standard Ethernet patch cable to connect the communication module to the Ethernet fieldbus.
  - Specification of the Ethernet cable (📖 23)

Note!

- Decouple your Ethernet house network from the system network for Ethernet-capable Lenze devices in order to prevent trouble in the Ethernet communication.
  Further information can be obtained from the "Ethernet in the industrial application" manual.
- To prevent the RJ45 socket from being damaged, hold the Ethernet cable connector straight (at a right angle) when inserting it into or removing it from the socket.

Pin assignment



RJ45 socket	Pin	Signal
 E94AYCXX004C	1	Tx +
	2	Tx -
	3	Rx +
	4	-
	5	-
	6	Rx -
	7	-
	8	-

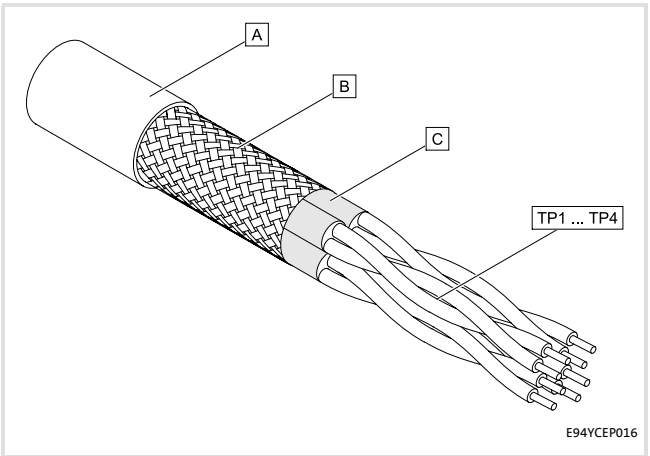
Tip!

The Ethernet interfaces feature an auto MDIX function. This function adjusts the polarity of the RJ45 interfaces so that a connection is established irrespective of the polarity of the opposite Ethernet interface, and irrespective of the type of cable used (standard patch cable or crossover cable).

Free space

When ordering and using your Ethernet cable, note the amount of free space available.

[5-4] Free space



5.2.3 Specification of the Ethernet cable

Note!

Only use cables that meet the listed specifications.

Specification of the Ethernet cable	
Ethernet standard	Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Cable type	S/FTP (Screened Foiled Twisted Pair), ISO/IEC 11801 or EN 50173, CAT 5e
Damping	23.2 dB (at 100 MHz and per 100 m)
Crosstalk damping	24 dB (at 100 MHz and per 100 m)
Return loss	10 dB (per 100 m)
Surface impedance	100 Ω

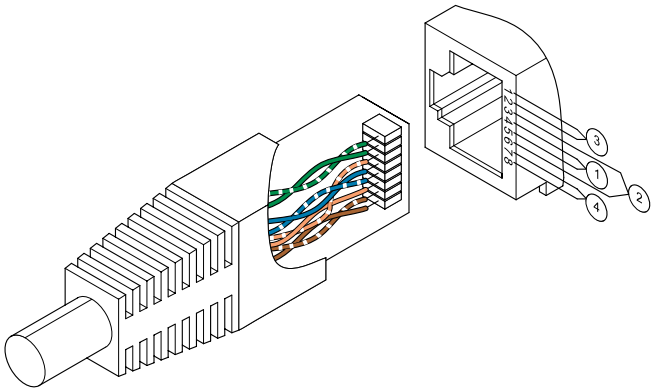
Structure of the Ethernet cable

A Cable insulation

B Braid

C Foil shield

TP1 ... TP4 Twisted core pairs 1 ... 4
▸ Colour coding of the Ethernet cable (📖 24)



[5-5] Structure of the Ethernet cable (S/FTP, CAT 5e)

Colour coding of the Ethernet cable

Note!

Wiring and colour code are standardised in EIA/TIA 568A/568B.

In accordance with the industrial standard, the use of 4-pin Ethernet cables is permissible. The cable type only connects the assigned pins 1, 2, 3 and 6 to one another.

[5-6] Ethernet plug in accordance with EIA/TIA 568A/568B

Pair	Pin	Signal	EIA/TIA 568A	EIA/TIA 568B
3	1	Tx +	white / green	white / orange
	2	Tx -	green	orange
2	3	Rx +	white / orange	white / green
1	4		blue	blue
	5		white / blue	blue / white
2	6	Rx -	orange	green
4	7		white / brown	white / brown
	8		brown	brown

5.2.4 Voltage supply

Internal supply

The communication module is solely supplied with voltage by the standard device.

Note!

If the standard device fails and daisy-chain wiring has been used, the transmission of data between the Ethernet nodes at interface X215 and the Ethernet nodes at interface X216 will be interrupted.

6 Commissioning

During commissioning, system-related data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the drive. For Lenze devices, this is done via the codes.

The codes of the drive and for communication are saved non-volatilely as a data set in the memory module.

In addition to codes for the configuration, there are codes for diagnosing and monitoring the nodes.

Note!

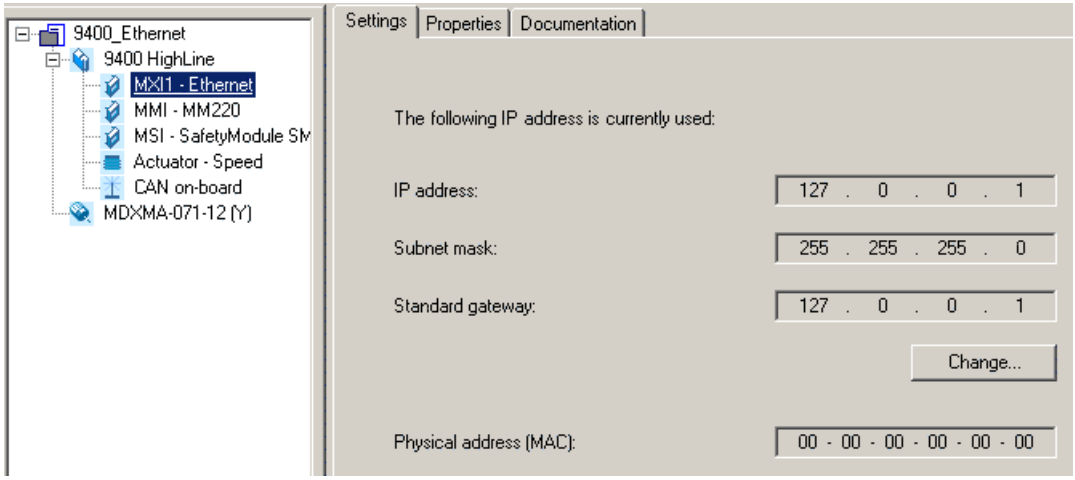
When parameterising the communication module, please note that the code number depends on the slot of the Servo Drive 9400 into which the communication module is plugged.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  ▸ Parameters of the communication module for slot MXI1 (📖 56)
- C**14**nnn for slot MXI2
  ▸ Parameters of the communication module for slot MXI2 (📖 60)

Additionally set the Parameters of the standard device that are relevant to communication (📖 54).

6.1 Before initial switch-on



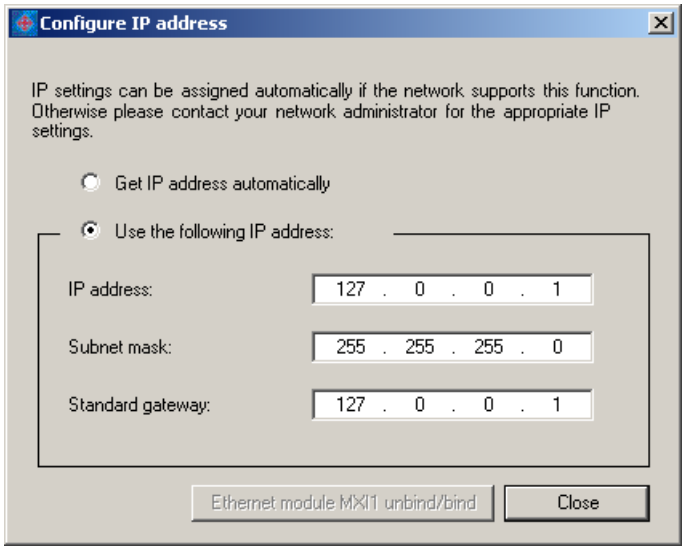
Stop!

Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Configuring the communication module

The address settings required for Ethernet operation are displayed in the »Engineer« in the **Settings** tab (Fig. [6-1]). The settings correspond to the values of the codes:

Parameter	Code		Lenze setting
	for slot MXI1	for slot MXI2	
IP address	C13000/1...4	C14000/1...4	127.0.0.1
Subnet mask	C13001/1...4	C14001/1...4	255.255.255.0
Standard gateway	C13002/1...4	C14002/1...4	127.0.0.1
Physical address (MAC)	C13003/1...6	C14003/1...6	00-00-00-00-00-00



[6-1] Ethernet address settings

You can set the IP address (📖 31), the Subnet mask (📖 31) and the Gateway address (📖 32) manually, but the IP address can also be received automatically from a DHCP server.

- Setting the address (📖 28)
- Automatically receiving an IP address (📖 29)

6.2.1 Setting the address

Clicking the **Change** button in the **Settings** tab (Fig. [6-1]) opens the "Configure IP address" dialog window:

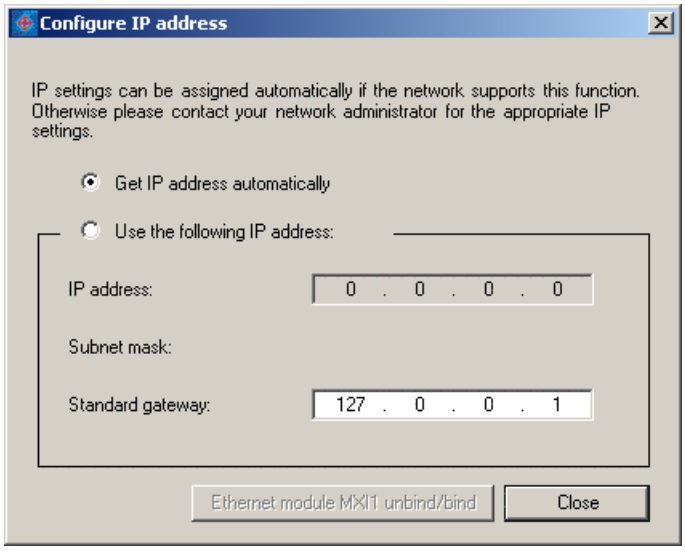
[6-2] Setting the address

In the input fields for the IP address, the subnet mask and the standard gateway, you can directly set the addresses.

Setting the standard device code **C00002** to "101: bind/unbind" or "102: bind/unbind" copies the values and writes them to the corresponding codes:

Parameter	Code	
	for slot MXI1	for slot MXI2
IP address	C13000/1...4	C14000/1...4
Subnet mask	C13001/1...4	C14001/1...4
Standard gateway	C13002/1...4	C14002/1...4

The codes can also be set via the parameter list of the Servo Drive 9400 (**All parameters** tab).



Tip!

You can use a ping command in the MS-DOS input window to test whether the entered IP address is valid or not.

6.2.2 Automatically receiving an IP address

Clicking the **Change** button in the **Settings** tab (Fig. [6-1]) opens the "Configure IP address" dialog window.

Mark "Receive IP address automatically" in order to receive an IP address automatically from the DHCP server:

[6-3] Automatically receiving an IP address

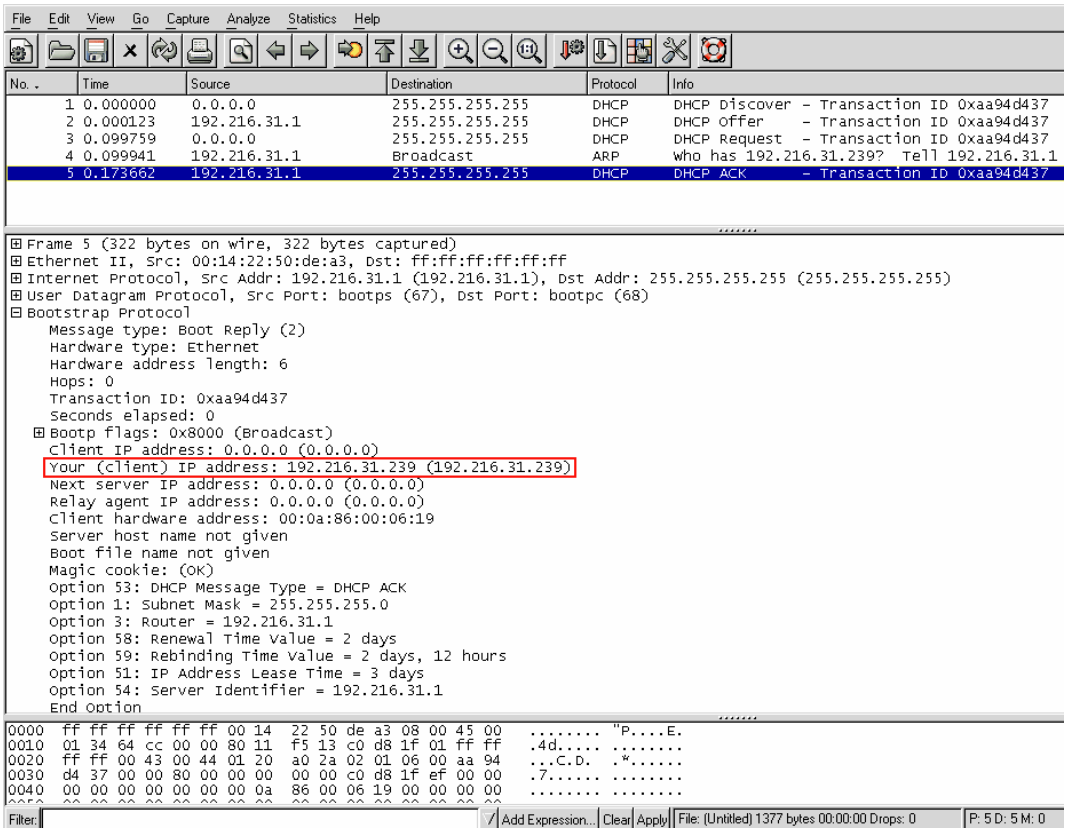
The input field for the standard gateway serves to manually enter a gateway address. By default, the current values of the corresponding codes are displayed.

Setting the standard device code **C00002** to "101: bind/unbind" or "102: bind/unbind" copies the values and writes them to the corresponding codes:

Parameter	Code	
	for slot MXI1	for slot MXI2
IP address	C13000/1...4	C14000/1...4
Use of DHCP	C13005	C14005

The codes can also be set via the parameter list of the Servo Drive 9400 (**All parameters** tab).

Note!



Observe the information given in chapter DHCP implementation in the Servo Drive 9400 (📖 34).

Tip!

You can use a ping command in the MS-DOS input window to test whether the received IP address is valid or not.

Output of the »Network Analyzer«

With "DHCP ACK", the DHCP server (here IP address "192.216.31.1") assigns the IP address "192.216.31.239" to the Servo Drive 9400 (DHCP client):

6.2.3 IP address

The IP address is required for addressing the Servo Drive 9400 if communication between the PC and the controller is to be established via an Ethernet connection.

- The IP address consists of four numbers between 0 and 255 which respectively are separated from each other by a point, e. g. "192.168.10.1".
- Eight bits are reserved for each of the four numbers, which makes a total of 32 bits.
- The first one, two, or three numbers indicate the network (Net-ID), the remaining numbers indicate the host (Host-ID). The definite specification of the part that is to be evaluated as Net-ID is effected via the Subnet mask (📖 31).

Codes

Parameter (MXI1):	C13000/1		C13000/2		C13000/3		C13000/4
Lenze setting	127	.	0	.	0	.	1

Parameter (MXI2):	C14000/1		C14000/2		C14000/3		C14000/4
Lenze setting	127	.	0	.	0	.	1

6.2.4 Subnet mask

The subnet mask indicates which part of the IP address is evaluated as net ID or host ID.

- The subnet mask consists of four numbers which are separated by a point, e.g. "255.255.255.0".
- Eight bits are reserved for each of the four numbers, which makes a total of 32 bits.

Examples

1. The first three numbers of the IP address indicate the network, the last number indicates the host (Lenze setting):

Subnet mask:	255	.	255	.	255	.	0
Subdivision of IP address:	Net ID						Host ID

2. The first two numbers of the IP address indicate the network, the last two numbers indicate the host:

Subnet mask:	255	.	255	.	0	.	0
Subdivision of IP address:	Net ID				Host ID		

3. The first number of the IP address indicates the network, the remaining three numbers indicate the host:

Subnet mask:	255	.	0	.	0	.	0
Subdivision of IP address:	Net ID		Host ID				

Codes

Parameter (MXI1):	C13001/1	C13001/2	C13001/3	C13001/4
Lenze setting	255 .	255 .	255 .	0

Parameter (MXI2):	C14001/1	C14001/2	C14001/3	C14001/4
Lenze setting	255 .	255 .	255 .	0

6.2.5 Gateway address

The gateway address is required if the Servo Drive 9400 is not located in the same subnetwork as the PC.

- The gateway address consists of four numbers between 0 and 255, separated by points, e.g. "127.0.0.0".
- Eight bits are reserved for each of the four numbers, which makes a total of 32 bits.

Codes

Parameter (MXI1):	C13002/1	C13002/2	C13002/3	C13002/4
Lenze setting	127 .	0 .	0 .	1

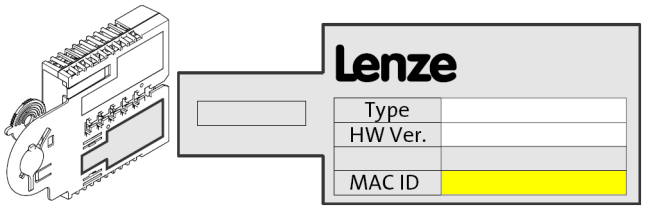
Parameter (MXI2):	C14002/1	C14002/2	C14002/3	C14002/4
Lenze setting	127 .	0 .	0 .	1

6.2.6 MAC-ID

The MAC-ID is a globally unique identifier of an Ethernet-capable device. The MAC-ID is assigned by the manufacturer and permanently burnt into the device (Lenze communication module).

- The MAC-ID consists of six hexadecimal numerical codes (00 ... FF) which respectively are separated from each other by a hyphen, e. g. "00-0A-86-00-00-0A".
- Eight bits are reserved for each one of the six numerical codes, which makes a total 48 bits.
- The MAC-ID consists of the manufacturer's identification mark and a running number which is clearly assigned by the manufacturer.

Display of the MAC-ID



The MAC-ID of the communication module is displayed in C13003/C14003:

Parameter (MXI1):	C13003/1		C13003/2		C13003/3		C13003/4		C13003/5		C13003/6
Display [hex]:	00	-	0A	-	86	-	xx	-	xx	-	xx
	Manufacturer's identification mark (Lenze)						Consecutive definite number				

Parameter (MXI2):	C14003/1		C14003/2		C14003/3		C14003/4		C14003/5		C14003/6
Display [hex]:	00	-	0A	-	86	-	xx	-	xx	-	xx
	Manufacturer's identification mark (Lenze)						Consecutive definite number				

Tip!

The MAC ID is also entered in the nameplate of the communication module:

6.3 DHCP implementation in the Servo Drive 9400

DHCP is the acronym for "Dynamic Host Configuration Protocol". This protocol is defined in RFC 2131 and is an advancement on BOOTP (RFC 951). DHCP enables computers to query information about the network configuration (e.g. IP address) from a server via a TCP/IP network. The DHCP server assigns the IP address to the client dynamically, from a defined address range. This means that the client always receives a new, but unique IP address.

DHCP is implemented in the firmware (program organisation unit RTCS). The following chapter describes how the Servo Drive 9400 receives an IP address via DHCP.

DHCP code

For standard devices from version **V03.xx.xx.xx**, the DHCP codes C13005 and C14005 are available. These codes can be used to define whether DHCP is to be used or not:

- Value 0 (FALSE): Do not use DHCP (Lenze setting)
- Value 1 (TRUE): Use DHCP

DHCP flag settings

- *UseIPfromDhcp* = TRUE (Use DHCP):
  The IP settings are assigned by the DHCP server.
- *UseIPfromDhcp* = FALSE (Do not use DHCP):
  The IP settings are assigned manually.

6.3.1 Basic terms

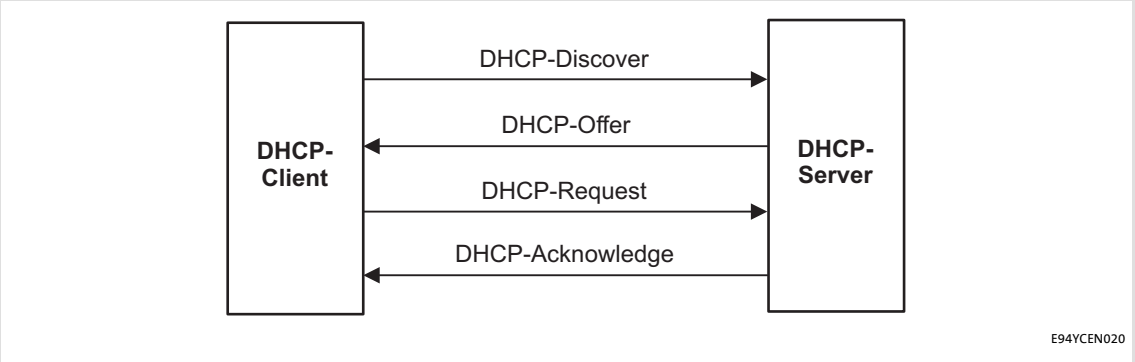
DHCP client

TCP/IP stack of a host. Network node that makes DHCP requests and is configured.

DHCP server

Network node that waits for DHCP requests and responds to them.

Lease time



Service life of the assigned IP address. After this period expires, the IP address will be invalid. If it still needs to be used after this period, the lease time must be extended.

6.3.2 DHCP network architecture

Data relating to the DHCP network architecture	
DHCP model	Client/Server
Transport protocol	UDP
Ports	Server - UDP port 67 Client - UDP port 68
DHCP packet size	576 bytes
Compatibility	DHCP is an advancement on BOOTP, so the DHCP server can also manage BOOTP clients.

6.3.3 DHCP operating mode

DHCP is a client-server architecture. The DHCP server has access to a pool of IP addresses, which it can freely assign to the DHCP clients. For larger networks, the DHCP server also needs to know which subnetworks and gateways are available.

[6-4] DHCP operating mode

- In the first step, the client transmits a "DHCP discover broadcast", which searches for the server.
- The server responds to the client with a "DHCP offer" (unicast). This message contains the IP address, subnet mask, lease time and other information for the client.
- The client then accepts this data and reports this situation to the server by means of a "DHCP request" message.
- The server completes the DHCP configuration with a "DHCP acknowledge" message. This message contains the server IP address, client IP address, lease time, subnet mask and other configuration information.

6.3.4 DHCP packet structure

The DHCP packets have the following structure:

Bit 1 ... 8	Bit 9 ... 16	Bit 17 ... 24	Bit 25 ... 32
op (1 byte)	htype (1 byte)	hlen (1 byte)	hops (1 byte)
xid (4 bytes)			
secs (2 bytes)		flags (2 bytes)	
ciaddr (4 bytes)			
yiaddr (4 bytes)			
siaddr (4 bytes)			
giaddr (4 bytes)			
chaddr (4 bytes)			
sname (4 bytes)			
file (4 bytes)			
options (variable)			

Description of the fields:

Field	Size	Description
op	1 Byte	**Opcode:** Task carried out by the DHCP packet • Indicates a client request or a server response.
htype	1 Byte	**Hardware type:** Specification of the network topology • Examples: 1 for Ethernet, 15 for Frame Relay (specification in RFC 1700)
hlen	1 Byte	**Hardware address length:** Length of the hardware address in the "chaddr" (client hardware address) field
hops	1 Byte	**Hop count:** Number of routers / gateways between the client and the server
xid	4 bytes	**Transaction ID:** Unique identifier generated by the client • This is required in order to assign a DHCP response to the corresponding DHCP request.
secs	2 bytes	**Number of seconds:** Time in seconds that has elapsed since the DHCP process began
flags	2 bytes	**Flags:** The first bit is used as a broadcast flag. All other flags are reserved for later use (status = 0).
ciaddr	4 bytes	**Client IP address:** Most recently used client IP address • This is only used in a client DHCP request.
yiadr	4 bytes	**Your IP address:** IP address assigned to the client by the server • This is only used in a server DHCP response.
siaddr	4 bytes	**Server IP address:** IP address of the server • This is only used in a server DHCP response.
giaddr	4 bytes	**Gateway IP address:** This field enables the client to communicate with servers in other DHCP subnetworks. • IP address "0.0.0.0" in a client request • A DHCP relay agent enters its IP address here.
chaddr	4 bytes	**Client hardware address:** MAC address of the client
sname	4 bytes	**Server host name:** This field is optional and can contain the server name.
file	4 bytes	**Boot filename:** The client defines the full path for its boot file here.
options	Variable (1 to 4 bytes)	**Options:** This field contains additional information for the client. • The specification of the DHCP message type, for example, is very important. • Defined in full in RFC 2132

6.4 Initial switch-on

Documentation for the standard device

Observe the safety instructions and information on residual hazards.

Note!

Activate changed settings

To activate changed settings ...

- execute the device command "11: Save start parameters" via standard device code **C00002** and ...
- then reset the bus node or switch off and on again the voltage supply of the communication module.

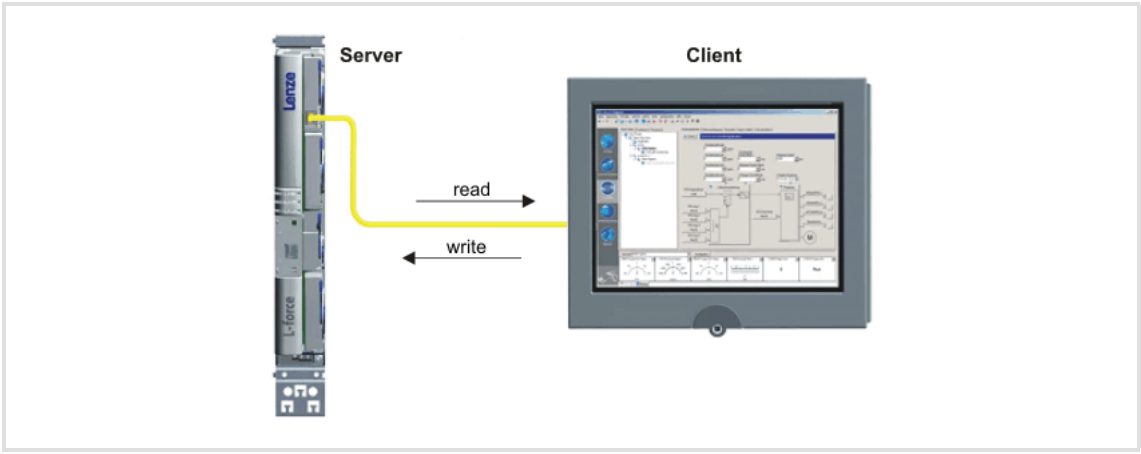
Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

The restart behaviour of the controller can be set using **C00142** ("Auto-restart following mains connection"):

- **C00142 = "0: Inhibited"** (Lenze setting)
  - The drive remains inhibited (even if the fault is no longer active).
  - An explicit controller enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.
- **C00142 = "1: Enabled"**
  - An uncontrolled restart of the drive is possible.



7 Parameter data transfer

The PC (client) used for setting parameters and the controller (server) communicate with one another by exchanging data telegrams via the Ethernet. The parameter data are contained in the user data area of the data telegram.

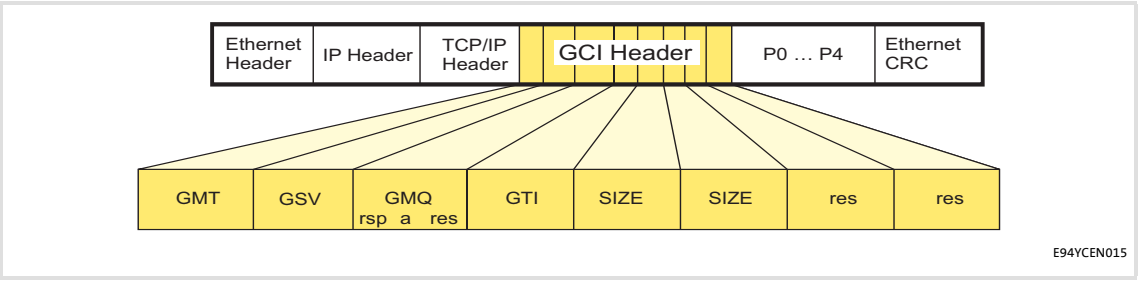
- Parameters are set, for instance, when the system is initially adjusted during commissioning or when the material of the production machine is changed.
- The parameter data are transmitted as SDOs (Service Data Objects) and confirmed by the receiver, i.e. the transmitter receives a feedback whether the transmission was successful.

  The SDOs provide for the write and read access to the object directory in the controller.
- The transmission of the parameter data usually is not time-critical.
- The parameter data are saved in Lenze devices as "codes".

  Via the codes, for instance operating parameters, motor data or diagnostics information can be set.

[7-1] Data communication according to the client/server model

Note!



With regard to the writing access on parameter data, observe that the changes carried out are not stored automatically in the controller.

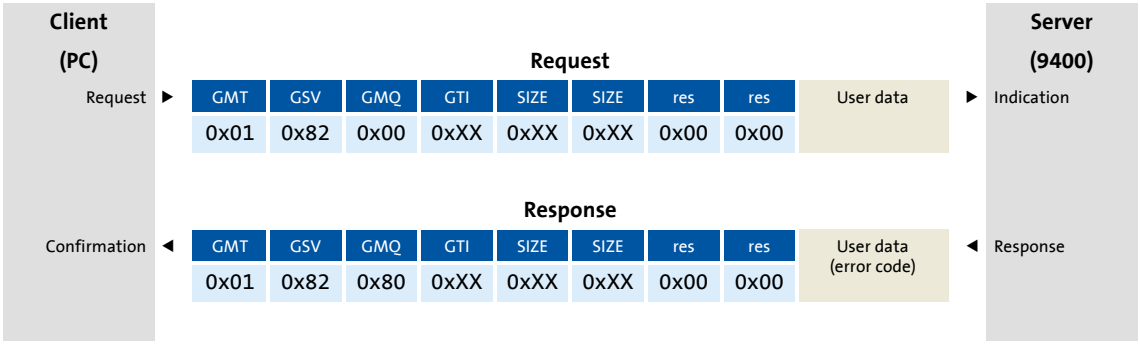
In order to save changed parameter settings with mains failure protection, carry out the device command **C00002 = "11: Save start parameters"**.

7.1 Structure of the Ethernet data telegram

The GCI protocol is used for communication.

The Ethernet data telegram is shown below. Here, the GCI header represents the part of the program that is independent of the type of command transmitted.

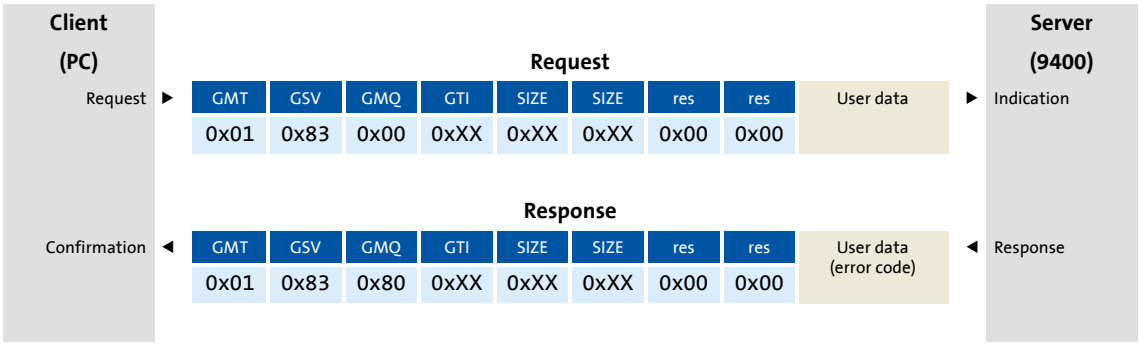
[7-2] Structure of the GCI header within the Ethernet frame



Field	Size	Description	
GMT	1 Byte	GCI message type	
		0x01	Reserved
GSV	1 Byte	GCI service identification	
		0x82	Reading parameters
		0x83	Writing parameters
GMQ	1 Byte	GCI message qualifier	
		Bit 7 Bit 6 / Bit 5 ... Bit 0 rsp | a | res	
		rsp	Request/response (1 bit) 0: request 1: response
		a	Abort (1 bit) 0: data transmission ok 1: data transmission aborted
		res	Reserved (6 bits) Data contents = 0
GTI	1 Byte	GCI transaction ID	
		0x00 ... 0xFF	Serial number (transaction identification) • For each client a definite serial number (0 ... 255) is allocated. • The serial number in the multitasking environment is used for referencing to the calling tasks (reverse transaction).
SIZE	2 bytes	User data length (P0, P1, P2, P3, P4)	
		0x14	20 bytes
		...	...
		0x114	276 bytes
res	2 bytes	Reserved	
		0x0000	Data contents = 0

Tip!

The GCI header will be described in greater detail during the course of this manual. The other signals refer to the transfer characteristics of the Ethernet telegram, which are not described in this documentation.



7.2 Reading parameters from the controller

With the service identification (GSV) = 0x82 in the GCI header parameter data can be read from the controller:

7.3 Writing parameters to the controller

With the service identification (GSV) = 0x83 in the GCI header parameter data can be written to the controller:

7.4 Assignment of user data areas P0 ... P4

Area	Byte 1	Byte 2	Byte 3	Byte 4
P0	Status/error code		Data type	Reserved
P1	Code		Reserved	Reserved
P2	Subcode		Reserved	Reserved*
P3	Parameter value			
P4	Parameter value			

* When the data type VISIBLE_STRING is transmitted, byte 4 contains the number of the characters attached.

Data type in P0 / byte 3

ID	Data type	Data length
0x01	INTEGER_8	1 byte
0x02	INTEGER_16	2 bytes
0x03	INTEGER_32	4 bytes
0x04	INTEGER_64	8 bytes
0x05	UNSIGNED_8	1 byte
0x06	UNSIGNED_16	2 bytes
0x07	UNSIGNED_32	4 bytes
0x08	UNSIGNED_64	8 bytes
0x09	FLOATING_POINT	4 bytes
0x0A	VISIBLE_STRING	256 bytes (max.)
0x0B	OCTET_STRING	256 bytes (max.)
0x0C	BITFIELD_8	1 byte
0x0D	BITFIELD_16	2 bytes
0x0E	BITFIELD_32	4 bytes
0x0F	FIXPOINT_16	2 bytes
0x10	FIXPOINT_32	4 bytes

Assignment of the User data area with parameter values of different data lengths

Depending on the data format, the parameter value occupies 1 to 8 bytes. Data are stored in little-endian format, i.e. first the low byte or low word, then the high byte or high word:

Data length	Data area P3				Data area P4			
	Byte 1	Byte 2	Byte 3	Byte 4	Byte 1	Byte 2	Byte 3	Byte 4
1 byte	Value	00	00	00	00	00	00	00
2 bytes	Low byte	High byte	00	00	00	00	00	00
	Value							
4 bytes	Double word				00	00	00	00
	Low word		High word					
	Low byte	High byte	Low byte	High byte				
	Value							
8 bytes	Lower-order double word				Higher-order double word			
	Low word		High word		Low word		High word	
	Low byte	High byte	Low byte	High byte	Low byte	High byte	Low byte	High byte
	Value							

7.5 Transmission abort

The transmission is either aborted by the client or the server of a parameter data telegram. The message is aborted without confirmation. If the SDO client awaits the message to be confirmed, it will receive an abort message instead.

7.6 Error codes

The error code is located in the User data area P0, byte 1 and byte 2.

User data area P0			
Byte 1	**Byte 2**	**Byte 3**	**Byte 4**
Error code		Data type	Reserved
Example error code 0x9002			
Low byte	High byte		
0x02	0x90		

Note!

The other user data contents correspond to those of an error-free message.

Possible error codes

Error code		Definition	Description
dec	hex		
33803	0x840B	Invalid type	Invalid parameter type
33805	0x840D	FB not found	Function block not found
33812	0x8414	Invalid size	Invalid parameter format
33813	0x8415	Not in select list	Parameter is not in the selection list
33814	0x8416	Read not allowed	Parameter read is not allowed
33815	0x8417	Write not allowed	Parameter write is not allowed
33816	0x8418	CINH not set	Controller inhibit is not set
33817	0x8419	PLC not stopped	The PLC is not in the "Stopped" status
33828	0x8424	Invalid index	Invalid parameter index
33829	0x8425	Invalid subindex	Invalid parameter subindex
33837	0x842D	Access not allowed	Parameter access not allowed
33848	0x8438	Invalid length	Invalid parameter length
33862	0x8446	Unallowed characters	Parameter contains invalid characters
33865	0x8449	No array parameter	Parameter is no array parameter
33874	0x8452	Invalid select index	Invalid selection index
36866	0x9002	No memory available	No more memory available
36867	0x9003	No TID available	No transaction ID (TID) available anymore for identifying the telegram. TIDs are released again after receiving a reply with the corresponding TID.
36868	0x9004	Channel init error	General error when opening the communication channel
36869	0x9005	Error if not connected	No connection could be established.
36870	0x9006	Error of send function	Error when sending a GCI telegram
36871	0x9007	Error of receive function	Error when receiving a GCI telegram
36872	0x9008	Timeout error of msg wait function	No reply could be received to a request within the timeout.

Error code		Definition	Description
dec	hex		
36873	0x9009	Wrong GMT received	The general telegram identification does not correspond to the GCI communication.
36874	0x900A	Unknown server request	Internal error in the GCI
36875	0x900B	Wrong server parameter	
36876	0x900C	Server queue is full	
36877	0x900D	SRV send error	
36878	0x900E	SRV timeout	
36879	0x900F	Wrong client parameter	
36880	0x9010	Wrong channel number	
36881	0x9011	TX conversion error	
36882	0x9012	RX conversion error	
36883	0x9013	Retry number abort	
36884	0x9014	Unknown client response	

7.7 Telegram examples

7.7.1 Example 1: Querying the heatsink temperature (read request)

The heatsink temperature of the controller is to be read.

- Code to be read: C00061
- Assumption: ϑ = 43°C

Request

- SDO command (GSV) = 0x82 = "Read parameter"
- GCI message qualifier (GMQ) = 0x00 = 00000000B = "Request"
- Transaction ID (GTI) here "0" (optional consecutive number 0 ... 255)
- Length of the user data (SIZE) = 0x0014 = 20 bytes

GCI header							
GMT	GSV	GMQ	GTI	SIZE	SIZE	res	res
0x01	0x82	0x00	0x00	0x14	0x00	0x00	0x00
Fixed	Reading parameters	Request	Transactions ID	Length of the user data = 20 bytes		Reserved	

User data area P0			
Byte 1	Byte 2	Byte 3	Byte 4
Reserved	Reserved	Data type	Reserved
0x00	0x00	0x00	0x00
		Optional for read request

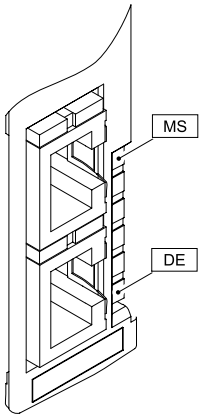
8 Diagnostics

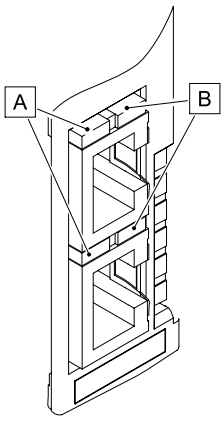
The LEDs on the front of the Ethernet module are used to diagnose faults.

Furthermore, the »Engineer« indicates via codes C13006 and C14006 if an error has occurred during Ethernet communication or if a telegram has been lost.



Note!

LED status displays for trouble-free operation:



- The **MS** LED is constantly lit.
- At the RJ45 sockets **X215** and **X216**, the green LEDs are lit and the yellow LEDs are lit or flickering.

8.1 LED status displays

▶ **MS** and **DE** status displays

LEDs	Pos.	Colour	Status	Description
 E94YCEN001B	MS	Green	On	The communication module is supplied with voltage.
	DE	Red	On	The communication module is not accepted by the standard device. (See notes provided in the documentation for the standard device.)

▶ Status display at **X215** and **X216**

LEDs	Pos.	Colour	Status	Description
 E94YCEN001B	A	Green	On	Ethernet connection has been established.
	B	Yellow	On/ Jittering	Data are being exchanged via Ethernet.

8.2 Error messages of the Servo Drive 9400

In the »Engineer«, the content of the fault memory can be displayed via the standard device code **C00168**.

Software manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

9 Parameter reference

This chapter supplements the parameter list and the table of attributes in the software manual and in the »Engineer« online help for the Servo Drive 9400 by the parameters of the E94AYCEN communication module (Ethernet).

Software manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on parameters.

9.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device config.**		Data type: UNSIGNED_32 Index: $23960_d = 5D98_h$
Response to impermissible device configuration

0	No Response

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

Note!

The standard device codes **C01501** and **C01502** have no effect when using the E94AYCEN (Ethernet) communication module.

9.2 Parameters of the communication module for slot MXI1

This chapter lists, in ascending numerical order, the parameters of the E94AYCEN (Ethernet) communication module for slot MXI1 of the Servo Drive 9400.

C13000

Parameter | Name:
C13000 | Ethernet: IP address

Data type: UNSIGNED_8
Index: $11575_d = 2D37_h$

The IP address is required for addressing the Servo Drive 9400 if communication between the PC and the controller is to be established via an Ethernet connection.

- The IP address consists of four numbers from 0 to 255 which can be set in the four subcodes.
- The first one, two, or three numbers indicate the network (Net-ID), the remaining numbers indicate the host (Host-ID). The definite specification of the part that is to be evaluated as Net-ID is effected in C13001 (Ethernet: Subnetwork mask).

▸ IP address (📖 31)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Info
C13000/1	127	IP address • Sequence: "[1].[2].[3].[4]" • Lenze setting: "127.0.0.1"
C13000/2	0	
C13000/3	0	
C13000/4	1	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13001

Parameter | Name:
C13001 | Ethernet: Subnetwork mask

Data type: UNSIGNED_8
Index: $11574_d = 2D36_h$

The subnet mask indicates which part of the IP address is evaluated as Net- ID and which part as Host-ID.

- The subnet mask consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Subnet mask (📖 31)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Info
C13001/1	255	Subnet mask • Sequence: "[1].[2].[3].[4]" • Lenze setting: "255.255.255.0" (The first three bytes of the IP address are the Net-ID.)
C13001/2	255	
C13001/3	255	
C13001/4	0	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13002

Parameter | Name:
C13002 | Ethernet gateway address

Data type: UNSIGNED_8
Index: $11573_d = 2D35_h$

The gateway address is required if the Servo Drive 9400 is not located in the same subnetwork as the PC.
- The gateway address consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Gateway address (📖 32)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Info
C13002/1	127	Gateway address • Sequence: "[1].[2].[3].[4]" • Lenze setting: "127.0.0.1"
C13002/2	0	
C13002/3	0	
C13002/4	1	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13003

Parameter | Name:
C13003 | Ethernet: MAC-ID

Data type: UNSIGNED_8
Index: $11572_d = 2D34_h$

The MAC-ID is a globally unique identifier of an Ethernet-capable device. The MAC-ID is assigned by the manufacturer and permanently burnt into the device (Lenze communication module).
- The MAC-ID consists of six numbers from 0 to 255 which are displayed in the six subcodes.

▸ MAC-ID (📖 32)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C13003/1	MAC-ID • Sequence: "[1]-[2]-[3]-[4]-[5]-[6]"
C13003/2	
C13003/3	
C13003/4	
C13003/5	
C13003/6	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13004

Parameter | Name:
C13004 | Resolved IP-Adress

Data type: UNSIGNED_8
Index: $11571_d = 2D33_h$

The IP address is required for addressing the Servo Drive 9400 if communication between the PC and the controller is to be established via an Ethernet connection.

- The IP address consists of four numbers from 0 to 255 which can be set in the four subcodes.
- The first one, two, or three numbers indicate the network (Net-ID), the remaining numbers indicate the host (Host-ID). The definite specification of the part that is to be evaluated as Net-ID is effected in C13001 (Ethernet: Subnetwork mask).

▸ IP address (📖 31)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C13004/1	IP address • Sequence: "[1].[2].[3].[4]"
C13004/2	
C13004/3	
C13004/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13005

Parameter | Name:
C13005 | Use of DHCP

Data type: UNSIGNED_8
Index: $11570_d = 2D32_h$

This code is available for Servo Drives 9400 of version **V03.00.00.00** or higher.
You use this code to define whether DHCP is to be used or not.

▸ DHCP implementation in the Servo Drive 9400 (📖 34)

Selection list (Lenze setting printed in bold)	
0	**Do not use DHCP**
1	Use DHCP

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13006

Parameter | Name:
C13006 | Ethernet node state

Data type: UNSIGNED_8
Index: $11569_d = 2D31_h$

Indicates if an error has occurred or a telegram has been lost during Ethernet communication.

Selection list (read only)	
0	No error
1	Error, frame lost

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13007

Parameter | Name:
C13007 | Resolved Subnetmask

Data type: UNSIGNED_8
Index: $11568_d = 2D30_h$

The subnet mask indicates which part of the IP address is evaluated as Net-ID and which part as Host-ID.
- The subnet mask consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Subnet mask (📖 31)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C13007/1	Subnet mask • Sequence: "[1].[2].[3].[4]"
C13007/2	
C13007/3	
C13007/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C13008

Parameter | Name:
C13008 | Resolved Gateway-Address

Data type: UNSIGNED_8
Index: $11567_d = 2D2F_h$

The gateway address is required if the Servo Drive 9400 is not located in the same subnetwork as the PC.
- The gateway address consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Gateway address (📖 32)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C13008/1	Gateway address • Sequence: "[1].[2].[3].[4]"
C13008/2	
C13008/3	
C13008/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

9.3 Parameters of the communication module for slot MXI2

This chapter lists, in ascending numerical order, the parameters of the E94AYCEN (Ethernet) communication module for slot MXI2 of the Servo Drive 9400.

C14000

Parameter | Name:
C14000 | Ethernet: IP address

Data type: UNSIGNED_8
Index: $10575_d = 294F_h$

The IP address is required for addressing the Servo Drive 9400 if communication between the PC and the controller is to be established via an Ethernet connection.

- The IP address consists of four numbers from 0 to 255 which can be set in the four subcodes.
- The first one, two, or three numbers indicate the network (Net-ID), the remaining numbers indicate the host (Host-ID). The definite specification of the part that is to be evaluated as Net-ID is effected in C14001 (Ethernet: Subnetwork mask).

▸ IP address (📖 31)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Info
C14000/1	127	IP address • Sequence: "[1].[2].[3].[4]" • Lenze setting: "127.0.0.1"
C14000/2	0	
C14000/3	0	
C14000/4	1	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14001

Parameter | Name:
C14001 | Ethernet: Subnetwork mask

Data type: UNSIGNED_8
Index: $10574_d = 294E_h$

The subnet mask indicates which part of the IP address is evaluated as Net-ID and which part as Host-ID.

- The subnet mask consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Subnet mask (📖 31)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Info
C14001/1	255	Subnet mask • Sequence: "[1].[2].[3].[4]" • Lenze setting: "255.255.255.0" (The first three bytes of the IP address are the Net-ID.)
C14001/2	255	
C14001/3	255	
C14001/4	0	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14002

Parameter | Name:
C14002 | Ethernet gateway address

Data type: UNSIGNED_8
Index: $10573_d = 294D_h$

The gateway address is required if the Servo Drive 9400 is not located in the same subnetwork as the PC.
- The gateway address consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Gateway address (📖 32)

Setting range (min. value | unit | max. value)		
0		255

Subcodes	Lenze setting	Info
C14002/1	127	Gateway address • Sequence: "[1].[2].[3].[4]" • Lenze setting: "127.0.0.1"
C14002/2	0	
C14002/3	0	
C14002/4	1	

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14003

Parameter | Name:
C14003 | Ethernet: MAC-ID

Data type: UNSIGNED_8
Index: $10572_d = 294C_h$

The MAC-ID is a globally unique identifier of an Ethernet-capable device. The MAC-ID is assigned by the manufacturer and permanently burnt into the device (Lenze communication module).
- The MAC-ID consists of six numbers from 0 to 255 which are displayed in the six subcodes.

▸ MAC-ID (📖 32)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C14003/1	MAC-ID • Sequence: "[1]-[2]-[3]-[4]-[5]-[6]"
C14003/2	
C14003/3	
C14003/4	
C14003/5	
C14003/6	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14004

Parameter | Name:
C14004 | Resolved IP-Adress

Data type: UNSIGNED_8
Index: $10571_d = 294B_h$

The IP address is required for addressing the Servo Drive 9400 if communication between the PC and the controller is to be established via an Ethernet connection.

- The IP address consists of four numbers from 0 to 255 which can be set in the four subcodes.
- The first one, two, or three numbers indicate the network (Net-ID), the remaining numbers indicate the host (Host-ID). The definite specification of the part that is to be evaluated as Net-ID is effected in C14001 (Ethernet: Subnetwork mask).

▸ IP address (📖 31)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C14004/1	IP address • Sequence: "[1].[2].[3].[4]"
C14004/2	
C14004/3	
C14004/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14005

Parameter | Name:
C14005 | Use of DHCP

Data type: UNSIGNED_8
Index: $10570_d = 294A_h$

This code is available for Servo Drives 9400 of version **V03.00.00.00** or higher.
You use this code to define whether DHCP is to be used or not.

▸ DHCP implementation in the Servo Drive 9400 (📖 34)

Selection list (Lenze setting printed in bold)	
0	**Do not use DHCP**
1	Use DHCP

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14006

Parameter | Name:
C14006 | Ethernet node state

Data type: UNSIGNED_8
Index: $10569_d = 2949_h$

Indicates if an error has occurred or a telegram has been lost during Ethernet communication.

Selection list (read only)	
0	No error
1	Error, frame lost

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14007

Parameter | Name:
C14007 | Resolved Subnetmask

Data type: UNSIGNED_8
Index: $10568_d = 2948_h$

The subnet mask indicates which part of the IP address is evaluated as Net-ID and which part as Host-ID.
- The subnet mask consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Subnet mask (📖 31)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C14007/1	Subnet mask • Sequence: "[1].[2].[3].[4]"
C14007/2	
C14007/3	
C14007/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

C14008

Parameter | Name:
C14008 | Resolved Gateway-Address

Data type: UNSIGNED_8
Index: $10567_d = 2947_h$

The gateway address is required if the Servo Drive 9400 is not located in the same subnetwork as the PC.
- The gateway address consists of four numbers from 0 to 255 which can be set in the four subcodes.

▸ Gateway address (📖 32)

Display range (min. value | unit | max. value)		
0		255

Subcodes	Info
C14008/1	Gateway address • Sequence: "[1].[2].[3].[4]"
C14008/2	
C14008/3	
C14008/4	

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer

9.4 Table of attributes

The table of attributes contains information required for communicating with the drive via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Only required for access via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte, without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit (CINH) required	☑ Writing is only possible when the controller is inhibited (CINH)	

Table of attributes

Code	Name	Index		Data				Access		
		dec	hex	DS	DA	DT	Factor	R	W	CINH
C13000	Ethernet: IP address	11575	2D37	A	4	UNSIGNED_8	1	☑	☑	
C13001	Ethernet: Subnetwork mask	11574	2D36	A	4	UNSIGNED_8	1	☑	☑

1 About this documentation

Contents

This documentation only contains descriptions of the E94AYCEO (EtherNet/IP™) communication module.

Note!

This documentation supplements the **mounting instructions** supplied with the controller and the **Servo Drives 9400 hardware manual**.

The mounting instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe the software of another manufacturer. No guarantee can be given for corresponding information in this documentation. Information on the use of the software can be found in the documents for the host system (PLC, scanner).

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information on EtherNet/IP can be found on the website of the user organisation ODVA (Open DeviceNet Vendor Association):

www.odva.org

Target group

This documentation addresses persons who configure, install, commission, and maintain the networking and remote servicing of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.lenze.com

Information regarding the validity

The information given in this documentation is valid for the following devices:

Extension module	Type designation	From hardware version	From software version
Communication module EtherNet/IP	E94AYCEO	VE	01.01.00.00

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and software version of the installed engineering tools (»Engineer«, »RSLogix 5000«), the screenshots in this documentation may differ from the screen representation.

1.1 Document history

Version			Description
1.0	03/2012	TD17	First edition for field test version V0.3.0.0
2.0	09/2012	TD17	General revision of version V01.01.00.00
3.0	12/2013	TD17	• New layout • Revision of the parameter descriptions

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Identification	Examples/notes
Numbers		
Decimal	Standard notation	Example: 1234
Decimal separator	Point	In general, the decimal point is used. Example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Text colour blue	All pieces of information that only apply to or from a specific software version of the device are highlighted accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze PC software »Engineer«...
Control element	**Bold**	The **OK** button... / The **Copy** command... / The **Properties** tab... / The **Name** input field...
Sequence of menu commands		If several successive commands are required for executing a function, the individual commands are separated from each other by an arrow: Select the command **File → Open** to...

1.3 Terminology used

Term	Meaning
ACD	Address Conflict Detection
Adapter	EtherNet/IP slave
Drive	Lenze inverters of the "Servo Drives 9400" product series
Inverter	
Standard device	
ARP	Address Resolution Protocol
BOOTP	Bootstrap Protocol
Code	Parameter which serves to parameterise and monitor the drive. In normal usage, the term is usually referred to as "Index".
Subcode	If a code contains several parameters, they are stored in so-called "subcodes". This manual uses a slash "/" as a separator between code and subcode (e.g. "C00118/3"). In normal usage, the term is also referred to as "Subindex".
DHCP	Dynamic Host Configuration Protocol
DSCP	Differentiated Services Codepoints
EDS	Electronic Data Sheet
»Engineer«	PC software from Lenze which supports you during engineering (parameterisation, diagnostics, and configuration) throughout the entire life cycle, i.e. from planning to maintenance of the commissioned machine.
EtherNet/IP	EtherNet/IP™ (EtherNet Industrial Protocol) is a fieldbus system based on Ethernet which uses the Common Industrial Protocol™ (CIP™) for data exchange. EtherNet/IP™ and Common Industrial Protocol™ (CIP™) are trademarks and patented technologies, licensed by the user organisation ODVA (Open DeviceNet Vendor Association), USA.
Explicit messages	Explicit Messages are used to transfer parameter data.
HW	Hardware
IGMP	Internet Group Management Protocol
Implicit messages	Implicit Messages are used to transfer I/O data.
"Class 1" connection	I/O connection
"Class 3" connection	Explicit connection
Level 2	EtherNet/IP performance level 2: I/O Message Server including Explicit Message Server
Lenze setting	Default settings of the device, preconfigured ex works.
Standard setting	
PLC	Programmable Logic Controller
QoS	Quality of Service
RPI	Requested Package Interval: Interval requested between 2 telegrams for cyclic data transmission
»RSLogix 5000«	Programming and development software from Rockwell for hosts (scanners) in EtherNet/IP networks (e.g. Allen-Bradley Logix controllers).
Scanner	EtherNet/IP master or client
Host	
SW	Software
TTL	Time To Live: Validity time of data packets in the EtherNet/IP network
UCMM	Unconnected Message Manager

1.4 Notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Pictograph and signal word!

(characterise the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

If the following basic safety measures are disregarded, severe injuries to persons and damage to material assets may result.

Lenze drive and automation components ...

- must only be applied as directed.
  ▸ Application as directed (📖 13)
- must never be commissioned if they display signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- during and after operation can have live, moving and rotating parts, depending on their degree of protection. Surfaces can be hot.

The following applies to Lenze drive components ...

- only use the accessories approved.
- only use original manufacturer spare parts.

Observe all specifications contained in the enclosed documentation and related documentation.

- This is the precondition for a safe and trouble-free operation and for achieving the specified product features.
  ▸ Product features (📖 14)
- The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

All works on and with Lenze drive and automation components must only be carried out by qualified personnel. According to IEC 60364 or CENELEC HD 384 these are persons who ...

- are familiar with installing, mounting, commissioning, and operating the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).
- Only use cables that comply with the listed specifications.
  ▸ Ethernet cable specification (📖 30)

Documentation for the standard device, control system, system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage of ≥ 400 V, the protection against accidental contact is not ensured without external measures.
▸ Protective insulation (📖 19)

Device protection

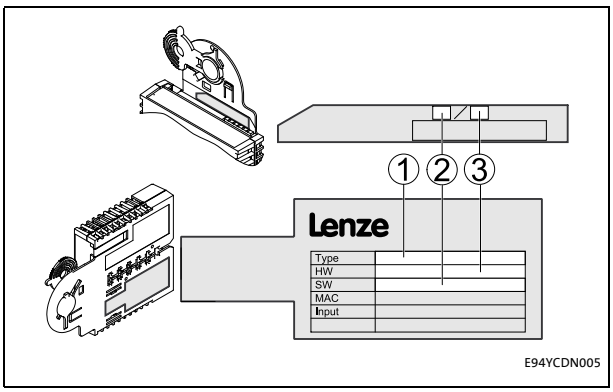
The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 23)

3 Product description

3.1 Application as directed

The EtherNet/IP communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxxx	1A	04.00
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in EtherNet/IP networks.

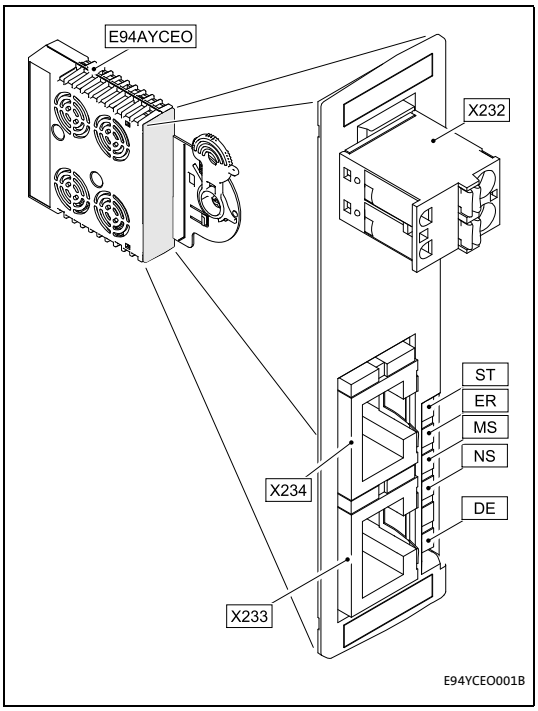
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: Extension module
- C Module type: Communication module
- EO EtherNet/IP



2 Hardware version (HW)

3 Software version (SW)

3.3 Product features

- Interface module for the EtherNet/IP communication system to be connected to the expansion slots of the Servo Drives 9400
- The communication module can either be supplied internally by the standard device or externally by a separate voltage source.
- The Servo Drive 9400 is always an adapter device:
  EtherNet/IP adapter with "Level 2" functionality
- 2-port interface with integrated switch functionality
- Access to all Lenze parameters (configurable via TCP/IP using the Lenze »Engineer«)
- Up to 3 TCP/IP socket connections for communication with the Lenze »Engineer«
- Support of "IP Config Pending" (activation of changed IP configuration by "power off/on" or "type 0 reset")
- Support of the redundancy protocol DLR (Device Level Ring) as "beacon-based ring node"
- Up to 32 I/O data words (64 bytes) are possible.
- Further CIP features:
  - Max. 8 CIP connections
  - 1 "exclusive owner" connection
  - I/O connection type: cyclic
  - Minimum I/O cycle time: 2 ms
  - Support of multicast messages, "IGMP snooping" (V2 according to RFC 2236), UCMM, ACD, BOOTP/DHCP, VLAN tagging/DSCP

3.4 Terminals and interfaces

4 Technical data

4.1 General data and operating conditions

Range	Values
Order designation	E94AYCEO
Communication profile	EtherNet/IP
Communication medium	S/FTP (Screened Foiled Twisted Pair), ISO/IEC 11801 or EN 50173, CAT 5e
Interface for communication	RJ45: Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Type of node	Adapter (slave)
Number of nodes	Max. 254 in the subnetwork
Max. cable length	100 m
Vendor ID	587 (0x24B), Lenze (’Lenze AC Tech’ in older Rockwell data)
Device type	43 (0x2B), Generic device
Product code	9400 (0x24B8)
TCP port	9410 (GCI)
Baud rate	• 10 Mbps • 100 Mbps
Transmission mode	Half duplex / full duplex
Switching method	Store-and-Forward
Switch latency	Approx. 125 µs at max. telegram length
Voltage supply	External supply via separate power supply unit + : U = 24 V DC (20.4 ... 28.8 V), I_{max} = 130 mA - : Reference potential for external voltage supply
Conformities, approvals	• CE • UL (see also hardware manual)

Servo Drives 9400 hardware manual

Here you can find the **ambient conditions** and data on the **electromagnetic compatibility (EMC)**, which also apply to the communication module.

4.2 Protocol data

Range	Values
I/O data words	1 ... 32 words (max. 64 bytes, 16 bits/word)
Supported CIP services	• Get_Attributes_All • Get_Attribute_Single • Set_Attribute_Single • Reset (only type '0') • Forward_Open • Forward_Close

4.3 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

The communication times in an EtherNet/IP network depend on the ...

- processing time in the inverter;
- telegram runtime (baud rate / telegram length);
- nesting depth of the network.

processing time within the inverter

Data	Processing time	
Process data (I/O data)	10 ms + 0 ... 1 ms + 1 ... x ms	Lenze standard update cycle (can be changed in the Rockwell engineering tool) Processing time in the module Runtime of the application task of the technology application used (tolerance)
Parameter data	Approx. 30 ms + a tolerance of 20 ms (typically) Some codes may require a longer processing time (see reference manual/ »Engineer« online help for the Servo Drive 9400).	

There are no interdependencies between parameter data and I/O data.

4.4 Internal switch latency

The integrated 2-port switch causes runtime delays. For "store-and-forward" and 100 Mbps, these runtime delays can be calculated as follows.

- Runtime delay for an output data packet of the scanners incl. 32-bit "Run/Idle header" with 16-bit sequence counter:

Runtime delay = ((66 permanent bytes + I/O data in bytes) x 8 x 10 nsec) + 4 µsec

- Runtime delay for an output data packet of an adapter without 32/bit "Run/Idle header":

Runtime delay = ((62 permanent bytes + I/O data in bytes) x 8 x 10 nsec) + 4 µsec

Example

Delay of an output data packet of the scanners with 8 output data words (16 bytes):

- ((66 permanent bytes + 16 bytes) x 8 x 10 nsec) + 4 µsec
- (82 bytes x 8 x 10 nsec) + 4 µsec
- 6.56 µsec + 4 µsec = **10.56 µsec**

Note!

The use of external switches can also lead to runtime delays. Depending on the system constellation, it may be useful to create a star topology or a line/mix topology.

▸ Network topology (📖 26)

4.5 Protective insulation

Danger!

Dangerous voltage

If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

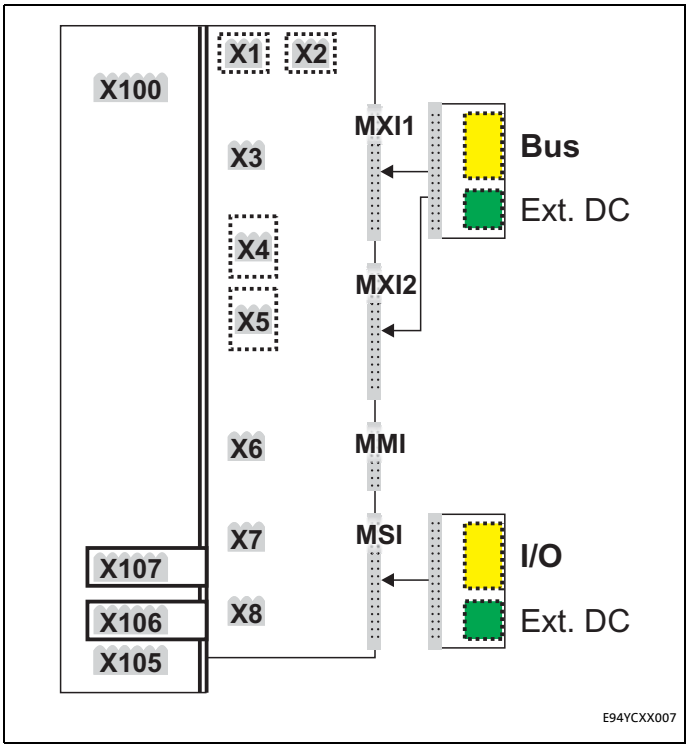
Possible consequences:

Death or severe injuries

Protective measures:

If protection against accidental contact is required for the control terminals of the inverter and the connections of the plugged device modules, ...

- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.



Note!

The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

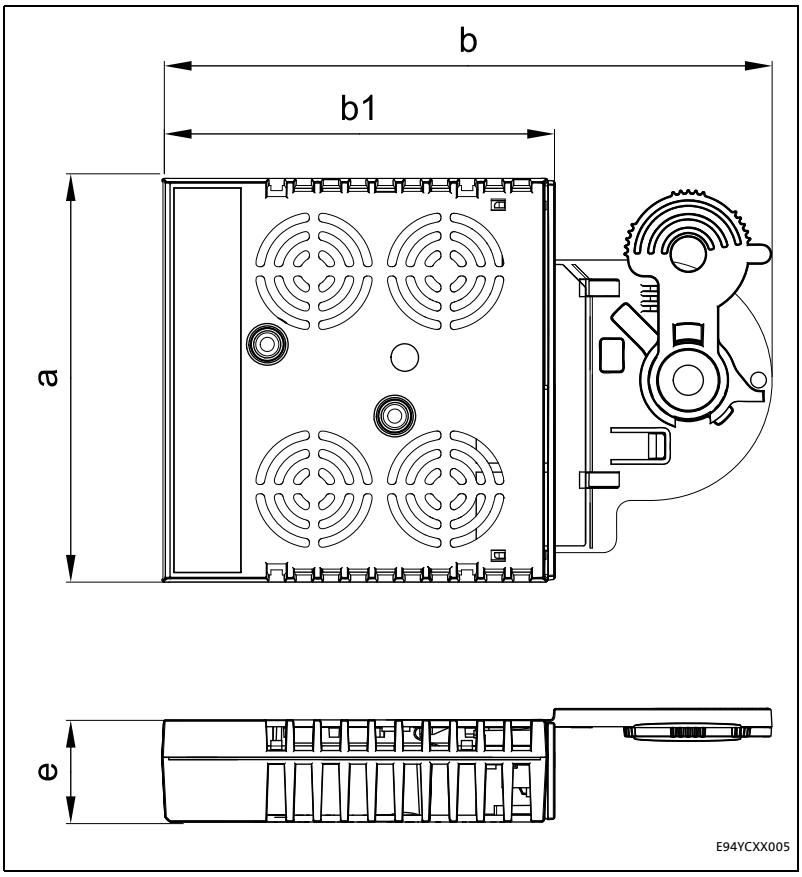
The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the inverter.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example



Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.6 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

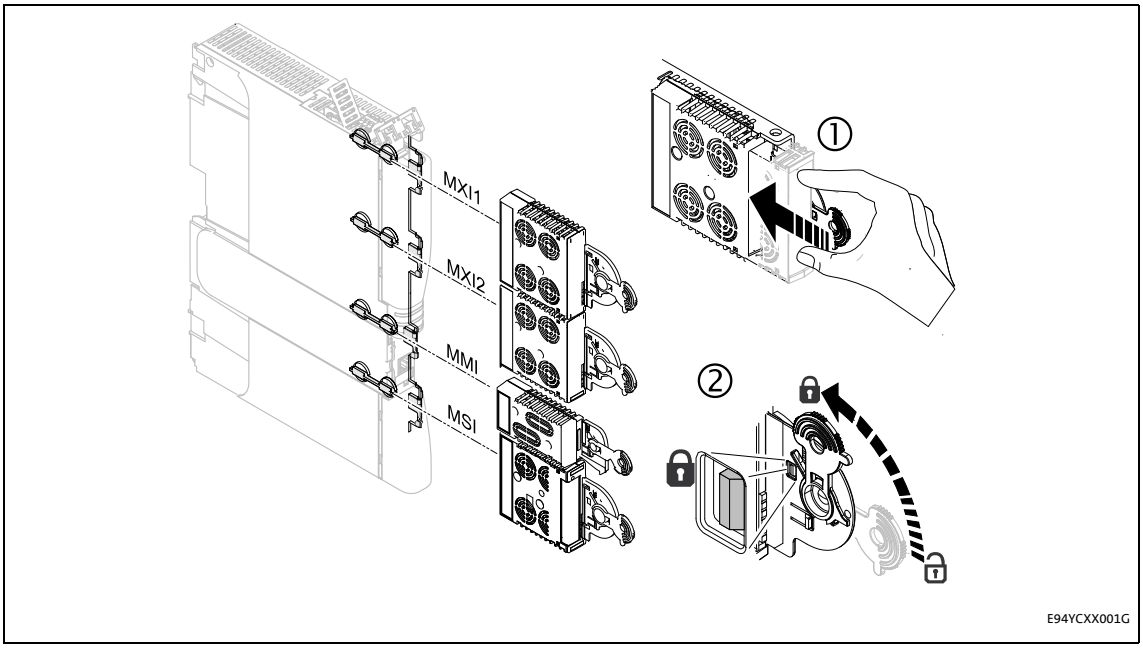
5 Installation

Stop!

Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

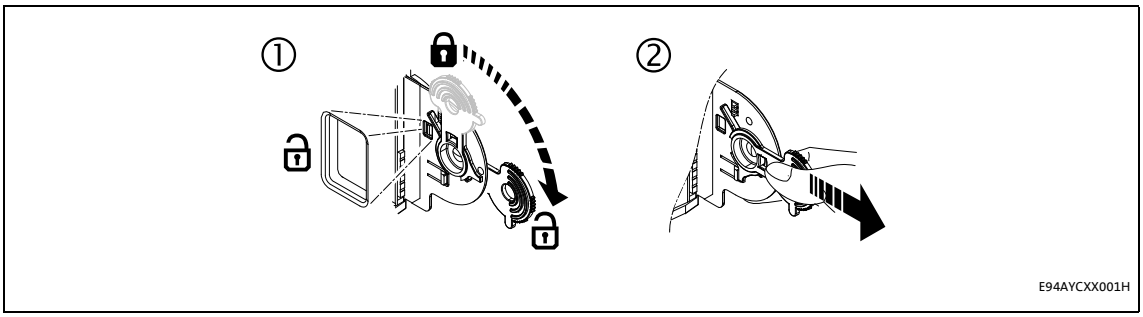
Possible consequences:



- The communication module is defective.
- Fieldbus communication is not possible or faulty.

Protective measures

- Before touching the module, be sure that you are free of electrostatic charge.



5.1 Mechanical installation

5.1.1 Assembly

[5-1] Assembly

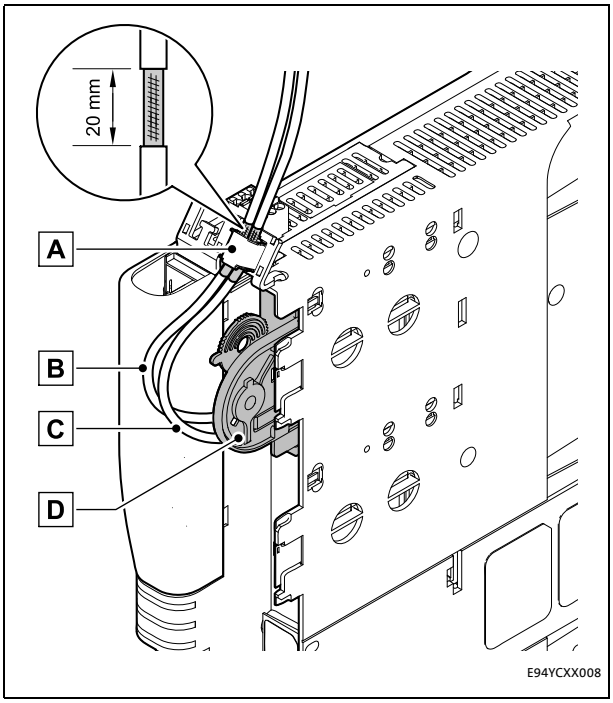
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation for the standard device, control system, system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring according to EMC guidelines

In typical systems, standard shielding is sufficient for Ethernet cables.

However, in environments with a very high level of interference, EMC resistance can be improved by additionally earthing the cable shield on both sides.

For this observe the following notes:

1. The distance between the additional earthing and the Ethernet plug depends on the module slot and is as follows:
   - approx. 10 cm for the upper slot (MXI1)
   - approx. 20 cm for the lower slot (MXI2)
2. Measure the appropriate distance along the cable and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Connect the cable shield to the shield sheet of the Servo Drive 9400.

A Connection to the shield sheet of the Servo Drive 9400

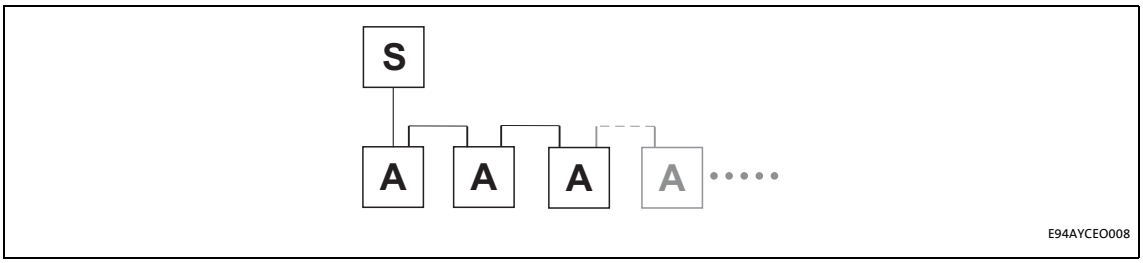
B Ethernet cable at X234

C Ethernet cable at X233

D Communication module in slot MXI1 of the Servo Drive 9400

[5-3] Wiring according to EMC guidelines

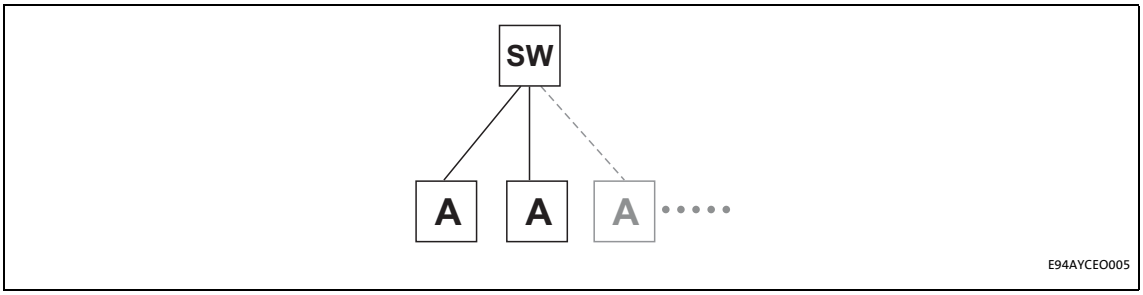
5.2.2 Network topology



It is typical of EtherNet/IP to have a rather free topology the limiting factor of which is large message latencies due to e.g. switches connected in series.

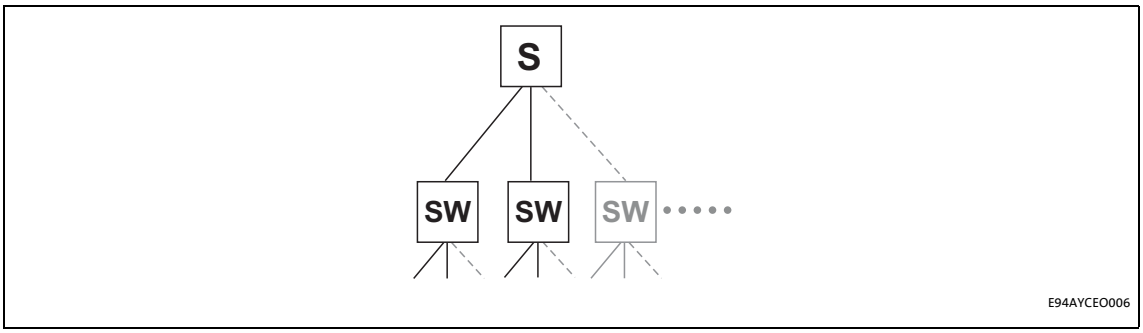
▸ Internal switch latency (📖 18)

The combination of a line and a stub is useful for system wiring.



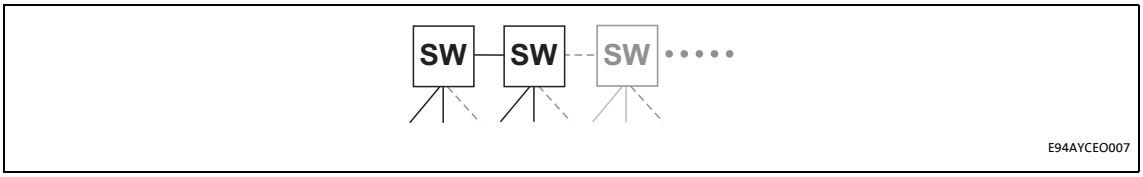
EtherNet/IP supports the following topologies:

- Line



[5-4] Line topology (S = scanner, A = adapter)

- Switch / star



[5-5] Switch / star topology (SW = switch, A = adapter)

- Tree via switches

[5-6] Tree topology (S = scanner, SW = switch)

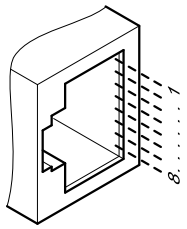
- Switch / switch

[5-7] Switch / switch topology (S = switch)

5.2.3 EtherNet/IP connection

The EtherNet/IP connection is carried out via the RJ45 sockets **X233** and **X234**.

You can use a standard Ethernet patch cable to connect the communication module to the EtherNet/IP fieldbus.



▸ Ethernet cable specification (📖 30)

The installation and removal of the Ethernet cables is optimised for the use of connectors in accordance with the "Automation Initiative of German Domestic Automobile Manufacturers" (AIDA).

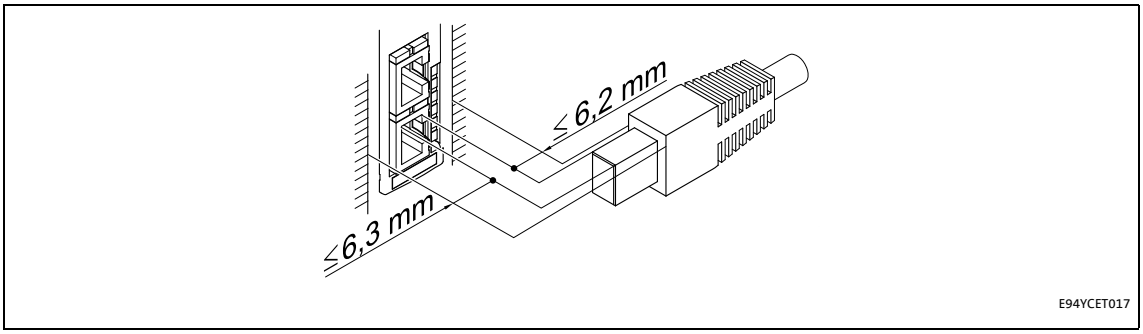
Note!

To prevent the RJ45 socket from being damaged, insert or remove the Ethernet cable connector straight (at a right angle) into or from the socket.

Pin assignment

RJ45 socket	Pin	Signal
 E94AYCXX004C	1	Tx +
	2	Tx -
	3	Rx +
	4	-
	5	-
	6	Rx -
	7	-
	8	-

Note!



Dependent on the configuration of the Ethernet port of the device to be connected, we recommend the use of a cross-over cable.

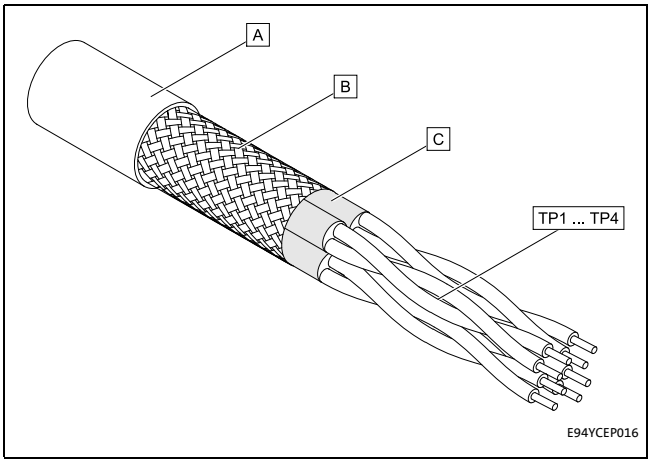
Tip!

The EtherNet/IP interfaces feature an auto-MDIX function. This function adjusts the polarity of the RJ45 interfaces so that a connection can be established irrespective of the polarity of the opposite EtherNet/IP interface and irrespective of the type of cable used (standard patch cable or crossover cable).

Mounting clearance

When ordering and using your Ethernet cable, note the amount of free space available.

[5-8] Mounting clearance



5.2.4 Ethernet cable specification

Note!

Only use cables that meet the listed specifications.

Ethernet cable specification	
Ethernet standard	Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Cable type	S/FTP (Screened Foiled Twisted Pair), ISO/IEC 11801 or EN 50173, CAT 5e
Damping	23.2 dB (for 100 MHz and 100 m each)
Crosstalk damping	24 dB (at 100 MHz and per 100 m)
Return loss	10 dB (per 100 m)
Surge impedance	100 Ω

Structure of the Ethernet cable

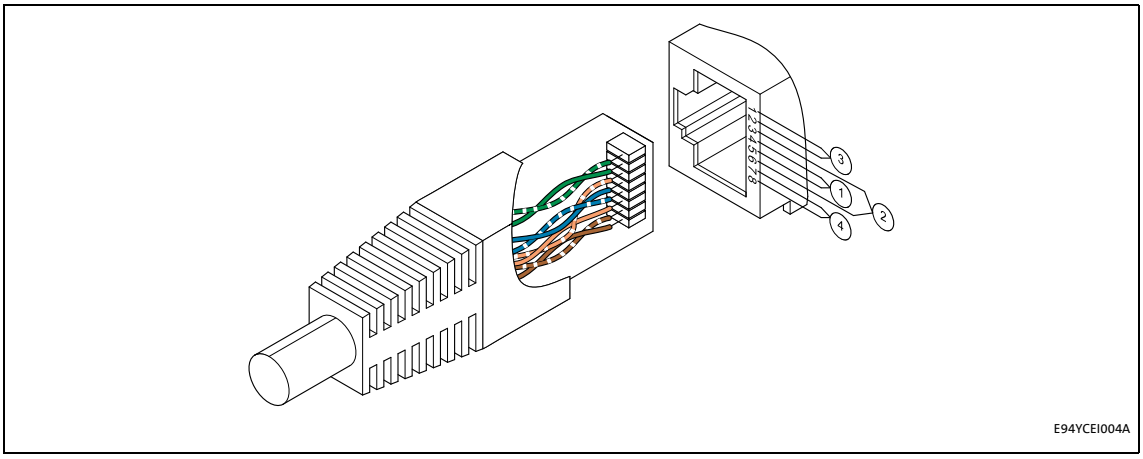
A Cable insulation

B Braid

C Foil shielding

TP1 Twisted core pairs 1 ... 4
...
TP4

▸ Colour code of the Ethernet cable (📖 31)



[5-9] Structure of the Ethernet cable (S/FTP, CAT 5e)

Colour code of the Ethernet cable

Note!

Wiring and colour code are standardised in EIA/TIA 568A/568B.

In accordance with the industrial standard, the use of 4-pin Ethernet cables is permissible. The cable type only connects the assigned pins 1, 2, 3 and 6 to one another.

[5-10] Ethernet plug in accordance with EIA/TIA 568A/568B

Pair	Pin	Signal	EIA/TIA 568A	EIA/TIA 568B
3	1	Tx +	white / green	white / orange
	2	Tx -	Green	orange
2	3	Rx +	white / orange	white / green
1	4		blue	blue
	5		white / blue	blue / white
2	6	Rx -	orange	Green
4	7		white / brown	white / brown
	8		brown	brown

5.2.5 External voltage supply

The communication module can be supplied externally with voltage via separate supply cables at the 2-pole plug connector **X232**.

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).

The external voltage supply of the communication module is necessary if the power supply for the basic device fails but communication via the fieldbus is to be maintained.

The parameters of a standard device separated from the mains cannot be accessed.

Assignment of the X232 plug connector

Name	Description
+	U = 24 V DC (20.4 ... 28.8 V) I = 130 mA
-	Reference potential for the external voltage supply

Terminal data

Range	Values	
Electrical connection	2-pin plug connector with spring connection	
Possible connections	Rigid:	
		1.5 mm^2 (AWG 16)
	Flexible:	
		Without wire end ferrule 1.5 mm^2 (AWG 16)
		With wire end ferrule, without plastic sleeve 1.5 mm^2 (AWG 16)
		With wire end ferrule, with plastic sleeve 1.5 mm^2 (AWG 16)
Stripping length	9 mm	

6 Commissioning

During commissioning, plant-specific data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the inverter. Lenze devices use codes for this purpose.

The codes of the inverter and for communication are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

▸ Parameter reference (📖 88)

Note!

When parameterising the communication module, please note that the code number depends on the slot of the Servo Drive 9400 into which the communication module is plugged.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  ▸ Parameters of the communication module for slot MXI1 (📖 90)
- C**14**nnn for slot MXI2
  ▸ Parameters of the communication module for slot MXI2 (📖 103)

Additionally set Parameters of the standard device that are relevant to communication (📖 88).

6.1 Before initial switch-on

Stop!

Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Configuring the host system (scanner)

To be able to communicate with the communication module, the host (scanner) must be configured first.

The configuration of EtherNet/IP networks always requires an EtherNet/IP scanner configuration software (e.g. »RSLogix 5000« from Rockwell) for the host (scanner).

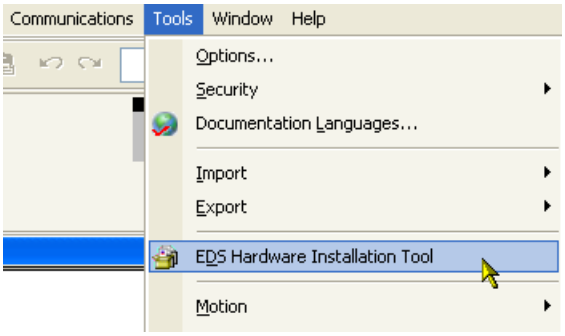
The configuration software is necessary for the programming of controller programs, EtherNet/IP configuration, real-time execution and diagnostics.

The basic parameters of the communication module are stored in the internal configuration memory and can be used for node detection by the scanner.

For node detection (fieldbus scan), the corresponding device descriptions of the Lenze device family are used.

6.2.1 EDS files

Depending on the EtherNet/IP scanner configuration software, the EDS files (Electronic Data Sheet) may be used for the configuration of the network profile, the communication with the participating devices and the automatic generation of tags. For this purpose, the EDS files must be imported into the controller project of the scanner configuration software.



The EDS file required for the configuration can be found in the download area at:

www.lenze.com

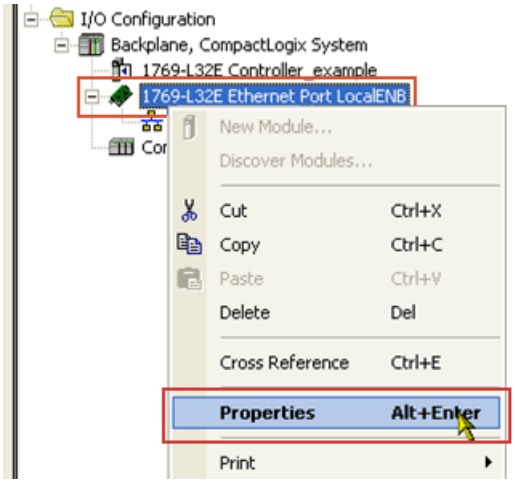
Tip!

From version 20 onwards, Rockwell's »RSLogix 5000« programming software features an "EDS Hardware Installation Tool" that can be used to ...

- install/import EDS files;
- create EDS files;
- carry out EDS uploads;
- delete EDS files from your controller project.

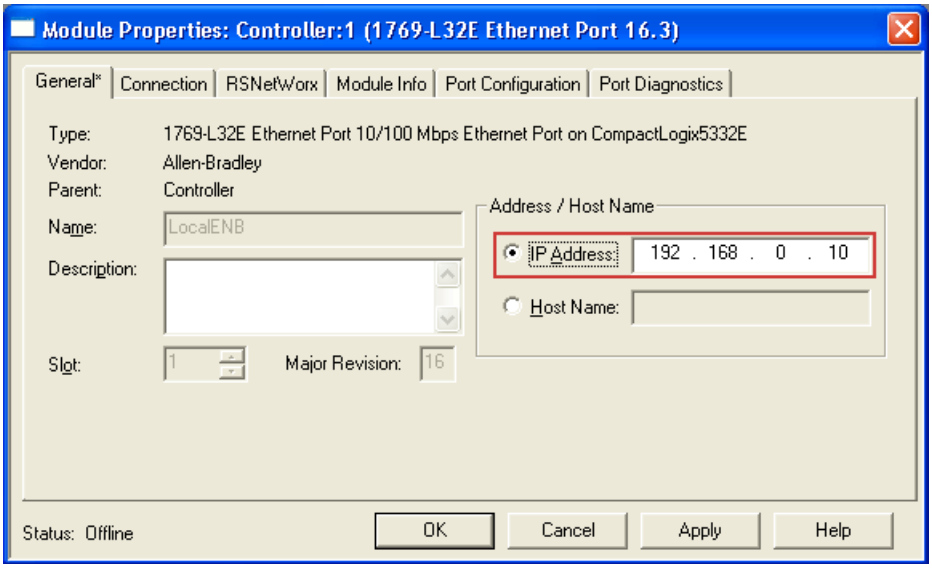
In »RSLogix 5000«, the dialog for the "EDS Hardware Installation Tool" is self-explanatory and not described further in this documentation.

6.2.2 Example: IP configuration of the Allen-Bradley 1769-L32E CompactLogix controller



In this example, the Allen-Bradley CompactLogix controller 1769-L32E with an integrated EtherNet/IP interface is used to communicate with Servo Drives 9400.

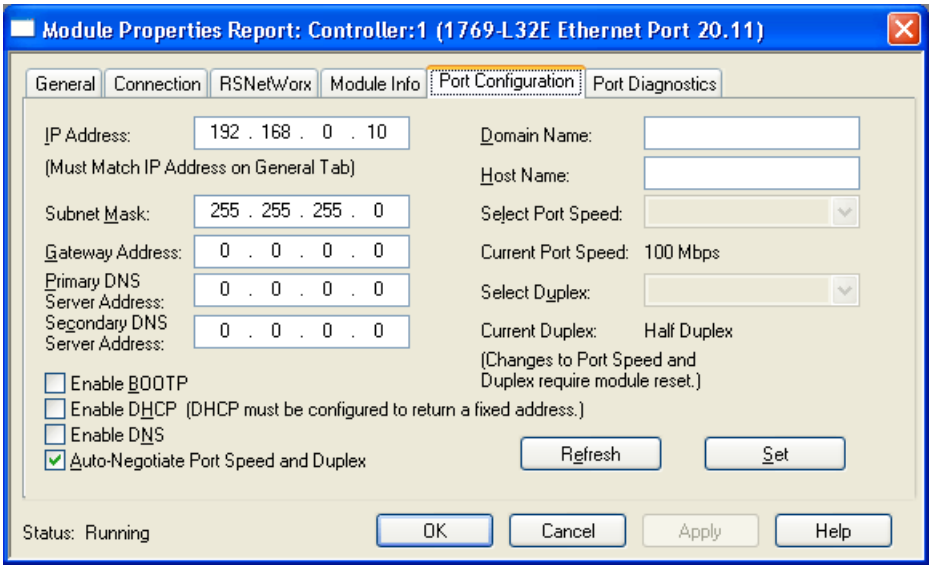
The »RSLogix 5000« programming software from Rockwell is used for the configuration.



To establish communication via an EtherNet/IP network, add the controller and its scanner to the I/O configuration.

How to set the IP configuration of the 1769-L32E CompactLogix controller using the »RSLogix 5000« programming software:

1. Click on the **I/O Configuration** folder in the configuration tree.
2. Right click on "1769-L32E Ethernet Port LocalENB" and select "Properties" from the context menu.



3. Go to the **General** tab of the "Module Properties: ..." dialog window and enter the IP address of the scanner.

4. Then click **OK**.

5. Go to the **Port Configuration** tab and enter the IP configuration, BOOTP setting, Ethernet baud rate and duplex mode.

6. Then click **OK**.
   - Now, the scanner is configured for the EtherNet/IP network.
   - Information on project planning with the »RSLogix 5000« programming software by Rockwell can be found here:
     - I/O configuration with »RSLogix 5000« version 19 or lower (📖 58)
     - I/O configuration with »RSLogix 5000« version 20 or higher (📖 63)

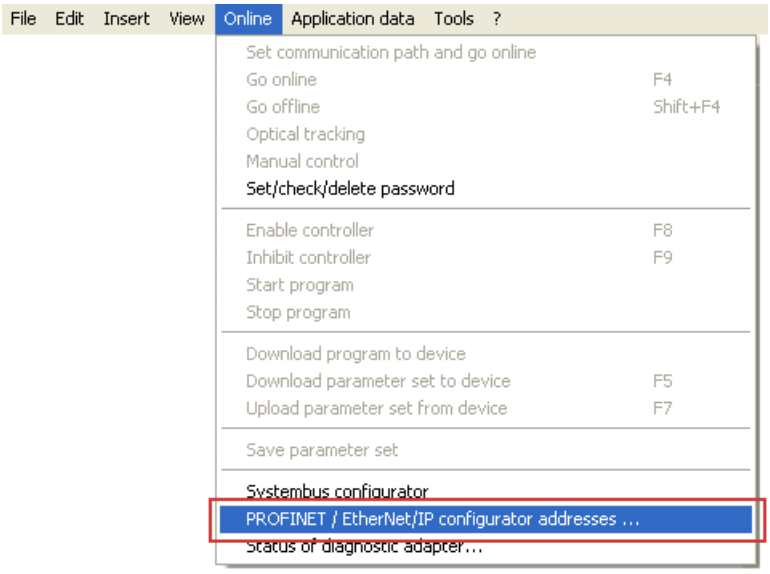
6.3 Setting the IP configuration of the Servo Drive 9400

The IP configuration is required for addressing the Servo Drive 9400 to ensure that communication between the PC/»Engineer« or the scanner and the drive can be effected via EtherNet/IP. For this, an IP address, subnet mask, and gateway address must be allocated. You have the following options to select the IP parameters for the Servo Drive 9400:

- Setting via the EtherNet/IP configurator of the »Engineer« (📖 38)
- Setting via codes in the »Engineer« (📖 40)
- Setting via a BOOTP/DHCP server (📖 42)
- Setting via the TCP/IP Interface Object (0xF5) (📖 42)

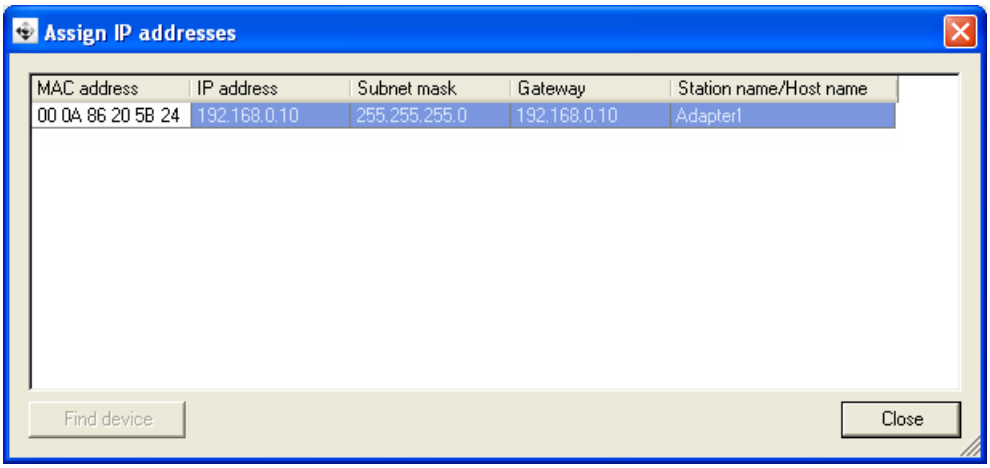
Note!

- The assignment of invalid combinations of IP address, subnet mask, and gateway address can have the consequence that no connection to the EtherNet/IP network can be established.
- Codes C13010 / C14010 (IP address), C13011 / C14011 (subnet mask), C13012 / C14012 (gateway address), and C13016 / C14016 (multicast IP address) show the IP parameters currently used.
- In the case of impermissible settings, the error message EtherNet/IP: Invalid IP parameters [0x00c86533] (📖 84) is output.



6.3.1 Setting via the EtherNet/IP configurator of the »Engineer«

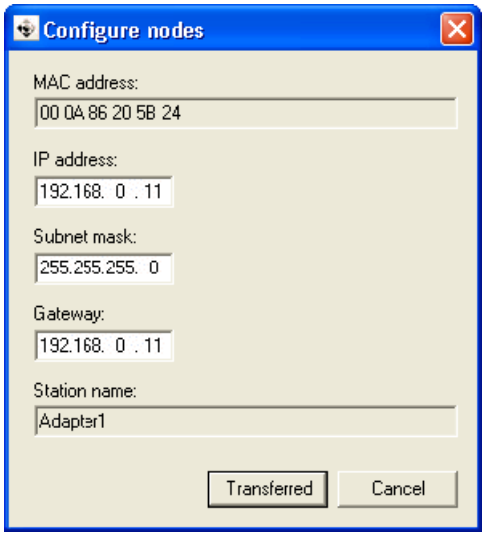
Note!



- Changes in the IP parameters will become effective immediately.
- An existing IP connection to the Servo Drive 9400 will be interrupted.
- This procedure cannot be applied if the network is configured by a BOOTP/DHCP server.
  ▸ Setting via a BOOTP/DHCP server (📖 42) (C13005 / C14005)

How to set the IP parameters via the EtherNet/IP configurator:

1. Execute the menu command **Online → PROFINET /EtherNet/IP configurator addresses ...**.

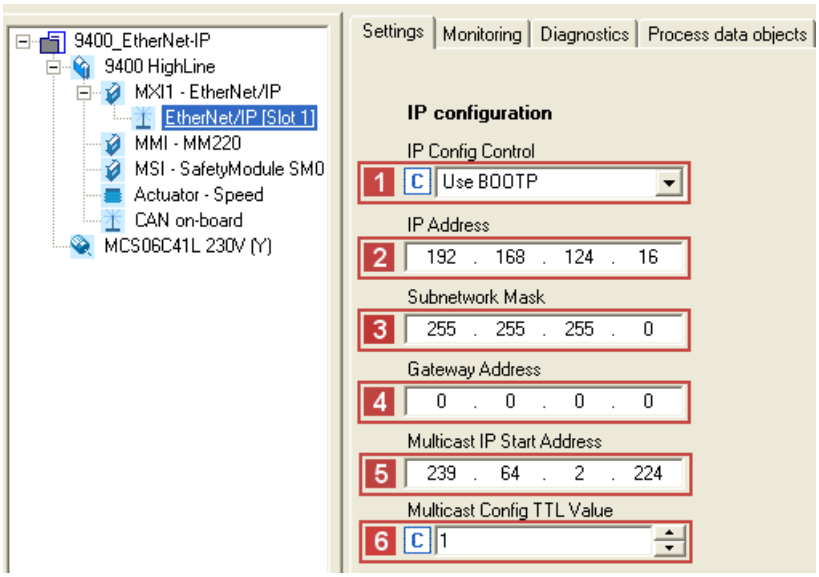


The **Assign IP addresses** dialog window is opened and all Lenze EtherNet/IP nodes connected are listed.

2. A double-click on an EtherNet/IP node opens the **Configure nodes** dialog window.

   Here you can set the IP parameters.

3. Click on **Transferred**.
   - The IP configuration is transferred to the corresponding EtherNet/IP node.
   - The communication module carries out a stack reset.
   - The IP parameters are written to codes C13000 / C14000 (IP address), C13001 / C14001 (subnet mask) und C13002 / C14002 (gateway address).
   - Code C13005 / C14005 (IP configuration reference) is set to '0: Saved address' to ensure that the address transferred can be used.



Tip!

Check whether the configuration has been transferred successfully.

For this purpose, open the **Assign IP addresses** dialog window (see step 1) and click on the **Find device** button.

6.3.2 Setting via codes in the »Engineer«

You can also set the IP parameters manually in the »Engineer« under the **Settings** tab. The values will be transferred to the corresponding codes.

Settings		Description
1	**IP Config Control**	Selection (C13005 / C14005) of how the IP configuration is to be effected: • **0**: The IP configuration currently stored in the communication module is used. • **1**: The IP configuration is assigned by a BOOTP server using the BOOTP. • **2**: The IP configuration is assigned by a DHCP server using the DHCP.
2	**IP Address**	Setting the IP address (C13000 / C14000)
3	**Subnet mask**	Setting the subnet mask (C13001 / C14001)
4	**Gateway Address**	Setting the gateway address (C13002 / C14002)
5	**Multicast IP Start Address**	Setting of the multicast IP start address (C13006 / C14006) ▸ Setting the multicast configuration (📖 43)
6	**Multicast Config TTL Value**	Setting of the multicast TTL value (C13019 / C14019)

How to activate changed settings in the »Engineer«:

1. Execute device command **C00002 = "11: Save all parameter sets"**.

   The current IP configuration is stored in the memory module of the drive.

2. Carry out a "Type 0 reset" for the Identity Object (1 / 0x01) (📖 121) of the node, or switch the voltage supply of the communication module off and on again.

IP address

The IP address is set/changed in C13000 / C14000.

In C13010/1...4 / C14010/1...4 the currently used IP address is shown.

Example: Display of the IP address 192.168.0.10				
Code	C13010/1 C14010/1	C13010/2 C14010/2	C13010/3 C14010/3	C13010/4 C14010/4
Value	192	168	0	10

Subnet mask

The subnet mask indicates which part of the IP address is evaluated as net ID or host ID.

Valid subnet masks are defined in accordance with RFC 1878

The subnet mask is set/changed in C13001 / C14001.

In C13011/1...4 / C14011/1...4 the currently used subnet mask is shown.

Example: Display of the subnet mask 255.255.255.0				
Code	C13011/1 C14011/1	C13011/2 C14011/2	C13011/3 C14011/3	C13011/4 C14011/4
Value	255	255	255	0

Gateway address

The gateway address is valid if the network address of the IP address and the gateway address are identical.

If the gateway address and the IP address are identical or if the address is '0.0.0.0', gateway functionality is not used.

The gateway address is set/changed in C13002 / C14002.

In C13012/1...4 / C14012/1...4 the currently used gateway address is shown.

Example: Display of the gateway address 192.168.0.10				
Code	C13012/1 C14012/1	C13012/2 C14012/2	C13012/3 C14012/3	C13012/4 C14012/4
Value	192	168	0	10

6.3.3 Setting via a BOOTP/DHCP server

DHCP is the acronym for "Dynamic Host Configuration Protocol". This protocol is defined in RFC 2131 and is a compatible advancement of the "Bootstrap Protocol" (BOOTP) according to RFC 951.

Both protocols enable network nodes to query information about the network configuration (e.g. the IP address) from a server via a TCP/IP network. The BOOTP/DHCP server assigns the IP address to the client dynamically from a defined address range. This means that the client receives an unambiguous IP address.

Code C13005 / C14005 is used to define how the IP configuration is to be carried out:

- Value '0': The IP configuration currently saved in the communication module is used.
- Value '1': BOOTP is used. (Lenze standard setting)
- Value '2': DHCP is used.

This setting can also be made by means of write access to attribute 3 (Configuration Control) of instance 1 of the TCP/IP Interface Object (245 / 0xF5) (📖 132).

6.3.4 Setting via the TCP/IP Interface Object (0xF5)

A scanner serves to set the IP configuration via attribute 5 (Interface configuration) of instance 1 of the TCP/IP Interface Object (245 / 0xF5) (📖 132).

After the IP configuration, carry out a node reset ("power off/on" or "Type 0 reset" for the Identity Object (1 / 0x01) (📖 121)).

In »Engineer«, codes C13010 / C14010 (IP address), C13011 / C14011 (subnet mask), C13012 / C14012 (gateway address), and C13016 / C14016 (multicast IP address) show the IP parameters currently used.

6.3.5 Setting the multicast configuration

Several scanners ("Listen only" or "Input only" connections) can access multicast telegrams which are sent by drives. Settings for multicast configuration have to be carried out as well in the EtherNet/IP configuration software (z. B. »RSLogix 5000« from Rockwell).

By default, the communication module automatically generates the Multicast IP start address for I/O data transfer. The standard TTL value for Multicast transfer is '1'; the Multicast I/O data packages are therefore distributed solely via the local network.

Note!

You can also explicitly set the multicast IP start address and the multicast TTL value. We recommend, however, not to change the default settings in order to ensure a secure multicast transmission.

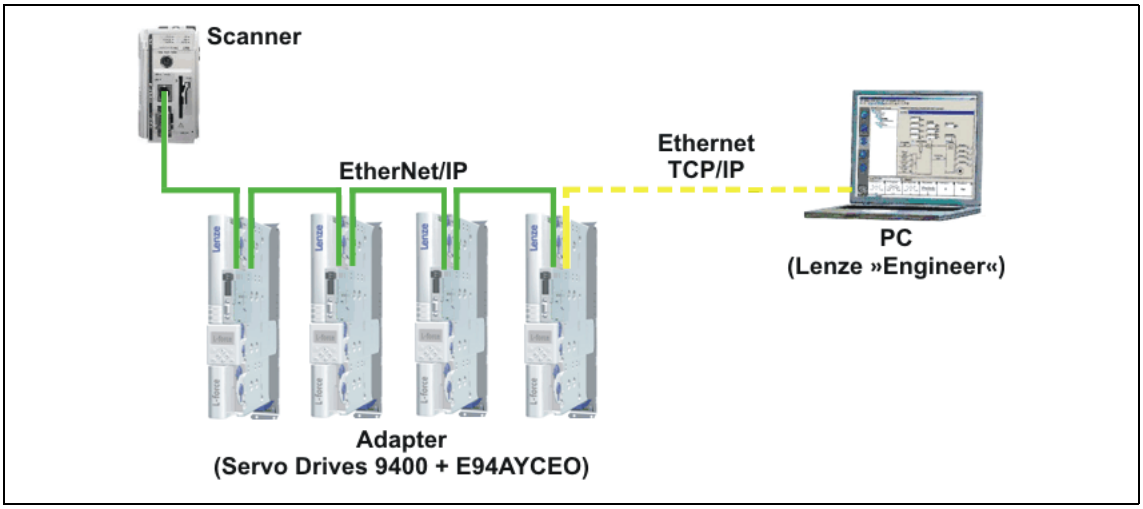
The following multicast codes are configurable:

Code	Description
C13018 / C14018	Selection for multicast IP addressing via the instance attribute 9 (Mcast Config) in the TCP/IP Interface Object (245 / 0xF5) (📖 132) • Value '0': The default algorithm is used. • Value '1': The address stored in code C13006 / C14006 is used as multicast IP start address.
C13019 / C14019	Setting of the multicast TTL value for the validity time of data packets in the EtherNet/IP network (Instance attribute 8 (TTL Value) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))
C13020 / C14020	Used to set how many multicast IP addresses will be assigned. (Instance attribute 9 (Num Mcast) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))

Multicast IP Start Address

Multicast IP start addresses serve to send a message to the members of a certain group (i.e. possibly to several nodes).

The multicast IP start address is set/changed in C13006 / C14006.

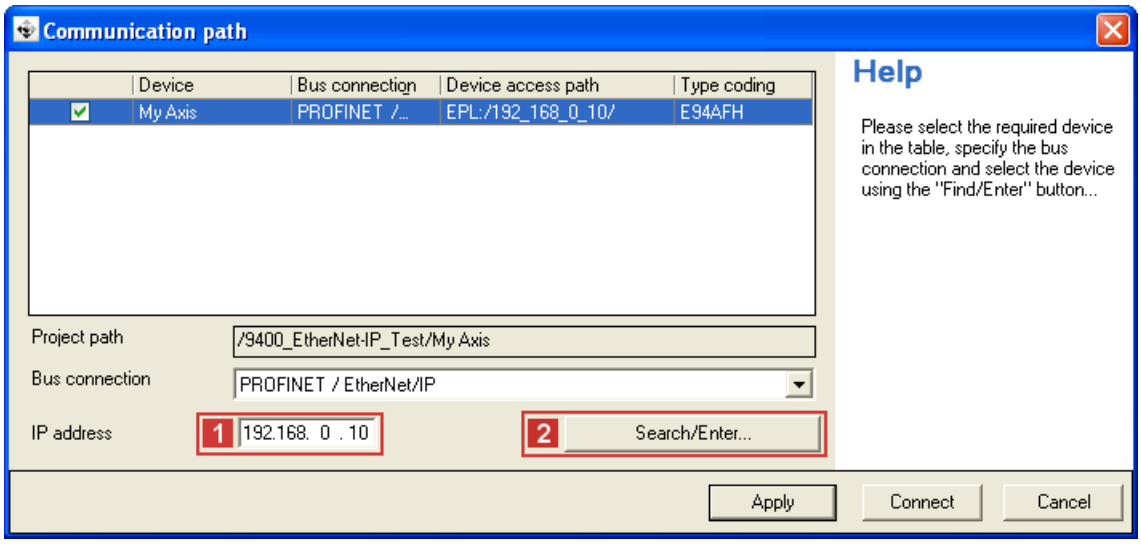


In C13016/1...4 / C14016/1...4 the currently used multicast IP address of the drive is shown.

Example: Display of the multicast IP address 239.64.2.224				
Code	C13016/1 C14016/1	C13016/2 C14016/2	C13016/3 C14016/3	C13016/4 C14016/4
Value	239	64	2	224

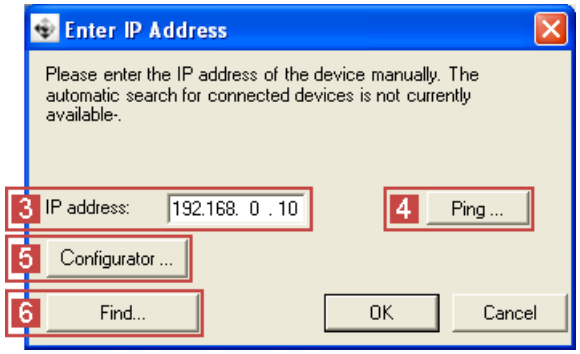
6.4 Establishing an online connection via EtherNet/IP with the Lenze »Engineer«

Note!



- In order to ensure perfect operation of cyclic EtherNet/IP communication, online access with the »Engineer« should be executed via an IEEE 802.1Q-capable switch.
- The IEEE 802.1Q-capable switch integrated in the communication module can manage cyclic EtherNet/IP communication preferentially to normal TCP/IP communication. In the case of EtherNet/IP this is effected using the VLAN identification in the Ethernet frame (adjustable in C13021 / C14021).
- If the redundancy protocol DLR (Device Level Ring) is used, the switch also must be DLR-compliant.

[6-1] Example setup: Allen-Bradley CompactLogix controller with Servo Drives 9400



For an online connection between the »Engineer« and the drive, the drive must have an IP address (see Setting the IP configuration of the Servo Drive 9400 (📖 37)).

In the »Engineer«, you can use the **Online → Set communication path and go online** menu command to select the EtherNet/IP communication path. The previously configured EtherNet/IP nodes are shown in the "Communication path" dialog window:

If the device access path is not configured correctly, the 1 **IP address** of the drive selected in the display field can be entered manually here.

Via the 2 **Search/Enter** button, you can establish a connection to devices which have not appeared in the display field. Corresponding settings for this can be made in the "Enter IP Address" dialog window that will appear:

Here you can enter an 3 **IP address** manually or execute the following actions using the buttons:

- Execute the console command 4 **Ping**.
- Assign the IP address via the 5 **Configurator**.
  ▸ Setting via the EtherNet/IP configurator of the »Engineer« (📖 38)
- Select the device access path to the desired drive by clicking 6 **Find**.

After having established the online connection, you can continue work with the »Engineer« as usual.

6.5 Initial switch-on

Documentation for the Servo Drive 9400

Observe the safety instructions and information on residual hazards.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

For further communication of the externally supplied module it is not relevant whether the standard device is switched on or not.

Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

The restart behaviour of the drive can be set via **C00142** ("auto restart after mains connection"):

C00142 = "0: Inhibited" (Lenze setting)

- The drive remains inhibited (even if the fault is no longer active).
- An explicit drive enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.

C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

7 Data transfer

EtherNet/IP uses CIP™ (Common Industrial Protocol) for the data exchange between devices via an Ethernet network – just like the closely related bus systems DeviceNet and ControlNet.

Lenze implements the CIP following the ODVA standard (Open DeviceNet Vendor Association, www.odva.org) and supports the two main types of EtherNet/IP communication:

- Explicit messaging (for parameter data)
- Implicit messaging (for I/O data)

7.1 Communication channels

Note!

The terms "input" and "output" refer to the point of view of the scanner:
- Input data is produced by the adapter and consumed by the scanner.
- Output data is produced by the scanner and consumed by the adapter.

EtherNet/IP transmits parameter data and I/O data between the host system (scanner) and the drives (adapters) connected to the fieldbus. The data are transmitted via corresponding communication channels depending on their time-critical behaviour.

The I/O data channel transmits I/O data by means of "implicit messages".

- The drive is controlled by means of the I/O data.
- The transmission of I/O data is time-critical.
- I/O data are transmitted cyclically between the host system (scanner) and the drives (adapters) (permanent exchange of current input and output data).
- The host system (scanner) has direct access to the I/O data (the data are, for example, stored directly in the I/O area).
- In the case of Servo Drives 9400, maximally 32 data words (max. 64 bytes) for each direction can be exchanged.
- I/O data are not stored in the drive.
- I/O data are e.g. setpoints, actual values, control and status words

The parameter data channel transmits parameter data by means of "explicit messages".

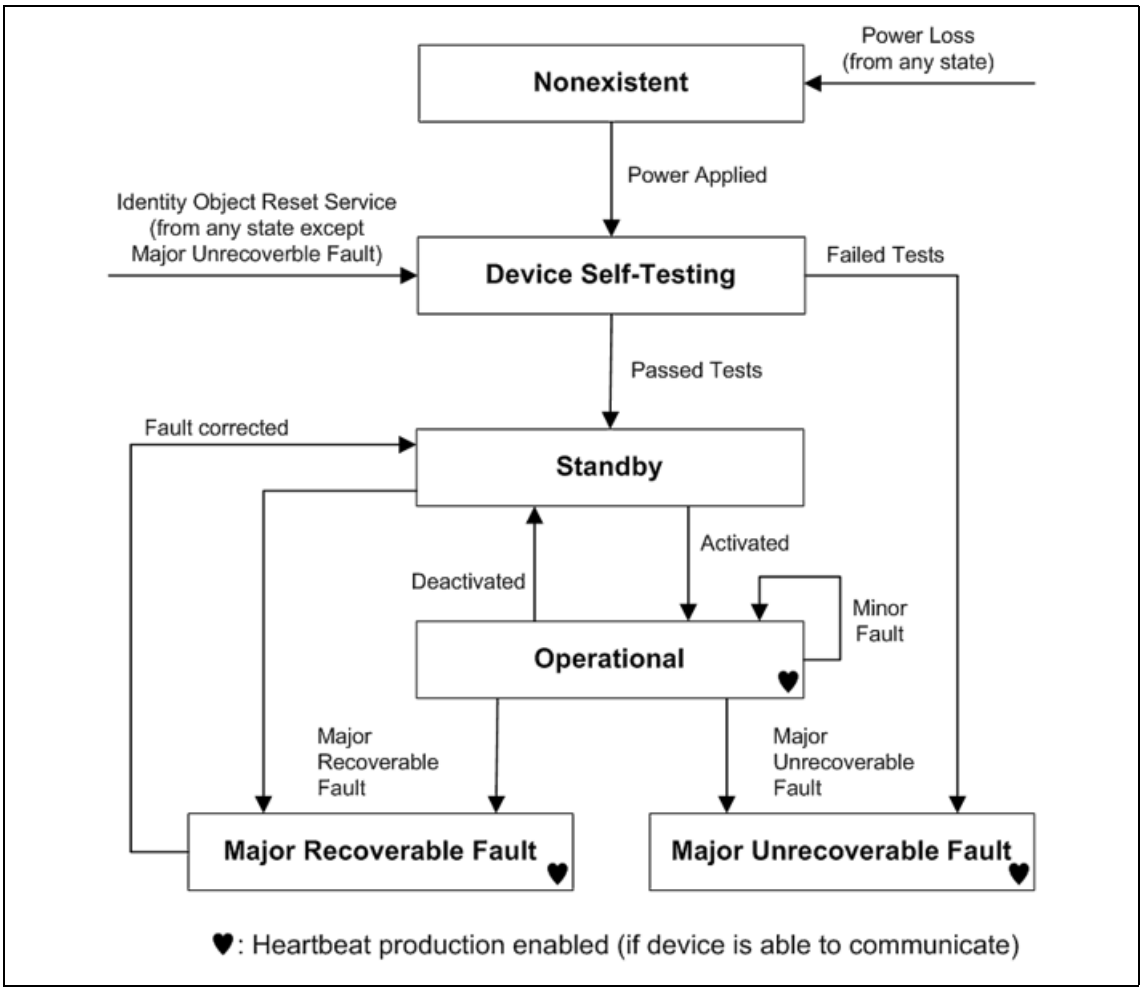
- The transmission of parameter data is usually not time-critical.
- Examples of parameter data are operating parameters, motor data, and diagnostic information.
- The parameter data channel provides access to all Lenze codes.
- Parameter changes must be saved via code **C00002** of the Servo Drive 9400.

7.2 Telegram types

The "implicit message" and "explicit message" telegram types are transmitted between the host system (scanner) and the drive (adapter).

Implicit messages (I/O data transfer)

"Implicit messages" are transmitted or received according to the producer/consumer principle. There is one transmitter and no receiver or an optional number of receivers.



The "cyclic I/O data" transmission mode is supported. The scanner and the adapter use "cyclic I/O data" to generate their data independently of each other, which are then transmitted depending on a timer. The user must set the value of the timer in the scanner.

Explicit messages (parameter data transfer)

"Explicit messages" serve to configure and parameterise the individual EtherNet/IP nodes.

Two nodes have a client/server relationship:
The client transmits a job (request). The server receives this job and tries to accomplish it. The server then transmits the requested data (positive response) or an error message (negative response).

7.3 EtherNet/IP state diagram

[7-1] EtherNet/IP state diagram

The current EtherNet/IP device state is ...

- output via code C13861 / C14861;
- output in the Identity Object (1 / 0x01) (📖 121) via instance attributes 5 and 8;
- indicated via the LED **MS** (see CIP™ status displays (📖 78)).

8 I/O data transfer (implicit messages)

To exchange I/O data (implicit messages) between the host system (scanner) and the drive (adapter), you have to ...

- assign the I/O data to the internal port modules in the drive (adapter):
  ▸ I/O configuration in the »Engineer« (📖 55)
- configure the I/O data transfer in the host (scanner):
  ▸ I/O configuration with »RSLogix 5000« version 19 or lower (📖 58)
  ▸ I/O configuration with »RSLogix 5000« version 20 or higher (📖 63)

Preconditions for establishing an I/O connection

- The data length of the displayed ports in the receive PDO (PDO_RX0) must comply with the length of the I/O data of the assembly object instance 110 (0x6E, Custom Output) in the scanner.
- The data length of the displayed ports in the transmit PDO (PDO_TX0) must comply with the length of the I/O data of the assembly object instance 111 (0x6F, Custom Input) in the scanner.
- An I/O data object can contain a maximum of 32 mapping entries.
- The maximum data length of an I/O data object is 64 bytes

8.1 Technology applications (TA) / drive profiles

The Servo Drive 9400 is provided with different drive profiles. They define a standardised or individual control and status word assignment as well as the standardisation of setpoint and actual value scalings.

The Servo Drive 9400 supports Lenze technology applications and user-definable parameter sets.

8.1.1 Lenze technology applications / user-definable parameter sets

The technology applications integrated in the drive provide the main signal flow for realising a general or specific drive solution.

In order to use the Lenze technology applications, the following assembly object instances must be used in the host (scanner):

Instance ID		Assembly object instance
[dec]	[hex]	
110	0x6E	Custom Output (from the adapter to the scanner)
111	0x6F	Custom Input (from the adapter to the scanner)

See also Assembly Object (4 / 0x04) (📖 124).

The custom assemblies also allow for a user-definable parameter setting, depending on the application. Hence, 32 data words (64 bytes) can freely be assigned in the »Engineer« with variables of the port modules.

The user-definable parameter setting can be used in addition to the previously set technology application.

▸ I/O configuration in the »Engineer« (📖 55)

Tip!

Here you will find information on configuring with the »RSLogix 5000« programming software from Rockwell:

▸ I/O configuration with »RSLogix 5000« version 19 or lower (📖 58)
▸ I/O configuration with »RSLogix 5000« version 20 or higher (📖 63)

8.1.2 I/O assemblies

Note!

The terms "input" and "output" refer to the point of view of the scanner:

- Input data is produced by the adapter and consumed by the scanner.
- Output data is produced by the scanner and consumed by the adapter.

The length of the I/O data must correspond to the resulting length of the mapped ports (I/O configuration in the »Engineer« (📖 55)).

The communication module supports the "I/O Assembly Object" class "0x04" (Assembly Object (4 / 0x04) (📖 124)).

- For the data exchange, the assembly object instances 110 (0x6E, Custom Output), and 111 (0x6F, Custom Input) are supported
- Both assembly objects transmit a maximum of 64 bytes of I/O data, respectively.
- Depending on the data length defined by the scanner, the memory map of the data can have a different size.

Assembly output objects are usually used for controlling the enable/disable state of the drive and for supplying the speed or torque references.

Assembly input objects are usually used to monitor the drive status and the runtime values such as actual speed, current, actual position and position error.

Depending on the data length defined by the scanner, the memory map of the I/O data can have different sizes.

Assembly output objects (scanner ➞ adapter)

Assembly output objects are assumed to have a 4-byte header (32-bit "Run/Idle header"). When mapping the assemblies, this header will automatically be added to the data stream by most Allen-Bradley PLC/SLC equipment.

If your PLC does not support this header (like the Rockwell PLCs do), add a preceding 32-bit header to the output image.

You can then define the **bit 0** of this header in the process image of your PLC:

- 0: Idle mode
- 1: Run mode

For the operation with Rockwell PLCs, adaptations are not required.

Assembly input objects (adapter ➞ scanner)

The assembly input objects are mapped in the adapter memory starting with byte 0.

The input objects are transmitted in a "modeless" manner, i.e. a 4-byte header (32-bit "Run/Idle header") is not included in the transfer.

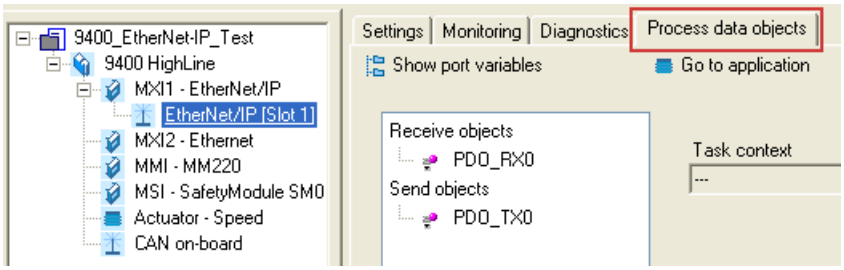
So the start address in the assembly memory map is the actual start of the first assembly data element.

Please observe the actual assembly lengths when mapping the input objects to the controller memory.

The contents of the input data depends on the I/O data arrangement in the drive (I/O configuration in the »Engineer« (📖 55)).

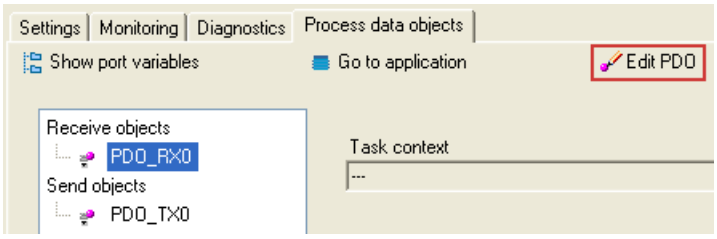
8.2 I/O configuration in the »Engineer«

For the Servo Drives 9400 HighLine the I/O data can be arranged individually (mapping). For this purpose, the »Engineer« is provided with a port configurator.



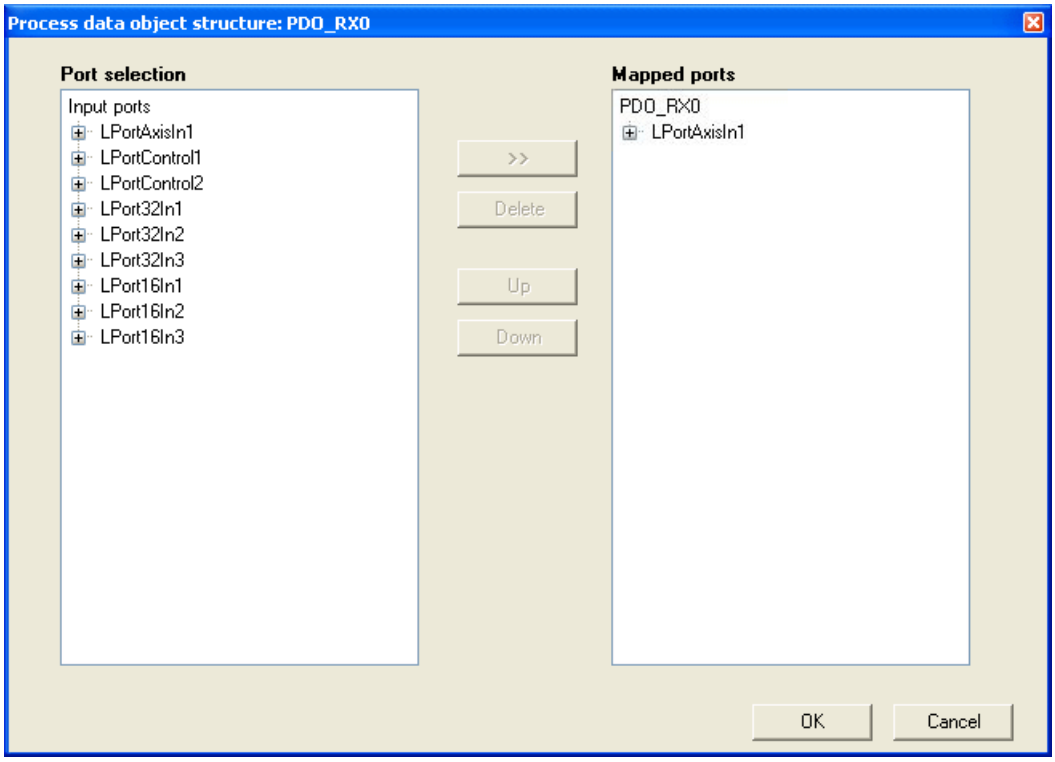
Note!

The port mapping is no configuration that can be carried out online for the Servo Drive 9400. For this purpose, an update of the »Engineer« project and a subsequent download of the application is always required.



Below you can find a description of the steps required to realise an I/O data communication with the host (scanner) in which one control/status word and one 32 bit setpoint/actual value are exchanged each.

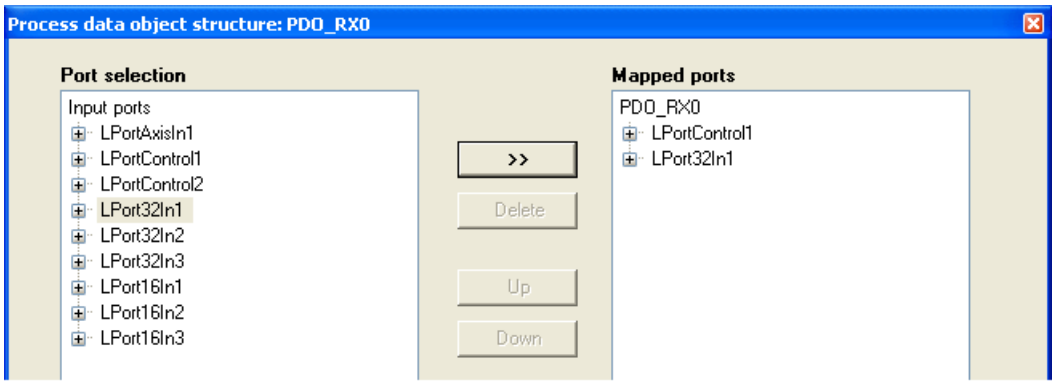
How to implement PDO mapping using the »Engineer«:

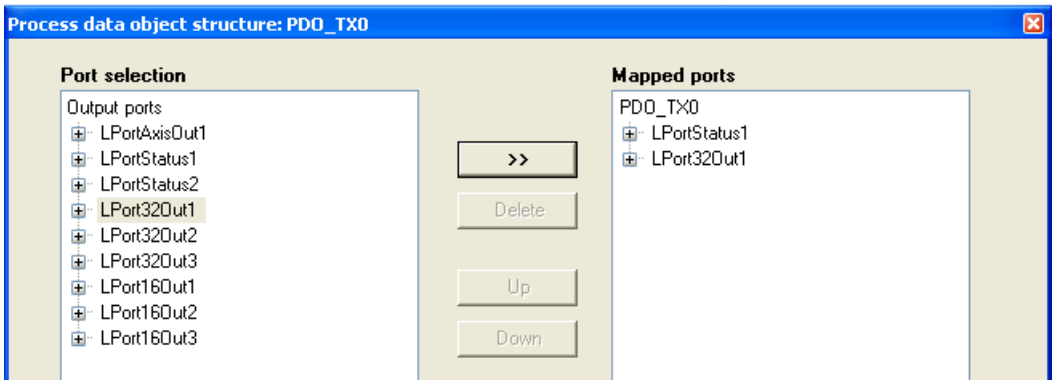


1. In the »Engineer«, the mapping of the I/O data is carried out under the **Process data objects** tab of the respective fieldbus communication module:

2. Select the receive object **PDO_RX0**:

3. Click the **Edit PDO** button. The **Process data object structure:PDO_RX0** selection window opens:





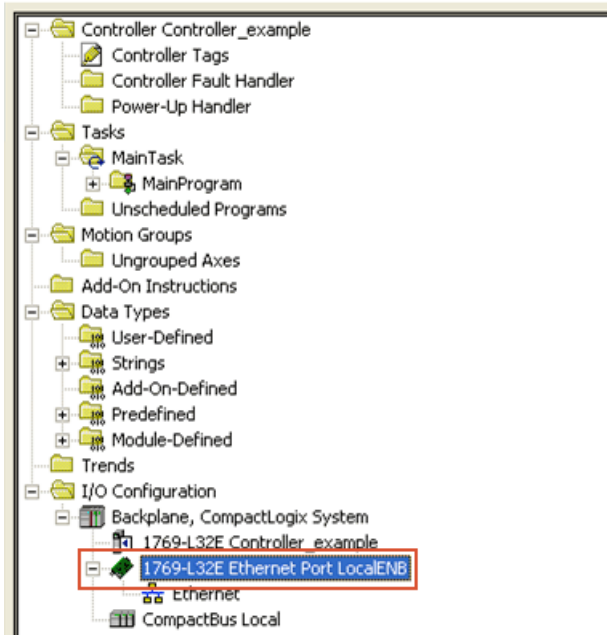
Here you can map the individual ports from the **Port Selection** list to the receive PDO "PDO_RX0" by clicking the **>>** button. The **Up** and **Down** buttons serve to shift the sequence of the ports within the PDO.

4. Repeat steps 2. and 3. for the send object **PDO_TX0**.

In the following example, ...

- the ports "LPortControl1" and "Lport32In1" (a total of 6 bytes) have been mapped into the receive PDO **PDO_RX0**;
- the ports "LPortStatus1" and "LPort32Out1" (a total of 6 bytes) have been mapped into the transmit PDO **PDO_TX0**.

5. Then link the mapped ports to application signals in the technology application selected.
   - Activate the »FB-Editor« via the multiplexer codes (from code C03000) if this has not been done yet.
   - If the »FB Editor« is activated, the multiplexer codes are no longer available. In this case, you must carry out the interconnection directly in the »FB Editor«.

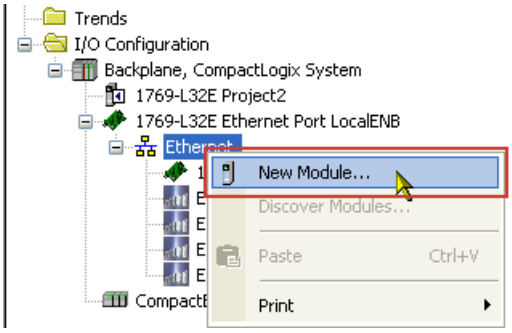


8.3 I/O configuration with »RSLogix 5000« version 19 or lower

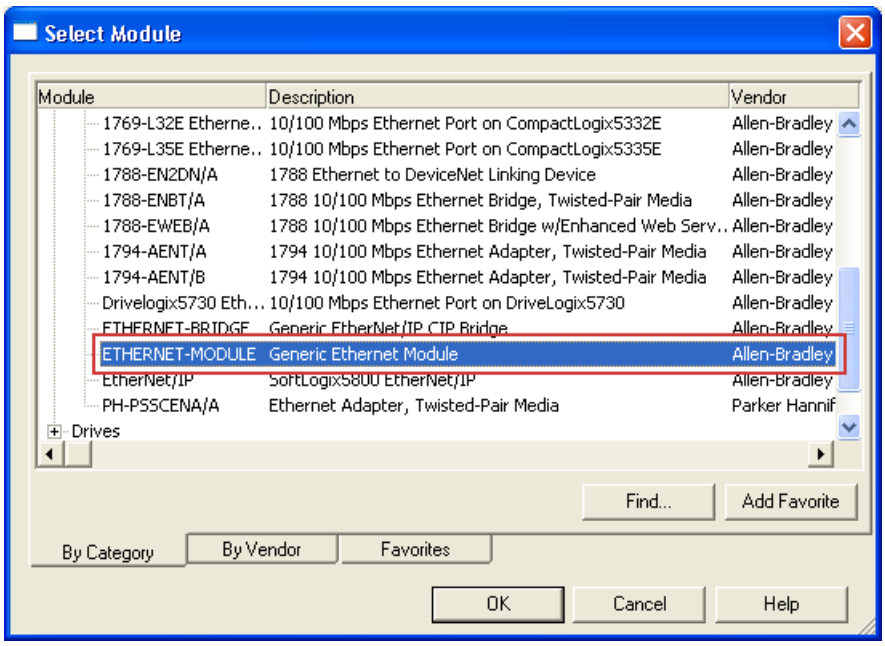
The following example describes the I/O configuration of the Allen-Bradley 1769-L32E CompactLogix controller using the Rockwell »RSLogix 5000« programming software up to version 19.

Up to and including software version 19 the I/O configuration is carried out without EDS files (📖 34).

How to carry out the I/O configuration, taking the CompactLogix controller 1769-L32E with »RSLogix 5000« as an example:



1. Click on the **I/O Configuration** folder in the configuration tree.

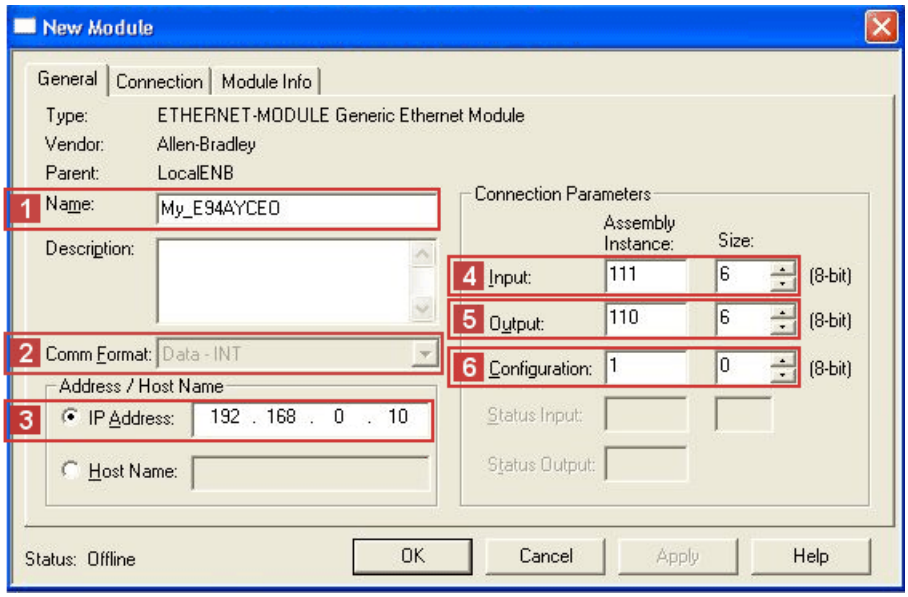


For the 1769-L32E CompactLogix controller, the I/O configuration already includes a local Ethernet port.

If a SoftLogic or ControlLogix controller is used, an Ethernet port scanner needs to be added to the configuration.

2. Right click on "Ethernet" and execute the **"New Module ..."** command from the context menu.

3. Open "Communications" and select "ETHERNET-MODULE | Generic Ethernet Module".



4. Confirm the selection by clicking**OK**.

5. Go to the "New Module" dialog window and define the properties of the newly added device .

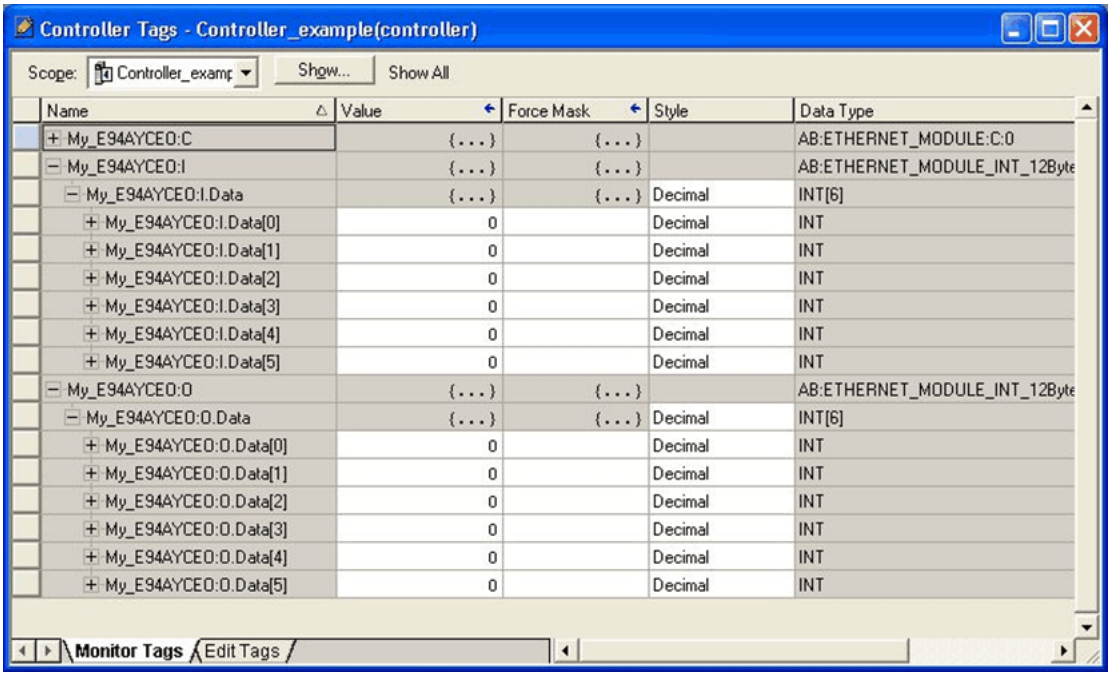
   The terms "input" and "output" refer to the point of view of the scanner:
   - Assembly input objects (input) are sent from the adapter to the scanner.
   - Assembly output objects (output) are sent from the scanner to the adapter.

   Example settings

Settings		Description
1	**Name**	Device name or drive type, usually referring to the process (in the example "My_E94AYCEO")
2	**Comm Format**	Data format for the assembly object instances ("connection parameters" area)
3	**IP Address**	IP address of the drive • The IP address must be in the same subnetwork like the controller. (Depending on the subnet mask; in general, the first 3 octets of the IP address must be identical.) • DNS is not supported; the host name merely describes the device.
4	**Input**	Assembly object instance for input objects • Max. 32 input data words (64 bytes, 16 bits/word) • The number of input data must correspond to the length of the mapped ports in the transmit PDO (PDO_TX0), otherwise the adapter will reject the connection with the error message "Invalid Target to Originator Size" (0x0128).
5	**Output**	Assembly object instance for output objects • Max. 32 output data words (64 bytes, 16 bits/word) • The number of output data must correspond to the length of the mapped ports in the receive PDO (PDO_RX0), otherwise the adapter will reject the connection with the error message "Invalid Originator to Target Size" (0x0127).
6	**Configuration**	Select the **assembly instance "1"** and the **size "0"** for the configuration. These values are required!

6. Complete the settings with **OK**.

7. Under **I/O Configuration** in the configuration tree, right click "1769-L32E Ethernet Port LocalENB" and select "Properties".
8. Go to the **Connection** tab and set further properties.



Required settings

Setting		Description
1	**Requested Packet Interval (RPI)**	Set **RPI ≥ 2.0 ms**. (Standard setting: 10 ms) The RPI [ms] specifies the intervals for the I/O data exchange between the drive (adapter) and the controller (scanner).
4	**Use Unicast Connection over EtherNet/IP**	**Option deactivated (standard setting):** • The input data is sent from the adapter to the scanner by means of **multicast telegrams**. • Other scanners can access this data in addition to the currently configured scanner ("Listen only" or "Input only" connections).
		Option activated: The input data is sent from the adapter to the scanner by means of **unicast telegrams**.

Optional settings

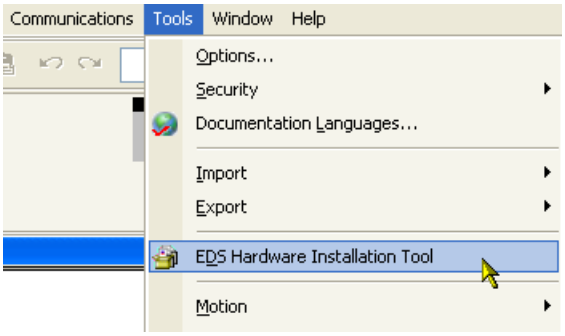
Settings		Description
2	**Inhibit module**	This option serves to interrupt or inhibit the communication to the adapter.
3	**Major Fault On Controller If Connection Fails While In Run Mode**	This option serves to put the scanner into the error status if the EtherNet/IP connection to the drive (adapter) fails while the scanner is in operation.

9. Complete the settings with **OK**.
   - The I/O configuration is now complete.
   - The corresponding tags are then created in the "controller tags" of the control project:

   In the example, the drive was named "My_E94AYCEO". There are three tag sets labelled "My_E94AYCEO":
   - "My_E94AYCEO:C" for the assembly configuration instance "1"
   - "My_E94AYCEO:I" for the assembly input object instance "111"
   - "My_E94AYCEO:O" for the assembly output object instance "110"

   Click on the **[+]** in front of the "My_E94AYCEO" data to display the I/O data words of the assemblies.

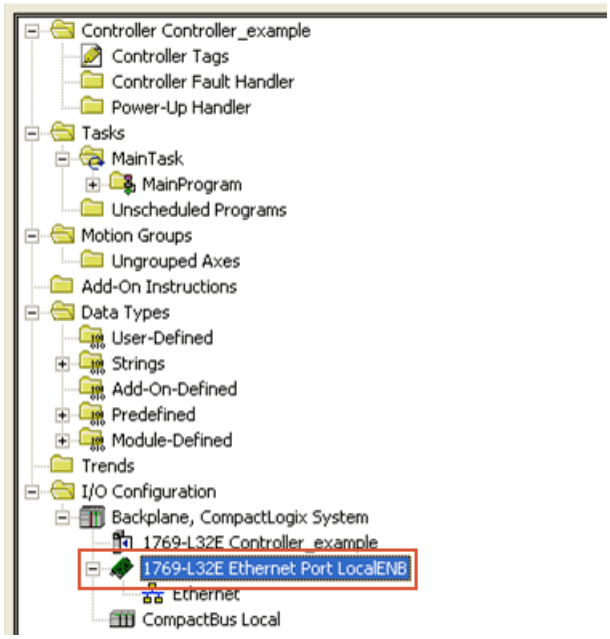
10. The last step is Saving the I/O configuration in »RSLogix 5000« (📖 69).



8.4 I/O configuration with »RSLogix 5000« version 20 or higher

The following example describes the I/O configuration of the Allen-Bradley 1769-L32E CompactLogix controller using the Rockwell »RSLogix 5000« programming software from version 20.

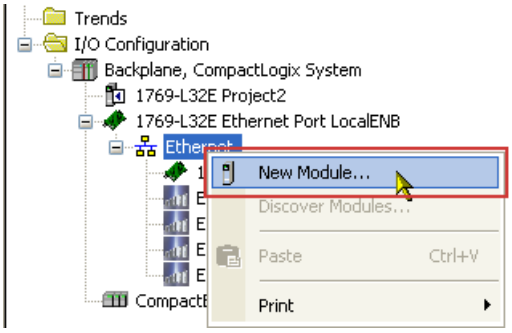
From software version 20 onwards, EDS files (📖 34) are used for the I/O configuration.



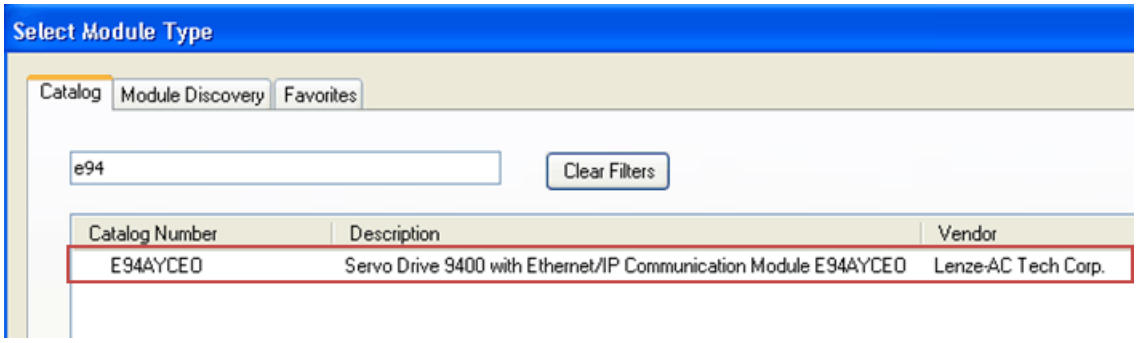
How to carry out the I/O configuration, taking the CompactLogix controller 1769-L32E with »RSLogix 5000« as an example:

1. Use the "EDS Hardware Installation Tool" item to import the EDS files (📖 34) of the EtherNet/IP nodes.

In »RSLogix 5000«, the dialog for the "EDS Hardware Installation Tool" is self-explanatory and not described further in this documentation.



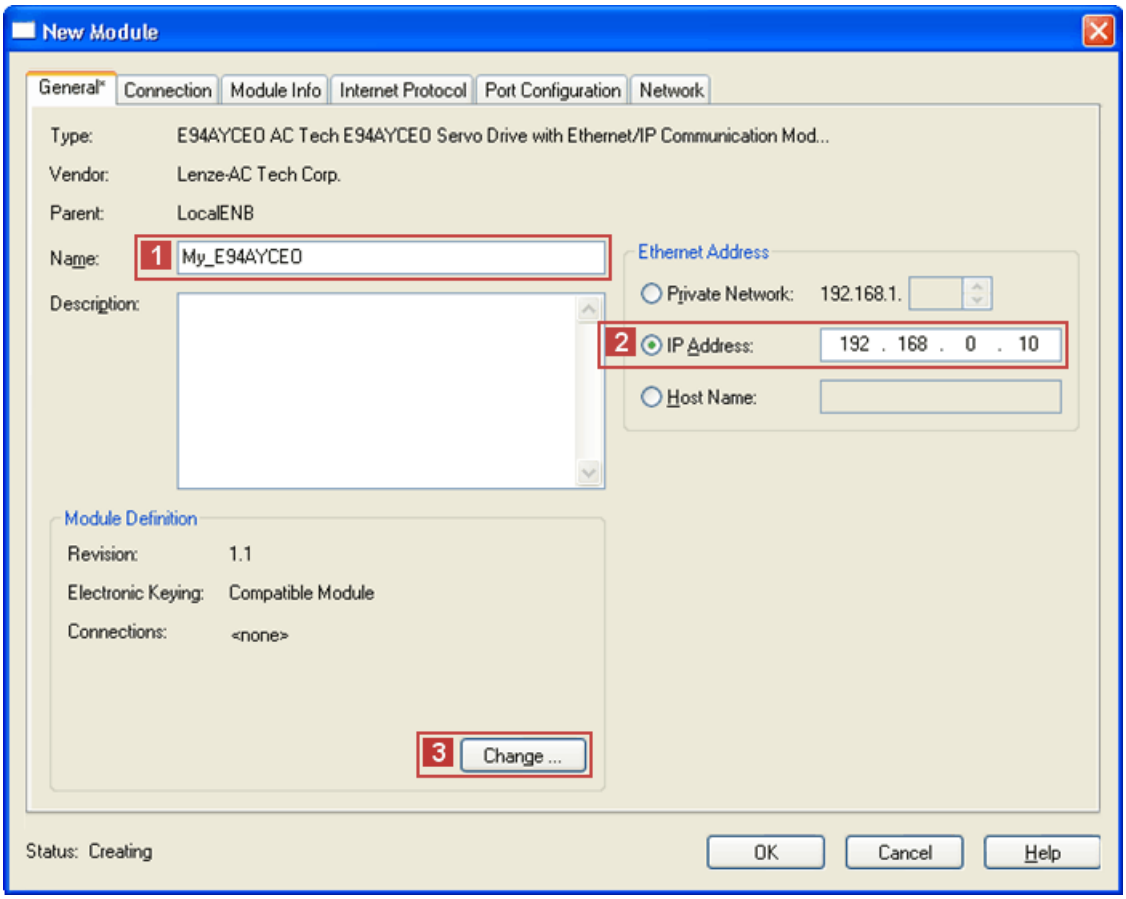
2. Click the **I/O Configuration** folder in the configuration tree.



For the 1769-L32E CompactLogix controller, the I/O configuration already includes a local Ethernet port.

If a SoftLogic or ControlLogix controller is used, an Ethernet port scanner needs to be added to the configuration.

3. Right click on "Ethernet" and execute the **"New Module ..."** command from the context menu.



4. Go to the "Select Module Type" dialog box and select "E94AYCEO" on the **Catalog** tab.

5. Confirm the selection with **Create**.

6. In the "New Module" dialog window, select the **General** tab and allocate a 1 **name** and an unique 2 **IP address**.

   Example settings:

   DNS is not supported; the host name merely describes the device.

7. Click the 3 **Change ...** button.

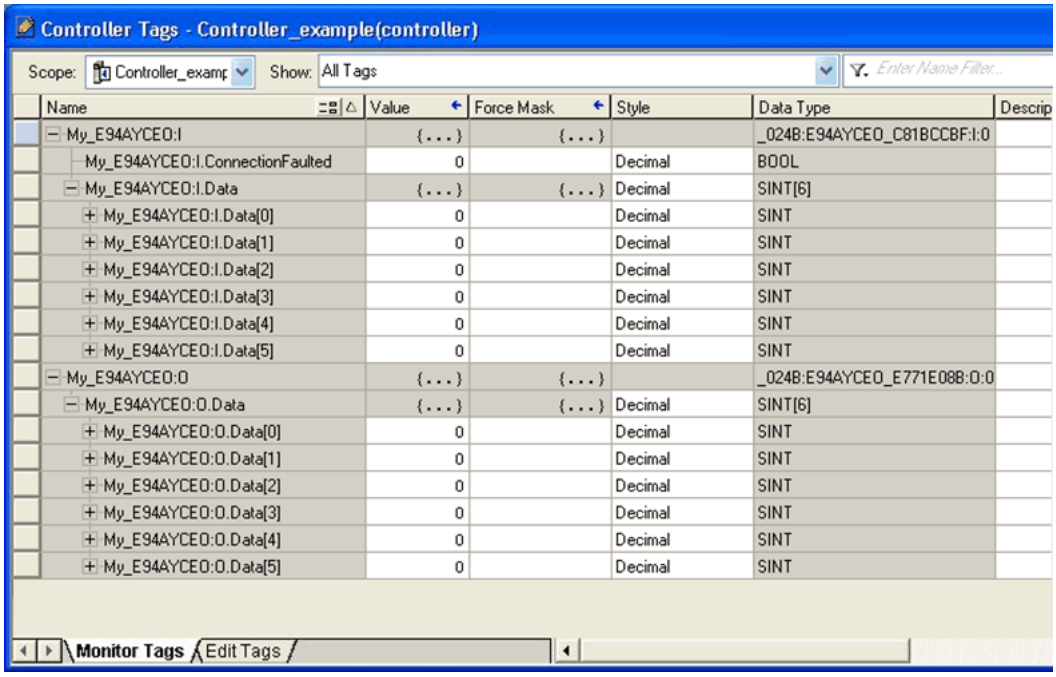
8. Go to the "Module Definition" dialog window and make the connection settings.

   The terms "input" and "output" refer to the point of view of the scanner:
   - Assembly input objects (input) are sent from the adapter to the scanner.
   - Assembly output objects (output) are sent from the scanner to the adapter.

Settings		Value / description
1	**Name**	Name (type) of the connection • "Exclusive owner": The scanner controls the adapter outputs. • "Listen only": If a connection has been established, the scanner only receives the input data. • "Input only": The scanner does not transmit any output data to the adapter, but only receives the input data.
2	**Number of I/O data words**	A maximum of 32 data words (max. 64 bytes) for each direction
3	**Selection of the data type**	• The number of input data must correspond to the length of the mapped ports in the transmit PDO (PDO_TX0), otherwise the adapter will reject the connection with the error message "Invalid Target to Originator Size" (0x0128). • The number of output data must correspond to the length of the mapped ports in the receive PDO (PDO_RX0), otherwise the adapter will reject the connection with the error message "Invalid Originator to Target Size" (0x0127).

9. Complete the settings with **OK**.

10. Open the "New Module" dialog window, select the **Connection** tab and set further properties.



Required settings

Settings		Description
1	**Requested Packet Interval (RPI)**	Set **RPI ≥ 2.0 ms**. (Standard: 10 ms) The RPI [ms] specifies the intervals for the I/O data exchange between the drive (adapter) and the controller (scanner).
2	**Input type**	**"Multicast"** input type: • The input data is sent from the adapter to the scanner by means of multicast telegrams. • Other scanners can access this data in addition to the currently configured scanner ("Listen only" or "Input only" connections).
		"Unicast" input type: The input data is sent from the adapter to the scanner by means of unicast telegrams.

Optional settings

Settings		Description
3	**Inhibit module**	This option serves to interrupt or inhibit the communication to the adapter.
4	**Major Fault On Controller If Connection Fails While In Run Mode**	This option serves to put the scanner into the error status if the EtherNet/IP connection to the drive (adapter) fails while the scanner is in operation.

11. Complete the settings with **OK**.
    - The drive is inserted in the configuration tree under the "I/O Configuration".
    - The corresponding tags are created in the "Controller Tags".

In the example, the drive was named "My_E94AYCEO".

- Tag "My_E94AYCEO:I.ConnectionFaulted" for the connection status
- Tag set "My_E94AYCEO:I.Data" for the assembly input object instance "111"
- Tag set "My_E94AYCEO:O.Data" for the assembly output object instance "110"

If you click "+" before the assembly tag name, all data contained in the assembly tag are displayed below.

12. The last step is Saving the I/O configuration in »RSLogix 5000« (📖 69).

8.5 Saving the I/O configuration in »RSLogix 5000«

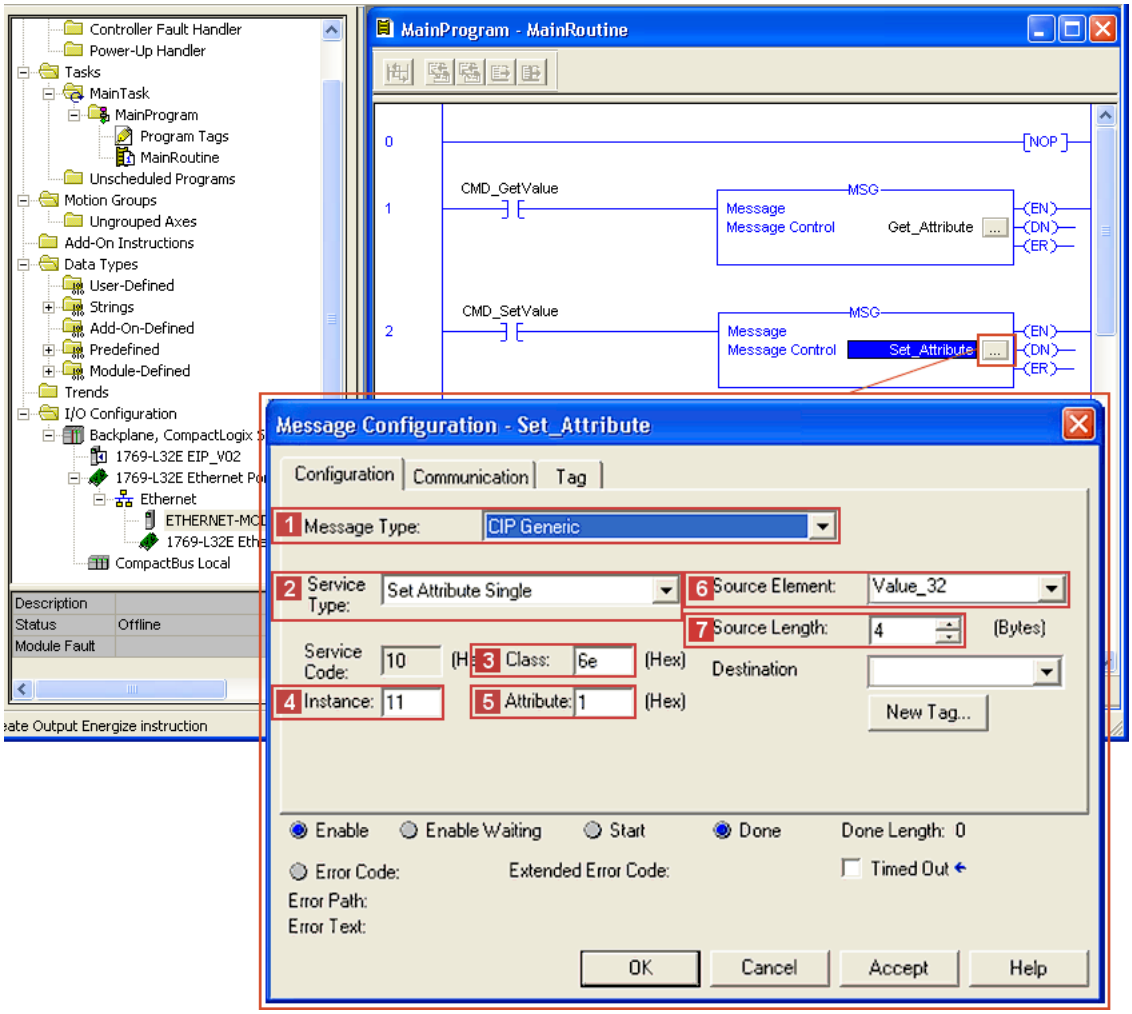
After adding the scanner and the adapter to the I/O configuration, the configuration must be downloaded to the controller. The configuration file should also be saved on your computer.

How to save the I/O configuration:

1. Select the menu command **Communications → Download**.
   - The "Download" dialog box will open.
   - If a message box reports that »RSLogix 5000« is unable to go online, select the menu command **Communications → Communications Who Active** and try to find your controller in the "Who Active" dialog box. If the controller is not shown there, the EtherNet/IP driver needs to be added to »RSLinx« or configured in »RSLinx«. For more information, please refer to the »RSLinx« online help.
2. Click the **Download** button.
   - The I/O configuration is downloaded to the controller.
   - When the download has been successfully completed, »RSLogix 5000« changes to online mode and the I/O OK box in the upper left of the screen is green.
3. Select the menu command **File → Save**.
   - If this is the first time the I/O configuration is saved, the "Save As" dialog box will open.
   - Select a folder and enter a file name to save the configuration to a file on your computer.
   - Finally, click the **Save** button.

9 Parameter data transfer (explicit messages)

An "explicit message" is a logical instruction in the PLC program used for messaging. It can be used to read or write to either a parameter setting or the data of an assembly.

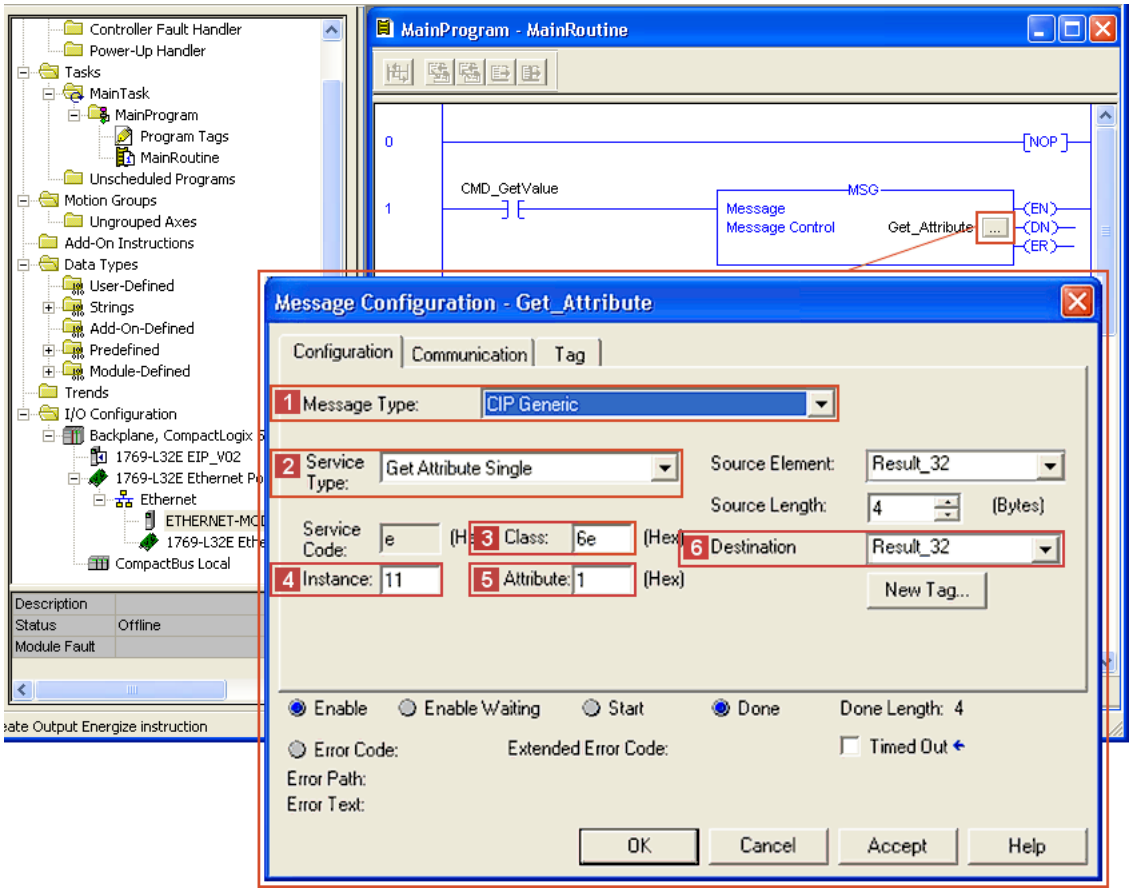


For all Allen-Bradley devices of the CompactLogix, ControlLogix and SoftLogix series, the MSG instruction provides the application possibilities described in this chapter. For other PLC types, please consult the programming documentation for the corresponding PLC.

Note!

When you use several MSG BLOCKs per adapter, you can work resource-friendly by sequential triggering and hold available enough communication reserves in the EtherNet/IP module for further possible clients.

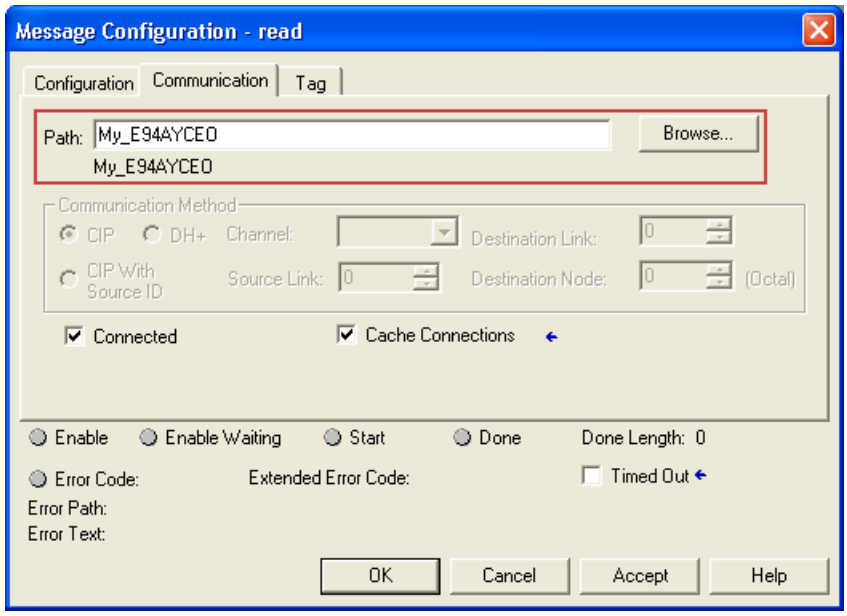
9.1 Write parameters



In order to write data into code **C00011** (reference speed) of the Inverter Drive 8400 by means of explicit message transfer, for example, the following settings are necessary:

Settings		Value / description
1	**Message Type**	"CIP Generic"
2	**Service Type**	"Set Attribute Single" (service code "10" [hex])
3	**Class**	"6E" [hex] (access to Lenze code)
4	**Instance**	"11" = Lenze code C00011 of the Servo Drive 9400
5	**Attribute**	"1" = Subcode of the Lenze code • If the corresponding Lenze code does not have a subcode, the value 1 must be entered. • A display code cannot be configured by the "SET" service.
6	**Source Element**	Variable in the PLC program used as data source for writing.
7	**Source Length**	The source length has to be set to the length (data type) of the current parameter (see parameter reference in the documentation of the drive). For writing to code C00011, set the source length to "4 bytes".

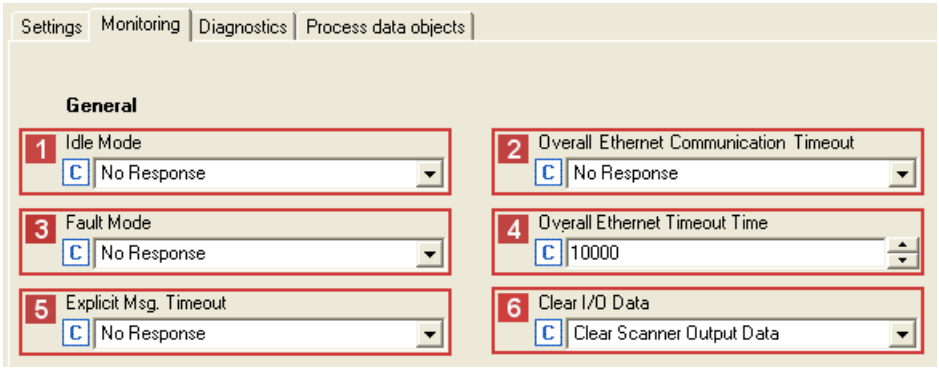
9.2 Read parameters



If you want to use explicit EtherNet/IP messaging, for instance, in order to read the Lenze code **C00011** (motor reference speed) of the Servo Drive 9400, the following settings are required:

Settings		Value / description
1	**Message Type**	"CIP Generic"
2	**Service Type**	"Get Attribute Single" (service code "e" [hex])
3	**Class**	"6E" [hex] (access to Lenze code)
4	**Instance**	"11" = Lenze code C00011 of the Servo Drive 9400
5	**Attribute**	"1" = Subcode of the Lenze code If the corresponding Lenze code does not have a subcode, the value 1 must be entered.
6	**Destination**	Variable in the PLC program the drive data will be copied to. When reading code C00011, make sure that the tag used as destination is a single word in DINT format.

For every "explicit message", the path for sending the message via the Ethernet port of the controller (scanner) to the IP address of the drive (adapter) needs to be set under the **Communication** tab.



If you need assistance with the setting of this path, please consult the PLC manufacturer.

10 Monitoring

10.1 Fault with regard to EtherNet/IP communication

The response of the Servo Drive 9400 to a fault with regard to EtherNet/IP communication can be set in the »Engineer« under the **Monitoring** tab.

Settings		Description
1	**Idle Mode**	The 32-bit real time header sent by the scanner is evaluated. Run/Idle flag (Bit 0) = TRUE: • The scanner indicates the validity of the I/O data. Run/Idle flag (Bit 0) = FALSE: • The I/O data is invalid and the response parameterised here (C13880/1 / C14880/1) is activated in the drive. • The I/O data is processed as set in 6 (C13885 / C14885).
2	**Overall Ethernet Communication Timeout**	If the time set in 4 (C13881 / C14881) has elapsed and no explicit or implicit messages are received any more or if there is no more access via the »Engineer«, the response parameterised here (C13880/4 / C14880/4) is effected in the drive. Access to the web server is not monitored.
3	**Fault Mode**	The adapter (communication module) monitors the I/O connection to the scanner. If there is no "implicit message" received within the time-out time for implicit messages parameterised by the scanner, the response parameterised here (C13880/2 / C14880/2) is activated in the drive.
4	**Overall Ethernet Communication Timeout Timer**	Here, the overall message monitoring time (C13881 / C14881) is set. If no message is received within this time, the response parameterised in 2 (C13880/4 / C14880/4) is activated. The following messages are monitored: • Implicit messages • Explicit messages • »Engineer« access via EtherNet/IP
5	**Timeout in the case of explicit messages**	If there is no "explicit message" reveived within the time-out time for explicit messages parameterised by the scanner, the response parameterised here (C13880/3 / C14880/3) is activated in the drive.
6	**Clear I/O Data**	Setting (C13885 / C14885), which I/O data is to processed by the adapter in order to maintain the internal communication if ... • the CIP network status (C13862 / C14862) of the controlling I/O connection is not "Connected" or • an idle event has occurred.

10.2 Interruption of internal communication

The response to a communication error between the communication module and the Servo Drive 9400 can be set via standard device codes C01501 (module in slot MXI1) and C01502 (module in slot MXI2).

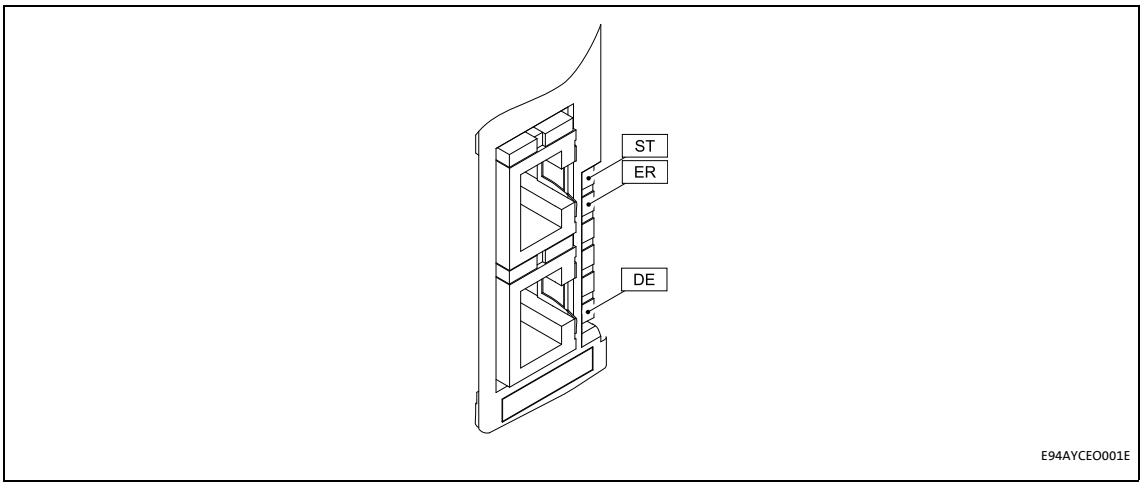
11 Diagnostics

The LEDs on the front of the communication module serve to diagnose faults. Moreover, the »Engineer« serves to show diagnostic information.

11.1 LED status displays

Note!

LED status displays for trouble-free operation:



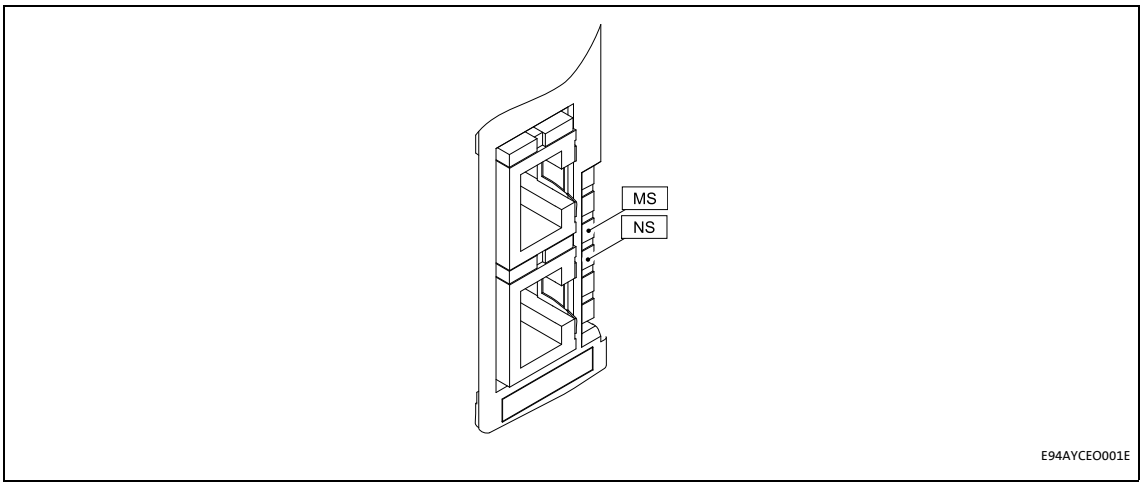
- The LEDs **ST** (📖 77) and **NS** (📖 78) are permanently on.
- The green LEDs on the **X233** and **X234** RJ45 sockets are lit, and the yellow LEDs are blinking or jittering (📖 80).

The following status displays are distinguished:

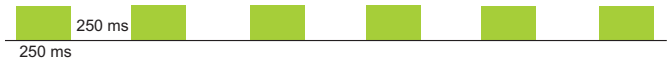
- Module status displays (📖 77)
- CIP™ status displays (📖 78)
- Status displays on the RJ45 sockets (X233, X234) (📖 80)

11.1.1 Module status displays

Module states are indicated by the **ST**, **ER** and **DE** LEDs.



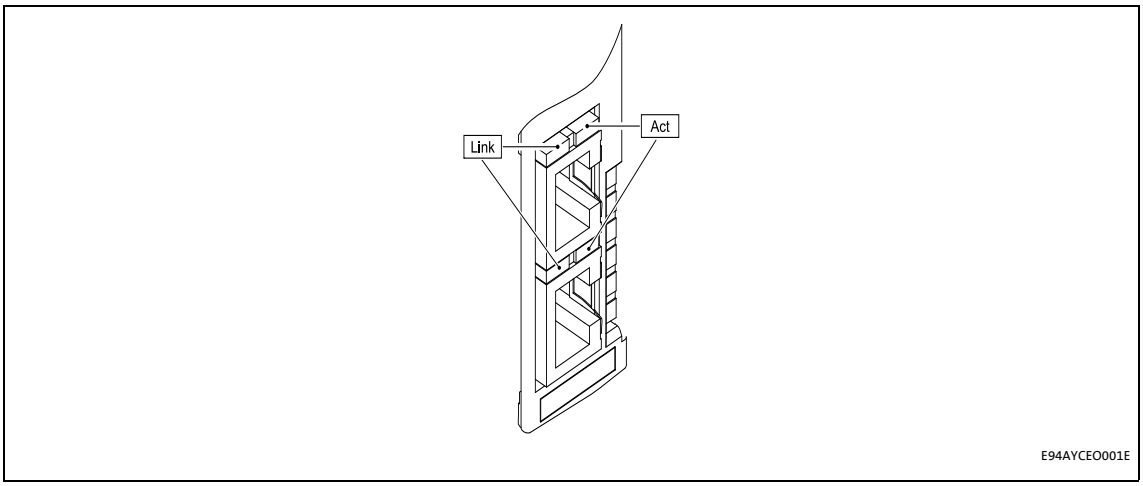
[11-1] LEDs ST, ER, DE



LED	Colour	Status	Description
ST	Green	On	The communication module is supplied with voltage and is connected to the standard device.
		Blinking	250 ms 250 ms The communication module is supplied with voltage, but is not connected to the standard device. (Standard device is switched off, in the initialisation phase, or not available.)
ER	Red	On	An error has occurred in the communication module.
DE	Red	On	The communication module is not accepted by the basic device or the basic device is not active (see notes in the documentation relating to the basic device.)

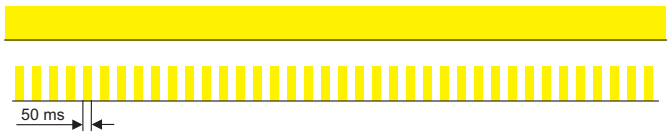
11.1.2 CIP™ status displays

CIP statuses are indicated by the **MS** and **NS** LEDs.



[11-2] LEDs MS, NS

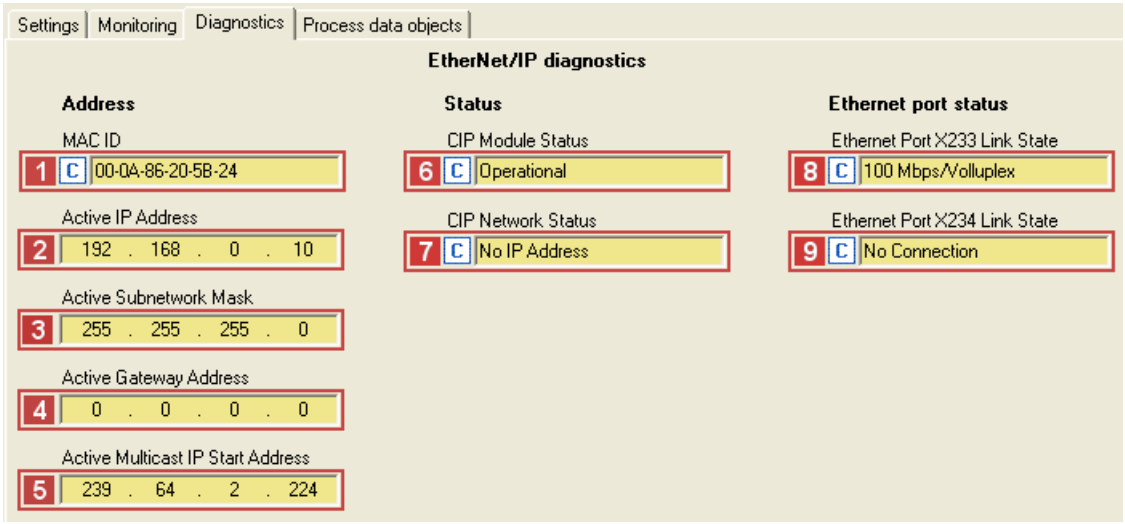
LED	Colour / status		Description
MS	**Green**	**Red**	
	Off	Off	CIP module status: "Nonexistent" The communication module is not being supplied with voltage.
	Off	On	 CIP module status: "Major Unrecoverable Fault" The communication module has a fault that cannot be rectified. The status is set if the pending status determining device error shows the "System fault" response.
	Off	Blinking	 CIP module status: "Major Recoverable Fault" The communication module has a fault that can be rectified. The status is set if the pending status determining device error shows the "Fault", "Trouble", "Quick stop by trouble", "Warning locked", or "Warning" response.
	On	Off	 CIP module status: "Operational" The communication module is working perfectly.
	Blinking	Off	 CIP module status: "Standby" The communication module has not been fully configured yet, or the configuration is incorrect (e.g. invalid IP address).
	Blinking	Blinking	 CIP module status: "Device Self Testing" The communication module is currently undergoing a self-test.



LED	Colour / status		Description
NS	**Green**	**Red**	
	Off	Off	CIP network status: "No IP Address" The communication module is not being supplied with voltage or has not been given an IP address.
	Off	On	 CIP network status: "Duplicate IP" The communication module is unable to gain access to the fieldbus (IP address conflict).
	Off	Blinking	 CIP network status: "Connection Timeout" A time-out is executed.
	On	Off	 CIP network status: "Connected" The communication module is working perfectly and has established a connection to the scanner.
	Blinking	Off	 CIP network status: "No Connections" The communication module ... • is working correctly; • has been assigned an IP address; • has not been integrated into the network by the scanner yet.
	Blinking	Blinking	 CIP network status: "Self-Test" The communication module is currently undergoing a self-test.

11.1.3 Status displays on the RJ45 sockets (X233, X234)

The LEDs on the RJ45 sockets **X233** and **X234** indicate the Ethernet connection status.



[11-3] LEDs Link , Act

LED	Colour	Status	Description
Link	Green	Off	No Ethernet connection
		On	 There is a physical Ethernet connection.
Act	Yellow	Off	No Ethernet data transfer
		On *or* flickers	 Data are being exchanged via Ethernet.

11.2 Diagnostics with the »Engineer«

In the »Engineer« under the **Diagnostics** tab, you will find EtherNet/IP diagnostics information.

Display		Code
1	**MAC-ID**	C13003 / C14003
2	**Active IP Address**	C13010 / C14010
3	**Active Subnetwork Mask**	C13011 / C14011
4	**Active gateway address**	C13012 / C14012
5	**Active Multicast IP Start Address**	C13016 / C14016
6	**CIP Module Status**	C13861 / C14861
7	**CIP Network Status**	C13862 / C14862
8	**Ethernet Port X233 connection status**	C13863/1 / C14863/1
9	**Ethernet Port X234 connection status**	C13863/2 / C14863/2

12 Error messages

This chapter supplements the error list in the reference manual and the »Engineer« online help for the Servo Drive 9400 by the error messages of the communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

12.1 Short overview of the EtherNet/IP error messages

The following table lists all EtherNet/IP error messages in the numerical order of the error numbers. Furthermore, the preset error response and - if available - the parameter for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Name	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c85531	13129009	EtherNet/IP: Memory: No Access	6: Information	-
0x00c85532	13129010	EtherNet/IP: Memory: Read Error	6: Information	-
0x00c85533	13129011	EtherNet/IP: Memory: Write Error	6: Information	-
0x00c86010	13131792	EtherNet/IP: Restart by Watchdogreset	1: No Response	-
0x00c86011	13131793	EtherNet/IP: Internal Error	1: No Response	-
0x00c86100	13132032	EtherNet/IP: Internal Error	1: No Response	-
0x00c86101	13132033	EtherNet/IP: Internal Error	1: No Response	-
0x00c8641f	13132831	EtherNet/IP: Invalid Parameter Set	1: No Response	-
0x00c86420	13132832	EtherNet/IP: Error: Lenze Setting Loaded	1: No Response	-
0x00c86430	13132848	EtherNet/IP: Internal mapping error	6: Information	-
0x00c86533	13133107	EtherNet/IP: Invalid IP Parameter	1: No Response	-
0x00c88111	13140241	EtherNet/IP: Fault Mode	1: No Response	C13880/2 / C14880/2
0x00c88112	13140242	EtherNet/IP: Explicit Message Timeout	1: No Response	C13880/3 / C14880/3
0x00c88114	13140244	EtherNet/IP: Overall Ethernet Timeout	1: No Response	C13880/4 / C14880/4
0x00c88132	13140274	EtherNet/IP: Idle Mode	1: No Response	C13880/1 / C14880/1
0x00c88142	13140290	EtherNet/IP: Class 1 Connection Closed	6: Information	-
0x00c88143	13140291	EtherNet/IP: Class 3 Connection Closed	6: Information	-
0x00c88273	13140595	EtherNet/IP: Duplicate IP Address	1: No Response	-

12.2 Possible causes and remedies

This chapter lists all EtherNet/IP error messages in the numerical order of the error numbers. Possible causes and remedies as well as responses to the error messages are described in detail.

EtherNet/IP: No access to memory [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Access to memory was not possible.	Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Error while reading from memory [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be read.	• Download application again (including module). • Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Error while writing to memory [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be written.	• Download application again (including module). • Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Restart by watchdog reset [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Internal error [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module with error description to Lenze.

EtherNet/IP: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module with error description to Lenze.

EtherNet/IP: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	• Download application again (including module). • Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access to parameter set in memory module via standard device was not successful.	• Download application again (including module). • Send communication module together with a description of the fault to Lenze.

EtherNet/IP: Internal mapping error [0x00c86430]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The entered I/O data mapping is invalid. • An object not supporting the required properties has been specified. • More than 64 bytes of data have been mapped.	Repeat I/O configuration in the »Engineer« (📖 55).

EtherNet/IP: Invalid IP parameters [0x00c86533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
One or more IP parameters are faulty.	Check and correct IP configuration. ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)

EtherNet/IP: Fault Mode [0x00c88111]

Response (Lenze setting printed in bold)	**Setting:** C13880/2 / C14880/2
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
• Connection to scanner has been interrupted. • Controlling I/O connection failed by timeout. • Within the timeout time for implicit messages parameterised by the scanner, no "implicit messages" have been received.	• Check cables and terminals. • Plug in the network cable into the Ethernet port. • Check Requested Package Interval (RPI) of I/O connection. • Increase timeout time for implicit messages.

EtherNet/IP: Explicit Message Timeout [0x00c88112]

Response (Lenze setting printed in bold)	**Setting:** C13880/3 / C14880/3
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
• Connection to scanner has been interrupted. • Failure of an explicit connection • Within the timeout time for explicit messages parameterised by the scanner, no "explicit messages" have been received.	• Check cables and terminals. • Plug in the network cable into the Ethernet port. • Check Requested Package Interval (RPI) of the explicit connection. • Increase timeout time for explicit messages.

EtherNet/IP: Overall Ethernet communication timeout [0x00c88114]

Response (Lenze setting printed in bold)	**Setting:** C13880/4 / C14880/4
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
• Failure of »Engineer« communication via Ethernet • When the time set in C13881 / C14881 has expired, there is no access via the »Engineer«.	• Check cables and terminals. • Plug in the network cable into the Ethernet port. • Increase the overall Ethernet timeout time in C13881. ▸ Fault with regard to EtherNet/IP communication (📖 74)

EtherNet/IP: Idle Mode [0x00c88132]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
• Scanner has received an idle event. • The scanner is in the "PROG" mode. • In the "Scanner Command Register", the Run/ Idle flag (bit 0) is 0.	Set the scanner to the run mode. Run/Idle flag (bit 0) = 1

EtherNet/IP: Class 1 Connection Closed [0x00c88142]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
The scanner has closed the controlling "Class 1" connection.	Check scanner functionality.

EtherNet/IP: Class 3 Connection Closed [0x00c88143]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Scanner has closed a "Class 3" connection.	Check scanner functionality.

EtherNet/IP: Duplicate IP address [0x00c88273]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
An IP address has been allocated twice within the network. The addresses of the network nodes must differ from each other.	Correct IP address (C13000 / C14000). ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)

12.3 CIP™ error messages

Error code [hex]	Error designation	Description
0x000	SUCCESS	No error
0x001	. . .	Instance error messages (📖 126) of the Connection Manager Object (6 / 0x06) (📖 126)
0x002	RESOURCE_UNAVAILABLE	Resource required to perform the service not available.
0x003	INVALID_PARAM_VALUE	Invalid parameter value
0x008	SERVICE_NOT_SUPP	Service is not supported.
0x009	INVALID_ATTRIB_VALUE	Invalid attribute.
0x00B	ALREADY_IN_STATE	The object is already in the required state.
0x00C	OBJ_STATE_CONFLICT	The object cannot perform the service.
0x00E	ATTR_NOT_SETTABLE	The attribute is write-protected.
0x00F	PRIVILEGE_VIOLATION	Access denied.
0x010	DEVICE_STATE_CONFLICT	The current state of the device prohibits performing the requested service.
0x011	REPLY_DATA_TOO_LARGE	The response data are longer than the response buffer
0x013	NOT_ENOUGH_DATA	The data length is too short.
0x014	ATTRIBUTE_NOT_SUPP	The attribute is not supported.
0x015	TOO_MUCH_DATA	The data length is too long.
0x016	OBJECT_DOES_NOT_EXIST	The object is not supported by the adapter.
0x017	FRAGMENTATION	The fragmentation for the requested service is currently not activated.
0x020	INVALID_PARAMETER	Invalid parameter

13 Parameter reference

This chapter supplements the parameter list and the attribute table in the reference manual and the »Engineer« online help for the Servo Drive 9400 by the parameter of the E94AYCEO (EtherNet/IP) communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on parameters.

13.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response to impermissible device configuration		
Selection list		
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No Response	Reserved
C00615/2	1: No Response	Resp. to imp. module in MXI1
C00615/3	1: No Response	Resp. to imp. module in MXI2
C00615/4	0: No Response	Reserved
C00615/5	0: No Response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response for the case where a new module has been plugged into slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response if a new module has been plugged into module slot 2 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 1 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

13.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCEO communication module (EtherNet/IP) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C13000

Parameter | Name: **C13000 | IP address**			Data type: UNSIGNED_8 Index: 11575 = 0x2D37
Setting of the IP address ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C13000/1	192		IP address (most significant byte)
C13000/2	168		IP address
C13000/3	124		IP address
C13000/4	16		IP address (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13001

Parameter | Name: **C13001 | Subnetwork Mask**			Data type: UNSIGNED_8 Index: 11574 = 0x2D36
Setting of the subnet mask ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C13001/1	255		Subnet mask (most significant byte)
C13001/2	255		Subnet mask
C13001/3	255		Subnet mask
C13001/4	0		Subnet mask (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13002

Parameter | Name: **C13002 | Gateway address**			Data type: UNSIGNED_8 Index: 11573 = 0x2D35
Setting of the gateway address ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C13002/1	0		Gateway address (most significant byte)
C13002/2	0		Gateway address
C13002/3	0		Gateway address
C13002/4	0		Gateway address (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13003

Parameter | Name: **C13003 | MAC ID**	Data type: OCTET_STRING Index: 11572 = 0x2D34
Display of the MAC-ID	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13005

Parameter | Name: **C13005 | IP configuration reference**		Data type: UNSIGNED_8 Index: 11570 = 0x2D32
Selection how the IP configuration is to be effected. (Instance attribute 3 (Configuration Control) in the TCP/IP Interface Object (245 / 0xF5) (📖 132)) ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)		
Selection list (Lenze setting printed in bold)		**Info**
0	Use stored IP	The IP configuration currently saved in the communication module is used.
1	**Use BOOTP**	The IP configuration is assigned by the scanner using BOOTP.
2	Use DHCP	The IP configuration is assigned by the scanner using DHCP. The assignment of a gateway address which is not in the same subnetwork than the IP address, is rejected.
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13006

Parameter | Name: **C13006 | Multicast IP Start Address**			Data type: UNSIGNED_8 Index: 11569 = 0x2D31
Setting of the multicast IP address ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C13006/1	239		Multicast IP start address (most significant byte)
C13006/2	64		Multicast IP start address
C13006/3	2		Multicast IP start address
C13006/4	224		Multicast start address (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13010

Parameter | Name: **C13010 | Active IP Address**			Data type: UNSIGNED_8 Index: 11565 = 0x2D2D
Display of the active IP address (Instance attribute 5 (IP Address) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13010/1			Active IP address (most significant byte)
C13010/2			Active IP Address
C13010/3			Active IP Address
C13010/4			Active IP address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13011

Parameter | Name: **C13011 | Active Subnetwork Mask**			Data type: UNSIGNED_8 Index: 11564 = 0x2D2C
Display of the active subnetwork mask (Instance attribute 5 (IP Network Mask) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13011/1			Active subnet mask (most significant byte)
C13011/2			Active Subnetwork Mask
C13011/3			Active Subnetwork Mask
C13011/4			Active subnet mask (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13012

Parameter | Name: **C13012 | Active Gateway Address**			Data type: UNSIGNED_8 Index: 11563 = 0x2D2B
Display of the active gateway address (Instance attribute 5 (Gateway Address) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13012/1			Active gateway address (most significant byte)
C13012/2			Active gateway address
C13012/3			Active gateway address
C13012/4			Active gateway address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13016

Parameter | Name: **C13016 | Active Multicast IP Address**			Data type: UNSIGNED_8 Index: 11559 = 0x2D27
Display of the active multicast IP address			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13016/1			Multicast IP address (most significant byte)
C13016/2			Multicast IP address
C13016/3			Multicast IP address
C13016/4			Multicast IP address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13017

Parameter | Name: **C13017 | Ethernet Config Control**			Data type: UNSIGNED_16 Index: 11558 = 0x2D26
Setting of the baud rate for the Ethernet connections • Depending on the configuration of the Ethernet port of the device to be connected, we recommend the use of a cross-over cable. ▸ EtherNet/IP connection (📖 28) • After changing the setting, carry out a "Type 0 Reset" for the Identity Object (1 / 0x01) (📖 121) of the node or switch off and on the voltage supply of the communication module.			
Selection list			
0	Auto-Negotiation		
1	Reserved		
2	Reserved		
3	Reserved		
4	Reserved		
5	10 Mbps/Half Duplex		
6	10 Mbps/Full Duplex		
7	100 Mbps/Half Duplex		
8	100 Mbps/Full Duplex		
9	Reserved		
10	Reserved		
11	Reserved		
12	Reserved		
Subcodes	**Lenze setting**		**Info**
C13017/1	0: Auto-Negotiation		Ethernet setting port X233
C13017/2	0: Auto-Negotiation		Ethernet setting port X234
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13018

Parameter | Name: **C13018 | Multicast Config Alloc Control**	Data type: UNSIGNED_8 Index: 11557 = 0x2D25
Selection for multicast IP addressing via the instance attribute 9 (Mcast Config) in the TCP/IP Interface Object (245 / 0xF5) (📖 132)	

Selection list (Lenze setting printed in bold)	
0	**Default Allocation Algorithm**
1	Multicast IP Start Address

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13019

Parameter | Name: **C13019 | Multicast Config TTL Value**	Data type: UNSIGNED_8 Index: 11556 = 0x2D24
Setting of the multicast TTL value for the validity time of data packets in the EtherNet/IP network (Instance attribute 8 (TTL Value) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		255	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13020

Parameter | Name: **C13020 | Multicast Config Num Mcast**	Data type: UNSIGNED_8 Index: 11555 = 0x2D23
Used to set how many multicast IP addresses will be assigned. (Instance attribute 9 (Num Mcast) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		32	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13021

Parameter | Name: **C13021 | Quality of Service (VLAN-Tagging)**	Data type: UNSIGNED_8 Index: 11554 = 0x2D22
Used to set whether QoS tags will be used for the prioritisation of the data packets to be transferred. (Instance attribute 1 (802.1Q Tag Enable) in the Quality of Service (QoS) Object (72 / 0x48) (📖 130))	

Selection list (Lenze setting printed in bold)	
0	**802.1Q Tag Disable**
1	802.1Q Tag Enable

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13022

Parameter | Name: **C13022 | Quality of Service (DSCP)**			Data type: UNSIGNED_8 Index: 11553 = 0x2D21
Setting for the prioritisation of the data packets to be transferred using Differentiated Services Codepoints (DSCP)			
Setting range (min. value | unit | max. value)			
0		63	
Subcodes	**Lenze setting**		**Info**
C13022/1	59		Reserved
C13022/2	47		Reserved
C13022/3	55		Reserved
C13022/4	47		QoS DSCP Scheduled (Instance attribute 5 (DSCP Scheduled) in the Quality of Service (QoS) Object (72 / 0x48) (📖 130))
C13022/5	43		QoS DSCP High Prio (Instance attribute 6 (DSCP High Prio) in the Quality of Service (QoS) Object (72 / 0x48) (📖 130))
C13022/6	31		Reserved
C13022/7	27		QoS DSCP Explicit Msg (Instance attribute 8 (DSCP Explicit Msg.) in theQuality of Service (QoS) Object (72 / 0x48) (📖 130))
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13840

Parameter | Name: **C13840 | DLR Network Topology**		Data type: UNSIGNED_8 Index: 10735 = 0x29EF
Display of the used DLR network topology (Device Level Ring) (Instance attribute 1 (Network Topology) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))		
Selection list (read only)		
0	Linear	
1	Ring	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13841

Parameter | Name: **C13841 | DLR Network Status**		Data type: UNSIGNED_8 Index: 10734 = 0x29EE
Display of the DLR network status (Device Level Ring) (Instance attribute 2 (Network Status) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))		
Selection list (read only)		
0	Normal	
1	Ring Fault	
2	Unexpected Loop detected	
3	Partial network fault	
4	Rapid fault/restore cycle	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13842

Parameter | Name: **C13842 | Supervisor IP Address**			Data type: UNSIGNED_8 10733 = 0x29ED
Display of the supervisor IP address (Instance attribute 10 (Supervisor IP Address) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13842/1			Supervisor IP address (most significant byte)
C13842/2			Supervisor IP Address
C13842/3			Supervisor IP Address
C13842/4			Supervisor IP address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13843

Parameter | Name: **C13843 | Supervisor MAC ID**	Data type: OCTET_STRING Index: 10732 = 0x29EC
Display of the supervisor MAC ID (Instance attribute 10 (Supervisor MAC Address) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13846

Parameter | Name: **C13846 | Address Conflict Detection**		Data type: UNSIGNED_8 Index: 10729 = 0x29E9
Activation of the address conflict detection (ACD) (Instance attribute 10 (Selectcd) in the TCP/IP Interface Object (245 / 0xF5) (📖 132)) Changing this value requires a reset of the device ("power off/on" or "type 0 reset").		
Selection list (Lenze setting printed in bold)		
0	Deactivated	
1	**Enable**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13850

Parameter | Name: **C13850 | All words to scanner**			Data type: INTEGER_16 Index: 10725 = 0x29E5
Display of the I/O data words transferred from the communication module (adapter) to the scanner. In the subcodes, all I/O data words transferred to the scanner are displayed. However, only the configured I/O data words are valid.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C13850/1			
...			
C13850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13851

Parameter | Name: **C13851 | All words from scanner**			Data type: INTEGER_16 Index: 10724 = 0x29E4
Display of the I/O data words transferred from the scanner to the communication module. In the subcodes, all I/O data words transferred from the scanner are displayed. However, only the configured I/O data words are valid.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C13851/1			
...			
C13851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13852

Parameter | Name: **C13852 | All words to the basic device**			Data type: INTEGER_16 Index: 10723 = 0x29E3
Display of the I/O data words transferred from the communication module to the standard device.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C13852/1			
...			
C13852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13853

Parameter | Name: **C13853 | All words to the basic device**			Data type: INTEGER_16 Index: 10722 = 0x29E2
Display of the I/O data words transferred from the standard device to the communication module.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C13853/1			
...			
C13853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13858

Parameter | Name: **C13858 | Ethernet Port Statistics**	Data type: UNSIGNED_32 Index: 10717 = 0x29DD
Display of statistical values for the data transfer via the Ethernet connections	
Subcodes	**Info**
C13858/1	Ethernet port X233: RX
C13858/2	Ethernet port X233: RX CRC error
C13858/3	Ethernet port X233: RX rejected
C13858/4	Ethernet port X233: TX
C13858/5	Ethernet port X233: TX rejected
C13858/6	Ethernet port X234: RX
C13858/7	Ethernet port X234: RX CRC error
C13858/8	Ethernet port X234: RX rejected
C13858/9	Ethernet port X234: TX
C13858/10	Ethernet port X234: TX rejected
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13861

Parameter | Name: **C13861 | CIP Module Status**	Data type: UNSIGNED_16 Index: 10714 = 0x29DA
Display of the current CIP module status (Instance attribute 8 (State) in the Identity Object (1 / 0x01) (📖 121)) • The status is also indicated via the **MS** LED. ▸ CIP™ status displays (📖 78)	
Selection list (read only)	
0	Nonexistent
1	Device Self Testing
2	Standby
3	Operational
4	Major Recoverable Fault
5	Major Unrecoverable Fault
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13862

Parameter | Name: **C13862 | CIP Network Status**	Data type: UNSIGNED_16 Index: 10713 = 0x29D9
Display of the current CIP network status • The status is also indicated via the **NS** LED. ▸ CIP™ status displays (📖 78)	
Selection list (read only)	
0	No IP Address
1	Nonexistent
2	Established
3	Timed Out
4	Duplicate IP
5	Self-Test
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13863

Parameter | Name: **C13863 | Ethernet Port**		Data type: UNSIGNED_16 Index: 10712 = 0x29D8
Display of the baud rate currently used on the Ethernet connections		
Selection list (read only)		
0	Nonexistent	
1	10 Mbps/Half Duplex	
2	10 Mbps/Full Duplex	
3	100 Mbps/Half Duplex	
4	100 Mbps/Full Duplex	
5	Reserved	
6	Reserved	
Subcodes		**Info**
C13863/1		Ethernet port X233 link state
C13863/2		Ethernet port X234 link state
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13870

Parameter | Name: **C13870 | CIP Connections State**		Data type: UNSIGNED_16 Index: 10705 = 0x29D1
Display of the current CIP connection status		
Selection list (read only)		
0	Nonexistent	
3	Established	
4	Timed Out	
Subcodes		**Info**
C13870/1		Status of CIP connection 1
...		...
C13870/8		Status of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13871

Parameter | Name: **C13871 | CIP Connections Type**		Data type: UNSIGNED_16 Index: 10704 = 0x29D0
Display of the current CIP connection types • "Listen Only" connections are not displayed.		
Selection list (read only)		
0	Nonexistent	
1	Exclusive Owner	
2	Input Only	
3	Listen Only	
4	Explicit Connection	
Subcodes		**Info**
C13871/1		Type of CIP connection 1
...		...
C13871/8		Type of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13872

Parameter | Name: **C13872 | CIP Connection Triggers**		Data type: UNSIGNED_16 Index: 10703 = 0x29CF
Display of the current CIP connection class		
Selection list (read only)		
0	Nonexistent	
1	Class 1, Cyclic, Client	
163	Class 3, App. Obj., Server	
Subcodes		**Info**
C13872/1		Trigger of CIP connection 1
...		...
C13872/8		Trigger of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13873

Parameter | Name: **C13873 | CIP Connections RPI**			Data type: UNSIGNED_32 Index: 10702 = 0x29CE
Indication of the current RPI times (Requested Package Interval) of the CIP connections			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C13873/1			RPI of CIP connection 1
...			...
C13873/8			RPI of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13874

Parameter | Name: **C13874 | CIP Connections Timeout Time**			Data type: UNSIGNED_32 Index: 10701 = 0x29CD
Display of the timeouts (ms) of the CIP connections			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C13874/1			Timeout time of CIP connection 1
...			...
C13874/8			Timeout time of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13875

Parameter | Name: **C13875 | CIP Connections RUN/IDLE Flag**		Data type: UNSIGNED_16 Index: 10700 = 0x29CC
Display of the run and idle flags of the CIP connections		
Selection list (read only)		
0	Nonexistent	
1	IDLE	
2	RUN	
Subcodes		**Info**
C13875/1		RUN/IDLE flag - CIP connection 1
...		...
C13875/8		RUN/IDLE flag - CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13880

Parameter | Name: **C13880 | Monitoring Reaction**			Data type: UNSIGNED_8 Index: 10695 = 0x29C7
Setting of the monitoring response in the event of a Fault with regard to EtherNet/IP communication (📖 74) (Mapping of the Lenze object Lenze Class (101 / 0x65) (📖 139)) A change in the monitoring response becomes immediately effective.			
Selection list			
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**		**Info**
C13880/1	0: No Response		Idle Mode
C13880/2	0: No Response		Fault Mode (only for "exclusive owner" connections)
C13880/3	0: No Response		Expl. message timeout
C13880/4	0: No Response		Overall Ethernet communication timeout
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13881

Parameter | Name: **C13881 | Overall Ethernet Timeout Time**			Data type: UNSIGNED_16 Index: 10694 = 0x29C6
Setting of the overall monitoring time (see Fault with regard to EtherNet/IP communication (📖 74)) A change in the monitoring response becomes immediately effective.			
Setting range (min. value | unit | max. value)			**Lenze setting**
500	ms	65535	**10000 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13885

Parameter | Name: **C13885 | Clear I/O Data**	Data type: UNSIGNED_8 Index: 10690 = 0x29C2
Setting which I/O data are to be processed by the adapter to maintain internal communication if ... • the network status of the controlling I/O connection is "Not connected" (see C13862) or • an idle event has occurred. Changes in the setting becomes effective immediately. (See Fault with regard to EtherNet/IP communication (📖 74).)	
Selection list (Lenze setting printed in bold)	
0	Use of last Scanner Output Data
1	**Clear Scanner Output Data**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13899

Parameter | Name: **C13899 | Hostname**	Data type: VISIBLE_STRING Index: 10676 = 0x29B4
Each subcode contains a string with a length of 64 bytes indicating the designation of the EtherNet/IP node. (Instance attribute 6 (Host Name) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13900

Parameter | Name: **C13900 | Firmware Product Type**	Data type: VISIBLE_STRING Index: 10675 = 0x29B3
The code contains a string with a length of 8 bytes. The identification code "E84DGFCG" is displayed.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13901

Parameter | Name: **C13901 | Firmware Compilation Date**	Data type: VISIBLE_STRING Index: 10674 = 0x29B2
The code contains a string with a length of 20 bytes. The software creation date ("MMM DD YYYY") and time ("hh:mm:ss") are displayed (e.g. "Mar 21 2005 12:31:21").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13902

Parameter | Name: **C13902 | Firmware Version**	Data type: VISIBLE_STRING Index: 10673 = 0x29B1
The code contains a string with a length of 11 bytes. The firmware version is displayed (e.g. "00.01.00.00").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

13.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCEO communication module (EtherNet/IP) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C14000

Parameter | Name: **C14000 | IP address**			Data type: UNSIGNED_8 Index: 10575 = 0x294F
Setting of the IP address ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C14000/1	192		IP address (most significant byte)
C14000/2	168		IP address
C14000/3	124		IP address
C14000/4	16		IP address (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14001

Parameter | Name: **C14001 | Subnetwork mask**			Data type: UNSIGNED_8 Index: 10574 = 0x294E
Setting of the subnet mask ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C14001/1	255		Subnet mask (most significant byte)
C14001/2	255		Subnet mask
C14001/3	255		Subnet mask
C14001/4	0		Subnet mask (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14002

Parameter | Name: **C14002 | Gateway address**			Data type: UNSIGNED_8 Index: 10573 = 0x294D
Setting of the gateway address ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C14002/1	0		Gateway address (most significant byte)
C14002/2	0		Gateway address
C14002/3	0		Gateway address
C14002/4	0		Gateway address (least significant byte)
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14003

Parameter | Name: **C14003 | MAC ID**	Data type: OCTET_STRING Index: 10572 = 0x294C
Display of the MAC-ID	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14005

Parameter | Name: **C14005 | IP Config Control**	Data type: UNSIGNED_8 Index: 10570 = 0x294A
Selection how the IP configuration is to be effected. (Instance attribute 3 (Configuration Control) in the TCP/IP Interface Object (245 / 0xF5) (📖 132)) ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)	

Selection list (Lenze setting printed in bold)		**Info**
0	Use stored IP	The IP configuration currently saved in the communication module is used.
1	**Use BOOTP**	The IP configuration is assigned by the scanner using BOOTP.
2	Use DHCP	The IP configuration is assigned by the scanner using DHCP. The assignment of a gateway address which is not in the same subnetwork than the IP address, is rejected.

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14006

Parameter | Name: **C14006 | Multicast IP Start Address**	Data type: UNSIGNED_8 Index: 10569 = 0x2949
Setting of the multicast IP address ▸ Setting the IP configuration of the Servo Drive 9400 (📖 37)	

Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**		**Info**
C14006/1	239		Multicast IP start address (most significant byte)
C14006/2	64		Multicast IP start address
C14006/3	2		Multicast IP start address
C14006/4	224		Multicast start address (least significant byte)

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14010

Parameter | Name: **C14010 | Active IP address**			Data type: UNSIGNED_8 Index: 10565 = 0x2945
Display of the active IP address (Instance attribute 5 (IP Address) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14010/1			Active IP address (most significant byte)
C14010/2			Active IP Address
C14010/3			Active IP Address
C14010/4			Active IP address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14011

Parameter | Name: **C14011 | Active subnetwork mask**			Data type: UNSIGNED_8 Index: 10564 = 0x2944
Display of the active subnetwork mask (Instance attribute 5 (IP Network Mask) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14011/1			Active subnet mask (most significant byte)
C14011/2			Active Subnetwork Mask
C14011/3			Active Subnetwork Mask
C14011/4			Active subnet mask (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14012

Parameter | Name: **C14012 | Active gateway address**			Data type: UNSIGNED_8 Index: 10563 = 0x2943
Display of the active gateway address (Instance attribute 5 (Gateway Address) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14012/1			Active gateway address (most significant byte)
C14012/2			Active gateway address
C14012/3			Active gateway address
C14012/4			Active gateway address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14016

Parameter | Name: **C14016 | Active Multicast IP Address**			Data type: UNSIGNED_8 Index: 10559 = 0x293F
Display of the active multicast IP address			
Display range (min. value | unit | max. value)			
0		255	

Subcodes	Info
C14016/1	Multicast IP address (most significant byte)
C14016/2	Multicast IP address
C14016/3	Multicast IP address
C14016/4	Multicast IP address (least significant byte)

☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14017

Parameter | Name: **C14017 | Ethernet Config Control**	Data type: UNSIGNED_16 Index: 10558 = 0x293E

Setting of the baud rate for the Ethernet connections
- Depending on the configuration of the Ethernet port of the device to be connected, we recommend the use of a cross-over cable.
  ▸ EtherNet/IP connection (📖 28)
- After changing the setting, carry out a "Type 0 Reset" for the Identity Object (1 / 0x01) (📖 121) of the node or switch off and on the voltage supply of the communication module.

Selection list	
0	Auto-Negotiation
1	Reserved
2	Reserved
3	Reserved
4	Reserved
5	10 Mbps/Half Duplex
6	10 Mbps/Full Duplex
7	100 Mbps/Half Duplex
8	100 Mbps/Full Duplex
9	Reserved
10	Reserved
11	Reserved
12	Reserved

Subcodes	Lenze setting	Info
C14017/1	0: Auto-Negotiation	Ethernet setting port X233
C14017/2	0: Auto-Negotiation	Ethernet setting port X234

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14018

Parameter | Name: **C14018 | Multicast Config Alloc Control**	Data type: UNSIGNED_8 Index: 10557 = 0x293D
Selection for multicast IP addressing via the instance attribute 9 (Mcast Config) in the TCP/IP Interface Object (245 / 0xF5) (📖 132)	

Selection list (Lenze setting printed in bold)	
0	**Default Allocation Algorithm**
1	Multicast IP Start Address

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14019

Parameter | Name: **C14019 | Multicast Config TTL Value**	Data type: UNSIGNED_8 Index: 10556 = 0x293C
Setting of the multicast TTL value for the validity time of data packets in the EtherNet/IP network (Instance attribute 8 (TTL Value) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		255	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14020

Parameter | Name: **C14020 | Multicast Config Num Mcast**	Data type: UNSIGNED_8 Index: 10555 = 0x293B
Used to set how many multicast IP addresses will be assigned. (Instance attribute 9 (Num Mcast) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		32	**1**

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14021

Parameter | Name: **C14021 | Quality of Service (VLAN tagging)**	Data type: UNSIGNED_8 Index: 10554 = 0x293A
Used to set whether QoS tags will be used for the prioritisation of the data packets to be transferred. (Instance attribute 1 (802.1Q Tag Enable) in the Quality of Service (QoS) Object (72 / 0x48) (📖 130))	

Selection list (Lenze setting printed in bold)	
0	**802.1Q Tag Disable**
1	802.1Q Tag Enable

☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14022

Parameter | Name: **C14022 | Quality of Service (DSCP)**			Data type: UNSIGNED_8 Index: 10553 = 0x2939
Setting for the prioritisation of the data packets to be transferred using Differentiated Services Codepoints (DSCP)			
Setting range (min. value | unit | max. value)			
0		63	
Subcodes	**Lenze setting**		**Info**
C14022/1	59		Reserved
C14022/2	47		Reserved
C14022/3	55		Reserved
C14022/4	47		QoS DSCP Scheduled (Instance attribute 5 (DSCP Scheduled) in the Quality of Service (QoS) Object (72 / 0x48) (📖 130))
C14022/5	43		QoS DSCP High Prio (Instance attribute 6 (DSCP High Prio) in the Quality of Service (QoS) Object (72 / 0x48) (📖 130))
C14022/6	31		Reserved
C14022/7	27		QoS DSCP Explicit Msg (Instance attribute 8 (DSCP Explicit Msg.) in theQuality of Service (QoS) Object (72 / 0x48) (📖 130))
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14840

Parameter | Name: **C14840 | DLR Network Topology**		Data type: UNSIGNED_8 Index: 9735 = 0x2607
Display of the used DLR network topology (Device Level Ring) (Instance attribute 1 (Network Topology) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))		
Selection list (read only)		
0	Linear	
1	Ring	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14841

Parameter | Name: **C14841 | DLR Network Status**		Data type: UNSIGNED_8 Index: 9734 = 0x2606
Display of the DLR network status (Device Level Ring) (Instance attribute 2 (Network Status) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))		
Selection list (read only)		
0	Normal	
1	Ring Fault	
2	Unexpected Loop detected	
3	Partial network fault	
4	Rapid fault/restore cycle	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14842

Parameter | Name: **C14842 | Supervisor IP Address**			Data type: UNSIGNED_8 Index: 9733 = 0x2605
Display of the supervisor IP address (Instance attribute 10 (Supervisor IP Address) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14842/1			Supervisor IP address (most significant byte)
C14842/2			Supervisor IP Address
C14842/3			Supervisor IP Address
C14842/4			Supervisor IP address (least significant byte)
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14843

Parameter | Name: **C14843 | Supervisor MAC ID**	Data type: OCTET_STRING Index: 9732 = 0x2604
Display of the supervisor MAC ID (Instance attribute 10 (Supervisor MAC Address) in the Device Level Ring (DLR) Object (71 / 0x47) (📖 128))	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14846

Parameter | Name: **C14846 | Address Conflict Detection**		Data type: UNSIGNED_8 Index: 9729 = 0x2601
Activation of the address conflict detection (ACD) (Instance attribute 10 (Selectcd) in the TCP/IP Interface Object (245 / 0xF5) (📖 132)) Changing this value requires a reset of the device ("power off/on" or "type 0 reset").		
Selection list (Lenze setting printed in bold)		
0	Deactivated	
1	**Enable**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C14850

Parameter | Name: **C14850 | All words to scanner**			Data type: INTEGER_16 Index: 9725 = 0x25FD
Display of the I/O data words transferred from the communication module (adapter) to the scanner. In the subcodes, all I/O data words transferred to the scanner are displayed. However, only the configured I/O data words are valid.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C14850/1			
...			
C14850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14851

Parameter | Name: **C14851 | All words from scanner**			Data type: INTEGER_16 Index: 9724 = 0x25FC
Display of the I/O data words transferred from the scanner to the communication module (adapter). In the subcodes, all I/O data words transferred from the scanner are displayed. However, only the configured I/O data words are valid.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C14851/1			
...			
C14851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14852

Parameter | Name: **C14852 | All words to standard device**			Data type: INTEGER_16 Index: 9723 = 0x25FB
Display of the I/O data words transferred from the communication module to the standard device.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C14852/1			
...			
C14852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14853

Parameter | Name: **C14853 | All words from standard device**			Data type: INTEGER_16 Index: 9722 = 0x25FA
Display of the I/O data words transferred from the standard device to the communication module.			
Display range (min. value | unit | max. value)			
-32768		32767	
Subcodes			**Info**
C14853/1			
...			
C14853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14858

Parameter | Name: **C14858 | Ethernet Port Statistics**	Data type: UNSIGNED_32 Index: 9717 = 0x25F5
Display of statistical values for the data transfer via the Ethernet connections	
Subcodes	**Info**
C14858/1	Ethernet port X233: RX
C14858/2	Ethernet port X233: RX CRC error
C14858/3	Ethernet port X233: RX rejected
C14858/4	Ethernet port X233: TX
C14858/5	Ethernet port X233: TX rejected
C14858/6	Ethernet port X234: RX
C14858/7	Ethernet port X234: RX CRC error
C14858/8	Ethernet port X234: RX rejected
C14858/9	Ethernet port X234: TX
C14858/10	Ethernet port X234: TX rejected
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14861

Parameter | Name: **C14861 | CIP Module Status**	Data type: UNSIGNED_16 Index: 9714 = 0x25F2
Display of the current CIP module status (Instance attribute 8 (State) in the Identity Object (1 / 0x01) (📖 121)) • The status is also indicated via the **MS** LED. ▸ CIP™ status displays (📖 78)	
Selection list (read only)	
0	Nonexistent
1	Device Self Testing
2	Standby
3	Operational
4	Major Recoverable Fault
5	Major Unrecoverable Fault
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14862

Parameter | Name: **C14862 | CIP Network Status**	Data type: UNSIGNED_16 Index: 9713 = 0x25F1
Display of the current CIP network status • The status is also indicated via the **NS** LED. ▸ CIP™ status displays (📖 78)	
Selection list (read only)	
0	No IP Address
1	Nonexistent
2	Established
3	Timed Out
4	Duplicate IP
5	Self-Test
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14863

Parameter | Name: **C14863 | Ethernet Port**		Data type: UNSIGNED_16 Index: 9712 = 0x25F0
Display of the baud rate currently used on the Ethernet connections		
Selection list (read only)		
0	Nonexistent	
1	10 Mbps/Half Duplex	
2	10 Mbps/Full Duplex	
3	100 Mbps/Half Duplex	
4	100 Mbps/Full Duplex	
5	Reserved	
6	Reserved	
Subcodes		**Info**
C14863/1		Ethernet port X233 link state
C14863/2		Ethernet port X234 link state
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14870

Parameter | Name: **C14870 | CIP Connections State**		Data type: UNSIGNED_16 Index: 9705 = 0x25E9
Display of the current CIP connection status		
Selection list (read only)		
0	Nonexistent	
3	Established	
4	Timed Out	
Subcodes		**Info**
C14870/1		Status of CIP connection 1
...		...
C14870/8		Status of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14871

Parameter | Name: **C14871 | CIP Connections Type**		Data type: UNSIGNED_16 Index: 9704 = 0x25E8
Display of the current CIP connection types • "Listen Only" connections are not displayed.		
Selection list (read only)		
0	Nonexistent	
1	Exclusive Owner	
2	Input Only	
3	Listen Only	
4	Explicit Connection	
Subcodes		**Info**
C14871/1		Type of CIP connection 1
...		...
C14871/8		Type of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14872

Parameter | Name: **C14872 | CIP Connection Triggers**		Data type: UNSIGNED_16 Index: 9703 = 0x25E7
Display of the current CIP connection class		
Selection list (read only)		
0	Nonexistent	
1	Class 1, Cyclic, Client	
163	Class 3, App. Obj., Server	
Subcodes		**Info**
C14872/1		Trigger of CIP connection 1
...		...
C14872/8		Trigger of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14873

Parameter | Name: **C14873 | CIP Connections RPI**			Data type: UNSIGNED_32 Index: 9702 = 0x25E6
Indication of the current RPI times (Requested Package Interval) of the CIP connections			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C14873/1			RPI of CIP connection 1
...			...
C14873/8			RPI of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14874

Parameter | Name: **C14874 | CIP Connections Timeout Time**			Data type: UNSIGNED_32 Index: 9701 = 0x25E5
Display of the timeouts (ms) of the CIP connections			
Display range (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C14874/1			Timeout time of CIP connection 1
...			...
C14874/8			Timeout time of CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14875

Parameter | Name: **C14875 | CIP Connections RUN/IDLE Flag**		Data type: UNSIGNED_16 Index: 9700 = 0x25E4
Display of the run and idle flags of the CIP connections		
Selection list (read only)		
0	Nonexistent	
1	IDLE	
2	RUN	
Subcodes		**Info**
C14875/1		RUN/IDLE flag - CIP connection 1
...		...
C14875/8		RUN/IDLE flag - CIP connection 8
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14880

Parameter | Name: **C14880 | Reaction on communication fault**			Data type: UNSIGNED_8 Index: 9695 = 0x25DF
Setting of the monitoring response in the event of a Fault with regard to EtherNet/IP communication (📖 74) (Mapping of the Lenze object Lenze Class (101 / 0x65) (📖 139)) A change in the monitoring response becomes immediately effective.			
Selection list			
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**		**Info**
C13880/1	0: No Response		Idle Mode
C13880/2	0: No Response		Fault Mode (only for "exclusive owner" connections)
C13880/3	0: No Response		Expl. message timeout
C13880/4	0: No Response		Overall Ethernet communication timeout
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14881

Parameter | Name: **C14881 | Overall Ethernet Timeout Time**			Data type: UNSIGNED_16 Index: 9694 = 0x25DE
Setting of the overall monitoring time (see Fault with regard to EtherNet/IP communication (📖 74)) A change in the monitoring response becomes immediately effective.			
Setting range (min. value | unit | max. value)			**Lenze setting**
500	ms	65535	**10000 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14885

Parameter | Name: **C14885 | Clear I/O Data**		Data type: UNSIGNED_8 Index: 9690 = 0x25DA
Setting which I/O data are to be processed by the adapter to maintain internal communication if ... • the network status of the controlling I/O connection is "Not connected" (see C14862) or • an idle event has occurred. Changes in the setting becomes effective immediately. (See Fault with regard to EtherNet/IP communication (📖 74).)		
Selection list (Lenze setting printed in bold)		
0	Use of last Scanner Output Data	
1	**Clear Scanner Output Data**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14899

Parameter | Name: **C14899 | Hostname**	Data type: VISIBLE_STRING Index: 9676 = 0x25CC
Each subcode contains a string with a length of 64 bytes indicating the designation of the EtherNet/IP node. (Instance attribute 6 (Host Name) in the TCP/IP Interface Object (245 / 0xF5) (📖 132))	
☑ Read access ☑ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14900

Parameter | Name: **C14900 | Firmware product type**	Data type: VISIBLE_STRING Index: 9675 = 0x25CB
The code contains a string with a length of 8 bytes. The identification code "E94AYCEO" is output.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14901

Parameter | Name: **C14901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: 9674 = 0x25CA
The code contains a string with a length of 20 bytes. The software creation date ("MMM DD YYYY") and time ("hh:mm:ss") are displayed (e.g. "Mar 21 2005 12:31:21").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14902

Parameter | Name: **C14902 | Firmware version**	Data type: VISIBLE_STRING Index: 9673 = 0x25C9
The code contains a string with a length of 11 bytes. The firmware version is displayed (e.g. "00.01.00.00").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

13.4 Table of attributes

The table of attributes contains information required for communication with the inverter via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit (CINH) required	☑ Writing is only possible when the controller is inhibited

14 Implemented CIP™ objects

An EtherNet/IP node can be seen as an accumulation of objects. An individual object is characterised by its class, its instances and attributes. Several services such as read and write services can be applied to these objects.

Note!

This chapter only describes the CIP objects implemented by Lenze and the properties supported by them (attributes, service codes etc.).

Not all object properties described in the "Common Industrial Protocol Specification" of the ODVA are supported.

"Common Industrial Protocol Specification" of the ODVA

Here you will find detailed information about the CIP objects.

Overview of implemented objects

CIP objects	Description
General objects	
TCP/IP Interface Object (245 / 0xF5) (📖 132)	Identification and general information about the device
Message Router Object (2 / 0x02) (📖 123)	Addressing of a service for the transfer of data to any object class or instance
Assembly Object (4 / 0x04) (📖 124)	Input/output data of the scanner
Connection Manager Object (6 / 0x06) (📖 126)	Management of the internal resources for the transfer of data (implicit/explicit messaging)
EtherNet/IP objects	
Device Level Ring (DLR) Object (71 / 0x47) (📖 128)	Status information for the DLR protocol
Quality of Service (QoS) Object (72 / 0x48) (📖 130)	Classification and prioritisation of the data packets for EtherNet/IP communication
TCP/IP Interface Object (245 / 0xF5) (📖 132)	Configuration of the TCP/IP network interface of the device
Ethernet Link Object (246 / 0xF6) (📖 136)	General information and status information about the Ethernet interfaces of the device
Lenze objects	
Lenze Class (101 / 0x65) (📖 139)	Lenze error responses to EtherNet/IP errors
Lenze Class (103 / 0x67) (📖 141)	Image of the scanner input data
Lenze Class (104 / 0x68) (📖 142)	Image of the scanner output data
Lenze Class (110 / 0x6E) (📖 143)	Access to Lenze codes

General class attributes

Attribute ID	Service	Name	Data type	Description
1	Get	Revision	UINT	Revision no. of the object
2	Get	Max. Instance	UINT	Max. number of instances of the object
3	Get	Number of Instances	UINT	Number of instances of the object
6	Get	Max. ID Number Class Attributes	UINT	The attribute ID of the last class attribute of the class description implemented in the device
7	Get	Max. ID Number Instance Attributes	UINT	The attribute ID of the last instance attribute of the class description implemented in the device

14.1 General CIP objects

14.1.1 Identity Object (1 / 0x01)

The "Identity Object" provides the identification and general information about the device.

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	1 (0x0001)
2	Get	Max. Instance	UINT	1 (0x0001)
3	Get	Number of Instances	UINT	1 (0x0001)
6	Get	Max. ID Number Class Attributes	UINT	7 (0x0007)
7	Get	Max. ID Number Instance Attributes	UINT	10 (0x000A)

Instance attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Vendor ID	UINT	587 (0x024B)
2	Get	Device Type	UINT	43 (0x002B)
3	Get	Product Code	UINT	9400 (0x24B8)
4	Get	Revision:	STRUCT of:	Firmware revision of the device
		Major Revision	USINT	
		Minor Revision	USINT	
5	Get	Status	WORD	Current device status (status bits) • Instance attribute "Status" (attribute 5) (📖 122) • EtherNet/IP state diagram (📖 50)
6	Get	Serial Number	UDINT	Serial number of the device
7	Get	Product Name	SHORT_STRING	E94AYCEO
8	Get	State	USINT	Current device state: • 0: Nonexistent • 1: Device self-testing • 2: Standby • 3: Operational • 4: Major Recoverable Fault [1)] • 5: Major Unrecoverable Fault [2)] • 6 ... 254: Reserved • 255: Standard for "Get_Attributes_All" service (See also C13861 / C14861, LED status displays (📖 76))

1) The status is set if the pending, status determining device error displays the fault, trouble, quick stop by trouble, warning locked, or warning response.

2) The status is set if the pending, status determining device error displays the system fault response.

Attribute ID	Service	Name	Data type	Value
10	Get	Heartbeat Interval	USINT	Interval between heartbeat messages in milliseconds 0 ms: No transmission of heartbeat messages (standard setting)

Instance attribute "Status" (attribute 5)

Bits	Name	Description
0	Owned	The state '1' indicates that the device (or an object within the device) has an owner. Within a master/slave model, the state '1' indicates that the "predefined master/slave connection set" is assigned to a master. Outside the master/slave model, it means "TBD".
1	-	Reserved (0)
2	Configured	The state '1' indicates that the activities the device application carries out differ from the "out of box" standard configuration. This should not comprise the configuration of communication.
3	-	Reserved (0)
4 ... 7	Extended Device Status	• 0000: Status is "self-testing" or unknown • 0001: Firmware update is being carried out • 0010: At least one faulty I/O connection • 0011: No I/O connections available • 0100: Non-volatile configuration is faulty • 0101: "Major fault" (bit 10 or 11 is '1') • 0110: At least one I/O connection is in the "run mode" • 0111: At least one I/O connection is available, all are in the "idle mode" • 1000: Reserved • 1001: Reserved • 1010 ... 1111: Reserved / manufacturer-specific
8	Minor Recoverable Fault	The state '1' indicates that a "Minor Recoverable Fault" has occurred.
9	Minor Unrecoverable Fault	The state '1' indicates that a "Minor Unrecoverable Fault" has occurred.
10	Major Recoverable Fault	The state '1' indicates that a "Major Recoverable Fault" has occurred.
11	Major Unrecoverable Fault	The state '1' indicates that a "Major Unrecoverable Fault" has occurred.
12 ... 15	Extended Device Status 2	Reserved (0) / manufacturer-specific

Supported service codes

Service code [hex]	Name	Description
0x01	Get_Attributes_All	Outputs a list of the attributes and the attribute's values for a certain object.
0x05	Reset	Only reset service type '0' is supported: • Mains switching (power off/on) is simulated.
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute. (Not attribute 10, Heartbeat Interval)

14.1.2 Message Router Object (2 / 0x02)

With the "Message Router Object", a client can address a service for the transfer of data to any object class or instance.

Note!

There are no GET/SET services for this object!

14.1.3 Assembly Object (4 / 0x04)

For the data exchange, the communication module supports the assembly object instances 110 (0x6E, Custom Output) and 111 (0x6F, Custom Input).

The contents of the input and output data depends on the I/O data arrangement in the drive (I/O configuration in the »Engineer« (📖 55)).

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x02)
2	Get	Max. Instance	UINT	111 (0x6F)

Instance attributes for output data of the scanner

Attribute ID	Service	Name	Data type	Value
3	Get / Set	Data	Array of BYTE	Max. 64 bytes from the scanner
4	Get	Size	UINT	Number of bytes in attribute 3 (Data)

Assembly output objects (scanner to adapter) are assumed to have a 4-byte header (32-bit "Run/Idle header"). When mapping the assemblies, this header will automatically be added to the data stream by most Allen-Bradley PLC/SLC equipment.

If your PLC does not support this header (like the Rockwell PLCs do), add a preceding 32-bit header to the output image.

You can then define the **bit 0** of this header in the process image of your PLC:

- State '0': idle mode
- State '1': run mode

For the operation with Rockwell PLCs, adaptations are not required.

The Lenze Class (104 / 0x68) (📖 142) provides the image of the scanner output data.

Instance attributes for input data of the scanner

Attribute ID	Service	Name	Data type	Value
3	Get / Set	Data	Array of BYTE	Max. 64 bytes to the scanner
4	Get	Size	UINT	Number of bytes in attribute 3 (Data)

The assembly input objects (adapter to scanner) are mapped in the adapter memory starting with byte 0.

The input objects are transmitted in a "modeless" manner, i.e. a 4-byte header is not included in the transfer.

So the start address in the assembly memory map is the actual start of the first assembly data element.

Please observe the actual assembly lengths when mapping the input objects to the controller memory.

The Lenze Class (103 / 0x67) (📖 141) provides the image of the scanner input data.

Instance attribute "Data" (attribute 3)

Instance	Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
110 (0x6E)	**0**	Custom Output							
	...	...							
	31	Custom Output							
111 (0x6F)	**0**	Custom Input							
	...	...							
	31	Custom Input							

Supported service codes

Service code [hex]	Name	Description
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.
0x10	Set_Attribute_Single	Changes the value of a certain attribute.

14.1.4 Connection Manager Object (6 / 0x06)

The "Connection Manager Object" manages the internal resources for the I/O data transfer (implicit messaging) and the parameter data transfer (explicit messaging). The instance specified by the "connection manager" class refers to a "connection instance" or a "connection object".

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	1 (0x0001)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance error messages

Error code [hex]	Extended code [hex]	Error designation	Description
0x000	-	SUCCESS	No error
0x001	0x119	NON- LISTEN ONLY CONNECTION NOT OPENED	The connection could not be established because there is no "non-listen only" connection (input only, exclusive owner). The "non-listen only" connection must be of the "multicast" connection type.
0x001	0x127	INVALID_ORIGINATOR_TO_TARGET_SIZE	The resulting length of the ports mapped in the receive object PDO_RX0 does not correspond to the number of data bytes of the assembly object instance 110 (0x6E, Custom Output) defined in the scanner.
0x001	0x128	INVALID_TARGET_TO_ORIGINATOR_SIZE	The resulting length of the ports mapped in the transmit object PDO_TX0 does not correspond to the number of data bytes of the assembly object instance 111 (0x6F, Custom Input) defined in the scanner.
0x001	0x204	UNCONNECTED_REQUEST_TIMED_OUT	The adapter does not respond to the establishment of the connection. • There might be no physical connection. • The adapter is switched off. • The adapter has an invalid IP configuration.
0x001	0x320	ACCESS_CONTENTION	Manufacturer-specific error: • The configurations of the assembly input and output objects are mixed up. • The connection could not be established because another connection has already occupied the required resources. It is only possible to establish an "exclusive owner" connection to the adapter.
0x001	0x111	ROUTER_EXT_ERR_RPI_NOT_SUPPORTED	The RPI set for a connection is not supported. • Min. class-1-RPI = 2 ms • Min class-3-RPI = 10 ms
0x001	0x112	RROUTER_EXT_ERR_RPI_VALUE_NOT_ACCEPTABLE	The RPI set for a connection is not supported. • Min. class-1-RPI = 2 ms • Min class-3-RPI = 10 ms
0x001	0x123	ROUTER_EXT_ERR_INVALID_TO_CONNECTION_TYPE	The output image connection type is invalid or not supported.
0x001	0x124	ROUTER_EXT_ERR_INVALID_TO_CONNECTION_TYPE	The input image connection type is invalid or not supported.
0x001	0x12A	ROUTER_EXT_ERR_INVALID_CONSUMING_PATH	The path specification for the output data from the scanner is invalid.
0x001	0x12B	ROUTER_EXT_ERR_INVALID_PRODUCING_PATH	The path specification for the input data to the scanner is invalid.

Supported service codes

Service code [hex]	Name	Description
0x54	Forward_Open	Opens a CIP connection from the PLC to the target drive.
0x4E	Forward_Close	Closes a CIP connection from the PLC to the target drive.
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.

14.2 EtherNet/IP objects

14.2.1 Device Level Ring (DLR) Object (71 / 0x47)

The "Device Level Ring (DLR) Object" provides status information for the DLR protocol. The DLR protocol is a "layer 2" protocol enabling the use of an Ethernet ring topology.

Note!

Only the "beacon-based ring node" mode is supported.

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x0002)

Instance attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Network Topology	USINT	Current network topology • 0: Line topology • 1: Ring topology (display via C13840 / C14840))
2	Get	Network Status	USINT	Current network status • 0: Normal • 1: Ring Fault (only for ring topology) • 2: Unexpected Loop Detected (only for line topology) • 3: Partial network fault • 4: Rapid fault/restore cycle (display via C13841 / C14841)
10	Get	Active Supervisor Address	STRUCT of:	IP and MAC address of the active ring supervisor
		Supervisor IP Address	UDINT	Ethernet MAC address The value '0' indicates that no IP address has been configured for the device. (display via C13842 / C14842)
		Supervisor MAC Address	ARRAY of USINT[6]	Ethernet MAC address (display via C13843 / C14843)
12	Get	Capability Flags	DWORD	Telegram processing method for the ring node implementation • 2: Beacon-based ring node ▸ Instance attribute "Capability Flags" (attribute 12) (📖 129)

Instance attribute "Capability Flags" (attribute 12)

Bits	Name	Description
0	Announce-based Ring Node	Is not supported (state '0').
1	Beacon-based Ring Node	The state '1' is set if the ring node implementation is based on the processing of "beacon frames".
2 ... 31	-	Reserved (0)

Supported service codes

Service code [hex]	Name	Description
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.

14.2.2 Quality of Service (QoS) Object (72 / 0x48)

The "Quality of Service (QoS) Object" enables different classifications and prioritisations of the data packets for EtherNet/IP communication. For this purpose, the EtherNet/IP messages are marked with "802.1Q tags" and "Differentiated Services Codepoints" (DSCP).

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	1 (0x0001)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance attributes

The instance attributes act independently of each other.

The DSCP values are used for the IP headers.

Irrespective of this, **VLAN tagging** can be activated additionally (C13021 / C14021 = 1).

The VLAN ID of Lenze devices is '0'.

The VLAN priority results from the DSCP values configured.

Changes in the attribute values will only take effect after a reset of the device ("power off/on" or "type 0 reset").

Note!

Before activating VLAN tagging, please ensure that all involved components support VLAN tagging. It may occur that the devices not supporting VLAN tagging cannot be accessed anymore.

Attribute ID	Service	Name	Data type	Value
1	Set	802.1Q Tag Enable	USINT	Enables the transmission of data packets with 802.1Q tags (C13021 / C14021) • 0: No use of 802.1Q tags (Lenze setting) • 1: Use of 802.1Q tags
4	Set	DSCP Urgent	USINT	55: Urgent/imperative messages **Is not supported at the moment.**
5	Set	DSCP Scheduled	USINT	47: Scheduled messages (Can only be used for "exclusive owner" connections.) (C13022/4 / C14022/4)
6	Set	DSCP High	USINT	43: Messages with high priority (Can only be used for "input only" and "listen only" connections.) (C13022/5 / C14022/5)
7	Set	DSCP Low	USINT	31: Messages with low priority **Is not supported at the moment.**
8	Set	DSCP Explicit	USINT	27: "Explicit messages" (parameter data) (C13022/7 / C14022/7)

Supported service codes

Service code [hex]	Name	Description
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.
0x10	Set_Attribute_Single	Changes the value of a certain attribute.

14.2.3 TCP/IP Interface Object (245 / 0xF5)

The "TCP/IP Interface Object" serves to configure the TCP/IP network interface of the device.

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x0002)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance attributes

Note!

Write access to attribute 3 (Configuration Control) permanently saves the TCP/IP configuration defined in attribute 5.

If the TCP/IP configuration defined in attribute 5 is to be used as a "static IP" during the start-up, "0 = use static TCP/IP configuration" must be set in attribute 3.

Attribute ID	Service	Name	Data type	Value
1	Get	Status	DWORD	Current status of the TCP/IP network interface ▸ Instance attribute "Status" (attribute 1) (📖 133)
2	Get	Configuration Capability	DWORD	Possible options for TCP/IP configuration ▸ Instance attribute "Configuration Capability" (attribute 2) (📖 134)
3	Get / Set	Configuration Control	DWORD	Selection of how the TCP/IP configuration is to be effected (C13005 / C14005): Possible values for bits 0 ... 3: • 0000: Use static TCP/IP config. • 0001: TCP/IP config. via BOOTP • 0010: TCP/IP config. via DHCP Bits 4 ... 31 are reserved (0).
4	Get	Physical Link Object:	STRUCT of:	Path to "Physical Link Object"
		Path Size	UINT	2 (0x0002)
		Path	padded EPATH	• 32 (0x0020) • 246 (0x00F6) • 36 (0x0024) • 1 (0x0001)
5	Get	Interface Configuration:	STRUCT of:	Current TCP/IP configuration
		IP Address	UDINT	C13010 / C14010 (active IP address)
		Network Mask	UDINT	C13011 / C14011 (active subnet mask)
		Gateway Address	UDINT	C13012 / C14012 (active gateway address)
		Name Server	UDINT	
		Name Server 2	UDINT	
		Domain Name 1	STRING	
6	Get / Set	Host Name	STRING	Host name of the device (C13899 / C14899, max. 64 ASCII characters)

Attribute ID	Service	Name	Data type	Value
8	Get / Set	TTL Value	USINT	TTL value (C13019 / C14019) for EtherNet/IP multicast data packets (value range: 1 ... 255)
9	Get / Set	Mcast Config:	STRUCT of:	Configuration of the multicast IP addressing
		Alloc Control	USINT	Control word (C13018 / C14018) for addressing: • 0: The multicast IP addresses are generated with the standard assignment algorithm. • 1: The multicast IP addresses are assigned via the values in "Num Mcast" and "Mcast Start Addr" (C13006 / C14006) • 2: Reserved
		Reserved	USINT	0 (0x0000)
		Num Mcast	UINT	Total number of multicast IP addresses assigned (C13020 / C14020)
		Mcast Start Addr	UDINT	Active multicast IP start address (C13016 / C14016)
10	Set	SelectAcd	BOOL	Activation of address conflict detection (ACD, C13846 / C14846) • 0: Disable ACD • 1: Enable ACD Changing this value requires a reset of the device ("power off/on" or "type 0 reset").
11	Get / Set	LastConflictDetected:	STRUCT of:	ACD diagnostics information about the last occurred address conflict
		AcdActivity	USINT	Status of the ACD algorithm when the last address conflict occurred: • 0: NoConflictDetected (default) • 1: ProbeIpv4Address • 2: OngoingDetection • 3: SemiActiveProbe
		RemoteMAC	ARRAY of USINT[6]	MAC address of the device with the last address conflict
		ArpPdu	ARRAY of USINT[28]	Reproduction of the ARP message with information about the address conflict ▸ Structure of the ARP message (attribute 11, "ArpPdu") (📖 135)

Instance attribute "Status" (attribute 1)

Bits	Name	Description
0 ... 3	Interface Configuration Status	• 0000: No TCP/IP configuration available (attribute 5) • 0001: Valid TCP/IP configuration (attribute 5) via BOOTP, DHCP or static/permanent storage • 0010 ... 1111: Reserved
4	Mcast Pending	This bit indicates a pending change of the multicast configuration in attribute 9 (Mcast Config) and/or the TTL value (C13019 / C14019). It is set to '1' if either a multicast attribute or the TTL value is set. The pending change will only take effect after a reset of the device ("power off/on" or "type 0 reset"). This bit is then reset to '0'.
5	Interface Configuration Pending	This bit indicates a pending change of the TCP/IP configuration in attribute 5 (Interface Configuration). It is set to '1' if an attribute is set. The pending change will only take effect after a reset of the device ("power off/on" or "type 0 reset").

Bits	Name	Description
6	AcdStatus	Display of the status of address conflict detection (ACD): • 0: No address conflict detected • 1: Address conflict detected
7 ... 31	-	Reserved (0)

Instance attribute "Configuration Capability" (attribute 2)

Bits	Name	Description
0	BOOTP Client	The state '1' indicates that BOOTP is used for the TCP/IP configuration of the device.
1	DNS Client	Is not supported (state '0').
2	DHCP Client	The state '1' indicates that DHCP is used for the TCP/IP configuration of the device.
3	DHCP-DNS Update	Is not supported (state '0').
4	Configuration Settable	The state '1' indicates that the TCP/IP configuration can be set in attribute 5 (Interface Configuration).
5	Hardware Configurable	Is not supported (state '0').
6	Interface Configuration Change Requires Reset	The state '1' indicates that changes of the TCP/IP configuration in attribute 5 (Interface Configuration) will only take effect after a reset of the device ("power off/on" or "type 0 reset"). The state '0' is not supported (changes becoming effective immediately).
7	AcdCapable	The state '1' indicates that the device is provided with address conflict detection (ACD).
8 ... 31	-	Reserved (0)

Structure of the ARP message (attribute 11, "ArpPdu")

Field size [Bytes]	Field name	Value
2	Hardware Address Type	1: Ethernet H/W
2	Protocol Address Type	0x0800: IP
1	HADDR LEN	6: Ethernet H/W
1	PADDR LEN	4: IP
2	OPERATION	1: Request 2: Response
6	SENDER HADDR	H/W address of the sender
4	SENDER PADDR	Protocol address of the sender
6	TARGET HADDR	H/W address of the target
4	TARGET PADDR	Protocol address of the target

Supported service codes

Service code [hex]	Name	Description
0x01	Get_Attributes_All	Outputs a list of the attributes and the attributes' values for a certain object (only instance 1).
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.
0x10	Set_Attribute_Single	Changes the value of a certain attribute.

14.2.4 Ethernet Link Object (246 / 0xF6)

The "Ethernet Link Object" provides general information and status information about the Ethernet interfaces (IEEE 802.3).

Note!

Write accesses to writable attributes become only effective after the device is reset ("Power off/on" or "Type 0 Reset").

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	3 (0x0003)
2	Get	Max. Instance	UINT	2 (0x0002)
3	Get	Number of Instances	UINT	2 (0x0002)

Instance attributes

(instance 1 for X233 interface / instance 2 for X234 interface)

Attribute ID	Service	Name	Data type	Value
1	Get	Interface Speed	UDINT	Current baud rate • 10 Mbps • 100 Mbps
2	Get	Interface Flags	DWORD	Status bits of the Ethernet interface ▸ Instance attribute "Interface Flags" (attribute 2) (📖 137)
3	Get	Physical Address	ARRAY of USINT[6]	MAC address of the Ethernet interface
6	Set	Interface Control	STRUCT of:	
		Control Bits	WORD	Control bits for the Ethernet interface ▸ Instance attribute "Control Bits" (attribute 6, Interface Control) (📖 138)
		Forced Interface Speed	UINT	Baud rate [in Mbps] at which the Ethernet interface is to be operated (C13017 / C14017). Example values: • 10 = 10 Mbps • 100 = 100 Mbps
10	Get	Interface Label	SHORT_ STRING	Text for the identification/designation of the Ethernet interface: • X233 (instance 1) • X234 (instance 2)

Instance attribute "Interface Flags" (attribute 2)

Bits	Name	Description
0	Link Status	This bit indicates whether the Ethernet interface is connected to an active network. • 0: No Ethernet connection available • 1: Ethernet connection available
1	Half/Full Duplex	This bit indicates the current transmission mode of the Ethernet interface. • 0: Half duplex • 1: Full duplex **Note:** If "Link Status" bit = 0, it is not possible to determine the value of the "Half/Full Duplex" bit.
2 ... 4	Negotiation Status	This bit indicates the status of "Link Auto-Negotiation". • 000: "Link Auto-Negotiation" is being processed. • 001: "Link Auto-Negotiation" and speed detection have failed. • Use the standard baud rate and transmission mode values. • The standard values depend on the product; recommended values are '10 Mbps' and 'Half Duplex'. • 010: "Link Auto-Negotiation" has failed, but a baud rate has been detected. • Use the recommended value ('Half Duplex') for the transmission mode . • 011: "Link Auto-Negotiation" and speed detection have been successful. • 100: No "Link Auto-Negotiation" active.
5	Manual Setting Requires Reset	Reset after changes in the link parameters • 0: The Ethernet interface can activate changes in the link parameters (auto-negotiation, transmission mode, baud rate) automatically. - **Is not supported!** • 1: If the link parameters (auto-negotiation, transmission mode, baud rate) are changed, the device must be reset ("power off/on" or "type 0 reset").
6	Local Hardware Fault	Hardware fault detection • 0: No hardware fault has been detected on the Ethernet interface. • 1: A hardware fault has been detected on the Ethernet interface.
7 ... 31	-	Reserved (0)

Instance attribute "Control Bits" (attribute 6, Interface Control)

Bits	Name	Description
0	Auto-negotiate	Activation of "Link Auto-Negotiation" • 0: "Link Auto-Negotiation" is not active. The device uses the settings of the bits "Forced Duplex Mode" (bit 1) and "Forced Interface Speed" (see attribute 6, Interface Control). • 1: "Link Auto-Negotiation" is active.
1	Forced Duplex Mode	If "Auto-negotiate" bit = 0, this bit indicates the transmission mode to be used. • 0: Half duplex • 1: Full duplex
2 ... 15	-	Reserved (0)

Supported service codes

Service code [hex]	Name	Description
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.
0x10	Set_Attribute_Single	Changes the value of a certain attribute.

14.3 Lenze objects

14.3.1 Lenze Class (101 / 0x65)

The "Lenze Class (101 / 0x65)" enables the access to the error responses to EtherNet/IP errors adjustable in code C13880 / C14880.

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x0002)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance attributes

Attribute ID	Service	Name	Data type	Value
1	Get	No. of supported Attributes	USINT	6 (0x0006)
2	Get	Attribute List	USINT	1 (0x0001) ... 6 (0x0006)
3	Get / Set	Reaction on Idle Mode	USINT	Corresponds to the value in C13880/1 / C14880/1: • 0 = no response • 1 = error • 3 = quick stop by trouble • 4 = warning locked • 6 = information
4	Get / Set	Reaction on Fault Mode	USINT	Corresponds to the value in C13880/2 / C14880/2: • 0 = no response • 1 = error • 3 = quick stop by trouble • 4 = warning locked • 6 = information
5	Get / Set	Reaction on Expl. Msg. TO	USINT	Corresponds to the value in C13880/3 / C14880/3: • 0 = no response • 1 = error • 3 = quick stop by trouble • 4 = warning locked • 6 = information
6	Get / Set	Reaction on I/O Timeout	USINT	Corresponds to the value in C13880/4 / C14880/4: • 0 = no response • 1 = error • 3 = quick stop by trouble • 4 = warning locked • 6 = information

Supported service codes

Service code [hex]	Name	Description
0x01	Get_Attributes_All	Outputs a list of the attributes and the attribute's values for a certain object.
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.
0x10	Set_Attribute_Single	Changes the value of a certain attribute.

14.3.2 Lenze Class (103 / 0x67)

The "Lenze Class (103 / 0x67)" provides the image of the scanner input data.

The input data for the scanner are sent to the scanner via the assembly object instance **111 (0xE6)**.

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x0002)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance attributes

Attribute ID	Service	Name	Data type	Value
1	Get	No. of supported Attributes	USINT	3 (0x0003)
2	Get	Attribute List	USINT	1 (0x0001) ... 3 (0x0003)
3	Get	I/O image of produced data	USINT	Image of the scanner input data

Supported service codes

Service code [hex]	Name	Description
0x01	Get_Attributes_All	Outputs a list of the attributes and the attribute's values for a certain object.
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.

14.3.3 Lenze Class (104 / 0x68)

The "Lenze Class (104 / 0x68)" provides the image of the scanner output data.

The output data of the scanner are transmitted via the assembly object instance **110 (0xE5, Custom Output)**.

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x0002)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance attributes

Attribute ID	Service	Name	Data type	Value
1	Get	No. of supported Attributes	USINT	3 (0x0003)
2	Get	Attribute List	USINT	1 (0x0001) ... 3 (0x0003)
3	Get	I/O image of consumed data	USINT	Image of the scanner output data

Supported service codes

Service code [hex]	Name	Description
0x01	Get_Attributes_All	Outputs a list of the attributes and the attribute's values for a certain object.
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.

14.3.4 Lenze Class (110 / 0x6E)

The "Lenze Class (110 / 0x6E)" enables read or write access to Lenze codes.

The Lenze code must be specified as an "instance" (corresponding code no. 1 ... 65535) and its subcodes must be specified as "attributes".

Note!

- If the corresponding Lenze code does not have a subcode, the value '0' must be entered in the attribute. If '0' is not supported as attribute value by the engineering tool used, the value '1' must be entered.
- A display code cannot be configured using "Set_Attribute_Single".

Class attributes

Attribute ID	Service	Name	Data type	Value
1	Get	Revision	UINT	2 (0x0002)
2	Get	Max. Instance	UINT	1 (0x0001)

Instance attributes

Attribute ID	Service	Name	Data type	Value
0 ... 255	Get / Set	Lenze Subcode number	Data type of the subcode	Value of the subcode

Supported service codes

Service code	Name	Description
0x0E	Get_Attribute_Single	Outputs the value of a certain attribute.
0x10	Set_Attribute_Single	Changes the value of a certain attribute.

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

Perhaps we have not succeeded in achieving this objective in every respect. If you have suggestions for improvement, please e-mail us to:

feedback-docu@lenze.com

Thank you very much for your support.

1 About this documentation

This documentation exclusively describes the E94AYCIB communication module (INTERBUS).

Note!

This documentation supplements the **mounting instructions** supplied with the communication module and the **Servo Drives 9400 hardware manual**.

The mounting instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe any software provided by other manufacturers. No warranty can be given for corresponding data provided in this documentation. For information on how to use the software, please refer to the host (PLC, master) documents.

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

More information on the INTERBUS can be found on this internet page:

www.interbus.com

Maintenance activities for the INTERBUS technologies are carried out by the user organisation PROFIBUS & PROFINET International (PI).

www.profibus.com

Target group

This documentation is intended for all persons who plan, install, commission and maintain the networking and remote servicing of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.lenze.com

Information regarding the validity

The information given in this documentation is valid for the following devices:

Extension module	Type designation	From hardware version	From software version
Communication module INTERBUS	E94AYCIB	PA	01.00

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and the software version of the engineering tools installed (e.g. »Engineer«), the screenshots in this documentation may differ from the actual screen representation.

1.1 Document history

Version			Description
1.0	03/2009	TD17	Field test version
2.0	06/2009	TD17	General revision
3.0	11/2009	TD17	General revision
4.0	02/2014	TD17	• New layout • General updates

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Spelling of numbers		
Decimal	Normal spelling	Example: 1234
Decimal separator	Point	The decimal point is always used. For example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Blue text colour	All information that applies to from a certain software version of the device onwards are marked accordingly in this documentation. Example: This function extension is available from software version V3.0 onwards!
Program name	» «	The Lenze PC software »Engineer«...
Control element	**bold**	The **OK** button ... / The **Copy** command ... / The Properties tab ... / The **Name** input field ...
Sequence of menu commands		If several commands are required to execute one function, the single commands are separated by an arrow: Select the **File → Open** command to...
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse-click in this online documentation.
Icons		
Page reference	(📖 8)	Optically highlighted reference to another page. In this online documentation activated via mouse-click.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning
Drive	Lenze inverter of the "Servo Drives 9400" product series, with which the communication module can be used. ▸ Application as directed (📖 12)
Inverter	
Standard device	
Code	Parameter which serves to parameterise and monitor the drive. In normal usage, the term is usually referred to as "Index".
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3"). In everyday language, the term is also referred to as "subindex".
»Engineer«	Lenze PC software which supports you during the "Engineering" process (parameterisation, diagnostics, and configuration) throughout the whole life cycle, i. e. from planning to maintenance of the machine commissioned.
INTERBUS	INTERBUS was developed as sensor/actuator bus system for transmitting process data. Maintenance activities for the INTERBUS technologies are carried out by the user organisation PROFIBUS & PROFINET International (PI).
Host	PLC, INTERBUS master
PCP	**P**eripherials **C**ommunication **P**rotocol for transmitting parameter data
PDO	Process data object
PDU	Process Data Unit
PMS	Peripheral Message Specification
HW	Hardware
SW	Software

1.4 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

If the following basic safety measures are disregarded, severe injuries to persons and damage to material assets may result.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 12)
- must never be commissioned if they display signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- during and after operation can have live, moving and rotating parts, depending on their degree of protection. Surfaces can be hot.

The following applies to Lenze drive components ...

- only use the accessories approved.
- Only use original manufacturer spare parts.

Observe all specifications contained in the enclosed documentation and related documentation.

- This is the precondition for safe and trouble-free operation and for obtaining the product features specified.
  ▸ Product features (📖 13)
- The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

All works on and with Lenze drive and automation components must only be carried out by qualified personnel. According to IEC 60364 or CENELEC HD 384 these are persons who ...

- are familiar with installing, mounting, commissioning, and operating the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).
- Only use cables corresponding to the given specifications.
  ▸ Bus cable specification (📖 27)

Documentation for the standard device, host (PLC, master), system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.
▸ Protective insulation (📖 17)

Device protection

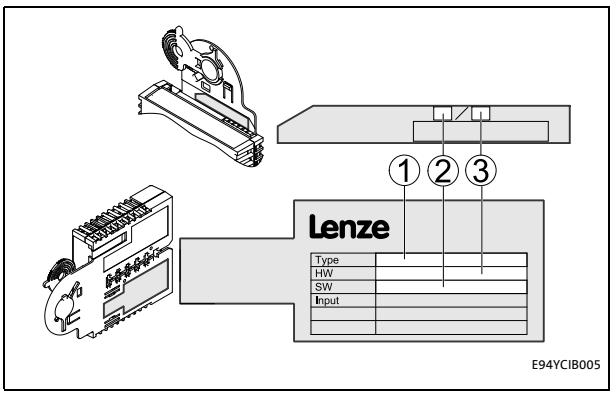
The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 21)

3 Product description

3.1 Application as directed

The communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxx	1A	03.00
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in INTERBUS networks.

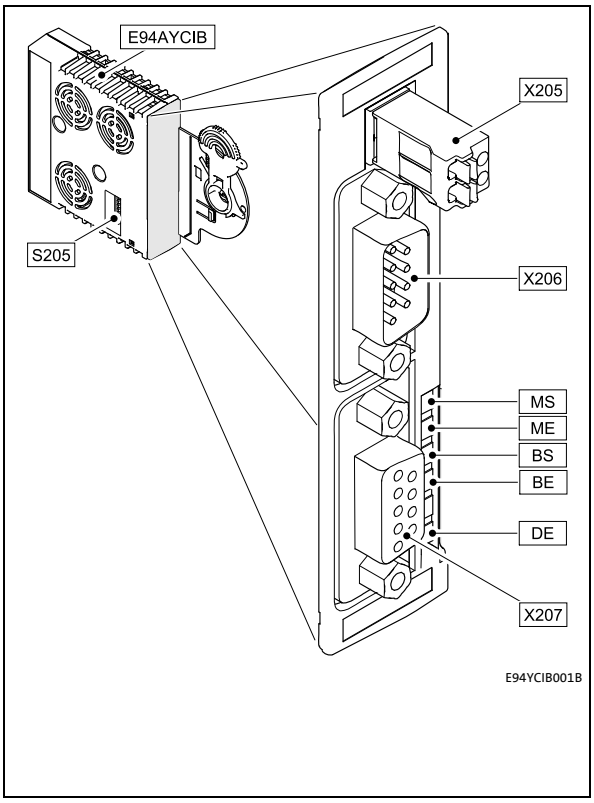
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: Extension module
- C Module type: Communication module
- IB INTERBUS



2 Hardware version (HW)

3 Software version (SW)

3.3 Product features

- Interface module for the INTERBUS communication system to be connected to the expansion slots of the Servo Drives 9400
- The communication module can either be supplied internally by the standard device or externally by a separate voltage source.
- Slave functionality
- DIP switch settings:
  - Number of process data words and parameter data words
  - Baud rate (500 kbps or 2 Mbps)
- Bus coupling via remote bus according to the RS485 standard
- Up to 10 process data words (20 bytes) can be used.
- 0, 1, 2 order 4 parameter data words can be used.
- The parameter data is transmitted in accordance with the Peripherials Communication Protocol (PCP).
- Access to all Lenze parameters
- Support of the PMS services:
  - Initiate
  - Abort
  - Reject
  - Read
  - Write
  - Get-OD
  - Identify
  - Status

4 Technical data

4.1 General data and operating conditions

Range	Values
Order designation	E94AYCIB
Communication profile	INTERBUS
Communication medium	RS485
Interface for communication	• Input (IN): 9-pole Sub-D plug • Output (OUT): 9-pole Sub-D socket
Network topology	Ring
Type of node	Slave
Number of nodes	• 1 master • 512 slaves
Baud rate	500 kbps or 2 Mbps (can be set via DIP switch or code)
Max. cable length	• 400 m at 500 kbps • 150 m at 2 Mbps (between the single INTERBUS nodes)
Process data words	0 ... 10 words (16 bits/word) (can be set via DIP switch or code)
Parameter data words	0, 1, 2, 4 words (16 bits/word) (can be set via DIP switch or code) The parameter data is transmitted in accordance with the Peripherials Communication Protocol (PCP).
Max. number of data words	10 words (process data word + parameter data words), 16 bits/word
Max. PDU length	64 bytes
Device identification (module ID)	• 3 = 0x03 (0 parameter data words) • 227 = 0xE3 (1 parameter data words) • 224 = 0xE0 (2 parameter data words) • 225 = 0xE1 (4 parameter data words)
Voltage supply	External supply via separate power supply unit +: U = 24 V DC (+/- 10 %), I_{max} = 180 mA - : Reference potential for external voltage supply
Conformities, approvals	• CE • UL (see also hardware manual)

Servo Drives 9400 hardware manual

Here you can find the **ambient conditions** and information on the **electromagnetic compatibility (EMC)** which also apply to the communication module.

4.2 Protocol data

Range	Values
Process data words	0 ... 10 words (16 bits/word)
Parameter data words	0, 1, 2, 4 words (16 bits/word) The parameter data is transmitted in accordance with the Peripherials Communication Protocol (PCP).
Supported PMS services	• Initiate • Abort • Reject • Read • Write • Get-OD • Identify • Status

Note!

The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).

4.3 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

The communication times in an INTERBUS network depend on the ...

- processing time in the inverter;
- telegram runtime (baud rate / telegram length);
- nesting depth of the network.

processing time within the inverter

Data	Processing time	
Process data	Approx. 4 ms + 0 ... 1 ms + 1 ... x ms	Update cycle Processing time in the module Runtime of the application task of the technology application used (tolerance)
Parameter data	Approx. 30 ms + a tolerance of 20 ms (typically) Some codes may require a longer processing time (see reference manual/ »Engineer« online help for the Servo Drive 9400).	

There are no interdependencies between parameter data and process data.

4.4 Protective insulation

Danger!

Dangerous voltage

If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

Possible consequences:

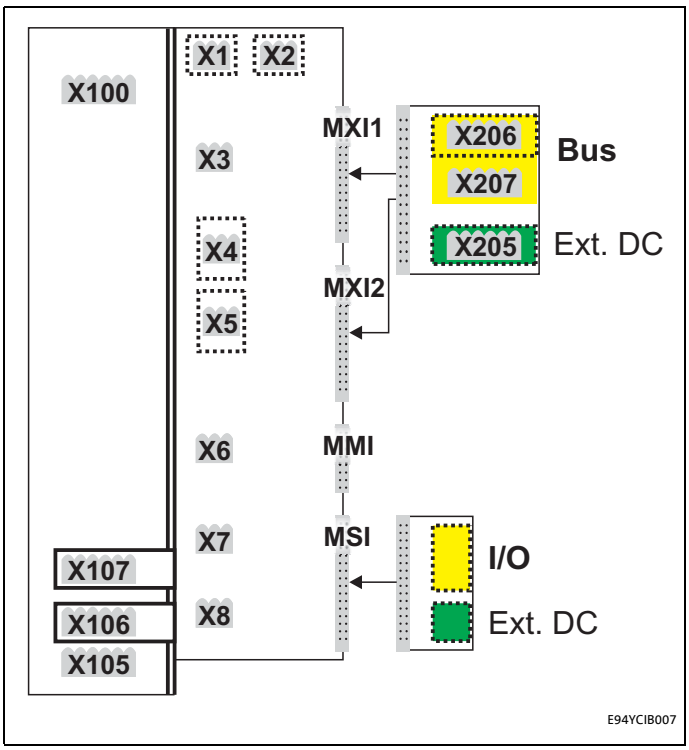
Death or severe injuries

Protective measures:

If protection against accidental contact is required for the control terminals of the inverter and the connections of the plugged device modules, ...

- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.

Note!



The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the Servo Drive 9400.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

Note!

The INTERBUS input (X206) is isolated from the voltage supply (X205) and the INTERBUS output (X207).

|| Reinforced insulation

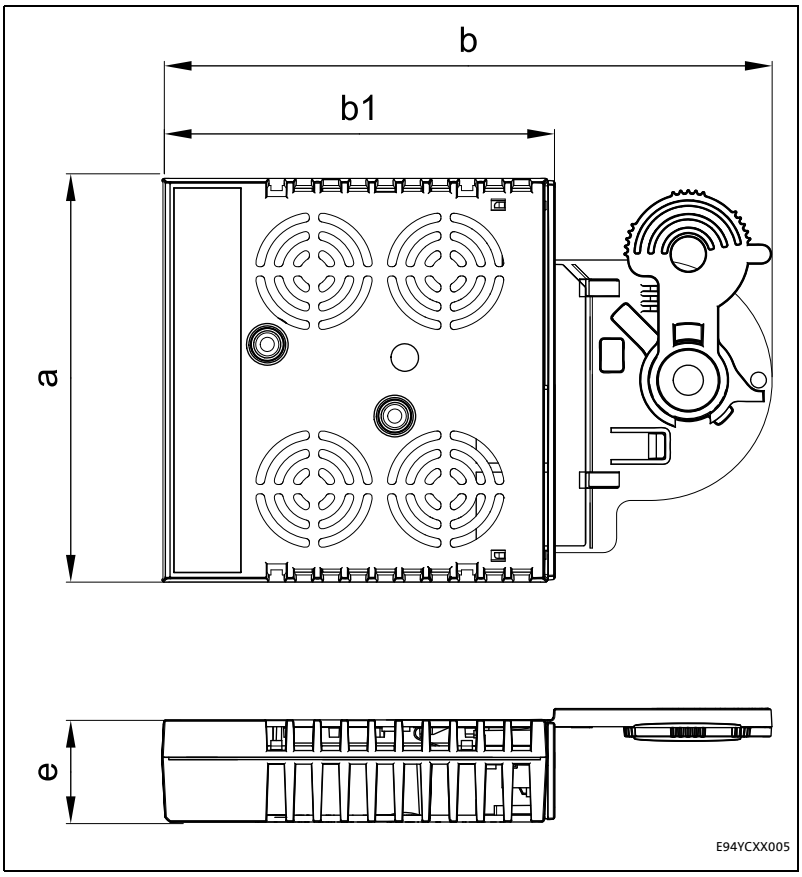
| Basic insulation

¦ Functional insulation

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module
		X205	External voltage supply (24 V DC)
		X206	INTERBUS connection, input (IN)
		X207	INTERBUS connection, output (OUT)

Example



Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.5 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

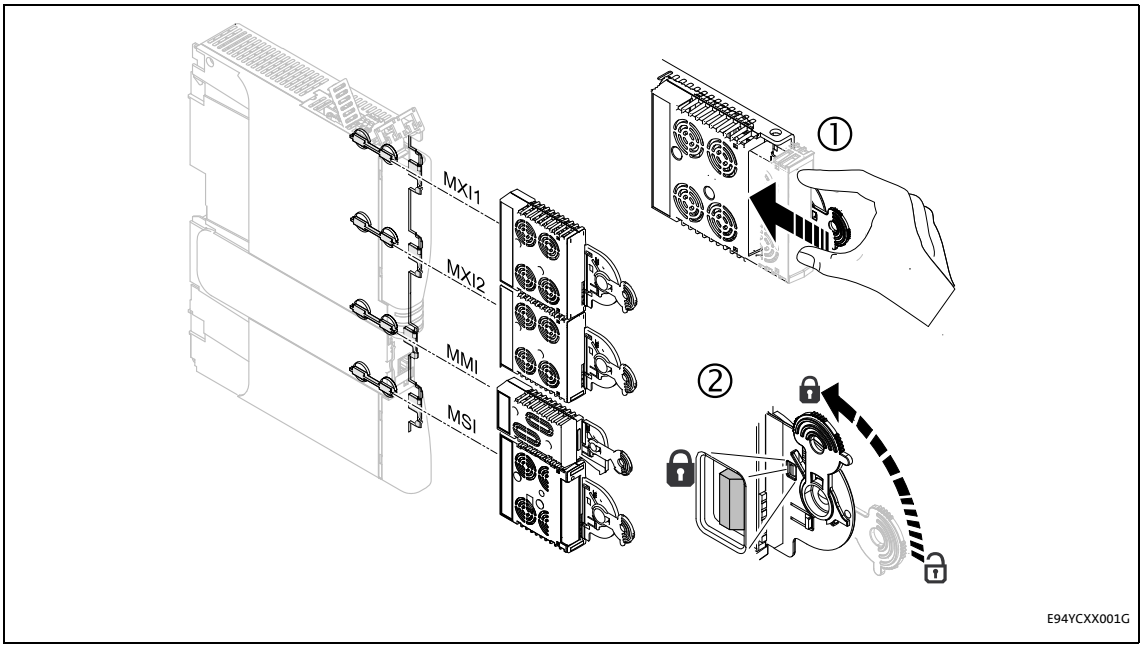
5 Installation

Stop!

Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

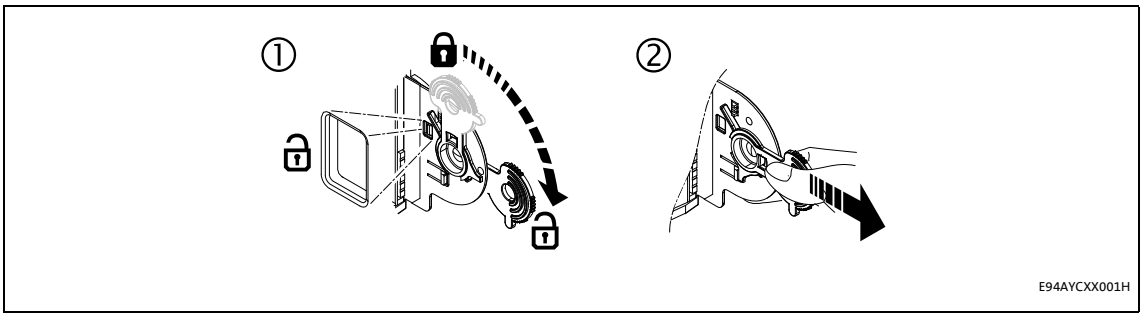
Possible consequences



- The communication module is defective.
- Fieldbus communication is not possible or faulty.

Protective measures

- Before touching the module, be sure that you are free of electrostatic charge.



5.1 Mechanical installation

5.1.1 Assembly

[5-1] Assembly

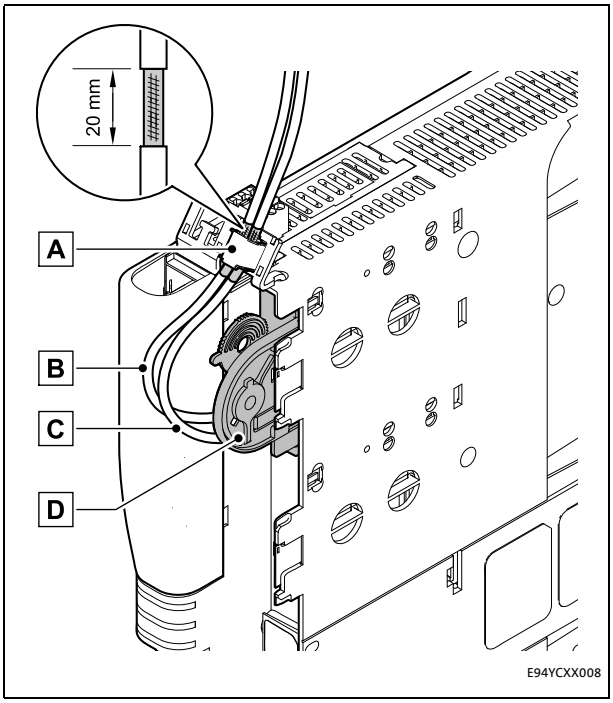
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation for the standard device, host (PLC, master), system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring according to EMC guidelines

In typical systems, standard shielding is sufficient for the INTERBUS cable.

In environments with very strong interferences, the EMC compatibility can be improved by an additional earthing of the cable shield.

For this observe the following notes:

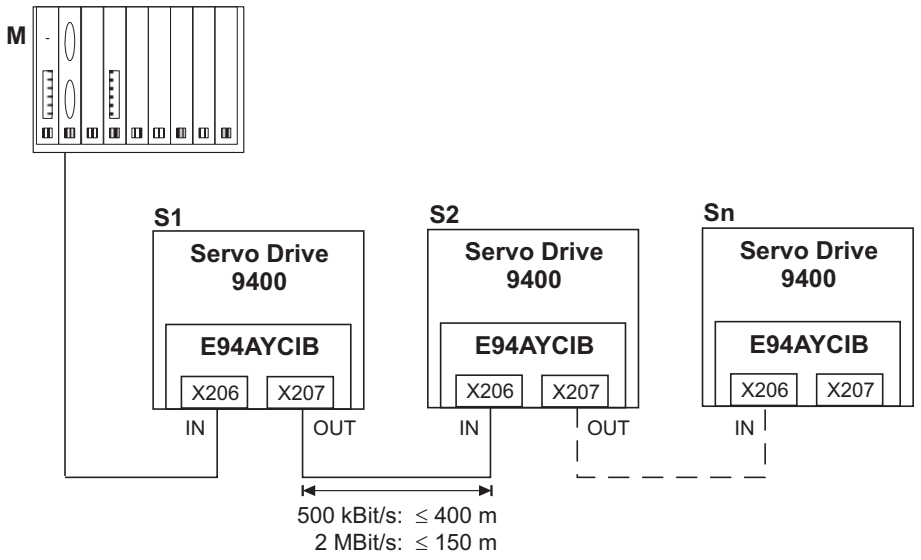
1. The distance of the additional earthing of the INTERBUS plug (Sub-D, 9-pole) depends on the module slot and is as follows ...
   - approx 10 cm for the upper slot (MXI1);
   - approx. 20 cm for the lower slot (MXI2).
2. Measure the appropriate distance along the cables and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Connect the cable shield to the shield sheet of the Servo Drive 9400.

A Connection to the shield sheet of the Servo Drive 9400

B IncomingINTERBUS line at X206 (IN)

C Outgoing INTERBUS line at X207 (OUT)

D Communication module in slot MXI1 of the Servo Drive 9400



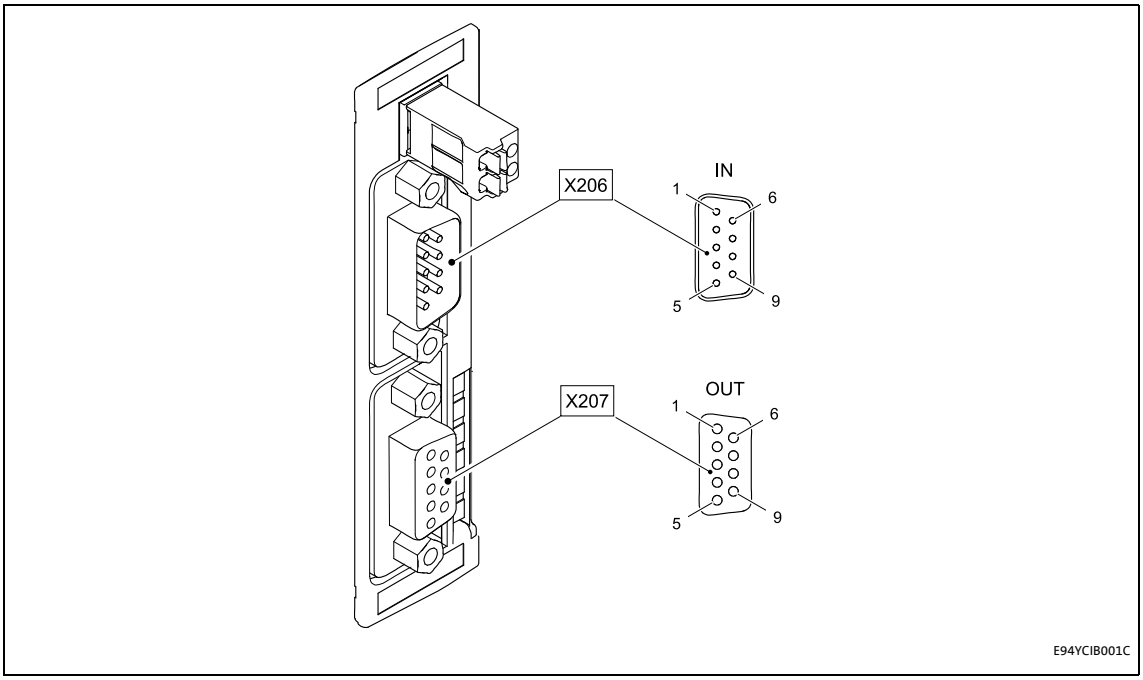
[5-3] Wiring according to EMC guidelines

5.2.2 Wiring of the INTERBUS

For communication with the master and all further components, Servo Drives 9400 have to be assembled with communication modules.

The INTERBUS system has to be designed as a ring. Here, go and return lines are integrated in the same bus cable. The ring comes from the INTERBUS master via all other nodes back again to the master.

An INTERBUS ring can consist of maximally 513 nodes (1 master + further slaves (slaves)).



M: Master (e.g. PLC, Industrial PC)
S1 ... Sn: Slaves

[5-4] INTERBUS ring

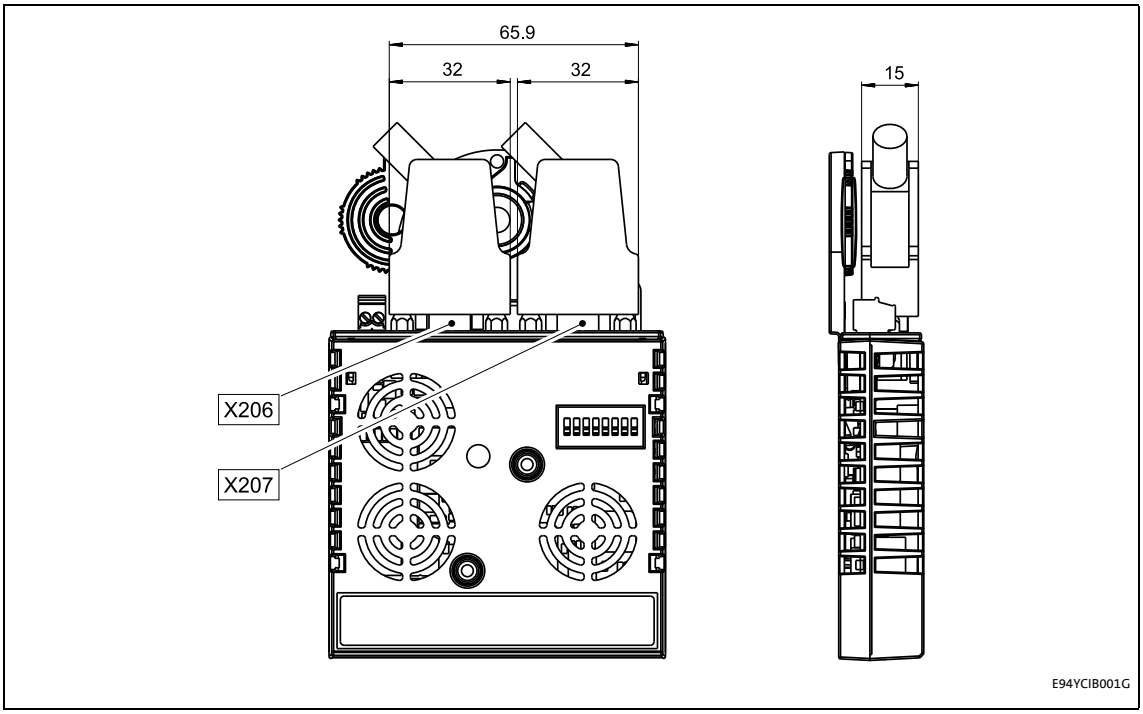
5.2.3 INTERBUS connection

The INTERBUS of the communication module is connected via the 9-pole Sub-D plug **X206** (input) and the 9-pole Sub-D socket **X207** (output).

[5-5] INTERBUS terminals X206 (input) and X207 (output)

Assignment of the 9-pole Sub-D plug X206 (IN)

Pin	Name	Input/output	Description
1	DO1	Input	RS485: DO1 not inverted
2	DI1	Output	RS485: DI1 not inverted
3	GND		Reference potential
4	Free		not assigned
5	Vcc5	Output	5 V DC
6	/DO1	Input	RS485: DO1 inverted
7	/DI1	Output	RS485: DI1 inverted
8	Vcc5	Output	5 V DC
9	Free		not assigned



Assignment of the 9-pole Sub-D socket X207 (OUT)

Pin	Name	Input/output	Description
1	DO2	Output	RS485: DO2 not inverted
2	DI2	Input	RS485: DI2 not inverted
3	GND		Reference potential
4	GND		
5	Vcc5	Output	5 V DC
6	/DO2	Output	RS485: DO2 inverted
7	/DI2	Input	RS485: DI2 inverted
8	Vcc5	Output	5 V DC
9	RBST	Signalling input	Connection to the outgoing INTERBUS is plugged.

5.2.4 Dimensions of 9-pole sub-D connectors

Note!

Comply with the dimensions for width and depth of the 9-pole Sub-D connectors for the INTERBUS terminals X206/X207.

[5-6] Dimensions of 9-pole sub-D connectors

5.2.5 Bus cable specification

The nodes at the bus system must be wired with one of the fieldbus cables that complies with the INTERBUS specification.

A manufacturer of INTERBUS cables is e.g. PHOENIX CONTACT (Germany).

Note!

A cable which does not fulfil the requirements of the INTERBUS specification must not be used!

Properties of the bus cable according to the INTERBUS specification

General properties	
Cable type	Sold by the meter (e.g. PHOENIX CONTACT: IBS RBC meter-T, order no. 28 06 28 6)
No. of conductors	3 x 2, twisted in pairs, with joint shielding
Conductor cross-section	> 0.2 mm^2
DC-cable resistance	< 96 Ω/km
Impedance (characteristic)	• 120 Ω ± 20 % (f = 64 kHz) • 100 Ω ± 15 Ω (f > 1 MHz)
Capacitance per unit length	< 60 nF/km (f = 800 Hz)

5.2.6 Bus cable length

Set the baud rate according to the length of the bus cable between the single INTERBUS nodes:

Baud rate	Cable length between the single INTERBUS nodes
500 kbps	max.400 m
2 Mbps	max. 150 m

Note!

Select the baud rate which depends on the data volume, cycle time, and number of nodes just high enough to suit your application.

▸ Possible settings via DIP switch (📖 30)
▸ Settings in »Engineer« (📖 34)

5.2.7 External voltage supply

The communication module can be externally supplied with voltage via separate supply cables at the 2-pin plug connector **X205**.

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).

External voltage supply of the communication module is required if the communication via the bus should be maintained when the supply of the standard device fails.

The parameters of a standard device separated from the mains cannot be accessed.

Assignment of the plug connector X205

Name	Explanation
+	U = 24 V DC (+/- 10 %) I = 180 mA
-	Reference potential for external voltage supply

Terminal data

Range	Values	
Electrical connection	2-pin plug connector with spring connection	
Possible connections	Rigid:	
		1.5 mm^2 (AWG 16)
	Flexible:	
		Without wire end ferrule 1.5 mm^2 (AWG 16)
		With wire end ferrule, without plastic sleeve 1.5 mm^2 (AWG 16)
		With wire end ferrule, with plastic sleeve 1.5 mm^2 (AWG 16)
Stripping length	9 mm	

6 Commissioning

During commissioning, system-related data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined in the inverter. For Lenze devices, this is done by means of codes.

The codes of the inverter and for communication are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

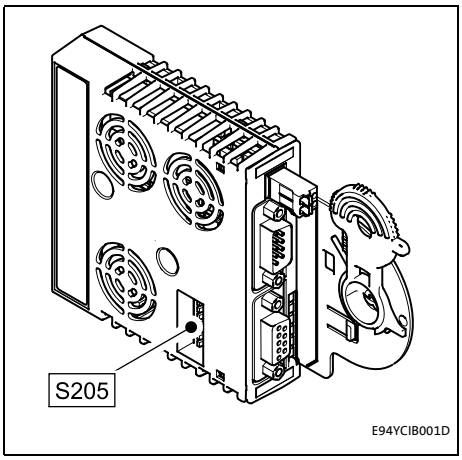
▸ Parameter reference (📖 53)

Note!

When parameterising the communication module, please note that the code number depends on the slot of the standard device into which the communication module is plugged.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  ▸ Parameters of the communication module for slot MXI1 (📖 55)
- C**14**nnn for slot MXI2
  ▸ Parameters of the communication module for slot MXI2 (📖 63)



You also have to set the Parameters of the standard device that are relevant to communication (📖 53).

6.1 Before initial switch-on

Stop!

Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Possible settings via DIP switch

[6-1] DIP switch

The following can be set via the **S205** DIP switch:

- Number of the process data words
  switches: 1 ... 4 (📖 31)
- Number of the parameter data words
  switches: 5 and 6 (📖 32)
- Baud rate
  switch: 8 (📖 33)

Lenze setting: All switches "OFF"

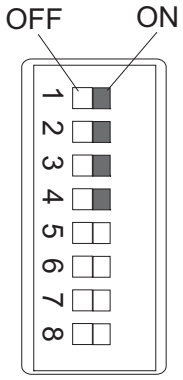
Switch 7 has no function.

Note!

- All DIP switches = "OFF" (Lenze setting):
  At switch-on, the configuration from the codes gets active (Settings in »Engineer« (📖 34)).
- At least one DIP switch = "ON":
  At switch-on, the values are accepted from the switch positions.
- The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).
- Switch off the voltage supply of the communication module and afterwards on again to activate changed settings.

6.2.1 Setting the number of process data words

- The number of process data words can be set via the **switches 1 ... 4**.
- 0 ... 10 process data words can be used.
- The current setting is displayed in the »Engineer« in C13860/2 / C14860/2.



Note!

The data word sum (process data word + parameter data words) has to consist of 1 ... 10 words (16 bits/word).

Impermissible settings are reported by the **BE** LED (red blinking).

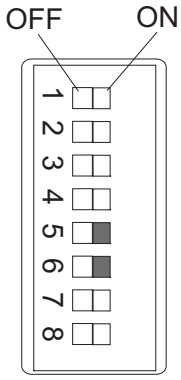
▸ LED status displays (📖 47)

The communication module then operates internally with the following values:
- 2 process data words (PD)
- 1 parameter data word (PCP)

DIP switch	Number of PD	Switch				Max. number of PCP
		1	2	3	4	
	0	OFF	OFF	OFF	OFF	4
	1	OFF	OFF	OFF	**ON**	
	2	OFF	OFF	**ON**	OFF	
	3	OFF	OFF	**ON**	**ON**	
	4	OFF	**ON**	OFF	OFF	
	5	OFF	**ON**	OFF	**ON**	
	6	OFF	**ON**	**ON**	OFF	
	7	OFF	**ON**	**ON**	**ON**	2
	8	**ON**	OFF	OFF	OFF	
	9	**ON**	OFF	OFF	**ON**	1
	10	**ON**	OFF	**ON**	OFF	0

6.2.2 Setting the number of parameter data words

- The number of parameter data words can be set via the **switches 5 and 6**.
- 0, 1, 2 order 4 parameter data words can be used.
- The current setting is displayed in the »Engineer« in C13860/1 / C14860/1.



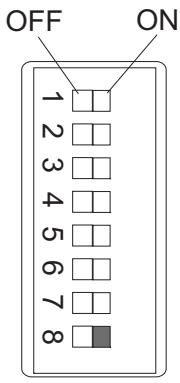
Note!

The data word sum (process data word + parameter data words) has to consist of 1 ... 10 words (16 bits/word).

Impermissible settings are reported by the **BE** LED (red blinking).

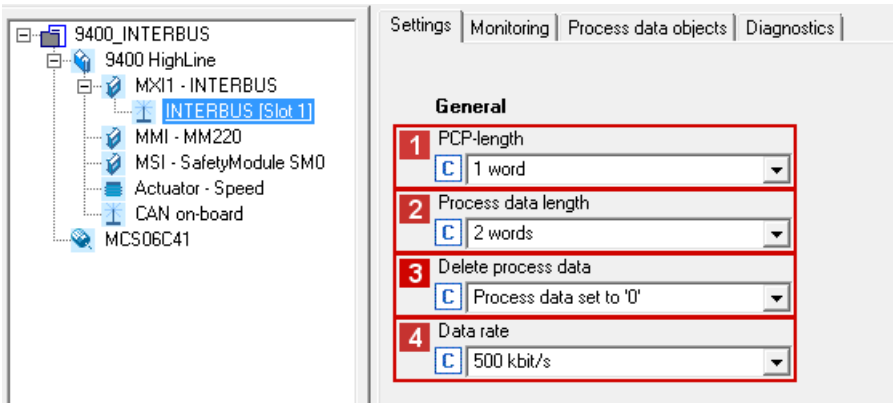
▸ LED status displays (📖 47)

The communication module then operates internally with the following values:
- 2 process data words (PD)
- 1 parameter data word (PCP)



DIP switch	Number of PCP	Switch		Max. number of PD	ID code [hex]
		5	6		
	0	OFF	OFF	10	0x03
	1	OFF	**ON**	9	0xE3
	2	**ON**	OFF	8	0xE0
	4	**ON**	**ON**	6	0xE1

6.2.3 Setting the baud rate



Note!

Select the baud rate which depends on the data volume, cycle time, and number of nodes just high enough to suit your application.

- The baud rate can be set via the **switch 8**.
- Set the baud rate according to the length of the bus cable between the single INTERBUS nodes.
- The current setting is displayed in the »Engineer« in C13863 / C14863.

DIP switch	Switch 8	Baud rate	Cable length between adjacent nodes
	OFF	500 kbps	max. 400 m
	ON	2 Mbps	max. 150 m

6.3 Settings in »Engineer«

Note!

The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).

Impermissible settings are reported by the **BE** LED (red blinking).

▸ LED status displays (📖 47)

The communication module then operates internally with the following values:

- 2 process data words
- 1 parameter data word

Select the baud rate which depends on the data volume, cycle time, and number of nodes just high enough to suit your application.

Setting		Description
1	**PCP data length**	0, 1, 2 or 4 parameter data words can be used (C13892 / C14892).
2	**Process data length**	1 ... 10 process data words can be used (C13893 / C14893).
3	**Clear process data**	Setting (C13885 / C14885) the selection of the process data the Servo Drive 9400 is to process for maintaining the internal communication when the INTERBUS has exited the "IBS-ACTIVE" state. • 0: Use of the last master process data • 1: PDOs are set to the value "0". (Standard setting)
4	**Baud rate**	Set the baud rate (C13894 / C14894) according to the length of the bus cable between the single INTERBUS nodes: • 500 kbps: Max. 400 m between the single nodes • 2 Mbps: Max. 150 m between the single nodes

How to activate changed settings in the »Engineer«:

1. Execute the device command **C00002 = "11: Save start parameters"**.
2. Carry out a "Reset node" of the node, or switch the voltage supply of the communication module off and then on again.

6.4 Initial switch-on

Documentation for the standard device

Observe the safety instructions and information on residual hazards.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

For further communication of the externally supplied module it is not relevant whether the standard device is switched on or not.

Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

The restart behaviour of the inverter can be set via **C00142** ("auto restart after mains connection"):

C00142 = "0: Inhibited" (Lenze setting)

- The inverter remains inhibited (even if the fault is no longer active).
- An explicit controller enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.

C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

7 Data transfer

The INTERBUS transmits parameter data, configuration data, diagnostic data, alarm messages and process data between the host (master) and the inverters (slaves) participating in the fieldbus. Depending on their time-critical nature, the data are transmitted via different communication channels.

Communication channels

The **process data channel** transmits process data.

- The process data serve to control the inverter.
- The transmission of process data is time-critical.
- Process data are cyclically transferred between the host (master) and the inveters connected to the fieldbus (slaves) (continuous exchange of current input and output data).
- The host (master) can directly access the process data. In the PLC, for instance, the data are directly saved to the IO area.
- 0 ... 10 process data words can be used.
- Process data are not saved in the inverter.
- Process data are e.g. setpoints, actual values, control words, and status words.

The **parameter data channel** serves to transfer parameter data.

- The parameter data channel provides access to all Lenze codes.
- The transmission of parameter data is usually not time-critical.
- Parameter data are, for instance, operating parameters, diagnostic information, and motor data.
- 0, 1, 2 order 4 parameter data words can be used.
- The parameter data is transmitted in accordance with the Peripherials Communication Protocol (PCP).
- The parameter data channel is identical for both transmission directions.

Note!

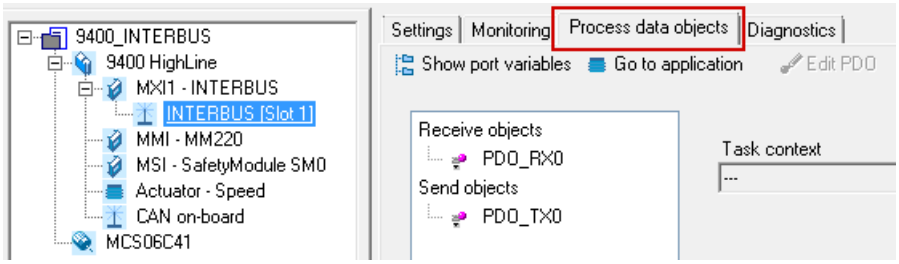
The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).

Please observe the direction of the flow of information:

- Input data (Rx data): Process data from the inverter (slave) to the master
- Output data (Tx data): Process data from the master to the inverter (slave)

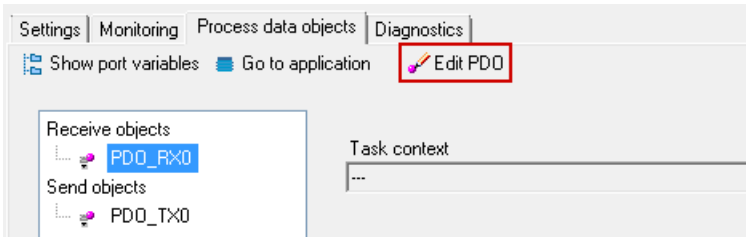
8 Process data transfer

Configuring process data (PDO mapping)



The Servo Drives 9400 enable the individual mapping of process data. For this purpose, the »Engineer« is provided with a port configurator.

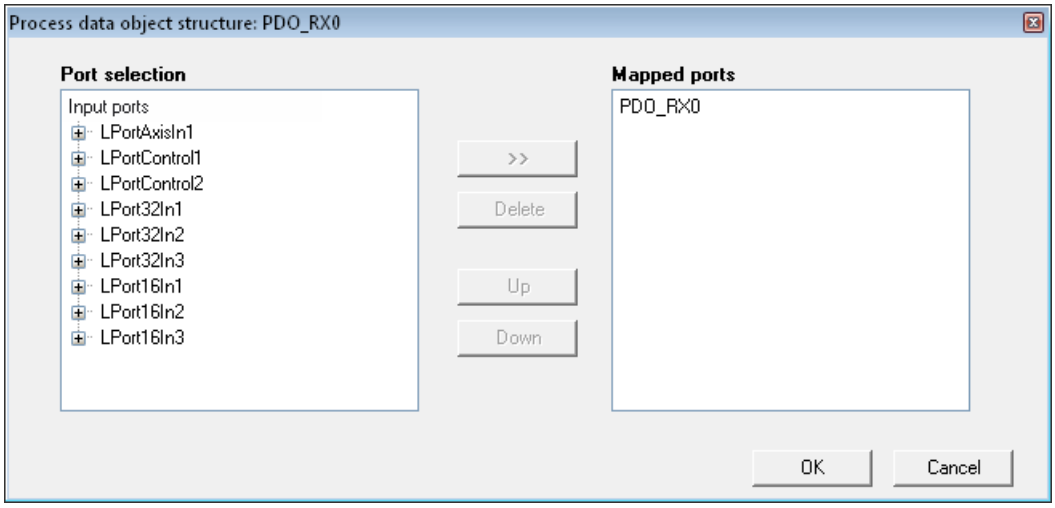
Note!



- The port mapping for the Servo Drive 9400 is no configuration that can be carried out online. For this purpose, an update of the »Engineer« project and a subsequent download of the application is always required.
- The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).

How to set the PDO mapping with the »Engineer«:

1. The process data mapping to the port variables is executed in the »Engineer« under the **Process data objects** tab of the corresponding fieldbus communication module:



2. Select the receive object **PDO_RX0**:

3. Click the **Edit PDO** button.

   The selection window for editing the process data object is opened:

   Here you can transfer the individual ports from the **Port Selection** list to the receive PDO "PDO_RX0" by clicking the **>>** button.

   The **Up** and **Down** buttons serve to shift the sequence of the ports within the PDOs.

4. Confirm the selection with **OK**.
5. Repeat the steps 2. to 4. for the transmit object **PDO_TX0**.
6. Then link the ports to application signals in the technology application selected.

   The »FB Editor« can be activated in the multiplexer codes (> C03000), if necessary.

   If the »FB Editor« is activated, the multiplexer codes (> C03000) are no longer available. In this case, you must carry out the interconnection directly in the »FB Editor«.

9 Parameter data transfer

The parameter data of Lenze devices are contained in codes which are listed in this documentation and the documentation of the Servo Drive 9400.

▸ Parameter reference (📖 53)

9.1 Addressing of the parameter data

The parameters of a Lenze device are not directly addressed via codes but via an index and subindex.

The conversion is made via an offset: 24575 or 0x5FFF

- INTERBUS index (decimal) = 24575 - Lenze code number (decimal)
- INTERBUS index (hexadecimal) = 0x5FFF - Lenze code number (hexadecimal)

Example of **C00105** (deceleration time quick stop (QSP)):

- INTERBUS index (decimal) = 24575 - 105 = 24470
- INTERBUS index (hexadecimal) = 0x5FFF - 0x69 = 0x5F96

Parameter changes must be saved via code **C00002** of the Servo Drive 9400.

9.2 Initialising PCP communication

Make entries into the CRL (communication relation list) in order that communication between the INTERBUS master and the communication module can take place.

Make the following entries in the CRL of the INTERBUS master:

Field name	Entry
Communication reference	2
Connection type	Master slave acyclic
Connection attribute	Defined
Max-PDU Sending-High-Prio	0
Max-PDU Sending-Low-Prio	64
Max-PDU Receiving-High-Prio	0
Max-PDU Receiving-Low-Prio	64
Supported Services Request	0x803000
Supported Services Response	0x000000
Maximum SCC	1
Maximum RCC	1
Maximum SAC	1
Maximum RAC	1

9.3 Supported PMS services

The parameter data is transferred via PMS services.

In the following, only parameters and their contents are given that are returned by the Lenze inverters. All other transfer parameters of the given PMS services can be obtained from the corresponding descriptions of the INTERBUS master.

The following PMS services are supported by Lenze inverters:

- Initiate: Establish a connection of the INTERBUS master to the inverter
- Abort: Abort connection
- Reject: Reject impermissible PMS service
- Read: Read parameters
- Write: Write parameters
- Get-OD: Read out the object directory
- Identify: Identification of the inverter
- Status: Read the status of the inverter

9.3.1 Initiate

The "Initiate" PMS service establishes a logic connection between the INTERBUS master and the communication module.

The inverter provides the following parameters:

Name	Value	Description
Profile number	0	No profile is supported.
Password	0	The password function of INTERBUS is not supported.
Access groups	0	No access groups exist.
Access-Protection Supported	TRUE	Access protection is supported.
Version OD	0	Version of the object directory

9.3.2 Abort

The "Abort" PMS service aborts a logic connection between the INTERBUS master and the communication module.

9.3.3 Reject

The "Reject" PMS service rejects a non-supported PMS service.

9.3.4 Read/Write

The "Read" PMS service reads parameters from the inverter. The inverter outputs the requested parameter or an error message.

The "Write" PMS service writes on parameters of the inverter. The inverter outputs a positive feedback or an error message.

The following error messages can occur:

Error Class	Error code	Additional Code [hex]	Description
6	3	0x00	No access authorisation
6	5	0x10	Impermissible job parameter
6	5	0x11	Invalid subindex
6	5	0x12	Data length too large
6	5	0x13	Data length too small
6	6	0x00	Object is no parameter
6	7	0x00	Object does not exist
6	8	0x00	Data types do not comply with each other
8	0	0x00	Request cannot be executed
8	0	0x20	Request cannot be executed at the moment
8	0	0x21	Cannot be executed because of local control
8	0	0x22	Cannot be executed because of device state
8	0	0x30	Quit value range / parameter can only be changed when the controller is inhibited.
8	0	0x31	Parameter value too high
8	0	0x32	Parameter value too low
8	0	0x33	Sub parameter outside the value range
8	0	0x34	Value of the subparameter is too high
8	0	0x35	Value of the subparameter is too low
8	0	0x36	Maximum value is lower than minimum value
8	0	0x41	Communication object cannot be displayed on process data
8	0	0x42	Length of the process data exceeded
8	0	0x43	General collision with other values

9.3.5 Get-OD

The "Get-OD" PMS service reads out the object description for every parameter and data type.

9.3.6 Identify

The P "Identify" MS service provides information on how to identify the inverter.

The inverter with the plugged-on communication module provides the following parameters for this:

Parameter	Type	Description
Device manufacturer	Visible string	Company name "Lenze"
Device type	Visible-string (15 characters)	Device name for inverter and communication module
Device version	Visible-string (15 characters)	Firmware version of the inverter and the communication module

Example: Visible string "device type" (15 characters)

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
E	9	4		A	F	H	B		A	F	C	I	B	

Character	Description
1 ... 3	Product range of the inverter and the communication module ("E94" = 9400 series)
4	Blank
5 ... 8	Firmware of the inverter (from C00200/0) • Character 5: Version ("A" = 1st generation) • Character 6 ... 8: Firmware version • "FHB" = Servo Drive 9400 HighLine • "FRB" = Servo Drive 9400 regenerative power supply module • "VPB" = Servo Drive 9400 PLC
9	Blank
10 ... 14	Firmware of the communication module (from C13900 / C14900) • Character 10: Version ("A" = 1st generation) • Characters 11 ... 14: Firmware version • "FCIB" = INTERBUS module
15	Blank

Example: Visible string "device version" (15 characters)

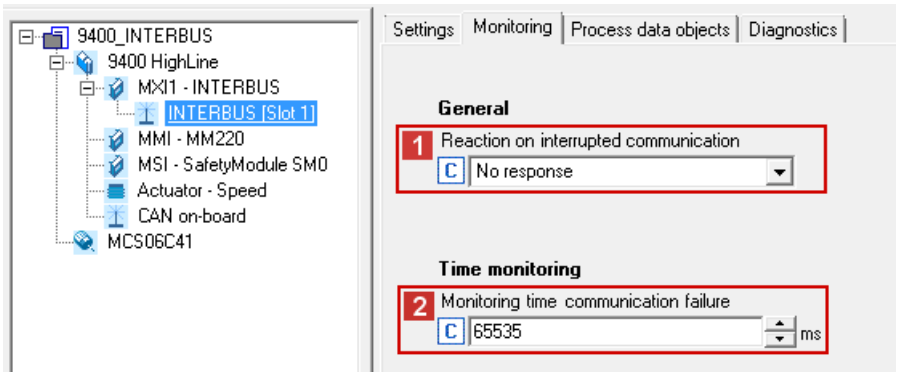
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	5	.	0	0		0	1	.	0	0				

Character	Description
1 ... 5	Firmware version of the inverter (from C00099/0 = "05.00.xx.yy", without internal revision status ["xx"] and build status ["yy"])
6	Blank
7 ... 11	Firmware version of the communication module (from C13902 / C14902 = "01.00.xx", without internal revision status ["xx"])
12...15	Blank

9.3.7 Status

The "Status" PMS service provides status information about the inverter.

The inverter provides the following values:



Status	Value	Description
Logical status	0 = ready for communication	Information about the current operating mode of the inverter with regard to communication
Physical status	• 0 = ready for operation (device state "OPERATION ENABLED") • 1 = ready for operation to a limited extent (all other device states)	Information about the current operating status of the inverter.
Local Detail	0	Is not supported.

10 Monitoring

10.1 Interruption of the INTERBUS communication

An interruption of the INTERBUS communication, e.g. by cable break or failure of the host (PLC, master), is recognised by the communication module.

Responses to communication faults can be set in the **Monitoring** tab:

Settings		Description
1	**Response to interrupted INTERBUS communication**	When the INTERBUS communication is interrupted, the response set here (C13880/1 / C14880/1) takes place in the inverter. A change in the monitoring response becomes immediately effective.
2	**Response time if the INTERBUS communication** is interrupted	If the "IBS-ACTIVE" status (INTERBUS active, cyclic data exchange) is left, the response set under 1 takes place after the response time set here (C13881 / C14881) has elapsed. • A value of "65535" in this code deactivates the monitoring function. • A change in the monitoring is immediately effective. • The monitoring time elapses when the "IBS-ACTIVE" status is left. • After this response delay has elapsed, the response set is executed with the error message "INTERBUS: Data exchange stopped [0x00c88131]" (📖 52).

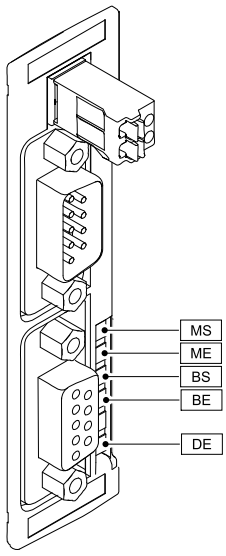
If the Servo Drive 9400 does not receive any valid process data in the "IBS-ACTIVE" state, the setting in C13885 / C14885 is taken as a basis for the process data. (Like this the data sent last by the master can be used or reset to zero.)

▸ Settings in »Engineer« (📖 34)

10.2 Interruption of internal communication

The response to a communication error between the communication module and the Servo Drive 9400 can be set via these codes:

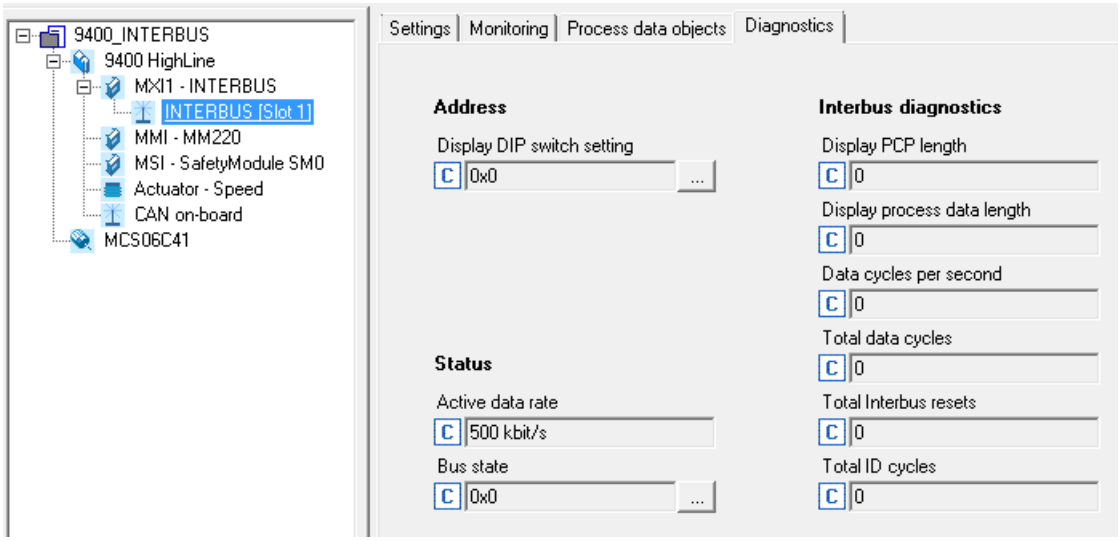
- C01501 (module in slot MXI1)
- C01502 (module in slot MXI2)



11 Diagnostics

For purposes of fault diagnostics, the communication module is provided with the LEDs on the front. Furthermore you can carry out the Diagnosing with the »Engineer« (📖 48).

11.1 LED status displays



Note!

During normal operation, the LED **BS** blinks and the LED **MS** is permanently lit.

LEDs	Pos.	Colour	Status	Description
	MS	Green	On	The communication module is supplied with voltage and is connected to the standard device.
			Blinking	The communication module is supplied with voltage, but has no connection to the standard device. (The standard device is either switched off, in the initialisation phase, or not available).
	ME	Red	On	An error has occurred in the communication module.
	BS	Green	Blinking	The INTERBUS communication has been established via the communication module. The INTERBUS is active. Data cycles are executed.
			Off	The communication module is not active at the fieldbus. Data cycles are not executed.
	BE	Red	On	The INTERBUS communication has been interrupted. Data cycles are not executed.
			Blinking	Impermissible setting: • Process data words + parameter data words > 10 • Process data words + parameter data words = 0 The communication module has been initialised and operates internally with the following values: • 2 process data words • 1 parameter data word
	DE	Red	On	The communication module is not accepted by the basic device or the basic device is not active (see notes in the documentation relating to the basic device.)

11.2 Diagnosing with the »Engineer«

In the »Engineer« under the **Diagnostics** tab, you will find INTERBUS diagnostics information.

Querying the current bus status

C13861 / C14861 displays the bus status of the INTERBUS node:

Value C13861/14861 [hex]	Bus status	Description
0xyyy0	IBS-INIT	Initialisation
0xyyy1	IBS-ACTIVE	The bus is active. Data cycles are executed.
0xyyy2	IBS-READY	The bus is ready for operation. No data cycles are executed.
yyy = device-internal use		

12 Error messages

This chapter supplements the error list for the Servo Drive 9400 contained in the reference manual and in the »Engineer« online help with the error messages of the communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

12.1 Short overview of the INTERBUS error messages

The following table lists all INTERBUS error messages in the numerical order of the error numbers. Furthermore, the preset error response and - if available - the parameter for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Name	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c85531	13129009	INTERBUS: No access to the memory	6: Information	-
0x00c85532	13129010	INTERBUS: Error while reading the memory	6: Information	-
0x00c85533	13129011	INTERBUS: Error while writing into the memory	6: Information	-
0x00c86010	13131792	INTERBUS: Internal error	1: No Response	-
0x00c86011	13131793	INTERBUS: Internal error	1: No Response	-
0x00c86100	13132032	INTERBUS: Internal error	1: No Response	-
0x00c86101	13132033	INTERBUS: Internal error	1: No Response	-
0x00c86110	13132048	INTERBUS: Internal mapping error	4: Warning locked	-
0x00c8641f	13132831	INTERBUS: Parameter set invalid	1: No Response	-
0x00c86420	13132832	INTERBUS: Lenze setting loaded	1: No Response	-
0x00c88125	13140261	INTERBUS: Invalid configuration	5: Warning	-
0x00c88126	13140262	INTERBUS: Reset of communication	1: No Response	-
0x00c88127	13140263	INTERBUS: Invalid initialisation	5: Warning	-
0x00c88131	13140273	INTERBUS: Data exchange stopped	None	C13880/1 / C14880/1
0x00c88211	13140497	INTERBUS: Received process data length is contradictory	5: Warning	-
0x00c88212	13140498	INTERBUS: Process data length to be sent is contradictory	5: Warning	-

12.2 Possible causes and remedies

This chapter lists all INTERBUS error messages in the numerical order of the error numbers. Possible causes and remedies as well as responses to the error messages are described in detail.

INTERBUS: No access to memory [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Memory could not be accessed.	Send module with error description to Lenze.

INTERBUS: Error while reading the memory [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be read.	Send module with error description to Lenze.

INTERBUS: Error while writing into the memory [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be written.	Send module with error description to Lenze.

INTERBUS: Internal error [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Module is defective.	Send module with error description to Lenze.

INTERBUS: Internal error [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Module is defective.	Send module with error description to Lenze.

INTERBUS: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Module is defective.	Send module with error description to Lenze.

INTERBUS: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error	Send module with error description to Lenze.

INTERBUS: Internal mapping error [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The selected PDO mapping is invalid: • An object not supporting the required properties has been specified. • The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/ word).	Repeat Configuring process data (PDO mapping) (📖 37).

INTERBUS: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Download application again (including module).

INTERBUS: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access via standard device to the parameter set in the memory module failed.	Download application again (including module).

INTERBUS: Invalid configuration [0x00c88125]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
The active configuration is invalid: • Process data words + parameter data words > 10 • Process data words + parameter data words = 0 The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/ word).	Adapt the number of process data words and parameter data words: • Process data words + parameter data words = 1 ... 10

INTERBUS: Reset of the communication stack [0x00c88126]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ warning ☐ Information	

Cause	Remedy
Error when processing the INTERBUS services	Execute renewed initialisation by the master.

INTERBUS: Invalid initialisation [0x00c88127]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
The INTERBUS initialisation has failed.	Execute renewed initialisation by the master.

INTERBUS: Data exchange stopped [0x00c88131]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1
☒ **None** ☐ System fault ☒ Fault ☐ Trouble ☒ Quick stop by trouble ☒ Warning locked ☐ Warning ☒ Information	

Cause	Remedy
Data exchange via INTERBUS has been stopped.	• Check cables and terminals. • Execute renewed initialisation by the master.

INTERBUS: Received process data length is contradictory [0x00c88211]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
The number of received I/O data via INTERBUS (display in C13860/2 / C14860/2) does not correspond to the number configured by the device through port mapping (display in C13854/1 / C14854/1). The data word sum (process data word + parameter data words) has to consist of 1 ... 10 words (16 bits/word).	Check whether the differing data length is sufficient for the application. If required, adapt the port mapping or the I/O data length of the received data. ▸ Configuring process data (PDO mapping) (📖 37) ▸ Setting the number of process data words (📖 31)

INTERBUS: Process data length to be sent is contradictory [0x00c88212]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
The number of I/O data to be sent via INTERBUS (display in C13860/2 / C14860/2) does not correspond to the number configured by the device through port mapping (display in C13855/1 / C14855/1). The data word sum (process data word + parameter data words) has to consist of 1 ... 10 words (16 bits/word).	Check whether the differing data length is sufficient for the application. If required, adapt the port mapping or the I/O data length of the data to be sent. ▸ Configuring process data (PDO mapping) (📖 37) ▸ Setting the number of process data words (📖 31)

13 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the reference manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCIB (INTERBUS) communication module.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you will find general information on parameters.

13.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response to impermissible device configuration		
Selection list		
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No Response	Reserved
C00615/2	1: No Response	Resp. to imp. module in MXI1
C00615/3	1: No Response	Resp. to imp. module in MXI2
C00615/4	0: No Response	Reserved
C00615/5	0: No Response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response for the case where a new module has been plugged into slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response if a new module has been plugged into module slot 2 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 1 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

13.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCIB communication module (INTERBUS) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C13231

Parameter | Name: **C13231 | Service code**			Data type: UNSIGNED_64 Index: 11344 = 0x2C50
This code is for device-internal use only and must not be written to by the user.			
Value is bit-coded:			**Info**
Bit 0	Bit 0		
...	...		
Bit 63	Bit 63		
Subcodes	**Lenze setting**		**Info**
C13231/1	0		
...	...		
C13231/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13489

Parameter | Name: **C13489 | Service code**			Data type: UNSIGNED_8 Index: 11086 = 0x2B4E
This code is for device-internal use only and must not be written to by the user.			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C13489/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13531

Parameter | Name: **C13531 | Service code**			Data type: UNSIGNED_64 Index: 11044 = 0x2B24
This code is for device-internal use only and must not be written to by the user.			
Value is bit-coded:			**Info**
Bit 0	Bit 0		
...	...		
Bit 63	Bit 63		
Subcodes	**Lenze setting**		**Info**
C13531/1	0		
...	...		
C13531/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13789

Parameter | Name: **C13789 | Service code**			Data type: UNSIGNED_8 Index: 10786 = 0x2A22
This code is for device-internal use only and must not be written to by the user.			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C13789/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13850

Parameter | Name: **C13850 | All words from drive to master**			Data type: UNSIGNED_16 Index: 10725 = 0x29E5
Display of the process data words which are transmitted from the communication module to the master. • In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13850/1			
...			
C13850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13851

Parameter | Name: **C13851 | All words from master to drive**			Data type: UNSIGNED_16 Index: 10724 = 0x29E4
Display of the process data words which are transmitted from the master to the communication module. • In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13851/1			
...			
C13851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13852

Parameter | Name: **C13852 | All words to the basic device**			Data type: UNSIGNED_16 Index: 10723 = 0x29E3
Display of the process data words which are transmitted from the communication module to the standard device. • In the subcodes 1 ... 32, all process data words from the communication module are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13852/1			
...			
C13852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13853

Parameter | Name: **C13853 | All words to the basic device**			Data type: UNSIGNED_16 Index: 10722 = 0x29E2
Display of the process data words which are transmitted from the standard device to the communication module. • In the subcodes 1 ... 32, all process data words from the standard device are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13853/1			
...			
C13853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13854

Parameter | Name: **C13854 | Length of ports mapped into receive PDO**			Data type: UNSIGNED_8 Index: 10721 = 0x29E1
Display of the total data length (in bytes) of the ports that have been entered into the receive PDO. The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word). ▸ Configuring process data (PDO mapping) (📖 37)			
Display area (min. value | unit | max. value)			
0		64	
Subcodes			**Info**
C13854/1			Length of the ports entered into the receive PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13855

Parameter | Name: **C13855 | Length of ports mapped into send PDO**			Data type: UNSIGNED_8 Index: 10720 = 0x29E0
Display of the total data length (in bytes) of the ports that have been entered into the send PDO. The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word). ▸ Configuring process data (PDO mapping) (📖 37)			
Display area (min. value | unit | max. value)			
0		64	
Subcodes			**Info**
C13855/1			Length of the ports entered into the send PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13860

Parameter | Name: **C13860 | Settings**			Data type: UNSIGNED_8 Index: 10715 = 0x29DB
Display of the set number of the • Parameter data words • Process data words The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).			
Display area (min. value | unit | max. value)			
0		10	
Subcodes			**Info**
C13860/1			Display of parameter data length (PCP)
C13860/2			Display of process data length
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13861

Parameter | Name: **C13861 | Bus status**		Data type: BITFIELD_16 Index: 10714 = 0x29DA
Display of the current bus status Meaning of the resulting hexadecimal values: • 0xyyy0 = IBS-INIT • 0xyyy1 = IBS-ACTIVE • 0xyyy2 = IBS-READY ▸ Querying the current bus status (📖 48)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 15	Bit 15	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13862

Parameter | Name: **C13862 | Counter**			Data type: UNSIGNED_16 Index: 10713 = 0x29D9
Counter for cycles and INTERBUS resets			
Display area (min. value | unit | max. value)			
0		65535	

Subcodes	Info
C13862/1	Data cycles per second
C13862/2	Total data cycles
C13862/3	Number of INTERBUS resets
C13862/4	Number of ID cycles

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13863

Parameter | Name: **C13863 | Active baud rate**		Data type: UNSIGNED_8 Index: 10712 = 0x29D8
Display of the set baud rate		
Selection list (read only)		**Info**
0	500 kbps	
1	2.00 Mbps	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13880

Parameter | Name: **C13880 | Monitoring Reaction**		Data type: UNSIGNED_8 Index: 10695 = 0x29C7
Monitoring response in case of a communication fault • A change in the monitoring response becomes immediately effective. ▸ Interruption of the INTERBUS communication (📖 45)		
Selection list		**Info**
0	No response	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	

Subcodes	Lenze setting	Info
C13880/1	0: No Response	Response to interrupted INTERBUS communication

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13881

Parameter | Name: **C13881 | Response time if the INTERBUS communication is interrupted**			Data type: UNSIGNED_16 Index: 10694 = 0x29C6
If the "IBS-ACTIVE" status (INTERBUS is active and data is cyclically exchanged) is quit, the response parameterised in C13880/1 is executed after the monitoring time set for the data exchange has elapsed. • A value of "65535" in this code deactivates the monitoring function. • A change in the monitoring is immediately effective. ▸ Interruption of the INTERBUS communication (📖 45)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**65535 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13885

Parameter | Name: **C13885 | Clear process data**		Data type: UNSIGNED_8 Index: 10690 = 0x29C2
Setting which process data of the inverters are to be further processed for maintaining the internal communication if the INTERBUS failed.		
Selection list (Lenze setting printed in bold)		**Info**
0	Use of the last master process data	
1	**Process data are set to the value '0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13892

Parameter | Name: **C13892 | PCP data length**		Data type: UNSIGNED_8 Index: 10683 = 0x29BB
Setting of the number of the parameter data words to be used (PCP) The setting is activated ... • if all DIP switches (S205) are in the "OFF" position; • after executing the "11: Save start parameters" device command via standard device code C00002 and performing another mains switching of the communication module/drive afterwards. ▸ Setting the number of process data words (📖 31)		
Selection list (Lenze setting printed in bold)		**Info**
0	No PCB data	
1	**1 word**	
2	2 words	
4	4 words	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13893

Parameter | Name: **C13893 | Process data length**		Data type: UNSIGNED_8 Index: 10682 = 0x29BA
Setting of the number of the process data words to be used The setting is activated ... • if all DIP switches (S205) are in the "OFF" position; • after executing the "11: Save start parameters" device command via standard device code C00002 and performing another mains switching of the communication module/drive afterwards. ▸ Setting the number of process data words (📖 31)		
Selection list (Lenze setting printed in bold)		**Info**
0	No process data	
1	1 word	
2	**2 words**	
3	3 words	
4	4 words	
5	5 words	
6	6 words	
7	7 words	
8	8 words	
9	9 words	
10	10 words	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13894

Parameter | Name: **C13894 | Baud rate**		Data type: UNSIGNED_8 Index: 10681 = 0x29B9
setting the baud rate The setting is activated ... • if all DIP switches (S205) are in the "OFF" position; • after executing the "11: Save start parameters" device command via standard device code C00002 and performing another mains switching of the communication module/drive afterwards. ▸ Setting the baud rate (📖 33)		
Selection list (Lenze setting printed in bold)		**Info**
0	**500 kbps**	
1	2.00 Mbps	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT		

C13900

Parameter | Name: **C13900 | Firmware product type**	Data type: VISIBLE_STRING Index: 10675 = 0x29B3
Display of the product type (string with a length of 8 bytes) • The following identification code is displayed: "E94AFCIB".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13901

Parameter | Name: **C13901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: 10674 = 0x29B2
Display of the compilation date of the firmware (string with a length of 20 bytes) • The date ("MMM TT JJJJ") and the time ("hh:mm:ss") are output, e.g. "Mar 21 2005 12:31:21".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13902

Parameter | Name: **C13902 | Firmware version**	Data type: VISIBLE_STRING Index: 10673 = 0x29B1
Display of the firmware version (string with a length of 8 bytes) The identification code is output, e.g. "01.00.00".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13920

Parameter | Name: **C13920 | Display of DIP switch position**		Data type: BITFIELD_8 Index: 10655 = 0x299F
Display of the current DIP switch position • The set parameter data length (PCP) is displayed in C13860/1. • The set process data length is displayed in C13860/2. • The set baud rate is displayed in C13863. ▸ Possible settings via DIP switch (📖 30)		
Value is bit-coded:		**Info**
Bit 0	DIP 8	Baud rate
Bit 1	DIP 7	No response
Bit 2	DIP 6	Number of parameter data words (PCP)
Bit 3	DIP 5	
Bit 4	DIP 4	Number of process data words
Bit 5	DIP 3	
Bit 6	DIP 2	
Bit 7	DIP 1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

13.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCIB communication module (INTERBUS) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C14231

Parameter | Name: **C14231 | Service code**			Data type: UNSIGNED_64 Index: 10344 = 0x2868
This code is for device-internal use only and must not be written to by the user!			
Value is bit-coded:		**Info**	
Bit 0	Bit 0		
...	...		
Bit 63	Bit 63		
Subcodes	**Lenze setting**	**Info**	
C14231/1	0		
...	...		
C14231/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14489

Parameter | Name: **C14489 | Service code**			Data type: UNSIGNED_8 Index: 10086 = 0x2766
This code is for device-internal use only and must not be written to by the user!			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**	**Info**	
C14489/1	0	Service code	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14531

Parameter | Name: **C14531 | Service code**			Data type: UNSIGNED_64 Index: 10044 = 0x273C
This code is for device-internal use only and must not be written to by the user!			
Value is bit-coded:		**Info**	
Bit 0	Bit 0		
...	...		
Bit 63	Bit 63		
Subcodes	**Lenze setting**	**Info**	
C14531/1	0		
...	...		
C14531/32	0		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14789

Parameter | Name: **C14789 | Service code**			Data type: UNSIGNED_8 Index: 9786 = 0x263A
This code is for device-internal use only and must not be written to by the user!			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**		**Info**
C14789/1	0		Service code
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14850

Parameter | Name: **C14850 | All words to master**			Data type: UNSIGNED_16 Index: 9725 = 0x25FD
Display of the process data words which are transmitted from the communication module to the master. • In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14850/1			
...			
C14850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14851

Parameter | Name: **C14851 | All words from master**			Data type: UNSIGNED_16 Index: 9724 = 0x25FC
Display of the process data words which are transmitted from the master to the communication module. • In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14851/1			
...			
C14851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14852

Parameter | Name: **C14852 | All words to standard device**			Data type: UNSIGNED_16 Index: 9723 = 0x25FB
Display of the process data words 1 ... 32 transferred from the communication module to the standard device. • In the subcodes 1 ... 32, all process data words from the communication module are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14852/1			
...			
C14852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14853

Parameter | Name: **C14853 | All words from standard device**			Data type: UNSIGNED_16 Index: 9722 = 0x25FA
Display of the process data words 1 ... 32 transferred from the standard device to the communication module. • In the subcodes 1 ... 32, all process data words from the standard device are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14853/1			
...			
C14853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14854

Parameter | Name: **C14854 | Length of ports mapped into receive PDO**			Data type: UNSIGNED_8 Index: 9721 = 0x25F9
Display of the total data length (in bytes) of the ports that have been entered into the receive PDO. The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word). ▸ Configuring process data (PDO mapping) (📖 37)			
Display area (min. value | unit | max. value)			
0		64	
Subcodes			**Info**
C14854/1			Length of the ports entered into the receive PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14855

Parameter | Name: **C14855 | Length of ports mapped into send PDO**			Data type: UNSIGNED_8 Index: 9720 = 0x25F8
Display of the total data length (in bytes) of the ports that have been entered into the send PDO. The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word). ▸ Configuring process data (PDO mapping) (📖 37)			
Display area (min. value | unit | max. value)			
0		64	
Subcodes			**Info**
C14855/1			Length of the ports entered into the send PDO
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14860

Parameter | Name: **C14860 | Settings**			Data type: UNSIGNED_8 Index: 9715 = 0x25F3
Display of the set number of the • Parameter data words • Process data words The data word sum (process data words + parameter data words) has to consist of 1 ... 10 words (16 bits/word).			
Display area (min. value | unit | max. value)			
0		10	
Subcodes			**Info**
C14860/1			Display of parameter data length (PCP)
C14860/2			Display of process data length
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14861

Parameter | Name: **C14861 | Bus status**		Data type: BITFIELD_16 Index: 9714 = 0x25F2
Display of the current bus status Meaning of the resulting hexadecimal values: • 0xyyy0 = IBS-INIT • 0xyyy1 = IBS-ACTIVE • 0xyyy2 = IBS-READY ▸ Querying the current bus status (📖 48)		
Value is bit-coded:		**Info**
Bit 0	Bit 0	
...	...	
Bit 15	Bit 15	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14862

Parameter | Name: **C14862 | Counter**			Data type: UNSIGNED_16 Index: 9713 = 0x25F1
Counter for cycles and INTERBUS resets			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14862/1			Data cycles per second
C14862/2			Total data cycles
C14862/3			Number of Interbus resets
C14862/4			Number of ID cycles
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14863

Parameter | Name: **C14863 | Active baud rate**		Data type: UNSIGNED_8 Index: 9712 = 0x25F0
Display of the set baud rate		
Selection list (read only)		**Info**
0	500 kbps	
1	2.00 Mbps	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14880

Parameter | Name: **C14880 | Reaction on communication fault**			Data type: UNSIGNED_8 Index: 9695 = 0x25DF
Monitoring response in case of a communication fault • A change in the monitoring response becomes immediately effective. ▸ Interruption of the INTERBUS communication (📖 45)			
Selection list			**Info**
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**		**Info**
C14880/1	0: No Response		Response to interrupted INTERBUS communication
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14881

Parameter | Name: **C14881 | Response time if the INTERBUS communication is interrupted**			Data type: UNSIGNED_16 Index: 9694 = 0x25DE
If the "IBS-ACTIVE" status (INTERBUS is active and data is cyclically exchanged) is quit, the response parameterised in C14880/1 is executed after the monitoring time set for the data exchange has elapsed. • A value of "65535" in this code deactivates the monitoring function. • A change in the monitoring is immediately effective. ▸ Interruption of the INTERBUS communication (📖 45)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**65535 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14885

Parameter | Name: **C14885 | Clear process data**		Data type: UNSIGNED_8 Index: 9690 = 0x25DA
Setting which process data of the inverters are to be further processed for maintaining the internal communication if the INTERBUS failed.		
Selection list (Lenze setting printed in bold)		**Info**
0	Use of the last master process data	
1	**Process data are set to the value '0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14892

Parameter | Name: **C14892 | PCP data length**		Data type: UNSIGNED_8 Index: 9683 = 0x25D3
Setting of the number of the parameter data words to be used (PCP) The setting is activated ... • if all DIP switches (S205) are in the "OFF" position; • after executing the "11: Save start parameters" device command via standard device code C00002 and performing another mains switching of the communication module/drive afterwards. ▸ Setting the number of process data words (📖 31)		
Selection list (Lenze setting printed in bold)		**Info**
0	No PCB data	
1	**1 word**	
2	2 words	
4	4 words	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14893

Parameter | Name: **C14893 | Process data length**	Data type: UNSIGNED_8 Index: 9682 = 0x25D2

Setting of the number of the process data words to be used
The setting is activated ...
- if all DIP switches (S205) are in the "OFF" position;
- after executing the "11: Save start parameters" device command via standard device code C00002 and performing another mains switching of the communication module/drive afterwards.

▸ Setting the number of process data words (📖 31)

Selection list (Lenze setting printed in bold)		**Info**
0	No process data	
1	1 word	
2	**2 words**	
3	3 words	
4	4 words	
5	5 words	
6	6 words	
7	7 words	
8	8 words	
9	9 words	
10	10 words	

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14894

Parameter | Name: **C14894 | Baud rate**	Data type: UNSIGNED_8 Index: 9681 = 0x25D1

setting the baud rate
The setting is activated ...
- if all DIP switches (S205) are in the "OFF" position;
- after executing the "11: Save start parameters" device command via standard device code C00002 and performing another mains switching of the communication module/drive afterwards.

▸ Setting the baud rate (📖 33)

Selection list (Lenze setting printed in bold)		**Info**
0	**500 kbps**	
1	2.00 Mbps	

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14900

Parameter | Name: **C14900 | Firmware product type**	Data type: VISIBLE_STRING Index: 9675 = 0x25CB

Display of the product type (string with a length of 8 bytes)
- The following identification code is displayed: "E94AFCIB".

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14901

Parameter | Name: **C14901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: 9674 = 0x25CA
Display of the compilation date of the firmware (string with a length of 20 bytes) • The date ("MMM TT JJJJ") and the time ("hh:mm:ss") are output, e.g. "Mar 21 2005 12:31:21".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14902

Parameter | Name: **C14902 | Firmware version**	Data type: VISIBLE_STRING Index: 9673 = 0x25C9
Display of the firmware version (string with a length of 8 bytes) The identification code is output, e.g. "01.00.00".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14920

Parameter | Name: **C14920 | Display of DIP switch position**		Data type: BITFIELD_8 Index: 9655 = 0x25B7
Display of the current DIP switch position • The set parameter data length (PCP) is displayed in C13860/1. • The set process data length is displayed in C13860/2. • The set baud rate is displayed in C13863. ▸ Possible settings via DIP switch (📖 30)		
Value is bit-coded:		**Info**
Bit 0	DIP 8	Baud rate
Bit 1	DIP 7	No response
Bit 2	DIP 6	Number of parameter data words (PCP)
Bit 3	DIP 5	
Bit 4	DIP 4	Number of process data words
Bit 5	DIP 3	
Bit 6	DIP 2	
Bit 7	DIP 1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

13.4 Table of attributes

The table of attributes contains information required for communication with the inverter via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit required	☑ Writing is only possible if controller inhibit is set	

Table of attributes

Code	Name	Index		Data				Access		
		dec	hex	DS	DA	DT	Factor	R	W	CINH

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

Perhaps we have not succeeded in achieving this objective in every respect. If you have suggestions for improvement, please e-mail us to:

feedback-docu@lenze.com

Thank you very much for your support.

1 About this documentation

Contents

This documentation exclusively describes the E94AYCEC communication module (POWERLINK).

Note!

This documentation supplements the **mounting instructions** supplied with the drive and the **"Servo Drives 9400" hardware manual**.

The mounting instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe the software of other manufacturers. No responsibility is taken for corresponding information given in this documentation. Information on how to use the software can be obtained from the documents of the host (PLC).

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information on POWERLINK can be found on the website of the "Ethernet POWERLINK Standardization Group":

www.ethernet-powerlink.org

Target group

This documentation is intended for all persons who plan, install, commission and maintain the networking and remote servicing of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.lenze.com

Information regarding the validity

The information given in this documentation is valid for the following devices:

Extension module	Type designation	From hardware version	From software version
Communication module POWERLINK	E94AYCEC	VB	01.00

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and the software version of the installed engineering tools (e.g. »Engineer«), the screenshots in this documentation may differ from the screen representation.

1.1 Document history

Version			Description
1.0	11/2007	TD17	First edition
2.0	09/2012	TD17	General revision
3.0	08/2014	TD17	• New layout • General updates

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Spelling of numbers		
Decimal	Standard notation	Example: 1234
Decimal separator	Point	The decimal point is always used. For example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Blue text colour	All information that applies to from a certain software version of the device onwards are marked accordingly in this documentation. Example: This function extension is available from software version V3.0 onwards!
Program name	» «	The Lenze PC software »Engineer«...
Control element	**bold**	The **OK** button ... / The **Copy** command ... / The Properties tab ... / The **Name** input field ...
Sequence of menu commands		If several commands are required to execute one function, the single commands are separated by an arrow: Select the **File → Open** command to...
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse-click in this online documentation.
Icons		
Page reference	(📖 8)	Optically highlighted reference to another page. In this online documentation activated via mouse-click.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning
Inverter	Lenze controller of the "Servo Drives 9400" product series for which the communication module can be used. ▸ Application as directed (📖 12)
Standard device	
CN	Controlled node (POWERLINK slave)
Code	Parameter which serves to parameterise and monitor the drive. In normal usage, the term is usually referred to as "Index".
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3"). In everyday language, the term is also referred to as "subindex".
»Engineer«	Lenze PC software which supports you during the "Engineering" process (parameterisation, diagnostics, and configuration) throughout the whole life cycle, i. e. from planning to maintenance of the machine commissioned.
EPL	Abbreviation for "Ethernet POWERLINK"
(EPL) nodes	POWERLINK nodes (Managing Node, Controlled Nodes)
ETHERNET POWERLINK	POWERLINK is a real-time capable fieldbus system based on Ethernet. For user data exchange, POWERLINK specifies a communication protocol based on CANopen. POWERLINK is a patented technology, licenced by the Ethernet POWERLINK Standardization Group (EPSG), Germany.
HW	Hardware
Host	SPS, Managing Node (POWERLINK master)
Lenze setting	Default settings of the device, preconfigured ex works.
Basic setting	
MN	Managing node (POWERLINK master) The managing node accepts the control function for the data communication of the decentralised field devices. Typically, the managing node is the communication interface of a PLC.
Node ID	POWERLINK node address
SW	Software

1.4 Notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Pictograph and signal word!

(characterise the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

If the following basic safety measures are disregarded, severe injuries to persons and damage to material assets may result.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 12)
- must never be commissioned if they display signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- during and after operation can have live, moving and rotating parts, depending on their degree of protection. Surfaces can be hot.

The following applies to Lenze drive components ...

- only use the accessories approved.
- Only use original manufacturer spare parts.

Observe all specifications contained in the enclosed documentation and related documentation.

- This is the precondition for safe and trouble-free operation and for achieving the product features specified.
  ▸ Product features (📖 13)
- The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

All works on and with Lenze drive and automation components must only be carried out by qualified personnel. According to IEC 60364 or CENELEC HD 384 these are persons who ...

- are familiar with installing, mounting, commissioning, and operating the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).
- Only use cables corresponding to the given specifications.
  ▸ Ethernet cable specification (📖 31)

Documentation on standard device, host (PLC), system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.
▸ Protective insulation (📖 18)

Device protection

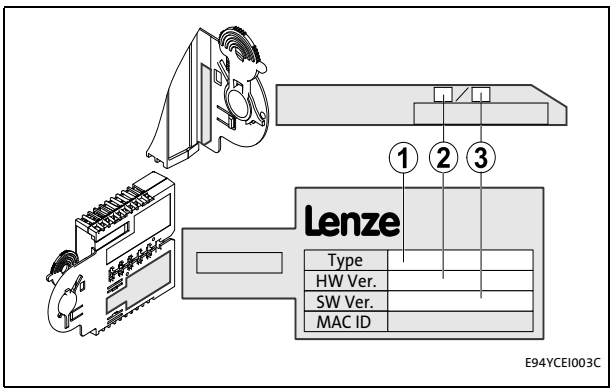
The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 22)

3 Product description

3.1 Application as directed

The communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxx	VB	01.50
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in POWERLINK networks.

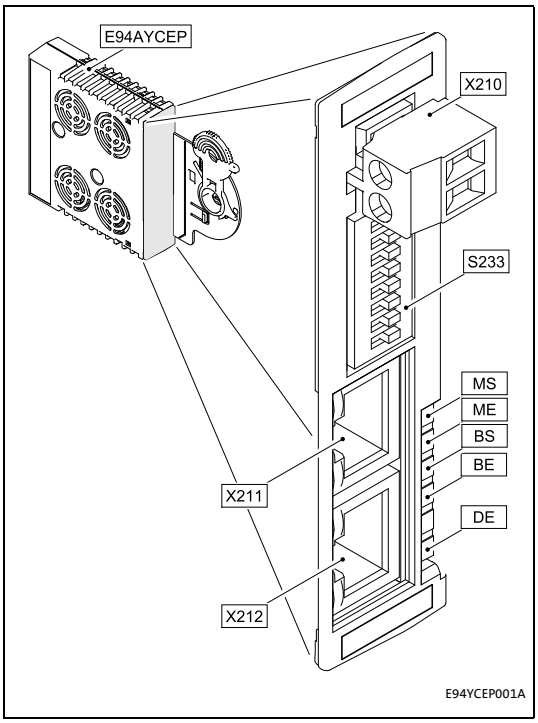
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: Extension module
- C Module type: Communication module
- EC POWERLINK CN



2 Hardware version (HW)

3 Software version (SW)

3.3 Product features

- Interface module for the POWERLINK communication system to be connected to the expansion slots of the Servo Drives 9400
- The communication module can either be supplied internally by the standard device or externally by a separate voltage source.
- Real time Ethernet with the POWERLINK V2 communication profile for motion and general applications
- A line topology can be implemented by means of the integrated 2-port hub.
- Supported functionality: POWERLINK CN (controlled node)
- Use of max. 10 PDO crosslinks for the Managing Node or the Controlled Node to create systems with "distributed intelligence"
- Very short CN response times for optimal network performance
- Parallel Ethernet communication between the Lenze »Engineer« and the Servo Drive 9400 if a POWERLINK router is used.
- Access to all Lenze parameters

3.4 Terminals and interfaces

[3-2] Communication module E94AYCEC (POWERLINK CN)

X250 External voltage supply of the communication module
- 2-pole connector with screw connection

▸ External voltage supply (📖 33)

X251 POWERLINK port 1

X252 POWERLINK port 2
- RJ45-sockets
- each with 2 LED status displays for diagnostics

▸ POWERLINK connection (📖 29)
▸ Status displays at the RJ45 sockets (X251, X252) (📖 48)

S233 DIP switch for setting the node address (Node ID)

▸ Node address setting (📖 35)

MS LED status displays for diagnostic purposes
ME ▸ Module status displays (📖 46)
BS ▸ Fieldbus status displays (📖 47)
BE
DE

4 Technical data

4.1 General data and operating conditions

Range	Values	
Order designation	E94AYCEC	
Communication profile	POWERLINK V2	
Communication medium	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e	
Interface for communication	RJ45, Standard Ethernet (according to IEEE 802.3), 100Base-TX (Fast Ethernet)	
Network topology	Tree, star, line	
Max. cable length	Number of nodes x 100 m	
Cable length between 2 nodes/hubs	max. 100 m	
Baud rate	100 Mbps	
Type of node	Controlled node	
Node addresses (Node IDs)	1 ... 100	E94AYCEC is controlled node with Lenze module E94AYCEP as managing node.
	1 ... 239	E94AYCEC is Controlled Node with Managing Node of another manufacturer.
Voltage supply	External supply via separate power supply unit +: U = 24 V DC (20.4 V ... 28.8 V), I = 140 mA - : Reference potential for external voltage supply	
Conformities, approvals	CE	2004/108/EC, EMC Directive 2006/95/EC, Low-Voltage Directive

Servo Drives 9400 hardware manual

Here you can find the **ambient conditions** and data on the **electromagnetic compatibility (EMC)**, which also apply to the communication module.

4.2 POWERLINK communication data

Range	Values
Jitter synchronisation information	approx. 1 µs
Minimum cycle time	Controlled Node: 0.5 ms
Total cycle times	Controlled Node: 0.5 / 1.0 / 2.0 / 3.0 ... 20.0 ms
Buffer size	Tx-iso: max. 92 bytes (64 bytes of PDO user data)
	Rx-iso: max. 328 Bytes (300 bytes of PDO user data)
Delay times (Controlled Node)	T_{Preq} - T_{Res}: approx. 1 µs
	T_{SoA} - T_{ASnd}: approx. 20 µs
Dead times for Managing Node	Between 2 transmission messages: min. 1 µs
	Between receive and transmit frame: min. 1 µs
Frame size	Max. asynchronous frame size (MTU): 1518 bytes
SDO communication method	UDP/IP
Number of RPDOs	Max. 10 channels (max. 300 bytes of PDO user data per channel)
RPDO user data per application (all RPDOs)	Max. 32 objects (max. 64 bytes)
Number of TPDOs	1 channel (data access of all nodes by broadcasting)
TPDO user data per application	Max. 32 objects (max. 64 bytes)

4.2.1 Operating mode "Controlled Node"

- Support of multiplexed CNs
- Support of optional CNs

4.2.2 Communication time

Parameter data (SDO)

The communication time for parameter data is the time between the transmission of an SDO request and the arrival of the corresponding response.

- The processing time in the Servo Drive 9400 is approx. 30 ms + 20 ms tolerance (typical)
- For some codes, the processing time may be longer (see reference manual/»Engineer« online help for the Servo Drive 9400).

Process data (PDO)

The communication time for process data is the time between the reception of a PDO with setpoints and the return of a PDO with the current actual values.

The communication times for process data depend on ...

- processing time in the Servo Drive 9400 (interval time of the application task, process data mode);
- Telegram runtime on the fieldbus (telegram length, number of nodes, PDO update time, instant of transmission of the POWERLINK telegram);
- Use of the synchronisation to the POWERLINK cycles.

Processing time

The basic conditions mentioned above cause the following processing times for the process data in the Servo Drive 9400:

- Process data for synchronised operation: approx. 1.2 ms
- Process data for non-synchronised operation: approx. 3.0 ms

4.3 Protective insulation

Danger!

Dangerous voltage

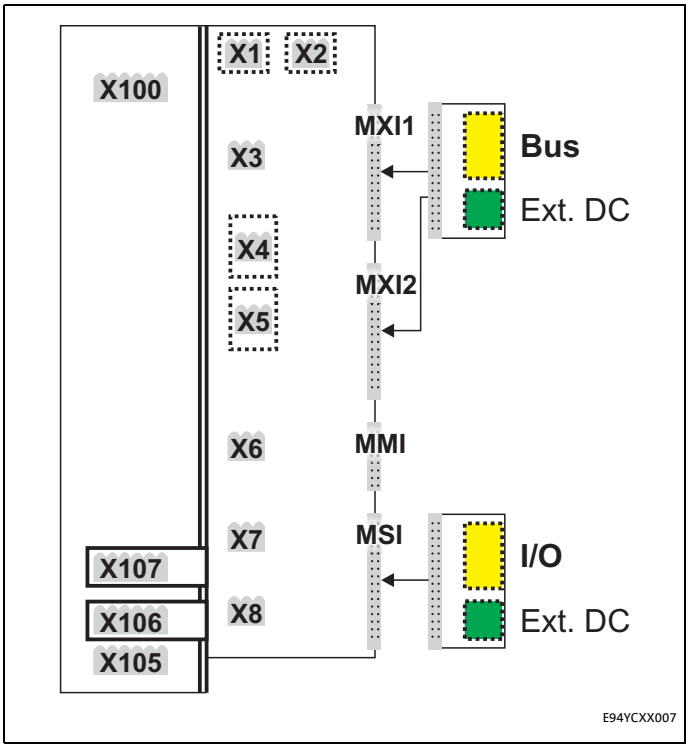
If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

Possible consequences:

Death or severe injuries

Protective measures:

If protection against accidental contact is required for the control terminals of the Servo Drive 9400 and the connections of the plugged device modules, ...



- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.

Note!

The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

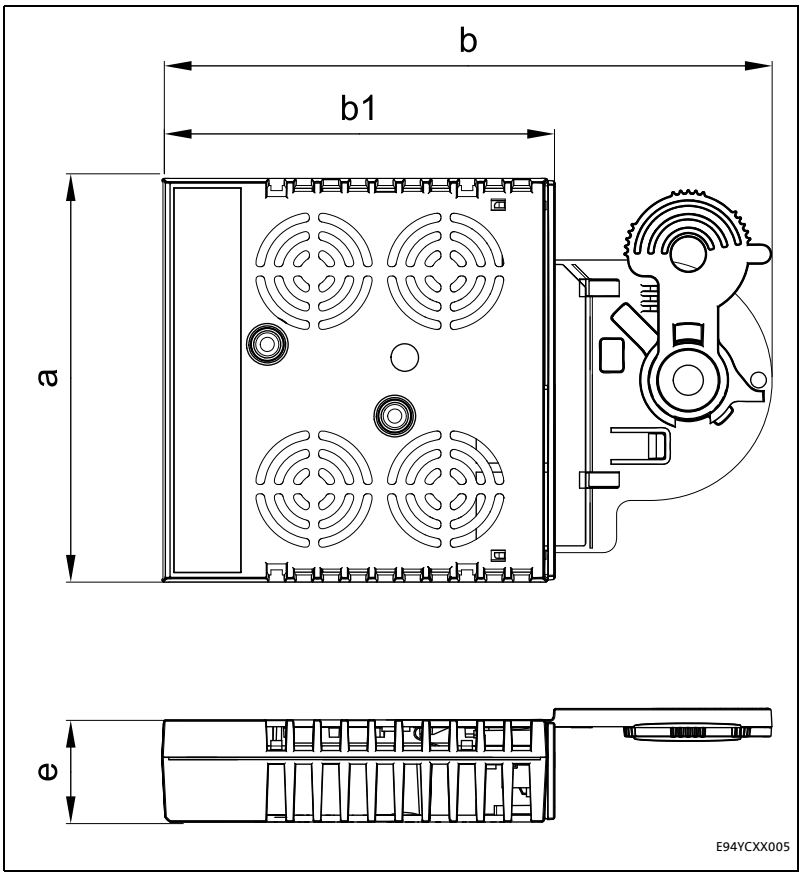
The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the Servo Drive 9400.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example



Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.4 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

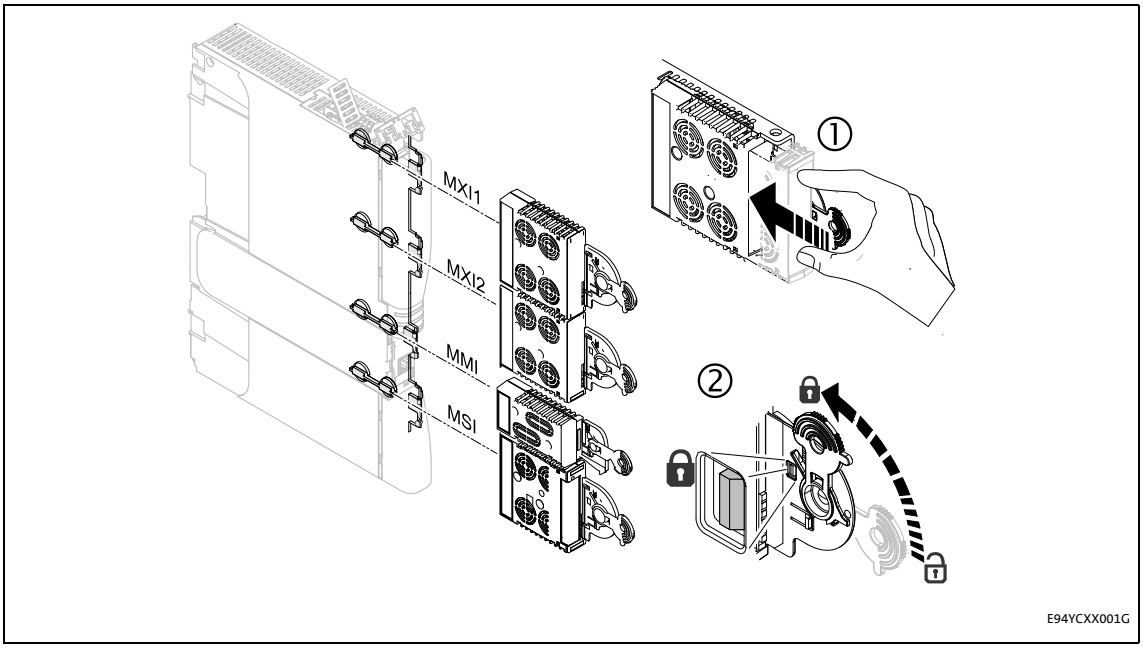
5 Installation

Stop!

Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

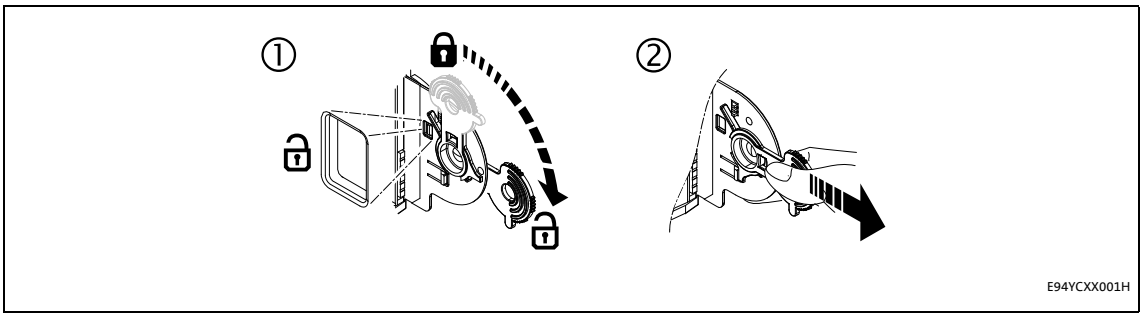
Possible consequences:



- The communication module is defective.
- Fieldbus communication is not possible or faulty.

Protective measures

- Before touching the module, be sure that you are free of electrostatic charge.



5.1 Mechanical installation

5.1.1 Assembly

[5-1] Assembly

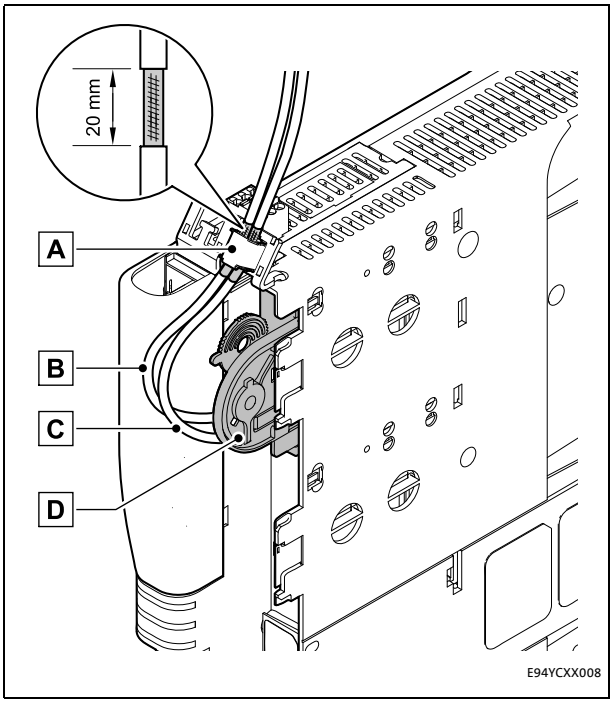
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation on standard device, host (PLC), system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring according to EMC guidelines

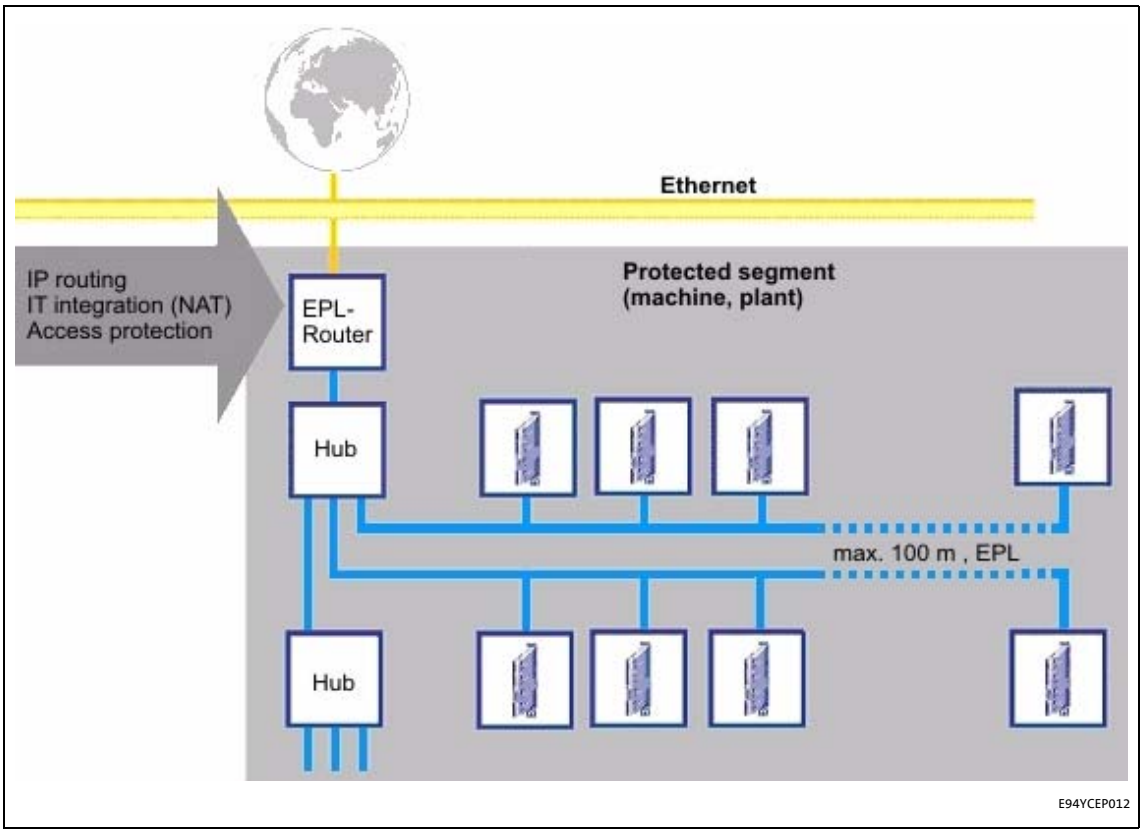
In typical systems, standard shielding is sufficient for Ethernet cables.

However, in environments with a very high level of interference, EMC resistance can be improved by additionally earthing the cable shield on both sides.

For this observe the following notes:

1. The distance between the additional earthing and the Ethernet plug depends on the module slot and is as follows:
   - approx. 10 cm for the upper slot (MXI1)
   - approx. 20 cm for the lower slot (MXI2)
2. Measure the appropriate distance along the cable and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Connect the cable shield to the shield sheet of the Servo Drive 9400.

A Connection to the shield sheet of the Servo Drive 9400



B Ethernet cable to X251

C Ethernet cable to X252

D Communication module in slot MXI1 of the Servo Drive 9400

[5-3] Wiring according to EMC guidelines

5.2.2 Network topology

[5-4] Network topology for POWERLINK

Note!

The use of class I hubs and switches inside the POWERLINK network segment is not permitted.

Inside the segment only Ethernet hubs may be used as infrastructure elements. The hubs must meet the requirements on class II repeaters acc. to IEEE 802.3u.

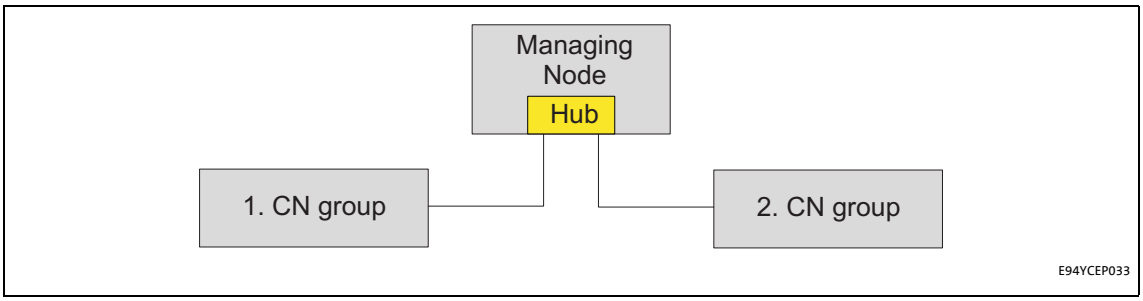
For this purpose Lenze offers the dual hub integrated into the communication module and the separate eight-fold hub, type E94AZCEH.

Class I hubs and switches are not permissible since they have considerably longer delay times for the frame forwarding and a bigger jitter. Both sizes reduce the real-time capability and dynamics.

The cable length between two POWERLINK nodes is limited to 100 m.

The topology rules (IEEE 802.3u) required for controlling the collisions may be violated in the POWERLINK network segment since according to the POWERLINK access order, telegram collisions are prevented. This enables a structure of lines and any hybrid forms between star and line topology.

Recommended topology



For an easy configuration and due to many possible topology variants we recommend to create networks according to the following rules:

1. Create CN groups with up to 10 nodes.
2. Connect CN groups in star shape to the managing node.
3. Connect CN groups to the managing node via one external hub each.
   - For more than 2 CN groups, use an external 8-port hub (e.g. Lenze hub E94AZCEH).
   - For max. 7 CN groups one hub is sufficient.
   - For more than 7 CN groups, use further hubs.
   - The groups can be distributed on the hubs just as you like.
   - Observe the restrictions of the used managing node.

Note!

E94AYCEP communication module als Managing Node

With maximally 2 CN groups and the use of an E94AYCEP communication module as Managing Node, connect the CN group(s) directly to the POWERLINK terminals X211 and X212 of the E94AYCEP communication module.

[5-5] Star topology for 1 to 2 CN groups

5.2.3 Ethernet POWERLINK

Note!

Standard Ethernet nodes are not permitted in the POWERLINK network segment.

In order to use the real-time capability of the POWERLINK technology, POWERLINK nodes must be interconnected in a separate network segment.

In accordance with the POWERLINK rules, only the Managing Node controls the access of POWERLINK nodes to the network. The Managing Node is the only node that transmits autonomously. The slave nodes (i.e. all Controlled Nodes) only transmit when the are entitled to transmit by the Managing Node.

Non-POWERLINK nodes (e.g. PCs) typically violate these rules by sending telegrams independently from the Managing Node. The telegrams interfere with the cyclic telegram exchange of the POWERLINK-nodes and impede the real-time capability of POWERLINK.

Connection to the standard Ethernet network

The connection to an external standard Ethernet network is carried out via an POWERLINK router or an POWERLINK gateway.

These infrastructure components separate the network traffic in the POWERLINK network segment from the one in the standard Ethernet. The handling of the frames depend on their direction:

- Standard Ethernet ---> POWERLINK network segment:
  Only telegrams that are addressed to nodes in the network segment are forwarded. The forwarding takes place in the asynchronous area of the POWERLINK cycle.
- POWERLINK network segment ---> standard Ethernet:
  Only asynchronous telegrams that are not addressed to nodes in the POWERLINK network segment are forwarded.

Tip!

Detailed information on the function and setting of the router or gateway can be obtained from the documentation of the component manufacturer.

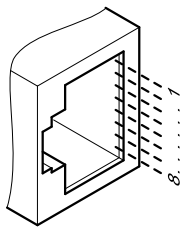
5.2.4 Basic Ethernet Mode

Note!

Operation in the "Basic Ethernet Mode" does not permit any real-time communication.

The communication module can be operated in the "Basic Ethernet Mode" for a basic parameter setting provided that the following applies:

1. Operation of the module with network address ≤ 239.
   - IP address: 192.168.100.[Node ID]
   - see Node address setting (📖 35)
2. Operation with real time POWERLINK must not be carried out.
3. No integration of a Managing Node (node ID = 240) into the standard Ethernet network.



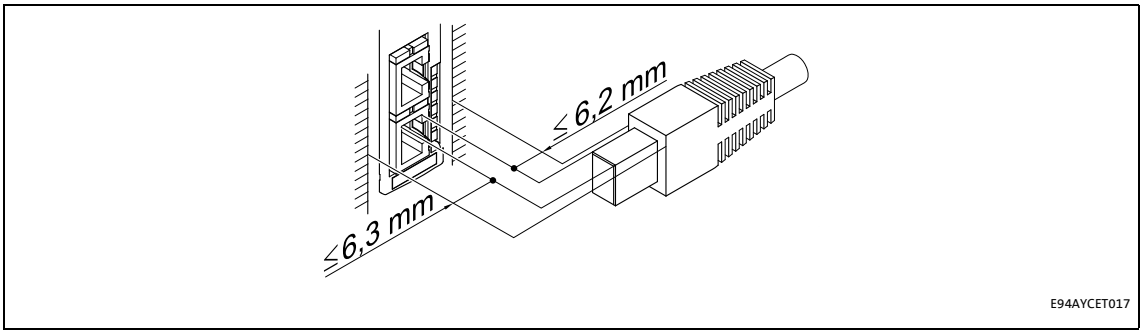
5.2.5 POWERLINK connection

- The POWERLINK is wired using the two RJ45 sockets **X251** and **X252**.
- If possible, do not wire more than 10 nodes in a row in a network line.
- In case of more than 10 nodes you should deactivate the automatic calculation of the hub level in the »Engineer« and enter it manually to increase the performance.
- With a cycle time of 1 ms, 25 nodes can be operated.
  The number of nodes can be increased if the POWERLINK cycle time is increased as well.
- You can use a standard Ethernet patch cable to connect the communication module to the POWERLINK fieldbus.
  ▸ Ethernet cable specification (📖 31)
- The installation and removal of the Ethernet cables is optimised for the use of connectors in accordance with the "Automation Initiative of German Domestic Automobile Manufacturers" (AIDA).

Note!

To prevent the RJ45 socket from being damaged, insert or remove the Ethernet cable connector straight (at a right angle) into or from the socket.

Pin assignment of the RJ45 sockets



RJ45 socket	Pin	Signal
 E94AYCXX004C	1	Tx +
	2	Tx -
	3	Rx +
	4	-
	5	-
	6	Rx -
	7	-
	8	-

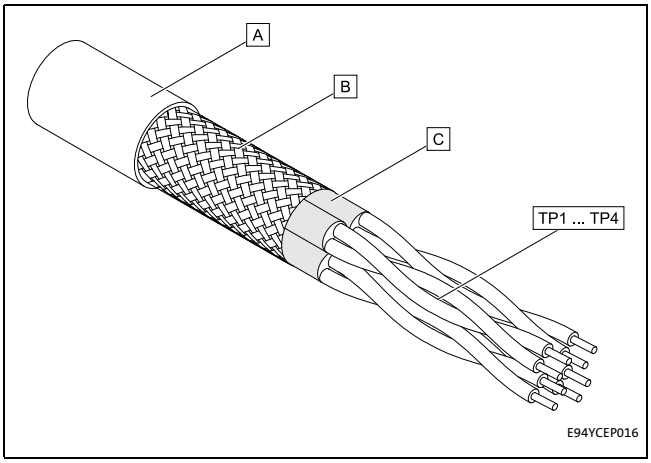
Tip!

The POWERLINK interfaces feature an auto-MDIX function. This function adjusts the polarity of the RJ45 interfaces so that a connection can be established irrespective of the polarity of the opposite POWERLINK interface and irrespective of the type of cable used (standard patch cable or crossover cable).

Mounting clearance

When ordering and using your Ethernet cable, note the amount of free space available.

[5-6] Mounting clearance



5.2.6 Ethernet cable specification

Note!

Only use cables that meet the listed specifications.

Ethernet cable specification	
Ethernet standard	Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Cable type	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e
Damping	23.2 dB (for 100 MHz and 100 m each)
Crosstalk damping	24 dB (at 100 MHz and per 100 m)
Return loss	10 dB (per 100 m)
Surge impedance	100 Ω

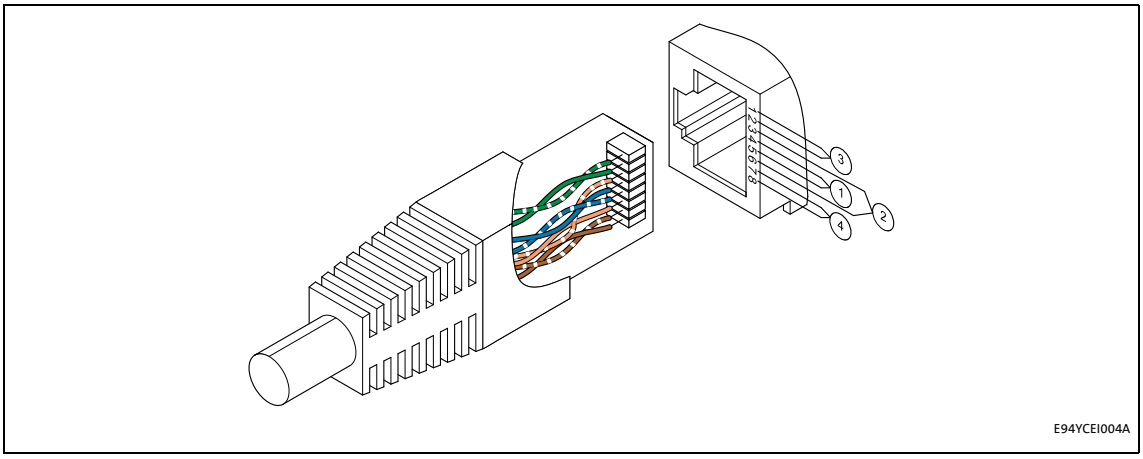
Structure of the Ethernet cable

A Cable insulation

B Braid

C Foil shielding

TP1 ... TP4 Twisted core pairs 1 ... 4



[5-7] Structure of the Ethernet cable (S/FTP, CAT 5e)

Colour code of the Ethernet cable

Note!

Wiring and colour code are standardised in EIA/TIA 568A/568B.

In accordance with the industrial standard, the use of 4-pin Ethernet cables is permissible. The cable type only connects the assigned pins 1, 2, 3 and 6 to one another.

[5-8] Ethernet plug in accordance with EIA/TIA 568A/568B

Pair	Pin	Signal	EIA/TIA 568A	EIA/TIA 568B
3	1	Tx +	white / green	white / orange
	2	Tx -	Green	orange
2	3	Rx +	white / orange	white / green
1	4		blue	blue
	5		white / blue	blue / white
2	6	Rx -	orange	Green
4	7		white / brown	white / brown
	8		brown	brown

5.2.7 External voltage supply

The communication module can be externally supplied with voltage via separate supply cables at the 2-pin plug connector **X250**.

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).

The external voltage supply of the communication module is necessary if the power supply for the basic device fails but communication via the fieldbus is to be maintained.

Access to parameters of a standard device disconnected from the mains is not possible.

Assignment of the X250 plug connector

Name	Explanation
+	U = 24 V DC (20.4 ... 28.8 V) I = 140 mA
-	Reference potential for external voltage supply

Data of the terminals

Range	Values	
Electrical connection	2-pole connector with screw connection	
Possible connections	Rigid:	
		1.5 mm^2 (AWG 16)
	Flexible:	
		Without wire end ferrule 1.5 mm^2 (AWG 16)
		With wire end ferrule, without plastic sleeve 1.5 mm^2 (AWG 16)
		With wire end ferrule, with plastic sleeve 1.5 mm^2 (AWG 16)
Starting torque	0.5 ... 0.6 Nm (4.4 ... 5.3 lb-in)	
Stripping length	6 mm	

6 Commissioning

During commissioning, plant-specific data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the inverter. Lenze devices use codes for this purpose.

The codes of the inverter and for communication are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

Note!

When parameterising the communication module, please note that the code number depends on the slot of the Servo Drive 9400 into which the communication module is plugged.

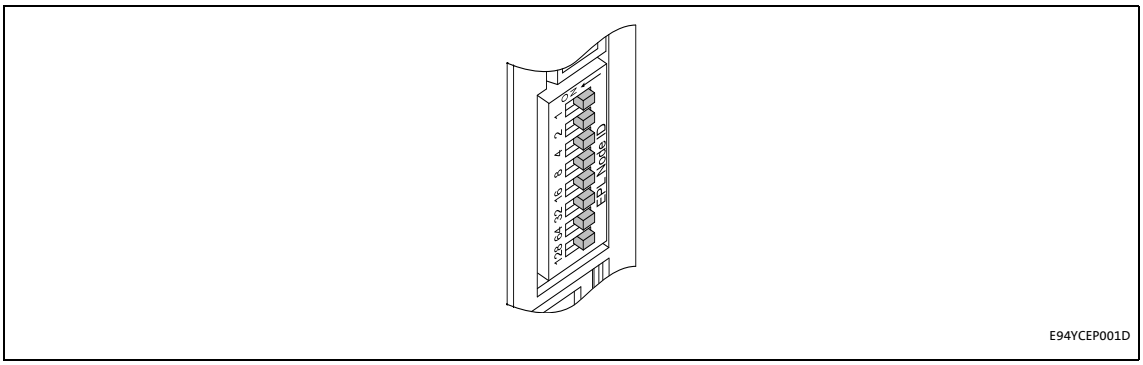
The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  - Parameters of the communication module for slot MXI1 (📖 65)
- C**14**nnn for slot MXI2
  - Parameters of the communication module for slot MXI2 (📖 87)

You also have to set the Parameters of the standard device that are relevant to communication (📖 63).

6.1 Before initial switch-on

Stop!



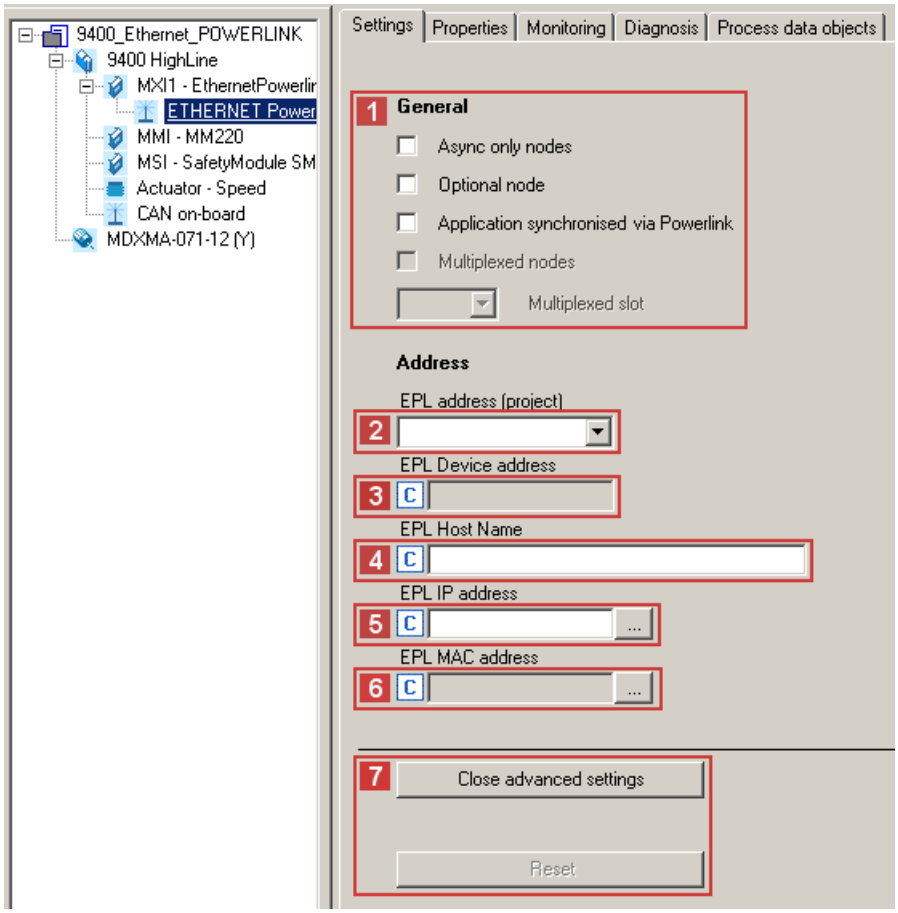
Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Node address setting

Note!

- Each network node address must only be used once.
- The node address setting in the configuration software (e.g. »Engineer«) and the DIP switches must be identical for each node.
- Switch the voltage supply of the communication module off and on again to activate changed settings.

The POWERLINK node address (node ID) is set via the front DIP switches.



[6-1] DIP switch

- The labelling on the housing corresponds to the valencies of the individual DIP switches for determining the node address (Node ID).
- Lenze setting for DIP switches 1 ... 128 = OFF (invalid value "0")
- Valid addresses in the POWERLINK network for the communication module:
  - 1 ... 100: Controlled node with Lenze module E94AYCEP as managing node
  - 1 ... 239: Controlled node with managing node of another manufacturer
- The corresponding Ethernet IP address of the communication module results from the address setting of the DIP switches:
  IP address: 192.168.100.[Node ID]

Examples for address setting with the DIP switches

Address setting	DIP switch							
	128	64	32	16	8	4	2	1
1	OFF	OFF	OFF	OFF	OFF	OFF	OFF	**ON**
2	OFF	OFF	OFF	OFF	OFF	OFF	**ON**	OFF
3	OFF	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**
4	OFF	OFF	OFF	OFF	OFF	**ON**	OFF	OFF
5	OFF	OFF	OFF	OFF	OFF	**ON**	OFF	**ON**
6	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**	OFF
7	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**	**ON**
8	OFF	OFF	OFF	OFF	**ON**	OFF	OFF	OFF
9	OFF	OFF	OFF	OFF	**ON**	OFF	OFF	**ON**
10	OFF	OFF	OFF	OFF	**ON**	OFF	**ON**	OFF
...	...	...	...	...	...	...	...	...
239	**ON**	**ON**	**ON**	OFF	**ON**	**ON**	**ON**	**ON**

6.3 Settings and displays in the »Engineer«

Setting / display		Description
1	**General**	General information on the node type or the synchronisation of the application
2	**EPL address (project)**	Setting of the POWERLINK address (node ID: C13044 / C14044) You can set the address '1' ... '100' for the communication module.
3	**Current EPL device address**	Display of the current POWERLINK device address (C13042 / C14042)
4	**EPL host name**	The DNS-compatible **host name** (C13045 / C14045) has to be non-ambiguous within the network domain. The device name ... • consists of max. 15 characters ([A ... Z], [a ... z], [0 ... 9], [-]); • starts with a letter; • ends with a letter or a digit.
5	**EPL IP address**	The IP address (C13000 / C14000) is created from the POWERLINK address (Node ID): 192.168.100.[C13044 / C14044] Example: 192.168.100.1 = 0xC0.A8.64.01
6	**EPL MAC address**	Display of the MAC address (C13004 / C14004)
7	**Open/close advanced settings**	Here, the POWERLINK communication can be reset.

6.4 Initial switch-on

Documentation for the Servo Drive 9400

Observe the safety instructions and information on residual hazards.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

For further communication of the externally supplied module it is not relevant whether the standard device is switched on or not.

Activating changed setting

In order to activate any changed settings, ...

- execute the device command "11: Save start parameter" via the standard device code **C00002** and ...
- then reset the bus node or switch off and on again the voltage supply of the communication module.

Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

Via the standard device code **C00142** ("Auto restart after mains connection") you can set the restart behaviour of the inverter:

C00142 = "0: Inhibited" (Lenze setting)

- The inverter remains inhibited (even if the fault is no longer active).
- An explicit controller enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.

C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

Initial switch-on and diagnosing

1. Switch on the Servo Drive 9400 and check whether it is ready for operation using the diagnostic LEDs of the communication module.
   - Red diagnostic LEDs must not be on.
   - The following signalling should be visible:

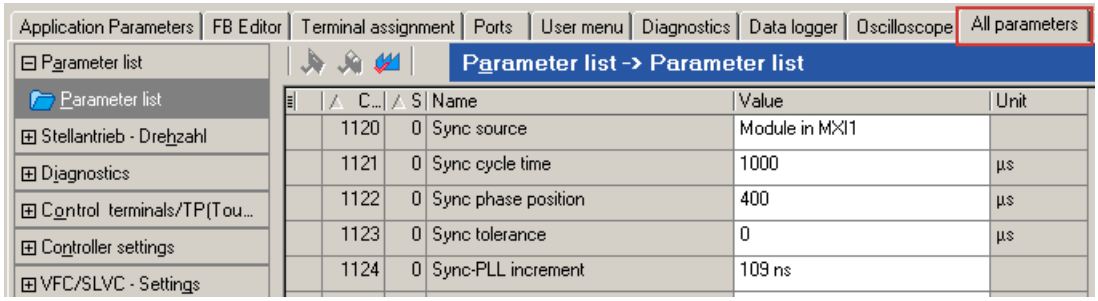
LED	Colour	Status	Meaning	
MS	Green	On	Module Status	▸ Module status displays (📖 46)
DE	-	Off	Device Error	
X251	Green	On	LED is lit if a connection to the node has been established. ▸ Status displays at the RJ45 sockets (X251, X252) (📖 48)	
X252	Green	On		

2. If not already done, load the POWERLINK configuration into the Servo Drive 9400.
3. Repeat steps 1. and 2. for all POWERLINK nodes.
4. Start the POWERLINK network.

   The network starts automatically if you set the managing node last.

   Otherwise there are two options:
   - Switch off the network nodes and switch them on together or
   - execute a fault reset at the Managing Node (Node ID = ’240’).
5. Check the POWERLINK network again using the diagnostic LEDs of the communication module.

   The following signalling should be visible:



LED	Colour	Status	Meaning	
MS	Green	On	Module Status	▸ Module status displays (📖 46)
ME	-	Off	Module Error	
BE	-	Off	Bus Error	
DE	-	Off	Device Error	
BS	Green	On	Bus Status	▸ Fieldbus status displays (📖 47)
X251	Green	On	LED is lit if a connection to the node has been established. ▸ Status displays at the RJ45 sockets (X251, X252) (📖 48)	
X252	Green	On		

6.5 Drive synchronisation

Examples of the use of drive synchronisation via POWERLINK:

- Implementation of the "electrical shaft"
- Specification of cyclic position information
- Exactly simultaneous data processing of several drives
- Optimisation of the processing times of cyclic process data (PDO).

Settings in the »Engineer«

- Set the MXI slot of the communication module as synchronisation source in code **C01120** of the Servo Drive 9400.
- The sync cycle time **C01121** and the sync phase position **C01122** are automatically calculated from the communication module. Default settings of these parameters are ignored.
- It is not necessary to adjust the sync tolerance **C01123** and the sync increment **C01124**.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you can find detailed information on drive synchronisation and the corresponding parameters.

6.6 Optimising the POWERLINK communication

SDO bandwidth

Note!

The channel bandwidth should only be increased if the network is below capacity limit.

The SDO channel width (C13075 / C14075 is the size of the asynchronous channel used for parameter setting and diagnostics. A higher value improves the transmission of large amounts of data (e.g. parameter downloads) and at the same time reduces the number of possible nodes.

Maximum time for device search

During the device search, the managing node has to wait until all controlled nodes have been found.

- Unless all Controlled Nodes are available in the defined POWERLINK cycle time, the "EPL_BOOTUP_1" error message is generated. The Managing Node remains in this status.
- If the managing node has found all controlled nodes, it starts the network.

Due to machine or system-specific switch-on sequences, it may be required to adapt the following POWERLINK objects:

- CN object **0x1F99**: NMT_CNBasicEthernetTimeout_U32 (C13078 / C14078)

Note!

In order to avoid a too quick change to the Basic Ethernet Mode (📖 28), the value of the **0x1F99** object (NMT_CNBasicEthernetTimeout_U32) must be higher than the value of the **0x1F89** object (NMT_BootTime_REC) which is the case by default.

▸ POWERLINK objects (📖 113)

7 Monitoring

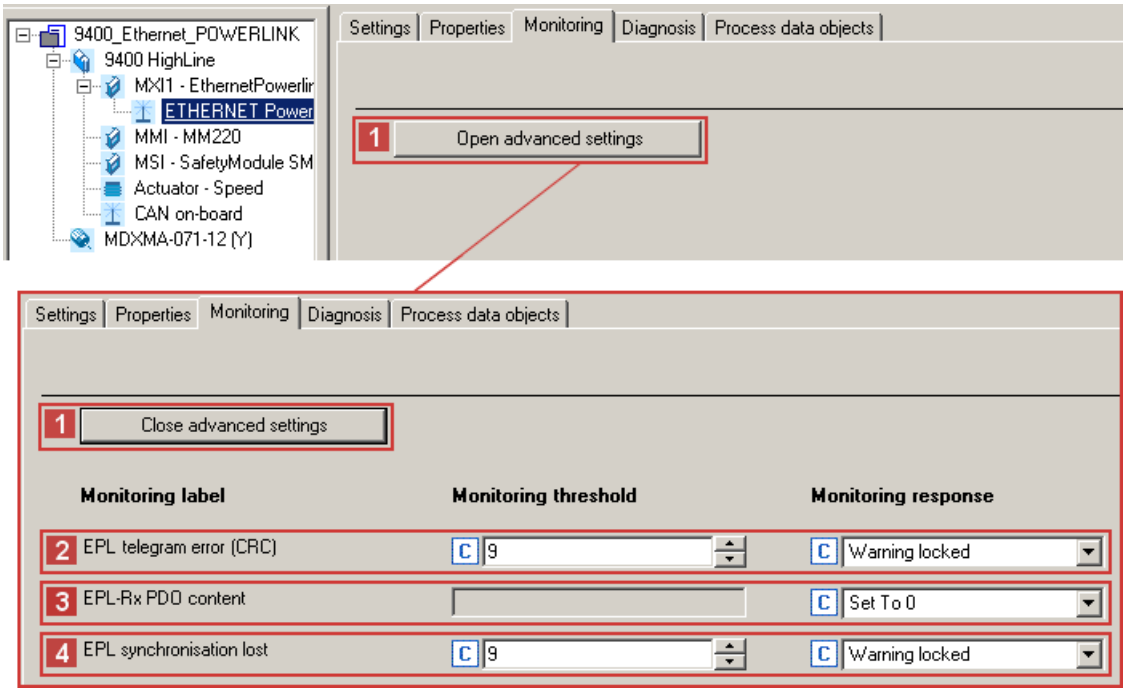
The communication module provides several monitoring functions. The standard settings can be changed in the »Engineer« under the **Monitoring** tab.

For the settings, monitoring responses and monitoring thresholds can be specified. When the monitoring thresholds are exceeded, the response of the Servo Drive 9400 is specified together with the POWERLINK-specific monitoring response. The required status is adopted which is additionally entered into the logbook of the Servo Drive 9400. The setting 'No response' deactivates the monitoring function.

Note!

Generally, all set monitoring functions must be reset after they occurred and before they can be transmitted again since they affect the fieldbus behaviour and the behaviour of the communication module.

Weighted process



The monitoring threshold, for instance, serves to define the number of errors which may occur in succession. Here, the POWERLINK uses a weighted process which must be considered when the monitoring threshold is entered:

- As soon as an error occurs, an internal error counter is increased by the value "8".
- As soon as a POWERLINK cycle was successful, the error counter is reduced by the value '1'.
- Thus 8 faultless transmissions are required after an error has been detected, in order that the error counter assumes the value "0" again.

7.1 Monitoring functions of the controlled node

Note!

The E94AYCEC communication module only supports monitoring for the "LeaveDataExchange" status.

In order to change the standard settings of the monitoring functions, press the 1 **"Open advanced settings"** button.

- The input fields for monitoring thresholds and monitoring responses are shown.
- The 1 **"Close advanced settings"** serves to mask out the input fields again.

Settings

Monitoring function		Description
2	**EPL frame error (CRC)**	Weighted number of received faulty frames • This error can occur due to very strong EMC interferences or by non-POWERLINK-compliant nodes. • Monitoring threshold: C13131/3 / C14131/3 • Monitoring response: C13891/4 / C14891/4
3	**EPL-Rx PDO contents**	This monitoring response defines the way the cyclic process data (PDO) are forwarded from the POWERLINKnetwork to the standard device/application in the event of an error. An error has occurred if no valid process data is received and the "POWERLINK synchronisation loss" monitoring function is activated. The following settings are possible with C13885 / C14885: • 0: The valid data received last remains. • 1: All data is set to the value "0".
4	**EPL synchronisation loss**	This monitoring detects a failure of the Managing Node by means of the number of POWERLINK cycles failed. This monitoring is independent of the setting for the Drive synchronisation (📖 40). • Monitoring threshold: C13127/3 / C14127/3 • Monitoring response: C13891/3 / C14891/3

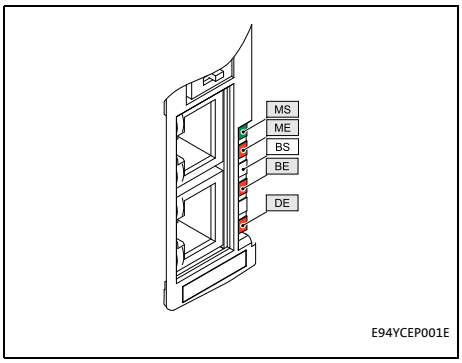
8 Diagnostics

For fault diagnostics, the communication module is provided with the LEDs on the front. Furthermore, you can carry out a comprehensive diagnostics of the entire POWERLINK network using the »Engineer«.

8.1 LED status displays

Note!

LED status displays for trouble-free operation:



- The LEDs **MS** (📖 46) and **BS** (📖 47) are permanently lit.
- The green LED at the RJ45 sockets **X251** and **X252** is permanently lit or blinking (📖 48).

The following status displays are distinguished:

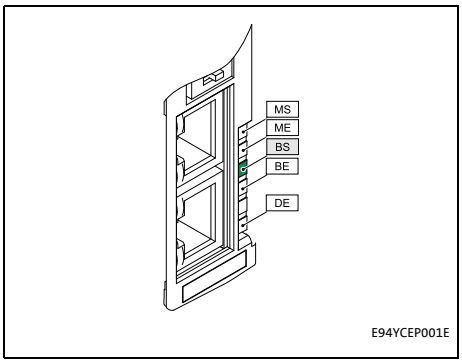
- Module status displays (📖 46)
- Fieldbus status displays (📖 47)
- Status displays at the RJ45 sockets (X251, X252) (📖 48)

8.1.1 Module status displays

The LEDs **MS**, **ME, BE** and **DE** indicate the module status.

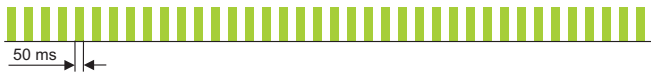
MS: Module Status

ME: Module Error



BE: Bus Error

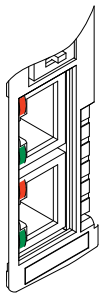
DE: Device Error

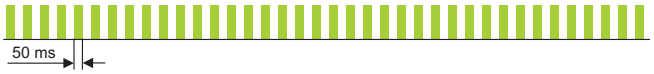


LED	Colour	Status	Description
MS	Green	On	The communication module is supplied with voltage and is connected to the standard device.
		Blinking	200 ms 200 ms The communication module is supplied with voltage, but has no connection to the standard device. (The standard device is either switched off, in the initialisation phase, or not available).
ME	Red	On	An error has occurred in the communication module.
BE	Red	On	A fieldbus error has occurred.
DE	Red	On	The communication module is not accepted by the standard device. See notes given in the documentation for the standard device.

8.1.2 Fieldbus status displays

The **BS** LED indicates the fieldbus status.



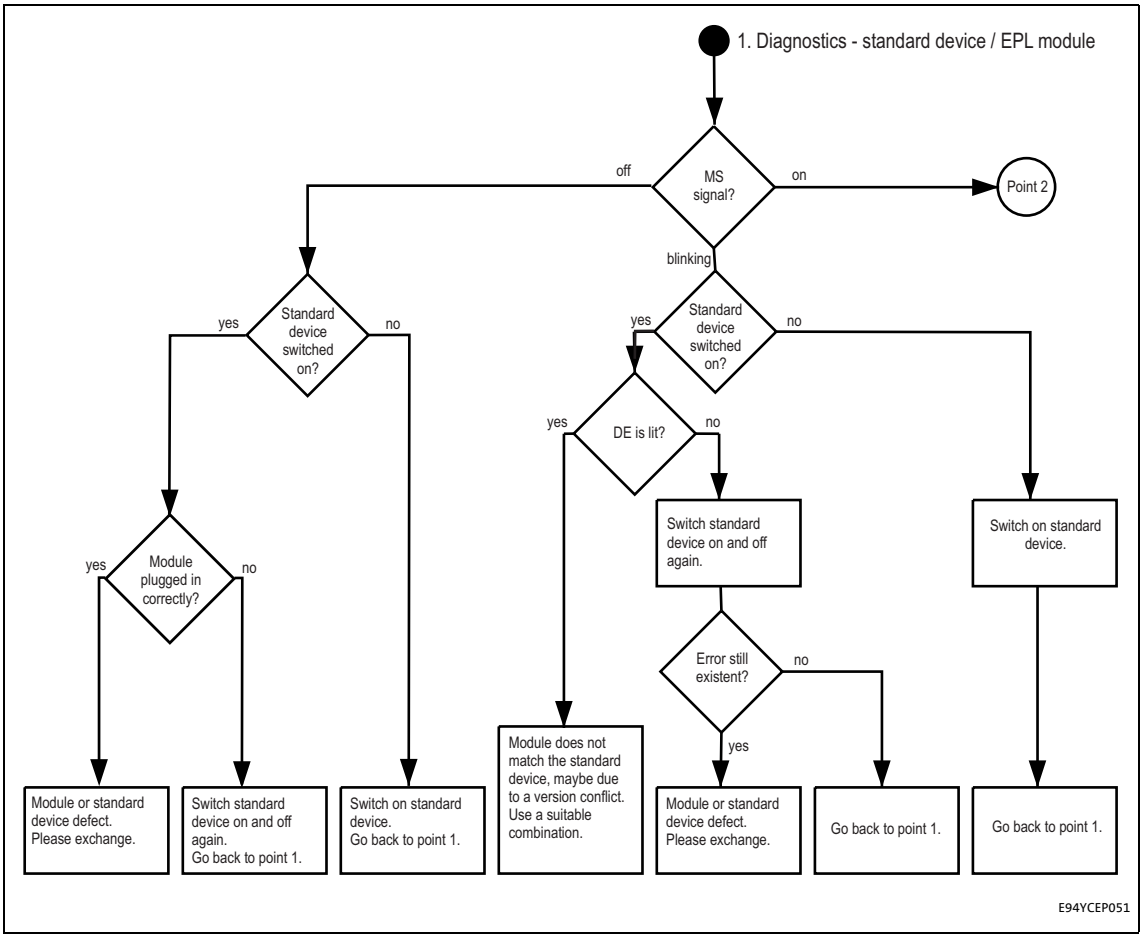


BS: Bus Status

LED	Colour	Status	Description
BS	Green	Off	The communication module is not active on the fieldbus or is in the INIT state.
		Blinking	 The POWERLINK network is in the initialisation phase. NMT_MS_PREOPERATIONAL_1 / NMT_CS_PREOPERATIONAL_1
		Blinking	 The POWERLINK network is in the initialisation phase with cyclic traffic. NMT_MS_PREOPERATIONAL_2 / NMT_CS_PREOPERATIONAL_2
		Blinking	 The POWERLINK node is waiting for the start signal. NMT_MS_READY_TO_OPERATE / NMT_CS_READY_TO_OPERATE
		Blinking	 The POWERLINK node has not found a Managing Node and is in Basic Ethernet Mode (📖 28). NMT_CS_BASIC_ETHERNET
		Blinking	 The POWERLINK node is in the "Stopped" status (waiting for disconnection). NMT_CS_STOPPED
		On	 The POWERLINK node is in the operating phase. NMT_MS_OPERATIONAL / NMT_CS_OPERATIONAL

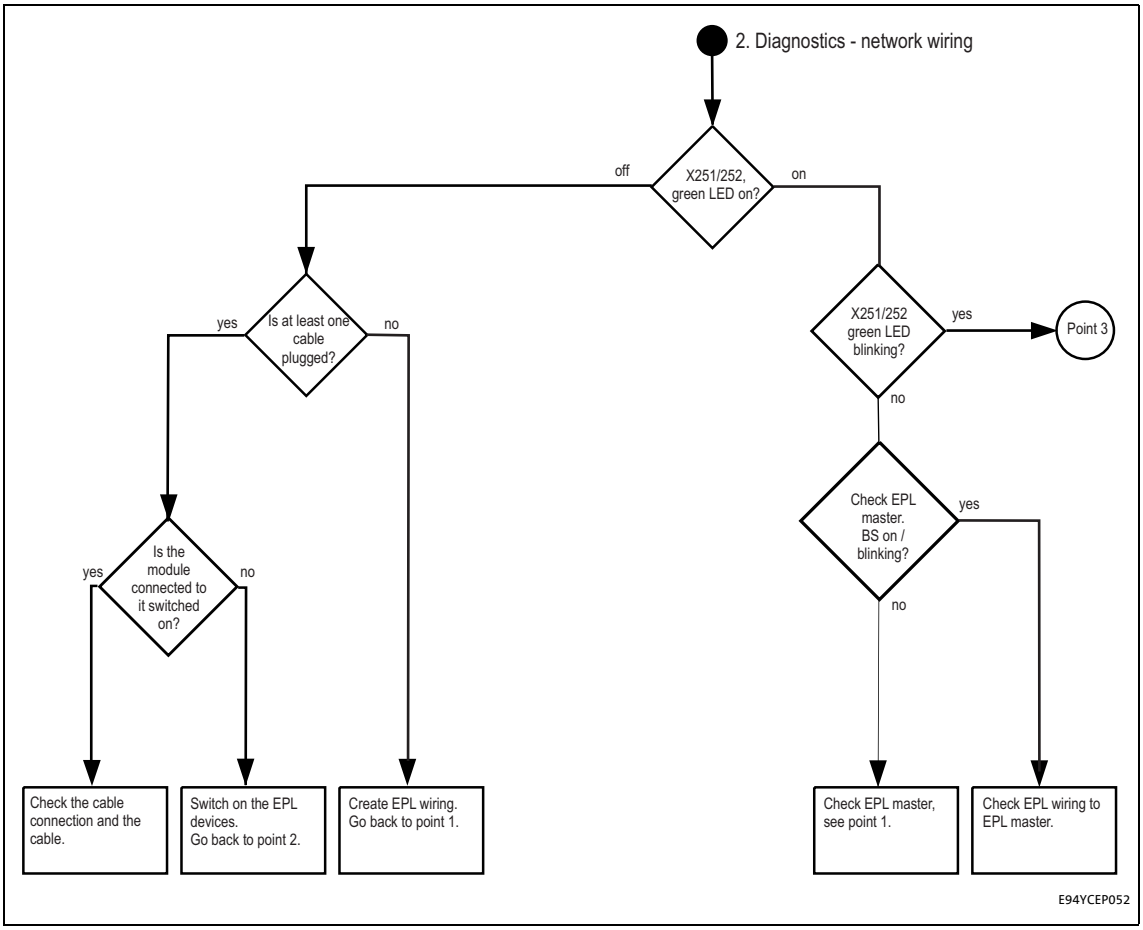
8.1.3 Status displays at the RJ45 sockets (X251, X252)

The LEDs at the RJ45 sockets **X251** and **X252** indicate the POWERLINK connection status.



LEDs	Colour	Status	Description
 E94YCEP001E	Green	Off	No POWERLINK connection
		On	 POWERLINK connection has been established.
		Blinking	 Data communication of POWERLINK connection is active.
	Red	On	 POWERLINK collision has occurred.

8.2 Troubleshooting with module signalling

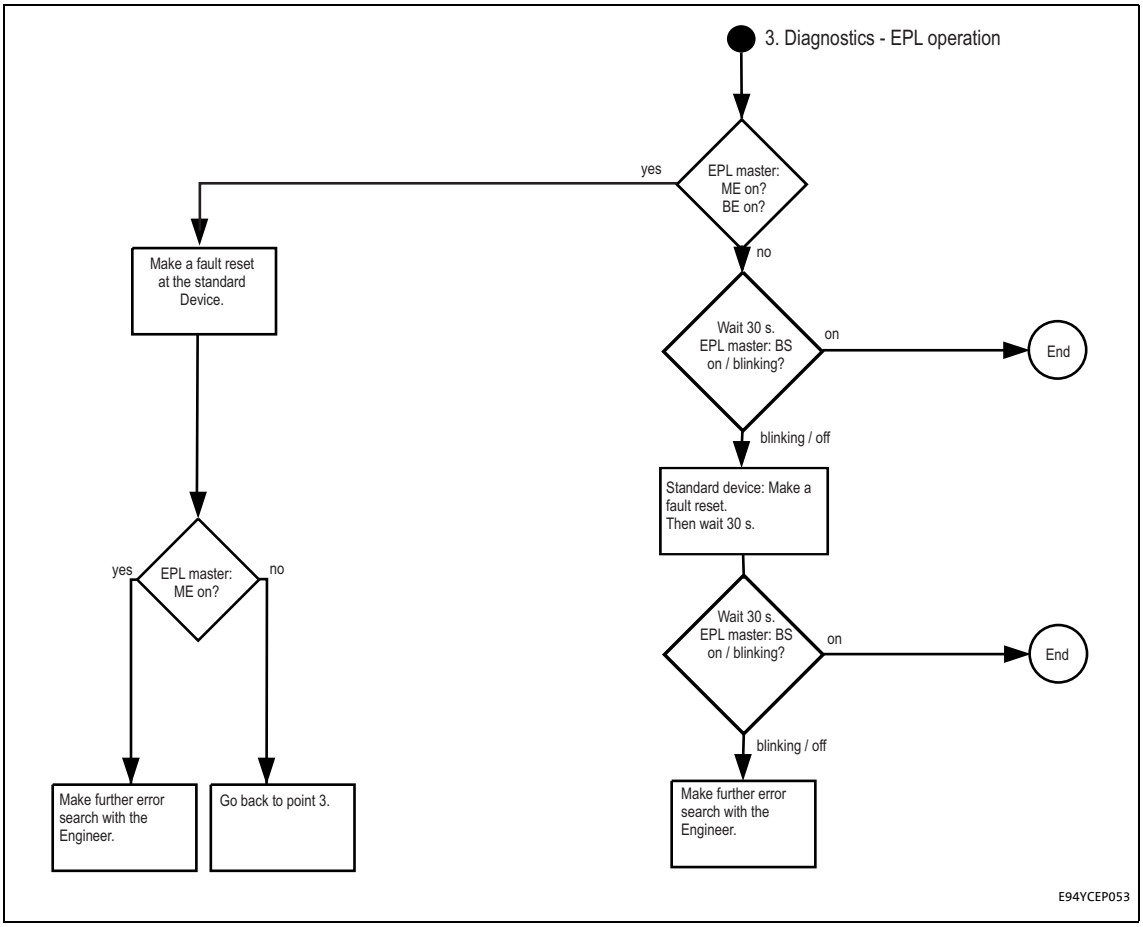


In the following, troubleshooting via the module signals will be described.

Please particularly observe ...

- the basic readiness for operation between the standard device and the communication module;
- the network wiring.

[8-1] Diagnostics - standard device / POWERLINK module



[8-2] Diagnostics - network wiring

Note!

The **BS** (Bus Status) LED refers to the Lenze E94AYCEP communication module as managing node.

This status display applies analogously to the managing nodes of other manufacturers.

[8-3] Diagnostics - POWERLINK operation

Note!

The LEDs **ME** (Module Error), **BE** (Bus Error) and **BS** (Bus Status) refer to the Lenze communication module E94AYCEP as Managing Node.

This status display applies analogously to the managing nodes of other manufacturers.

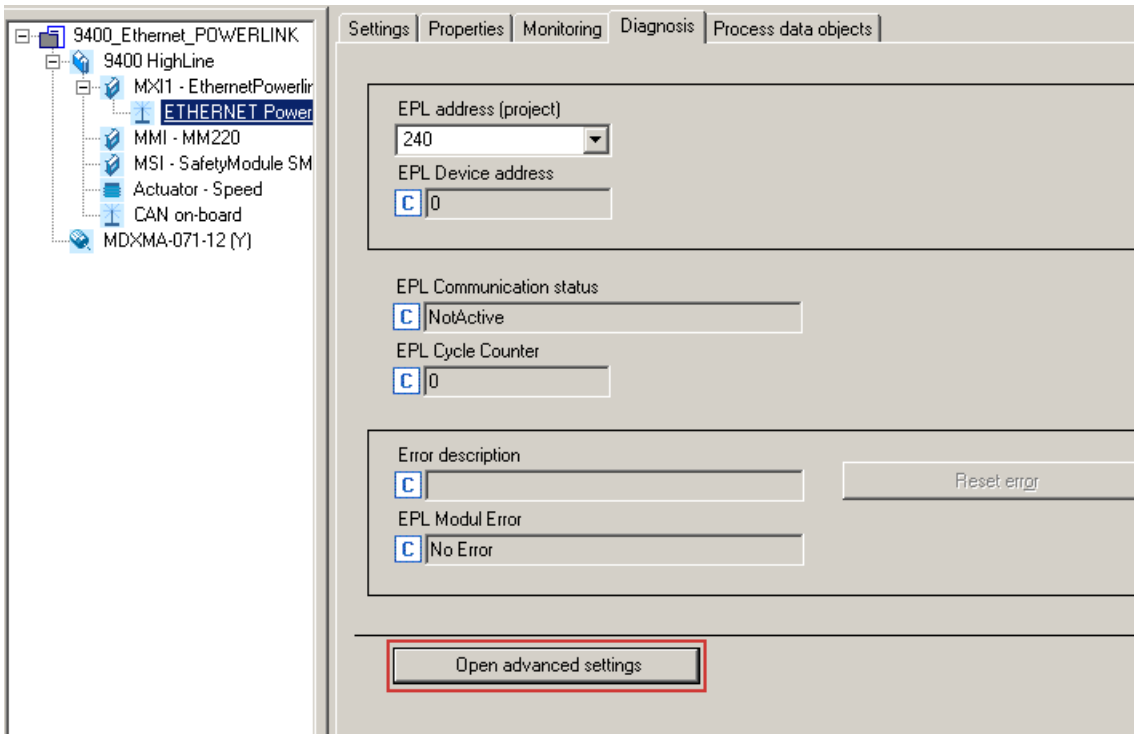
8.3 Diagnostic data

Pending diagnostic data are signalled from the controlled node to the managing node by means of an emergency message.

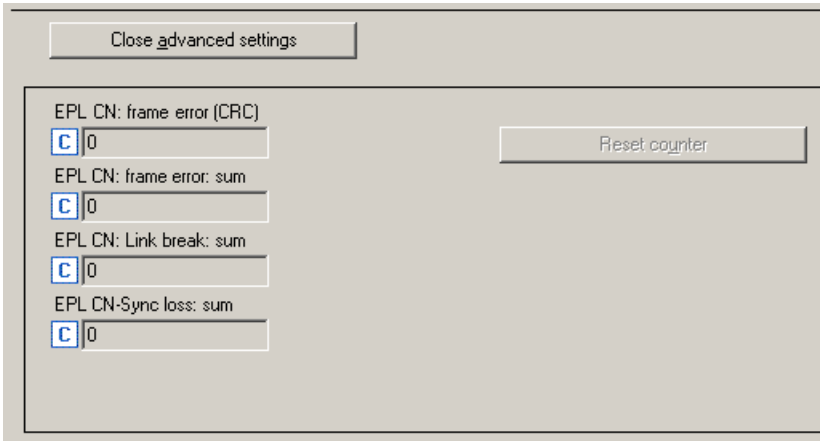
Errors and warnings in the Servo Drive 9400 and the plugged communication module are sent to the Managing Node as extended diagnostic messages.

The diagnostic data is visible via the engineering software of the host (PLC).

Bytes	Meaning	Value [hex]
1 ... 6	Diagnostic block header	0x0010 001C 0100
7 ... 8	Alarm type	0x0001 (diagnosis)
9 ... 12	API (Application Programming Interface)	0x0000 0000
13, 14	Slot number	0x0001 / 0x0002
15, 16	Subslot number	0x0001
17 ... 20	Module ID	ID according to module
21 ... 24	Submodule number	ID according to module
25, 26	Alarm specification	0xB000
27, 28	User structure ID	0x0001
29 ... 32	Error code	



Reference manual/»Engineer« online help for Servo Drive 9400



Here you will find general information on diagnostics & fault analysis and on error messages.

8.4 Diagnosing with the »Engineer«

In the »Engineer« under the **Diagnostics** tab, you will find POWERLINK diagnostics information.

The **"Open extended settings"** tab serves to display further diagnostics information on the controlled node (node ID '0' ... '239'):

9 Error messages

This chapter supplements the error list in the reference manual and the »Engineer« online help for the Servo Drive 9400 by the error messages of the POWERLINK communication module.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

9.1 Error messages of the communication module

This chapter describes all error messages of the communication module and their causes and remedies.

9.1.1 Short overview

The following table contains all error messages of the communication module in numerical order of the error numbers. Moreover the preset error response and - if applicable - the parameters for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Name	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c83100	13119744	EPL: Lost connection to 9400 target	No response	-
0x00c85531	13129009	EPL: Memory access error	Information	-
0x00c85532	13129010	EPL: Memory: Read error	Information	-
0x00c85533	13129011	EPL: Memory: Write error	Information	-
0x00c86010	13131792	EPL: Internal watchdog activated	Fault	-
0x00c86011	13131793	EPL: Internal watchdog activated	Fault	-
0x00c86100	13132032	EPL: Internal error	Information	-
0x00c86101	13132033	EPL: Internal error	Fault	-
0x00c86110	13132048	EPL: Invalid PDO mapping detected	Warning Locked	-
0x00c8641f	13132831	EPL: Invalid parameter set	Fault	-
0x00c86420	13132832	EPL: Lenze settings loaded	Fault	-
0x00c88130	13140272	EPL: Fieldbus watchdog activated	Fault	
0x00c88131	13140273	EPL: DataExchange exited	No response	C13883 / C14883
0x00c88261	13140577	EPL: Invalid address selected	Fault	-
0x00c88263	13140579	EPL MN: Network has not been started (bootup-1)	Warning Locked	C13891/2 / C14891/2
0x00c88264	13140580	EPL MN: Not all nodes are in the operational status (bootup-2)	Warning Locked	C13891/2 / C14891/2
0x00c88265	13140581	EPL: Synchronisation of MN lost	Warning Locked	C13891/3 / C14891/3
0x00c88266	13140582	EPL: Defective telegram (CRC) detected	Warning Locked	C13891/4 / C14891/4
0x00c88267	13140583	EPL: Failure of a network node	No response	C13891/5 / C14891/5
0x00c88281	13140609	EPL: Cycle time exceeded	Warning Locked	C13891/1 / C14891/1
0x00c88283	13140611	EPL: MN address assigned double	Fault	-
0x00c88284	13140612	EPL: Internal error	Fault	-

9.1.2 Possible causes and remedies

In this chapter, all error messages of the communication module are listed in numerical order of the error numbers. Possible causes and remedies and responses to the error messages are described in detail.

EPL: Lost connection to 9400 [0x00c83100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☒ **None** ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The MXI communication to the Servo Drive 9400 is interrupted. • Servo Drive 9400 is switched off. • The communication module is not connected correctly at the MXI slot of the Servo Drive 9400. • Communication module is defective.	• Switch on Servo Drive 9400. • Plug in the communication module correctly at the MXI slot of the Servo Drive 9400. • Send communication module together with a description of the fault to Lenze.

EPL: Memory access error [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Access via the Servo Drive 9400 to a parameter set in the memory module failed.	Download application again (including module).

EPL: Memory: Read error [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter in the memory module could not be read.	Download application again (including module).

EPL: Memory: Write error [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter in the memory module could not be written.	Download application again (including module).

EPL: Internal watchdog activated [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EPL: Internal watchdog activated [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EPL: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

EPL: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

EPL: Invalid PDO mapping detected [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The entered PDO mapping is invalid.	Re-execute PDO mapping.

EPL: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Download application again (including module).

EPL: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access via the Servo Drive 9400 to a parameter set in the memory module failed.	Download application again (including module).

EPL: Fieldbus watchdog activated [0x00c88130]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EPL: DataExchange exited [0x00c88131]

Response (Lenze setting printed in bold)	**Setting:** C13883 / C14883 (☑ Adjustable response)
☒ **None** ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
The POWERLINK data exchange has been terminated.	• Check wiring. • Plug network cable into POWERLINK terminal X251 or X252.

EPL: Invalid address selected [0x00c88261]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
An invalid IP address has been assigned by the managing node via POWERLINK or set as node ID.	• Ensure that a valid IP address is assigned by the managing node via POWERLINK. • Set valid node ID. ▸ Node address setting (📖 35)

EPL MN: Network has not been started (bootup-1) [0x00c88263]

Response (Lenze setting printed in bold)	**Setting:** C13891/2 / C14891/2
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
• The Managing Node could not start the POWERLINK network. • Not all required nodes were found.	• Check if all nodes are switched on • Check address setting and wiring.

EPL MN: Not all nodes are in the operational status (bootup-2) [0x00c88264]

Response (Lenze setting printed in bold)	**Setting:** C13891/2 / C14891/2
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
The Managing Node could not transfer all nodes into the "NMT_CS_OPERATIONAL" status via process data exchange.	Check whether single nodes are in error status.

EPL: Synchronisation lost from MN [0x00c88265]

Response (Lenze setting printed in bold)	**Setting:** C13891/3 / C14891/3
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
In the controlled node, the synchronisation cycle of the managing node has failed. The controlled node changes automatically to the NMT_CS_PREOPERATIONAL_1 state and waits for a new run-up by the managing node.	• Check wiring components (failure of Managing Node, router). • Restart managing node if required. • Change CN monitoring thresholds via C13127 / C14127. ▸ Monitoring functions of the controlled node (📖 43)

EPL: Defective telegram (CRC) detected [0x00c88266]

Response (Lenze setting printed in bold)	**Setting:** C13891/4 / C14891/4
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
Faulty Ethernet frames (CRC error) have been detected. Possible causes: • A device an the network is not POWERLINK-compliant. • EMC interference is too strong.	• Check if a non-POWERLINK-compliant device is in the network (e.g. diagnostics PC). • Reduce EMC interference on the network or use an additional shield connection. • Change monitoring thresholds: • Controlled Node: C13131/3 / C14131/3 ▸ Monitoring functions of the controlled node (📖 43)

EPL: Failure of a network node [0x00c88267]

Response (Lenze setting printed in bold)	**Setting:** C13891/5 / C14891/5
☒ **None** ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
In case of the managing node, an unwanted change from the "Operational" status has occurred due to an error. Possible causes are: • Node failure • Network cables have been detached. • Servo Drive 9400 is switched off. • Communication module is defective. • Time-out with Controlled Nodes • Telegram collisions due to non-compliant POWERLINK nodes	• Check wiring. • Plug network cable into POWERLINK terminal X251 or X252. • Restart managing node if required. • Switch on Servo Drive 9400. • Check if a non-POWERLINK compliant device is in the network (e.g. diagnostics PC). • Check whether collisions have occurred with the managing node. • Send communication module together with a description of the fault to Lenze.

EPL: Cycle time exceeded [0x00c88281]

Response (Lenze setting printed in bold)	**Setting:** C13891/1 / C14891/1
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
The Managing Node has detected that the previous cycle has not yet been completed when the new cycle starts.	Select a larger POWERLINK cycle time via C13060 / C14060.

EPL: MN address assigned double [0x00c88283]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ No reaction ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ WarningLocked ☐ Warning ☐ Information	

Cause	Remedy
The address setting of the Managing Node has been assigned several times (node ID = '240'). This node is configured as Managing Node but does not participate in the frame traffic due to double addressing.	Correct address setting. ▸ Node address setting (📖 35)

EPL: Internal error [0x00c88284]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ No reaction ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ WarningLocked ☐ Warning ☐ Information	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

9.2 POWERLINK error messages

- The POWERLINK error messages are displayed via code C13910 / C14910.
- In order to distinguish between the error responses, the displayed error messages are preceded with 3 characters:

Response	Meaning
EL_...	Trouble (Fault)
QL_...	Quick stop by trouble
WL_...	Warning locked
I__...	Information (Info)

Error number		Name	Description
hex	dec		
0x1	1	EL_ LeaveData Exchange	The POWERLINK data exchange has been completed (the node recognises that it does not have the "DataExchange" status anymore). **Causes & remedy:** • see error description EPL: DataExchange exited [0x00c88131] (📖 58) **Codes:** • C13883 / C14883 (error response)
0x3	3	QL_ LeaveData Exchange	
0x4	4	WL_LeaveData Exchange	
0x6	6	I__LeaveData Exchange	
0x18263	98915	EL_EPL_BOOTUP_1	The Managing Node could not start the POWERLINK network. OR: Not all required nodes were found. **Causes & remedy:** • see error description EPL MN: Network has not been started (bootup-1) [0x00c88263] (📖 58) **Codes:** • C13891/2 / C14891/2 (error response)
0x38263	229987	QL_EPL_BOOTUP_1	
0x48263	295523	WL_EPL_BOOTUP_1	
0x68263	426595	I__EPL_BOOTUP_1	
0x18264	98916	EL_EPL_BOOTUP_2	The Managing Node could not transfer all nodes into the "NMT_CS_OPERATIONAL" status via process data exchange. **Causes & remedy:** • see error description EPL MN: Not all nodes are in the operational status (bootup-2) [0x00c88264] (📖 58) **Codes:** • C13891/2 / C14891/2 (error response)
0x38264	229988	QL_EPL_BOOTUP_2	
0x48264	295524	WL_EPL_BOOTUP_2	
0x68264	426596	I__EPL_BOOTUP_2	
0x18265	98917	EL_EPL_CN_SYNC_ LOSS	In the Controlled Node, the synchronisation cycle of the Managing Node has failed. The Controlled Node automatically changes to the "NMT_xx_PREOPERATIONAL_1" status and waits for a new run-up by the Managing Node. **Causes & remedy:** • see error description EPL: Synchronisation lost from MN [0x00c88265] (📖 59) **Codes:** • C13127/3 / C14127/3 (monitoring threshold) • C13891/3 / C14891/3 (error response) • C13127/1 / C14127/1 (error counter)
0x38265	229989	QL_EPL_CN_SYNC_ LOSS	
0x48265	295525	WL_EPL_CN_SYNC_ LOSS	
0x68265	426597	I__EPL_CN_SYNC_ LOSS	

Error number		Name	Description
hex	dec		
0x18266	98918	EL_EPL_COM_CRC	Faulty Ethernet frames (CRC error) have been detected. **Causes & remedy:** • see error description EPL: Defective telegram (CRC) detected [0x00c88266] (📖 59) **Codes:** • C13131/3 / C14131/3 (monitoring threshold) • C13891/4 / C14891/4 (error response) • C13131/1 / C14131/1 (error counter)
0x38266	229990	QL_EPL_COM_CRC	
0x48266	295526	WL_EPL_COM_CRC	
0x68266	426598	I__EPL_COM_CRC	
0x18267	98919	EL_EPL_MN_LOSS_CN	The MXI connection to the Servo Drive 9400 is interrupted or a node has failed. **Causes & remedy:** • see error description EPL: Lost connection to 9400 [0x00c83100] (📖 56) EPL: Failure of a network node [0x00c88267] (📖 59) **Codes:** • C13891/5 / C14891/5 (error response) • C13132 / C14132 (CN: link interruptions)
0x38267	229991	QL_EPL_MN_LOSS_CN	
0x48267	295527	WL_EPL_MN_LOSS_CN	
0x68267	426599	I__EPL_MN_LOSS_CN	
0x18283	98947	EL_EPL_ADDRESS_MN	An invalid IP address has been assigned by the Managing Node via POWERLINK or set as Node ID. OR: The address setting of the managing node (Node ID = '240') has been assigned several times. **Causes & remedy:** • see error description EPL: Invalid address selected [0x00c88261] (📖 58) EPL: MN address assigned double [0x00c88283] (📖 60) **Codes:** • see Node address setting (📖 35) • see Settings and displays in the »Engineer« (📖 37)
0x38283	230019	QL_EPL_ADDRESS_MN	
0x48283	295555	WL_EPL_ADDRESS_MN	
0x68283	426627	I__EPL_ADDRESS_MN	

10 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the reference manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCEC (POWERLINK) communication module.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you will find general information on parameters.

10.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response to impermissible device configuration		
Selection list		
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No Response	Reserved
C00615/2	1: No Response	Resp. to imp. module in MXI1
C00615/3	1: No Response	Resp. to imp. module in MXI2
C00615/4	0: No Response	Reserved
C00615/5	0: No Response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response for the case where a new module has been plugged into slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response if a new module has been plugged into module slot 2 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 1 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

10.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCEC communication module (POWERLINK) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C13000

Parameter | Name: **C13000 | EPL IP address**				Data type: UNSIGNED_32 Index: 11575 = 0x2D37 EPL index: See subcodes
The code displays the IP address of the communication module. • The IP address is derived from the EPL node address (Node ID): **192.168.100.[Node ID]** • The node ID is derived from the DIP switch position or from C13044. ▸ Node address setting (📖 35)				
Setting range (min. value | unit | max. value)				
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C13000/1	3232261130 (0xC0A86401 = 192.168.100.1)		EPL IP address	0x1E40.0x02
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C13001

Parameter | Name: **C13001 | EPL IP subnet mask**				Data type: UNSIGNED_32 Index: 11574 = 0x2D36 EPL index: See subcodes
The code describes the IP subnet mask which restricts the directly addressable IP address range (i.e. without a gateway in the EPL segment of the routers). The value 255.255.255.0 (0xFFFFFF00) is always assigned to the subnet mask in one segment.				
Setting range (min. value | unit | max. value)				
255.0.0.0 (0xFF000000)		255.255.255.0 (0xFFFFFF00)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C13001/1	4294967040 (0xFFFFFF00 = 255.255.255.0)		EPL IP-subnet mask	0x1E40.0x03
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C13003

Parameter | Name: **C13003 | EPL IP address router**			Data type: UNSIGNED_32 Index: 11572 = 0x2D34 EPL index: See subcodes
The code describes the IP address of the router which connects the EPL segment to the higher-level network. The standard entry corresponds to the standard router address of the EPL specification: **→ 192.168.100.254** Permissible entries replace the lowest-order byte of the standard entry with the EPL address of the node which has the function of a router.			
Setting range (min. value | unit | max. value)			
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13003/1	3232261374 (0xC0A864FE = 192.168.100.254)	EPL IP address router	0x1E40.0x05
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13004

Parameter | Name: **C13004 | EPL MAC address**		Data type: OCTET_STRING Index: 11571 = 0x2D33 EPL index: See subcodes
The code indicates the physical address (MAC address) of the POWERLINK interface of the communication module. When the communication module is produced, the MAC address is assigned unequivocally worldwide and provides addressing on the lowest level.		
Subcodes	**Info**	**EPL index**
C13004/1	MAC Address (octet string[6]) 00-0A-86-xx-yy-zz • 00-0A-86 = Lenze • xx-yy-zz = consecutive number	0x1030.0x05
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13028

Parameter | Name: **C13028 | EPL node declaration CN**			Data type: UNSIGNED_32 Index: 11547 = 0x2D1B EPL index: See subcodes
The code describes the controlled nodes 1 ... 100 and their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13028/1	0	EPL node declaration CN	0x1F81.0x01
...	...	...	...
C13028/100	0	EPL node declaration CN	0x1F81.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a controlled node.
				1	EPL node with this ID is a controlled node.
2	☑	☐	1	0 *)	On detection of a booting controlled node, the application will not be informed.
				1	On detection of a booting controlled node, the application will be informed and the controlled node will be started.
3	☑	☑	1	0	Optional controlled node
				1	Obligatory controlled node
4	☑	☐	0	0	The managing node is allowed to send reset commands.
				1 *)	The managing node must not send any reset command.
5	☑	☐	0	0	Software version verification of the controlled node is not required.
				1 *)	Software version verification of the controlled node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed controlled node
				1	Asynchronously accessed controlled node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed controlled node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The managing node does not send any PRes frames
				1	The managing node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C13029

Parameter | Name: **C13029 | EPL node declaration MN**			Data type: UNSIGNED_32 Index: 11546 = 0x2D1A EPL index: See subcodes
The code describes managing node, diagnostic device, and EPL router as well as their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13029/1	2147483661 (0x8000000D)	EPL node assignment managing node	0x1F81.0xF0
C13029/2	0	EPL node assignment diagnostic device	0x1F81.0xFD
C13029/3	2147483655 (0x80000007)	EPL node assignment router	0x1F81.0xFE
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a controlled node.
				1	EPL node with this ID is a controlled node.
2	☑	☐	1	0 *)	On detection of a booting controlled node, the application will not be informed.
				1	On detection of a booting controlled node, the application will be informed and the controlled node will be started.
3	☑	☑	1	0	Optional controlled node
				1	Obligatory controlled node

				1 *)	Software version verification of the controlled node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed controlled node
				1	Asynchronously accessed controlled node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed controlled node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The managing node does not send any PRes frames
				1	The managing node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C13030

Parameter | Name: **C13030 | EPL device type**			Data type: UNSIGNED_32 Index: 11545 = 0x2D19 EPL index: 0x1000
The code indicates the device type of the EPL node.			
Value is bit-coded:			
Bit 1	Bit1		
Bit 2	Bit2		
Bit 3	Bit3		
Bit 4	Bit4		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13034

Parameter | Name: **C13034 | EPL identity object**			Data type: UNSIGNED_32 Index: 11541 = 0x2D15 EPL index: See subcodes
The code indicates the Manufacturer's EPL ID no. for Lenze.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13034/1	59 (0x3B)	Manufacturer's EPL ID no.	0x1018.0x01
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13040

Parameter | Name: **C13040 | EPL feature flags**	Data type: UNSIGNED_32 Index: 11535 = 0x2D0F EPL index: 0x1F82
The code displays the POWERLINK functions implemented by the EPL node.	
Value is bit-coded:	
Bit 0 ... 31 | see below	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Description of the bits 0 ... 31

Bit	Relevance		Value	Description
	MN	CN		
0 (LSB)	☐	☑	0	Asynchronous access
			1	Isochronous access *)
1	☑	☑	0	No SDO by UDP/IP
			1	SDO via UDP/IP *)
2	☑	☑	0	No SDO via EPL "ASnd" *)
			1	SDO by EPL "ASnd"
3	☑	☑	0	No SDO integrated in PDO *)
			1	SDO integrated in PDO
4	☑	☑	0	No "NMT Info Services"
			1	"NMT Info Services" supported
5	☑	☑	0	No extended "NMT State Commands" *)
			1	Extended "NMT State Commands" supported
6	☑	☑	0	No dynamic PDO mapping *)
			1	Dynamic PDO mapping supported
7	☑	☐	0	No dynamic PDO mapping
			1	Dynamic PDO mapping supported
8	☑	☑	0	No configuration manager function
			1	Configuration manager function
9	☑	☑	0	Only isochronous cyclic access permitted.
			1	Isochronous multiplexed access possible.
10	☐	☑	0	No address assignment via software
			1	Address assignment via software
11	☑	☐	0	No support of the "Basic Ethernet Mode" by the master
			1	Support of the "Basic Ethernet Mode" by the master
12	☑	☑	0	No "POWERLINK to standard Ethernet" router function
			1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
13	☑	☑	0	No "POWERLINK to fieldbus" router function
			1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
14 ... 31 (MSB)	-	-	-	Reserved / No function

*) Values implemented by 9400 Servo Drives (MN: $0x0087_h = 135_d$, CN $0x0083_h = 131_d$).

C13041

Parameter | Name: **C13041 | EPL version**	Data type: UNSIGNED_8 Index: 11534 = 0x2D0E EPL index: not available
The code describes the version of the POWERLINK communication profile implemented by the communication module. The higher-order nibble describes the major version, the lower order nibble describes the minor version. The implemented value corresponds to the POWERLINK version 2.0.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13042

Parameter | Name: **C13042 | Current EPL device address**	Data type: UNSIGNED_8 Index: 11533 = 0x2D0D EPL index: 0x1F93.0x01
The code displays the currently valid EPL node address (Node ID). • The node ID must be unequivocal in the EPL network segment. • See also C13044.	

Display area (min. value | unit | max. value)			
1		240	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13043

Parameter | Name: **C13043 | EPL device address selection**	Data type: UNSIGNED_8 Index: 11532 = 0x2D0C EPL index: 0x1F93.0x02
The code indicates whether the EPL node address (node ID) has been set via DIP switches at the communication module or via the software. • 0: Node ID has been set via software (C13044). • 1: Node ID has been set via DIP switches at the communication module. ▸ Node address setting (📖 35)	

Display area (min. value | unit | max. value)			
0		1	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13044

Parameter | Name: **C13044 | EPL device address SW**	Data type: UNSIGNED_8 Index: 11531 = 0x2D0B EPL index: 0x1F93.0x03
This code serves to set the EPL node address (node ID) via the software. The value "0" (Lenze setting) is not a valid node ID. It serves to activate the setting via the DIP switches. ▸ Node address setting (📖 35)	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		240	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13045

Parameter | Name: **C13045 | EPL host name**	Data type: VISIBLE_STRING Index: 11530 = 0x2D0A EPL index: 0x1F9A
The code defines a DNS-compatible device name. The length is limited to 15 characters. **The device name must be unambiguous within the network domain.** Naming convention: The device name • starts with a character • ends with a character or digit The device name consists of • letters ([A ... Z], [a ... z]) • digits ([0 ... 9]) • hyphen ([-])	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT	

C13060

Parameter | Name: **C13060 | EPL cycle time**	Data type: UNSIGNED_32 Index: 11515 = 0x2CFB EPL index: 0x1006
The code declares the length of the EPL cycle in µs. • In the configured state, this code must have an identical value in all EPL nodes. • The selected value must correspond to the actual bus cycle time so that the internal monitoring functions work correctly.	

Selection list (Lenze setting printed in bold)	
500	0.5
1000	**1**
2000	2
3000	3
4000	4
5000	5
6000	6
7000	7
8000	8
9000	9
10000	10
11000	11
12000	12

15000	15
16000	16
17000	17
18000	18
19000	19
20000	20

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13066

Parameter | Name: **C13066 | EPL CN: Max. user data PRes RPDO**			Data type: UNSIGNED_16 Index: 11509 = 0x2CF5 EPL index: See subcodes
The code defines the reserved user data length of the PRes telegrams for controlled nodes 1 ... 100. Each subcode number corresponds to one EPL node with the same node ID. The EPL node must be enabled via code C13028. The subcodes describe the PRes telegrams received. The value must be within the range of 36 ... 1490 bytes. The values are upper limit values for the entire size of the PDO mappings for received PRes telegrams. **In the configured state, the values stored for the EPL nodes must be identical to the corresponding C13072 entries. C13066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490	

Subcodes	Lenze setting	Info	EPL index
C13066/1	0 byte	EPL CN: max. user data of RPDO	0x1F8D.0x01
...	...	...	...
C13066/100	0 byte	EPL CN: max. user data of RPDO	0x1F8D.0x64

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13071

Parameter | Name: **C13071 | EPL Max. PDO user data RPDO PReq**			Data type: UNSIGNED_16 Index: 11504 = 0x2CF0 EPL index: 0x1F98.0x04
The code defines the maximum data volume to be received by the controlled node of the PDP mapping for the PReq telegram to be defined via one of the codes C13231 ... C13240. In the configured state, the value must be identical to the entry for a response valid for the EPL node. **When a Servo Drive 9400 is used, the code as managing node is irrelevant since Servo Drives 9400 as managing nodes only transmit PDO data via broadcast PRes telegrams (C13071 = 36 bytes).**			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Byte	1490	**36 bytes**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13072

Parameter | Name: **C13072 | EPL Max. PDO user data TPDO PRes**			Data type: UNSIGNED_16 Index: 11503 = 0x2CEF EPL index: 0x1F98.0x05
The code defines the maximum PDO data size to be sent by the EPL node for the current network configuration. The PDO mapping C13531 can assign data with a total size greater than or equal to C13072. **In the configured state, C13072 must be identical to the entry in C13066 valid for the EPL node.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Byte	1490	**400 bytes**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13074

Parameter | Name: **C13074 | EPL multi-stage cycle timing**			Data type: UNSIGNED_8 Index: 11501 = 0x2CED EPL index: 0x1F98.0x07
This code serves to define the maximum number of the multiplexed cycles. If, e.g., the value "3" is entered, the multiplexed cycle is repeated every three cycles. Within one multiplexed cycle, the nodes are queried according to the values in code C13079. If, e.g., the value "2" is entered for a node in C13079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Cycles	255	**0 cycles**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13075

Parameter | Name: **C13075 | EPL SDO channel width**			Data type: UNSIGNED_16 Index: 11500 = 0x2CEC EPL index: 0x1F98.0x08
The code defines the maximum user data size of asynchronous frames. Protocol-specific headers for POWERLINK, UDP/IP and others as well as service-specific headers are to be interpreted as part of the user data. **In the configured state, the C13075 values of all EPL nodes must be identical.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
282	Byte	1500	**282 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13078

Parameter | Name: **C13078 | EPL CN: Max. time - MN detection**			Data type: UNSIGNED_32 Index: 11497 = 0x2CE9 EPL index: 0x1F99
The code defines the time interval needed for detecting a managing node. If a booting controlled node detects a managing node during the interval, it changes to NMT_CS_PREOPERATIONAL_1. If not, it changes to "Basic Ethernet Mode".			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	µs	4294967295	**10000000 µs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13079

Parameter | Name: **C13079 | EPL multi-stage node declaration CN**			Data type: UNSIGNED_8 Index: 11496 = 0x2CE8 EPL index: See subcodes
This code indicates in which multiplexed cycle the controlled node is queried. The value entered must not exceed the value in code C13074. If, for instance, the value "3" is entered in code C13074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C13079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13079/1	0 cycles		0x1F9B.0x01
...	...		...
C13079/100	0 cycles		0x1F9B.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13095

Parameter | Name: **C13095 | EPL communication status**		Data type: UNSIGNED_8 Index: 11480 = 0x2CD8 EPL index: 0x1F8C
The code indicates the current NMT status of the EPL node.		
Selection list (read only)		**Info**
0	Off	NMT_GS_OFF
25	Initialising	NMT_GS_INITIALISING
41	ResetAppl	NMT_GS_RESET_APPLICATION
57	ResetComm	NMT_GS_RESET_COMMUNICATION
121	ResetConfig	NMT_GS_RESET_CONFIGURATION
28	NotActive	NMT_CS_NOT_ACTIVE NMT_MS_NOT_ACTIVE
29	PreOp1	NMT_CS_PRE_OPERATIONAL_1 NMT_MS_PRE_OPERATIONAL_1
93	PreOp2	NMT_CS_PRE_OPERATIONAL_2 NMT_MS_PRE_OPERATIONAL_2
109	ReadyToOp	NMT_CS_READY_TO_OPERATE NMT_MS_READY_TO_OPERATE
253	Operational	NMT_CS_OPERATIONAL NMT_MS_OPERATIONAL
77	Stopped	NMT_CS_STOPPED (only controlled node)
30	BasicEthernet	NMT_CS_BASIC_ETHERNET (only controlled node)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13102

Parameter | Name: **C13102 | EPL reset command**		Data type: UNSIGNED_8 Index: 11473 = 0x2CD1 EPL index: 0x1F9E
A reset command to a single EPL node in the network can result in cycle and monitoring errors. The code initiates a reset of the EPL node. When the reset has been executed, the code is automatically set to "NMTInvalidService".		
Selection list (Lenze setting printed in bold)		**Info**
40	ResetNode	Status transition → NMT_GS_RESET_APPLICATION
41	ResetCommunication	Status transition → NMT_GS_RESET_COMMUNICATION
42	ResetConfiguration	Status transition → NMT_GS_RESET_CONFIGURATION
255	**No command**	No function
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13110

Parameter | Name: **C13110 | EPL fault memory**	Data type: UNSIGNED_8 Index: 11465 = 0x2CC9 EPL index: 0x1001
The code indicates the currently pending errors (according to error classes).	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13126

Parameter | Name: **C13126 | EPL CN: Frame collisions**			Data type: UNSIGNED_32 Index: 11449 = 0x2CB9 EPL index: See subcodes
The code indicates the number of POWERLINK collisions detected by the controlled node. Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C13126/1	0	CumulativeCnt_U32	0x1C0A.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13127

Parameter | Name: **C13127 | EPL CN: Sync loss**			Data type: UNSIGNED_32 Index: 11448 = 0x2CB8 EPL index: See subcodes
The controlled node expects SoC frames in time intervals which correspond to the cycle time (C13060). The code indicates the error counters for missing SoC frames. The monitoring response is determined via C13891/3.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C13127/1	0	CumulativeCnt_U32	0x1C0B.0x01
C13127/2	0	ThresholdCnt_U32	0x1C0B.0x02
C13127/3	9	Threshold_U32	0x1C0B.0x03

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13131

Parameter | Name: **C13131 | EPL CN: Frame error (CRC)**			Data type: UNSIGNED_32 Index: 11444 = 0x2CB4 EPL index: See subcodes
The code indicates the number of frame checksum errors detected by the controlled nodes. The monitoring response is determined via C13891/4.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C13131/1	0	CumulativeCnt_U32	0x1C0F.0x01
C13131/2	0	ThresholdCnt_U32	0x1C0F.0x02
C13131/3	9	Threshold_U32	0x1C0F.0x03

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13132

Parameter | Name: **C13132 | EPL CN: Link interruptions**			Data type: UNSIGNED_32 Index: 11443 = 0x2CB3 EPL index: 0x1C10
The code indicates the counter of the Controlled Node for POWERLINK connection interruptions. Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13136

Parameter | Name: **C13136 | EPL telegram counter**			Data type: UNSIGNED_32 Index: 11439 = 0x2CAF EPL index: 0x1101.0x01
The subcodes of the code indicate a counter for EPL cycles. The counter is started with each mains power-up of the EPL node at 0. An overflow occurs at 4.294.967.295.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13219

Parameter | Name: **C13219 | EPL device type MN**			Data type: UNSIGNED_32 Index: 11356 = 0x2C5C EPL index: See subcodes
The code contains the device type ID of the EPL nodes. Each subcode corresponds to an EPL node with node ID = subcode number. **When being in the configured status, the values must be identical with the device types stored locally in each EPL node under** C13030**.**			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13219/1	0	Managing node	0x1F84.0xF0
C13219/2	0	Diagnostics device	0x1F84.0xFD
C13219/3	0	router	0x1F84.0xFE
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13225

Parameter | Name: **C13225 | EPL MN: Max. user data RPDO**			Data type: UNSIGNED_16 Index: 11350 = 0x2C56 EPL index: See subcodes
The code defines the reserved user data length of the PRes frames. Each subcode number corresponds to an EPL node with the same node ID. The subcode describes the PRes frames received. The value must be within the limits of 36 ... 1490 bytes. The values are upper limit values for the total size of the PDO mappings which must be defined each one of the codes C13231 ... C13240 for PRes frames received. **In the configured state, the values stored for the EPL nodes must be identical to the corresponding C13072 entries. C13066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490	

Subcodes	Lenze setting	Info	EPL index
C13225/1	0 byte	Managing node	0x1F8D.0xF0
C13225/2	0 byte	Diagnostics device	0x1F8D.0xFD
C13225/3	0 byte	router	0x1F8D.0xFE

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13229

Parameter | Name: **C13229 | EPL multi-stage node declaration MN**			Data type: UNSIGNED_8 Index: 11346 = 0x2C52 EPL index: See subcodes
This code indicates in which multiplexed cycle the node is queried. The value entered must not exceed the value in code C13074. If, for instance, the value "3" is entered in code C13074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C13229/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255	

Subcodes	Lenze setting	Info	EPL index
C13229/1	0 cycles	Managing node	0x1F9B.0xF0
C13229/2	0 cycles	Diagnostics device	0x1F9B.0xFD
C13229/3	0 cycles	router	0x1F9B.0xFE

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13231

C13484

Parameter | Name: **C13484 | EPL address: RPDO**			Data type: UNSIGNED_8 Index: 11091 = 0x2B53 EPL index: See subcodes
The subcodes 1 ... 10 describe the node address of the transmitting EPL node for the PDO channels 1 ... 10 (mapping see C13231 ... C13240). Values > "0" describe the origin of a PRes frame. The value "0" is reserved for PReq (must not be used in systems with a Servo Drive 9400 as managing node). The subcodes 1 ... 10 are only valid if the corresponding subcode of C13489 has a value > "0". Before writing the EPL node address in a subcode of C13484, the corresponding subcode of C13489 must be set to the value "0". Renewed writing of the number of mapping entries in the subcode of C13489 enables the node address.			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13484/1	0	EPL address: RPDO	0x1400.0x01
...	...	...	...
C13484/10	0	EPL address: RPDO	0x1409.0x01
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13489

Parameter | Name: **C13489 | EPL number RPDO**			Data type: UNSIGNED_8 Index: 11086 = 0x2B4E EPL index: See subcodes
The subcodes 1 ... 10 describe the number of valid mapping entries of the PDO channels 1 ... 10 (valid subcodes in C13231 ... C13240). The value "0" inhibits the corresponding PDO channel. Before writing the mapping entries in C13231 ... C13240 or the EPL address of the SDO transmitter in the corresponding subcode of C13484, the corresponding subcode of code C13489 must be set to the value "0". A renewed writing of the number of mapping entries in the subcode of C13489 enables the mapping and the transmission EPL address for the PDO channel. The sum of all mapping entries enabled via the subcodes of C13489 must not exceed the value "64". Make sure that the sum of memory requirements of all objects mapped in C13231 ... C13240 does not exceed 64 bytes.			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13489/1	0	EPL RPDO: object count	0x1600.0x00
...	...	...	...
C13489/10	0	EPL RPDO: object count	0x1609.0x00
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13531

Parameter | Name: **C13531 | EPL TPDO**	Data type: UNSIGNED_64 Index: 11044 = 0x2B24 EPL index: See subcodes

The code describes the mapping for the TPDO channel.C13789.1 describes the number of valid mapping object entries in this code. Subcodes 1 ... 32 describe the mapping of the single objects.
Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped on variables with a compatible data length.
The "Offset" (bytes 4 and 5) and "Length" (bytes 6 and 7) of the mapping object description must be a multiple of 8.
Before changing the mapping object entries in C13531, C13789/1 must be set to "0". This deactivates the mapping.
Writing into C13789/1 with a value unequal "0" re-enables the mapping.
Offset and length of the data object relevant for the receiving EPL node must be identical with the corresponding values of the entry in C13531.

Subcodes	Lenze setting	Info	EPL index
C13531/1	0	EPL TPDO	0x1A00.0x01
...	...	...	...
C13531/32	0	EPL TPDO	0x1A00.0x20

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13789

Parameter | Name: **C13789 | EPL number TPDO**	Data type: UNSIGNED_8 Index: 10786 = 0x2A22 EPL index: See subcodes

The subcode 1 describes the number of valid mapping object entries (subcodes) in code C13531. The value "0" inhibits the TPDO.
Before writing a subcode of C13531, set C13789 subcode 1 to the value "0". Renewed writing of the number of mapping object entries in C13789 subcode 1 enables the TPDO mapping.

Setting range (min. value | unit | max. value)				
0		32		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C13789/1	0		EPL TPDO: object count	0x1A00.0x00

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13880

Parameter | Name: **C13880 | EPL quality lights**	Data type: UNSIGNED_8 Index: 10695 = 0x29C7 EPL index: not available

The code indicates the current quality status (values: 1, 2 or 4) of the network functions of the communication module.

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☑ PDO_MAP_TX ☐ COM ☐ MOT

C13881

Parameter | Name: **C13881 | EPL reset error counter**	Data type: UNSIGNED_8 Index: 10694 = 0x29C6 EPL index: not available

The value "1" (TRUE) enables the code to reset the cycle counter.
After reset termination the code automatically assumes the value "0" (FALSE).

Setting range (min. value | unit | max. value)			Lenze setting
0		1	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13882

Parameter | Name: **C13882 | EPL reset cycle counter**			Data type: UNSIGNED_8 Index: 10693 = 0x29C5 EPL index: not available
The value "1" (TRUE) enables the code to reset the cycle counter (C13136). After reset termination the code automatically assumes the value "0" (FALSE).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		1	**0**

10.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCEC communication module (POWERLINK) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C14000

Parameter | Name: **C14000 | EPL IP address**				Data type: UNSIGNED_32 Index: 10575 = 0x294F EPL index: See subcodes
The code displays the IP address of the communication module. • The IP address is derived from the EPL node address (Node ID): **192.168.100.[Node ID]** • The node ID is derived from the DIP switch position or from C14044. ▸ Node address setting (📖 35)				
Setting range (min. value | unit | max. value)				
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C14000/1	3232261130 (0xC0A86401 = 192.168.100.1)		EPL IP address	0x1E40.0x02
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C14001

Parameter | Name: **C14001 | EPL IP subnet mask**				Data type: UNSIGNED_32 Index: 10574 = 0x294E EPL index: See subcodes
The code describes the IP subnet mask which restricts the directly addressable IP address range (i.e. without a gateway in the EPL segment of the routers). The value 255.255.255.0 (0xFFFFFF00) is always assigned to the subnet mask in one segment.				
Setting range (min. value | unit | max. value)				
255.0.0.0 (0xFF000000)		255.255.255.0 (0xFFFFFF00)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C14001/1	4294967040 (0xFFFFFF00 = 255.255.255.0)		EPL IP-subnet mask	0x1E40.0x03
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C14003

Parameter | Name: **C14003 | EPL IP address router**			Data type: UNSIGNED_32 Index: 10572 = 0x294C EPL index: See subcodes
The code describes the IP address of the router which connects the EPL segment to the higher-level network. The standard entry corresponds to the standard router address of the EPL specification: **→ 192.168.100.254** Permissible entries replace the lowest-order byte of the standard entry with the EPL address of the node which has the function of a router.			
Setting range (min. value | unit | max. value)			
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14003/1	3232261374 (0xC0A864FE = 192.168.100.254)	EPL IP address router	0x1E40.0x05
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14004

Parameter | Name: **C14004 | EPL MAC address**		Data type: OCTET_STRING Index: 10571 = 0x294B EPL index: See subcodes
The code indicates the physical address (MAC address) of the POWERLINK interface of the communication module. When the communication module is produced, the MAC address is assigned unequivocally worldwide and provides addressing on the lowest level.		
Subcodes	**Info**	**EPL index**
C14004/1	MAC Address (octet string[6]) 00-0A-86-xx-yy-zz • 00-0A-86 = Lenze • xx-yy-zz = consecutive number	0x1030.0x05
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14028

Parameter | Name: **C14028 | EPL node declaration CN**			Data type: UNSIGNED_32 Index: 10547 = 0x2933 EPL index: See subcodes
The code describes the controlled nodes 1 ... 100 and their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14028/1	0	EPL node declaration CN	0x1F81.0x01
...	...	...	...
C14028/100	0	EPL node declaration CN	0x1F81.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a controlled node.
				1	EPL node with this ID is a controlled node.
2	☑	☐	1	0 *)	On detection of a booting controlled node, the application will not be informed.
				1	On detection of a booting controlled node, the application will be informed and the controlled node will be started.
3	☑	☑	1	0	Optional controlled node
				1	Obligatory controlled node
4	☑	☐	0	0	The managing node is allowed to send reset commands.
				1 *)	The managing node must not send any reset command.
5	☑	☐	0	0	Software version verification of the controlled node is not required.
				1 *)	Software version verification of the controlled node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed controlled node
				1	Asynchronously accessed controlled node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed controlled node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The managing node does not send any PRes frames
				1	The managing node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C14029

Parameter | Name: **C14029 | EPL node declaration MN**			Data type: UNSIGNED_32 Index: 10546 = 0x2932 EPL index: See subcodes
The code describes managing node, diagnostic device, and EPL router as well as their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14029/1	2147483661 (0x8000000D)	EPL node assignment managing node	0x1F81.0xF0
C14029/2	0	EPL node assignment diagnostic device	0x1F81.0xFD
C14029/3	2147483655 (0x80000007)	EPL node assignment router	0x1F81.0xFE
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a controlled node.
				1	EPL node with this ID is a controlled node.
2	☑	☐	1	0 *)	On detection of a booting controlled node, the application will not be informed.
				1	On detection of a booting controlled node, the application will be informed and the controlled node will be started.
3	☑	☑	1	0	Optional controlled node
				1	Obligatory controlled node
4	☑	☐	0	0	The managing node is allowed to send reset commands.

5	☑	☐	0	0	Software version verification of the controlled node is not required.
				1 *)	Software version verification of the controlled node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed controlled node
				1	Asynchronously accessed controlled node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed controlled node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The managing node does not send any PRes frames
				1	The managing node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C14030

Parameter | Name: **C14030 | EPL device type**			Data type: UNSIGNED_32 Index: 10545 = 0x2931 EPL index: 0x1000
The code indicates the device type of the EPL node.			
Value is bit-coded:			
Bit 1	Bit1		
Bit 2	Bit2		
Bit 3	Bit3		
Bit 4	Bit4		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14034

Parameter | Name: **C14034 | EPL identity object**			Data type: UNSIGNED_32 Index: 10541 = 0x292D EPL index: See subcodes
The code indicates the Manufacturer's EPL ID no. for Lenze.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14034/1	59 (0x3B)	Manufacturer's EPL ID no.	0x1018.0x01
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14040

Parameter | Name: **C14040 | EPL feature flags**	Data type: UNSIGNED_32 Index: 10535 = 0x2927 EPL index: 0x1F82
The code displays the POWERLINK functions implemented by the EPL node.	
Value is bit-coded:	
Bit 0 ... 31 | see below	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Description of the bits 0 ... 31

Bit	Relevance		Value	Description
	MN	CN		
0 (LSB)	☐	☑	0	Asynchronous access
			1	Isochronous access *)
1	☑	☑	0	No SDO by UDP/IP
			1	SDO via UDP/IP *)
2	☑	☑	0	No SDO via EPL "ASnd" *)
			1	SDO by EPL "ASnd"
3	☑	☑	0	No SDO integrated in PDO *)
			1	SDO integrated in PDO
4	☑	☑	0	No "NMT Info Services"
			1	"NMT Info Services" supported
5	☑	☑	0	No extended "NMT State Commands" *)
			1	Extended "NMT State Commands" supported
6	☑	☑	0	No dynamic PDO mapping *)
			1	Dynamic PDO mapping supported
7	☑	☐	0	No dynamic PDO mapping
			1	Dynamic PDO mapping supported
8	☑	☑	0	No configuration manager function
			1	Configuration manager function
9	☑	☑	0	Only isochronous cyclic access permitted.
			1	Isochronous multiplexed access possible.
10	☐	☑	0	No address assignment via software
			1	Address assignment via software
11	☑	☐	0	No support of the "Basic Ethernet Mode" by the master
			1	Support of the "Basic Ethernet Mode" by the master
12	☑	☑	0	No "POWERLINK to standard Ethernet" router function
			1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
13	☑	☑	0	No "POWERLINK to fieldbus" router function
			1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
14 ... 31 (MSB)	-	-	-	Reserved / No function

*) Values implemented by 9400 Servo Drives (MN: $0x0087_h = 135_d$, CN $0x0083_h = 131_d$).

C14041

Parameter | Name: **C14041 | EPL version**	Data type: UNSIGNED_8 Index: 10534 = 0x2926 EPL index: not available
The code describes the version of the POWERLINK communication profile implemented by the communication module. The higher-order nibble describes the major version, the lower order nibble describes the minor version. The implemented value corresponds to the POWERLINK version 2.0.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14042

Parameter | Name: **C14042 | Current EPL device address**	Data type: UNSIGNED_8 Index: 10533 = 0x2925 EPL index: 0x1F93.0x01
The code displays the currently valid EPL node address (Node ID). • The node ID must be unequivocal in the EPL network segment. • See also C14044.	

Display area (min. value | unit | max. value)			
1		240	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14043

Parameter | Name: **C14043 | EPL device address selection**	Data type: UNSIGNED_8 Index: 10532 = 0x2924 EPL index: 0x1F93.0x02
The code indicates whether the EPL node address (node ID) has been set via DIP switches at the communication module or via the software. • 0: Node ID has been set via software (C14044). • 1: Node ID has been set via DIP switches at the communication module. ▸ Node address setting (📖 35)	

Display area (min. value | unit | max. value)			
0		1	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14044

Parameter | Name: **C14044 | EPL device address SW**	Data type: UNSIGNED_8 Index: 10531 = 0x2923 EPL index: 0x1F93.0x03
This code serves to set the EPL node address (node ID) via the software. The value "0" (Lenze setting) is not a valid node ID. It serves to activate the setting via the DIP switches. ▸ Node address setting (📖 35)	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		240	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14045

Parameter | Name: **C14045 | EPL host name**	Data type: VISIBLE_STRING Index: 10530 = 0x2922 EPL index: 0x1F9A
The code defines a DNS-compatible device name. The length is limited to 15 characters. **The device name must be unambiguous within the network domain.** Naming convention: The device name • starts with a character • ends with a character or digit The device name consists of • letters ([A ... Z], [a ... z]) • digits ([0 ... 9]) • hyphen ([-])	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT	

C14060

Parameter | Name: **C14060 | EPL cycle time**	Data type: UNSIGNED_32 Index: 10515 = 0x2913 EPL index: 0x1006
The code declares the length of the EPL cycle in µs. • In the configured state, this code must have an identical value in all EPL nodes. • The selected value must correspond to the actual bus cycle time so that the internal monitoring functions work correctly.	

Selection list (Lenze setting printed in bold)	
500	0.5
1000	**1**
2000	2
3000	3
4000	4
5000	5
6000	6
7000	7
8000	8
9000	9
10000	10
11000	11
12000	12
13000	13
14000	14
15000	15
16000	16

18000	18
19000	19
20000	20

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14066

Parameter | Name: **C14066 | EPL CN: Max. user data PRes RPDO**			Data type: UNSIGNED_16 Index: 10509 = 0x290D EPL index: See subcodes
The code defines the reserved user data length of the PRes telegrams for controlled nodes 1 ... 100. Each subcode number corresponds to one EPL node with the same node ID. The EPL node must be enabled via code C14028. The subcodes describe the PRes telegrams received. The value must be within the range of 36 ... 1490 bytes. The values are upper limit values for the entire size of the PDO mappings for received PRes telegrams. **In the configured state, the values stored for the nodes must be identical to the corresponding C14072 entries.** **C14066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14066/1	0 byte	EPL CN: max. user data of RPDO	0x1F8D.0x01
...	...	...	...
C14066/100	0 byte	EPL CN: max. user data of RPDO	0x1F8D.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14071

Parameter | Name: **C14071 | EPL Max. PDO user data RPDO PReq**			Data type: UNSIGNED_16 Index: 10504 = 0x2908 EPL index: 0x1F98.0x04
The code defines the maximum data volume to be received by the controlled node of the PDP mapping for the PReq telegram to be defined via one of the codes C14231 ... C14240. In the configured state, the value must be identical to the entry for a response valid for the EPL node. **When a Servo Drive 9400 is used, the code as managing node is irrelevant since Servo Drives 9400 as managing nodes only transmit PDO data via broadcast PRes telegrams (C14071 = 36 bytes).**			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Byte	1490	**36 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14072

Parameter | Name: **C14072 | EPL Max. PDO user data TPDO PRes**			Data type: UNSIGNED_16 Index: 10503 = 0x2907 EPL index: 0x1F98.0x05
The code defines the maximum PDO data size to be sent by the EPL node for the current network configuration. The PDO mapping C14531 can assign data with a total size greater than or equal to C14072. **In the configured state, C14072 must be identical to the entry in C14066 valid for the EPL node.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Byte	1490	**400 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14074

Parameter | Name: **C14074 | EPL multi-stage cycle timing**			Data type: UNSIGNED_8 Index: 10501 = 0x2905 EPL index: 0x1F98.0x07
This code serves to define the maximum number of the multiplexed cycles. If, e.g., the value "3" is entered, the multiplexed cycle is repeated every three cycles. Within one multiplexed cycle, the nodes are queried according to the values in code C14079. If, e.g., the value "2" is entered for a node in C14079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Cycles	255	**0 cycles**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14075

Parameter | Name: **C14075 | EPL SDO channel width**			Data type: UNSIGNED_16 Index: 10500 = 0x2904 EPL index: 0x1F98.0x08
The code defines the maximum user data size of asynchronous frames. Protocol-specific headers for POWERLINK, UDP/IP and others as well as service-specific headers are to be interpreted as part of the user data. **In the configured state, the C14075 values of all EPL nodes must be identical.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
282	Byte	1500	**282 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14078

Parameter | Name: **C14078 | EPL CN: Max. time - MN detection**			Data type: UNSIGNED_32 Index: 10497 = 0x2901 EPL index: 0x1F99
The code defines the time interval needed for detecting a managing node. If a booting controlled node detects a managing node during the interval, it changes to NMT_CS_PREOPERATIONAL_1. If not, it changes to "Basic Ethernet Mode".			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	µs	4294967295	**10000000 µs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14079

Parameter | Name: **C14079 | EPL multi-stage node declaration CN**			Data type: UNSIGNED_8 Index: 10496 = 0x2900 EPL index: See subcodes
This code indicates in which multiplexed cycle the controlled node is queried. The value entered must not exceed the value in code C14074. If, for instance, the value "3" is entered in code C14074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C14079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14079/1	0 cycles		0x1F9B.0x01
...	...		...
C14079/100	0 cycles		0x1F9B.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14095

Parameter | Name: **C14095 | EPL communication status**		Data type: UNSIGNED_8 Index: 10480 = 0x28F0 EPL index: 0x1F8C
The code indicates the current NMT status of the EPL node.		
Selection list (read only)		**Info**
0	Off	NMT_GS_OFF
25	Initialising	NMT_GS_INITIALISING
41	ResetAppl	NMT_GS_RESET_APPLICATION
57	ResetComm	NMT_GS_RESET_COMMUNICATION
121	ResetConfig	NMT_GS_RESET_CONFIGURATION
28	NotActive	NMT_CS_NOT_ACTIVE NMT_MS_NOT_ACTIVE
29	PreOp1	NMT_CS_PRE_OPERATIONAL_1 NMT_MS_PRE_OPERATIONAL_1
93	PreOp2	NMT_CS_PRE_OPERATIONAL_2 NMT_MS_PRE_OPERATIONAL_2
109	ReadyToOp	NMT_CS_READY_TO_OPERATE NMT_MS_READY_TO_OPERATE
253	Operational	NMT_CS_OPERATIONAL NMT_MS_OPERATIONAL
77	Stopped	NMT_CS_STOPPED (only controlled node)
30	BasicEthernet	NMT_CS_BASIC_ETHERNET (only controlled node)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14102

Parameter | Name: **C14102 | EPL reset command**		Data type: UNSIGNED_8 Index: 10473 = 0x28E9 EPL index: 0x1F9E
A reset command to a single EPL node in the network can result in cycle and monitoring errors. The code initiates a reset of the EPL node. When the reset has been executed, the code is automatically set to "NMTInvalidService".		
Selection list (Lenze setting printed in bold)		**Info**
40	ResetNode	Status transition → NMT_GS_RESET_APPLICATION
41	ResetCommunication	Status transition → NMT_GS_RESET_COMMUNICATION
42	ResetConfiguration	Status transition → NMT_GS_RESET_CONFIGURATION
255	**No command**	No function
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14110

Parameter | Name: **C14110 | EPL fault memory**	Data type: UNSIGNED_8 Index: 10465 = 0x28E1 EPL index: 0x1001
The code indicates the currently pending errors (according to error classes).	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14126

Parameter | Name: **C14126 | EPL CN: Frame collisions**			Data type: UNSIGNED_32 Index: 10449 = 0x28D1 EPL index: See subcodes
The code indicates the number of POWERLINK collisions detected by the controlled node. Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C14126/1	0	CumulativeCnt_U32	0x1C0A.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14127

Parameter | Name: **C14127 | EPL CN: Sync loss**			Data type: UNSIGNED_32 Index: 10448 = 0x28D0 EPL index: See subcodes
The controlled node expects SoC frames in time intervals which correspond to the cycle time (C14060). The code indicates the error counters for missing SoC frames. The monitoring response is determined via C14891/3.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C14127/1	0	CumulativeCnt_U32	0x1C0B.0x01
C14127/2	0	ThresholdCnt_U32	0x1C0B.0x02
C14127/3	9	Threshold_U32	0x1C0B.0x03

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14131

Parameter | Name: **C14131 | EPL CN: Frame error (CRC)**			Data type: UNSIGNED_32 Index: 10444 = 0x28CC EPL index: See subcodes
The code indicates the number of frame checksum errors detected by the controlled nodes. The monitoring response is determined via C14891/4.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C14131/1	0	CumulativeCnt_U32	0x1C0F.0x01
C14131/2	0	ThresholdCnt_U32	0x1C0F.0x02
C14131/3	9	Threshold_U32	0x1C0F.0x03

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14132

Parameter | Name: **C14132 | EPL CN: Link interruptions**			Data type: UNSIGNED_32 Index: 10443 = 0x28CB EPL index: 0x1C10
The code indicates the counter of the Controlled Node for POWERLINK connection interruptions. Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14136

Parameter | Name: **C14136 | EPL telegram counter**			Data type: UNSIGNED_32 Index: 10439 = 0x28C7 EPL index: 0x1101.0x01
The subcodes of the code indicate a counter for EPL cycles. The counter is started with each mains power-up of the EPL node at 0. An overflow occurs at 4.294.967.295.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14219

Parameter | Name: **C14219 | EPL device type MN**			Data type: UNSIGNED_32 Index: 10356 = 0x2874 EPL index: See subcodes
The code contains the device type ID of the EPL nodes. Each subcode corresponds to an EPL node with node ID = subcode number. **When being in the configured status, the values must be identical with the device types stored locally in each EPL node under** C14030**.**			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14219/1	0	Managing node	0x1F84.0xF0
C14219/2	0	Diagnostics device	0x1F84.0xFD
C14219/3	0	router	0x1F84.0xFE
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14225

Parameter | Name: **C14225 | EPL MN: Max. user data RPDO**			Data type: UNSIGNED_16 Index: 10350 = 0x286E EPL index: See subcodes
The code defines the reserved user data length of the PRes frames. Each subcode number corresponds to an EPL node with the same node ID. The subcode describes the PRes frames received. The value must be within the limits of 36 ... 1490 bytes. The values are upper limit values for the total size of the PDO mappings which must be defined each one of the codes C14231 ... C14240 for PRes frames received. **In the configured state, the values stored for the EPL nodes must be identical to the corresponding C14072 entries. C14066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490	

Subcodes	Lenze setting	Info	EPL index
C14225/1	0 byte	Managing node	0x1F8D.0xF0
C14225/2	0 byte	Diagnostics device	0x1F8D.0xFD
C14225/3	0 byte	router	0x1F8D.0xFE

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14229

Parameter | Name: **C14229 | EPL multi-stage node declaration MN**			Data type: UNSIGNED_8 Index: 10346 = 0x286A EPL index: See subcodes
This code indicates in which multiplexed cycle the node is queried. The value entered must not exceed the value in code C14074. If, for instance, the value "3" is entered in code C14074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C14229/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255	

Subcodes	Lenze setting	Info	EPL index
C14229/1	0 cycles	Managing node	0x1F9B.0xF0
C14229/2	0 cycles	Diagnostics device	0x1F9B.0xFD
C14229/3	0 cycles	router	0x1F9B.0xFE

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14231

Parameter | Name: **C14231 | EPL RPDO**			Data type: UNSIGNED_64 Index: 10344 = 0x2868 EPL index: See subcodes

C14484

Parameter | Name: **C14484 | EPL address: RPDO**			Data type: UNSIGNED_8 Index: 10091 = 0x276B EPL index: See subcodes
The subcodes 1 ... 10 describe the node address of the transmitting EPL node for the PDO channels 1 ... 10 (mapping see C14231 ... C14240). Values > "0" describe the origin of a PRes frame. The value "0" is reserved for PReq (must not be used in systems with a Servo Drive 9400 as managing node). The subcodes 1 ... 10 are only valid if the corresponding subcode of C14489 has a value > "0". Before writing the EPL node address in a subcode of C14484, the corresponding subcode of C14489 must be set to the value "0". Renewed writing of the number of mapping entries in the subcode of C14489 enables the node address.			
Setting range (min. value | unit | max. value)			
0		255	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14484/1	0	EPL address: RPDO	0x1400.0x01
...	...	...	...
C14484/10	0	EPL address: RPDO	0x1409.0x01
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14489

Parameter | Name: **C14489 | EPL number RPDO**			Data type: UNSIGNED_8 Index: 10086 = 0x2766 EPL index: See subcodes
The subcodes 1 ... 10 describe the number of valid mapping entries of the PDO channels 1 ... 10 (valid subcodes in C14231 ... C14240). The value "0" inhibits the corresponding PDO channel. Before writing the mapping entries in C14231 ... C14240 or the EPL address of the SDO transmitter in the corresponding subcode of C14484, the corresponding subcode of code C14489 must be set to the value "0". A renewed writing of the number of mapping entries in the subcode of C14489 enables the mapping and the transmission EPL address for the PDO channel. The sum of all mapping entries enabled via the subcodes of C14489 must not exceed the value "64". Make sure that the sum of memory requirements of all objects mapped in C14231 ... C14240 does not exceed 64 bytes.			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14489/1	0	EPL RPDO: object count	0x1600.0x00
...	...	...	...
C14489/10	0	EPL RPDO: object count	0x1609.0x00
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14531

Parameter | Name: **C14531 | EPL TPDO**			Data type: UNSIGNED_64 Index: 10044 = 0x273C EPL index: See subcodes
The code describes the mapping for the TPDO channel.C14789.1 describes the number of valid mapping object entries in this code. Subcodes 1 ... 32 describe the mapping of the single objects. Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped on variables with a compatible data length. The "Offset" (bytes 4 and 5) and "Length" (bytes 6 and 7) of the mapping object description must be a multiple of 8. Before changing the mapping object entries in C14531, C14789/1 must be set to "0". This deactivates the mapping. Writing into C14789/1 with a value unequal "0" re-enables the mapping. Offset and length of the data object relevant for the receiving EPL node must be identical with the corresponding values of the entry in C14531.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14531/1	0	EPL TPDO	0x1A00.0x01
...	...	...	...
C14531/32	0	EPL TPDO	0x1A00.0x20
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14789

Parameter | Name: **C14789 | EPL number TPDO**			Data type: UNSIGNED_8 Index: 9786 = 0x263A EPL index: See subcodes
The subcode 1 describes the number of valid mapping object entries (subcodes) in code C14531. The value "0" inhibits the TPDO. Before writing a subcode of C14531, set C14789 subcode 1 to the value "0". Renewed writing of the number of mapping object entries in C14789 subcode 1 enables the TPDO mapping.			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14789/1	0	EPL TPDO: object count	0x1A00.0x00
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14880

Parameter | Name: **C14880 | EPL quality lights**	Data type: UNSIGNED_8 Index: 9695 = 0x25DF EPL index: not available
The code indicates the current quality status (values: 1, 2 or 4) of the network functions of the communication module.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☑ PDO_MAP_TX ☐ COM ☐ MOT	

C14881

Parameter | Name: **C14881 | EPL reset error counter**			Data type: UNSIGNED_8 Index: 9694 = 0x25DE EPL index: not available
The value "1" (TRUE) enables the code to reset the cycle counter. After reset termination the code automatically assumes the value "0" (FALSE).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		1	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14882

Parameter | Name: **C14882 | EPL reset cycle counter**			Data type: UNSIGNED_8 Index: 9693 = 0x25DD EPL index: not available
The value "1" (TRUE) enables the code to reset the cycle counter (C14136). After reset termination the code automatically assumes the value "0" (FALSE).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		1	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14883

Parameter | Name: **C14883 | EPL response when "DataExchange" is quit**		Data type: UNSIGNED_8 Index: 9692 = 0x25DC EPL index: not available
Setting of the response when the "DataExchange" sate is quit. A change in the monitoring response becomes immediately effective.		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Trouble	
3	Quick stop by trouble

C14920

Parameter | Name: **C14920 | EPL DIP switch**	Data type: UNSIGNED_8 Index: 9655 = 0x25B7 EPL index: not available
The code outputs the current DIP switch setting of the communication module. • The switch with the labelling "128" is displayed on the most significant bit, the switch "1" on the least significant bit. • The numerical value of C14920 corresponds to the node ID of the communication module. ▸ Node address setting (📖 35)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

10.4 Table of attributes

The table of attributes contains information required for communicating with the Servo Drive 9400 via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit (CINH) required	☑ Writing is only possible when the controller is inhibited (CINH)

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

Perhaps we have not succeeded in achieving this objective in every respect. If you have suggestions for improvement, please e-mail us to:

feedback-docu@lenze.com

Thank you very much for your support.

1 About this documentation

Contents

This documentation exclusively describes the E94AYCEP communication module (POWERLINK).

Note!

This documentation supplements the **mounting instructions** supplied with the drive and the **"Servo Drives 9400" hardware manual**.

The mounting instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe the software of other manufacturers. No responsibility is taken for corresponding information given in this documentation. Information on how to use the software can be obtained from the documents of the host (PLC).

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information on POWERLINK can be found on the website of the "Ethernet POWERLINK Standardization Group":

www.ethernet-powerlink.org

Target group

This documentation is intended for all persons who plan, install, commission and maintain the networking and remote servicing of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.lenze.com

Information regarding the validity

The information given in this documentation is valid for the following devices:

Extension module	Type designation	From hardware version	From software version
Communication module POWERLINK	E94AYCEP	VB	01.50

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and the software version of the installed engineering tools (e.g. »Engineer«), the screenshots in this documentation may differ from the screen representation.

1.1 Document history

Version			Description
1.0	10/2006	TD17	First edition
2.0	11/2006	TD17	General revision
3.0	11/2007	TD17	• Revised for publication as »Engineer« online help • Other corrections
4.0	08/2011	TD17	General revision
5.0	09/2012	TD17	• General updates • Supplements in the chapter Error messages (📖 60)
6.0	02/2014	TD17	• New layout • General updates

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Spelling of numbers		
Decimal	Standard notation	Example: 1234
Decimal separator	Point	The decimal point is always used. For example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Blue text colour	All information that applies to from a certain software version of the device onwards are marked accordingly in this documentation. Example: This function extension is available from software version V3.0 onwards!
Program name	» «	The Lenze PC software »Engineer«...
Control element	**bold**	The **OK** button ... / The **Copy** command ... / The Properties tab ... / The **Name** input field ...
Sequence of menu commands		If several commands are required to execute one function, the single commands are separated by an arrow: Select the **File → Open** command to...
Hyperlink	Underlined	Optically highlighted reference to another topic. It is activated with a mouse-click in this online documentation.
Icons		
Page reference	(📖 9)	Optically highlighted reference to another page. In this online documentation activated via mouse-click.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning
Drive	Lenze inverter of the "Servo Drives 9400" product series for which the communication module can be used. ▸ Application as directed (📖 13)
Inverter	
Standard device	
CN	Controlled Node (POWERLINK slave)
Code	Parameter which serves to parameterise and monitor the drive. In normal usage, the term is usually referred to as "Index".
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3"). In everyday language, the term is also referred to as "subindex".
»Engineer«	Lenze PC software which supports you during the "Engineering" process (parameterisation, diagnostics, and configuration) throughout the whole life cycle, i. e. from planning to maintenance of the machine commissioned.
EPL	Abbreviation for "Ethernet POWERLINK"
(EPL) nodes	POWERLINK nodes (Managing Node, Controlled Nodes)
ETHERNET POWERLINK	POWERLINK is a real-time capable fieldbus system based on Ethernet. For user data exchange, POWERLINK specifies a communication protocol based on CANopen. POWERLINK is a patented technology, licenced by the Ethernet POWERLINK Standardization Group (EPSG), Germany.
HW	Hardware
Host	SPS, Managing Node (POWERLINK master)
Lenze setting	Default settings of the device, preconfigured ex works.
Basic setting	
MN	Managing Node (POWERLINK master) The Managing Node accepts the control function for the data communication of the decentralised field devices. Typically, the Managing Node is the communication interface of a PLC.
Node ID	POWERLINK node address
SW	Software

1.4 Notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Pictograph and signal word!

(characterise the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

If the following basic safety measures are disregarded, severe injuries to persons and damage to material assets may result.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 13)
- must never be commissioned if they display signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- during and after operation can have live, moving and rotating parts, depending on their degree of protection. Surfaces can be hot.

The following applies to Lenze drive components ...

- only use the accessories approved.
- Only use original manufacturer spare parts.

Observe all specifications contained in the enclosed documentation and related documentation.

- This is the precondition for safe and trouble-free operation and for achieving the specified product features.
  ▸ Product features (📖 14)
- The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

All works on and with Lenze drive and automation components must only be carried out by qualified personnel. According to IEC 60364 or CENELEC HD 384 these are persons who ...

- are familiar with installing, mounting, commissioning, and operating the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).
- Only use cables corresponding to the given specifications.
  ▸ Ethernet cable specification (📖 32)

Documentation on standard device, host (PLC), system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.
▸ Protective insulation (📖 19)

Device protection

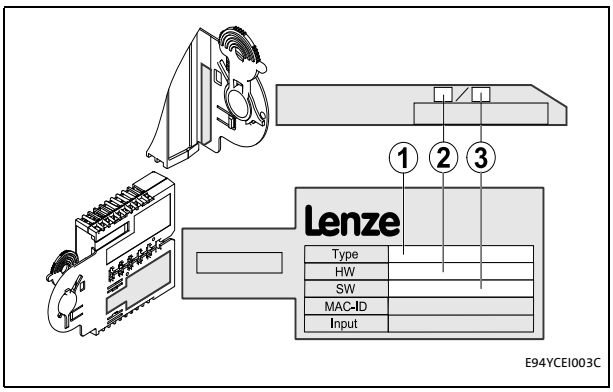
The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 23)

3 Product description

3.1 Application as directed

The communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400 HighLine	E94AxHExxx	VB	01.50
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in POWERLINK networks.

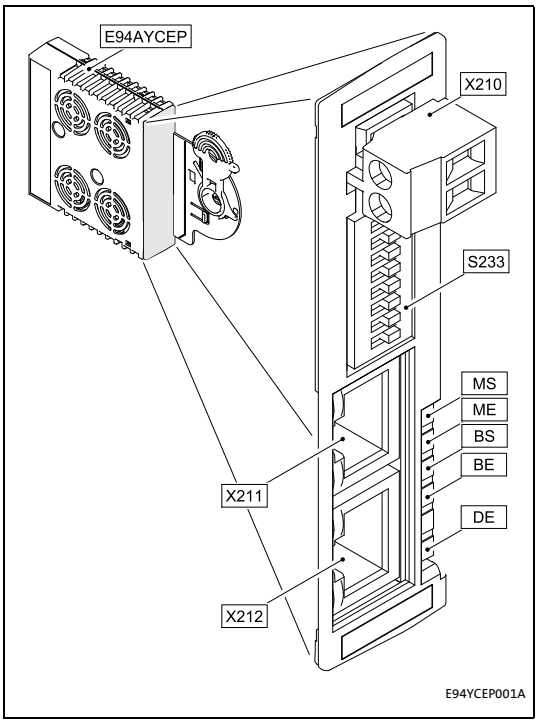
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and hardware and software version of the communication module are specified on the nameplate:

[3-1] Identification data

1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: Extension module
- C Module type: Communication module
- EP POWERLINK



2 Hardware version (HW)

3 Software version (SW)

3.3 Product features

- Interface module for the POWERLINK communication system to be connected to the expansion slots of the Servo Drives 9400
- The communication module can either be supplied internally by the standard device or externally by a separate voltage source.
- Real time Ethernet with the POWERLINK V2 communication profile for motion and general applications
- A line topology can be implemented by means of the integrated 2-port hub.
- Supported functions:
  - POWERLINK MN (Managing Node)
  - POWERLINK CN (Controlled Node)
- The "Managing Node mode" supports up to 50 nodes.
- Use of max. 10 PDO crosslinks for the Managing Node or the Controlled Node to create systems with "distributed intelligence"
- Very short CN response times for optimal network performance
- Parallel Ethernet communication between the Lenze »Engineer« and the Servo Drive 9400 if a POWERLINK router is used.
- Access to all Lenze parameters

3.4 Terminals and interfaces

4 Technical data

4.1 General data and operating conditions

Range	Values	
Order designation	E94AYCEP	
Communication profile	POWERLINK V2	
Communication medium	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e	
Interface for communication	RJ45, Standard Ethernet (according to IEEE 802.3), 100Base-TX (Fast Ethernet)	
Network topology	Tree, star, line	
Max. cable length	Number of nodes x 100 m	
Cable length between 2 nodes/hubs	max. 100 m	
Baud rate	100 Mbps	
Type of node	• Managing Node (support of up to 50 nodes) • Controlled Node Adjustable by node address (node ID).	
Node addresses (Node IDs)	240	E94AYCEP is Managing Node (max. 50 nodes)
	1 ... 100	E94AYCEP is Controlled Node with another E94AYCEP as Managing Node.
	1 ... 239	E94AYCEP is Controlled Node with Managing Node of another manufacturer.
Voltage supply	External supply via separate power supply unit +: U = 24 V DC (20.4 V ... 28.8 V), I = 140 mA - : Reference potential for external voltage supply	
Conformities, approvals	• CE • UL (see also hardware manual)	

Servo Drives 9400 hardware manual

Here you can find the **ambient conditions** and data on the **electromagnetic compatibility (EMC)**, which also apply to the communication module.

4.2 POWERLINK communication data

Range	Values
Jitter synchronisation information	approx. 1 µs
Minimum cycle time	Managing Node: 1.0 ms
	Controlled Node: 0.5 ms
Total cycle times	Managing Node: 1.0 ... 20.0 ms
	Controlled Node: 0.5 / 1.0 / 2.0 / 3.0 ... 20.0 ms
Buffer size	Tx-iso: max. 92 bytes (64 bytes of PDO user data)
	Rx-iso: max. 328 Bytes (300 bytes of PDO user data)
Delay times (Controlled Node)	T_{Preq} - T_{Res}: approx. 1 µs
	T_{SoA} - T_{ASnd}: approx. 20 µs
Dead times for Managing Node	Between 2 transmission messages: min. 1 µs
	Between receive and transmit frame: min. 1 µs
Frame size	Max. asynchronous frame size (MTU): 1518 bytes
SDO communication method	UDP/IP
Number of RPDOs	Max. 10 channels (max. 300 bytes of PDO user data per channel)
RPDO user data per application (all RPDOs)	Max. 32 objects (max. 64 bytes)
Number of TPDOs	1 channel (data access of all nodes by broadcasting)
TPDO user data per application	Max. 32 objects (max. 64 bytes)

4.2.1 Operating mode "Managing Node"

Range	Values
Node address (node ID)	240
Max. number of nodes	50 Controlled Nodes + POWERLINK router + diagnostic device
Nodes per ms	Approx. 25
Support of multiplex CNs	Yes
Support of optional CNs	Yes

4.2.2 Operating mode "Controlled Node"

- Support of multiplexed CNs
- Support of optional CNs

4.2.3 Communication time

Parameter data (SDO)

The communication time for parameter data is the time between the transmission of an SDO request and the arrival of the corresponding response.

- The processing time in the Servo Drive 9400 is approx. 30 ms + 20 ms tolerance (typical)
- For some codes, the processing time may be longer (see reference manual/»Engineer« online help for the Servo Drive 9400).

Process data (PDO)

The communication time for process data is the time between the reception of a PDO with setpoints and the return of a PDO with the current actual values.

The communication times for process data depend on ...

- processing time in the Servo Drive 9400 (interval time of the application task, process data mode);
- Telegram runtime on the fieldbus (telegram length, number of nodes, PDO update time, instant of transmission of the POWERLINK telegram);
- Use of the synchronisation to the POWERLINK cycles.

Processing time

The basic conditions mentioned above cause the following processing times for the process data in the Servo Drive 9400:

- Process data for synchronised operation: approx. 1.2 ms
- Process data for non-synchronised operation: approx. 3.0 ms

4.3 Protective insulation

Danger!

Dangerous voltage

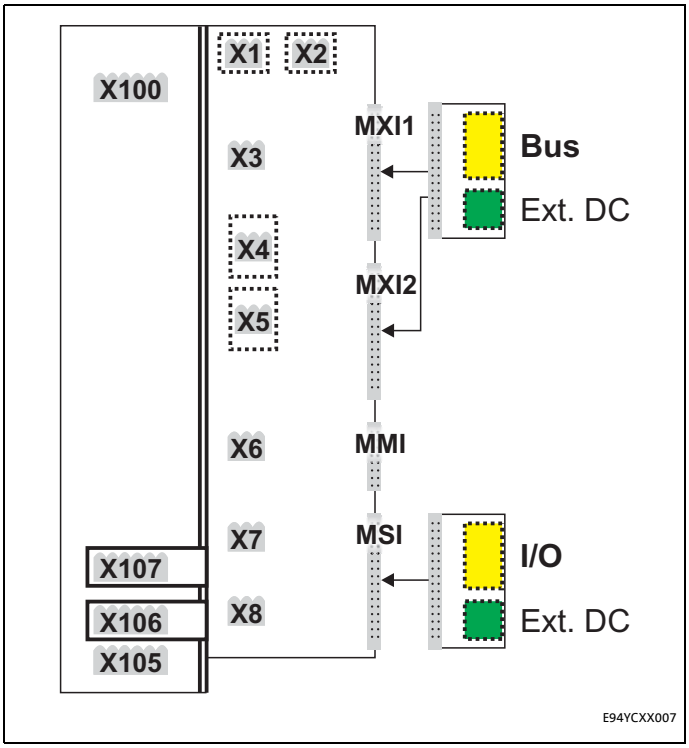
If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

Possible consequences:

Death or severe injuries

Protective measures:

If protection against accidental contact is required for the control terminals of the Servo Drive 9400 and the connections of the plugged device modules, ...



- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.

Note!

The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

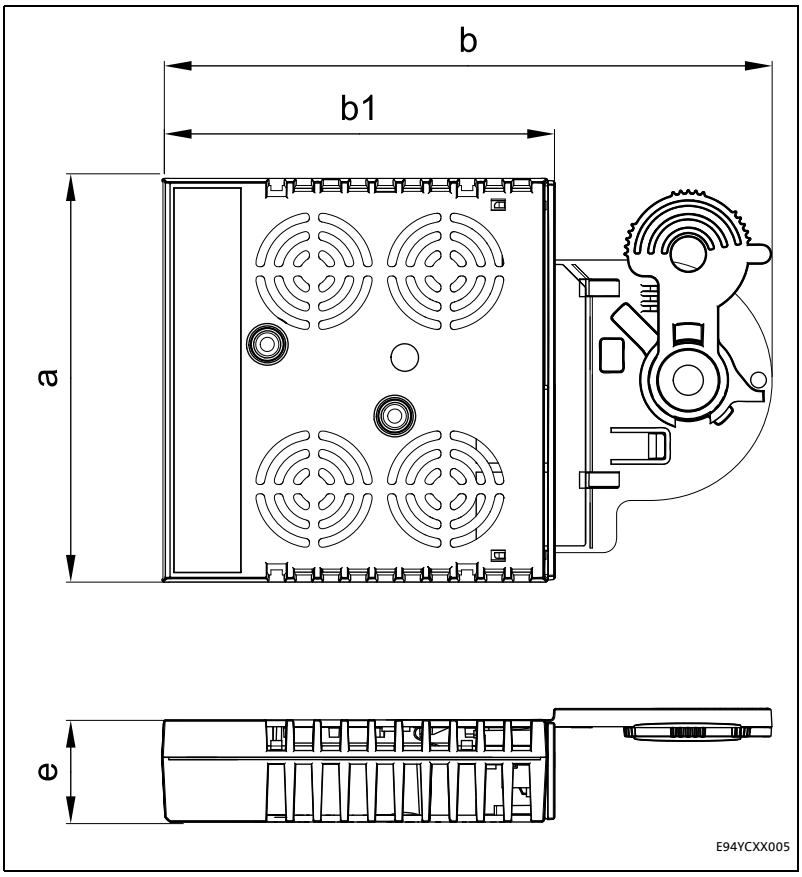
The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the Servo Drive 9400.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example



Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.4 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

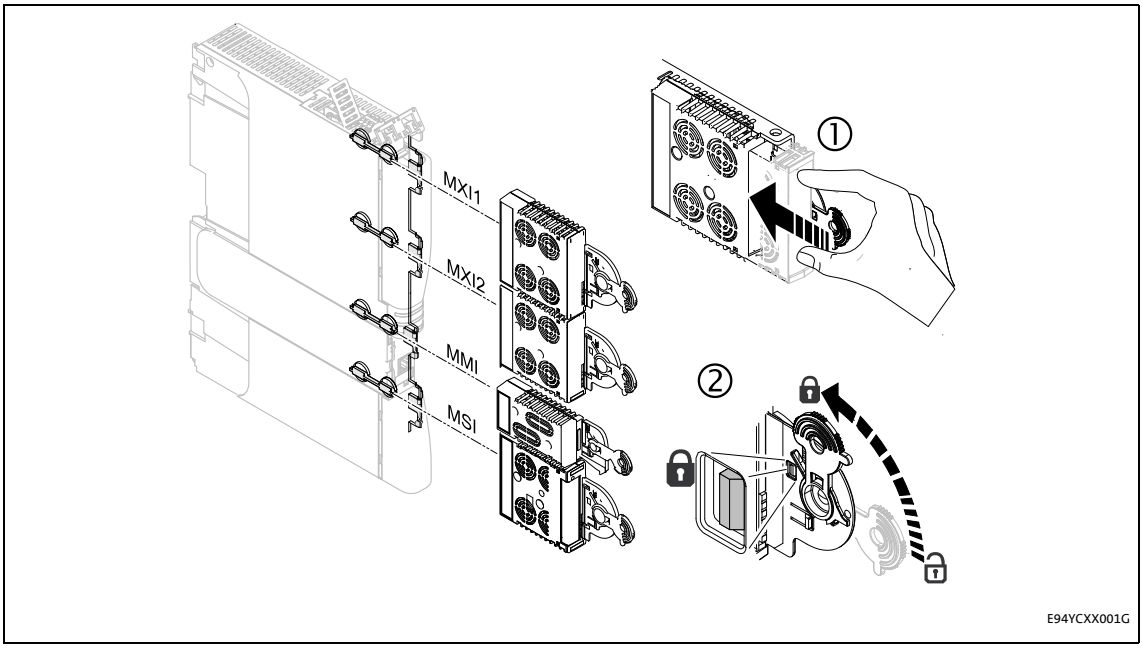
5 Installation

Stop!

Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

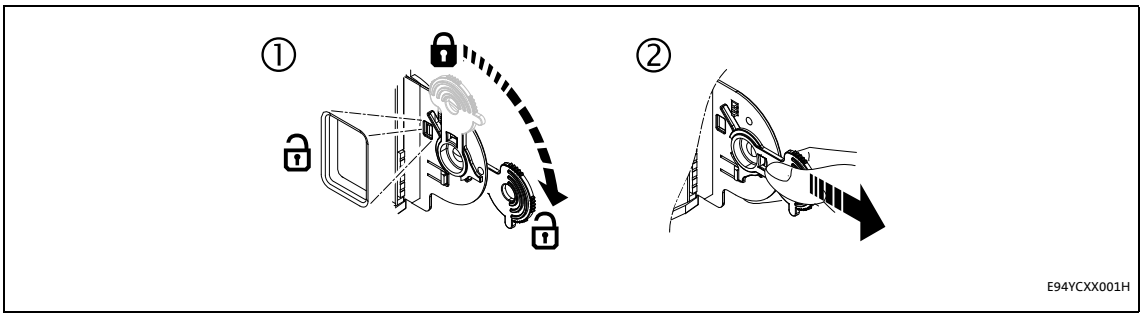
Possible consequences:



- The communication module is defective.
- Fieldbus communication is not possible or faulty.

Protective measures

- Before touching the module, be sure that you are free of electrostatic charge.



5.1 Mechanical installation

5.1.1 Assembly

[5-1] Assembly

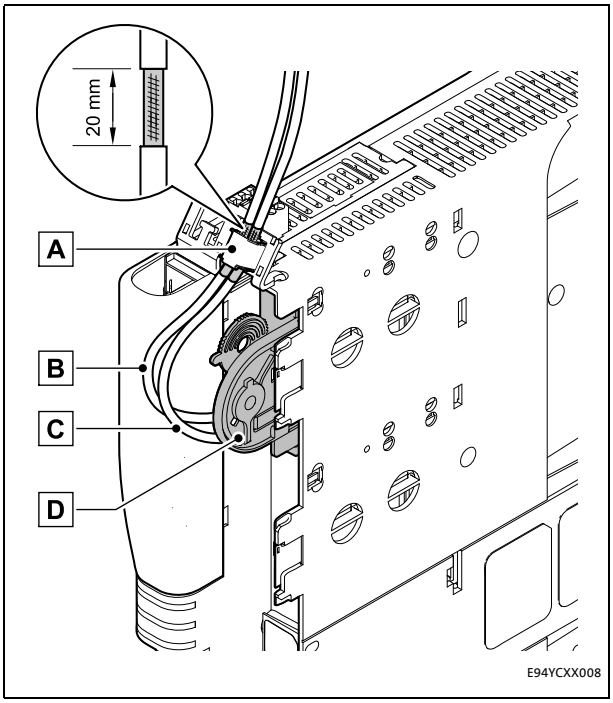
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation on standard device, host (PLC), system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring according to EMC guidelines

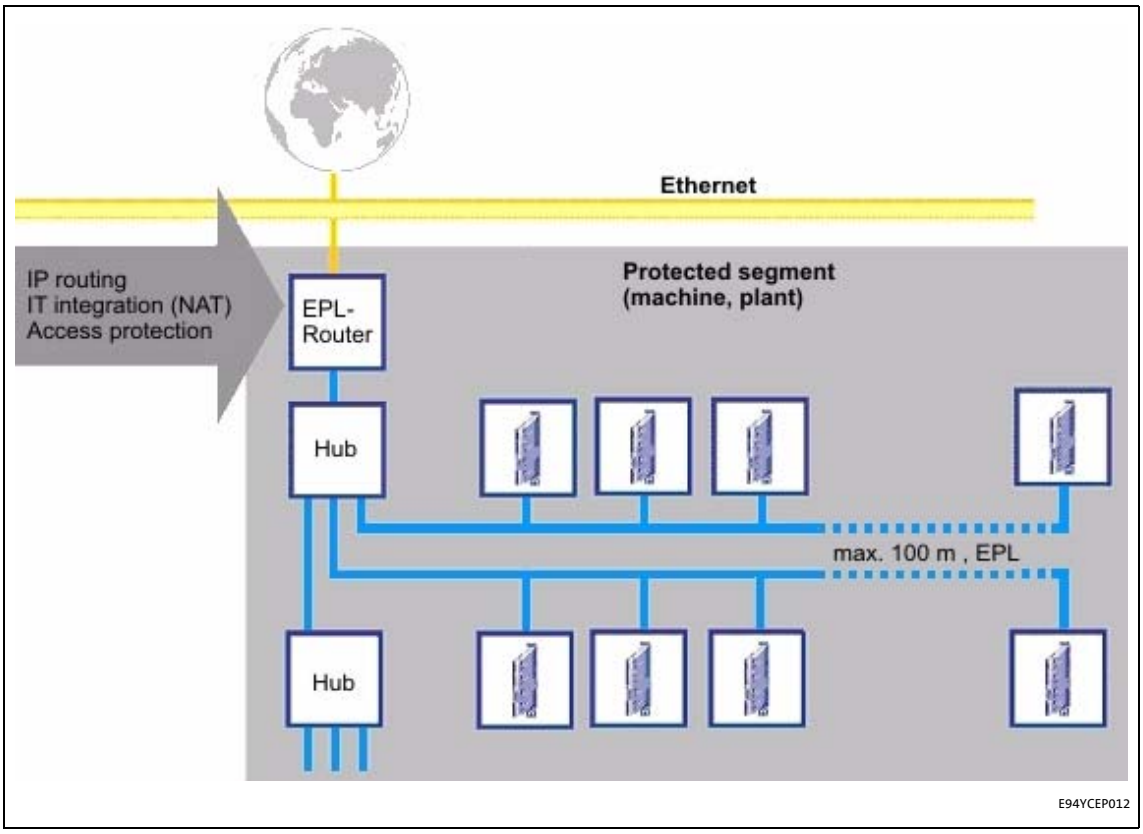
In typical systems, standard shielding is sufficient for Ethernet cables.

However, in environments with a very high level of interference, EMC resistance can be improved by additionally earthing the cable shield on both sides.

For this observe the following notes:

1. The distance between the additional earthing and the Ethernet plug depends on the module slot and is as follows:
   - approx. 10 cm for the upper slot (MXI1)
   - approx. 20 cm for the lower slot (MXI2)
2. Measure the appropriate distance along the cable and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Connect the cable shield to the shield sheet of the Servo Drive 9400.

A Connection to the shield sheet of the Servo Drive 9400



B Ethernet cable to X211

C Ethernet cable to X212

D Communication module in slot MXI1 of the Servo Drive 9400

[5-3] Wiring according to EMC guidelines

5.2.2 Network topology

[5-4] Network topology for POWERLINK

Note!

The use of class I hubs and switches inside the POWERLINK network segment is not permitted.

Inside the segment only Ethernet hubs may be used as infrastructure elements. The hubs must meet the requirements on class II repeaters acc. to IEEE 802.3u.

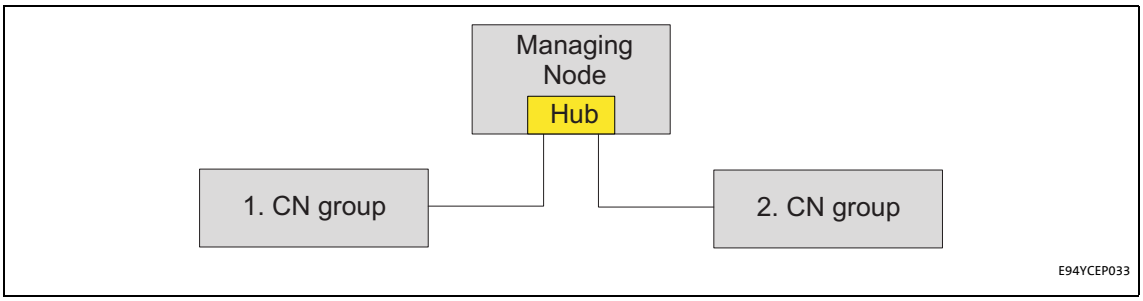
For this purpose Lenze offers the dual hub integrated into the communication module and the separate eight-fold hub, type E94AZCEH.

Class I hubs and switches are not permissible since they have considerably longer delay times for the frame forwarding and a bigger jitter. Both sizes reduce the real-time capability and dynamics.

The cable length between two POWERLINK nodes is limited to 100 m.

The topology rules (IEEE 802.3u) required for controlling the collisions may be violated in the POWERLINK network segment since according to the POWERLINK access order, telegram collisions are prevented. This enables a structure of lines and any hybrid forms between star and line topology.

Recommended topology



For an easy configuration and due to many possible topology variants we recommend to create networks according to the following rules:

1. Create CN groups with up to 10 nodes.
2. Connect CN groups in star shape to the Managing Node.
3. Connect CN groups to the Managing Node via one external hub each.
   - For more than 2 CN groups, use an external 8-port hub (e.g. Lenze hub E94AZCEH).
   - For max. 7 CN groups one hub is sufficient.
   - For more than 7 CN groups, use further hubs.
   - The groups can be distributed on the hubs just as you like.
   - Observe the restrictions of the used Managing Node.

Note!

E94AYCEP communication module als Managing Node

With maximally 2 CN groups and the use of an E94AYCEP communication module as Managing Node, connect the CN group(s) directly to the POWERLINK terminals X211 and X212 of the E94AYCEP communication module.

[5-5] Star topology for 1 to 2 CN groups

5.2.3 Ethernet POWERLINK

Note!

Standard Ethernet nodes are not permitted in the POWERLINK network segment.

In order to use the real-time capability of the POWERLINK technology, POWERLINK nodes must be interconnected in a separate network segment.

In accordance with the POWERLINK rules, only the Managing Node controls the access of POWERLINK nodes to the network. The Managing Node is the only node that transmits autonomously. The slave nodes (i.e. all Controlled Nodes) only transmit when the are entitled to transmit by the Managing Node.

Non-POWERLINK nodes (e.g. PCs) typically violate these rules by sending telegrams independently from the Managing Node. The telegrams interfere with the cyclic telegram exchange of the POWERLINK-nodes and impede the real-time capability of POWERLINK.

Connection to the standard Ethernet network

The connection to an external standard Ethernet network is carried out via an POWERLINK router or an POWERLINK gateway.

These infrastructure components separate the network traffic in the POWERLINK network segment from the one in the standard Ethernet. The handling of the frames depend on their direction:

- Standard Ethernet ---> POWERLINK network segment:
  Only telegrams that are addressed to nodes in the network segment are forwarded. The forwarding takes place in the asynchronous area of the POWERLINK cycle.
- POWERLINK network segment ---> standard Ethernet:
  Only asynchronous telegrams that are not addressed to nodes in the POWERLINK network segment are forwarded.

Tip!

Detailed information on the function and setting of the router or gateway can be found in the documentation of the component manufacturer.

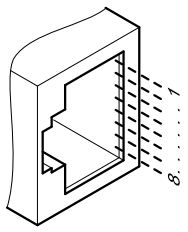
5.2.4 Basic Ethernet Mode

Note!

Operation in the "Basic Ethernet Mode" does not permit any real-time communication.

The communication module can be operated in the "Basic Ethernet Mode" for a basic parameter setting provided that the following applies:

1. Operation of the module with network address ≤ 239.
   - IP address: 192.168.100.[Node ID]
   - see Node address setting (📖 36)
2. Operation with real time POWERLINK must not be carried out.
3. No integration of a Managing Node (node ID = 240) into the standard Ethernet network.



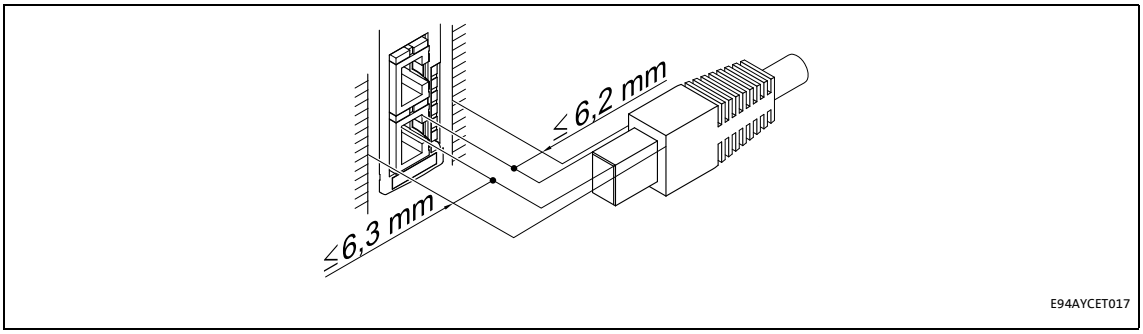
5.2.5 POWERLINK connection

- The POWERLINK is wired using the two RJ45 sockets **X211** and **X212**.
- If possible, do not wire more than 10 nodes in a row in a network line.
- In case of more than 10 nodes you should deactivate the automatic calculation of the hub level in the »Engineer« and enter it manually to increase the performance.
- With a cycle time of 1 ms, 25 nodes can be operated.
  - The number of nodes can be increased if the POWERLINK cycle time is increased as well.
- You can use a standard Ethernet patch cable to connect the communication module to the POWERLINK fieldbus.
  ▸ Ethernet cable specification (📖 32)
- The installation and removal of the Ethernet cables is optimised for the use of connectors in accordance with the "Automation Initiative of German Domestic Automobile Manufacturers" (AIDA).

Note!

To prevent the RJ45 socket from being damaged, insert or remove the Ethernet cable connector straight (at a right angle) into or from the socket.

Pin assignment of the RJ45 sockets



RJ45 socket	Pin	Signal
 E94AYCXX004C	1	Tx +
	2	Tx -
	3	Rx +
	4	-
	5	-
	6	Rx -
	7	-
	8	-

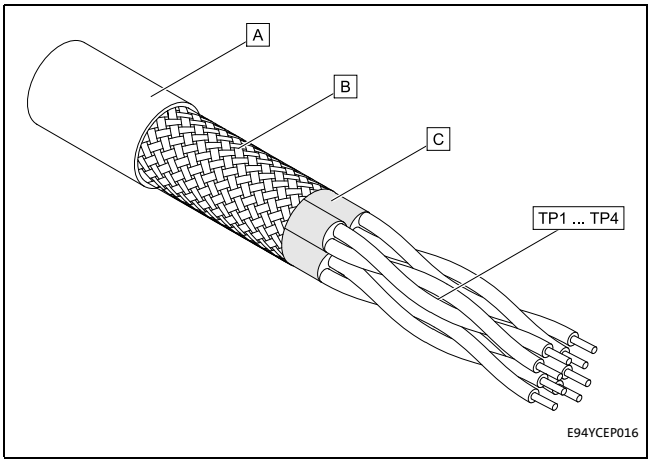
Tip!

The POWERLINK interfaces feature an auto-MDIX function. This function adjusts the polarity of the RJ45 interfaces so that a connection can be established irrespective of the polarity of the opposite POWERLINK interface and irrespective of the type of cable used (standard patch cable or crossover cable).

Mounting clearance

When ordering and using your Ethernet cable, note the amount of free space available.

[5-6] Mounting clearance



5.2.6 Ethernet cable specification

Note!

Only use cables that meet the listed specifications.

Ethernet cable specification	
Ethernet standard	Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Cable type	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e
Damping	23.2 dB (for 100 MHz and 100 m each)
Crosstalk damping	24 dB (at 100 MHz and per 100 m)
Return loss	10 dB (per 100 m)
Surge impedance	100 Ω

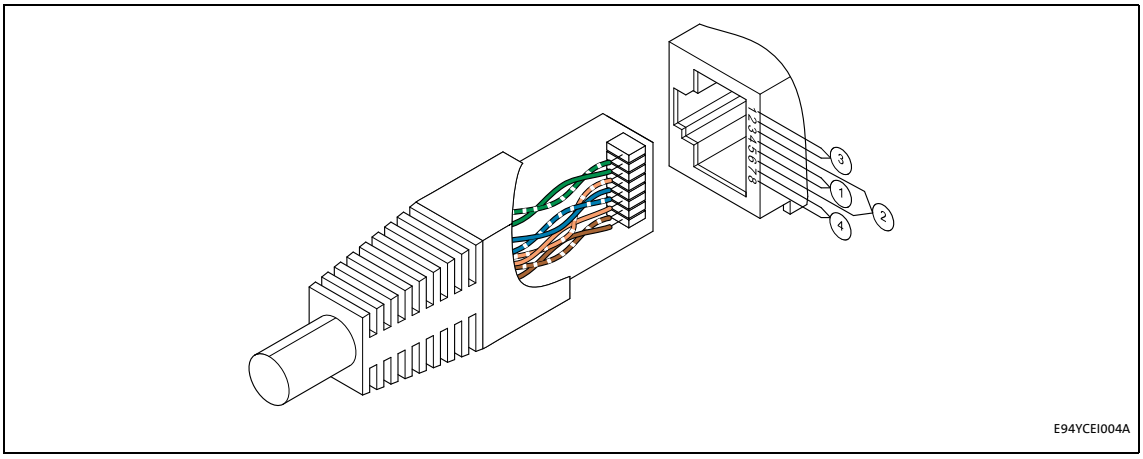
Structure of the Ethernet cable

A Cable insulation

B Braid

C Foil shielding

TP1 ... TP4 Twisted core pairs 1 ... 4



[5-7] Structure of the Ethernet cable (S/FTP, CAT 5e)

Colour code of the Ethernet cable

Note!

Wiring and colour code are standardised in EIA/TIA 568A/568B.

In accordance with the industrial standard, the use of 4-pin Ethernet cables is permissible. The cable type only connects the assigned pins 1, 2, 3 and 6 to one another.

[5-8] Ethernet plug in accordance with EIA/TIA 568A/568B

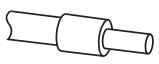
Pair	Pin	Signal	EIA/TIA 568A	EIA/TIA 568B
3	1	Tx +	white / green	white / orange
	2	Tx -	Green	orange
2	3	Rx +	white / orange	white / green
1	4		blue	blue
	5		white / blue	blue / white
2	6	Rx -	orange	Green
4	7		white / brown	white / brown
	8		brown	brown

5.2.7 External voltage supply

The communication module can be externally supplied with voltage via separate supply cables at the 2-pin plug connector **X210**.

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).



The external voltage supply of the communication module is necessary if the power supply for the basic device fails but communication via the fieldbus is to be maintained.

Access to parameters of a standard device disconnected from the mains is not possible.

Assignment of the X210 plug connector

Name	Explanation
+	U = 24 V DC (20.4 ... 28.8 V) I = 140 mA
-	Reference potential for external voltage supply

Data of the terminals

Range	Values	
Electrical connection	2-pole connector with screw connection	
Possible connections	Rigid:	
		1.5 mm^2 (AWG 16)
	Flexible:	
		Without wire end ferrule 1.5 mm^2 (AWG 16)
		With wire end ferrule, without plastic sleeve 1.5 mm^2 (AWG 16)
		With wire end ferrule, with plastic sleeve 1.5 mm^2 (AWG 16)
Starting torque	0.5 ... 0.6 Nm (4.4 ... 5.3 lb-in)	
Stripping length	6 mm	

6 Commissioning

During commissioning, plant-specific data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the inverter. Lenze devices use codes for this purpose.

The codes of the inverter and for communication are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

Note!

When parameterising the communication module, please note that the code number depends on the slot of the Servo Drive 9400 into which the communication module is plugged.

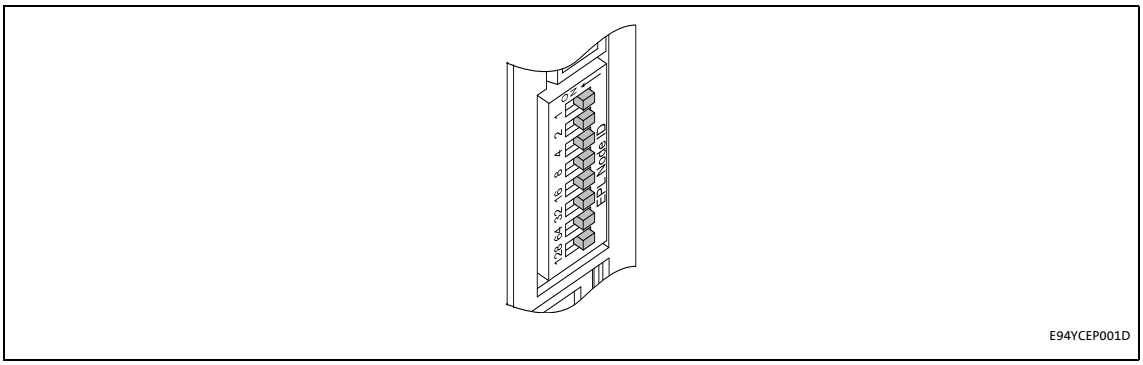
The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  - Parameters of the communication module for slot MXI1 (📖 71)
- C**14**nnn for slot MXI2
  - Parameters of the communication module for slot MXI2 (📖 101)

You also have to set the Parameters of the standard device that are relevant to communication (📖 69).

6.1 Before initial switch-on

Stop!



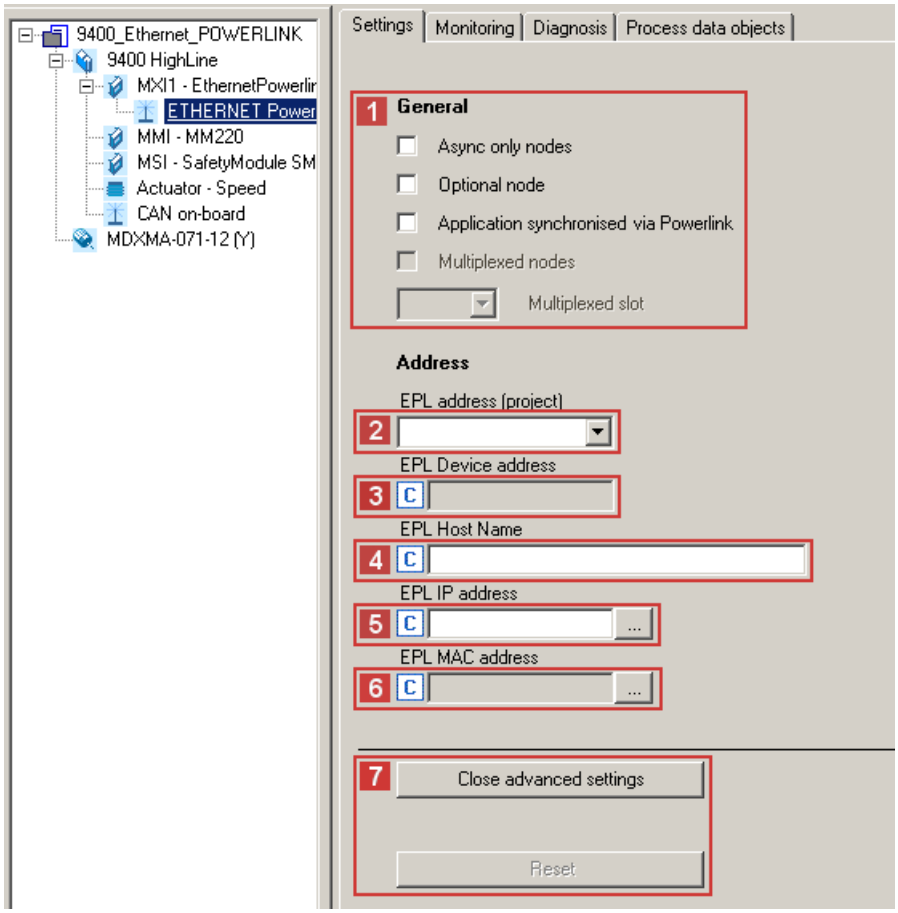
Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Node address setting

Note!

- Each network node address must only be used once.
- The node address setting in the configuration software (e.g. »Engineer«) and the DIP switches must be identical for each node.
- Switch the voltage supply of the communication module off and on again to activate changed settings.

The POWERLINK node address (node ID) is set via the front DIP switches.



[6-1] DIP switch

- The labelling on the housing corresponds to the valencies of the individual DIP switches for determining the node address (Node ID).
- Lenze setting for DIP switches 1 ... 128 = OFF (invalid value "0")
- Valid addresses in the POWERLINK network for the communication module:
  - 240: Managing Node
    The Managing Node mode" supports max. 50 nodes.
  - 1 ... 100: Controlled Node with Lenze module E94AYCEP as Managing Node
  - 1 ... 239: Controlled Node with Managing Node of another manufacturer
- The corresponding Ethernet IP address of the communication module results from the address setting of the DIP switches:
  IP address: 192.168.100.[Node ID]

Examples for address setting with the DIP switches

Address setting	DIP switch							
	128	**64**	**32**	**16**	**8**	**4**	**2**	**1**
1 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	OFF	OFF	**ON**
2 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	OFF	**ON**	OFF
3 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**
4 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	**ON**	OFF	OFF
5 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	**ON**	OFF	**ON**
6 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**	OFF
7 (Controlled Node)	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**	**ON**
8 (Controlled Node)	OFF	OFF	OFF	OFF	**ON**	OFF	OFF	OFF
9 (Controlled Node)	OFF	OFF	OFF	OFF	**ON**	OFF	OFF	**ON**
10 (Controlled Node)	OFF	OFF	OFF	OFF	**ON**	OFF	**ON**	OFF
...	...	...	...	...	...	...	...	...
239 (Controlled Node)	**ON**	**ON**	**ON**	OFF	**ON**	**ON**	**ON**	**ON**
240 (Managing Node)	**ON**	**ON**	**ON**	**ON**	OFF	OFF	OFF	OFF

6.3 Settings and displays in the »Engineer«

Setting / display		Description
1	**General**	General information on the node type or the synchronisation of the application
2	**EPL address (project)**	Setting of the POWERLINK address (node ID: C13044 / C14044) • If the address '240' (Managing Node) is set here, only "Application synchronised via Powerlink" can be activated in the general settings. • The "Managing Node node" supports max. 50 nodes.
3	**Current EPL device address**	Display of the current POWERLINK device address (C13042 / C14042)
4	**EPL host name**	The DNS-compatible **host name** (C13045 / C14045) has to be non-ambiguous within the network domain. The device name ... • consists of max. 15 characters ([A ... Z], [a ... z], [0 ... 9], [-]); • starts with a letter; • ends with a letter or a digit.
5	**EPL IP address**	The IP address (C13000 / C14000) is created from the POWERLINK address (Node ID): 192.168.100.[C13044 / C14044]
6	**EPL MAC address**	Display of the MAC address (C13004 / C14004)
7	**Open/close advanced settings**	Here, the POWERLINK communication can be reset.

6.4 Initial switch-on

Documentation for the Servo Drive 9400

Observe the safety instructions and information on residual hazards.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

For further communication of the externally supplied module it is not relevant whether the standard device is switched on or not.

Activating changed setting

In order to activate any changed settings, ...

- execute the device command "11: Save start parameter" via the standard device code **C00002** and ...
- then reset the bus node or switch off and on again the voltage supply of the communication module.

Protection against uncontrolled restart

After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

Via the standard device code **C00142** ("Auto restart after mains connection") you can set the restart behaviour of the inverter:

C00142 = "0: Inhibited" (Lenze setting)

- The inverter remains inhibited (even if the fault is no longer active).
- An explicit controller enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.

C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

Initial switch-on and diagnosing

1. Switch on the Servo Drive 9400 and check whether it is ready for operation using the diagnostic LEDs of the communication module.
   - Red diagnostic LEDs must not be on.
   - The following signalling should be visible:

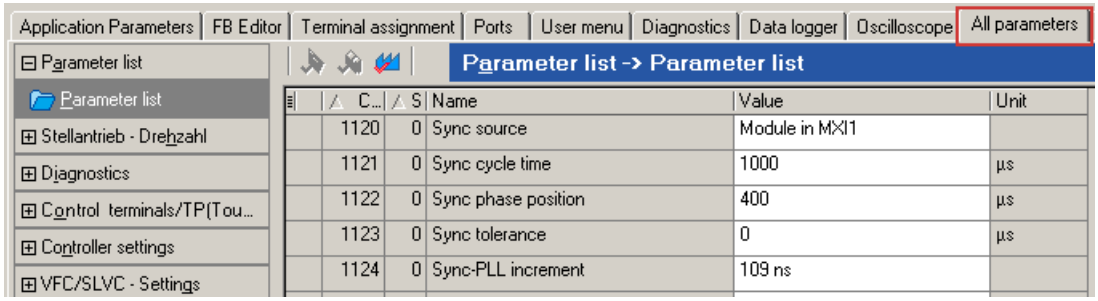
LED	Colour	Status	Meaning	
MS	Green	On	Module Status	▸ Module status displays (📖 51)
DE	-	Off	Device Error	
X211	Green	On	LED is lit if a connection to the node has been established. ▸ Status displays at the RJ45 sockets (X211, X212) (📖 53)	
X212	Green	On		

2. If not already done, load the POWERLINK configuration into the Servo Drive 9400.
3. Repeat steps 1. and 2. for all POWERLINK nodes.
4. Start the POWERLINK network.

   The network starts automatically if you set the Managing Node last.

   Otherwise there are two options:
   - Switch off the network nodes and switch them on together or
   - execute a fault reset at the Managing Node (Node ID = '240').
5. Check the POWERLINK network again using the diagnostic LEDs of the communication module.

   The following signalling should be visible:



LED	Colour	Status	Meaning	
MS	Green	On	Module Status	▸ Module status displays (📖 51)
ME	-	Off	Module Error	
BE	-	Off	Bus Error	
DE	-	Off	Device Error	
BS	Green	On	Bus Status	▸ Fieldbus status displays (📖 52)
X211	Green	On	LED is lit if a connection to the node has been established. ▸ Status displays at the RJ45 sockets (X211, X212) (📖 53)	
X212	Green	On		

6.5 Drive synchronisation

Examples of the use of drive synchronisation via POWERLINK:

- Implementation of the "electrical shaft"
- Specification of cyclic position information
- Exactly simultaneous data processing of several drives
- Optimisation of the processing times of cyclic process data (PDO).

Settings in the »Engineer«

- Set the MXI slot of the communication module as synchronisation source in code **C01120** of the Servo Drive 9400.
- The sync cycle time **C01121** and the sync phase position **C01122** are automatically calculated from the communication module. Default settings of these parameters are ignored.
- It is not necessary to adjust the sync tolerance **C01123** and the sync increment **C01124**.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you can find detailed information on drive synchronisation and the corresponding parameters.

6.6 Optimising the POWERLINK communication

SDO bandwidth

Note!

The channel bandwidth should only be increased if the network is below capacity limit.

The SDO channel width (C13075 / C14075) is the size of the asynchronous channel used for parameter setting and diagnostics. A higher value improves the transmission of large amounts of data (e.g. parameter downloads) and at the same time reduces the number of possible nodes.

Maximum time for device search

During the device search, the Managing Node has to wait until all Controlled Nodes have been found.

- Unless all Controlled Nodes are available in the defined POWERLINK cycle time, the "EPL_BOOTUP_1" error message is generated. The Managing Node remains in this status.
- If the Managing Node has found all Controlled Nodes, it starts the network.

Due to machine or system-specific switch-on sequences, it may be required to adapt the following POWERLINK objects:

- CN object **0x1F99**: NMT_CNBasicEthernetTimeout_U32 (C13078 / C14078)
- MN object **0x1F89**: NMT_BootTime_REC (C13062 / C14062)

Note!

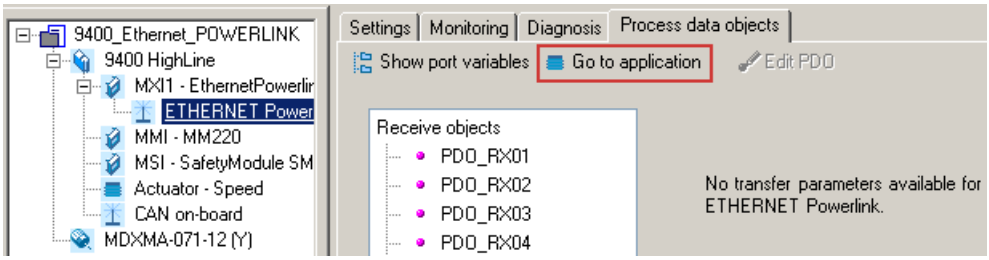
In order to avoid a too quick change to the Basic Ethernet Mode (📖 29), the value of the **0x1F99** object (NMT_CNBasicEthernetTimeout_U32) must be higher than the value of the **0x1F89** object (NMT_BootTime_REC) which is the case by default.

▸ POWERLINK objects (📖 136)

7 Process data transfer

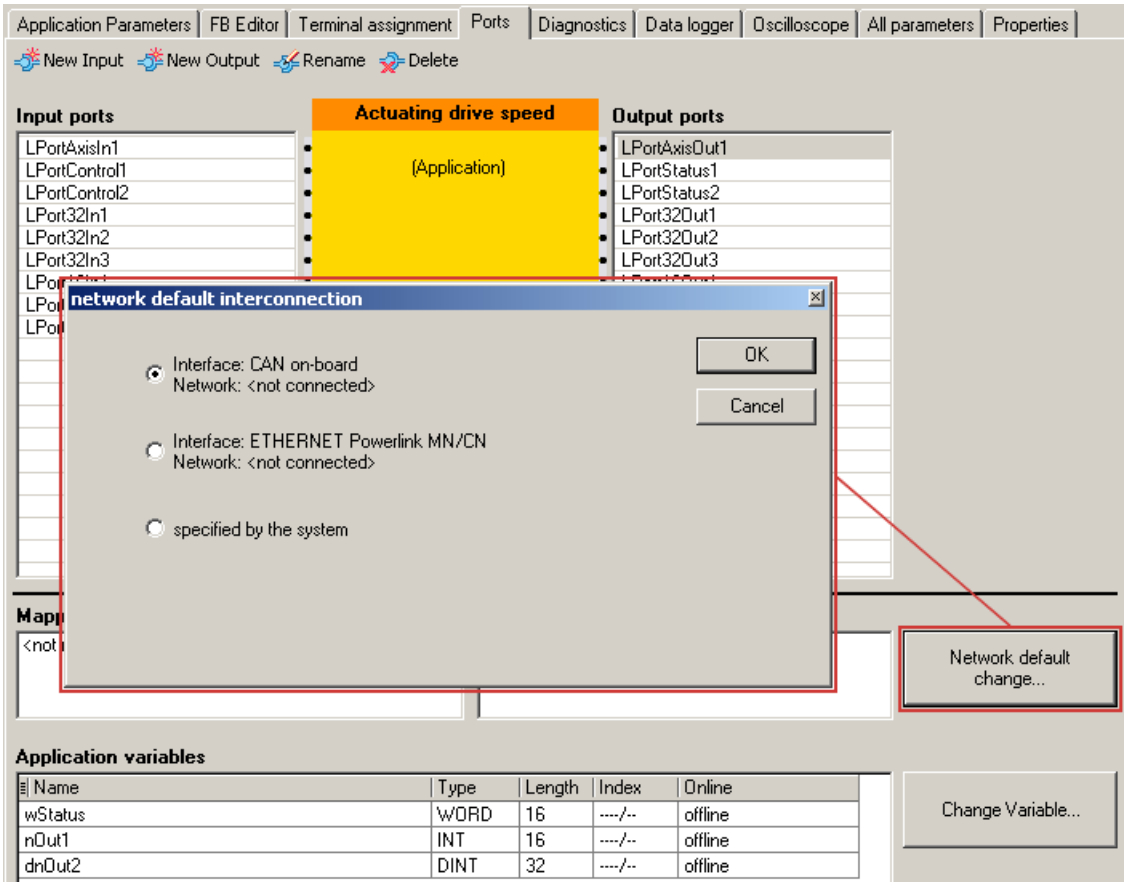
POWERLINK transmits process data, parameter data, configuration data and diagnostic data between the Managing Node and the Controlled Nodes. Depending on their time-critical behaviour, the data are transmitted via different communication channels.

- Process data are transmitted via the process data channel.
- Process data serve to control the Servo Drive 9400.
- The transmission of process data is time-critical.
- Process data are cyclically transferred between the Managing Node and the Controlled Nodes (permanent exchange of current input and output data).
- The Managing Node can directly access the process data. In the PLC, for instance, the data are directly assigned to the I/O area.
- 1 ... 10 process data words (16 bits/word) can be received:
  PDO_RX01 (C13231 / C14231) ... PDO_RX10 (C13240 / C14240).
- 1 process data word can be sent:
  PDO_TX01 (C13531 / C14531)
- Process data are not saved in the Servo Drive 9400.
- Process data are e.g. setpoints, actual values, control words, and status words.



Port mapping in the »Engineer«

The port mapping in the »Engineer« can be automatically carried out via a selectable interface:



- POWERLINK MN/CN
- CAN on board
- Defined by the system

How to select the interface for automatic assignment of the port mapping:

1. Go to **Process data objects** tab and press the **"Go to application"** button.

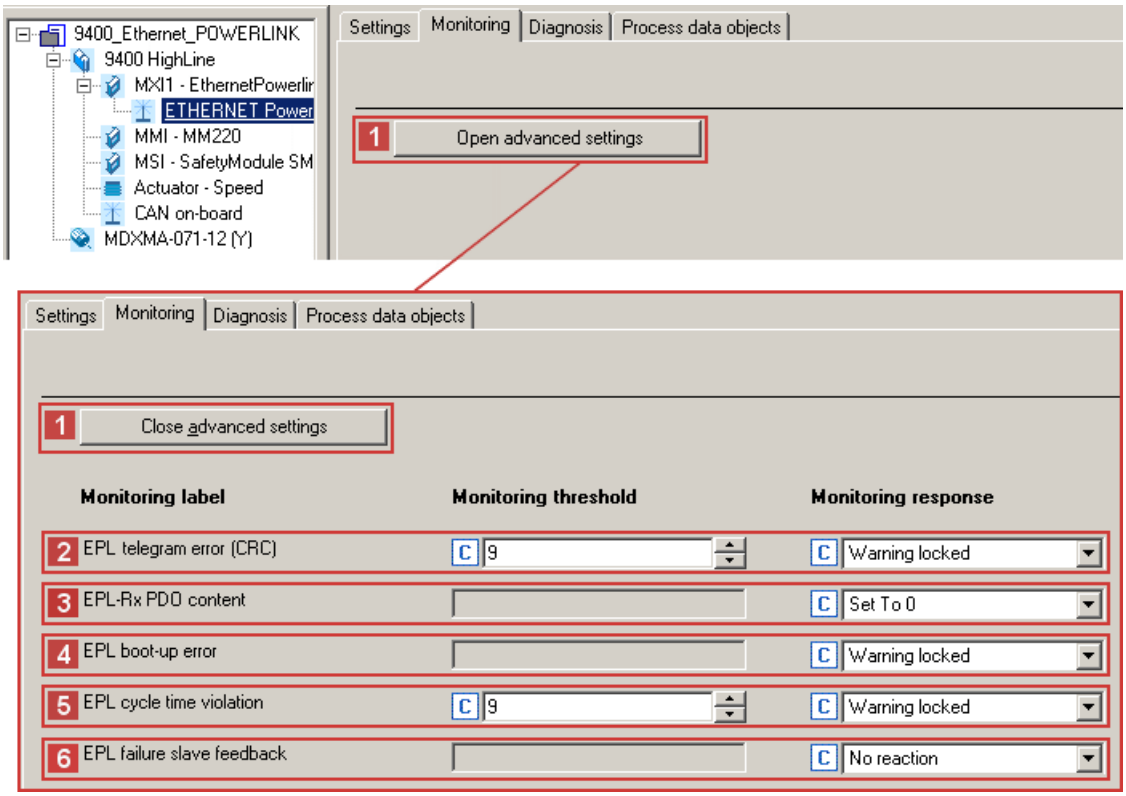
2. Go to **Ports** tab of the application, press the **"Interface for automatic allocation ..."** button and select the desired interface.

8 Monitoring

The communication module provides several monitoring functions for the "Managing Node" and "Controlled Node" operating modes. The standard settings can be changed in the »Engineer« under the **Monitoring** tab.

For the settings, monitoring responses and monitoring thresholds can be specified. When the monitoring thresholds are exceeded, the response of the Servo Drive 9400 is specified together with the POWERLINK-specific monitoring response. The required status is adopted which is additionally entered into the logbook of the Servo Drive 9400. The setting 'No response' deactivates the monitoring function.

Note!



Generally, all set monitoring functions must be reset after they occurred and before they can be transmitted again since they affect the fieldbus behaviour and the behaviour of the communication module.

Weighted process

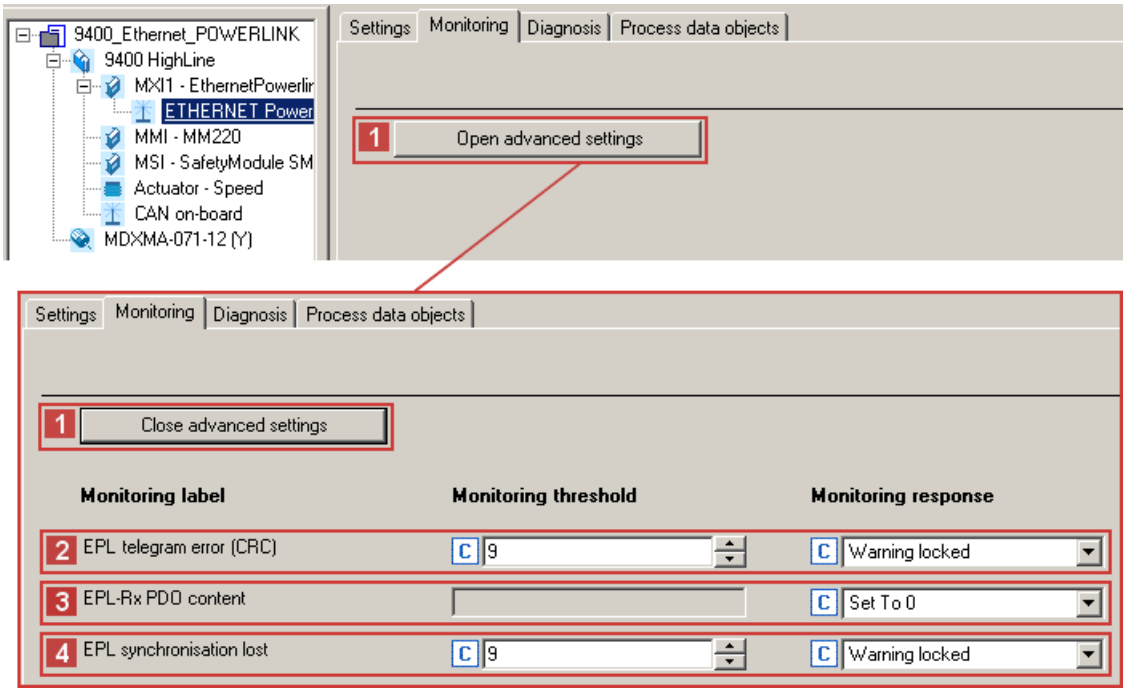
The monitoring threshold, for instance, serves to define the number of errors which may occur in succession. Here, the POWERLINK uses a weighted process which must be considered when the monitoring threshold is entered:

- As soon as an error occurs, an internal error counter is increased by the value "8".
- As soon as a POWERLINK cycle was successful, the error counter is reduced by the value '1'.
- Thus 8 faultless transmissions are required after an error has been detected, in order that the error counter assumes the value "0" again.

8.1 Monitoring functions of the Managing Node

In order to change the standard settings of the monitoring functions, press the 1 **"Open advanced settings"** button.

- The input fields for monitoring thresholds and monitoring responses are shown.
- The 1 **"Close advanced settings"** serves to mask out the input fields again.



Settings

Monitoring function		Description
2	**EPL frame error (CRC)**	Weighted number of received faulty frames • This error can occur due to very strong EMC interferences or by non-POWERLINK-compliant nodes. • Monitoring threshold: C13115/3 / C14115/3 • Monitoring response: C13891/4 / C14891/4
3	**EPL-Rx PDO contents**	This monitoring response defines the way the cyclic process data (PDO) will be forwarded from the POWERLINK network to the standard device/ application in the event of an error. An error has occurred if no valid process data is received and a failed Controlled Node is reported to the Managing Node. The following settings are possible with C13885 / C14885: • 0: The valid data received last remains. • 1: All data is set to the value "0".
4	**EPL bootup error**	The Managing Node could not set the POWERLINK network to the "NMT_xx_OPERATIONAL" status. • Monitoring response: C13891/2 / C14891/2
5	**EPL cycle time violation**	Weighted number of non-executable POWERLINK cycles. This error can occur if the network nodes do not behave in a POWERLINK-compliant way or the Managing Node / the network is overloaded (wrong POWERLINK cycle time). • Monitoring threshold: C13117/3 / C14117/3 • Monitoring response: C13891/1 / C14891/1
6	**EPL failure - slave feedback**	If at least one Controlled Node defined via C13028 / C14028 has failed, the set monitoring response (C13891/5 / C14891/5) is executed.

8.2 Monitoring functions of the Controlled Node

Note!

The E94AYCEP communication module as Controlled Node only supports monitoring for the "LeaveDataExchange" status.

In order to change the standard settings of the monitoring functions, press the 1 **"Open advanced settings"** button.

- The input fields for monitoring thresholds and monitoring responses are shown.
- The 1 **"Close advanced settings"** serves to mask out the input fields again.

Settings

Monitoring function		Description
2	**EPL frame error (CRC)**	Weighted number of received faulty frames • This error can occur due to ver strong EMC interferences or by non-POWERLINK-compliant nodes. • Monitoring threshold: C13131/3 / C14131/3 • Monitoring response: C13891/4 / C14891/4
3	**EPL-Rx PDO contents**	This monitoring response defines the way the cyclic process data (PDO) are forwarded from the POWERLINKnetwork to the standard device/application in the event of an error. An error has occurred if no valid process data is received and the "POWERLINK synchronisation loss" monitoring function is activated. The following settings are possible with C13885 / C14885: • 0: The valid data received last remains. • 1: All data is set to the value "0".
4	**EPL synchronisation loss**	This monitoring detects a failure of the Managing Node by means of the number of POWERLINK cycles failed. This monitoring is independent of the setting for the Drive synchronisation (📖 41). • Monitoring threshold: C13127/3 / C14127/3 • Monitoring response: C13891/3 / C14891/3

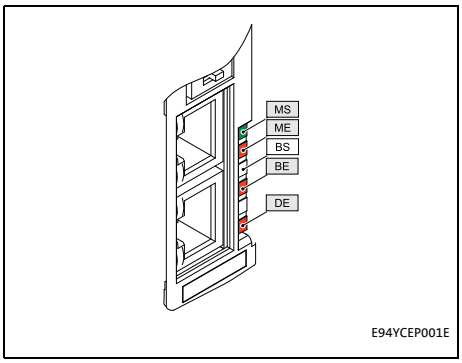
9 Diagnostics

For fault diagnostics, the communication module is provided with the LEDs on the front. Furthermore, you can carry out a comprehensive diagnostics of the entire POWERLINK network using the »Engineer«.

9.1 LED status displays

Note!

LED status displays for trouble-free operation:



- The LEDs **MS** (📖 51) and **BS** (📖 52) are permanently lit.
- The green LED at the RJ45 sockets **X211** and **X212** is permanently lit or blinking (📖 53).

The following status displays are distinguished:

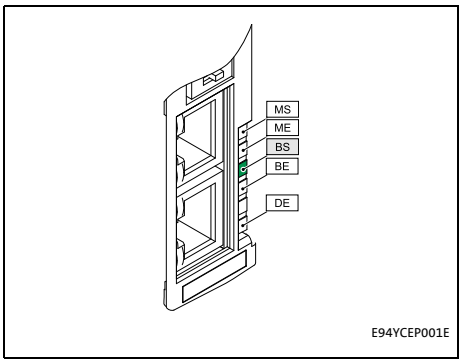
- Module status displays (📖 51)
- Fieldbus status displays (📖 52)
- Status displays at the RJ45 sockets (X211, X212) (📖 53)

9.1.1 Module status displays

The LEDs **MS**, **ME, BE** and **DE** indicate the module status.

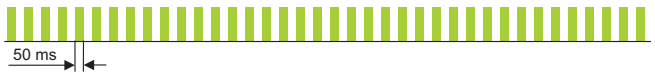
MS: Module Status

ME: Module Error



BE: Bus Error

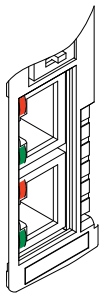
DE: Device Error

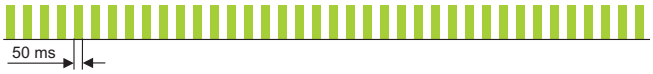


LED	Colour	Status	Description
MS	Green	On	The communication module is supplied with voltage and is connected to the standard device.
		Blinking	200 ms 200 ms The communication module is supplied with voltage, but has no connection to the standard device. (The standard device is either switched off, in the initialisation phase, or not available).
ME	Red	On	An error has occurred in the communication module.
BE	Red	On	A fieldbus error has occurred.
DE	Red	On	The communication module is not accepted by the standard device. See notes given in the documentation for the standard device.

9.1.2 Fieldbus status displays

The **BS** LED indicates the fieldbus status.



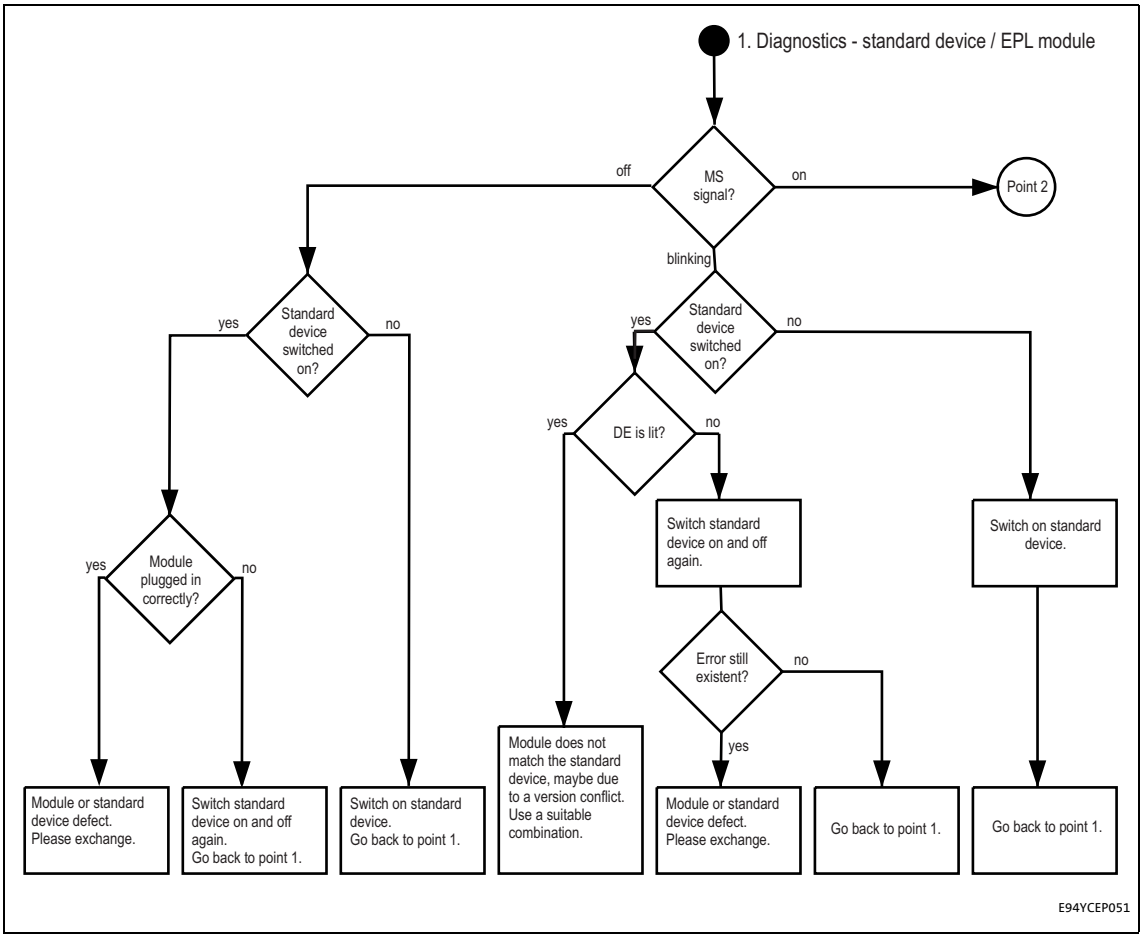


BS: Bus Status

LED	Colour	Status	Description
BS	Green	Off	The communication module is not active on the fieldbus or is in the INIT state.
		Blinking	 The POWERLINK network is in the initialisation phase. NMT_MS_PREOPERATIONAL_1 / NMT_CS_PREOPERATIONAL_1
		Blinking	 The POWERLINK network is in the initialisation phase with cyclic traffic. NMT_MS_PREOPERATIONAL_2 / NMT_CS_PREOPERATIONAL_2
		Blinking	 The POWERLINK node is waiting for the start signal. NMT_MS_READY_TO_OPERATE / NMT_CS_READY_TO_OPERATE
		Blinking	 The POWERLINK node has not found a Managing Node and is in Basic Ethernet Mode (📖 29). NMT_CS_BASIC_ETHERNET
		Blinking	 The POWERLINK node is in the "Stopped" status (waiting for disconnection). NMT_CS_STOPPED
		On	 The POWERLINK node is in the operating phase. NMT_MS_OPERATIONAL / NMT_CS_OPERATIONAL

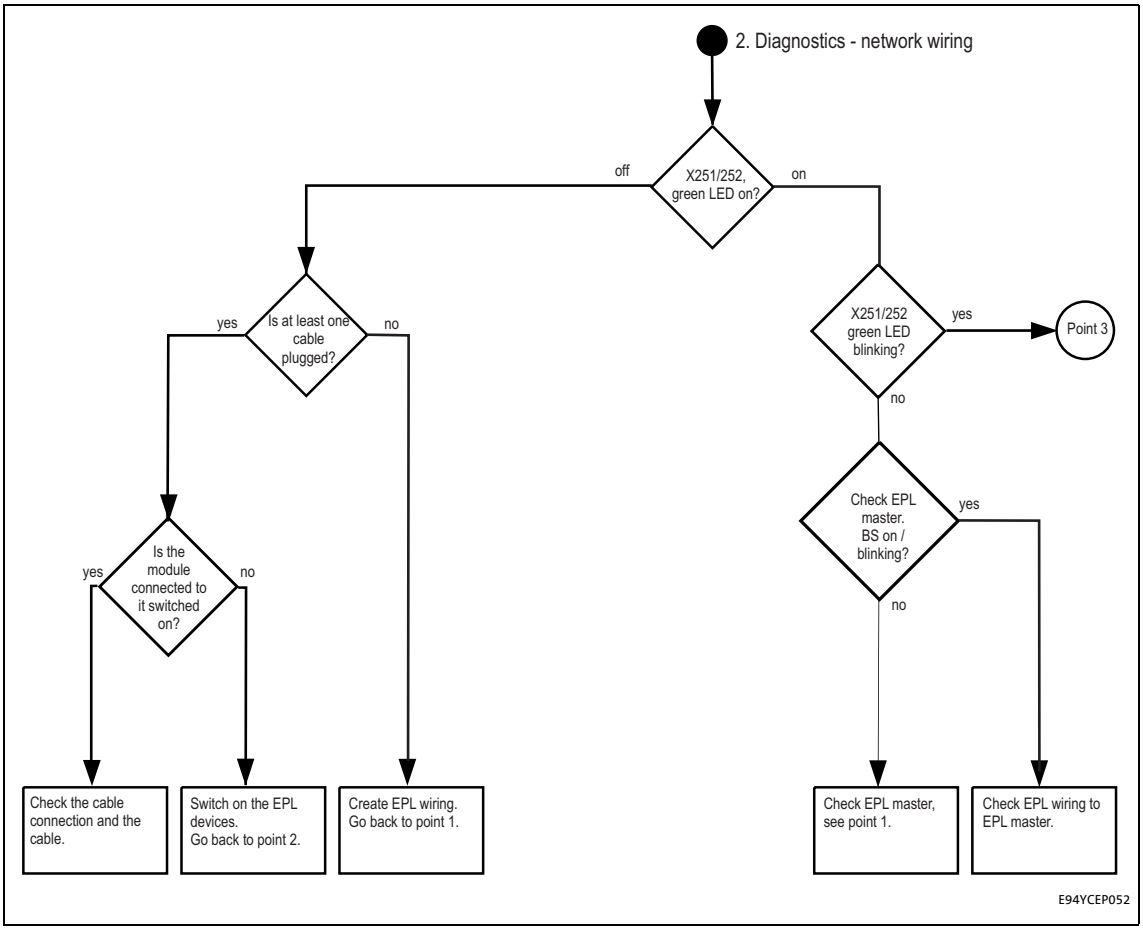
9.1.3 Status displays at the RJ45 sockets (X211, X212)

The LEDs at the RJ45 sockets **X211** and **X212** indicate the POWERLINK connection status.



LEDs	Colour	Status	Description
 E94YCEP001E	Green	Off	No POWERLINK connection
		On	 POWERLINK connection has been established.
		flickers	 Data communication of POWERLINK connection is active.
	Red	On	 POWERLINK collision has occurred.

9.2 Troubleshooting with module signalling

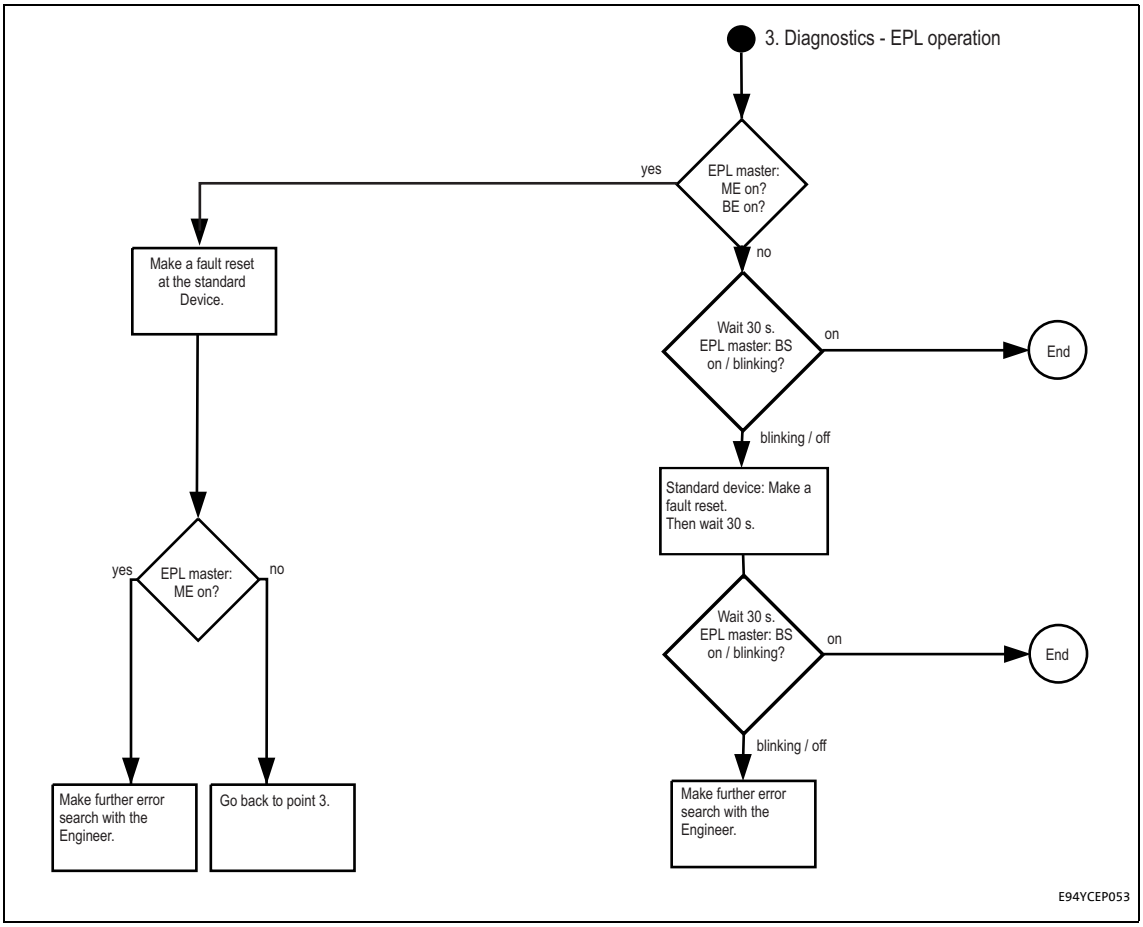


In the following, troubleshooting via the module signals will be described.

Please particularly observe ...

- the basic readiness for operation between the standard device and the communication module;
- the network wiring.

[9-1] Diagnostics - standard device / POWERLINK module



[9-2] Diagnostics - network wiring

Note!

The **BS** (Bus Status) LED refers to the Lenze E94AYCEP communication module as Managing Node.

This status display applies analogously to the Managing Nodes of other manufacturers.

[9-3] Diagnostics - POWERLINK operation

Note!

The LEDs **ME** (Module Error), **BE** (Bus Error) and **BS** (Bus Status) refer to the Lenze communication module E94AYCEP as Managing Node.

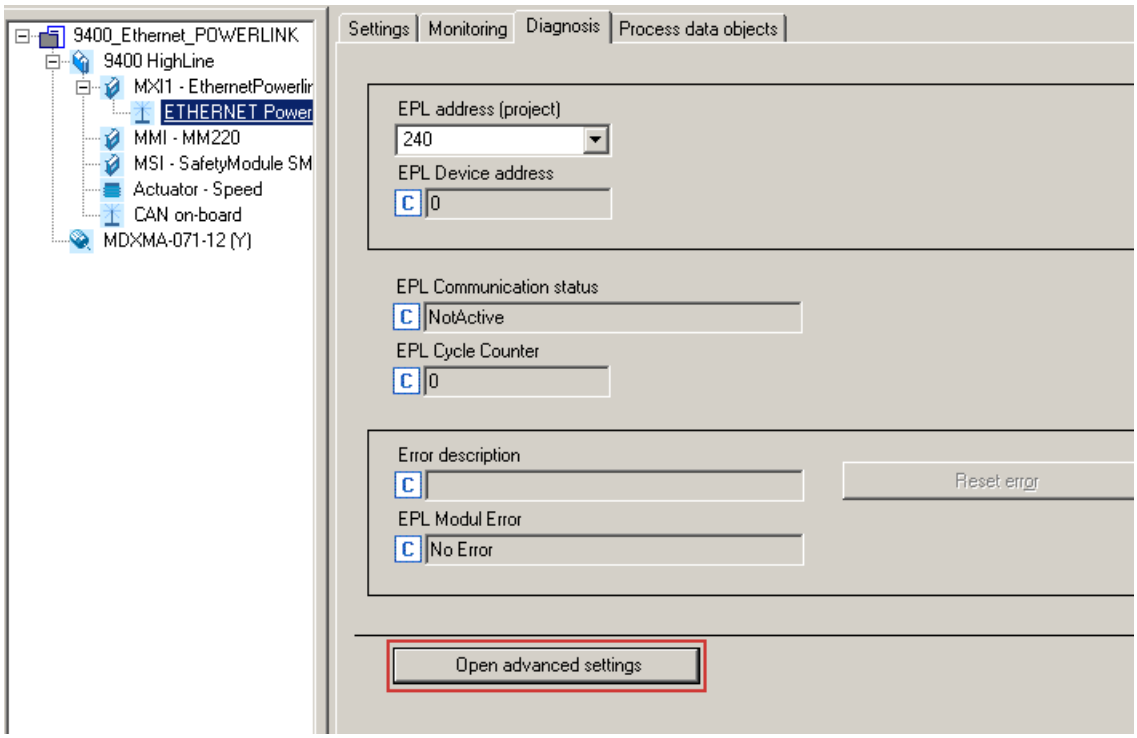
This status display applies analogously to the Managing Nodes of other manufacturers.

9.3 Diagnostic data

Pending diagnostic data are signalled from the Controlled Node to the Managing Node by means of an emergency message.

Errors and warnings in the Servo Drive 9400 and the plugged communication module are sent to the Managing Node as extended diagnostic messages.

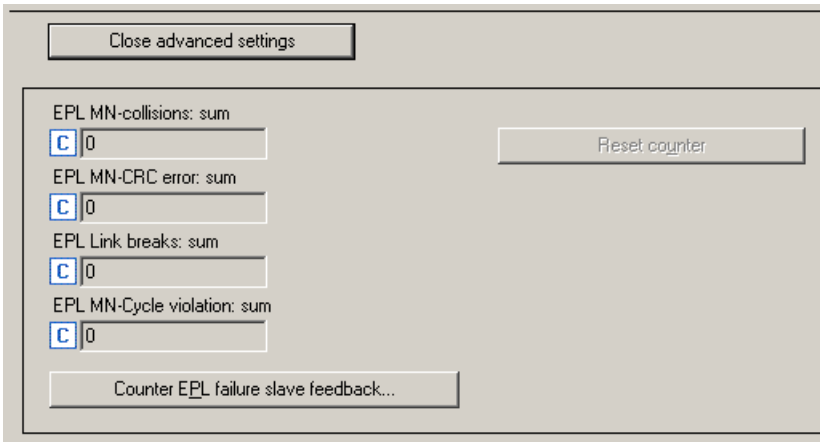
The diagnostic data is visible via the engineering software of the host (PLC).



Bytes	Meaning	Value [hex]
1 ... 6	Diagnostic block header	0x0010 001C 0100
7 ... 8	Alarm type	0x0001 (diagnosis)
9 ... 12	API (Application Programming Interface)	0x0000 0000
13, 14	Slot number	0x0001 / 0x0002
15, 16	Subslot number	0x0001
17 ... 20	Module ID	ID according to module
21 ... 24	Submodule number	ID according to module
25, 26	Alarm specification	0xB000
27, 28	User structure ID	0x0001
29 ... 32	Error code	

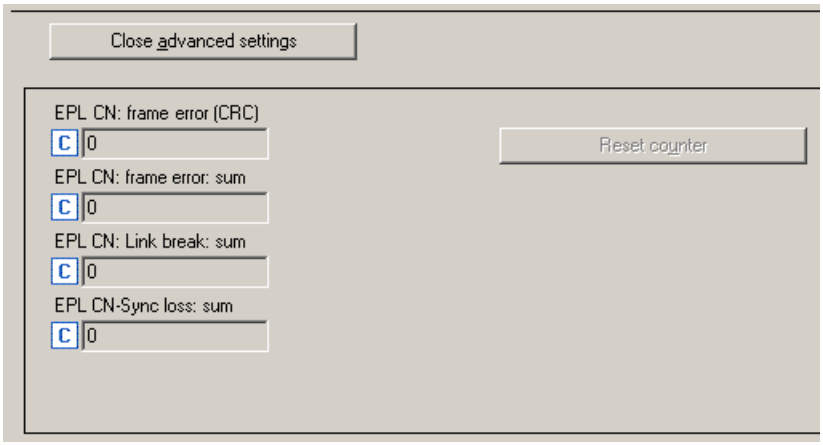
Reference manual/»Engineer« online help for Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.



9.4 Diagnosing with the »Engineer«

In the »Engineer« under the **Diagnostics** tab, you will find POWERLINK diagnostics information.



The **"Open extended settings"** tab serves to display further diagnostics information on the Managing Node (node ID = '240') or Controlled Node (node ID '0' ... '239').

Display of the extended settings for the Managing Node

Display of the extended settings for the Controlled Node

10 Error messages

This chapter supplements the error list in the reference manual and the »Engineer« online help for the Servo Drive 9400 by POWERLINK error messages of the communication module.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

10.1 Error messages of the communication module

This chapter describes all error messages of the communication module and their causes and remedies.

10.1.1 Short overview

The following table contains all error messages of the communication module in numerical order of the error numbers. Moreover the preset error response and - if applicable - the parameters for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Name	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c83100	13119744	EPL: Lost connection to 9400 target	No response	-
0x00c85531	13129009	EPL: Memory access error	Information	-
0x00c85532	13129010	EPL: Memory: Read error	Information	-
0x00c85533	13129011	EPL: Memory: Write error	Information	-
0x00c86010	13131792	EPL: Internal watchdog activated	Fault	-
0x00c86011	13131793	EPL: Internal watchdog activated	Fault	-
0x00c86100	13132032	EPL: Internal error	Information	-
0x00c86101	13132033	EPL: Internal error	Fault	-
0x00c86110	13132048	EPL: Invalid PDO mapping detected	Warning Locked	-
0x00c8641f	13132831	EPL: Invalid parameter set	Fault	-
0x00c86420	13132832	EPL: Lenze settings loaded	Fault	-
0x00c88130	13140272	EPL: Fieldbus watchdog activated	Fault	
0x00c88131	13140273	EPL: DataExchange exited	No response	C13883 / C14883
0x00c88261	13140577	EPL: Invalid address selected	Fault	-
0x00c88263	13140579	EPL MN: Network has not been started (bootup-1)	Warning Locked	C13891/2 / C14891/2
0x00c88264	13140580	EPL MN: Not all nodes are in the operational status (bootup-2)	Warning Locked	C13891/2 / C14891/2
0x00c88265	13140581	EPL: Synchronisation of MN lost	Warning Locked	C13891/3 / C14891/3
0x00c88266	13140582	EPL: Defective telegram (CRC) detected	Warning Locked	C13891/4 / C14891/4
0x00c88267	13140583	EPL: Failure of a network node	No response	C13891/5 / C14891/5
0x00c88281	13140609	EPL: Cycle time exceeded	Warning Locked	C13891/1 / C14891/1
0x00c88283	13140611	EPL: MN address assigned double	Fault	-
0x00c88284	13140612	EPL: Internal error	Fault	-

10.1.2 Possible causes and remedies

In this chapter, all error messages of the communication module are listed in numerical order of the error numbers. Possible causes and remedies and responses to the error messages are described in detail.

EPL: Lost connection to 9400 [0x00c83100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☒ **None** ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The MXI communication to the Servo Drive 9400 is interrupted. • Servo Drive 9400 is switched off. • The communication module is not connected correctly at the MXI slot of the Servo Drive 9400. • Communication module is defective.	• Switch on Servo Drive 9400. • Plug in the communication module correctly at the MXI slot of the Servo Drive 9400. • Send communication module together with a description of the fault to Lenze.

EPL: Memory access error [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System error ☐ Error ☐ Fault ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Access via the Servo Drive 9400 to a parameter set in the memory module failed.	Download application again (including module).

EPL: Memory: Read error [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter in the memory module could not be read.	Download application again (including module).

EPL: Memory: Write error [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter in the memory module could not be written.	Download application again (including module).

EPL: Internal watchdog activated [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EPL: Internal watchdog activated [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EPL: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

EPL: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

EPL: Invalid PDO mapping detected [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The entered PDO mapping is invalid.	Re-execute PDO mapping.

EPL: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Download application again (including module).

EPL: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access via the Servo Drive 9400 to a parameter set in the memory module failed.	Download application again (including module).

EPL: Fieldbus watchdog activated [0x00c88130]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

EPL: DataExchange exited [0x00c88131]

Response (Lenze setting printed in bold)	**Setting:** C13883 / C14883 (☑ Adjustable response)
☒ **None** ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
The POWERLINK data exchange has been terminated.	• Check wiring. • Plug network cable into POWERLINK terminal X211 or X212.

EPL: Invalid address selected [0x00c88261]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
An invalid IP address has been assigned by the Managing Node via POWERLINK or set as node ID.	• Ensure that a valid IP address is assigned by the Managing Node via POWERLINK. • Set valid node ID. ▸ Node address setting (📖 36)

EPL MN: Network has not been started (bootup-1) [0x00c88263]

Response (Lenze setting printed in bold)	**Setting:** C13891/2 / C14891/2
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
• The Managing Node could not start the POWERLINK network. • Not all required nodes were found.	• Check if all nodes are switched on • Check address setting and wiring. ▸ Monitoring functions of the Managing Node (📖 46)

EPL MN: Not all nodes are in the operational status (bootup-2) [0x00c88264]

Response (Lenze setting printed in bold)	**Setting:** C13891/2 / C14891/2
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
The Managing Node could not transfer all nodes into the "NMT_CS_OPERATIONAL" status via process data exchange.	Check whether single nodes are in error status. ▸ Monitoring functions of the Managing Node (📖 46)

EPL: Synchronisation lost from MN [0x00c88265]

Response (Lenze setting printed in bold)	**Setting:** C13891/3 / C14891/3
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
In the Controlled Node, the synchronisation cycle of the Managing Node has failed. The Controlled Node changes automatically to the NMT_CS_PREOPERATIONAL_1 state and waits for a new run-up by the Managing Node.	• Check wiring components (failure of Managing Node, router). • Restart Managing Node if required. • Change CN monitoring thresholds via C13127 / C14127. ▸ Monitoring functions of the Controlled Node (📖 48)

EPL: Defective telegram (CRC) detected [0x00c88266]

Response (Lenze setting printed in bold)	**Setting:** C13891/4 / C14891/4
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
Faulty Ethernet frames (CRC error) have been detected. Possible causes: • A device an the network is not POWERLINK-compliant. • EMC interference is too strong.	• Check if a non-POWERLINK-compliant device is in the network (e.g. diagnostics PC). • Reduce EMC interference on the network or use an additional shield connection. • Change monitoring thresholds: • Managing Node: C13115/3 / C14115/3 • Controlled Node: C13131/3 / C14131/3 ▸ Monitoring functions of the Managing Node (📖 46) ▸ Monitoring functions of the Controlled Node (📖 48)

EPL: Failure of a network node [0x00c88267]

Response (Lenze setting printed in bold)	**Setting:** C13891/5 / C14891/5
☒ **None** ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
In case of the Managing Node, an unwanted change from the "Operational" status has occurred due to an error. Possible causes are: • Node failure • Network cables have been detached. • Servo Drive 9400 is switched off. • Communication module is defective. • Time-out with Controlled Nodes • Telegram collisions due to non-compliant POWERLINK nodes	• Check wiring. • Plug network cable into POWERLINK terminal X211 or X212. • Restart Managing Node if required. • Switch on Servo Drive 9400. • POWERLINKCheck if a non--compliant device is in the network (e.g. diagnostics PC). • Check whether collisions have occurred with the Managing Node (C13126 / C14126). • Change CN monitoring thresholds (C13124 / C14124). ▸ Monitoring functions of the Controlled Node (📖 48) • Send communication module together with a description of the fault to Lenze.

EPL: Cycle time exceeded [0x00c88281]

Response (Lenze setting printed in bold)	**Setting:** C13891/1 / C14891/1
☑ None ☐ System fault ☐ Fault ☑ Trouble ☑ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☑ Information	

Cause	Remedy
The Managing Node has detected that the previous cycle has not yet been completed when the new cycle starts.	Select a larger POWERLINK cycle time via C13060 / C14060.

EPL: MN address assigned double [0x00c88283]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ No reaction ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ WarningLocked ☐ Warning ☐ Information	

Cause	Remedy
The address setting of the Managing Node has been assigned several times (node ID = '240'). This node is configured as Managing Node but does not participate in the frame traffic due to double addressing.	Correct address setting. ▸ Node address setting (📖 36)

EPL: Internal error [0x00c88284]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ No reaction ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ WarningLocked ☐ Warning ☐ Information	

Cause	Remedy
Internal error.	Send communication module together with a description of the fault to Lenze.

10.2 POWERLINK error messages

- The POWERLINK error messages are displayed via code C13910 / C14910.
- In order to distinguish between the error responses, the displayed error messages are preceded with 3 characters:

Response	Meaning
EL_...	Trouble (Fault)
QL_...	Quick stop by trouble
WL_...	Warning locked
I__...	Information (Info)

Error number		Name	Description
hex	dec		
0x1	1	EL_ LeaveData Exchange	The POWERLINK data exchange has been completed (the node recognises that it does not have the "DataExchange" status anymore). **Causes & remedy:** • See error description EPL: DataExchange exited [0x00c88131] (📖 64) **Codes:** • C13883 / C14883 (error response)
0x3	3	QL_ LeaveData Exchange	
0x4	4	WL_LeaveData Exchange	
0x6	6	I__LeaveData Exchange	
0x18263	98915	EL_EPL_BOOTUP_1	The Managing Node could not start the POWERLINK network. OR: Not all required nodes were found. **Causes & remedy:** • See error description EPL MN: Network has not been started (bootup-1) [0x00c88263] (📖 64) **Codes:** • C13891/2 / C14891/2 (error response)
0x38263	229987	QL_EPL_BOOTUP_1	
0x48263	295523	WL_EPL_BOOTUP_1	
0x68263	426595	I__EPL_BOOTUP_1	
0x18264	98916	EL_EPL_BOOTUP_2	The Managing Node could not transfer all nodes into the "NMT_CS_OPERATIONAL" status via process data exchange. **Causes & remedy:** • see error description EPL MN: Not all nodes are in the operational status (bootup-2) [0x00c88264] (📖 64) **Codes:** • C13891/2 / C14891/2 (error response)
0x38264	229988	QL_EPL_BOOTUP_2	
0x48264	295524	WL_EPL_BOOTUP_2	
0x68264	426596	I__EPL_BOOTUP_2	
0x18265	98917	EL_EPL_CN_SYNC_ LOSS	In the Controlled Node, the synchronisation cycle of the Managing Node has failed. The Controlled Node automatically changes to the "NMT_xx_PREOPERATIONAL_1" status and waits for a new run-up by the Managing Node. **Causes & remedy:** • see error description EPL: Synchronisation lost from MN [0x00c88265] (📖 65) **Codes:** • C13127/3 / C14127/3 (monitoring threshold) • C13891/3 / C14891/3 (error response) • C13127/1 / C14127/1 (error counter)
0x38265	229989	QL_EPL_CN_SYNC_ LOSS	
0x48265	295525	WL_EPL_CN_SYNC_ LOSS	
0x68265	426597	I__EPL_CN_SYNC_ LOSS	

Error number		Name	Description
hex	dec		
0x18266	98918	EL_EPL_COM_CRC	Faulty Ethernet frames (CRC error) have been detected. **Causes & remedy:** • see error description EPL: Defective telegram (CRC) detected [0x00c88266] (📖 65) **Codes:** • C13131/3 / C14131/3 (monitoring threshold) • C13891/4 / C14891/4 (error response) • C13131/1 / C14131/1 (error counter)
0x38266	229990	QL_EPL_COM_CRC	
0x48266	295526	WL_EPL_COM_CRC	
0x68266	426598	I__EPL_COM_CRC	
0x18267	98919	EL_EPL_MN_LOSS_CN	The MXI connection to the Servo Drive 9400 is interrupted or a node has failed. **Causes & remedy:** • see error description EPL: Lost connection to 9400 [0x00c83100] (📖 62) EPL: Failure of a network node [0x00c88267] (📖 65) **Codes:** • C13891/5 / C14891/5 (error response) • C13132 / C14132 (CN: link interruptions)
0x38267	229991	QL_EPL_MN_LOSS_CN	
0x48267	295527	WL_EPL_MN_LOSS_CN	
0x68267	426599	I__EPL_MN_LOSS_CN	
0x18283	98947	EL_EPL_ADDRESS_MN	An invalid IP address has been assigned by the Managing Node via POWERLINK or set as Node ID. OR: The address setting of the Managing Node (Node ID = '240') has been assigned several times. **Causes & remedy:** • see error description EPL: Invalid address selected [0x00c88261] (📖 64) EPL: MN address assigned double [0x00c88283] (📖 66) **Codes:** • see Node address setting (📖 36) • see Settings and displays in the »Engineer« (📖 38)
0x38283	230019	QL_EPL_ADDRESS_MN	
0x48283	295555	WL_EPL_ADDRESS_MN

11 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the reference manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCEP (POWERLINK) communication module.

Reference manual/»Engineer« online help for Servo Drive 9400

Here you will find general information on parameters.

11.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response to impermissible device configuration		
Selection list		
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No Response	Reserved
C00615/2	1: No Response	Resp. to imp. module in MXI1
C00615/3	1: No Response	Resp. to imp. module in MXI2
C00615/4	0: No Response	Reserved
C00615/5	0: No Response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response for the case where a new module has been plugged into slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response if a new module has been plugged into module slot 2 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 1 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

11.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCEP communication module (POWERLINK) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C13000

Parameter | Name: **C13000 | EPL IP address**				Data type: UNSIGNED_32 Index: 11575 = 0x2D37 EPL index: See subcodes
The code displays the IP address of the communication module. • The IP address is derived from the EPL node address (Node ID): **192.168.100.[Node ID]** • The node ID is derived from the DIP switch position or from C13044. ▸ Node address setting (📖 36)				
Setting range (min. value | unit | max. value)				
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C13000/1	3232261130 (0xC0A86401 = 192.168.100.1)		EPL IP address	0x1E40.0x02
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C13001

Parameter | Name: **C13001 | EPL IP subnet mask**				Data type: UNSIGNED_32 Index: 11574 = 0x2D36 EPL index: See subcodes
The code declares the IP subnet mask which restricts the directly addressable IP address range (i.e. without a gateway in the EPL segment of the routers). The value 255.255.255.0 (0xFFFFFF00) is always assigned to the subnet mask in one segment.				
Setting range (min. value | unit | max. value)				
255.0.0.0 (0xFF000000)		255.255.255.0 (0xFFFFFF00)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C13001/1	4294967040 (0xFFFFFF00 = 255.255.255.0)		EPL IP-subnet mask	0x1E40.0x03
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C13003

Parameter | Name: **C13003 | EPL IP address router**			Data type: UNSIGNED_32 Index: 11572 = 0x2D34 EPL index: See subcodes
The code declares the IP address of the router which connects the EPL segment to the higher-level network. The standard entry corresponds to the standard router address of the EPL specification: **→ 192.168.100.254** Permissible entries replace the lowest-order byte of the standard entry with the EPL address of the node which has the function of a router.			
Setting range (min. value | unit | max. value)			
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13003/1	3232261374 (0xC0A864FE = 192.168.100.254)	EPL IP address router	0x1E40.0x05
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13004

Parameter | Name: **C13004 | EPL MAC address**		Data type: OCTET_STRING Index: 11571 = 0x2D33 EPL index: See subcodes
The code indicates the physical address (MAC address) of the POWERLINK interface of the communication module. When the communication module is produced, the MAC address is assigned unequivocally worldwide and provides addressing on the lowest level.		
Subcodes	**Info**	**EPL index**
C13004/1	MAC Address (octet string[6]) 00-0A-86-xx-yy-zz • 00-0A-86 = Lenze • xx-yy-zz = consecutive number	0x1030.0x05
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13027

Parameter | Name: **C13027 | EPL MN: Boot behaviour**	Data type: UNSIGNED_32 Index: 11548 = 0x2D1C EPL index: 0x1F80
The code controls the start of the EPL network by the Managing Node and the responses to errors in the network. Servo Drives 9400 have a constant value.	
Value is bit-coded:	
Bit 0 ... 31 | see below	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Description of the bits 0 ... 31

Bit	Value	Description
0	0	Reserved / No function
1	0 *)	Start CNs individually (when bit 3 = 0)
	1	Start CNs with broadcast NMTStartNode (when bit 3 = 0)
2	0	Go automatically to NMT_MS_OPERATIONAL
	1 *)	Application decides on change to NMT_MS_OPERATIONAL
3	0	Start CNs automatically, see bit 1
	1 *)	Application decides on CN start
4	0 *)	Individual reset of a CN after monitoring error
	1	Broadcast reset of all CNs after monitoring error
5	0	Reserved / No function
6	0	Response to monitoring errors after reset (bit 4)
	1 *)	Transmit broadcast "NMTStopNode" after monitoring error
7	0	Automatic change to NMT_MS_PRE_OPERATIONAL_2
	1 *)	Application decides on change to NMT_MS_PRE_OPERATIONAL_2
8	0	Automatic change to NMT_MS_READY_TO_OPERATE
	1 *)	Application decides on change to NMT_MS_READY_TO_OPERATE
9	0	Identification of the CNs only by verification of the corresponding NMT_MNDeviceTypeList_AU32-subindex
	1 *)	Extended identification
10	0	No check of the application software version of the CN
	1 *)	Check of the application software version of the CN
11	0	No check of the CN configuration
	1 *)	Check of the CN configuration
12	0	Error response: Change to NMT_MS_OPERATIONAL and NMT_MS_PREOPERATIONAL_1
	1 *)	Application-specific error response
13 ... 31	0	Reserved / No function

*) Not permissible for 9400 Servo Drives.

C13028

Parameter | Name: **C13028 | EPL node declaration CN**			Data type: UNSIGNED_32 Index: 11547 = 0x2D1B EPL index: See subcodes
The code declares the Controlled Nodes 1 ... 100 and their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13028/1	0	EPL node declaration CN	0x1F81.0x01
...	...	...	...
C13028/100	0	EPL node declaration CN	0x1F81.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a Controlled Node.
				1	EPL node with this ID is a Controlled Node.
2	☑	☐	1	0 *)	On detection of a booting Controlled Node, the application will not be informed.
				1	On detection of a booting Controlled Node, the application will be informed and the Controlled Node will be started.
3	☑	☑	1	0	Optional Controlled Node
				1	Obligatory Controlled Node
4	☑	☐	0	0	The Managing Node is allowed to send reset commands.
				1 *)	The Managing Node must not send any reset command.
5	☑	☐	0	0	Software version verification of the Controlled Node is not required.
				1 *)	Software version verification of the Controlled Node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed Controlled Node
				1	Asynchronously accessed Controlled Node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed Controlled Node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The Managing Node does not send any PRes frames
				1	The Managing Node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C13029

Parameter | Name: **C13029 | EPL node declaration MN**			Data type: UNSIGNED_32 Index: 11546 = 0x2D1A EPL index: See subcodes
The code declares Managing Node, diagnostic device, and EPL router, and describes their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13029/1	2147483661 (0x8000000D)	EPL node assignment Managing Node	0x1F81.0xF0
C13029/2	0	EPL node assignment diagnostic device	0x1F81.0xFD
C13029/3	2147483655 (0x80000007)	EPL node assignment router	0x1F81.0xFE
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a Controlled Node.
				1	EPL node with this ID is a Controlled Node.
2	☑	☐	1	0 *)	On detection of a booting Controlled Node, the application will not be informed.
				1	On detection of a booting Controlled Node, the application will be informed and the Controlled Node will be started.
3	☑	☑	1	0	Optional Controlled Node
				1	Obligatory Controlled Node
4	☑	☐	0	0	The Managing Node is allowed to send reset commands.
				1 *)	The Managing Node must not send any reset command.
5	☑	☐	0	0	Software version verification of the Controlled Node is not required.
				1 *)	Software version verification of the Controlled Node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed Controlled Node
				1	Asynchronously accessed Controlled Node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed Controlled Node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The Managing Node does not send any PRes frames
				1	The Managing Node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C13030

Parameter | Name: **C13030 | EPL device type**			Data type: UNSIGNED_32 Index: 11545 = 0x2D19 EPL index: 0x1000
The code indicates the device type of the EPL node.			
Value is bit-coded:			
Bit 1	Bit1		
Bit 2	Bit2		
Bit 3	Bit3		
Bit 4	Bit4		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13034

Parameter | Name: **C13034 | EPL identity object**			Data type: UNSIGNED_32 Index: 11541 = 0x2D15 EPL index: See subcodes
The code indicates the Manufacturer's EPL ID no. for Lenze.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13034/1	59 (0x3B)	Manufacturer's EPL ID no.	0x1018.0x01
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13035

Parameter | Name: **C13035 | EPL device type CN**			Data type: UNSIGNED_32 Index: 11540 = 0x2D14 EPL index: See subcodes
The code contains the device type ID of the declared Controlled Nodes. Each subcode corresponds to a Controlled Node with the node ID = subcode number. **When being in the configured status, the values must be identical with the device types stored locally in each node under C13030.**			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13035/1	0	EPL device type CN	0x1F84.0x01
...	...	...	...
C13035/100	0	EPL device type CN	0x1F84.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13040

Parameter | Name: **C13040 | EPL feature flags**	Data type: UNSIGNED_32 Index: 11535 = 0x2D0F EPL index: 0x1F82
The code displays the POWERLINK functions implemented by the EPL node.	
Value is bit-coded:	
Bit 0 ... 31 | see below	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Description of the bits 0 ... 31

Bit	Relevance		Value	Description
	MN	CN		
0 (LSB)	☐	☑	0	Asynchronous access
			1	Isochronous access *)
1	☑	☑	0	No SDO by UDP/IP
			1	SDO via UDP/IP *)
2	☑	☑	0	No SDO via EPL "ASnd" *)
			1	SDO by EPL "ASnd"
3	☑	☑	0	No SDO integrated in PDO *)
			1	SDO integrated in PDO
4	☑	☑	0	No "NMT Info Services"
			1	"NMT Info Services" supported
5	☑	☑	0	No extended "NMT State Commands" *)
			1	Extended "NMT State Commands" supported
6	☑	☑	0	No dynamic PDO mapping *)
			1	Dynamic PDO mapping supported
7	☑	☐	0	No dynamic PDO mapping
			1	Dynamic PDO mapping supported
8	☑	☑	0	No configuration manager function
			1	Configuration manager function
9	☑	☑	0	Only isochronous cyclic access permitted.
			1	Isochronous multiplexed access possible.
10	☐	☑	0	No address assignment via software
			1	Address assignment via software
11	☑	☐	0	No support of the "Basic Ethernet Mode" by the master
			1	Support of the "Basic Ethernet Mode" by the master
12	☑	☑	0	No "POWERLINK to standard Ethernet" router function
			1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
13	☑	☑	0	No "POWERLINK to fieldbus" router function
			1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
14 ... 31 (MSB)	-	-	-	Reserved / No function

*) Values implemented by 9400 Servo Drives (MN: $0x0087_h = 135_d$, CN $0x0083_h = 131_d$).

C13041

Parameter | Name: **C13041 | EPL version**	Data type: UNSIGNED_8 Index: 11534 = 0x2D0E EPL index: not available
The code describes the version of the POWERLINK communication profile implemented by the communication module. The higher-order nibble describes the major version, the lower order nibble describes the minor version. The implemented value corresponds to the POWERLINK version 2.0.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13042

Parameter | Name: **C13042 | Current EPL device address**	Data type: UNSIGNED_8 Index: 11533 = 0x2D0D EPL index: 0x1F93.0x01
The code displays the currently valid EPL node address (Node ID). • The node ID must be unequivocal in the EPL network segment. • See also C13044.	

Display area (min. value | unit | max. value)			
1		240	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13043

Parameter | Name: **C13043 | EPL device address selection**	Data type: UNSIGNED_8 Index: 11532 = 0x2D0C EPL index: 0x1F93.0x02
The code indicates whether the EPL node address (node ID) has been set via DIP switches at the communication module or via the software. • 0: Node ID has been set via software (C13044). • 1: Node ID has been set via DIP switches at the communication module. ▸ Node address setting (📖 36)	

Display area (min. value | unit | max. value)			
0		1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13044

Parameter | Name: **C13044 | EPL device address SW**	Data type: UNSIGNED_8 Index: 11531 = 0x2D0B EPL index: 0x1F93.0x03
This code serves to set the EPL node address (node ID) via the software. The value "0" (Lenze setting) is not a valid node ID. It serves to activate the setting via the DIP switches. ▸ Node address setting (📖 36)	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		240	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13045

Parameter | Name: **C13045 | EPL host name**	Data type: VISIBLE_STRING Index: 11530 = 0x2D0A EPL index: 0x1F9A
The code defines a DNS-compatible device name. The length is limited to 15 characters. **The device name must be unambiguous within the network domain.** Naming convention: The device name • starts with a character • ends with a character or digit The device name consists of • letters ([A ... Z], [a ... z]) • digits ([0 ... 9]) • hyphen ([-])	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT	

C13060

Parameter | Name: **C13060 | EPL cycle time**	Data type: UNSIGNED_32 Index: 11515 = 0x2CFB EPL index: 0x1006
The code declares the length of the EPL cycle in µs. • In the configured state, this code must have an identical value in all EPL nodes. • The selected value must correspond to the actual bus cycle time so that the internal monitoring functions work correctly.	

Selection list (Lenze setting printed in bold)	
500	0.5
1000	**1**
2000	2
3000	3
4000	4
5000	5
6000	6
7000	7
8000	8
9000	9
10000	10
11000	11
12000	12
13000	13
14000	14
15000	15
16000	16
17000	17
18000	18
19000	19
20000	20

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13062

Parameter | Name: **C13062 | EPL MN: boot timing**			Data type: UNSIGNED_32 Index: 11513 = 0x2CF9 EPL index: See subcodes
The code defines timeouts and waiting times for the booting process of the Managing Node. • The value "0" for subcode 2, 4, 5 deactivates the time-outs. The Managing Node waits for an indefinite period of time. No error message is generated. • The value "0" for subcode 3 deactivates the waiting time. After all expected Controlled Nodes have been detected by the Managing Node, the Managing Node immediately changes to NMT_MS_PREOPERATIONAL_2. **Observe the following conditions:** • Subcode 1 must be lower than C13078 - values of all EPL nodes. • Subcode 3 must be lower than subcode 2.			
Setting range (min. value | unit | max. value)			
0	µs	4294967295	

Subcodes	Lenze setting	Info	EPL index
C13062/1	2500000 µs	Max. time for detecting a redundant Managing Node Waiting time before changing to NMT_MS_PREOPERATIONAL_1	0x1F89.0x01
C13062/2	60000000 µs	Max. time for device search Dwell time in NMT_MS_PREOPERATIONAL_1 Error message if not all Controlled Nodes are in NMT_CS_PREOPERATIONAL_1.	0x1F89.0x02
C13062/3	0 µs	Waiting time in NMT_MS_PREOPERATIONAL_1	0x1F89.0x03
C13062/4	0 µs	Max. time in NMT_MS_PREOPERATIONAL_2 Error message if not all Controlled Nodes are in NMT_CS_PREOPERATIONAL_2.	0x1F89.0x04
C13062/5	0 µs	Max. time in NMT_MS_READY_TO_OPERATE Error message if not all Controlled Nodes are in NMT_CS_READY_TO_OPERATE.	0x1F89.0x05

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13063

Parameter | Name: **C13063 | EPL MN cycle timing**			Data type: UNSIGNED_32 Index: 11512 = 0x2CF8 EPL index: See subcodes
The code defines time intervals for the cycle control by the Managing Node.			
Setting range (min. value | unit | max. value)			
0	ns	4294967295

C13066

Parameter | Name: **C13066 | EPL CN: Max. user data PRes RPDO**			Data type: UNSIGNED_16 Index: 11509 = 0x2CF5 EPL index: See subcodes
The code defines the reserved user data length of the PRes telegrams for Controlled Nodes 1 ... 100. Each subcode number corresponds to one EPL node with the same node ID. The EPL node must be enabled via code C13028. The subcodes describe the PRes telegrams received. The value must be within the range of 36 ... 1490 bytes. The values are upper limit values for the entire size of the PDO mappings for received PRes telegrams. **In the configured state, the values stored for the EPL nodes must be identical to the corresponding C13072 entries. C13066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490	

Subcodes	Lenze setting	Info	EPL index
C13066/1	0 byte	EPL CN: max. user data of RPDO	0x1F8D.0x01
...	...	...	...

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13067

Parameter | Name: **C13067 | EPL MN: time-out isochronous comm. CN**			Data type: UNSIGNED_32 Index: 11508 = 0x2CF4 EPL index: See subcodes
The code defines the reserved user data length of the PRes frames for Managing Node, diagnostic device or router. Each subcode number corresponds to one EPL node with the same node ID. The EPL node must be enabled via code C13028. The subcode describes the PRes telegrams received. The value must be within the limits of 36 ... 1490 bytes. The values are upper limit values for the entire size of the PDO mappings for received PRes telegrams. **In the configured state, the values stored for the nodes must be identical to the corresponding C13072 entries. C13067 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	ns	4294967295	

Subcodes	Lenze setting	Info	EPL index
C13067/1	5000 ns	EPL Time-out isochronous comm. CN	0x1F92.0x01
...	...	...	...
C13067/100	5000 ns	EPL Time-out isochronous comm. CN	0x1F92.0x64

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13071

Parameter | Name: **C13071 | EPL Max. PDO user data RPDO PReq**			Data type: UNSIGNED_16 Index: 11504 = 0x2CF0 EPL index: 0x1F98.0x04
The code defines the maximum data volume to be received by the Controlled Node of the PDP mapping for the PReq telegram to be defined via one of the codes C13231 ... C13240. In the configured state, the value must be identical to the entry for a response valid for the EPL node. **When a Servo Drive 9400 is used, the code as Managing Node is irrelevant since Servo Drives 9400 as Managing Nodes only transmit PDO data via broadcast PRes telegrams (C13071 = 36 bytes).**			

Setting range (min. value | unit | max. value)			Lenze setting
0	Byte	1490	**36 bytes**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13072

Parameter | Name: **C13072 | EPL Max. PDO user data TPDO PRes**			Data type: UNSIGNED_16 Index: 11503 = 0x2CEF EPL index: 0x1F98.0x05
The code defines the maximum PDO data size to be sent by the EPL node for the current network configuration. The PDO mapping C13531 can assign data with a total size greater than or equal to C13072. **In the configured state, C13072 must be identical to the entry in C13066 valid for the EPL node.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Byte	1490	**400 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13074

Parameter | Name: **C13074 | EPL multi-stage cycle timing**			Data type: UNSIGNED_8 Index: 11501 = 0x2CED EPL index: 0x1F98.0x07
This code serves to define the maximum number of the multiplexed cycles. If, e.g., the value "3" is entered, the multiplexed cycle is repeated every three cycles. Within one multiplexed cycle, the nodes are queried according to the values in code C13079. If, e.g., the value "2" is entered for a node in C13079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Cycles	255	**0 cycles**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13075

Parameter | Name: **C13075 | EPL SDO channel width**			Data type: UNSIGNED_16 Index: 11500 = 0x2CEC EPL index: 0x1F98.0x08
The code defines the maximum user data size of asynchronous frames. Protocol-specific headers for POWERLINK, UDP/IP and others as well as service-specific headers are to be interpreted as part of the user data. **In the configured state, the C13075 values of all EPL nodes must be identical.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
282	Byte	1500	**282 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13078

Parameter | Name: **C13078 | EPL CN: Max. time - MN detection**			Data type: UNSIGNED_32 Index: 11497 = 0x2CE9 EPL index: 0x1F99
The code defines the time interval needed for detecting a Managing Node. If a booting Controlled Node detects a Managing Node during the interval, it changes to NMT_CS_PREOPERATIONAL_1. If not, it changes to "Basic Ethernet Mode".			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	µs	4294967295	**10000000 µs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13079

Parameter | Name: **C13079 | EPL multi-stage node declaration CN**			Data type: UNSIGNED_8 Index: 11496 = 0x2CE8 EPL index: See subcodes
This code indicates in which multiplexed cycle the Controlled Node is queried. The value entered must not exceed the value in code C13074. If, for instance, the value "3" is entered in code C13074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C13079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13079/1	0 cycles		0x1F9B.0x01
...	...		...
C13079/100	0 cycles		0x1F9B.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13095

Parameter | Name: **C13095 | EPL communication status**		Data type: UNSIGNED_8 Index: 11480 = 0x2CD8 EPL index: 0x1F8C
The code indicates the current NMT status of the EPL node.		
Selection list (read only)		**Info**
0	Off	NMT_GS_OFF
25	Initialising	NMT_GS_INITIALISING
41	ResetAppl	NMT_GS_RESET_APPLICATION
57	ResetComm	NMT_GS_RESET_COMMUNICATION

30	BasicEthernet	NMT_CS_BASIC_ETHERNET (only Controlled Node)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13096

Parameter | Name: **C13096 | EPL node status**			Data type: UNSIGNED_8 Index: 11479 = 0x2CD7 EPL index: See subcodes
The code indicates the NMT statuses reported by the Controlled Node to the Managing Node. Each subcode corresponds to an EPL node with node ID = subcode number. The EPL node must be enabled via C13028.			
Selection list		**Info**	
0	Off	NMT_GS_OFF	
25	Initialising	NMT_GS_INITIALISING	
41	ResetAppl	NMT_GS_RESET_APPLICATION	
57	ResetComm	NMT_GS_RESET_COMMUNICATION

Subcodes		**Info**	**EPL index**
C13096/1		EPL node status CN	0x1F8E.0x01
...		...	...
C13096/100		EPL node status CN	0x1F8E.0x64
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13102

Parameter | Name: **C13102 | EPL reset command**			Data type: UNSIGNED_8 Index: 11473 = 0x2CD1 EPL index: 0x1F9E
A reset command to a single EPL node in the network can result in cycle and monitoring errors. The code initiates a reset of the EPL node. When the reset has been executed, the code is automatically set to "NMTInvalidService".			
Selection list (Lenze setting printed in bold)		**Info**	
40	ResetNode	Status transition → NMT_GS_RESET_APPLICATION	
41	ResetCommunication	Status transition → NMT_GS_RESET_COMMUNICATION	
42	ResetConfiguration	Status transition → NMT_GS_RESET_CONFIGURATION	
255	**No command**	No function	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13103

Parameter | Name: **C13103 | EPL NMT command: Enable**	Data type: UNSIGNED_8 Index: 11472 = 0x2CD0 EPL index: 0x1F9F.0x01

The code enables the NMT command defined via C13104/C13105. The values have the following meaning:
- 0: The command is inhibited.
- 1: The command is enabled.

After the NMT command has been executed, the code is automatically set to FALSE.
NMT commands can cause serious faults in the network. Cycle and monitoring errors can occur.

Setting range (min. value | unit | max. value)			Lenze setting
0		1	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13104

Parameter | Name: **C13104 | EPL NMT command: Command ID**	Data type: UNSIGNED_8 Index: 11471 = 0x2CCF EPL index: 0x1F9F.0x02

The code defines the command to be executed.
NMT commands can cause serious faults in the network. Cycle and monitoring errors can occur.

Selection list (Lenze setting printed in bold)	
34	StopNode
40	ResetNode
41	ResetCommunication
42	ResetConfiguration
255	**No command**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13105

Parameter | Name: **C13105 | EPL NMT command: Target address**	Data type: UNSIGNED_8 Index: 11470 = 0x2CCE EPL index: 0x1F9F.0x03

The code defines the destination node of the command via its node address. The node address "255" addresses all EPL nodes of the network. "0" is an invalid address, a command with destination node "0" is ineffective.
NMT commands can cause serious faults in the network. Cycle and monitoring errors can occur.

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13110

Parameter | Name: **C13110 | EPL fault memory**	Data type: INTEGER_8 Index: 11465 = 0x2CC9 EPL index: 0x1001

The code indicates the currently pending errors (according to error classes).

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13115

Parameter | Name: **C13115 | EPL MN: Frame error (CRC)**			Data type: UNSIGNED_32 Index: 11460 = 0x2CC4 EPL index: See subcodes
The POWERLINK telegrams of the EPL network are protected by a checksum. The Managing Node counts the checksum errors which signalise a falsification of the frame. The monitoring response is determined via C13891/4.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C13115/1	0	CumulativeCnt_U32	0x1C00.0x01
C13115/2	0	ThresholdCnt_U32	0x1C00.0x02
C13115/3	9	Threshold_U32	0x1C00.0x03

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13116

Parameter | Name: **C13116 | EPL MN: Frame collisions**			Data type: UNSIGNED_32 Index: 11459 = 0x2CC3 EPL index: See subcodes
The code indicates the collision counter of the Managing Node. The Managing Node detects frame collisions in the EPL segment. This code contains the number of detected collisions. Each event is counted. Every single event is followed by an error message. No threshold value management is implemented. Due to extended topology options of EPL compared to the standard Ethernet according to IEEE802.3 it is not mandatory that the Managing Node recognises all collisions that occur in the segment.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C13116/1	0	CumulativeCnt_U32	0x1C01.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13117

Parameter | Name: **C13117 | EPL MN: Cycle time violation**			Data type: UNSIGNED_32 Index: 11458 = 0x2CC2 EPL index: See subcodes
The code indicates the counters of the Managing Node for cycle time overflows. The monitoring response is determined via C13891/1.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C13117/1	0	CumulativeCnt_U32	0x1C02.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13118

Parameter | Name: **C13118 | EPL MN: Link interruptions**			Data type: UNSIGNED_32 Index: 11457 = 0x2CC1 EPL index: 0x1C03
The code displays the counter of the Managing Node for interrupted POWERLINK connections. Each event is counted. Every single event is followed by an error response. A threshold value management is not implemented.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13122

Parameter | Name: **C13122 | EPL CN response error**			Data type: UNSIGNED_32 Index: 11453 = 0x2CBD EPL index: See subcodes
The subcodes of the code indicate Controlled Node-specific cumulative counters for missing PRes frames. The behaviour corresponds to a node The behaviour corresponds to subcode 1 of the single error counters (C13116). Each subcode corresponds to an EPL node with node ID = subcode number.			
Setting range (min. value | unit | max. value)

C13125

Parameter | Name: **C13125 | EPL MN: Break after collisions**			Data type: UNSIGNED_32 Index: 11450 = 0x2CBA EPL index: 0x1C12
The code determines the number of EPL cycles for the duration of which the Managing Node interrupts the cycle sequence after a POWERLINK collision has occurred.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Cycles	100	**1 cycles**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13126

Parameter | Name: **C13126 | EPL CN: Frame collisions**			Data type: UNSIGNED_32 Index: 11449 = 0x2CB9 EPL index: See subcodes
The code indicates the number of POWERLINK collisions detected by the Controlled Node (C13116). Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Setting range (min. value | unit | max. value)			
0		4294967295

C13136

Parameter | Name: **C13136 | EPL telegram counter**			Data type: UNSIGNED_32 Index: 11439 = 0x2CAF EPL index: 0x1101.0x01
The subcodes of the code indicate a counter for EPL cycles. The counter is started with each mains power-up of the EPL node at 0. An overflow occurs at 4.294.967.295.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13203

Parameter | Name: **C13203 | EPL CN response error**			Data type: UNSIGNED_32 Index: 11372 = 0x2C6C EPL index: See subcodes
The subcodes of the code indicate Controlled Node-specific cumulative counters for missing PRes frames. The behaviour corresponds to a node The behaviour corresponds to subcode 1 of the single error counters. Each subcode corresponds to an EPL node with node ID = subcode number.			
Display area (min. value | unit | max. value)

C13225

Parameter | Name: **C13225 | EPL MN: Max. user data RPDO**			Data type: UNSIGNED_16 Index: 11350 = 0x2C56 EPL index: See subcodes
The code defines the reserved user data length of the PRes frames. Each subcode number corresponds to an EPL node with the same node ID. The subcode describes the PRes frames received. The value must be within the limits of 36 ... 1490 bytes. The values are upper limit values for the total size of the PDO mappings which must be defined each one of the codes C13231 ... C13240 for PRes frames received. **In the configured state, the values stored for the EPL nodes must be identical to the corresponding C13072 entries. C13066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490

C13226

Parameter | Name: **C13226 | EPL node status MN**			Data type: UNSIGNED_8 Index: 11349 = 0x2C55 EPL index: See subcodes
The code indicates the current NMT statuses of the Managing Node. Each subcode corresponds to an EPL node with node ID = subcode number. The EPL node must be enabled via C13029.			
Selection list		**Info**	
0	Off	NMT_GS_OFF

C13228

Parameter | Name: **C13228 | EPL time-out isochronous comm.**			Data type: UNSIGNED_32 Index: 11347 = 0x2C53 EPL index: See subcodes
The code defines Controlled Node-specific timeout times to answer the PReq request frames by PRes response frames. Each subcode corresponds to an EPL node with node ID = subcode number.			
Setting range (min. value | unit | max. value)			
0	ns	4294967295

C13229

Parameter | Name: **C13229 | EPL multi-stage node declaration MN**			Data type: UNSIGNED_8 Index: 11346 = 0x2C52 EPL index: See subcodes
This code indicates in which multiplexed cycle the node is queried. The value entered must not exceed the value in code C13074. If, for instance, the value "3" is entered in code C13074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C13229/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255

C13484

Parameter | Name: **C13484 | EPL address: RPDO**			Data type: UNSIGNED_8 Index: 11091 = 0x2B53 EPL index: See subcodes
The subcodes 1 ... 10 describe the node address of the transmitting EPL node for the PDO channels 1 ... 10 (mapping see C13231 ... C13240). Values > "0" describe the origin of a PRes frame. The value "0" is reserved for PReq (must not be used in systems with a Servo Drive 9400 as Managing Node). The subcodes 1 ... 10 are only valid if the corresponding subcode of C13489 has a value > "0". Before writing the EPL node address in a subcode of C13484, the corresponding subcode of C13489 must be set to the value "0". Renewed writing of the number of mapping entries in the subcode of C13489 enables the node address.			
Setting range (min. value | unit | max. value)			
0		255	

Subcodes	Lenze setting	Info	EPL index
C13484/1	0	EPL address: RPDO	0x1400.0x01
...	...	...	...
C13484/10	0	EPL address: RPDO	0x1409.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13489

Parameter | Name: **C13489 | EPL number RPDO**			Data type: UNSIGNED_8 Index: 11086 = 0x2B4E EPL index: See subcodes
The subcodes 1 ... 10 describe the number of valid mapping entries of the PDO channels 1 ... 10 (valid subcodes in C13231 ... C13240). The value "0" inhibits the corresponding PDO channel. Before writing the mapping entries in C13231 ... C13240 or the EPL address of the SDO transmitter in the corresponding subcode of C13484, the corresponding subcode of code C13489 must be set to the value "0". A renewed writing of the number of mapping entries in the subcode of C13489 enables the mapping and the transmission EPL address for the PDO channel. The sum of all mapping entries enabled via the subcodes of C13489 must not exceed the value "64". Make sure that the sum of memory requirements of all objects mapped in C13231 ... C13240 does not exceed 64 bytes.			
Setting range (min. value | unit | max. value)			
0		32	

Subcodes	Lenze setting	Info	EPL index
C13489/1	0	EPL RPDO: object count	0x1600.0x00
...	...	...	...
C13489/10	0	EPL RPDO: object count	0x1609.0x00

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C13531

Parameter | Name: **C13531 | EPL TPDO**			Data type: UNSIGNED_64 Index: 11044 = 0x2B24 EPL index: See subcodes
The code describes the mapping for the TPDO channel.C13789.1 describes the number of valid mapping object entries in this code. Subcodes 1 ... 32 describe the mapping of the single objects. Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped on variables with a compatible data length. The "Offset" (bytes 4 and 5) and "Length" (bytes 6 and 7) of the mapping object description must be a multiple of 8. Before changing the mapping object entries in C13531, C13789/1 must be set to "0". This deactivates the mapping. Writing into C13789/1 with a value unequal "0" re-enables the mapping. Offset and length of the data object relevant for the receiving EPL node must be identical with the corresponding values of the entry in C13531.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C13531/1	0	EPL TPDO	0x1A00.0x01
...	...	...	...
C13531/32	0	EPL TPDO	0x1A00.0x20
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13789

Parameter | Name: **C13789 | EPL number TPDO**			Data type: UNSIGNED_8 Index: 10786 = 0x2A22 EPL index: See subcodes
The subcode 1 describes the number of valid mapping object entries (subcodes) in code C13531. The value "0" inhibits the TPDO. Before writing a subcode of C13531, set C13789 subcode 1 to the value "0". Renewed writing of the number of mapping object entries in C13789 subcode 1 enables the TPDO mapping.			
Setting range (min. value | unit | max. value)			
0		32

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13919

Parameter | Name: **C13919 | EPL additional error info**	Data type: UNSIGNED_32 Index: 10656 = 0x29A0 EPL index: not available
Display of coded additional information on a pending error	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13920

Parameter | Name: **C13920 | EPL DIP switch**	Data type: UNSIGNED_8 Index: 10655 = 0x299F EPL index: not available
The code outputs the current DIP switch setting of the communication module. • The switch with the labelling "128" is displayed on the most significant bit, the switch "1" on the least significant bit. • The numerical value of C13920 corresponds to the node ID of the communication module. ▸ Node address setting (📖 36)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

11.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCEP communication module (POWERLINK) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C14000

Parameter | Name: **C14000 | EPL IP address**				Data type: UNSIGNED_32 Index: 10575 = 0x294F EPL index: See subcodes
The code displays the IP address of the communication module. • The IP address is derived from the EPL node address (Node ID): **192.168.100.[Node ID]** • The node ID is derived from the DIP switch position or from C14044. ▸ Node address setting (📖 36)				
Setting range (min. value | unit | max. value)				
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C14000/1	3232261130 (0xC0A86401 = 192.168.100.1)		EPL IP address	0x1E40.0x02
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C14001

Parameter | Name: **C14001 | EPL IP subnet mask**				Data type: UNSIGNED_32 Index: 10574 = 0x294E EPL index: See subcodes
The code declares the IP subnet mask which restricts the directly addressable IP address range (i.e. without a gateway in the EPL segment of the routers). The value 255.255.255.0 (0xFFFFFF00) is always assigned to the subnet mask in one segment.				
Setting range (min. value | unit | max. value)				
255.0.0.0 (0xFF000000)		255.255.255.0 (0xFFFFFF00)		
Subcodes	**Lenze setting**		**Info**	**EPL index**
C14001/1	4294967040 (0xFFFFFF00 = 255.255.255.0)		EPL IP-subnet mask	0x1E40.0x03
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT				

C14003

Parameter | Name: **C14003 | EPL IP address router**			Data type: UNSIGNED_32 Index: 10572 = 0x294C EPL index: See subcodes
The code declares the IP address of the router which connects the EPL segment to the higher-level network. The standard entry corresponds to the standard router address of the EPL specification: **→ 192.168.100.254** Permissible entries replace the lowest-order byte of the standard entry with the EPL address of the node which has the function of a router.			
Setting range (min. value | unit | max. value)			
0.0.0.0 (0x00000000)		255.255.255.255 (0xFFFFFFFF)	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14003/1	3232261374 (0xC0A864FE = 192.168.100.254)	EPL IP address router	0x1E40.0x05
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14004

Parameter | Name: **C14004 | EPL MAC address**		Data type: OCTET_STRING Index: 10571 = 0x294B EPL index: See subcodes
The code indicates the physical address (MAC address) of the POWERLINK interface of the communication module. When the communication module is produced, the MAC address is assigned unequivocally worldwide and provides addressing on the lowest level.		
Subcodes	**Info**	**EPL index**
C14004/1	MAC Address (octet string[6]) 00-0A-86-xx-yy-zz • 00-0A-86 = Lenze • xx-yy-zz = consecutive number	0x1030.0x05
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14027

Parameter | Name: **C14027 | EPL MN: Boot behaviour**	Data type: UNSIGNED_32 Index: 10548 = 0x2934 EPL index: 0x1F80
The code controls the start of the EPL network by the Managing Node and the responses to errors in the network. Servo Drives 9400 have a constant value 274 (0x112).	
Value is bit-coded:	
Bit 0 ... 31 | see below	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Description of the bits 0 ... 31

Bit	Value	Description
0	0	Reserved / No function
1	0 *)	Start CNs individually (when bit 3 = 0)
	1	Start CNs with broadcast NMTStartNode (when bit 3 = 0)
2	0	Go automatically to NMT_MS_OPERATIONAL
	1 *)	Application decides on change to NMT_MS_OPERATIONAL
3	0	Start CNs automatically, see bit 1
	1 *)	Application decides on CN start
4	0 *)	Individual reset of a CN after monitoring error
	1	Broadcast reset of all CNs after monitoring error
5	0	Reserved / No function
6	0	Response to monitoring errors after reset (bit 4)
	1 *)	Transmit broadcast "NMTStopNode" after monitoring error
7	0	Automatic change to NMT_MS_PRE_OPERATIONAL_2
	1 *)	Application decides on change to NMT_MS_PRE_OPERATIONAL_2
8	0	Automatic change to NMT_MS_READY_TO_OPERATE
	1 *)	Application decides on change to NMT_MS_READY_TO_OPERATE
9	0	Identification of the CNs only by verification of the corresponding NMT_MNDeviceTypeList_AU32-subindex
	1 *)	Extended identification
10	0	No check of the application software version of the CN
	1 *)	Check of the application software version of the CN
11	0	No check of the CN configuration
	1 *)	Check of the CN configuration
12	0	Error response: Change to NMT_MS_OPERATIONAL and NMT_MS_PREOPERATIONAL_1
	1 *)	Application-specific error response
13 ... 31	0	Reserved / No function

*) Not permissible for 9400 Servo Drives.

C14028

Parameter | Name: **C14028 | EPL node declaration CN**			Data type: UNSIGNED_32 Index: 10547 = 0x2933 EPL index: See subcodes
The code declares the Controlled Nodes 1 ... 100 and their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14028/1	0	EPL node declaration CN	0x1F81.0x01
...	...	...	...
C14028/100	0	EPL node declaration CN	0x1F81.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a Controlled Node.
				1	EPL node with this ID is a Controlled Node.
2	☑	☐	1	0 *)	On detection of a booting Controlled Node, the application will not be informed.
				1	On detection of a booting Controlled Node, the application will be informed and the Controlled Node will be started.
3	☑	☑	1	0	Optional Controlled Node
				1	Obligatory Controlled Node
4	☑	☐	0	0	The Managing Node is allowed to send reset commands.
				1 *)	The Managing Node must not send any reset command.
5	☑	☐	0	0	Software version verification of the Controlled Node is not required.
				1 *)	Software version verification of the Controlled Node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed Controlled Node
				1	Asynchronously accessed Controlled Node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed Controlled Node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The Managing Node does not send any PRes frames
				1	The Managing Node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C14029

Parameter | Name: **C14029 | EPL node declaration MN**			Data type: UNSIGNED_32 Index: 10546 = 0x2932 EPL index: See subcodes
The code declares Managing Node, diagnostic device, and EPL router, and describes their properties.			
Value is bit-coded:			
Bit 0 ... 31	see below		
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14029/1	2147483661 (0x8000000D)	EPL node assignment Managing Node	0x1F81.0xF0
C14029/2	0	EPL node assignment diagnostic device	0x1F81.0xFD
C14029/3	2147483655 (0x80000007)	EPL node assignment router	0x1F81.0xFE
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

Description of the bits 0 ... 31

Bit	Relevance		Lenze	Value	Description
	MN	CN			
0 (LSB)	☑	☑	0, 1	0	EPL node with this ID does not exist.
				1	EPL node with this ID exists.
1	☑	☑	0, 1	0	EPL node with this ID is not a Controlled Node.
				1	EPL node with this ID is a Controlled Node.
2	☑	☐	1	0 *)	On detection of a booting Controlled Node, the application will not be informed.
				1	On detection of a booting Controlled Node, the application will be informed and the Controlled Node will be started.
3	☑	☑	1	0	Optional Controlled Node
				1	Obligatory Controlled Node
4	☑	☐	0	0	The Managing Node is allowed to send reset commands.
				1 *)	The Managing Node must not send any reset command.
5	☑	☐	0	0	Software version verification of the Controlled Node is not required.
				1 *)	Software version verification of the Controlled Node is required.
6	☑	☐	0, 1	0	Automatic application software update is not allowed.
				1	Automatic application software update is allowed.
7	-	-	0	0	Reserved / No function
8	☑	☑	0, 1	0	Isochronously accessed Controlled Node
				1	Asynchronously accessed Controlled Node (bit 9 is irrelevant)
9	☑	☑	0	0	Continuously accessed Controlled Node
				1	Multiplex EPL nodes are supported.
10	☑	☑	0	0	No "POWERLINK to standard Ethernet" router function.
				1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
11	☑	☑	0	0	No "POWERLINK to fieldbus" router function.
				1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
12	☑	☑	0	0	The Managing Node does not send any PRes frames
				1	The Managing Node sends PRes frames
13 ... 30	-	-	0	0	Reserved / No function
31 (MSB)	☑	☑	0, 1	0	Bits 0 ... 30 inhibited
				1	Bits 0 ... 30 enabled

*) Not permissible for 9400 Servo Drives.

C14030

Parameter | Name: **C14030 | EPL device type**			Data type: UNSIGNED_32 Index: 10545 = 0x2931 EPL index: 0x1000
The code indicates the device type of the EPL node.			
Value is bit-coded:			
Bit 1	Bit1		
Bit 2	Bit2		
Bit 3	Bit3		
Bit 4	Bit4		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14034

Parameter | Name: **C14034 | EPL identity object**			Data type: UNSIGNED_32 Index: 10541 = 0x292D EPL index: See subcodes
The code indicates the Manufacturer's EPL ID no. for Lenze.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14034/1	59 (0x3B)	Manufacturer's EPL ID no.	0x1018.0x01
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14035

Parameter | Name: **C14035 | EPL device type CN**			Data type: UNSIGNED_32 Index: 10540 = 0x292C EPL index: See subcodes
The code contains the device type ID of the declared Controlled Nodes. Each subcode corresponds to a Controlled Node with the node ID = subcode number. **When being in the configured status, the values must be identical with the device types stored locally in each node under C14030.**			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14035/1	0	EPL device type CN	0x1F84.0x01
...	...	...	...
C14035/100	0	EPL device type CN	0x1F84.0x64
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14040

Parameter | Name: **C14040 | EPL feature flags**	Data type: UNSIGNED_32 Index: 10535 = 0x2927 EPL index: 0x1F82
The code displays the POWERLINK functions implemented by the EPL node.	
Value is bit-coded:	
Bit 0 ... 31 | see below	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Description of the bits 0 ... 31

Bit	Relevance		Value	Description
	MN	CN		
0 (LSB)	☐	☑	0	Asynchronous access
			1	Isochronous access *)
1	☑	☑	0	No SDO by UDP/IP
			1	SDO via UDP/IP *)
2	☑	☑	0	No SDO via EPL "ASnd" *)
			1	SDO by EPL "ASnd"
3	☑	☑	0	No SDO integrated in PDO *)
			1	SDO integrated in PDO
4	☑	☑	0	No "NMT Info Services"
			1	"NMT Info Services" supported
5	☑	☑	0	No extended "NMT State Commands" *)
			1	Extended "NMT State Commands" supported
6	☑	☑	0	No dynamic PDO mapping *)
			1	Dynamic PDO mapping supported
7	☑	☐	0	No dynamic PDO mapping
			1	Dynamic PDO mapping supported
8	☑	☑	0	No configuration manager function
			1	Configuration manager function
9	☑	☑	0	Only isochronous cyclic access permitted.
			1	Isochronous multiplexed access possible.
10	☐	☑	0	No address assignment via software
			1	Address assignment via software
11	☑	☐	0	No support of the "Basic Ethernet Mode" by the master
			1	Support of the "Basic Ethernet Mode" by the master
12	☑	☑	0	No "POWERLINK to standard Ethernet" router function
			1	The device can be used as an "POWERLINK to standard Ethernet" router (router type 1).
13	☑	☑	0	No "POWERLINK to fieldbus" router function
			1	The device can be used as an "POWERLINK to fieldbus" router (router type 1).
14 ... 31 (MSB)	-	-	-	Reserved / No function

*) Values implemented by 9400 Servo Drives (MN: $0x0087_h = 135_d$, CN $0x0083_h = 131_d$).

C14041

Parameter | Name: **C14041 | EPL version**	Data type: UNSIGNED_8 Index: 10534 = 0x2926 EPL index: not available
The code describes the version of the POWERLINK communication profile implemented by the communication module. The higher-order nibble describes the major version, the lower order nibble describes the minor version. The implemented value corresponds to the POWERLINK version 2.0.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14042

Parameter | Name: **C14042 | Current EPL device address**	Data type: UNSIGNED_8 Index: 10533 = 0x2925 EPL index: 0x1F93.0x01
The code displays the currently valid EPL node address (Node ID). • The node ID must be unequivocal in the EPL network segment. • See also C14044.	

Display area (min. value | unit | max. value)			
1		240	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14043

Parameter | Name: **C14043 | EPL device address selection**	Data type: UNSIGNED_8 Index: 10532 = 0x2924 EPL index: 0x1F93.0x02
The code indicates whether the EPL node address (node ID) has been set via DIP switches at the communication module or via the software. • 0: Node ID has been set via software (C14044). • 1: Node ID has been set via DIP switches at the communication module. ▸ Node address setting (📖 36)	

Display area (min. value | unit | max. value)			
0		1	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14044

Parameter | Name: **C14044 | EPL device address SW**	Data type: UNSIGNED_8 Index: 10531 = 0x2923 EPL index: 0x1F93.0x03
This code serves to set the EPL node address (node ID) via the software. The value "0" (Lenze setting) is not a valid node ID. It serves to activate the setting via the DIP switches. ▸ Node address setting (📖 36)	

Setting range (min. value | unit | max. value)			**Lenze setting**
1		240	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14045

Parameter | Name: **C14045 | EPL host name**	Data type: VISIBLE_STRING Index: 10530 = 0x2922 EPL index: 0x1F9A
The code defines a DNS-compatible device name. The length is limited to 15 characters. **The device name must be unambiguous within the network domain.** Naming convention: The device name • starts with a character • ends with a character or digit The device name consists of • letters ([A ... Z], [a ... z]) • digits ([0 ... 9]) • hyphen ([-])	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT	

C14060

Parameter | Name: **C14060 | EPL cycle time**	Data type: UNSIGNED_32 Index: 10515 = 0x2913 EPL index: 0x1006
The code declares the length of the EPL cycle in µs. • In the configured state, this code must have an identical value in all EPL nodes. • The selected value must correspond to the actual bus cycle time so that the internal monitoring functions work correctly.	

Selection list (Lenze setting printed in bold)	
500	0.5
1000	**1**
2000	2
3000	3
4000	4

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14062

Parameter | Name: **C14062 | EPL MN: boot timing**			Data type: UNSIGNED_32 Index: 10513 = 0x2911 EPL index: See subcodes
The code defines timeouts and waiting times for the booting process of the Managing Node. • The value "0" for subcode 2, 4, 5 deactivates the time-outs. The Managing Node waits for an indefinite period of time. No error message is generated. • The value "0" for subcode 3 deactivates the waiting time. After all expected Controlled Nodes have been detected by the Managing Node, the Managing Node immediately changes to NMT_MS_PREOPERATIONAL_2. **Observe the following conditions:** • Subcode 1 must be lower than C14078 - values of all EPL nodes. • Subcode 3 must be lower than subcode 2.			
Setting range (min. value | unit | max. value)			
0	µs	4294967295	

Subcodes	Lenze setting	Info	EPL index
C14062/1	2500000 µs	Max. time for detecting a redundant Managing Node Waiting time before changing to NMT_MS_PREOPERATIONAL_1	0x1F89.0x01
C14062/2	60000000 µs	Max. time for device search Dwell time in NMT_MS_PREOPERATIONAL_1 Error message if not all Controlled Nodes are in NMT_CS_PREOPERATIONAL_1.	0x1F89.0x02
C14062/3	0 µs	Waiting time in NMT_MS_PREOPERATIONAL_1	0x1F89.0x03
C14062/4	0 µs	Max. time in NMT_MS_PREOPERATIONAL_2 Error message if not all Controlled Nodes are in NMT_CS_PREOPERATIONAL_2.	0x1F89.0x04
C14062/5	0 µs	Max. time in NMT_MS_READY_TO_OPERATE Error message if not all Controlled Nodes are in NMT_CS_READY_TO_OPERATE.	0x1F89.0x05

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14063

Parameter | Name: **C14063 | EPL MN cycle timing**			Data type: UNSIGNED_32 Index: 10512 = 0x2910 EPL index: See subcodes
The code defines time intervals for the cycle control by the Managing Node.			
Setting range (min. value | unit | max. value)			
0	ns	4294967295	

Subcodes	Lenze setting	Info	EPL index
C14063/1	2000 ns	Waiting time between SoC and PReq	0x1F8A.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14066

Parameter | Name: **C14066 | EPL CN: Max. user data PRes RPDO**			Data type: UNSIGNED_16 Index: 10509 = 0x290D EPL index: See subcodes
The code defines the reserved user data length of the PRes telegrams for Controlled Nodes 1 ... 100. Each subcode number corresponds to one EPL node with the same node ID. The EPL node must be enabled via code C14028. The subcodes describe the PRes telegrams received. The value must be within the range of 36 ... 1490 bytes. The values are upper limit values for the entire size of the PDO mappings for received PRes telegrams. **In the configured state, the values stored for the nodes must be identical to the corresponding C14072 entries.** **C14066 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490	

Subcodes	Lenze setting	Info	EPL index

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14067

Parameter | Name: **C14067 | EPL MN: time-out isochronous comm. CN**			Data type: UNSIGNED_32 Index: 10508 = 0x290C EPL index: See subcodes
The code defines the reserved user data length of the PRes frames for Managing Node, diagnostic device or router. Each subcode number corresponds to one EPL node with the same node ID. The EPL node must be enabled via code C14028. The subcode describes the PRes telegrams received. The value must be within the limits of 36 ... 1490 bytes. The values are upper limit values for the entire size of the PDO mappings for received PRes telegrams. **In the configured state, the values stored for the nodes must be identical to the corresponding C14072 entries.** **C14067 must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	ns	4294967295	

Subcodes	Lenze setting	Info	EPL index
C14067/1	5000 ns	EPL Time-out isochronous comm. CN	0x1F92.0x01
...	...	...	...
C14067/100	5000 ns	EPL Time-out isochronous comm. CN	0x1F92.0x64

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14071

Parameter | Name: **C14071 | EPL Max. PDO user data RPDO PReq**			Data type: UNSIGNED_16 Index: 10504 = 0x2908 EPL index: 0x1F98.0x04
The code defines the maximum data volume to be received by the Controlled Node of the PDP mapping for the PReq telegram to be defined via one of the codes C14231 ... C14240. In the configured state, the value must be identical to the entry for a response valid for the EPL node. **When a Servo Drive 9400 is used, the code as Managing Node is irrelevant since Servo Drives 9400 as Managing Nodes only transmit PDO data via broadcast PRes telegrams (C14071 = 36 bytes).**			

Setting range (min. value | unit | max. value)			Lenze setting
0	Byte	1490	**36 bytes**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14072

Parameter | Name: **C14072 | EPL Max. PDO user data TPDO PRes**			Data type: UNSIGNED_16 Index: 10503 = 0x2907 EPL index: 0x1F98.0x05
The code defines the maximum PDO data size to be sent by the EPL node for the current network configuration. The PDO mapping C14531 can assign data with a total size greater than or equal to C14072. **In the configured state, C14072 must be identical to the entry in C14066 valid for the EPL node.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Byte	1490	**400 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14074

Parameter | Name: **C14074 | EPL multi-stage cycle timing**			Data type: UNSIGNED_8 Index: 10501 = 0x2905 EPL index: 0x1F98.0x07
This code serves to define the maximum number of the multiplexed cycles. If, e.g., the value "3" is entered, the multiplexed cycle is repeated every three cycles. Within one multiplexed cycle, the nodes are queried according to the values in code C14079. If, e.g., the value "2" is entered for a node in C14079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Cycles	255	**0 cycles**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14075

Parameter | Name: **C14075 | EPL SDO channel width**			Data type: UNSIGNED_16 Index: 10500 = 0x2904 EPL index: 0x1F98.0x08
The code defines the maximum user data size of asynchronous frames. Protocol-specific headers for POWERLINK, UDP/IP and others as well as service-specific headers are to be interpreted as part of the user data. **In the configured state, the C14075 values of all EPL nodes must be identical.**			
Setting range (min. value | unit | max. value)			**Lenze setting**
282	Byte	1500	**282 bytes**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14078

Parameter | Name: **C14078 | EPL CN: Max. time - MN detection**			Data type: UNSIGNED_32 Index: 10497 = 0x2901 EPL index: 0x1F99
The code defines the time interval needed for detecting a Managing Node. If a booting Controlled Node detects a Managing Node during the interval, it changes to NMT_CS_PREOPERATIONAL_1. If not, it changes to "Basic Ethernet Mode".			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	µs	4294967295	**10000000 µs**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14079

Parameter | Name: **C14079 | EPL multi-stage node declaration CN**			Data type: UNSIGNED_8 Index: 10496 = 0x2900 EPL index: See subcodes
This code indicates in which multiplexed cycle the Controlled Node is queried. The value entered must not exceed the value in code C14074. If, for instance, the value "3" is entered in code C14074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C14079/x, it is always queried only in the second cycle of the three multiplexed cycles.			
Setting range (min. value | unit | max. value)			
0	Cycles	255

C14095

Parameter | Name: **C14095 | EPL communication status**		Data type: UNSIGNED_8 Index: 10480 = 0x28F0 EPL index: 0x1F8C
The code indicates the current NMT status of the EPL node.		
Selection list (read only)		**Info**
0	Off	NMT_GS_OFF
25	Initialising	NMT_GS_INITIALISING
41	ResetAppl	NMT_GS_RESET_APPLICATION

30	BasicEthernet	NMT_CS_BASIC_ETHERNET (only Controlled Node)

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14096

Parameter | Name: **C14096 | EPL node status CN**			Data type: UNSIGNED_8 Index: 10479 = 0x28EF EPL index: See subcodes
The code indicates the NMT statuses reported by the Controlled Node to the Managing Node. Each subcode corresponds to an EPL node with node ID = subcode number. The EPL node must be enabled via C14028.			
Selection list		**Info**	
0	Off	NMT_GS_OFF

C14102

Parameter | Name: **C14102 | EPL reset command**			Data type: UNSIGNED_8 Index: 10473 = 0x28E9 EPL index: 0x1F9E
A reset command to a single EPL node in the network can result in cycle and monitoring errors. The code initiates a reset of the EPL node. When the reset has been executed, the code is automatically set to "NMTInvalidService".			
Selection list (Lenze setting printed in bold)		**Info**	
40	ResetNode	Status transition → NMT_GS_RESET_APPLICATION	
41	ResetCommunication	Status transition → NMT_GS_RESET_COMMUNICATION	
42	ResetConfiguration	Status transition → NMT_GS_RESET_CONFIGURATION

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14103

Parameter | Name: **C14103 | EPL NMT command: Enable**	Data type: UNSIGNED_8 Index: 10472 = 0x28E8 EPL index: 0x1F9F.0x01

The code enables the NMT command defined via C14104/C14105. The values have the following meaning:
- 0: The command is inhibited.
- 1: The command is enabled.

After the NMT command has been executed, the code is automatically set to FALSE.
NMT commands can cause serious faults in the network. Cycle and monitoring errors can occur.

Setting range (min. value | unit | max. value)			Lenze setting
0		1	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14104

Parameter | Name: **C14104 | EPL NMT command: Command ID**	Data type: UNSIGNED_8 Index: 10471 = 0x28E7 EPL index: 0x1F9F.0x02

The code defines the command to be executed.
NMT commands can cause serious faults in the network. Cycle and monitoring errors can occur.

Selection list (Lenze setting printed in bold)	
34	StopNode
40	ResetNode
41	ResetCommunication
42	ResetConfiguration
255	**No command**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14105

Parameter | Name: **C14105 | EPL NMT command: Target address**	Data type: UNSIGNED_8 Index: 10470 = 0x28E6 EPL index: 0x1F9F.0x03

The code defines the destination node of the command via its node address. The node address "255" addresses all EPL nodes of the network. "0" is an invalid address, a command with destination node "0" is ineffective.
NMT commands can cause serious faults in the network. Cycle and monitoring errors can occur.

Setting range (min. value | unit | max. value)			Lenze setting
0		255	**0**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14110

Parameter | Name: **C14110 | EPL fault memory**	Data type: INTEGER_8 Index: 10465 = 0x28E1 EPL index: 0x1001

The code indicates the currently pending errors (according to error classes).

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14115

Parameter | Name: **C14115 | EPL MN: Frame error (CRC)**			Data type: UNSIGNED_32 Index: 10460 = 0x28DC EPL index: See subcodes
The POWERLINK telegrams of the EPL network are protected by a checksum. The Managing Node counts the checksum errors which signalise a falsification of the frame. The monitoring response is determined via C14891/4.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C14115/1	0	CumulativeCnt_U32	0x1C00.0x01
C14115/2	0	ThresholdCnt_U32	0x1C00.0x02
C14115/3	9	Threshold_U32	0x1C00.0x03

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14116

Parameter | Name: **C14116 | EPL MN: Frame collisions**			Data type: UNSIGNED_32 Index: 10459 = 0x28DB EPL index: See subcodes
The code indicates the collision counter of the Managing Node. The Managing Node detects frame collisions in the EPL segment. This code contains the number of detected collisions. Each event is counted. Every single event is followed by an error message. No threshold value management is implemented. Due to extended topology options of EPL compared to the standard Ethernet according to IEEE802.3 it is not mandatory that the Managing Node recognises all collisions that occur in the segment.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index

C14117

Parameter | Name: **C14117 | EPL MN: Cycle time violation**			Data type: UNSIGNED_32 Index: 10458 = 0x28DA EPL index: See subcodes
The code indicates the counters of the Managing Node for cycle time overflows. The monitoring response is determined via C14891/1.			
Setting range (min. value | unit | max. value)			
0		4294967295	

Subcodes	Lenze setting	Info	EPL index
C14117/1	0	CumulativeCnt_U32	0x1C02.0x01

C14118

Parameter | Name: **C14118 | EPL MN: Link interruptions**			Data type: UNSIGNED_32 Index: 10457 = 0x28D9 EPL index: 0x1C03
The code displays the counter of the Managing Node for interrupted POWERLINK connections. Each event is counted. Every single event is followed by an error response. A threshold value management is not implemented.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14122

Parameter | Name: **C14122 | EPL CN response error**			Data type: UNSIGNED_32 Index: 10453 = 0x28D5 EPL index: See subcodes
The subcodes of the code indicate Controlled Node-specific cumulative counters for missing PRes frames. The behaviour corresponds to a node The behaviour corresponds to subcode 1 of the single error counters (C14116). Each subcode corresponds to an EPL node with node ID = subcode number.			
Setting range (min. value | unit | max. value)			
0		4294967295

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14125

Parameter | Name: **C14125 | EPL MN: Break after collisions**			Data type: UNSIGNED_32 Index: 10450 = 0x28D2 EPL index: 0x1C12
The code determines the number of EPL cycles for the duration of which the Managing Node interrupts the cycle sequence after a POWERLINK collision has occurred.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	Cycles	100	**1 cycles**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14126

Parameter | Name: **C14126 | EPL CN: Frame collisions**			Data type: UNSIGNED_32 Index: 10449 = 0x28D1 EPL index: See subcodes
The code indicates the number of POWERLINK collisions detected by the Controlled Node (C14116). Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Setting range (min. value | unit | max. value)			
0		4294967295	
Subcodes	**Lenze setting**	**Info**	**EPL index**

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14127

Parameter | Name: **C14127 | EPL CN: Sync loss**			Data type: UNSIGNED_32 Index: 10448 = 0x28D0 EPL index: See subcodes
The Controlled Node expects SoC frames in time intervals which correspond to the cycle time (C14060). The code indicates the error counters for missing SoC frames. The monitoring response is determined via C14891/3.			
Setting range (min. value | unit | max. value)			
0		4294967295	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14127/1	0	CumulativeCnt_U32	0x1C0B.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14132

Parameter | Name: **C14132 | EPL CN: Link interruptions**			Data type: UNSIGNED_32 Index: 10443 = 0x28CB EPL index: 0x1C10
The code indicates the counter of the Controlled Node for POWERLINK connection interruptions (C14118). Each event is counted. Every single event is followed by an error message. No threshold value management is implemented.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14136

Parameter | Name: **C14136 | EPL telegram counter**			Data type: UNSIGNED_32 Index: 10439 = 0x28C7 EPL index: 0x1101.0x01
The subcodes of the code indicate a counter for EPL cycles. The counter is started with each mains power-up of the EPL node at 0. An overflow occurs at 4.294.967.295.			
Display area (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14203

Parameter | Name: **C14203 | EPL CN response error**			Data type: UNSIGNED_32 Index: 10372 = 0x2884 EPL index: See subcodes
The subcodes of the code indicate Controlled Node-specific cumulative counters for missing PRes frames. The behaviour corresponds to a node The behaviour corresponds to subcode 1 of the single error counters. Each subcode corresponds to an EPL node with node ID = subcode number.			
Display area (min. value | unit | max. value)

C14219

Parameter | Name: **C14219 | EPL device type MN**			Data type: UNSIGNED_32 Index: 10356 = 0x2874 EPL index: See subcodes
The code contains the device type ID of the declared EPL nodes. Each subcode corresponds to an EPL node with node ID = subcode number. **When being in the configured status, the values must be identical with the device types stored locally in each EPL node under** C14030**.**			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14219/1	0	Managing Node	0x1F84.0xF0
C14219/2	0	Diagnostics device	0x1F84.0xFD

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14225

Parameter | Name: **C14225 | EPL MN: Max. user data RPDO**			Data type: UNSIGNED_16 Index: 10350 = 0x286E EPL index: See subcodes
The code defines the reserved user data length of the PRes frames. Each subcode number corresponds to an EPL node with the same node ID. The subcode describes the PRes frames received. The value must be within the limits of 36 ... 1490 bytes. The values are upper limit values for the total size of the PDO mappings which must be defined each one of the codes C14231 ... C14240 for PRes frames received. **In the configured state, the values stored for the EPL nodes must be identical to the corresponding** C14072 **entries.** C14066 **must have an identical value in all EPL nodes of the network.**			
Setting range (min. value | unit | max. value)			
0	Byte	1490

C14229

Parameter | Name: **C14229 | EPL multi-stage node declaration MN**				Data type: UNSIGNED_8 Index: 10346 = 0x286A EPL index: See subcodes
This code indicates in which multiplexed cycle the node is queried. The value entered must not exceed the value in code C14074. If, for instance, the value "3" is entered in code C14074, the multiplexed cycle is repeated every three cycles. If now the value "3" is entered for one node in C14229/x, it is always queried only in the second cycle of the three multiplexed cycles.				
Setting range (min. value | unit | max. value)

C14484

Parameter | Name: **C14484 | EPL address: RPDO**			Data type: UNSIGNED_8 Index: 10091 = 0x276B EPL index: See subcodes
The subcodes 1 ... 10 describe the node address of the transmitting EPL node for the PDO channels 1 ... 10 (mapping see C14231 ... C14240). Values > "0" describe the origin of a PRes frame. The value "0" is reserved for PReq (must not be used in systems with a Servo Drive 9400 as Managing Node). The subcodes 1 ... 10 are only valid if the corresponding subcode of C14489 has a value > "0". Before writing the EPL node address in a subcode of C14484, the corresponding subcode of C14489 must be set to the value "0". Renewed writing of the number of mapping entries in the subcode of C14489 enables the node address.			
Setting range (min. value | unit | max. value)			
0		255	

Subcodes	Lenze setting	Info	EPL index
C14484/1	0	EPL address: RPDO	0x1400.0x01
...	...	...	...
C14484/10	0	EPL address: RPDO	0x1409.0x01

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14489

Parameter | Name: **C14489 | EPL number RPDO**			Data type: UNSIGNED_8 Index: 10086 = 0x2766 EPL index: See subcodes
The subcodes 1 ... 10 describe the number of valid mapping entries of the PDO channels 1 ... 10 (valid subcodes in C14231 ... C14240). The value "0" inhibits the corresponding PDO channel. Before writing the mapping entries in C14231 ... C14240 or the EPL address of the SDO transmitter in the corresponding subcode of C14484, the corresponding subcode of code C14489 must be set to the value "0". A renewed writing of the number of mapping entries in the subcode of C14489 enables the mapping and the transmission EPL address for the PDO channel. The sum of all mapping entries enabled via the subcodes of C14489 must not exceed the value "64". Make sure that the sum of memory requirements of all objects mapped in C14231 ... C14240 does not exceed 64 bytes.			
Setting range (min. value | unit | max. value)			
0		32	

Subcodes	Lenze setting	Info	EPL index
C14489/1	0	EPL RPDO: object count	0x1600.0x00
...	...	...	...
C14489/10	0	EPL RPDO: object count	0x1609.0x00

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT

C14531

Parameter | Name: **C14531 | EPL TPDO**			Data type: UNSIGNED_64 Index: 10044 = 0x273C EPL index: See subcodes
The code describes the mapping for the TPDO channel.C14789.1 describes the number of valid mapping object entries in this code. Subcodes 1 ... 32 describe the mapping of the single objects. Servo Drives 9400 exclusively support mapping objects with a data length of 8 bits (1 byte) or a multiple of this value. Incompatible objects must be mapped on variables with a compatible data length. The "Offset" (bytes 4 and 5) and "Length" (bytes 6 and 7) of the mapping object description must be a multiple of 8. Before changing the mapping object entries in C14531, C14789/1 must be set to "0". This deactivates the mapping. Writing into C14789/1 with a value unequal "0" re-enables the mapping. Offset and length of the data object relevant for the receiving EPL node must be identical with the corresponding values of the entry in C14531.			
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14531/1	0	EPL TPDO	0x1A00.0x01
...	...	...	...
C14531/32	0	EPL TPDO	0x1A00.0x20
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14789

Parameter | Name: **C14789 | EPL number TPDO**			Data type: UNSIGNED_8 Index: 9786 = 0x263A EPL index: See subcodes
The subcode 1 describes the number of valid mapping object entries (subcodes) in code C14531. The value "0" inhibits the TPDO. Before writing a subcode of C14531, set C14789 subcode 1 to the value "0". Renewed writing of the number of mapping object entries in C14789 subcode 1 enables the TPDO mapping.			
Setting range (min. value | unit | max. value)			
0		32	
Subcodes	**Lenze setting**	**Info**	**EPL index**
C14789/1	0	EPL TPDO: object count	0x1A00.0x00
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14880

Parameter | Name: **C14880 | EPL quality lights**	Data type: UNSIGNED_8 Index: 9695 = 0x25DF EPL index: not available
The code indicates the current quality status (values: 1, 2 or 4) of the network functions of the communication module.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☑ PDO_MAP_TX ☐ COM ☐ MOT	

C14881

Parameter | Name: **C14881 | EPL reset error counter**			Data type: UNSIGNED_8 Index: 9694 = 0x25DE EPL index: not available
The value "1" (TRUE) enables the code to reset the cycle counter. After reset termination the code automatically assumes the value "0" (FALSE).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		1	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14882

Parameter | Name: **C14882 | EPL reset cycle counter**			Data type: UNSIGNED_8 Index: 9693 = 0x25DD EPL index: not available
The value "1" (TRUE) enables the code to reset the cycle counter (C14136). After reset termination the code automatically assumes the value "0" (FALSE).			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		1	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☑ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14883

Parameter | Name: **C14883 | EPL response when "DataExchange" is quit**		Data type: UNSIGNED_8 Index: 9692 = 0x25DC EPL index: not available
Setting of the response when the "DataExchange" sate is quit. A change in the monitoring response becomes immediately effective.		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Trouble	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14885

Parameter | Name: **C14885 | EPL data RPDO: error response**		Data type: UNSIGNED_8 Index: 9690 = 0x25DA EPL index: not available
The code controls the error response to failing PDO communication with a node. The failure is detected because expected PDO data are missing.		
Selection list (Lenze setting printed in bold)		**Info**
0	Process data received	The data received last is continued to be used.
1	**Clear process data**	The data of all reception PDO channels is set to "0".
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14891

Parameter | Name: **C14891 | EPL module error responses**			Data type: UNSIGNED_8 Index: 9684 = 0x25D4 EPL index: See subcodes
The subcodes of C14891 determine the response to errors (e.g. communication errors) of the EPL stack.			
Selection list			
0	No response		
1	Trouble		
3	Quick stop by trouble		
4	Warning Locked

C14911

Parameter | Name: **C14911 | EPL module warning**	Data type: UNSIGNED_32 Index: 9664 = 0x25C0 EPL index: not available
Display of pending warnings	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14919

Parameter | Name: **C14919 | EPL additional error info**	Data type: UNSIGNED_32 Index: 9656 = 0x25B8 EPL index: not available
Display of coded additional information on a pending error	

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14920

Parameter | Name: **C14920 | EPL DIP switch**	Data type: UNSIGNED_8 Index: 9655 = 0x25B7 EPL index: not available
The code outputs the current DIP switch setting of the communication module. • The switch with the labelling "128" is displayed on the most significant bit, the switch "1" on the least significant bit. • The numerical value of C14920 corresponds to the node ID of the communication module. ▸ Node address setting (📖 36)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

11.4 Table of attributes

The table of attributes contains information required for communicating with the Servo Drive 9400 via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit (CINH) required	☑ Writing is only possible when the controller is inhibited (CINH)

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

Perhaps we have not succeeded in achieving this objective in every respect. If you have suggestions for improvement, please e-mail us to:

feedback-docu@lenze.com

Thank you very much for your support.

14.5 Implemented PROFIdrive objects (DP-V1) 114

15 DIP switch positions for setting the station address 116

Index 120

Your opinion is important to us 124

1 About this documentation

This documentation exclusively describes the communication module E94AYCPM (PROFIBUS).

Note!

This documentation supplements the **Mounting Instructions** supplied with the communication module and the **"Servo Drives 9400" Hardware Manual**.

The Mounting Instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Typical applications are explained with the help of examples.

The theoretical connections are only explained in so far as they are necessary for comprehending the function of the communication module.

This documentation does not describe the software of other manufacturers. No responsibility is taken for corresponding information given in this documentation. Information on how to use the software can be obtained from the documents of the host system (master).

All brand names used in this documentation are trademarks of their respective owners.

Tip!

Detailed information about PROFIBUS can be found on the website of the PROFIBUS & PROFINET user organisation:

www.profibus.com

Target group

This documentation is intended for all persons who plan, install, commission and maintain the networking and remote servicing of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.Lenze.com

Validity information

The information given in this documentation is valid for the following devices:

Extension module	Type designation	From hardware version	From software version
PROFIBUS communication module	E94AYCPM	1A	01.11

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and the software version of the Engineering tools installed (»Engineer«, »STEP7«), the screenshots in this documentation my differ from the actual screen display.

1.1 Conventions used

This manual uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Numbers		
Decimal separator	Point	The decimal point is always used. Example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Text colour blue	All pieces of information that only apply to or from a specific software version of the controller are highlighted accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze PC software »Engineer«...
Window	*italics*	The *message window*... / The *Options* dialog box ...
Variable name		Setting *bEnable* to TRUE...
Control element	**Bold**	The **OK** button ... / The **Copy** command ... / The Properties tab ... / The **Name** input field ...
Sequence of menu commands		If several successive commands are required for executing a function, the individual commands are separated from each other by an arrow: Select the command **File → Open** to...
Hyperlink	Underlined	Optically highlighted reference to another topic. Can be activated with a mouse-click in this online documentation.
Symbols		
Page reference	(📖 8)	Optically highlighted reference to another page. Can be activated with a mouse-click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.2 Terminology used

Term	Meaning
Controller	Lenze controller of the "Servo Drives 9400" product range
Standard device	
HW	Hardware
Lenze setting	Settings with which the device is preconfigured ex works.
Basic setting	
GSD / GSE	Device data base file (device description for PROFIBUS nodes)
	PROFIBUS® (Process Field Bus) is a widely-used fieldbus system for the automation of machines and production plants. PROFIBUS® is a registered trademark and patented technology licensed by the PROFIBUS & PROFINET International (PI) user organisation.
PDO	Process data object
PLC	Programmable Logic Controller
»STEP7«	Siemens software for programming and configuring PROFIBUS Siemens control systems
SW	Software
TCI	Tool Calling Interface

1.3 Definition of the notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Structure of the safety instructions:

Danger!

(characterises the type and severity of danger)

Note

(describes the danger and informs how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to other documents

2 Safety instructions

Note!

Always observe the specified safety measures to avoid severe injury to persons and damage to property!

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application instructions

Danger!

If you disregard the following basic safety measures, this can cause severe injury to persons and damage to material assets.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 12)
- must never be commissioned in the event of visible damage.
- must never be technically modified.
- must never be commissioned before they have been completely mounted.
- must never be operated without the covers required.
- can - depending on their degree of protection - have live, moving or rotating parts during and after operation. Surfaces can be hot.

For Lenze drive components ...

- use only the accessories approved.
- use only original spare parts from the manufacturer.

Observe all specifications given in the attached and associated documentation.

- This is the precondition for safe and trouble-free operation and for obtaining the product features specified.
  ▸ Features (📖 13)
- The procedural notes and circuit details described in this document are only proposals. It is up to the user to check whether they can be adapted to the particular applications. Lenze does not take any responsibility for the suitability of the procedures and circuit proposals described.

Only qualified personnel may work with and on Lenze drive and automation components. According to IEC 60364 and CENELEC HD 384, these are persons ...

- who are familiar with the installation, assembly, commissioning and operation of the product.
- who have the corresponding qualifications for their work.
- who know all regulations for the prevention of accidents, directives and laws applicable on site and are able to apply them.

2.2 Device- and application-specific safety instructions

- During operation, the communication module must be firmly connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV / PELV).
- Only use cables corresponding to the given specifications.
  ▸ Bus cable specification (📖 26)

Documentation for the standard device, control system, plant/machine

All other measures prescribed in this documentation must also be implemented.
Observe the safety instructions and application notes specified in the documentation.

2.3 Residual hazards

Protection of persons

If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

▸ Protective insulation (📖 16)

Device protection

The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.

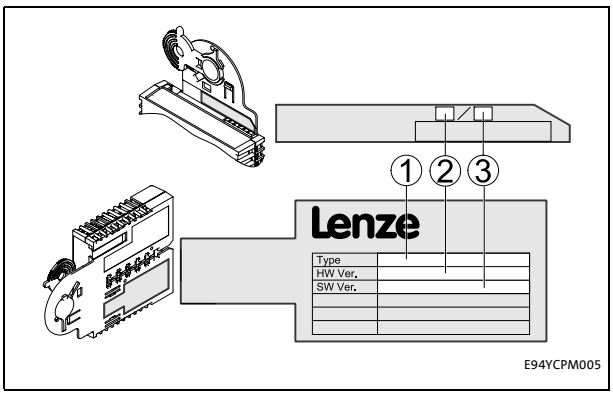
▸ Installation (📖 21)

3 Product description

3.1 Application as directed

The communication module ...

- is an accessory module for use in conjunction with the following Lenze standard devices:



Product series	Type designation	From hardware version	From software version
Servo Drives 9400	E94AxxExxxx	1A	01.35
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- is a device intended for use in industrial power systems.
- is only to be operated under the operating conditions specified in this documentation.
- may only be used in PROFIBUS networks.

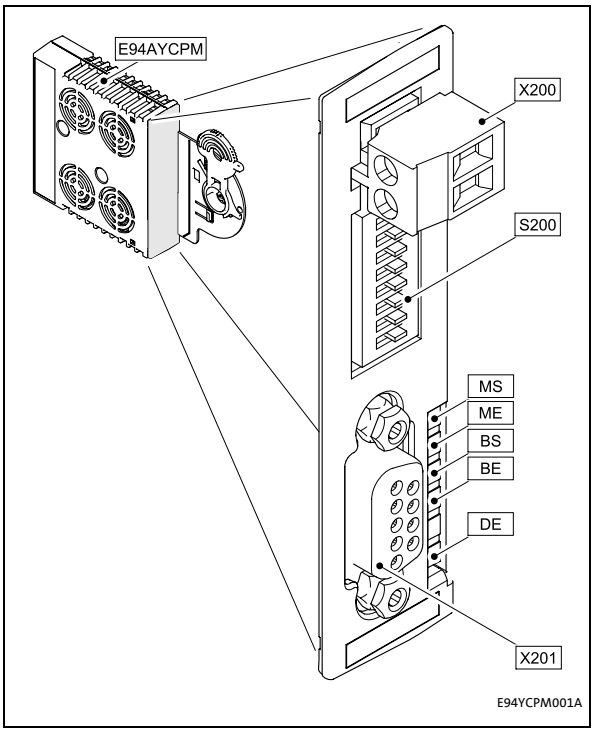
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation as well as the hardware and software version of the communication module are indicated on the nameplate:

[3-1] Nameplate

1 Type designation (type)
- E94 Product series
- A Version
- Y Module identification: extension module
- C Module type: communication module
- PM PROFIBUS



2 Hardware version (HW)

3 Software version (SW)

3.3 Features

- Interface module for the PROFIBUS communication system to be connected to the expansion slots of the Servo Drives 9400
- Support of parameter data channels DRIVECOM (DP-V0) and PROFIDrive (DP-V1)
- Transfer of safe information via the PROFIsafe protocol if an SM301 safety module (E94AYAE) is used simultaneously
- A maximum of 32 process data words per direction can be exchanged.
- The communication module can either be supplied internally by the Servo Drive 9400 or externally by a separate voltage source.
- Bus coupling via remote bus according to the RS485 standard
- Automatic detection of the baud rate (9.6 kbps to 12 Mbps)
- Setting of the station address is possible via DIP switch or code.
- Software compatibility with the EMF2133IB communication module
- Access to all Lenze parameters

3.4 Terminals and interfaces

[3-2] E94AYCPM communication module (PROFIBUS)

X200 2-pin plug connector with screw connection for external voltage supply
- ▸ External voltage supply (📖 28)

S200 DIP switches for setting the ...
- Station address
- compatibility with the EMF2133IB communication module

▸ Possible DIP switch settings (📖 31)

X201 PROFIBUS connection:
9-pin Sub-D socket
- ▸ PROFIBUS connection (📖 27)

MS 5 LED status displays for diagnostic purposes
ME

- ▸ LED status displays (📖 82)

4 Technical data

"Servo Drives 9400" Hardware Manual

Here you can find the **ambient conditions** and information on the **electromagnetic compatibility (EMC)** which also apply to the communication module.

4.1 General data and operating conditions

Area	Values
Order designation	E94AYCPM
Communication profile	• PROFIBUS DP-V0 (DRIVECOM) • PROFIBUS DP-V1 (PROFIdrive)
Communication medium	RS485
Interface	9-pin Sub-D socket
Network topology	• Line (without repeater) • Tree/line (with repeater)
Bus device type	PROFIBUS slave
Number of slaves	• Max. 31 (without repeater) • Max. 125 (with repeater)
Max. cable length	1200 m (depending on the selected baud rate and the cable type used)
PNO identification number	0x07A8
Baud rate for cable type A (EN 50170)	9.6 kbps ... 12 Mbps (automatic detection)
Voltage supply	External supply via the 2-pin plug connector • Terminal "+": U = 24 V DC (20.4 V - 0 % ... 28.8 V + 0 %), I = 130 mA • Terminal "-": Reference potential for external voltage supply
Conformities, approvals	• CE • UL

4.2 Protective insulation

Danger!

Dangerous voltage

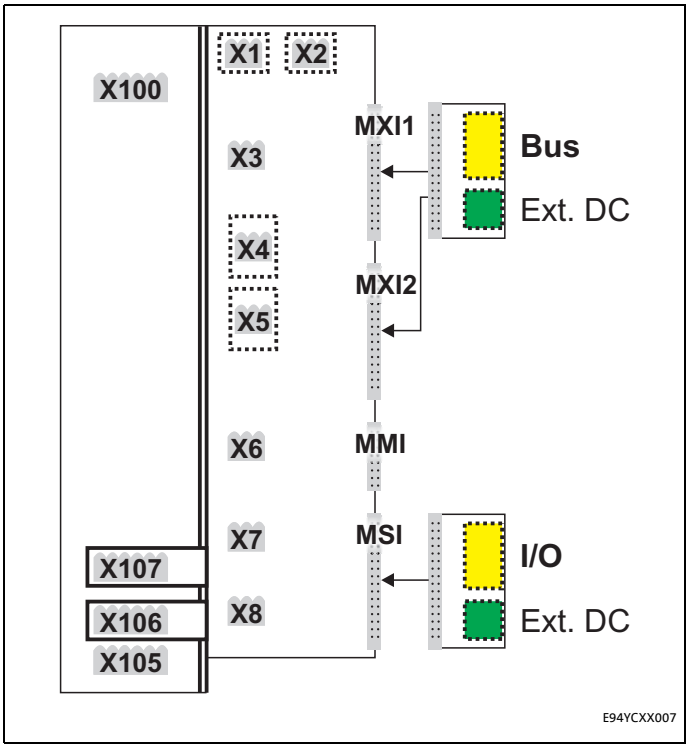
If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

Possible consequences:

Death or severe injury

Protective measures:

If protection against accidental contact is required for the control terminals of the controller and the terminals of the plugged-in device modules, ...



- a double isolating distance must be provided.
- the components to be connected must be provided with a second isolating distance.

Note!

The existing protective insulation in the Servo Drives 9400 is implemented according to EN 61800-5-1.

The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the Servo Drive 9400.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Connection	Terminal strip	Connection
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example

Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the device module's bus terminal is "functionally insulated".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between the mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

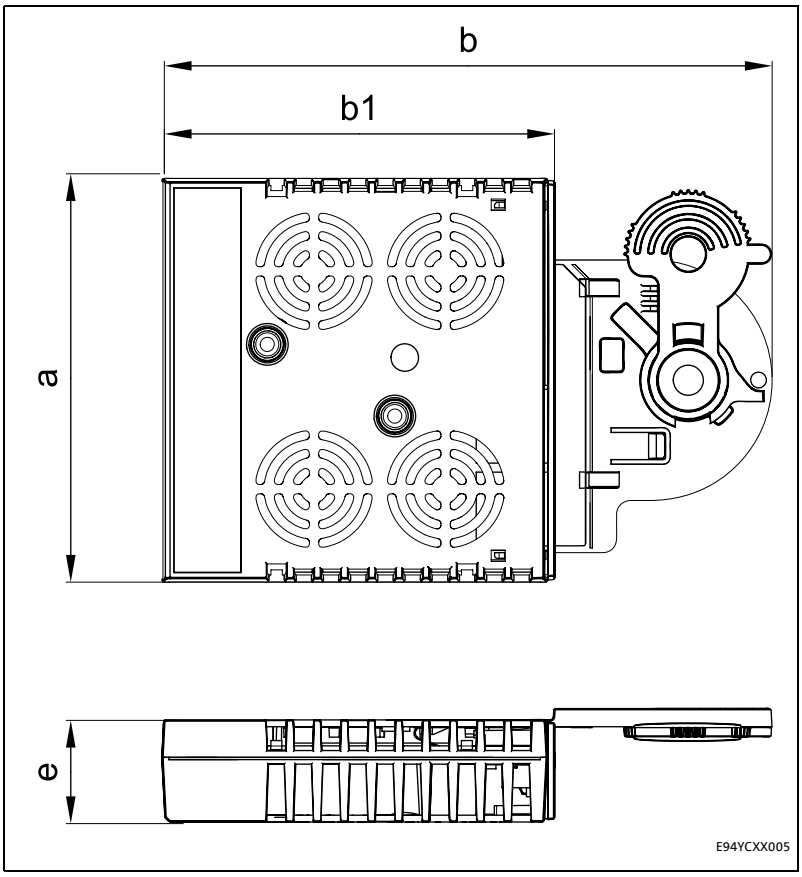
4.3 Protocol data

Area	Values
Process data words (PCD)	1 ... 32 words (16 bits/word)
Cyclic parameter data channel (DP-V0)	4 words
Acyclic parameter data channel (DP-V1)	Max. 240 bytes
Safety data	4 words
PROFIBUS user data length	1 ... 32 words (process data) + 4 words (parameter data or safety data)

4.4 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

The communication times in a PROFIBUS network depend on ...



- the processing time in the controller;
- the transmission delay time (baud rate / telegram length);
- the nesting depth of the network.

Processing time in the controller

Data	Processing time
Process data	Approx. 4 ms update cycle + 0 ... 1 ms processing time in the module + 1 ... x ms application task runtime of the technology application used (tolerance)
Parameter data	Approx. 30 ms + 20 ms tolerance (typical) For some codes, the processing time may be longer (see software manual/ online help for the Servo Drive 9400).

There are no interdependencies between parameter data and process data.

4.5 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

5 Installation

Stop!

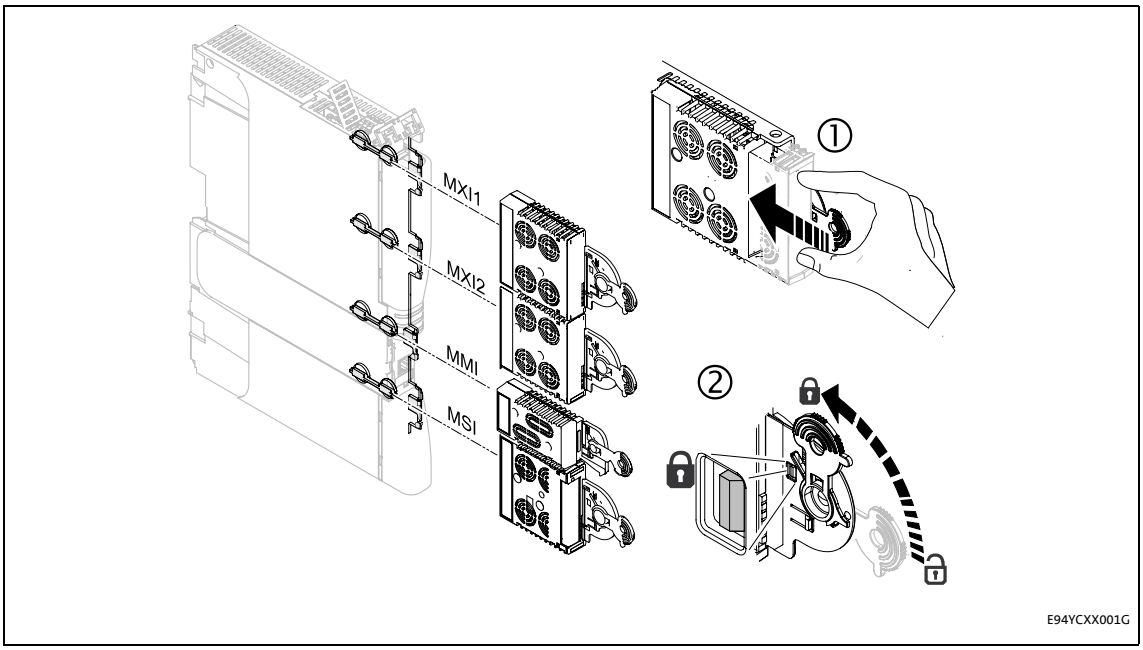
Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

Possible consequences:

- The communication module is defective.
- Communication via the fieldbus is not possible or faulty.

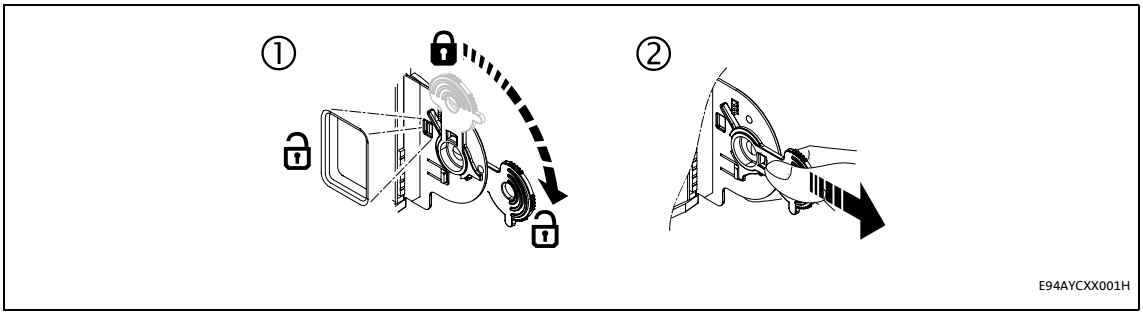
Protective measures



Discharge electrostatic charges before touching the module.

5.1 Mechanical installation

Note!



A safety bus system (PROFIsafe) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

5.1.1 Mounting

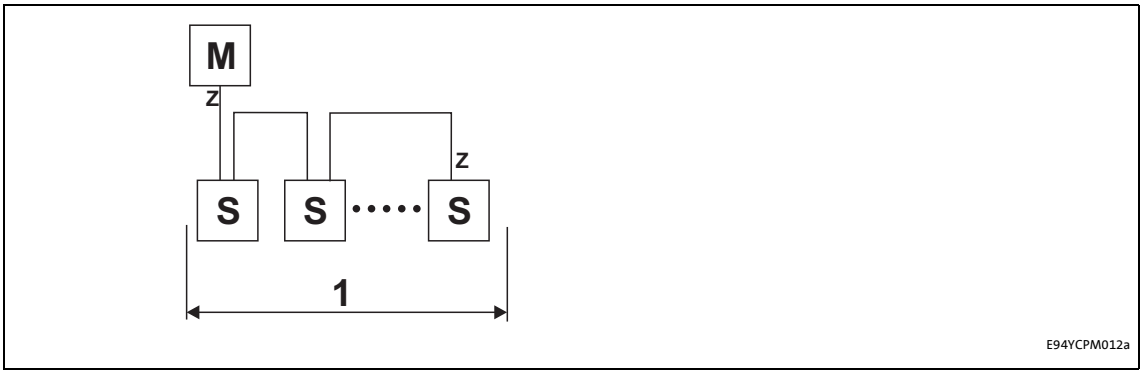
[5-1] Mounting

5.1.2 Dismounting

[5-2] Dismounting

5.2 Electrical installation

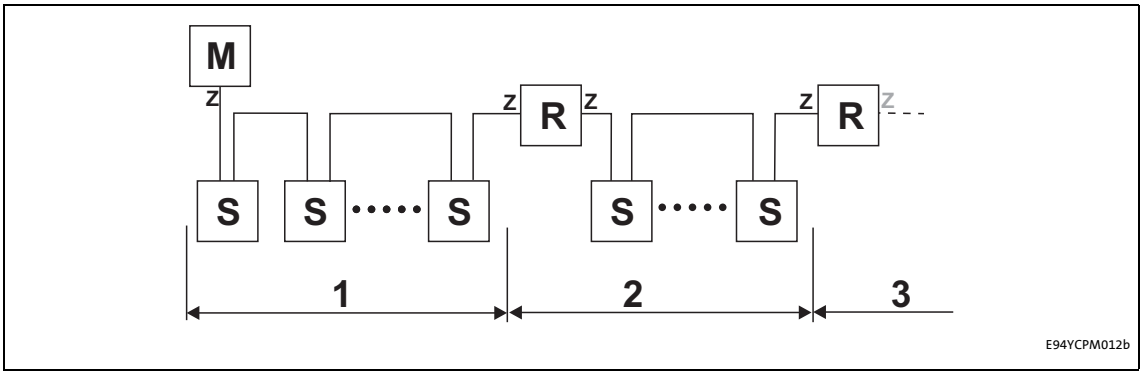
Documentation for the standard device, control system, plant/machine



Observe the notes and wiring instructions given in the documentation.

5.2.1 Network topology

The following examples show two simple RS485 networks.



Every segment of the network must be terminated at both ends. The bus terminators of the PROFIBUS are marked with a "Z" in the below examples.

In the case of an RS485 network of only one segment, the PROFIBUS master (M) with the integrated bus terminator starts the segment while the bus terminating resistor in the connector of the last PROFIBUS station (S) must be activated.

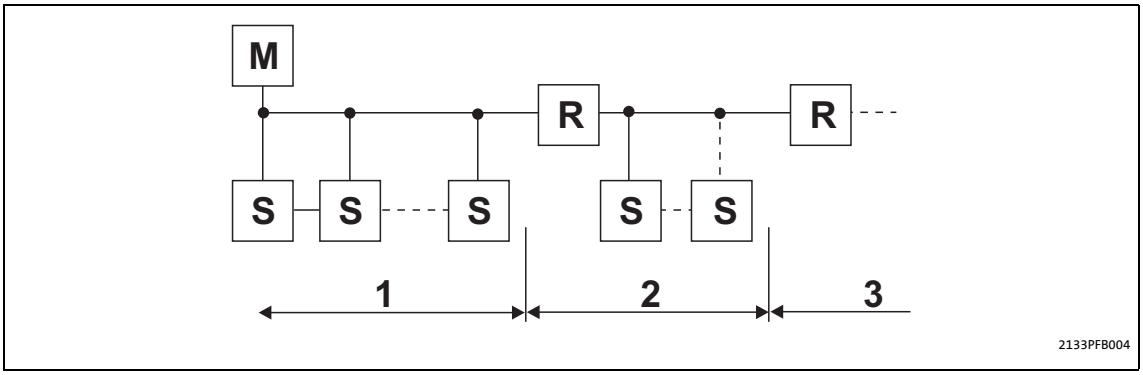
[5-3] RS485 network with one segment

An RS485 network consisting of several segments contains repeaters (R) for connecting the segments. The repeaters are provided with integrated bus terminating resistors.

[5-4] RS485 network with a repeater

If no repeater is to be used at the end of the segment, the bus terminating resistor must be activated in the connector of the last device. The bus termination is supplied by the station itself.

If the communication module is supplied externally, the bus terminator can be supplied independently of the standard device supply.



▸ External voltage supply (📖 28)

Note!

The bus terminator must always be supplied. Otherwise, the bus can get unstable.

▸ Activating the bus terminating resistor (📖 25)

Number of stations

[5-5] Number of stations

Segment	Master (M)	Slave (S)	Repeater (R)
1	1	31	-
	2	30	-
2	-	30	1
3	-	30	1

Tip!

Repeaters do not have a station address. When calculating the maximum number of stations, they reduce the number of stations by 1 on each side of the segment.

Repeaters can be used to build up line and tree topologies. The maximum total bus system expansion depends on ...

- the baud rate used;
- the number of repeaters used.

5.2.2 Activating the bus terminating resistor

The PROFIBUS must be terminated by a bus terminating resistor at the first and last physical bus station.

The bus terminating resistor in the bus connector of the bus cable is activated by means of a switch.

PROFIBUS cables with integrated bus terminating resistor are offered by several cable manufacturers.

Note!

If you want to disconnect individual bus stations, ensure that the bus terminators at the cable ends remain active.

Please observe that the bus termination is not active any longer if ...

- the bus connector has been disconnected;
- the voltage supply of the Servo Drive 9400 has been switched off;
- the External voltage supply (📖 28) of the communication module has been switched off.

5.2.3 Bus cable specification

Note!

Only use cables which meet the listed specifications of the PROFIBUS user organisation.

Area	Values
Cable resistance	135 ... 165 Ω/km, (f = 3 ... 20 MHz)
Capacitance per unit length	≤ 30 nF/km
Loop resistance	< 110 Ω/km
Core diameter	> 0.64 mm
Core cross-section	> 0.34 mm^2
Cores	Twisted in pairs, insulated and shielded

Bus cable length

The length of the bus cable depends on the baud rate and cable type used. The data in the following table applies to PROFIBUS cables of "FC-Standard Cable" cable type .

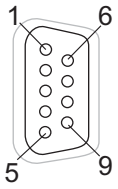
Baud rate	Length
9.6 ... 93.75 kbps	1200 m
187.5 kbps	1000 m
500 kbps	400 m
1500 kbps	200 m
3000 ... 12000 kbps	100 m

Note!

The baud rate depending of the data volume, cycle time and number of stations should only be selected as high as required for the application.

Tip!

We recommend taking the use of optical fibres into consideration for high baud rates.



Advantages of optical fibres:

- External electromagnetic interferences have no effect on the transmission path.
- Bus lengths of several kilometres are also possible with higher baud rates.
- The bus length is ...
  - independent of the baud rate;
  - dependent on the optical fibre used.

5.2.4 PROFIBUS connection

The 9-pin Sub-D socket **X201** serves to connect the communication module to the bus system.

Assignment of the 9-pin Sub-D socket X201

View	Pin	Assignment	Description
	1	Not assigned	-
	2	Not assigned	-
	3	RxD/TxD-P	Data line B (received data/transmitted data, plus)
	4	RTS	Request To Send (received data/transmitted data, no differential signal)
	5	M5V2	Data ground (ground to 5 V)
	6	P5V2	5 V DC / 30 mA (bus termination)
	7	Not assigned	-
	8	RxD/TxD-N	Data line A (received data/transmitted data, minus)
	9	Not assigned	-

5.2.5 External voltage supply

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV / PELV).

External voltage supply of the communication module is necessary if the bus communication is to continue when the supply of the standard device fails.

It is not possible to access the parameters of a standard device disconnected from the mains.

If required, feed the communication module with a separate supply voltage via the 2-pin plug connector.

Assignment of the 2-pin plug connector (X200)

Designation	Explanation
+	V = 24 V DC (20.4 V - 0 % ... 28.8 V + 0 %) I = 130 mA
-	Reference potential for external voltage supply

Terminal data

Area	Values	
Electrical connection	Plug connector with screw connection	
Possible connections	Rigid:	
		0.2 ... 1.5 mm^2 (AWG 24 ... 16)
	Flexible:	
		Without wire end ferrule 0.2 ... 1.5 mm^2 (AWG 24 ... 16)
		With wire end ferrule, without plastic sleeve 0.2 ... 1.5 mm^2 (AWG 24 ... 16)
		With wire end ferrule, with plastic sleeve 0.2 ... 1.5 mm^2 (AWG 24 ... 16)
Tightening torque	0.5 ... 0.6 Nm (4.4 ... 5.3 lb-in)	
Stripping length	6 mm	

6 Commissioning

During commissioning, plant-specific data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the controller. Lenze devices use codes for this purpose.

The codes of the controller and for communication are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

Note!

When parameterising the communication module, please observe that the code number depends on the slot of the Servo Drive 9400 in which the communication module has been inserted.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  - Parameters of the communication module for slot MXI1 (📖 93)
- C**14**nnn for slot MXI2
  - Parameters of the communication module for slot MXI2 (📖 102)

You also have to set the Communication-relevant parameters of the standard device (📖 91).

6.1 Before initial switch-on

Stop!

Before switching on the controller for the first time, check ...

- the entire wiring for completeness, short circuit and earth fault:
- whether the bus system is terminated through a bus terminating resistor at the first and last physical bus station.
  - Activating the bus terminating resistor (📖 25)

6.2 Configuration of the host (master)

The host (master) must be configured before communication with the communication module is possible.

Configuration for the host system (master) and the DP-V0 parameter data channel

For configuring the PROFIBUS you must read the device description file of the communication module into the master.

The device description file for the E94AYCPM communication module (PROFIBUS) can be found in the download area at:

www.Lenze.com

The following language variants of the device description file can be used:

- LENZ07A8.GSD (source file, English)
- LENZ07A8.GSG (German)
- LENZ07A8.GSE (English)

Defining the user data length

The user data length is defined during the initialisation phase of the master.

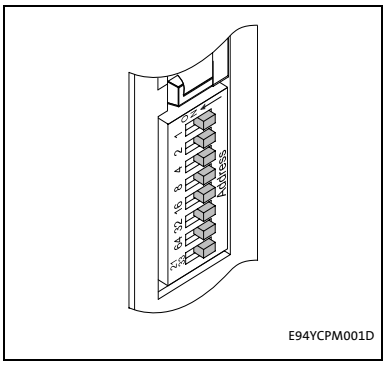
The Servo Drives 9400 support the configuration of a maximum of 32 process data words (max. 64 bytes). The optional activation of the cyclic parameter data channel additionally occupies 4 process data words (8 bytes). The transfer of PROFIsafe messages, too, occupies 4 additional process data words.

The user data lengths for process input data and process output data are the same.

Description of the device data base file

Selection text	Parameter data with consistency	Process data		Assigned IO memory
		with consistency	without consistency	
DRIVECOM-PAR (cons) + PCD (**n**W cons)	Yes	**n** words	-	**4** + **n** words
PCD (**n**W cons)	-	**n** words	-	**n** words
PCD (**n**W)	-	-	**4** words	**4** words
Safety (4W)	-	**4** words	-	**4** words
n = 1 ... 32 process data words				

Example of selecting the device data base file



```
DRIVECOM-PAR (cons) + PCD (8W cons)
```

- "Drivecom-PAR (cons)" = DP-V0 parameter data channel (4 words)
- "PCD (8W cons)" = 8 process data words

Tip!

A detailed description of consistency is given in the chapter "Consistent parameter data" (📖 76).

6.3 Possible DIP switch settings

[6-1] DIP switch

The front-panel DIP switches can be used to set:

- The station address (switches 1 ... 64)
- Compatibility with the communication module EMF2133IB (switch 2133)

Lenze setting: all switches in OFF position

6.3.1 Setting the station address

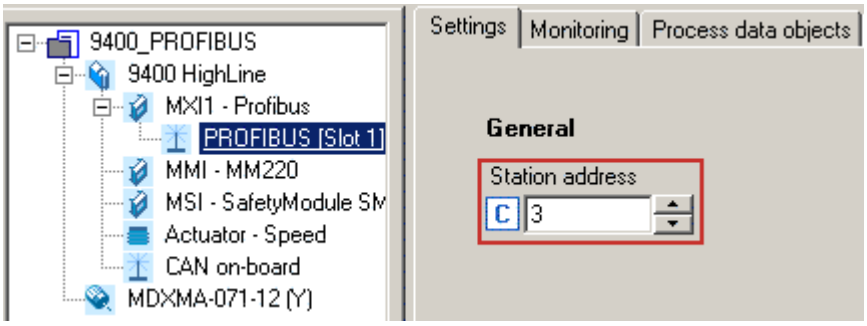
The station addresses must differ from each other if several networked PROFIBUS stations are used.

The station address can be set via the DIP switches **1 ... 64** or via the »Engineer« (code C13899 / C14899).

	Setting the station address via ...	
	DIP switch	**C13899 / 14899**
Condition	At least one switch **1 ... 64 = ON**	• Switches **1 ... 64 = OFF** • Switch **1 ... 64 = ON** (invalid value "127")

The housing labelling indicates the valencies of the individual DIP switches for setting the station address.

DIP switch	**64**	**32**	**16**	**8**	**4**	**2**	**1**
Switch position	OFF	OFF	**ON**	OFF	**ON**	**ON**	**ON**
Value	0	0	16	0	4	2	1
Station address	**= sum of the valencies = 16 + 4 + 2 + 1 = 23** ▶ DIP switch positions for setting the station address (📖 116)						



- Valid address range: 1 ... 126 (max. 126 slave stations)
- C13920 / C14920: Display of the current address setting of the switches
- C13864 / C14864: Display of the station address active on the PROFIBUS

Note!

Switch off the voltage supply of the communication module and then on again in order to activate changed settings.

Setting the station address via the »Engineer«

In the »Engineer«, the station address can be set via the **Settings** tab.

Invalid addresses are displayed in red in the **Station address** input field (code C13899 / C14899).

Save the changed settings via the device command **C00002 = 11** (save start parameters).

6.3.2 Establishing EMF2133IB compatibility

Establishing EMF2133IB compatibility is necessary if you need to communicate with systems using an EMF2133IB PROFIBUS communication module.

Software compatibility can be set via DIP switch **2133**.

Switch	Switch position	Function
2133	ON	Establishing EMF2133IB compatibility
	OFF	No EMF2133IB compatibility

Note!

- In the compatibility mode "EMF2133IB", only the DRIVECOM parameter data channel (DP-V0) and the Lenze device control can be used.
- Switch off the voltage supply of the communication module and then on again in order to activate changed settings.

Communication manual for the EMF2133IB module

Here you can find information on the configuration of the EMF2133IB communication module and the identification of the module on the bus.

6.4 First switch-on

Documentation for the standard device

Observe the safety instructions and residual hazards stated.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

After communication has been established, the externally supplied module operates independently of the power on/off state of the standard device.

Protection against uncontrolled restart

After a fault (e.g. short-time mains failure), the restart of a drive is not always wanted and - in some cases - even not allowed.

In the Lenze setting of the Servo Drives 9400, the restart protection is activated.

Via **C00142** ("Auto-restart after mains connection"), you can configure the restart behaviour of the controller:

C00142 = "0: Inhibited" (Lenze setting)

- The controller remains inhibited (even if the fault is no longer active).
- The drive starts in a controlled mode by explicitly enabling the controller: LOW-HIGH edge at digital input X5/RFR.

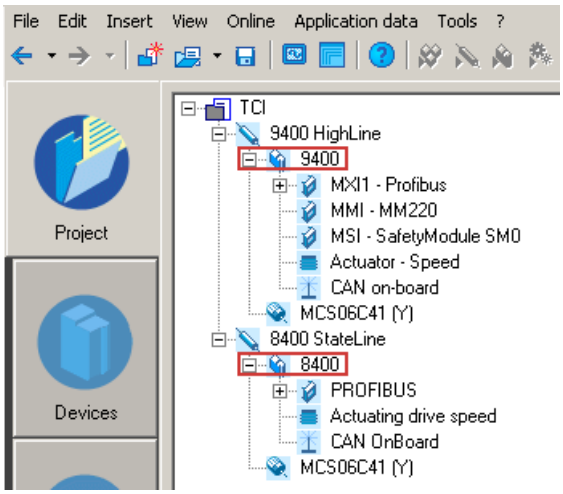
C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

6.5 Going online with »Engineer« via TCI

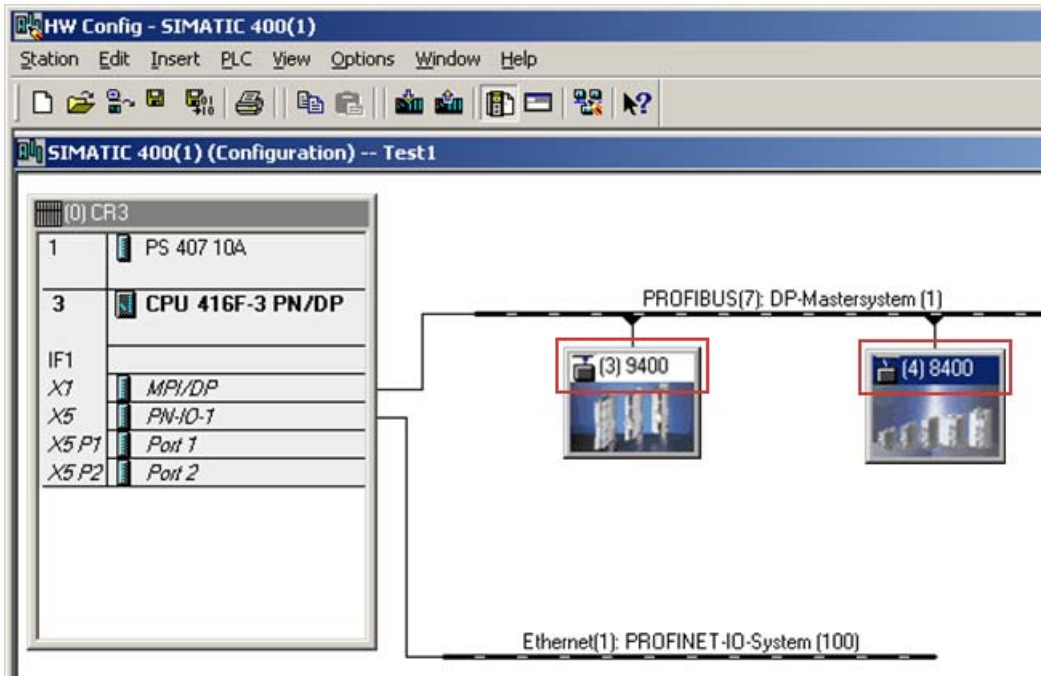
Via Tool Calling Interfaces (TCI) you can connect to a TCI-capable integrated development environment and parameterise and diagnose your field devices without having to exit the integrated development environment.

You cannot set the TCI communication path directly in the »Engineer«. The selection is carried out by the »STEP7« Siemens software.



The TCI function requires a PN/DP-CPU. Information on the Siemens PLC types that are equipped with the TCI function is provided via the Siemens Support at:

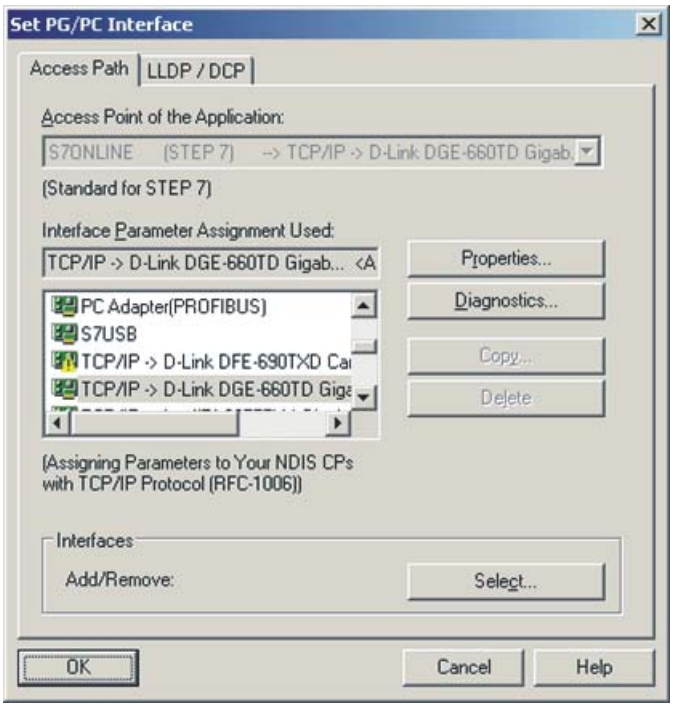
http://support.automation.siemens.com



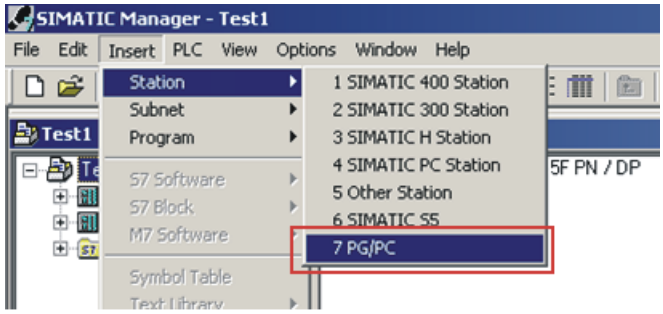
How to configure TCI communication:

1. Alllocate names for the individual axes in the »Engineer« project.

   In our case, "9400" was allocated for 9400 HighLine, and "8400" for 8400 StateLine:

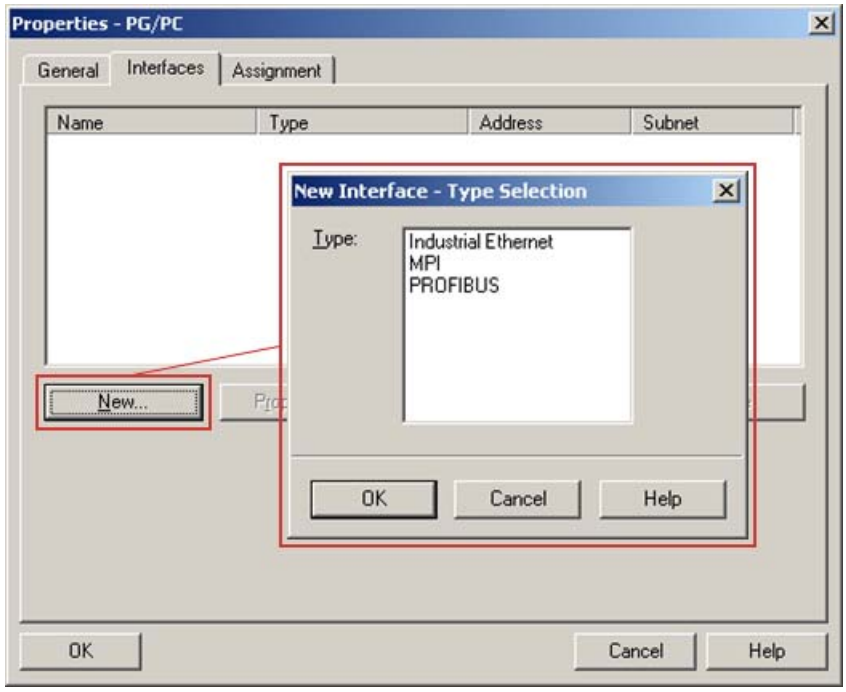


2. In »STEP7« in the »HW Config« ...
   - create the Lenze PROFIBUS stations with the corresponding station addresses and
   - create a PROFIBUS network.



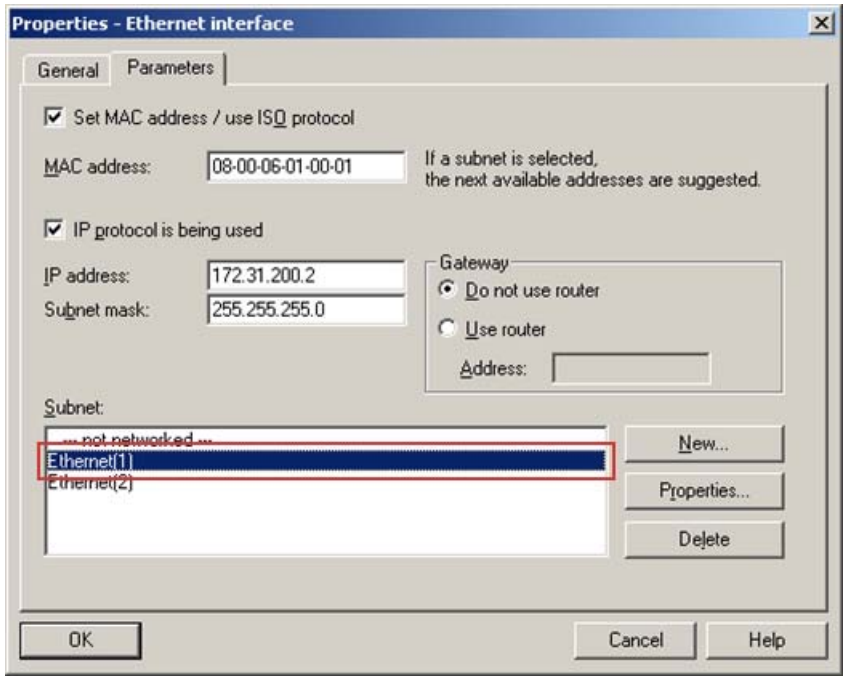
Here a Servo Drive 9400 (address 3) and an Inverter Drive 8400 (address 4) are operated on the PROFIBUS.

- The names of the PROFIBUS slaves in the »HW Config« must be identical to those of the corresponding Lenze axes in the »Engineer« (here "9400" and "8400").
- The selection of the process data configuration has no impact on TCI communication.

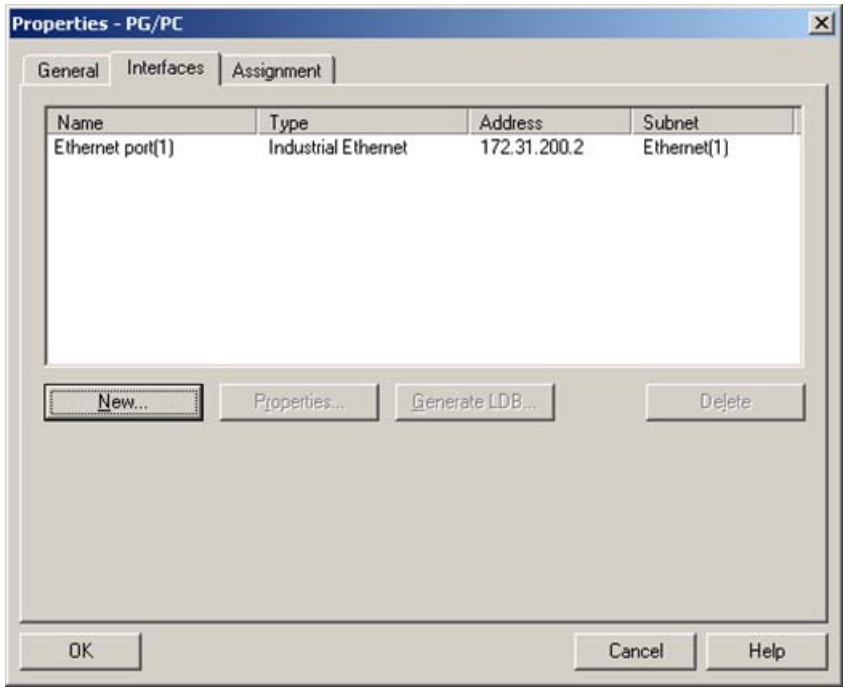


3. Establish an Ethernet connection to the PROFIBUS CPU.

4. Load the »STEP7« project to the CPU.
5. Use the menu command **Insert → Station → 7 PG/PC** to integrate a PG/PC station into the »STEP7« project.

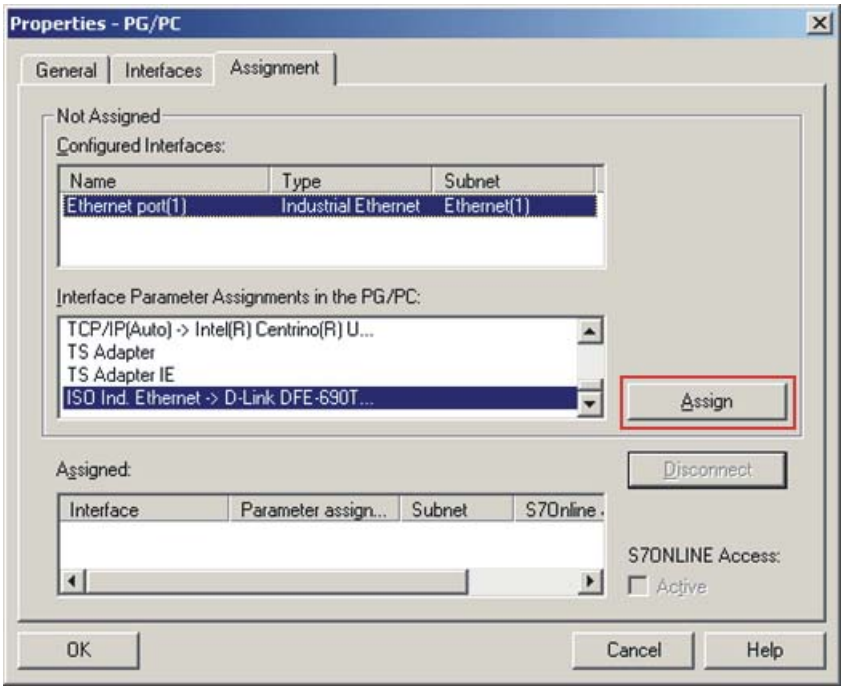


6. By double-clicking the PG/PC station inserted, open its "Properties" dialog.
7. Under the **Interfaces** tab, select a new Ethernet interface and confirm with **OK**.



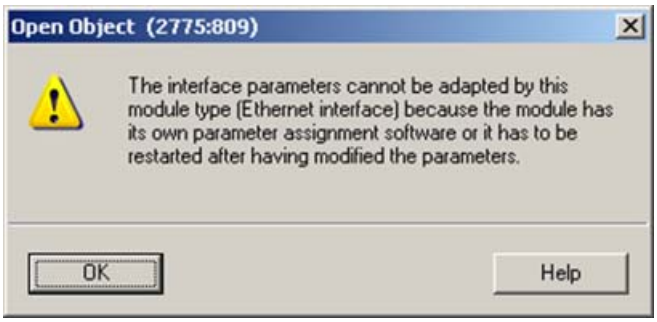
8. Select the connection which you are using to go online with »STEP7« (the same Ethernet connection that has been configured in the »HW Config«).

   In our case this is the Ethernet(1) connection:

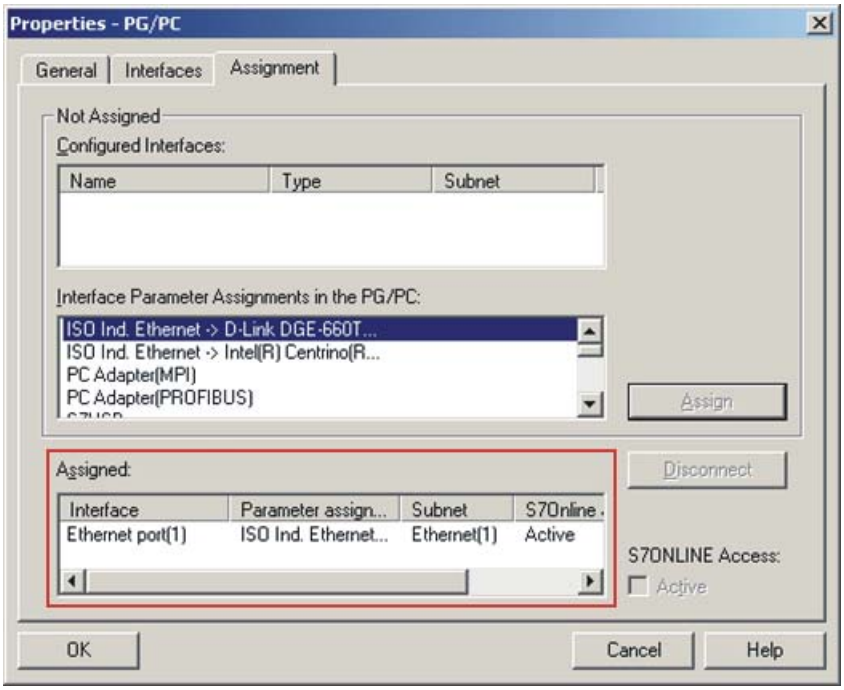


9. Confirm the selection with **OK**.

   The connection has been accepted.

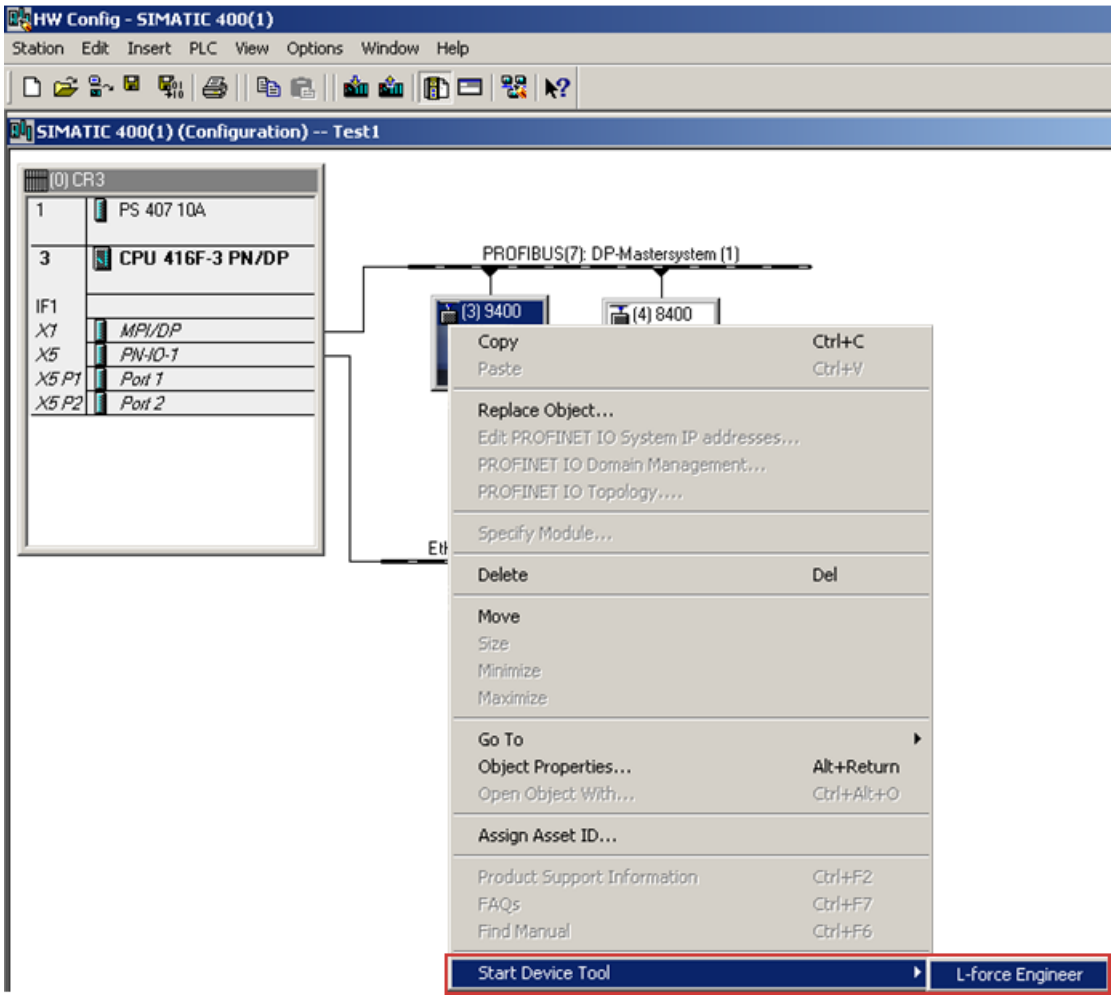


10. Select the actual PG/PC connection under the **Assignment** tab.

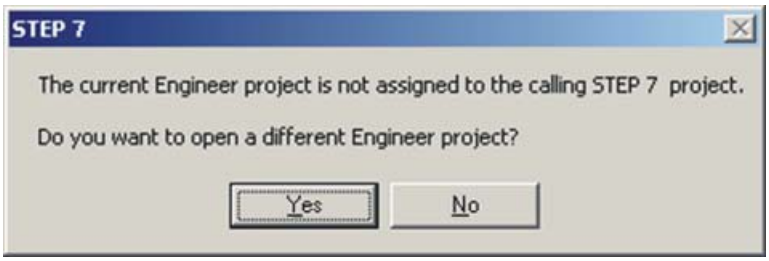


The connection highlighted is assigned by means of the **Assign** button.

11. Confirm the following message with **OK**.

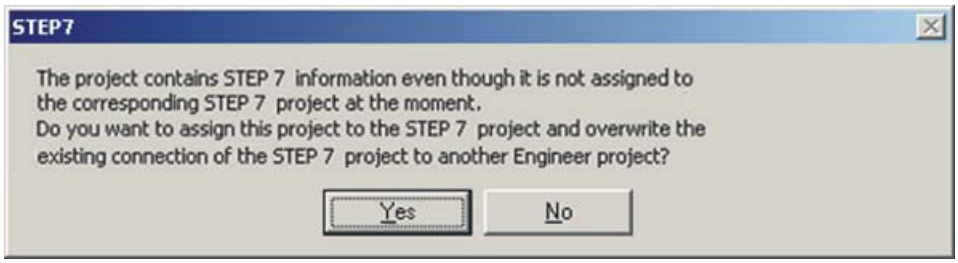


12. After the assignment, the connection appears in the "Assigned" display area. Complete the dialog with **OK**.

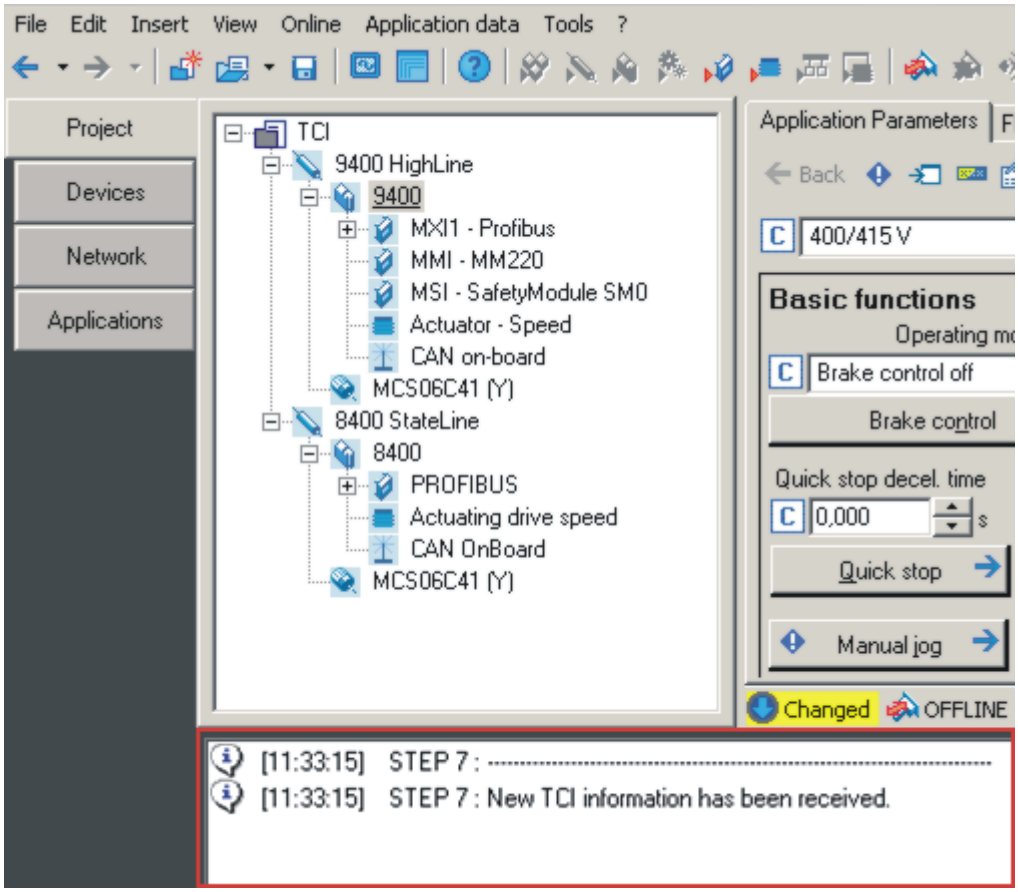


13. In the »STEP7« project, the PG/PC station is marked with a yellow arrow. (The connection selected is active.)

14. Start the transfer of the TCI communication parameters in the »HW Config« using the right mouse button and the menu command **Start device tool → L-force Engineer**.



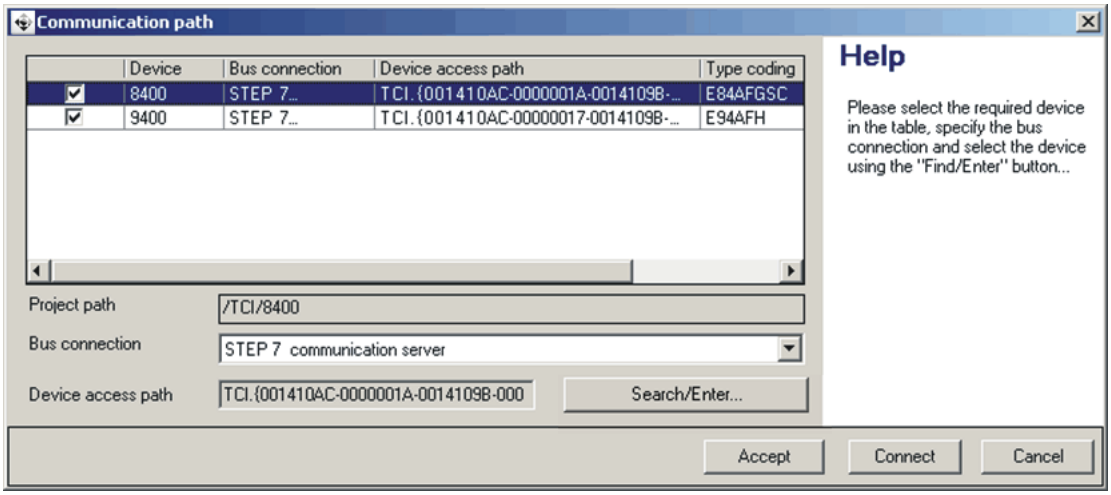
15. If the »Engineer« has already been started with the applicable project, the following message will appear:



- The message says that the »Engineer« project is not set to a TCI communication path and provides information on whether this action is to be executed now.
- If you confirm the message with **Yes**, the applicable TCI communication parameter settings of the »STEP7« project are transferred to the »Engineer«.

If the »Engineer« has not already been started, it is started automatically now and you have to open the applicable project.

If the project selected has not been set to a TCI communication path yet, this can now be executed with **Yes**:



16. The transfer of the TCI communication parameters is documented in the »Engineer« message window.

Here the communication settings have been carried out successfully. The individual PROFIBUS addresses in the respective codes have been adapted to the »STEP7« project.

17. If you now call the "Go online" function of the »Engineer«, the TCI communication settings are displayed as follows:

- "STEP7 Communication Server" appears as bus connection.
- The device access path contains a very long string.
- Use the **Connect** button to establish an online connection.
- By means of the **Search/Enter** button, you can update the TCI communication parameters.

7 Data transfer

The PROFIBUS master and controller communicate through the exchange of data telegrams via PROFIBUS. The user data area of the data telegram contains parameter data or process data. In the controller, different communication channels are assigned to the parameter data and process data.

Communication channels

The process data channel serves to transfer process data.

- The process data serve to control the drive controller.
- The host (master) can directly access the process data. In the PLC, for instance, the data are directly saved to the I/O area.
- Process data are not saved in the controller.
- Process data are transferred cyclically between the host system and the controllers (permanent exchange of current input / output data).
- Process data are, for instance, setpoints, actual values, control words and status words.
- The Servo Drives 9400 can exchange a maximum of 32 process data words (16 bits/word) per direction.

Note!

Observe the direction of the information flow!

Process input data (Rx data):

- Process data from the controller (slave) to the master

Process output data (Tx data):

- Process data from the master to the controller (slave)

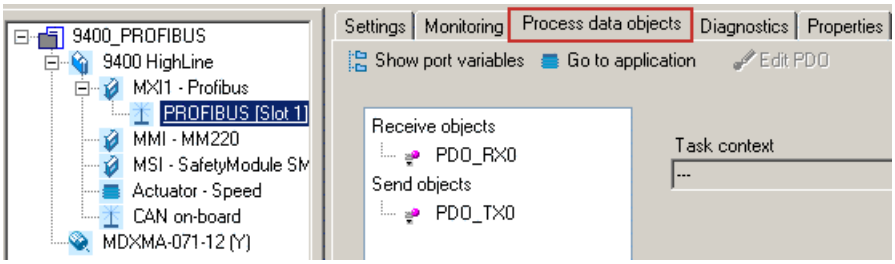
The parameter data channel serves to transfer parameter data.

- The parameter data channel provides access to all Lenze codes.
- In general, the parameter data transfer is not time-critical.
- Parameter data are, for instance, operating parameters, diagnostic information, and motor data.
- Parameter data changes must be saved via code **C00002** of the Servo Drives 9400.

8 Process data transfer

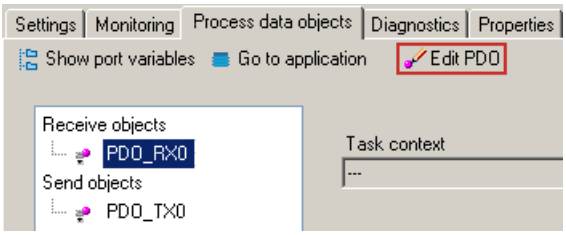
PDO mapping

The Servo Drives 9400 HighLine enable the individual mapping of process data. For this purpose, the »Engineer« is provided with a port configurator.



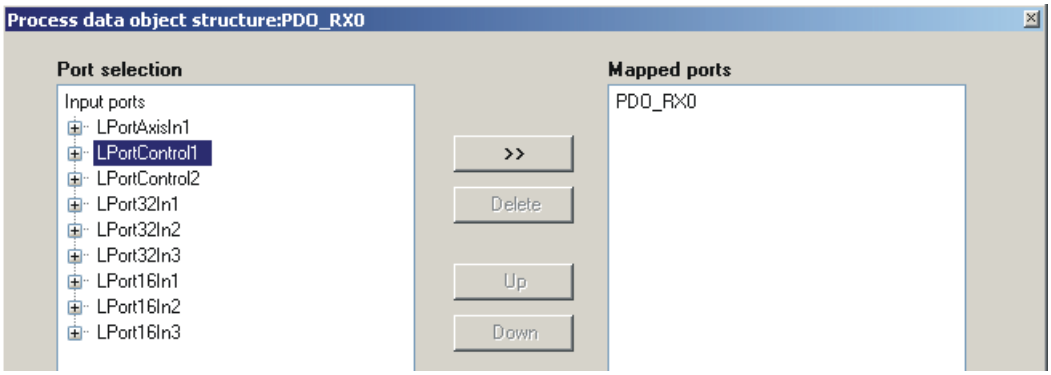
Below you can find a description of the steps required to implement a process data communication with a higher-level control, in which a control word/status word and a 32-bit setpoint/actual value are exchanged.

Note!



The »Engineer« screenshots shown on the following pages are only examples for the setting sequence and the resulting screens.

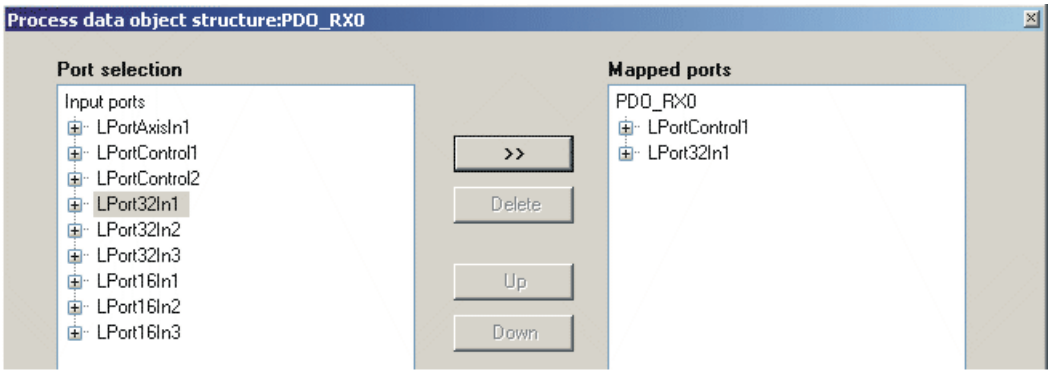
PDO mapping with the »Engineer«

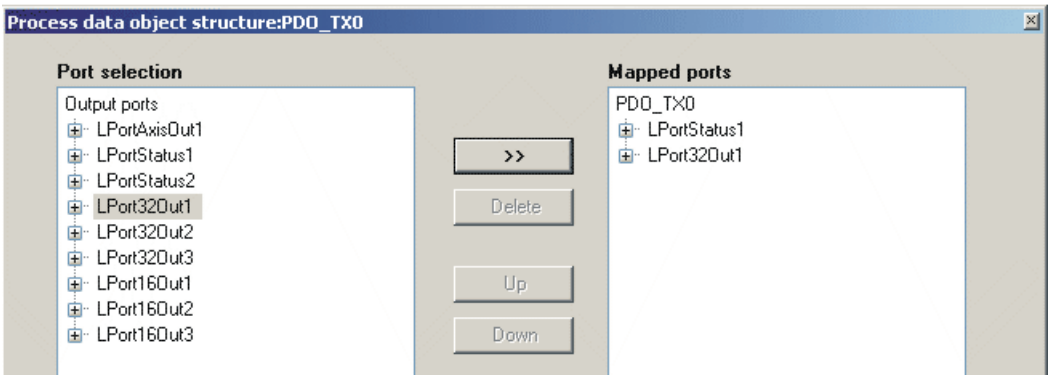


1. You can carry out the mapping of the process data in the »Engineer« on the **Process data objects** tab of the respective fieldbus communication module:

2. Select the receive object **PDO_RX0**:

3. Click the **Edit PDO** button. The **Process data object structure:PDO_RX0** selection window opens:





Here you can map the individual ports from the **Port selection** list into the receive PDO "PDO_RX0" by clicking the **>>** button. With the **Up** and **Down** buttons, you can change the order of the ports within the PDO.

Note

The port mapping is not a configuration, which can be carried out online for the Servo Drive 9400 HighLine. For this purpose, the »Engineer« project must be updated and then the application must be downloaded.

In the following example, the ports "LPortControl1" and "Lport32In1" have been mapped into the receive PDO "PDO_RX0" and the ports "LPortStatus1" and "LPort32Out1" have been mapped into the transmit PDO "PDO_TX0":

4. Now link the mapped ports to the application signals in the selected technology application.
   - If the »FB Editor« is not activated, you can use the multiplexer codes (from code C03000 onwards) for this purpose.
   - If the »FB Editor« is activated, the multiplexer codes are no longer available. In this case, you have to do the linking directly in the »FB Editor«.

9 Parameter data transfer

The E94AYCPM communication module supports the cyclic and acyclic transmission of parameter data:

- Cyclic DP-V0 parameter data are based on the DRIVECOM profile.
  If the parameter data channel is active according to DP-V0, it is assigned an additional 4 words of input / output data.
- Acyclic DP-V1 parameter data are based on the PROFIdrive profile.

9.1 Addressing of the parameter data

The parameter data are addressed via codes which can be found in this documentation and in the corresponding documentation of your controller.

▸ Parameter reference (📖 91)

Addressing of Lenze parameters

In the case of the DP-V0 parameter data channel, the parameters of a device are not addressed directly via Lenze code numbers, but via indices (bytes 3 + 4) and subindices (byte 2).

The conversion is made via an offset (24575 / 0x5FFF):

- PROFIBUS-DP $index_{dec}$ = 24575 - Lenze code number
- PROFIBUS-DP $index_{hex}$ = 0x5FFF - Lenze code $number_{hex}$

Example of C00105 (quick stop deceleration time):

- PROFIBUS-DP $index_{dec}$ = 24575 - 105 = 24470
- PROFIBUS-DP $index_{hex}$ = 0x5FFF - 0x69 = 0x5F96

The parameter values are entered into the user data (bytes 5 to 8) of the telegram.

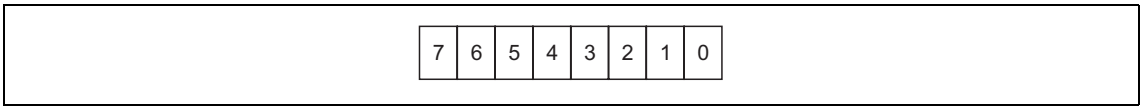
9.2 DRIVECOM parameter data channel (DP-V0)

The DRIVECOM parameter data channel (DP-V0) ...

- enables parameter setting and diagnosing of the controller;
- provides access to all Lenze parameters (codes);
- additionally occupies 4 words (16 bits/word) of the input and output data words in the master;
- is identical for both transmission directions.

9.2.1 Telegram structure (overview)

The telegram of the parameter data channel consists of a total of 8 bytes:



Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4 / Error 4	Data 3 / Error 3	Data 2 / Error 2	Data 1 / Error 1

The individual bytes are described in detail in the following subchapters.

9.2.2 Byte 1: Service

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4 / Error 4	Data 3 / Error 3	Data 2 / Error 2	Data 1 / Error 1

Request and response control for the parameter data channel

[9-1] Method of reading for bits 0 ... 7

Bit 0 ... 2: Request	
Read/write request from the master to the controller	
000	No request
001	Read request ▸ Reading parameter data from the controller (📖 50)
010	Write request (write data to the controller) ▸ Writing parameter data to the controller (📖 50)
100	Data transfer abort by the master ▸ Data transfer abort by the master (📖 51)

Bit 3
Reserved

Bit 4/5: Data length	
Data length ≤ 4 bytes in the telegram bytes 5 ... 8 (data 1 ... 4 / error 1 ... 4)	
00	1 byte
01	2 bytes
10	3 bytes
11	4 bytes

Bit 6: Handshake
Indicates a new request. • The state of this (toggle) bit is changed by the master for every new request. • The controller copies the bit into its response telegram.

Bit 7: Status	
Status information from the controller to the master when sending the request confirmation. This status bit informs the master whether the request has been carried out without errors.	
0	Request completed without errors. Bytes 5 ... 8 contain a parameter value (Data 1 ... 4).
1	Request not completed because of an error. • The set status bit indicates that the telegram is an "error telegram". • Bytes 5 ... 8 contain an error code (Error 1 ... 4). ▸ Error codes (📖 54)

9.2.2.1 Reading parameter data from the controller

General procedure:

1. Define the user data area of the controller, i.e. define the location of the DP user data in the host (observe manufacturer-specific information).
2. Enter the address of the required parameter in the "Index" and "Subindex" fields (DP output data).
3. Request in the service byte = read request.
   The handshake bit in the service byte must be changed (DP output data).
4. Check whether the handshake bit in the service byte is the same for the DP input data and the DP output data.
   - If the handshake bit is the same, the response has been received.
   - It is useful to implement a time monitoring tool.
5. Check whether the status bit in the service byte is set:
   - Status bit is not set: The "Data/Error" field contains the required Parameter value (data) (📖 53).
   - Status bit is set: The read request has not been executed correctly. The "Data/Error" field contains the Error codes (📖 54).

9.2.2.2 Writing parameter data to the controller

General procedure:

1. Define the user data area of the controller, i.e. define the location of the DP user data in the host (observe manufacturer-specific information).
2. Enter the address of the required parameter in the "Index" and "Subindex" fields (DP output data).
3. Enter the parameter value in the "Data/Error" field.
4. Request in the service byte = write request.
   The handshake bit in the service byte must be changed (DP output data).
5. Check whether the handshake bit in the service byte is the same for the DP input data and the DP output data.
   - If the handshake bit is the same, the response has been received.
   - It is useful to implement a time monitoring tool.
6. Check whether the status bit in the service byte is set:
   - Status bit is not set: The write request has been executed correctly.
   - Status bit is set: The write request has not been executed correctly. The "Data/Error" field contains the Error codes (📖 54).

9.2.2.3 Abort of data transfer by the controller

The error telegram is used to abort the transfer.

- The error telegram is marked by a set status bit in the service byte.
- The telegram can either be the response to an "Initiate Read/Write Service" or to a "Read/Write Segment Service".

Controller response in the event of an error:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4 / Error 4	Data 3 / Error 3	Data 2 / Error 2	Data 1 / Error 1
1t110000	SIDX	IDXH	IDXL	Error Class	Error code	Additional Code High	Additional Code Low

9.2.2.4 Data transfer abort by the master

The master can use this error telegram to abort a running segment transmission.

- The error telegram is marked by a set status bit in the service byte.
- The service byte also contains the request code "4" (100_{bin}).
- Bit 4 and bit 5 in the service byte (data length) are without meaning.
- Additional information (subindex, index, error information) is not transmitted.

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
1txx0100	0	0	0	0	0	0	0

Controller response in the case of correct execution:

The controller confirms the error telegram of the master by also sending an error telegram.

- The error telegram is marked by a set status bit in the service byte.
- In the case of correct execution, the telegram contains the error information "0x00000000" in bytes 5 ... 8.
- Additional information (subindex, index) is not transmitted.

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	SIDX	IDXH	IDXL	Error Class	Error code	Additional Code High	Additional Code Low
1t110000	0	0	0	0	0	0	0

9.2.3 Byte 2: Subindex

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	**Subindex**	Index High byte	Index Low byte	Data 4 / Error 4	Data 3 / Error 3	Data 2 / Error 2	Data 1 / Error 1

Additional addressing via the subindex is required for those codes of the Servo Drives 9400 that contain a subcode (see code table).

9.2.4 Bytes 3 + 4: Index

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	**Index High byte**	**Index Low byte**	Data 4 / Error 4	Data 3 / Error 3	Data 2 / Error 2	Data 1 / Error 1

The parameter (Lenze code) is selected via these two bytes according to the formula:

Index = 24575 - Lenze code number

(See also "Addressing of Lenze parameters" (📖 47))

Example:

The parameter C00105 (quick stop (QSP) deceleration time) is to be addressed:

- Index = 24575 - 105 = 24470 = 0x5F96
- The entries in bytes 3 + 4 for this example would be:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	**0x5F**	**0x96**	Data 4 / Error 4	Data 3 / Error 3	Data 2 / Error 2	Data 1 / Error 1

9.2.5 Bytes 5 ... 8: Parameter value / error information

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	**Data 4 / Error 4**	**Data 3 / Error 3**	**Data 2 / Error 2**	**Data 1 / Error 1**

The state of status bit 7 in the service byte determines the meaning of this data field:

Status bit	Meaning of bytes 5 ... 8
0	Bytes 5 ... 8 contain a parameter value (Data 1 ... 4).
1	Bytes 5 ... 8 contain an error code (Error 1 ... 4). ▸ Error codes (📖 54)

Parameter value (data)

Note!

Strings or data blocks cannot be transmitted.

Depending on the data format, the length of the parameter value is between 1 and 4 bytes.

Data are saved in the Motorola format, i.e. first the high byte (high word), then the low byte (low word):

Byte 5	Byte 6	Byte 7	Byte 8
High byte	Low byte	High byte	Low byte
High word		Low word	
Double word			

Principle for the assignment of bytes 5 ... 8 with parameter values of different lengths:

Byte 5	Byte 6	Byte 7	Byte 8
Parameter value (length 1)	0x00	0x00	0x00
Parameter value (length 2)		0x00	0x00
Parameter value (length 4)			

9.2.6 Error codes

The following error messages may appear:

Byte 8	Byte 7	Byte 6	Byte 5	Meaning
Error 1	Error 2	Error 3	Error 4	
0x06	0x03	0x00	0x00	No right to access
0x06	0x05		0x11	Invalid subindex
0x06	0x05		0x12	Data length too large
0x06	0x05		0x13	Data length too small
0x06	0x07		0x00	Object does not exist
0x06	0x08		0x00	Data types do not comply with each other
0x08	0x00		0x00	Request cannot be executed
0x08	0x00		0x20	Request cannot be executed at the moment
0x08	0x00		0x22	Request cannot be executed due to the device status / The parameter can only be changed in the case of a controller inhibit
0x08	0x00		0x30	Value ranged exited
0x08	0x00		0x31	Parameter value too high
0x08	0x00		0x32	Parameter value too low
0x08	0x00		0x80	Hardware error

9.2.7 Telegram examples

9.2.7.1 Read request: Querying the heatsink temperature

The heatsink temperature of the controller is to be read.

- Code to be read: C00061
- Heatsink temperature: 43 °C

Byte 1: Service (request)

Request = $0t110001_{bin}$

- Bit 0 ... 2 = 001_{bin} for read request
- Bit 3 = 0 (reserved)
- Bit 4/5 = 01_{bin} for 2-byte data length (only relevant for the response telegram)
- Bit 6 = handshake bit (t ≡ status is changed in the response telegram)
- Bit 7 = status bit (only relevant for the response telegram)

Byte 2: Subindex

Subindex = 0 because code C00061 does not contain any subindices.

Bytes 3 + 4: Index

Index = 24575 - code number = 24575 - 61 = 24514 = 0x5FC2

- Byte 3 (high byte) = 0x5F
- Byte 4 (low byte) = 0xC2

Bytes 5 ... 8: Data

The response telegram contains the value of code C00061:

Data 3 + 4 = 43 [°C] x 1 (internal factor) = 43 = 0x002B

Result

Request telegram from master to drive:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4	Data 3	Data 2	Data 1
0x01	0x00	0x5F	0xC2	0x00	0x00	0x00	0x00
$0t000001_{bin}$	00000000_{bin}	01011111_{bin}	11000010_{bin}	00000000_{bin}	00000000_{bin}	00000000_{bin}	00000000_{bin}
Waiting for change of handshake bit 6 in service byte 1 of the response.							

Response telegram from drive to master (for correct execution):

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4	Data 3	Data 2	Data 1
0x11	0x00	0x5F	0xC2	0x00	0x2B	0x00	0x00
$0t010001_{bin}$	00000000_{bin}	01011111_{bin}	11000010_{bin}	00000000_{bin}	00101011_{bin}	00000000_{bin}	00000000_{bin}

9.2.7.2 Write request: Setting the deceleration time for quick stop (QSP)

In the controller, the deceleration time for quick stop (QSP) is to be set to 50 ms.

- Code to be written: C00105

Byte 1: Service (request)

Request = $0t110010_{bin}$

- Bit 0 ... 2 = 010_{bin} for write request
- Bit 3 = 0 (reserved)
- Bit 4/5 = 11_{bin} for 4-byte data length
- Bit 6 = handshake bit (t ≡ status is changed in the response telegram)
- Bit 7 = status bit (only relevant for the response telegram)

Byte 2: Subindex

Subindex = 0 because code C00105 does not contain any subindices.

Bytes 3 + 4: Index

Index = 24575 - code number = 24575 - 105 = 24470 = 0x5F96

- Byte 3 (high byte) = 0x5F
- Byte 4 (low byte) = 0x96

Bytes 5 ... 8: Data

The parameter value of 0.05 s to be set is multiplied by the code-specific factor of "1000" and entered in the user data:

Data 1 ... 4 = 0.05 [s] x 1000 (internal factor) = 50 = 0x00000032

Result:

Request telegram from master to drive:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4	Data 3	Data 2	Data 1
0x72	0x00	0x5F	0x96	0x00	0x00	0x00	0x32
$0t110010_{bin}$	00000000_{bin}	01011111_{bin}	10010110_{bin}	00000000_{bin}	00000000_{bin}	00000000_{bin}	00110010_{bin}
Waiting for change of handshake bit 6 in service byte 1 of the response							

Response telegram from drive to master (for correct execution):

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Service	Subindex	Index High byte	Index Low byte	Data 4	Data 3	Data 2	Data 1
0x40	0x00	0x5F	0x96	0x00	0x00	0x00	0x32
$0t000000_{bin}$	00000000_{bin}	01011111_{bin}	10010110_{bin}	00000000_{bin}	00000000_{bin}	00000000_{bin}	00110010_{bin}

9.3 PROFIdrive parameter data channel (DP-V1)

Data communication with PROFIBUS-DP-V0 is characterised by cyclic diagnostics and cyclic process data and parameter data transfer.

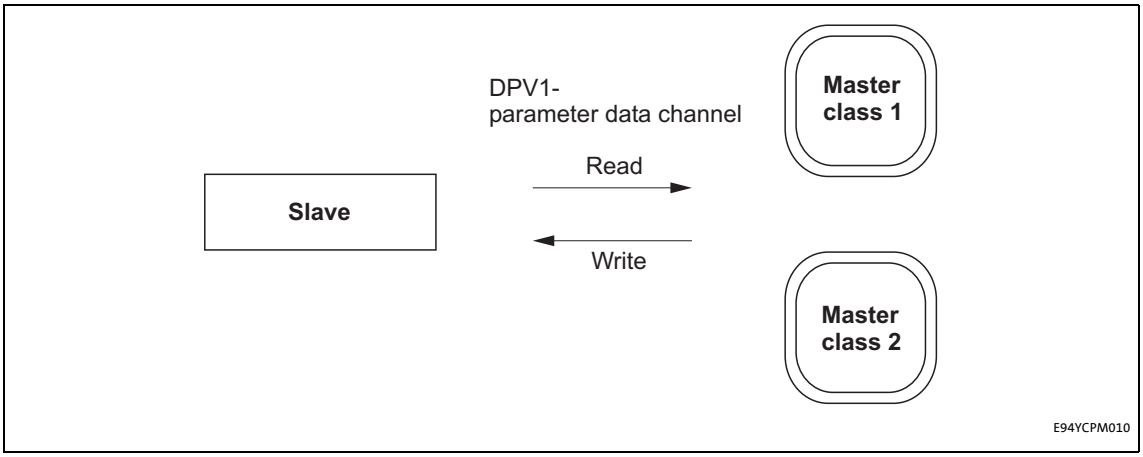
An optional service expansion is the acyclic parameter data transfer of PROFIBUS-DP-V1. This service does not impair the functionality of the standard services under PROFIBUS-DP-V0.

PROFIBUS-DP-V0 and PROFIBUS-DP-V1 can be operated simultaneously in the same network. This enables the step-by-step expansion or retrofitting of a system.

The services of PROFIBUS-DP-V1 can be used by the class 1 master (PLC) and the class 2 master (diagnostics master, etc.).

The integration of the acyclic service into the fixed bus cycle depends on the corresponding configuration of the class 1 master:

- With configuration, a time slot is reserved.
- Without configuration the acyclic service is appended when a class 2 master acyclically accesses a DP-V1 slave.



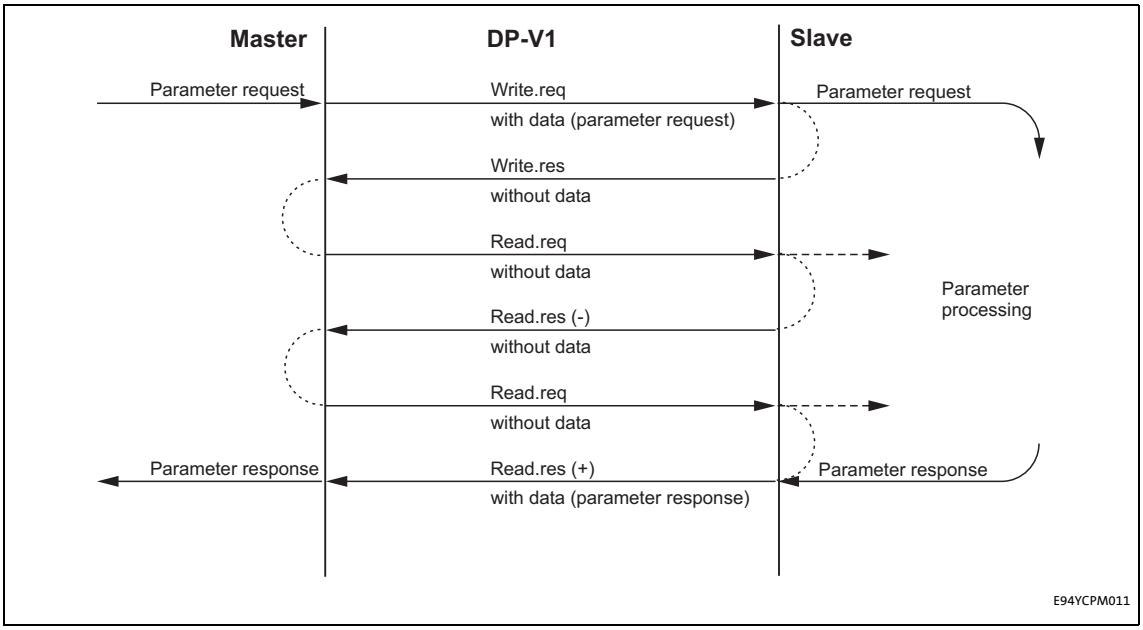
Features

- Parameter number and subindex addresses with a width of 16 bits each.
- Several parameter requests can be combined to one request (multi-parameter request).
- There is always only one parameter request in process (no pipelining).
- A parameter request/response must fit into a data block (max. 240 bytes). Requests/responses cannot be split into several data blocks.
- No spontaneous messages are transferred.
- There are only acyclic parameter requests.
- Profile-specific parameters can be read independently of the slave state.

9.3.1 Connection establishment between master and slave

A class 1 master can always request parameters from a slave if the slave is in the "Data_Exchange" state.

In addition to the class 1 master, a class 2 master can establish a communication connection to the slave:

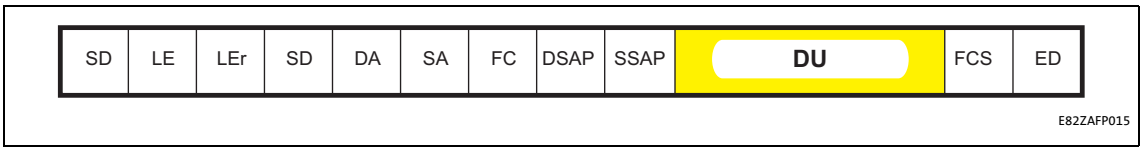


[9-2] Data communication via the DP-V1 parameter data channel

9.3.2 Acyclic data transfer

Note!

A parameter request refers to one or several parameter(s) (multi-parameter request).



[9-3] Transmission directions

Explanation

- A "Write.req" is used to pass the data set (DB47) to the slave in the form of a parameter request.
- With "Write.res" the master receives the confirmation for the receipt of the message.
- The master requests the response of the slave with "Read.req".
- The slave responds with "Read.res (-)" if processing has not yet been completed.
- After parameter processing, the parameter request is completed by transmitting the parameter response to the master with "Read.res (+)".

9.3.3 Telegram structure

[9-4] PROFIBUS data telegram

The data unit (DU) contains the DP-V1 header and the parameter request or the parameter response.

The following subchapters describe the parameter request and the parameter response in detail.

Note!

The DP-V1 header consists of:

- Function identification
- Slot number
- Data set
- Length of the user data

Please refer to the corresponding PROFIBUS specification for further information on the DP-V1 header.

Assignment of the user data depending on the data type

Depending on the data type used, the user data are assigned as follows:

Data type	Length	User data assignment				
		Byte 1	Byte 2	Byte 3	Byte 4	Byte ...
String	x bytes					
U8	1 byte		0x00			
U16	2 bytes	High byte	Low byte			
U32	4 bytes	High word		Low word		
		High byte	Low byte	High byte	Low byte	

9.3.3.1 Reading parameter data from the controller

Note!

- When a read request is processed, no parameter value is written to the slave.
- In the case of a multi-parameter read request, the parameter attribute, index, and subindex are repeated with the number "n" of the requested parameters.
- A read request must not exceed the maximum data length of 240 bytes.

Request header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices

Field	Data type	Values
Request reference	U8	This value is specified by the master
Request identification	U8	0x01: Request parameters for reading
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter attribute

Byte 5	Byte 6
Attribute	Number of subindices

Field	Data type	Values
Attribute	U8	0x10: Value
Number of subindices	U8	0x00 (For array elements: Enter the number of array elements required.)

Index and subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte

Field	Data type	Values
Index	U16	0x0001 ... 0xFFFF (1 ... 65535)
Subindex	U16	0x0001 ... 0xFFFF (1 ... 65535)

9.3.3.2 Response to a correctly executed read request

Note!

Responses to a read request do not contain parameter attributes, indices and subindices.

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x01: Parameter has been read
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter format

Byte 5	Byte 6
Format	Number of values

Field	Data type	Values
Format	U8	0x02: Integer8 0x03: Integer16 0x04: Integer32 0x05: Unsigned8 0x06: Unsigned16 0x07: Unsigned32 0x09: Visible string 0x0A: Octet string 0x40: Zero 0x41: Byte 0x42: Word 0x43: Double word
Number of values	U8	0x01 or number of requested subindices/parameters (with several subindices/parameters only the parameter value is repeated). In the case of string codes, the number of characters is entered here.

Parameter value

Byte 7	Byte 8	Byte 9	Byte 10
Value			

Field	Data type	Values
Value	String	Any (length > 4 bytes possible)
	U8	0x00 .... 0xFF
	U16	0x0000 .... 0xFFFF
	U32	0x0000 0000 .... 0xFFFF FFFF

9.3.3.3 Response to a read error

Note!

In case of a multi-parameter request, correct and possibly faulty messages are summarised in one telegram.

Correct message

- Format: data type of the value requested
- Number of values: as described in chapter "Reading parameter data from the controller" (61).
- Parameter value: value requested

Faulty message

- Format: 0x44
- Number of values: 0x01 or 0x02
- Error code without additional information (for number of values = 0x01) or
- Error code with additional information (for number of values = 0x02)

A faulty access to a parameter "n" is indicated at the nth position in the response telegram of a multi-parameter request.

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x81: Parameter has not been read The data in the bytes 7 + 8 must be interpreted as an error code.
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter format

Byte 5	Byte 6
Format	Number of values

Field	Data type	Values
Format	U8	0x44: Error
Number of values	U8	0x01: Error code without additional information 0x02: Error code with additional information

Error code

Byte 7	Byte 8	Byte 9	Byte 10
Error code		Additional information (if available)	
High byte	Low byte	High byte	Low byte

Field	Data type	Values
Error code	U16	0x0000 .... 0xFFFF ▸ Error codes (📖 70)
Additional information (if available)	U16	

9.3.3.4 Writing parameter data to the controller

Note!

When a multi-parameter write request is transferred, the ...
- Parameter attribute
- Index and subindex

and then the ...
- Parameter format
- Parameter value

... are repeated with the number "n" of the parameters addressed.

A write request must not exceed the maximum data length of 240 bytes.

Request header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices

Field	Data type	Values
Request reference	U8	This value is defined by the master.
Request identification	U8	0x02: Write parameter
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters addressed)

Parameter attribute

Byte 5	Byte 6
Attribute	Number of subindices

Field	Data type	Values
Attribute	U8	0x10: Value
Number of subindices	U8	0x00 (For array elements: Enter the number of array elements required.)

Index and subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte

Field	Data type	Values
Index	U16	0x0001 ... 0xFFFF (1 ... 65535)
Subindex	U16	0x0001 ... 0xFFFF (1 ... 65535)

Parameter format

Byte 11	Byte 12
Format	Number of values

Field	Data type	Values
Format	U8	0x02: Integer8 0x03: Integer16 0x04: Integer32 0x05: Unsigned8 0x06: Unsigned16 0x07: Unsigned32 0x09: Visible string 0x0A: Octet string 0x40: Zero 0x41: Byte 0x42: Word 0x43: Double word
Number of values	U8	0x01 or number of written subindices/parameters (with several subindices/parameters only the parameter value is repeated). In the case of string codes, the number of characters is entered here.

Parameter value

Byte 13	Byte 14	Byte 15	Byte 16
Value			

Field	Data type	Values
Value	String	Any (length > 4 bytes possible)
	U8	0x00 .... 0xFF
	U16	0x0000 .... 0xFFFF
	U32	0x0000 0000 .... 0xFFFF FFFF

9.3.3.5 Response to a correctly executed write request

Note!

In the case of a multi-parameter request, correct and possible faulty messages are summarised in one telegram. They have the following data contents:

Correct message

- Format: 0x40
- Number of values: 0x00

Faulty message

- Format: 0x44
- Number of values: 0x01 or 0x02
- Error code without additional information (for number of values = 0x01) or with additional information (for number of values = 0x02)

A faulty access to a parameter "n" is indicated at the nth position in the response telegram of a multi-parameter request.

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x02: Parameter has been written
Axis	U8	0x00 or 0x01
Number of indices	U8	0xn (n = number of parameter addressed)

9.3.3.6 Response to a write error

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x82: Parameter has not been written The data in the bytes 7 + 8 must be interpreted as an error code.
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters addressed)

Parameter format

Byte 5	Byte 6
Format	Number of values

Field	Data type	Values
Format	U8	0x44: Error
Number of values	U8	0x01: Error code without additional information 0x02: Error code with additional information

Error code

Byte 7		Byte 8		Byte 9		Byte 10	
Error code				Additional information (if available)			
High byte		Low byte		High byte		Low byte	

Field	Data type	Values
Error code	U16	0x0000 .... 0xFFFF ▸ Error codes (📖 70)
Additional information (if available)	U16	

9.3.4 Error codes

Error code	Description	Explanation	Additional information
0x0000	Impermissible parameter number	Access to unavailable parameter	-
0x0001	Parameter value cannot be changed	Change access to a parameter value that cannot be changed	Subindex
0x0002	Lower or upper value limit exceeded	Change access with value beyond the value limits	Subindex
0x0003	Faulty subindex	Access to unavailable subindex	Subindex
0x0004	No array	Access with subindex to non-indicated parameter	-
0x0005	Wrong data type	Change access with value that does not match the data type of the parameter	-
0x0006	No setting permitted (only resettable)	Change access with value unequal to 0 where this is not permitted	Subindex
0x0007	Description element cannot be changed	Change access to a description element that cannot be changed	Subindex
0x0008	Reserved	(PROFIdrive profile V2: PPO-Write requested in the IR is not available)	-
0x0009	Description data not available	Access to unavailable description (parameter value is available)	-
0x000A	Reserved	(PROFIdrive profile V2: Wrong access group)	-
0x000B	No parameter change rights	Change access without parameter change rights	-
0x000C	Reserved	(PROFIdrive profile V2: Wrong password)	-
0x000D	Reserved	(PROFIdrive profile V2: Text in the cyclic traffic cannot be read)	-
0x000E	Reserved	(PROFIdrive profile V2: Name in the cyclic traffic cannot be read)	-
0x000F	No text array available	Access to unavailable text array (parameter value is available)	-
0x0010	Reserved	(PROFIdrive profile V2: Missing PPO-Write)	-
0x0011	Request cannot be executed due to the operating state	Access is not possible due to temporary reasons not specified here	-
0x0012	Reserved	(PROFIdrive profile V2: Other error)	-
0x0013	Reserved	(PROFIdrive profile V2: date in the cyclic traffic cannot be read)	-
0x0014	Value impermissible	Change access with the value that is inside the value limits but not permissible for other permanent reasons (parameters with defined individual values)	Subindex
0x0015	Response too long	The length of the current response exceeds the maximum transmittable length	-
0x0016	Parameter address impermissible	Impermissible or non-supported value for attribute, number of subindices, parameter number, or subindex, or a combination	-
0x0017	Format impermissible	Write request: Impermissible or non-supported format of parameter data	-
0x0018	Number of values not consistent	Write request: Number of values of the parameter data do not match the number of subindices in the parameter address	-
0x0019	Reserved	-	-
...			
0x0064			

Error code	Description	Explanation	Additional information
0x0065	Manufacturer-specific	-	-
...			
0x00FF			

9.3.5 Telegram examples

9.3.5.1 Read request: Querying the heatsink temperature

The heatsink temperature of the controller is to be read.

- Code to be read: C00061
- Heatsink temperature: 43 °C

Parameter request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices
0xXX	0x01	0x00	0x01
	Request parameters for reading		

Byte 5	Byte 6
Attribute	Number of subindices
0x10	0x00
Value	No subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte
0x5F	0xC2	0x00	0x00
Index = 24575 - code no. = 24575 - 61 = 24514 = 0x5F C2		No subindex	

Parameter response to a correctly executed read request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices
0xXX	0x01	0x00	0x01
	Parameter has been read		

Byte 5	Byte 6
Format	Number of values
0x03	0x01
Integer16	1 value

Byte 7	Byte 8
Value	
High byte	Low byte
0x00	0x2B
Value read = 0x 00 2B = 43 x 1 (internal factor) = 43 [°C]	

Parameter response to a read error

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices
0xXX	0x81	0x00	0x01
	Parameter has not been read		

Byte 5	Byte 6
Format	Number of values
0x44	0x01
Error	Error code without additional information

Byte 7	Byte 8
Error code	
High byte	Low byte
For the meaning, see the "Error codes" (📖 70) chapter	

9.3.5.2 Write request: Setting the deceleration time for quick stop (QSP)

In the controller, the deceleration time for quick stop (QSP) is to be set to 50 ms.

Code to be written: C00105

Parameter request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices
0xXX	0x02	0x00	0x01
	Write parameter	Axis 0	1 index

Byte 5	Byte 6
Attribute	Number of subindices
0x10	0x00
Value	No subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte
0x5F	0x96	0x00	0x00
Index = 24575 - code no. = 24575 - 105 = 24470 = 0x5F 96		No subindex	

Byte 11	Byte 12
Format	Number of values
0x43	0x01
Double word	1 value

Byte 13	Byte 14	Byte 15	Byte 16
Value			
High word: high byte	High word: low byte	Low- word: high byte	Low word: low byte
0x00	0x00	0x00	0x32
Value to be written = 0.05 [s] x 1000 (internal factor) = 50 = 0x00 00 00 32			

Parameter response to a correctly executed write request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices
0xXX	0x02	0x00	0x01
	Parameter has been written		1 index

Parameter response to a read error

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices
0xXX	0x82	0x00	0x01
	Parameter has not been written		1 index

Byte 5	Byte 6
Format	Number of values
0x44	0x01
Error	Error code without additional information

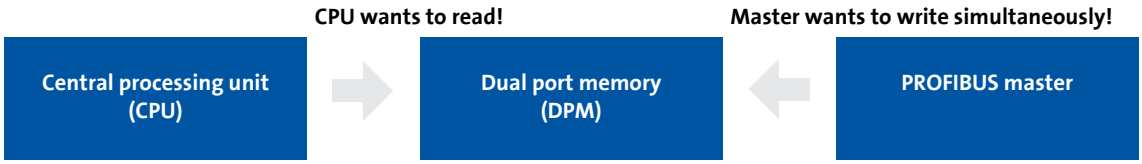
Byte 7	Byte 8
Error code	
High byte	Low byte
For the meaning, see Error codes (📖 70)	

9.4 Consistent parameter data

In the PROFIBUS communication system, data are permanently exchanged between the host (CPU + PROFIBUS master) and the standard device via the plugged-on communication module. Both the PROFIBUS master and the CPU (central processing unit) of the host access a joint memory: the dual port memory (DPM).

The DPM permits a data exchange in both directions (write/read):

It could happen that a slower PROFIBUS master writing would be overtaken by a faster CPU reading within a cycle time without any further data organisation.



In order to avoid such an impermissible state, the parameter data to be transmitted must be marked as "consistent".

Data communication with consistent data

With consistency, either "reading" or "writing" is possible when the master and the CPU simultaneously access the memory:

- The PROFIBUS master transfers data only as a complete data set.
- The CPU can only access completely updated data sets.
- The PROFIBUS master cannot read or write data as long as the CPU accesses consistent data.

The result becomes clear from the example below:

1. As the master can only write if the CPU does not read, the master waits until the data are read completely by the CPU.
2. The master only writes a complete data set into DPM.

Configuring consistent data

Note!

Consistency is achieved by an appropriate PROFIBUS master configuration.

For this purpose, refer to the documentation for your configuring software.

10 PROFIsafe

PROFIBUS enables the transfer of safe information via the PROFIsafe protocol in accordance with the "PROFIsafe - Profile for Safety Technology" specification, version 2.0.

Note!

A safety bus system (PROFIsafe) can only be operated via the upper module slot **MXI1** of the Servo Drive 9400.

- The PROFIsafe data are sent in the first slot of a PROFIBUS data telegram.
- One bit of the PROFIsafe data is always used to control specific safety functions.
- The structure of the PROFIsafe data is described in the PROFIsafe profile.
- The length of the PROFIsafe data (also called PROFIsafe message) always is 8 bytes.

Documentation for the safety module SM301 (E94AYAE)

Here you can find detailed information on the PROFIsafe connection.

11 Monitoring

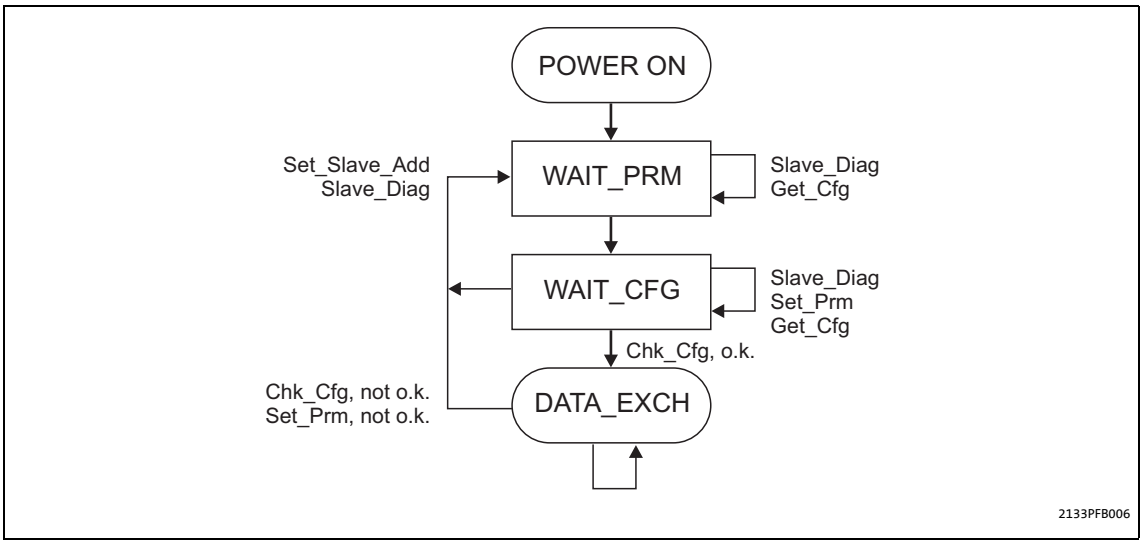
11.1 Permanent interruption of PROFIBUS communication

If PROFIBUS communication is interrupted permanently, e.g. by cable breakage or failure of the PROFIBUS master, no process data are transmitted to the slave being in the "Data Exchange" state.

After the watchdog monitoring time determined by the PROFIBUS master has expired, the response parameterised under C13880/1 / C14880/1 is executed in the controller (slave).

The process data handling depends on the setting in C13885 / C14885. (The last data sent by the master can either be used or set to zero.)

Preconditions for a controller (slave) response



- A monitoring time of 1 ... 65534 ms is set for the "Data_Exchange" state (C13881 / C14881).
  A value of "65535 ms" (Lenze setting) deactivates the monitoring.
- A response is set for the slave in C13880/1 / C14880/1 (Lenze setting: "No response").
- The slave is in the "Data_Exchange" state.
- The watchdog monitoring time is configured correctly in the master.

If one of these preconditions is not met, the response to the absence of cyclic process data telegrams from the master is not executed.

▸ Settings and displays in the »Engineer« (📖 80)

11.2 Short-time interruption of PROFIBUS communication

From software version 01.21, the current DP states are displayed in C13868 / C14868.

[11-1] DP states (Decentralized Peripherals) for short-time interruption of communication

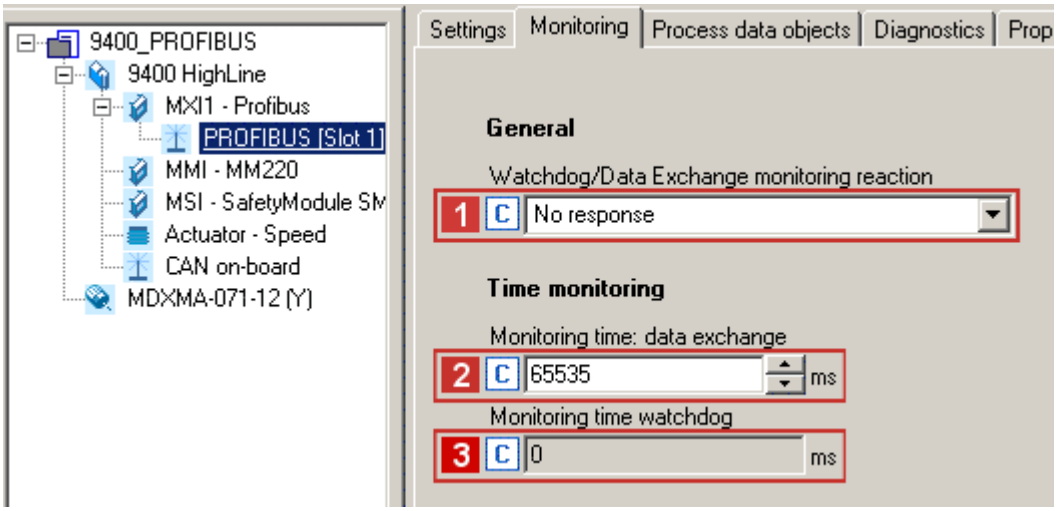
The master detects the communication fault and transfers the slave to the "WAIT_PRM" state of the DP state machine after only a few microseconds (see Fig. [11-1]).

Only after the state chain of the DP state machine ending in the "Data_Exchange" state (DATA_EXCH) has been passed through, the watchdog monitoring time calculated for the slave (in milliseconds) continues to run.

Note!

The watchdog monitoring time does not continue to run when the slave does not reach the "Data_Exchange" state due to repeated communication errors (e.g. caused by loose contact).

Additional monitoring for the data exchange



An additional monitoring function for data exchange is available under C13881 / C14881. This monitoring function already becomes active when the "Data_Exchange" state is exited and the parameterised time (0 ... 65535 ms) has expired. The active monitoring function triggers the response parameterised under C13880/1 / C14880/1.

Note!

Observe the following condition for the time setting:

Monitoring time for data exchange (C13881 / C14881) ≤ watchdog monitoring time of PROFIBUS (C13882/1 / C14882/1).

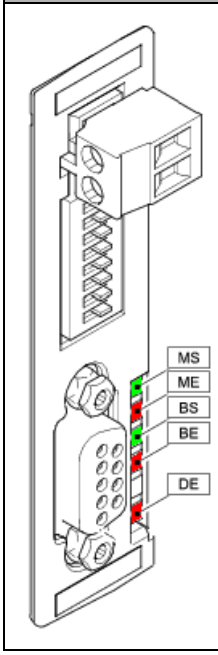
11.3 Settings and displays in the »Engineer«

On the **Monitoring** tab of the »Engineer«, you can set or display the following parameters:

- Set a response 1 (C13880/1 / C14880/1) to the interruption of communication.
- Set a monitoring time 2 (C13881 / C14881) for the "Data_Exchange" state.
- The watchdog monitoring time specified in the master 3 (C13882/1 / C14882/1).

11.4 Interruption of internal communication

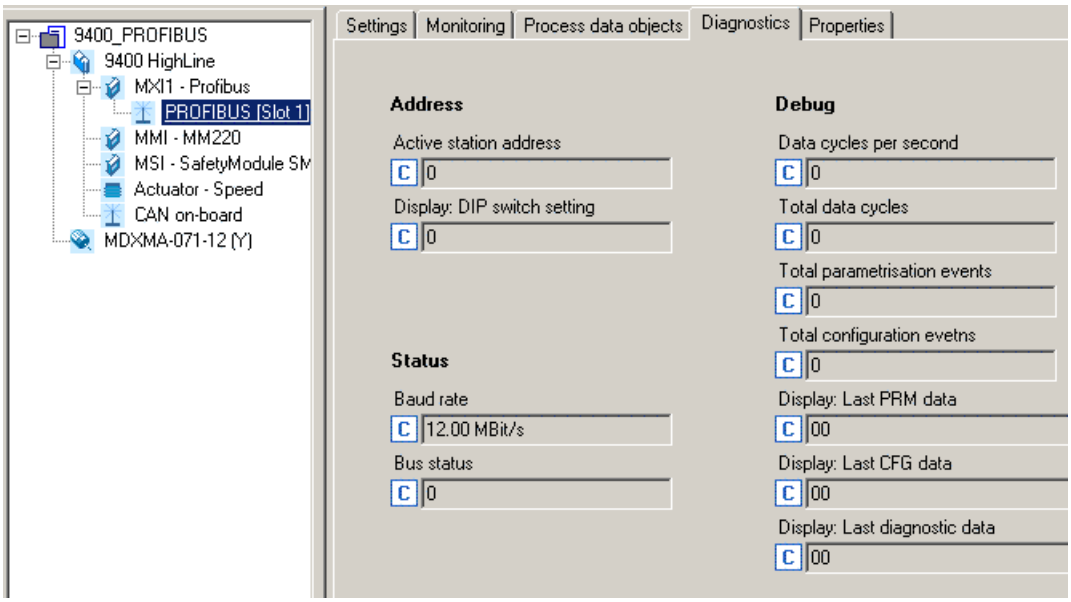
The response to a communication error between the communication module and the standard device can be set via the standard device codes C01501 (module in slot MXI1) and C01502 (module in slot MXI2) (📖 92).



12 Diagnostics

For diagnosing faults of the PROFIBUS module, the LEDs on the front panel are available. Furthermore, you can query the current bus status via codes C13861 / C14861.

12.1 LED status displays



Note!

During normal operation, the LED **BS** blinks and the LED **MS** is permanently lit.

LED status display	Pos.	Colour	State	Description
	MS	Green	On	The communication module is supplied with voltage and has established a connection to the standard device.
			Blinking	The communication module is supplied with voltage, but has not yet established a connection to the standard device. (Standard device is switched off, initialising or not present.)
	ME	Red	On	An error concerning the communication module has occurred.
	BS	Green	Blinking	The communication module is in the DATA_EXCH state ("Data_Exchange"). Data are exchanged via the PROFIBUS.
			Off	The communication module is not active on the fieldbus or is being initialised.
	BE	Red	On	Bus error/fault is active (e.g. bus cable unplugged).
	DE	Red	On	The communication module is not accepted by the standard device or the standard device is not active. (See notes in the documentation for the standard device.)

12.2 Diagnostics with the »Engineer«

In the »Engineer«, the **Diagnostics** tab displays various pieces of PROFIBUS diagnostic information.

Querying the current bus status

C13861 / C14861 indicate the current PROFIBUS state in bit-coded form:

Bit assignment				Description	
Bit 3	Bit 2	Bit 1	Bit 0	Reserved	
		Bit 5	Bit 4	**Status of the DP state machine (DP-STATE)**	
		0	0	WAIT_PRM	The slave waits for a parameter data telegram after acceleration. Other types of telegrams will not be processed. Data exchange is not yet possible.
		0	1	WAIT_CFG	The slave waits for the configuration telegram that specifies the number of input and output bytes. The master informs the slave about the number of I/O bytes that will be transferred.
		1	0	DATA_EXCH	If the parameter settings as well as the configuration have been accepted by the firmware and by the application, the slave state changes to DATA_EXCH ("Data Exchange", exchange of user data with the master).
		1	1	Not possible	
		Bit 7	Bit 6	**Status of the watchdog state machine (WD-STATE)**	
		0	0	BAUD_SEARCH	The PROFIBUS slave is able to detect the baud rate automatically.
		0	1	BAUD_CONTROL	After recognising the correct baud rate, the slave status changes to BAUD_CONTROL and the baud rate is monitored.
		1	0	DP_CONTROL	The DP_CONTROL state serves for response monitoring of the PROFIBUS master.
		1	1	Not possible	
Bit 11	Bit 10	Bit 9	Bit 8	**Detected PROFIBUS baud rate**	
0	0	0	0	12 Mbps	
0	0	0	1	6 Mbps	
0	0	1	0	3 Mbps	
0	0	1	1	1.5 Mbps	
0	1	0	0	500 kbps	
0	1	0	1	187.5 kbps	
0	1	1	0	93.75 kbps	
0	1	1	1	45.45 kbps	
1	0	0	0	19.2 kbps	
1	0	0	1	9.6 kbps	
Bit 15	Bit 14	Bit 13	Bit 12	Reserved	

From software version 01.21, the current DP states are displayed in C13868 / C14868 (see fig. [11-1], chapter Short-time interruption of PROFIBUS communication (📖 79)).

12.3 Advanced diagnostic message

Errors in the standard device and its plugged-in modules are transmitted to the PROFIBUS master in the form of advanced diagnostic messages.

Structure of the diagnostic message

Byte	Description
1	Bit 0: Station does not exist (set by the master). Bit 1: Slave is not ready for data exchange. Bit 2: Configuration data do not correspond. Bit 3: Slave has extended diagnostic data. Bit 4: Requested function is not supported by the slave. Bit 5: Slave response is invalid (set by the master) Bit 6: Incorrect parameter setting Bit 7: Slave has been parameterised by another master (set by the master).
2	Bit 0: Slave must be parameterised again. Bit 1: Static diagnostics Bit 2: Permanently set to "1". Bit 3: Watchdog active Bit 4: Freeze command received. Bit 5: Sync command received. Bit 6: Reserved Bit 7: Slave is deactivated (set by the master).
3	Bit 7: Diagnostics overflow - amount of diagnostic information present in the slave is too large to fit into one telegram.
4	Bits 0 ... 7: Master address after parameter setting ("0xFF" without parameterisation)
5	Bits 0 ... 7: ID number (high byte)
6	Bits 0 ... 7: ID number (low byte)
7	Header • The header contains the block length of the advanced diagnostics including the header byte. • In this case, the value of the entry is "0x0A" (bytes 7 ... 16 = 10 bytes).
8	Status_Type The value of this entry is fixed. For the following bit assignment it is "0x81": • Bit 7 = 1: "status" • Bit 0 = 1: "status message" • Value of all other bits = 0
9	Slot_Number The value of the slot number is "0x00".
10	Specifier • A detected error is entered in the specifier with the identification "0x0" (status coming). • An eliminated error is entered in the specifier with the identification "0x02" (status going). • If no errors are indicated, the entry in the specifier has the value "0x00" (no further differentiation).
11 12	PROFIsafe, error number of the safety module SM301 (E94AYAE) • If an error occurs in the safety module, byte 11 (low byte) and byte 12 (high byte) contain the corresponding error number. • See also documentation for the safety module.
13 ... 16	Error code of the Servo Drive 9400 • Code **C00168** can be used to read out the contents of the fault memory. • Detailed information on the error codes of the Servo Drive 9400 can be found in the documentation of the controller.

12.3.1 Example 1: Error in parameter data "Incorrect PROFIsafe target address"

This error was caused while communication of the PROFIBUS master was established because the PROFIsafe target address configured in the PROFIBUS master does not correspond to the set address anymore.

Byte	Value [hex]	Description
1	x	Standard data (PRM_Fault)
...		
6		
7	0A	Block length of the advanced diagnostics = 10 bytes
8	81	Status message
9	00	Slot 0
10	01	Status coming
11	40	PROFIsafe error "0x0040" (64) GSG: "F address differ to F_Dest_Add"
12	00	
13	00	No other error message
...	...	
16	00	

12.3.2 Example 2: Error "Undervoltage in the DC bus" in the Servo Drive 9400

Byte	Value [hex]	Description
1	x	Standard data (PRM_Fault)
...		
6		
7	0A	Block length of the advanced diagnostics = 10 bytes
8	81	Status message
9	00	Slot 0
10	01	Status coming
11	00	No PROFIsafe/safety error
12	00	
13	0F	Error message 0x447B000F "Undervoltage in DC bus" • Response: "Fault" • Instance ID: 1 • Module ID: 0x7B • Error ID: 0x0F
14	00	
15	7B	
16	44	

13 Error messages

This chapter supplements the error list for the Servo Drive 9400 contained in the software manual and in the »Engineer« online help with the error messages of the communication module.

Software manual/online help for Servo Drive 9400

Here you can find general information on diagnostics & fault analysis and on error messages.

13.1 Short overview of the PROFIBUS error messages

The following table lists all PROFIBUS error messages in numerical order of the error number. Furthermore the preset error response and – if available – the parameters for setting the error response are specified.

Tip!

When you click the cross-reference in the first column, you will see a detailed description (causes and remedies) of this error message.

Error number		Designation	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c83100	13119744	Profibus: Lost connection to 9400 base device	0: No response	-
0x00c85531	13129009	Profibus: No memory access	6: Information	-
0x00c85532	13129010	Profibus: Read memory error	6: Information	-
0x00c85533	13129011	Profibus: Write memory error	6: Information	-
0x00c86010	13131792	Profibus: Restart after watchdogreset	1: Fault	-
0x00c86011	13131793	Profibus: Internal error	1: Fault	-
0x00c86100	13132032	Profibus: Internal error	0: No response	-
0x00c86101	13132033	Profibus: Internal error	1: Fault	-
0x00c86110	13132048	Profibus: Internal mapping error	4: Warning locked	-
0x00c8641f	13132831	Profibus: Invalid parameter record	1: Fault	-
0x00c86420	13132832	Profibus: Error: Lenze setting loaded	1: Fault	-
0x00c88130	13140272	Profibus watchdog: Monitoring time elapsed	0: No response	C13880/1 C14880/1
0x00c88131	13140273	Profibus: Data_Exchange state exited	0: No response	C13880/1 C14880/1
0x00c88132	13140274	Profibus watchdog: DP-V1 MSAC2 elapsed	0: No response	C13880/2 C14880/2

13.2 Possible causes and remedies

This chapter lists all PROFIBUS error messages in the numerical order of the error numbers. Possible causes and remedies as well as responses to the error messages are described in detail.

Profibus: Lost connection to 9400 standard device [0x00c83100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☒ **None** ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
• Network cable (plug) is defective. • Network cable is not connected to the PROFIBUS terminal X201. • Voltage supply is interrupted.	Check cables and terminals. Connect network cable to the PROFIBUS terminal X201.

Profibus: No memory access [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Access to memory was not possible.	Repeat the download of the application (including module)

Profibus: Read memory error [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be read.	Repeat the download of the application (including module)

Profibus: Write memory error [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be written.	Repeat the download of the application (including module)

Profibus: Restart after watchdog reset [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Module defective.	If this occurs repeatedly, contact the Lenze service.

Profibus: Internal error [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Module defective.	If this occurs repeatedly, contact the Lenze service.

Profibus: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☒ **None** ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error.	If this occurs repeatedly, contact the Lenze service.

Profibus: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The communication module carries out an automatic software reset and reinitialises itself.	If this occurs repeatedly, contact the Lenze service.

Profibus: Internal mapping error [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The selected PDO mapping is invalid: • An object not supporting the required properties has been specified. • More than 64 bytes of data have been mapped.	Repeat the PDO mapping.

Profibus: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Repeat the download of the application (including module)

Profibus: Error: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Access to parameter set was not successful.	Repeat the download of the application (including module).

Profibus watchdog: Monitoring time elapsed [0x00c88130]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1 (☑ Adjustable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
Permanent interruption of communication to the PROFIBUS master. See also chapter "Permanent interruption of PROFIBUS communication" (📖 78).	Check cables and terminals.

Profibus: Data_Exchange state exited [0x00c88131]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1 (☑ Configurable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
Data exchange via PROFIBUS has been terminated. See also chapter "Permanent interruption of PROFIBUS communication" (📖 78).	Check cables and terminals. The slave must receive new parameterisation and configuration files from the master in order to be able to exchange data again.

Profibus watchdog: DP-V1 MSAC2 elapsed [0x00c88132]

Response (Lenze setting printed in bold)	**Setting:** C13880/2 / C14880/2 (☑ Configurable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
Permanent interruption of communication to C2-PROFIBUS master. See also chapter "Permanent interruption of PROFIBUS communication" (📖 78).	Check cables and terminals.

14 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the software manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCPM (PROFIBUS) communication module.

Software manual/»Engineer« online help for Servo Drive 9400

Here you can find general information on parameters.

14.1 Communication-relevant parameters of the standard device

This chapter lists the communication-relevant parameters of the Servo Drive 9400 in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: $23960_d = 5D98_h$
Response to incorrect device configuration		
Selection list		
1	Error	
3	Quick stop by trouble	
4	Warning locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No response	Reserved
C00615/2	1: Fault	Resp. to imp. module in MXI1
C00615/3	1: Fault	Resp. to imp. module in MXI2
C00615/4	0: No response	Reserved
C00615/5	0: No response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: $23939_d = 5D83_h$
Response when a new module has been inserted in module slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Error	
6	Information	
5	Warning	
4	**Warning locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**		Data type: UNSIGNED_32 Index: $23939_d = 5D83_h$
Response when a new module has been inserted in module slot 2 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Error	
6	Information	
5	Warning	
4	**Warning locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**		Data type: UNSIGNED_32 Index: $23074_d = 5A22_h$
Response to a communication error between an "intelligent" module in module slot 1 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Error	
3	Quick stop by trouble	
4	Warning locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: $23074_d = 5A22_h$
Response to a communication error between an "intelligent" module in module slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Error	
3	Quick stop by trouble	
4	Warning locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

14.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCPM communication module (PROFIBUS) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C13231

Parameter | Name: **C13231 | Service code**	Data type: UNSIGNED_64 Index: $11344_d = 2C50_h$
This code is for device-internal use only and must not be overwritten by the user!	

C13489

Parameter | Name: **C13489 | Service code**	Data type: UNSIGNED_8 Index: $11086_d = 2B4E_h$
This code is for device-internal use only and must not be overwritten by the user!	

C13531

Parameter | Name: **C13531 | Service code**	Data type: UNSIGNED_64 Index: $11044_d = 2B24_h$
This code is for device-internal use only and must not be overwritten by the user!	

C13789

Parameter | Name: **C13789 | Service code**	Data type: UNSIGNED_8 Index: $10786_d = 2A22_h$
This code is for device-internal use only and must not be overwritten by the user!	

C13850

Parameter | Name: **C13850 | All words to master**			Data type: UNSIGNED_16 Index: $10725_d = 29E5_h$
Display of the process data words transferred from the communication module to the PROFIBUS master. In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13850/1			
...			
C13850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13851

Parameter | Name: **C13851 | All words from master**			Data type: UNSIGNED_16 Index: $10724_d = 29E4_h$
Display of the process data words transferred from the PROFIBUS master to the communication module. In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13851/1			
...			
C13851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13852

Parameter | Name: **C13852 | All words to standard device**			Data type: UNSIGNED_16 Index: $10723_d = 29E3_h$
Display of the process data words 1 ... 32 transferred from the communication module to the standard device. In the subcodes 1 ... 32, all process data words from the communication module are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13852/1			
...			
C13852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13853

Parameter | Name: **C13853 | All words from standard device**			Data type: UNSIGNED_16 Index: $10722_d = 29E2_h$
Display of the process data words 1 ... 32 transferred from the standard device to the communication module. In the subcodes 1 ... 32, all process data words from the standard device are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13853/1			
...			
C13853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13854

Parameter | Name: **C13854 | COM word to standard device**	Data type: BITFIELD_32 Index: $10721_d = 29E1_h$
Available from software version 01.21! **This code is for device-internal use only and must not be overwritten by the user!**	

C13855

Parameter | Name: **C13855 | COM word from standard device**	Data type: BITFIELD_32 Index: $10720_d = 29E0_h$
Available from software version 01.21! **This code is for device-internal use only and must not be overwritten by the user!**	

C13860

Parameter | Name: **C13860 | Settings**			Data type: UNSIGNED_8 Index: $10715_d = 29DB_h$
Display of the current configuration data.			
Display area (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13860/1			PROFIsafe • 0: Not active • 1: Active
C13860/2			Number of process data words (1 ... 32 words)
C13860/3			DRIVECOM parameter data channel • 0: Not active • 1: Active
C13860/4			Number of PROFIsafe words (0 or 4 words)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13861

Parameter | Name: **C13861 | Bus status**			Data type: UNSIGNED_16 Index: $10714_d = 29DA_h$
Bit-coded display of the current bus state. ▸ Querying the current bus status (📖 84)			
Display area (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13862

Parameter | Name: **C13862 | Bus counter**			Data type: UNSIGNED_16 Index: $10713_d = 29D9_h$
When the maximum count value of 65535 is reached, the counter starts again with 0.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13862/1			Data cycles per second
C13862/2			Total data cycles
C13862/3			Total parameterisation events
C13862/4			Total configuration events
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13863

Parameter | Name: **C13863 | Baud rate**		Data type: UNSIGNED_8 Index: $10712_d = 29D8_h$
Display of the baud rate		
Selection list (read only)		
0	12.00 Mbps	
1	6.00 Mbps	
2	3.00 Mbps	
3	1.50 Mbps	
4	500.00 kbps	
5	187.50 kbps	
6	93.75 kbps	
7	45.45 kbps	
8	19.20 kbps	
9	9.60 kbps	
15	No baud rate detected	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13864

Parameter | Name: **C13864 | Active station address**			Data type: UNSIGNED_8 Index: $10711_d = 29D7_h$
Display of the active station address If all DIP switches 1 ... 64 are in the "OFF" position (Lenze setting), the station address set in C13899 becomes active and is displayed here after switching on. ▸ Setting the station address (📖 31)			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13865

Parameter | Name: **C13865 | Display: Most recent PRM data**	Data type: OCTET_STRING Index: $10710_d = 29D6_h$
Display of the last parameter data sent by the PROFIBUS master with the "Set-Prm" telegram (ASCII string with 24 characters)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13866

Parameter | Name: **C13866 | Display: Most recent CFG data**	Data type: OCTET_STRING Index: $10709_d = 29D5_h$
Display of the last configuration data sent by the PROFIBUS master with the "Chk-Cfg" telegram (ASCII string with 22 characters)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13867

Parameter | Name: **C13867 | Display: Most recent diagnostic data**	Data type: OCTET_STRING Index: $10708_d = 29D4_h$
Display of the last diagnostic data sent to the PROFIBUS master (ASCII string with 16 characters) ▸ Advanced diagnostic message (📖 85)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13868

Parameter | Name: **C13868 | Display: DP state**	Data type: UNSIGNED_8 Index: $10707_d = 29D3_h$
Available from software version 01.21! Display of the DP states (Decentralized Peripherals) ▸ Short-time interruption of PROFIBUS communication (📖 79), see fig. [11-1]	

Selection list (read only)	
0	Waiting for parameterisation
1	Waiting for configuration
2	Data exchange
3	n/a

☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13880

Parameter | Name: **C13880 | Reaction on communication fault**	Data type: UNSIGNED_8 Index: $10695_d = 29C7_h$
Monitoring response to a communication fault on the PROFIBUS A change in the monitoring response is effective immediately. ▸ Permanent interruption of PROFIBUS communication (📖 78)	

Selection list	
0	No response
1	Error
3	Quick stop by trouble
4	Warning locked
6	Information

Subcodes	**Lenze setting**	**Info**
C13880/1	0: No response	The response set here for the "Watchdog/Data Exchange" monitoring function is executed if the bus station ... • does not receive a message from the master within the watchdog monitoring time (displayed in C13882/1) if there is an active connection. • detects that it is no longer in the "Data_Exchange" status. Please see also the notes given under C13881.
C13880/2	0: No response	The response set here for the "DPV1 MSAC2" monitoring is executed if the bus station does not receive a "DPV1 MSAC2" message from the master within the monitoring time (displayed in C13882/2) if there is an active connection) and the MSAC2 connection is stopped by the slave. **Note:** We recommend only setting "information" as response so that no drive-relevant response is executed.

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13881

Parameter | Name: **C13881 | Monitoring time: Data exchange**			Data type: UNSIGNED_16 Index: $10694_d = 29C6_h$
If the "Data Exchange" state is exited, the response parameterised under C13880/1 is carried out when the monitoring time for data exchange set here has expired. • A value of "65535" in this code deactivates the monitoring function. • A change in monitoring is effective immediately. • The value set here for the monitoring time must be smaller than the watchdog monitoring time (C13882/1). ▸ Permanent interruption of PROFIBUS communication (📖 78)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**65535 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13882

Parameter | Name: **C13882 | Monitoring time: Watchdog**			Data type: UNSIGNED_32 Index: $10693_d = 29C5_h$
Display of the watchdog monitoring time determined by the PROFIBUS master • A change in the watchdog monitoring time is immediately effective. • Monitoring starts with the receipt of the first telegram. • When a value of "0" is displayed, the monitoring function is deactivated. ▸ Permanent interruption of PROFIBUS communication (📖 78)			
Display area (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C13882/1			Watchdog monitoring time
C13882/2			DP-V1 MSC2
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13885

Parameter | Name: **C13885 | Clear process data**		Data type: UNSIGNED_8 Index: $10690_d = 29C2_h$
Selection of the process data which the controller will process in the event of a PROFIBUS failure in order to maintain internal communication.		
Selection list (Lenze setting printed in bold)		
0	Use of most recent master PDOs	
1	**PDOs are set to the value '0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13886

Parameter | Name: **C13886 | Set ext. diagnostic bit upon**	Data type: BITFIELD_8 Index: $10689_d = 29C1_h$

Bit-coded selection of the error responses in the standard device causing the external diagnostic bit ("diag bit") to be set (see PROFIBUS specification; bit 3 of byte 1 of the DP diagnostic messages).
- The diagnostic bit is sent to the PROFIBUS master where it is evaluated separately.
- The diagnostic bit is always set when a system error occurs.
- The Lenze setting "0" means that the diagnostic bit is not set for the following error responses.
- An advanced diagnostic message is always sent.

Value is bit-coded:	
Bit 0	Error
Bit 1	Trouble
Bit 2	Quick stop by trouble
Bit 3	Warning locked
Bit 4	Warning
Bit 5	Reserved
Bit 6	Reserved
Bit 7	Reserved

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13887

Parameter | Name: **C13887 | Suppress signalling diag. mess. upon**	Data type: BITFIELD_8 Index: $10688_d = 29C0_h$

Available from software version 01.20!
Selection of the error responses not causing a diagnostic request to the PROFIBUS master.
A diagnostic request is always signalled if a system error or an error message from the SM301 (E94AYAE) safety module occurs.
The Lenze setting "0" means that for each of the following error responses a diagnostic request is signalled.

Value is bit-coded:		Info
Bit 0	Error	
Bit 1	Trouble	
Bit 2	Quick stop by trouble	
Bit 3	Warning locked	
Bit 4	Warning	
Bit 5	Reserved	
Bit 6	Reserved	
Bit 7	Error message 0x00c88130	Available from software version 01.21! Selective suppression of the error message "Available connection to 9400 standard device lost"

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C13897

Parameter | Name: **C13897 | PROFIsafe: Target address**			Data type: UNSIGNED_16 Index: $10678_d = 29B6_h$
Setting of the PROFIsafe target address • Only required if the SM301 (E94AYAE) safety module is used. • A unique PROFIsafe target address must be assigned to each controller.			
Setting range (min. value | unit | max. value)			**Lenze setting**
1		65534	**1**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13899

Parameter | Name: **C13899 | Station address**			Data type: UNSIGNED_8 Index: $10676_d = 29B4_h$
Optional setting of the station address (instead of setting via DIP switches 1 ... 64) • The station address set here only becomes effective if the DIP switches 1 ... 64 have been set to OFF prior to mains switching. • The active station address is displayed under C13864. **Note:** A change of the station address will not be effective until the " Save parameter set" device command has been executed and another mains switching for the communication module/controller has been performed. ▸ Setting the station address (📖 31)			
Setting range (min. value | unit | max. value)			**Lenze setting**
3		126	**3**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13900

Parameter | Name: **C13900 | Firmware product type**	Data type: VISIBLE_STRING Index: $10675_d = 29B3_h$
Display of the product type (string with a length of 8 bytes) The following identification code is displayed: "E94AFCPM".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13901

Parameter | Name: **C13901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: $10674_d = 29B2_h$
Display of the compilation date of the firmware (string with a length of 20 bytes) The date ("MMM DD YYYY") and time ("hh:mm:ss") are displayed, e.g. "Mar 21 2005 12:31:21".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13902

Parameter | Name: **C13902 | Firmware version**	Data type: VISIBLE_STRING Index: $10673_d = 29B1_h$
Display of the firmware version (string with a length of 5 bytes) Example: "01.21"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13920

Parameter | Name: **C13920 | Display: DIP switch setting**			Data type: UNSIGNED_8 Index: $10655_d = 299F_h$
Display of the current DIP switch setting • The displayed value corresponds to the sum of the individual DIP switch values 1 ... 64. • The active station address is displayed under C13864. ▸ Possible DIP switch settings (📖 31)			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13990

Parameter | Name: **C13990 | ICM statistic counter**	Data type: UNSIGNED_16 Index: $10585_d = 2959_h$
Available from software version 01.21! **This code is for device-internal use only and must not be overwritten by the user!**	

14.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCPM communication module (PROFIBUS) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

C14231

Parameter | Name: **C14231 | Service code**	Data type: UNSIGNED_64 Index: $10344_d = 2868_h$
This code is for device-internal use only and must not be overwritten by the user!	

C14489

Parameter | Name: **C14489 | Service code**	Data type: UNSIGNED_8 Index: $10086_d = 2766_h$
This code is for device-internal use only and must not be overwritten by the user!	

C14531

Parameter | Name: **C14531 | Service code**	Data type: UNSIGNED_64 Index: $10044_d = 273C_h$
This code is for device-internal use only and must not be overwritten by the user!	

C14789

Parameter | Name: **C14789 | Service code**	Data type: UNSIGNED_8 Index: $9786_d = 263A_h$
This code is for device-internal use only and must not be overwritten by the user!	

C14850

Parameter | Name: **C14850 | All words to master**			Data type: UNSIGNED_16 Index: $9725_d = 25FD_h$
Display of the process data words transferred from the communication module to the PROFIBUS master. In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14850/1			
...			
C14850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14851

Parameter | Name: **C14851 | All words from master**			Data type: UNSIGNED_16 Index: $9724_d = 25FC_h$
Display of the process data words transferred from the PROFIBUS master to the communication module. In the subcodes 1 ... 32, all process data words to the master are displayed. Only the configured process data words are valid.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14851/1			
...			
C14851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14852

Parameter | Name: **C14852 | All words to standard device**			Data type: UNSIGNED_16 Index: $9723_d = 25FB_h$
Display of the process data words 1 ... 32 transferred from the communication module to the standard device. In the subcodes 1 ... 32, all process data words from the communication module are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14852/1			
...			
C14852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14853

Parameter | Name: **C14853 | All words from standard device**			Data type: UNSIGNED_16 Index: $9722_d = 25FA_h$
Display of the process data words 1 ... 32 transferred from the standard device to the communication module. In the subcodes 1 ... 32, all process data words from the standard device are displayed.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14853/1			
...			
C14853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14854

Parameter | Name: **C14854 | COM word to standard device**	Data type: BITFIELD_32 Index: $9721_d = 25F9_h$
Available from software version 01.21! **This code is for device-internal use only and must not be overwritten by the user!**	

C14855

Parameter | Name: **C14855 | COM word from standard device**	Data type: BITFIELD_32 Index: $9720_d = 25F8_h$
Available from software version 01.21! **This code is for device-internal use only and must not be overwritten by the user!**	

C14860

Parameter | Name: **C14860 | Settings**			Data type: UNSIGNED_8 Index: $9715_d = 25F3_h$
Display of the current configuration data.			
Display area (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14860/1			PROFIsafe • 0: Not active • 1: Active
C14860/2			Number of process data words (1 ... 32 words)
C14860/3			DRIVECOM parameter data channel • 0: Not active • 1: Active
C14860/4			Number of PROFIsafe words (0 or 4 words)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14861

Parameter | Name: **C14861 | Bus status**			Data type: UNSIGNED_16 Index: $9714_d = 25F2_h$
Bit-coded display of the current bus state. ▸ Querying the current bus status (📖 84)			
Display area (min. value | unit | max. value)			
0		65535	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14862

Parameter | Name: **C14862 | Bus counter**			Data type: UNSIGNED_16 Index: $9713_d = 25F1_h$
When the maximum count value of 65535 is reached, the counter starts again with 0.			
Display area (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14862/1			Data cycles per second
C14862/2			Total data cycles
C14862/3			Total parameterisation events
C14862/4			Total configuration events
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14863

Parameter | Name: **C14863 | Baud rate**		Data type: UNSIGNED_8 Index: $9712_d = 25F0_h$
Display of the baud rate		
Selection list (read only)		
0	12.00 Mbps	
1	6.00 Mbps	
2	3.00 Mbps	
3	1.50 Mbps	
4	500.00 kbps	
5	187.50 kbps	
6	93.75 kbps	
7	45.45 kbps	
8	19.20 kbps	
9	9.60 kbps	
15	No baud rate detected	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14864

Parameter | Name: **C14864 | Active station address**			Data type: UNSIGNED_8 Index: $9711_d = 25EF_h$
Display of the active station address If all DIP switches 1 ... 64 are in the "OFF" position (Lenze setting), the station address set in C14899 becomes active and is displayed here after switching on. ▸ Setting the station address (📖 31)			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14865

Parameter | Name: **C14865 | Display: Most recent PRM data**	Data type: OCTET_STRING Index: $9710_d = 25EE_h$
Display of the last parameter data sent by the PROFIBUS master with the "Set-Prm" telegram (ASCII string with 24 characters)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14866

Parameter | Name: **C14866 | Display: Most recent CFG data**	Data type: OCTET_STRING Index: $9709_d = 25ED_h$
Display of the last configuration data sent by the PROFIBUS master with the "Chk-Cfg" telegram (ASCII string with 22 characters)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14867

Parameter | Name: **C14867 | Display: Most recent diagnostic data**	Data type: OCTET_STRING Index: $9708_d = 25EC_h$
Display of the last diagnostic data sent to the PROFIBUS master (ASCII string with 16 characters) ▸ Advanced diagnostic message (📖 85)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14868

Parameter | Name: **C14868 | Display: DP state**	Data type: UNSIGNED_8 Index: $9707_d = 25EB_h$
Available from software version 01.21! Display of the DP states (Decentralized Peripherals) ▸ Short-time interruption of PROFIBUS communication (📖 79), see fig. [11-1]	
Selection list (read only)	
0 | Waiting for parameterisation	
1 | Waiting for configuration	
2 | Data exchange	
3 | n/a	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14880

Parameter | Name: **C14880 | Reaction on communication fault**	Data type: UNSIGNED_8 Index: $9695_d = 25DF_h$
Monitoring response to a communication fault on the PROFIBUS A change in the monitoring response is effective immediately. ▸ Permanent interruption of PROFIBUS communication (📖 78)	
Selection list	
0 | No response	
1 | Error	
3 | Quick stop by trouble	
4 | Warning locked	
6 | Information	

Subcodes	Lenze setting	Info
C14880/1	0: No response	The response set here for the "Watchdog/Data Exchange" monitoring function is executed if the bus station ... • does not receive a message from the master within the watchdog monitoring time (displayed in C14882/1) if there is an active connection. • detects that it is no longer in the "DATA_EXCHANGE" status. Please see also the notes given under C14881.
C14880/2	0: No response	The response set here for the "DPV1 MSAC2" monitoring is executed if the bus station does not receive a "DPV1 MSAC2" message from the master within the monitoring time (displayed in C14882/2) if there is an active connection) and the MSAC2 connection is stopped by the slave. **Note:** We recommend only setting "information" as response so that no drive-relevant response is executed.

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14881

Parameter | Name: **C14881 | Monitoring time: Data exchange**			Data type: UNSIGNED_16 Index: $9694_d = 25DE_h$
If the "Data Exchange" state is exited, the response parameterised under C14880/1 is carried out when the monitoring time for data exchange set here has expired. • A value of "65535" in this code deactivates the monitoring function. • A change in monitoring is effective immediately. • The value set here for the monitoring time must be smaller than the watchdog monitoring time (C14882/1). ▸ Permanent interruption of PROFIBUS communication (📖 78)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**65535 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14882

Parameter | Name: **C14882 | Monitoring time: Watchdog**			Data type: UNSIGNED_32 Index: $9693_d = 25DD_h$
Display of the watchdog monitoring time determined by the PROFIBUS master • A change in the watchdog monitoring time is immediately effective. • Monitoring starts with the receipt of the first telegram. • When a value of "0" is displayed, the monitoring function is deactivated. ▸ Permanent interruption of PROFIBUS communication (📖 78)			
Display area (min. value | unit | max. value)			
0	ms	4294967295	
Subcodes			**Info**
C14882/1			Watchdog monitoring time
C14882/2			DP-V1 MSC2
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14885

Parameter | Name: **C14885 | Clear process data**		Data type: UNSIGNED_8 Index: $9690_d = 25DA_h$
Selection of the process data which the controller will process in the event of a PROFIBUS failure in order to maintain internal communication.		
Selection list (Lenze setting printed in bold)		
0	Use of most recent master PDOs	
1	**PDOs are set to the value '0'**	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C14886

Parameter | Name: **C14886 | Set ext. diagnostic bit upon**	Data type: BITFIELD_8 Index: $9689_d = 25D9_h$

Bit-coded selection of the error responses in the standard device causing the external diagnostic bit ("diag bit") to be set (see PROFIBUS specification; bit 3 of byte 1 of the DP diagnostic messages).
- The diagnostic bit is sent to the PROFIBUS master where it is evaluated separately.
- The diagnostic bit is always set when a system error occurs.
- The Lenze setting "0" means that the diagnostic bit is not set for the following error responses.
- An advanced diagnostic message is always sent.

Value is bit-coded:	
Bit 0	Error
Bit 1	Trouble
Bit 2	Quick stop by trouble
Bit 3	Warning locked
Bit 4	Warning
Bit 5	Reserved
Bit 6	Reserved
Bit 7	Reserved

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14887

Parameter | Name: **C14887 | Suppress signalling diag. mess. upon**	Data type: BITFIELD_8 Index: $9688_d = 25D8_h$

Available from software version 01.20!
Selection of the error responses not causing a diagnostic request to the PROFIBUS master.
A diagnostic request is always signalled if a system error or an error message from the SM301 (E94AYAE) safety module occurs.
The Lenze setting "0" means that for each of the following error responses a diagnostic request is signalled.

Value is bit-coded:		Info
Bit 0	Error	
Bit 1	Trouble	
Bit 2	Quick stop by trouble	
Bit 3	Warning locked	
Bit 4	Warning	
Bit 5	Reserved	
Bit 6	Reserved	
Bit 7	Error message 0x00c88130	Available from software version 01.21! Selective suppression of the error message "Available connection to 9400 standard device lost"

☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT

C14897

Parameter | Name: **C14897 | PROFIsafe: Target address**			Data type: UNSIGNED_16 Index: $9678_d = 25CE_h$
Setting of the PROFIsafe target address • Only required if the SM301 (E94AYAE) safety module is used. • A unique PROFIsafe target address must be assigned to each controller.			
Einstellbereich (min. Wert | Einheit | max. Wert)			**Lenze setting**
1		65534	**1**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14899

Parameter | Name: **C14899 | Station address**			Data type: UNSIGNED_8 Index: $9676_d = 25CC_h$
Optional setting of the station address (instead of setting via DIP switches 1 ... 64) • The station address set here only becomes effective if the DIP switches 1 ... 64 have been set to OFF prior to mains switching. • The active station address is displayed under C14864. **Note:** A change of the station address will not be effective until the " Save parameter set" device command has been executed and another mains switching for the communication module/controller has been performed. ▸ Setting the station address (📖 31)			
Einstellbereich (min. Wert | Einheit | max. Wert)			**Lenze setting**
3		126	**3**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14900

Parameter | Name: **C14900 | Firmware product type**	Data type: VISIBLE_STRING Index: $9675_d = 25CB_h$
Display of the product type (string with a length of 8 bytes) The following identification code is displayed: "E94AFCPM".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14901

Parameter | Name: **C14901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: $9674_d = 25CA_h$
Display of the compilation date of the firmware (string with a length of 20 bytes) The date ("MMM DD YYYY") and time ("hh:mm:ss") are displayed, e.g. "Mar 21 2005 12:31:21".	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14902

Parameter | Name: **C14902 | Firmware version**	Data type: VISIBLE_STRING Index: $9673_d = 25C9_h$
Display of the firmware version (string with a length of 5 bytes) Example: "01.21"	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14920

Parameter | Name: **C14920 | Display: DIP switch setting**			Data type: UNSIGNED_8 Index: $9655_d = 25B7_h$
Display of the current DIP switch setting • The displayed value corresponds to the sum of the individual DIP switch values 1 ... 64. • The active station address is displayed under C14864. • ▸ Possible DIP switch settings (📖 31)			
Display area (min. value | unit | max. value)			
0		255	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14990

Parameter | Name: **C14990 | ICM statistic counter**	Data type: UNSIGNED_16 Index: $9585_d = 2571_h$
Available from software version 01.21! **This code is for device-internal use only and must not be overwritten by the user!**	

14.4 Table of attributes

The table of attributes contains information required for communication with the controller via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter designation	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index by which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		$5FFF_h$ - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = no decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit required	☑ Writing is only possible if controller inhibit is set	

Table of attributes

15 DIP switch positions for setting the station address

The station address results from the sum of the binary valencies of switches 1 ... 64.

The following table shows the switch positions for the valid address range 1 ... 126.

▸ Setting the station address (📖 31)

Station address	DIP switch						
	64	32	16	8	4	2	1
1	OFF	OFF	OFF	OFF	OFF	OFF	**ON**
2	OFF	OFF	OFF	OFF	OFF	**ON**	OFF
3	OFF	OFF	OFF	OFF	OFF	**ON**	**ON**
4	OFF	OFF	OFF	OFF	**ON**	OFF	OFF
5	OFF	OFF	OFF	OFF	**ON**	OFF	**ON**
6	OFF	OFF	OFF	OFF	**ON**	**ON**	OFF
7	OFF	OFF	OFF	OFF	**ON**	**ON**	**ON**
8	OFF	OFF	OFF	**ON**	OFF	OFF	OFF
9	OFF	OFF	OFF	**ON**	OFF	OFF	**ON**
10	OFF	OFF	OFF	**ON**	OFF	**ON**	OFF
11	OFF	OFF	OFF	**ON**	OFF	**ON**	**ON**
12	OFF	OFF	OFF	**ON**	**ON**	OFF	OFF
13	OFF	OFF	OFF	**ON**	**ON**	OFF	**ON**
14	OFF	OFF	OFF	**ON**	**ON**	**ON**	OFF
15	OFF	OFF	OFF	**ON**	**ON**	**ON**	**ON**
16	OFF	OFF	**ON**	OFF	OFF	OFF	OFF
17	OFF	OFF	**ON**	OFF	OFF	OFF	**ON**
18	OFF	OFF	**ON**	OFF	OFF	**ON**	OFF
19	OFF	OFF	**ON**	OFF	OFF	**ON**	**ON**
20	OFF	OFF	**ON**	OFF	**ON**	OFF	OFF
21	OFF	OFF	**ON**	OFF	**ON**	OFF	**ON**
22	OFF	OFF	**ON**	OFF	**ON**	**ON**	OFF
23	OFF	OFF	**ON**	OFF	**ON**	**ON**	**ON**
24	OFF	OFF	**ON**	**ON**	OFF	OFF	OFF
25	OFF	OFF	**ON**	**ON**	OFF	OFF	**ON**
26	OFF	OFF	**ON**	**ON**	OFF	**ON**	OFF
27	OFF	OFF	**ON**	**ON**	OFF	**ON**	**ON**
28	OFF	OFF	**ON**	**ON**	**ON**	OFF	OFF
29	OFF	OFF	**ON**	**ON**	**ON**	OFF	**ON**

1 About this documentation

Contents

This documentation exclusively describes the E94AYCER communication module (PROFINET).

Note!

This documentation supplements the **mounting instructions** supplied with the inverter and the **"Servo Drives 9400" hardware manual**.

The mounting instructions contain safety instructions which must be observed!

The features and functions of the communication module are described in detail.

Examples illustrate typical applications.

The theoretical context is only explained as far as it is required for understanding the function of the communication module.

This documentation does not describe any software provided by other manufacturers. No warranty can be given for corresponding data provided in this documentation. For information on how to use the software, please refer to the host (PLC, IO Controller) documents.

All brand names mentioned in this documentation are trademarks of their corresponding owners.

Tip!

Detailed information about PROFINET can be found on the homepage of the PROFIBUS user organisation which also develops the PROFINET communication technology:

www.profibus.com

1 About this documentation

Target group

This documentation addresses to persons who configure, install, commission, and maintain the networking and remote maintenance of a machine.

Tip!

Current documentation and software updates with regard to Lenze products can be found in the download area at:

www.lenze.com

Information regarding the validity

The information given in this documentation is valid for the following devices:

Extension module	Type designation	From hardware version	From software version
PROFINET communication module	E94AYCER	VE	01.40

Screenshots/application examples

All screenshots in this documentation are application examples. Depending on the firmware version of the communication module and software version of the engineering tools installed (e.g. »Engineer«, »STEP7«), the screenshots in this documentation may differ from the screen representation.

1.1 Document history

Version			Description
11.0	04/2016	TD17	• Corrections with regard to software version 03.00 • Information regarding the use of the SM302 safety module
10.0	11/2015	TD17	• Corrections with regard to software version 02.10 • Chapter "Shared Device" function (📖 52) new • Chapter Media Redundancy Protocol (MRP) (📖 53) new
9.0	12/2013	TD17	• Revision for software version 02.10 • New layout
8.0	09/2012	TD17	Revision for software version 02.00
7.0	03/2011	TD17	Revision for software version 01.40
6.0	04/2010	TD17	Chapters "Commissioning (📖 32)" and "Monitoring (📖 77)" updated.
5.0	03/2010	TD17	New chapter "Establishing an online connection via PROFINET with the Lenze »Engineer«"
4.0	11/2009	TD17	General revision
3.0	02/2009	TD17	General revision
2.0	07/2008	TD17	Revision for hardware version VE (2 port PROFINET)
1.0	11/2007	TD17	First edition for hardware version VC (1 port PROFINET)

1.2 Conventions used

This documentation uses the following conventions to distinguish between different types of information:

Type of information	Writing	Examples/notes
Spelling of numbers		
Decimal	Normal spelling	Example: 1234
Decimal separator	Point	The decimal point is always used. For example: 1234.56
Hexadecimal	0x[0 ... 9, A ... F]	Example: 0x60F4
Binary • Nibble	In inverted commas Point	Example: '100' Example: '0110.0100'
Text		
Version information	Blue text colour	All information that only applies to or from a certain software version of the inverter is marked accordingly in this documentation. Example: This function extension is available from software version V3.0!
Program name	» «	The Lenze »Engineer« PC software...
Control element	**bold**	The **OK** button... / the **Copy** command... / the **Characteristics** tab... / the **Name** input field...
Sequence of menu commands		If several commands are required in succession for executing a function, the single commands are separated by an arrow: Select the **File → Open** command to...

Page reference	(📖 8)	Optically highlighted reference to another page. It is activated with a mouse-click in this online documentation.
Step-by-step instructions		Step-by-step instructions are indicated by a pictograph.

1.3 Terminology used

Term	Meaning
Inverter	Lenze inverters of the "Servo Drives 9400" product series
Standard device	
Code	Parameter that serves to parameterise and monitor the inverter. This term is usually referred to as "index" in common parlance.
Subcode	If a code contains several parameters, they are stored in "subcodes". In the documentation, the slash "/" is used as a separator between the code and the subcode (e.g. "C00118/3"). The term is also referred to as "subindex" in common parlance.
»Engineer«	Lenze PC software which supports you during the "Engineering" process (parameterisation, diagnostics, and configuration) throughout the whole life cycle, i. e. from planning to maintenance of the machine commissioned.
FW	Firmware
HW	Hardware
I/O controller	PROFINET master The I/O controller takes over the master function for data communication of the decentralised field devices. The I/O controller usually is the communication interface of a PLC.
I/O device	PROFINET slave
IO supervisor	Engineering and diagnostics tools The IO supervisor can access process data, diagnostic data, and alarm data.
IOPS (IO Provider State)	Status of the process data sent by the IO controller • A "GOOD" status indicates that the process data sent are valid. • A "BAD" status indicates that the process data sent are invalid.
Lenze setting	Default settings of the device, preconfigured ex works.
Basic setting	
PROFINET	PROFINET® (Process Field Network) is a real-time capable fieldbus system based on Ethernet. PROFINET® is a registered trademark and patented technology licensed by the PROFIBUS & PROFINET International (PI) user organisation.
PROFIsafe	The certified safety protocol for the transmission of safety-oriented data via PROFINET
»STEP7« / »HW Konfig«	Siemens PC software for PROFINET configuration
»Primary Setup Tool«	
SW	Software

1.4 Notes used

The following signal words and symbols are used in this documentation to indicate dangers and important information:

Safety instructions

Layout of the safety instructions:

Pictograph and signal word!

(characterise the type and severity of danger)

Note

(describes the danger and gives information about how to prevent dangerous situations)

Pictograph	Signal word	Meaning
	**Danger!**	**Danger of personal injury through dangerous electrical voltage** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Danger!**	**Danger of personal injury through a general source of danger** Reference to an imminent danger that may result in death or serious personal injury if the corresponding measures are not taken.
	**Stop!**	**Danger of property damage** Reference to a possible danger that may result in property damage if the corresponding measures are not taken.

Application notes

Pictograph	Signal word	Meaning
	**Note!**	Important note to ensure trouble-free operation
	**Tip!**	Useful tip for easy handling
		Reference to another document

2 Safety instructions

Note!

It is absolutely vital that the stated safety measures are implemented in order to prevent serious injury to persons and damage to material assets.

Always keep this documentation to hand in the vicinity of the product during operation.

2.1 General safety and application notes

Danger!

If the following basic safety measures are disregarded, severe injuries to persons and damage to material assets may result.

Lenze drive and automation components ...

- must only be used as directed.
  ▸ Application as directed (📖 12)
- must never be commissioned if they display signs of damage.
- must never be technically modified.
- must never be commissioned if they are not fully mounted.
- must never be operated without required covers.
- during and after operation can have live, moving and rotating parts, depending on their degree of protection. Surfaces can be hot.

The following applies to Lenze drive components ...

- only use the accessories approved.
- Only use original manufacturer spare parts.

Observe all specifications contained in the enclosed documentation and related documentation.

- This is the precondition for safe and trouble-free operation and for obtaining the product features specified.
  ▸ Product features (📖 13)
- The specifications, processes, and circuitry described in this document are for guidance only and must be adapted to your own specific application. Lenze does not take responsibility for the suitability of the process and circuit proposals.

All works on and with Lenze drive and automation components must only be carried out by qualified personnel. According to IEC 60364 or CENELEC HD 384 these are persons who ...

- are familiar with installing, mounting, commissioning, and operating the product.
- who have the corresponding qualifications for their work.
- who know and can apply all regulations for the prevention of accidents, directives, and laws applicable at the place of use.

2.2 Device and application-specific safety instructions

- During operation, the communication module must be securely connected to the standard device.
- With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).
- A safety bus system (PROFIsafe) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.
- Only use cables corresponding to the given specifications.
  ▸ Ethernet cable specification (📖 29)

Documentation for the standard device, control system, system/machine

All the other measures prescribed in this documentation must also be implemented. Observe the safety instructions and application notes contained in this manual.

2.3 Residual hazards

Protection of persons

If Servo Drives 9400 are used on a phase earthed mains with a rated mains voltage ≥ 400 V, protection against accidental contact is not guaranteed without external measures.
▸ Protective insulation (📖 18)

Device protection

The communication module contains electronic components which may be damaged or destroyed by electrostatic discharge.
▸ Installation (📖 22)

3 Product description

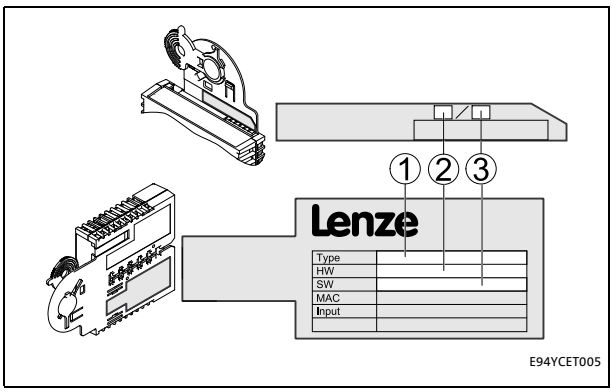
3.1 Application as directed

The communication module ...

- is an accessory module that can be used in conjunction with the following standard devices:

Product series	Type designation	From hardware version	From software version upwards
Servo Drives 9400 HighLine	E94AxHExxx	1A	04.00
Servo Drives 9400 PLC	E94AxPExxxx	VA	02.00
Regenerative power supply module	E94ARNxxxx	VA	01.00

- must only be used together with the following safety modules:



Product series	Type designation	From hardware version	From software version upwards
SM301 safety module	E94AYAE	VB	1.1
SM302 safety module (from SW version 3.00 onwards)	E94AYAF	VA	1.0

- is a device intended for use in industrial power systems.
- should only be used under the operating conditions prescribed in this documentation.
- can only be used in PROFINET networks.

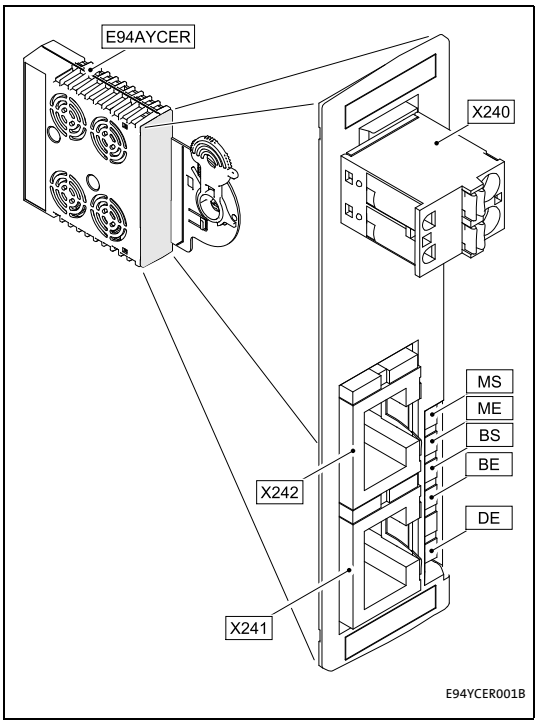
Any other use shall be deemed inappropriate!

3.2 Identification

The type designation and the hardware and software versions of the communication module are indicated on the nameplate:

[3-1] Identification data

1 Type designation
- E94 Product series
- A Version
- Y Module identification: Extension module
- C Module type: Communication module
- ER PROFINET



2 Hardware version

3 Software version

3.3 Product features

- Interface module for the PROFINET IO communication system, for attaching to the expansion slots of Servo Drives 9400
- The communication module can either be supplied internally by the standard device or externally by a separate voltage source.
- Support of the I&M0...4 functionality for the identification of the standard device
- Automatic detection of the baud rate 100 Mbps
- A line topology is enabled by the integrated 2-port switch.
- Support of the LLDP (Link Layer Discovery Protocol) for the topology recognition
- Support of the SNMP (Simple Network Management Protocol) for diagnostic purposes
- Support of the MRP (Media Redundancy Protocol) from SW version 2.10
  The Servo Drive 9400 can be integrated as client node into a ring topology.
- Support of the "Shared Device" function from SW version 2.10
- Transfer of safe information via the PROFIsafe protocol if the SM301 safety module (E94AYAE) is used simultaneously
  From SW version 3.00 onwards, the SM302 safety module (E94AYAF) can also be used.
- Up to 32 process data words (64 bytes) per direction can be exchanged.
- Access to all Lenze parameters
- An online connection via PROFINET can be established using the Lenze »Engineer«.
  From SW version 2.10 onwards, up to 3 connections are supported at the same time.
  Note: It must be ensured that file services accessing a file (e.g. load parameter set) are always only executed via one engineering tool. Otherwise file access errors will occur.

3.4 Terminals and interfaces

[3-2] E94AYCER communication module (PROFINET)

X240 External voltage supply of the communication module
- 2-pin plug connector with spring connection

▸ External voltage supply (📖 31)

X241 PROFINET input (IN)

X242 PROFINET output (OUT)
- RJ45 sockets according to IEC/EN 60603-7
- each with 2 LED status displays for diagnostics

▸ Network topology (📖 25)
▸ PROFINET connection (📖 27)
▸ Status displays at X241 and X242 (📖 82)

MS LED status displays for diagnostics
ME ▸ Module status displays (📖 80)
BS ▸ Fieldbus status displays (📖 81)
BE
DE

4 Technical data

4.1 General data and operating conditions

Range	Values	
Order designation	E94AYCER	
Communication profile	PROFINET	
Communication medium	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e	
Interface for communication	RJ45: Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)	
Network topology	Tree, star, and line	
Type of node	I/O device with real time (RT) communication properties	
Number of device nodes	Max. 255 in the subnetwork	
Max. cable length	100 m	
PNO identification number	0x0106	
Device identification (Device ID)	0x9400	
TCP port	9410	
Number of TCP ports	• 1 • 3 (from SW version 2.10)	
Optional PROFINET functions (from SW version 2.10)	• Multiple access (Shared Device) • MRP (Media Redundancy Protocol)	
Baud rate	100 Mbps	
Minimum cycle time	• 4 ms • 2 ms (from SW version 2.10)	
Switching method	• "Store and forward" • "Cut-Through" (from SW version 2.10)	
Switch latency	• Approx. 125 µs at max. frame length • 6 µs (from SW version 2.10)	
Voltage supply	External supply via separate power supply unit +: U = 24 V DC (20.4 V ... 28.8 V), I = 130 mA -: reference potential for external voltage supply	
Conformities, approvals	CE	2004/108/EC, EMC Directive 2006/95/EC, Low-Voltage Directive
	EAC	Eurasian conformity TR CU: Technical Regulations of Customs Union
		TP TC 004/2011 (TR CU 004/2011) About the safety of low voltage equipment
		TP TC 020/2011 (TR CU 020/2011) Electromagnetic compatibility of technical means
	UL	UL 508C, Power Conversion Equipment (file no. E132659)

Servo Drives 9400 hardware manual

Here you can find the **ambient conditions** and data on the **electromagnetic compatibility (EMC)**, which also apply to the communication module.

4.2 Protocol data

Range	Values
Process data words (PCD)	Maximally 32 process data words (max. 64 bytes)
PROFIsafe data for use of the SM301 safety module	4 words (8 bytes)
PROFIsafe data for use of the SM302 safety module (from SW version 3.00 onwards)	8 words (16 bytes)
Acyclic parameter data channel	Limited by the PROFINET frame size

4.3 Communication time

The communication time is the time between the start of a request and the arrival of the corresponding response.

The communication times in an PROFINET network depend on the ...

- processing time in the inverter;
- frame runtime (baud rate / frame length);
- nesting depth of the network.

Processing time inside the inverter

Data	Processing time	
Process data (I/O data)	10 ms + 0 ... 1 ms + 1 ... x ms	Lenze standard update cycle (can be changed in the Rockwell engineering tool) Processing time in the module Runtime of the application task of the technology application used (tolerance)
Parameter data	Approx. 30 ms + a tolerance of 20 ms (typically) • Some codes may require a longer processing time (see reference manual/ »Engineer« online help for the Servo Drive 9400). • The times specified apply if the TCP/IP channel of the communication module is not used (»Engineer« communication, chapter Setting the IP configuration (📖 37)).	

There are no interdependencies between parameter data and process data.

4.4 Internal switch latency

The integrated 2-port switch causes runtime delays. These runtime delays can be calculated as follows for modules up to and including SW version V01.40:

Runtime delay = ((36 permanent bytes + process data in bytes) x 8 x 10 nsec) + 4 µsec

Example

20 process data words + 4 PROFIsafe words => 48 bytes

- ((36 permanent bytes + 48 bytes) x 8 x 10 nsec) + 4 µsec
- (84 bytes x 8 x 10 nsec) + 4 µsec
- 6.72 µsec + 4 µsec = **10.72 µsec**

In accordance with the PROFINET specification, the shortest PROFINET I/O frame must have a data length of 72 bytes. If the 36 permanent bytes are subtracted from the 72 bytes, 36 bytes are available for process data. If now less than 36 bytes of process data are used, the PROFINET I/O frame is filled with "zero bytes" until it can be transmitted. As a consequence for the calculation formula, the shortest PROFINET I/O frame with 18 process data words (36 bytes) has always the same length and thus the runtime delay is the same, too.

From SW version V2.10, a frame length-independent delay time of < 6 µs applies.

Note!

The use of external switches can also lead to runtime delays. Depending on the system constellation, it may be useful to create a star topology or a line/mix topology.

▸ Network topology (📖 25)

4.5 Protective insulation

Danger!

Dangerous voltage

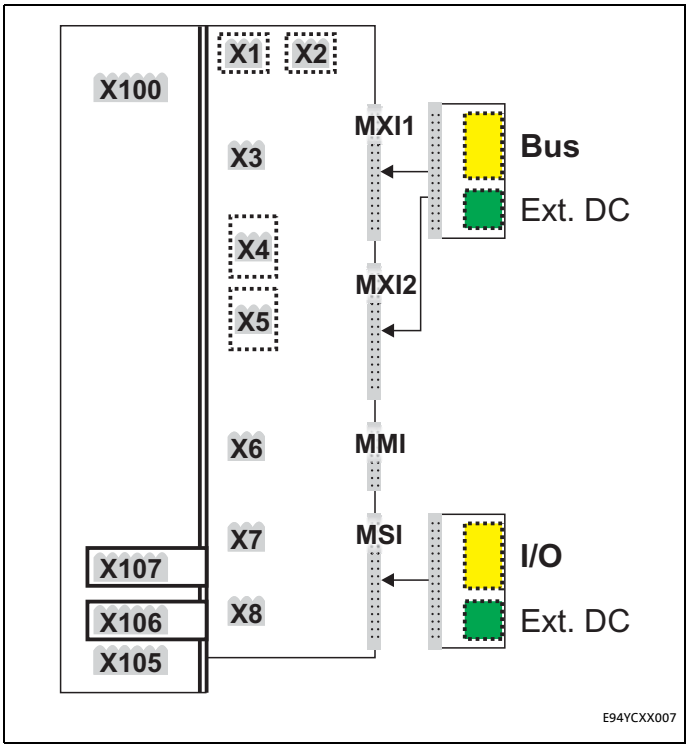
If the Servo Drives 9400 are operated on a phase earthed mains with a rated mains voltage ≥ 400 V, external measures need to be implemented in order to ensure protection against accidental contact.

Possible consequences:

Death or severe injuries

Protective measures:

If protection against accidental contact is required for the control terminals of the inverter and the connections of the device modules plugged, ...



- a double isolating distance must exist.
- the components to be connected must be provided with the second isolating distance.

Note!

The protective insulation provided in Servo Drives 9400 is implemented in accordance with EN 61800-5-1.

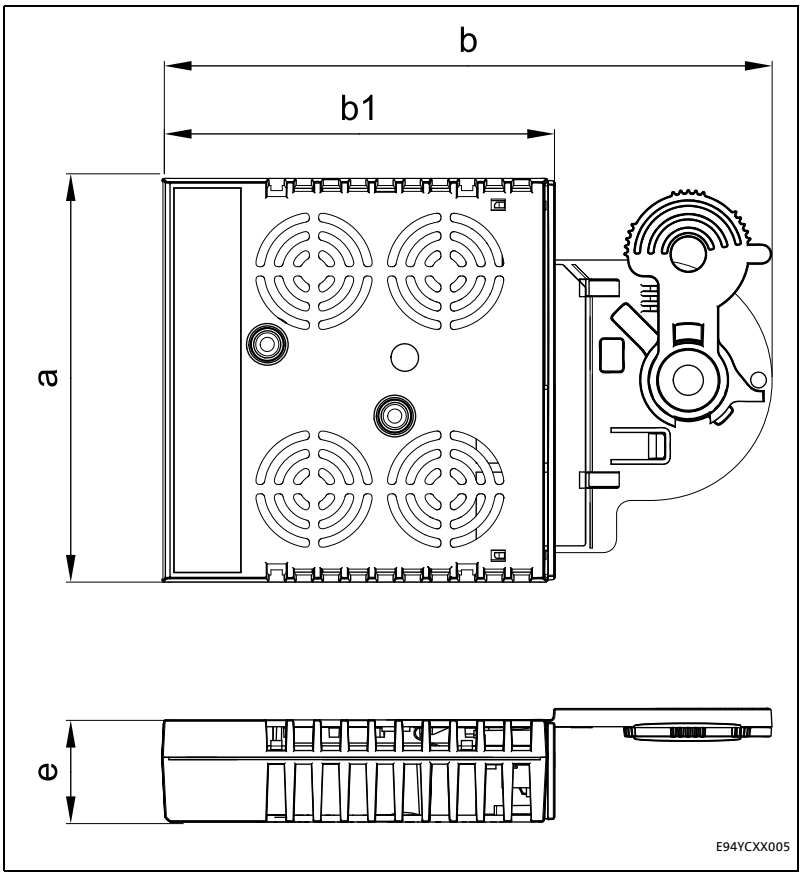
The following illustration ...

- shows the arrangement of the terminal strips and the separate potential areas of the Servo Drive 9400.
- serves to determine the decisive protective insulation between two terminals located in differently insulated separate potential areas.

[4-1] Protective insulation in accordance with EN61800-5-1

Terminal strip	Terminal	Terminal strip	Terminal
X100	L1, L2, L3 (Single Drive only)	X1	CAN on board 9400
	+UG, -UG	X2	State bus
X105	U, V, W		24 V (ext.)
	Rb1, Rb2 (Single Drive only)	X3	Analog inputs/outputs
X106	Motor PTC	X4	Digital outputs
X107	Control of the motor holding brake	X5	Digital inputs
		X6	Diagnostics
		X7	Resolver
		X8	Encoder
		MXI1, MXI2	Extension module
		MMI	Memory module
		MSI	Safety module

Example



Which type of protective insulation is used between the bus terminal of the device module in slot MXI1 or MXI2 and the mains terminal X100?

The separate potential area with the better protective insulation is decisive.

- The separate potential area of the bus terminal of the device module has a "functional insulation".
- The separate potential area of the mains terminal has a "reinforced insulation".

Result: The insulation between mains terminal X100 and the bus terminal is of the "reinforced insulation" type.

4.6 Dimensions

a 89 mm
b 134 mm
b1 87 mm
e 23 mm

[4-2] Dimensions

5 Installation

Stop!

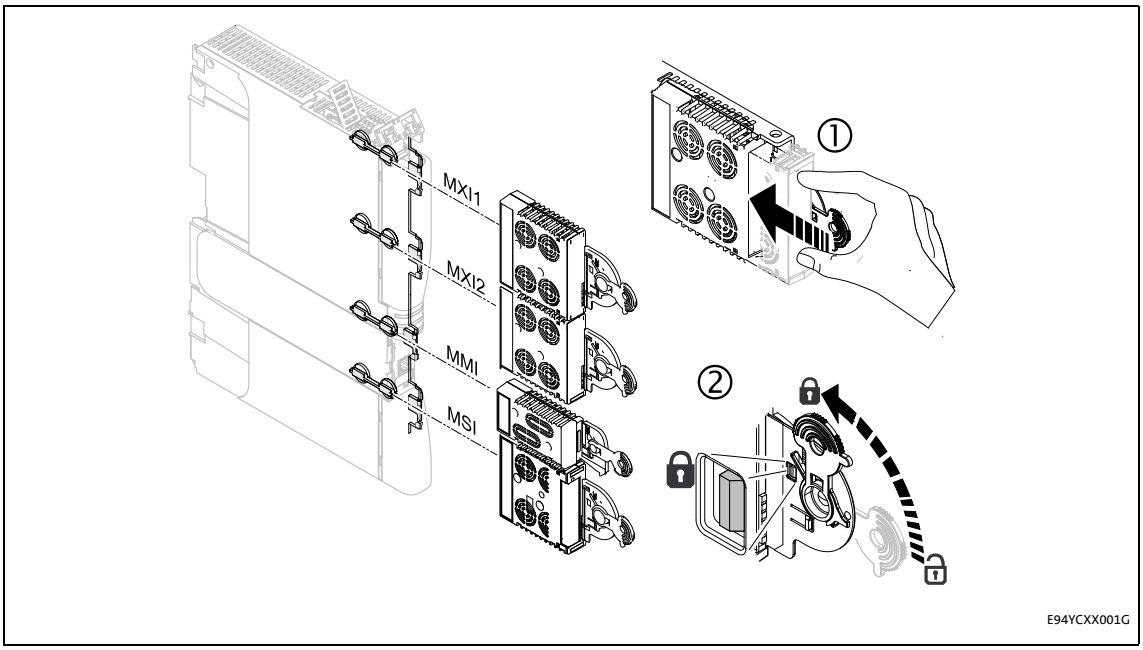
Electrostatic discharge

Electronic components within the communication module can be damaged or destroyed by electrostatic discharge.

Possible consequences:

- The communication module is defective.
- Fieldbus communication is not possible or faulty.

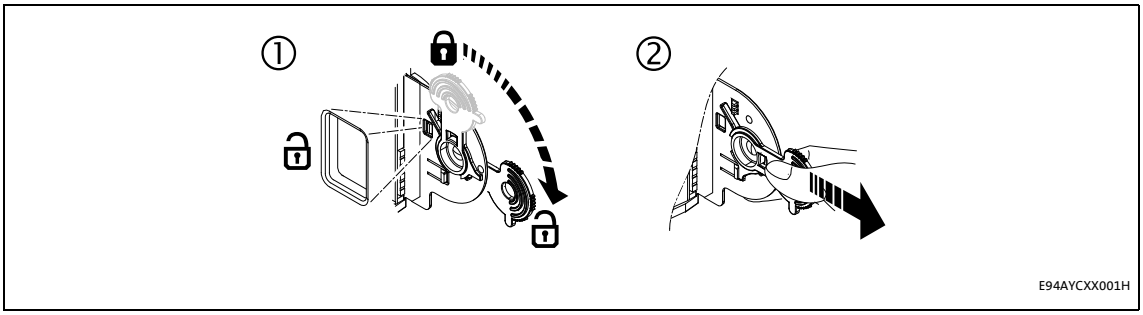
Protective measures



- Before touching the module, be sure that you are free of electrostatic charge.

5.1 Mechanical installation

Note!



A safety bus system (PROFIsafe) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

5.1.1 Assembly

[5-1] Assembly

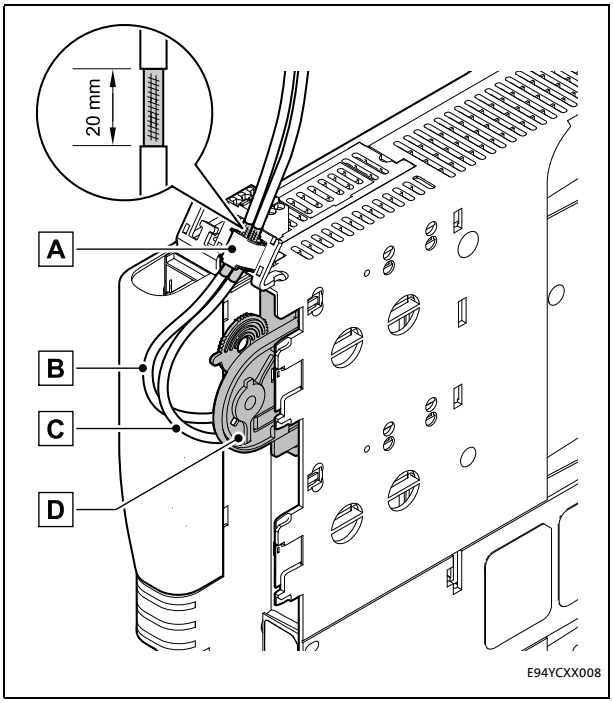
5.1.2 Disassembly

[5-2] Disassembly

5.2 Electrical installation

Documentation for the standard device, control system, system/machine

Observe the notes and wiring instructions contained in this documentation.



5.2.1 Wiring according to EMC guidelines

In typical systems, standard shielding is sufficient for Ethernet cables.

However, in environments with a very high level of interference, EMC resistance can be improved by additionally earthing the cable shield on both sides.

For this observe the following notes:

1. The distance between the additional earthing and the Ethernet plug depends on the module slot and is as follows:
   - approx. 10 cm for the upper slot (MXI1)
   - approx. 20 cm for the lower slot (MXI2)
2. Measure the appropriate distance along the cable and, starting from this point, remove 2 cm of the cable's plastic sheath.
3. Connect the cable shield to the shield sheet of the Servo Drive 9400.

A Connection to the shield sheet of the Servo Drive 9400

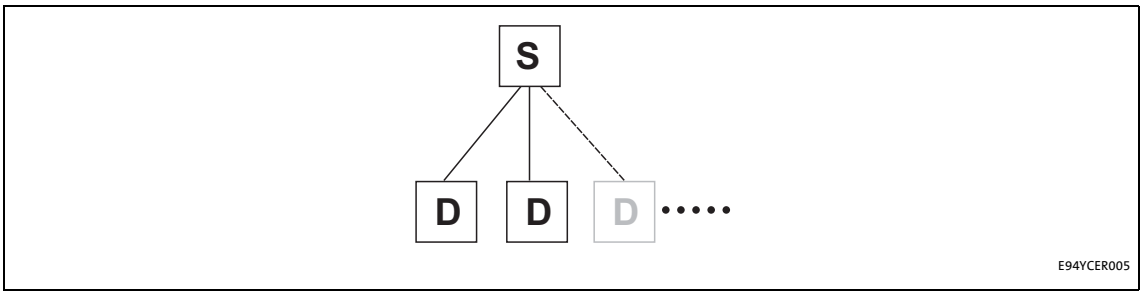
B Outgoing PROFINET cable at X242

C Incoming PROFINET cable at X241

D Communication module in slot MXI1 of the Servo Drive 9400

[5-3] Wiring according to EMC guidelines

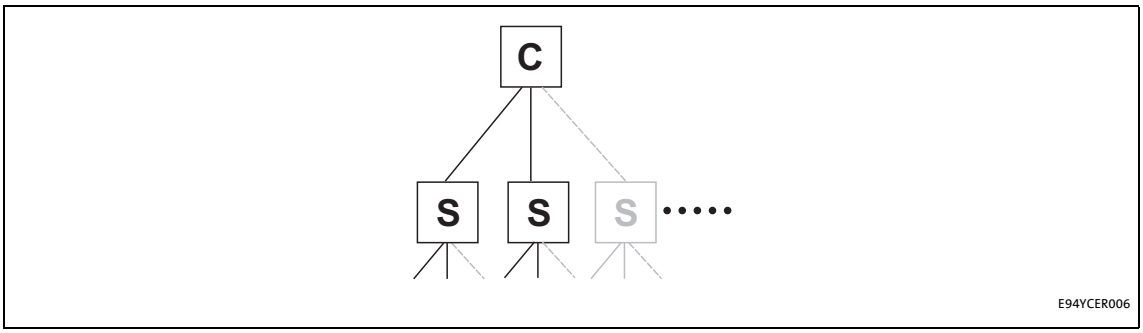
5.2.2 Network topology



It is typical of PROFINET to have a rather free topology the limiting factor of which is large message latencies due to e.g. switches connected in series.

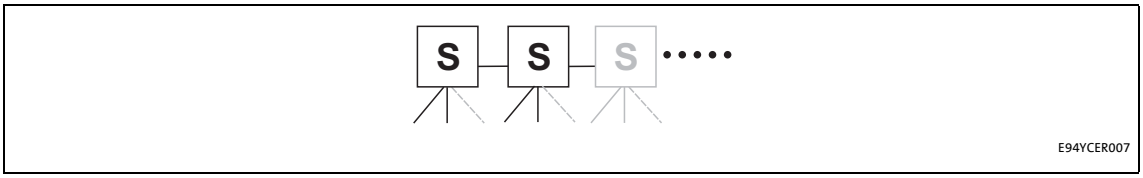
▸ Internal switch latency (📖 17)

The combination of a line and a stub is useful for system wiring.



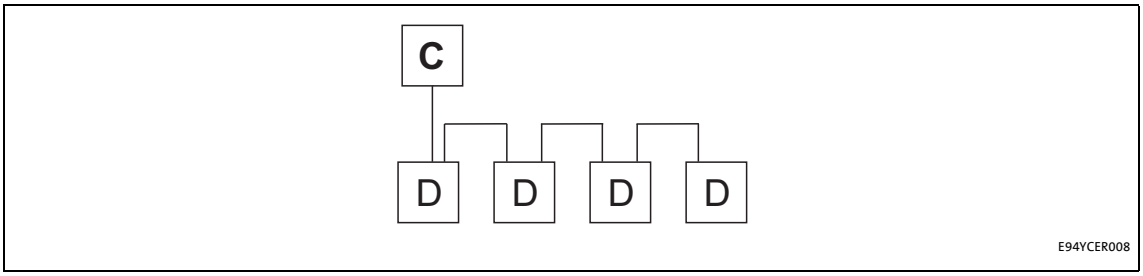
PROFINET supports the following topologies:

- Switch / star



[5-4] Switch / star topology (S = switch, D = I/O device)

- Tree via switches



[5-5] Tree topology (C =I/O controller, S = switch)

- Switch / switch

[5-6] Switch/switch topology (S = switch)

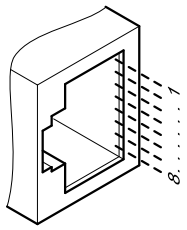
- I/O controller / I/O device

[5-7] Line topology (C = I/O controller, D = I/O device)

5.2.3 PROFINET connection

PROFINET is connected via the RJ45 sockets **X241** and **X242**.

For connection of the communication module to the PROFINET fieldbus, a standard Ethernet patch cable is suitable.



▸ Ethernet cable specification (📖 29)

The installation and removal of the Ethernet cables is optimised for the use of connectors in accordance with the "Automation Initiative of German Domestic Automobile Manufacturers" (AIDA).

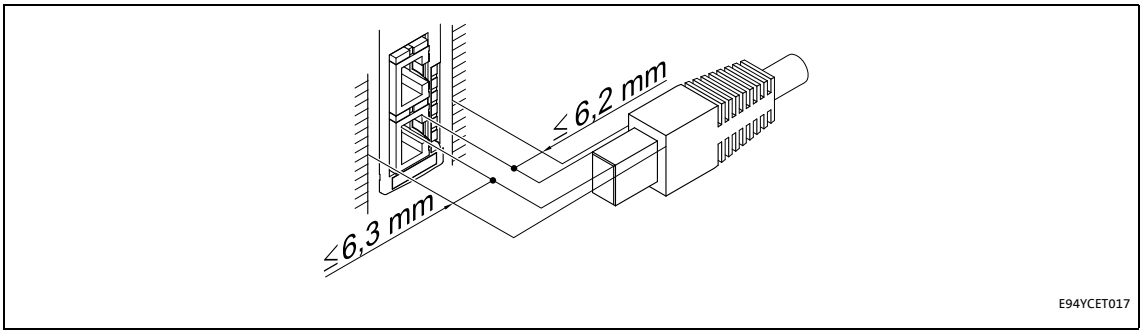
Note!

To prevent the RJ45 socket from being damaged, insert or remove the Ethernet cable connector straight (at a right angle) into or from the socket.

Pin assignment

RJ45 socket	Pin	Signal
 E94AYCXX004C	1	Tx +
	2	Tx -
	3	Rx +
	4	-
	5	-
	6	Rx -
	7	-
	8	-

Note!



Dependent on the configuration of the Ethernet port of the device to be connected, we recommend the use of a cross-over cable.

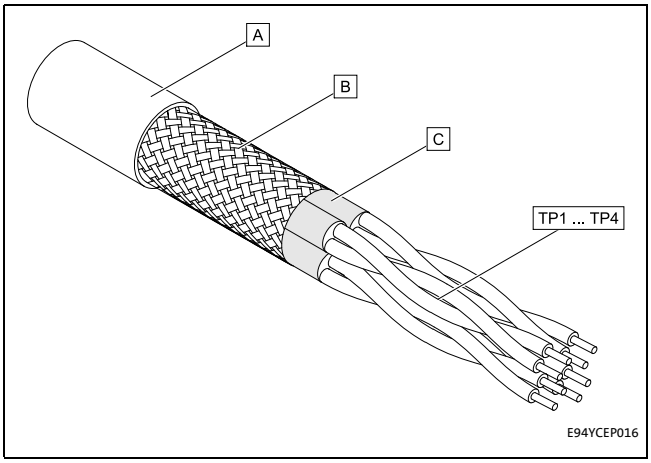
Tip!

The PROFINET interfaces feature an auto-MDIX function. This function adjusts the polarity of the RJ45 interfaces so that a connection can be established irrespective of the polarity of the opposite PROFINET interface and irrespective of the type of cable used (standard patch cable or crossover cable).

Mounting clearance

When ordering and using your Ethernet cable, note the amount of free space available.

[5-8] Mounting clearance



5.2.4 Ethernet cable specification

Note!

Only use cables that meet the listed specifications.

Ethernet cable specification	
Ethernet standard	Standard Ethernet (in accordance with IEEE 802.3), 100Base-TX (Fast Ethernet)
Cable type	S/FTP (Screened Foiled Twisted Pair, ISO/IEC 11801 or EN 50173), CAT 5e
Damping	23.2 dB (for 100 MHz and 100 m each)
Crosstalk damping	24 dB (at 100 MHz and per 100 m)
Return loss	10 dB (per 100 m)
Surge impedance	100 Ω

Structure of the Ethernet cable

A Cable insulation

B Braid

C Foil shielding

TP1 Twisted core pairs 1 ... 4

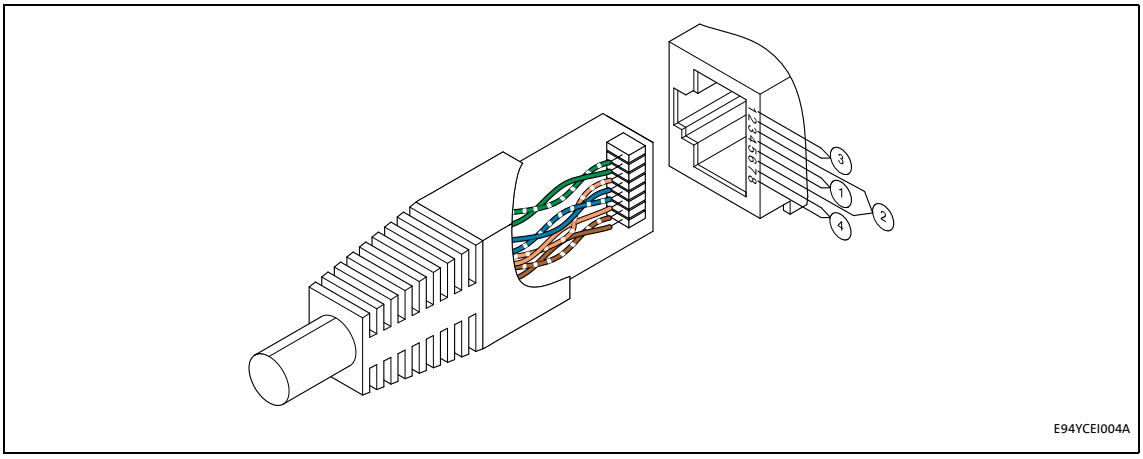
TP4 (📖 30)



[5-9] Structure of the Ethernet cable (S/FTP, CAT 5e)

Colour code of the Ethernet cable

Note!

Wiring and colour code are standardised in EIA/TIA 568A/568B.

In accordance with the industrial standard, the use of 4-pin Ethernet cables is permissible. The cable type only connects the assigned pins 1, 2, 3 and 6 to one another.

[5-10] Ethernet plug in accordance with EIA/TIA 568A/568B

Pair	Pin	Signal	EIA/TIA 568A	EIA/TIA 568B
3	1	Tx +	White / Green	White / Orange
	2	Tx -	Green	orange
2	3	Rx +	White / Orange	White / Green
1	4		blue	blue
	5		White / Blue	Blue / White
2	6	Rx -	orange	Green
4	7		White / Brown	White / Brown
	8		brown	brown

5.2.5 External voltage supply

The communication module can be supplied externally with voltage via separate supply cables at the 2-pole plug connector **X240**.

Note!

With external voltage supply, always use a separate power supply unit, safely separated to EN 61800-5-1 in every control cabinet (SELV/PELV).

External voltage supply of the communication module is required if the communication via the bus should be maintained when the supply of the standard device fails.

The parameters of a standard device separated from the mains cannot be accessed.

Assignment of plug connector X240

Name	Description
+	U = 24 V DC (20.4 ... 28.8 V) I = 130 mA
-	Reference potential for the external voltage supply

Terminal data

Range	Values	
Electrical connection	2-pin plug connector with spring connection	
Possible connections	Rigid:	
		1.5 mm^2 (AWG 16)
	Flexible:	
		Without wire end ferrule 1.5 mm^2 (AWG 16)
		With wire end ferrule, without plastic sleeve 1.5 mm^2 (AWG 16)
		With wire end ferrule, with plastic sleeve 1.5 mm^2 (AWG 16)
Stripping length	9 mm	

6 Commissioning

During commissioning, plant-specific data such as motor parameters, operating parameters, responses, and parameters for fieldbus communication are defined for the inverter. Lenze devices use codes for this purpose.

The inverter and communication codes are saved to the memory module in a non-volatile data set.

In addition, there are codes for diagnosing and monitoring the stations.

▸ Parameter reference (📖 91)

Note!

When parameterising the communication module, please note that the code number depends on the slot of the standard device into which the communication module is plugged.

The first two digits of the code number indicate the slot:

- C**13**nnn for slot MXI1
  ▸ Parameters of the communication module for slot MXI1 (📖 93)
- C**14**nnn for slot MXI2
  ▸ Parameters of the communication module for slot MXI2 (📖 102)

You also have to set the Parameters of the standard device that are relevant to communication (📖 91).

6.1 Before initial switch-on

Stop!

Before switching on the Servo Drive 9400 and the communication module for the first time, check the entire wiring for completeness, short circuit and earth fault.

6.2 Configuring the PROFINET IO controller

To enable communication with the Servo Drive 9400, you have to configure the IO controller first.

Configuration for device control

For the configuration of PROFINET, the current PROFINET device description file (XML) of the E94AYCER communication module (PROFINET) has to be imported in the IO controller.

The device description file **GSDML-Vx.z-Lenze-9400PNabb-yyyymmdd.xml** can be found in the download area at:

www.lenze.com

Wildcards in the file name "GSDML-Vx.z-Lenze-9400PNabb-yyyymmdd.xml"	
x	Main version of the GSDML scheme used
z	Subversion of the GSDML scheme used
a	Major version of the software version
bb	Minor version of the software version
yyyy	Year
mm	Month
dd	Day

Defining the user data length

The user data length is defined during the initialisation phase of the I/O controller.

Servo Drives 9400 HighLine support the configuration of max. 32 process data words (max. 64 bytes).

Description of the device data base file

Selection text	Process data (with consistency)	Assigned I/O memory	Safety module
PCD (**n**W) AR cons.	**n** words	**n** words	-
Safety (4W) AR	4 words	4 words	SM301
Safety (8W) AR (from SW version 3.00 onwards)	8 words	8 words	SM302
n = 1 ... 32 process data words			

Examples of selecting the device data base file

- "PCD (8W) AR cons." = 8 process data words (only in slot 1 of the PROFINET frame)
- "Safety (4W) AR" = 4 safety data words (only in slot 2 of the PROFINET frame if the SM301 safety module is used simultaneously)
- "Safety (8W) AR" = 8 safety data words (only in slot 2 of the PROFINET frame if the SM302 safety module is used at the same time, from SW version 3.00 onwards)

Note!

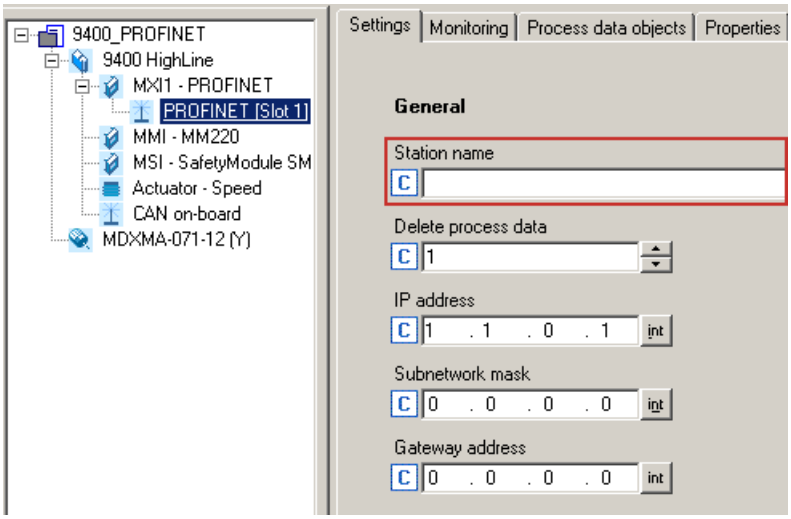
A safety bus system (PROFIsafe) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

Tip!

A detailed description of consistency is given in the chapter "Consistent parameter data" (📖 75).

6.3 Setting the station name

Note!



- The "node blinking" PROFINET function by means of which an accessible field service can be identified is supported. While the function is being executed, the red LED **ME** (Module status displays (📖 80)) is blinking.
- Operation of PROFINET requires a valid station name.
- In case of impermissible settings, the red LED **BE** (Fieldbus status displays (📖 81)) is blinking and the error message PROFINET: Invalid station name [0x00c86532] (📖 88) is output. The communication module then continues to work internally with the deleted name.
- If the station name is assigned by the IO controller via PROFINET or via the PROFINET configurator of the »Engineer«, changes will become effective immediately.

The station name currently used is shown in code C13864 / C14864.

The station name ...

- is required for unambiguous addressing of the Servo Drive 9400 by the I/O controller.
- can either be assigned by the I/O controller via PROFINET or set manually in the »Engineer«.
- has to be allocated in accordance with the PROFINET specification:
  - 1 or several labels separated by ".".
  - Max. length per label: 63 characters
  - Max. total length: 240 characters
  - Permissible characters: [a ... z], [0 ... 9], [.], [-]
  - Labels must not begin or end with [-].
- Prohibited syntax:
  - "n.n.n.n" (n = 0 ... 999)
  - "port-xyz" (x, y, z = 0 ... 9)
  - "port-xyz-abcde" (a, b, c, d, e, x, y, z = 0 ... 9)

In the »Engineer« the station name is set under the **Settings** tab.

The station name is written to code C13899 / C14899.

In the Lenze setting a deleted name is displayed. The name is also deleted if the "Reset to factory defaults" command is executed by an IO supervisor or an I/O controller.

How to activate changed settings in the »Engineer«:

1. Execute the device command **C00002 = "11: Save start parameters"**.
2. Carry out a "Reset node" of the node, or switch the voltage supply of the communication module off and then on again

6.4 Setting the IP configuration

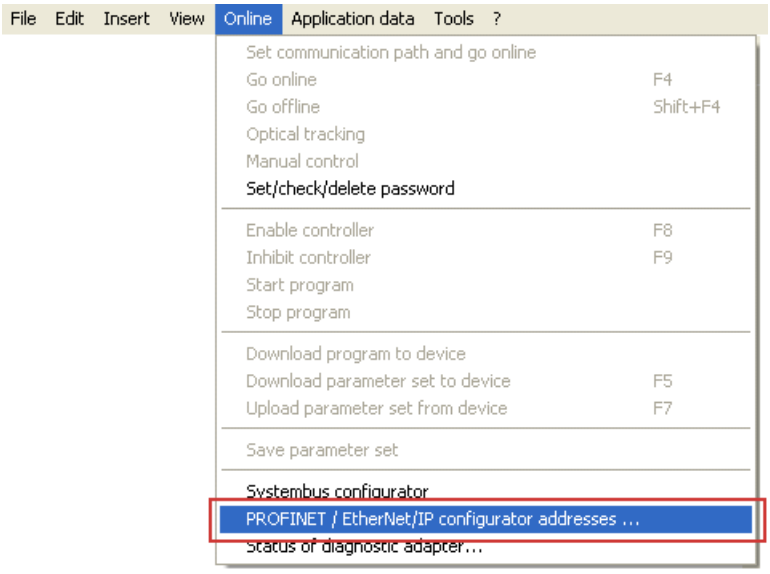
The IP configuration is required for addressing the Servo Drive 9400 in the PROFINET network. For this purpose, an IP address, subnet mask and gateway address have to be allocated.

If no PROFINET network or IO controller is available yet, you can allocate the IP address, subnet mask, and gateway address for the communication module by using the following options:

- Setting via the PROFINET configurator of the »Engineer« (📖 38)
- Setting via codes in the »Engineer« (📖 40)
- Setting via Siemens »STEP7« (»HW Konfig«) (📖 43)
- Setting via the Siemens »Primary Setup Tool« (📖 47)

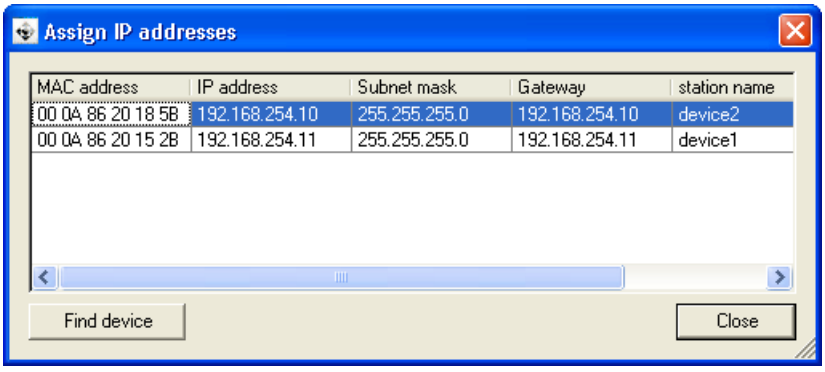
Note!

- If the IP parameters are assigned by the IO Controller via the PROFINET, the PROFINET configurator of the »Engineer«, Siemens »STEP7« or the Siemens »Primary Setup Tool«, the changes become effective immediately and are saved with mains failure protection.
- The assignment of invalid combinations of the IP address, subnet mask, and gateway address can have the consequence that no connection to PROFINET can be established.
- In case of impermissible settings, the red LED **BE** (Fieldbus status displays (📖 81)) is blinking and the error message PROFINET: Invalid IP parameters [0x00c86533] (📖 89) is output.



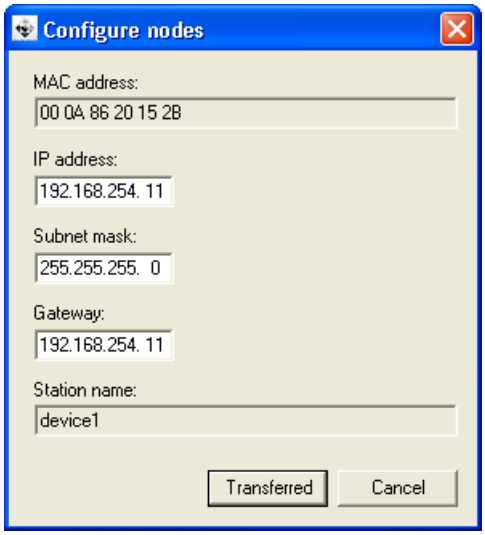
6.4.1 Setting via the PROFINET configurator of the »Engineer«

Note!



- The IP address must only be allocated manually in the »Engineer« if the PROFINET network is not operated on the IO controller yet (IP address has not been allocated by the IO controller yet).
- While setting the IP parameters in the »Engineer«, PROFINET communication with the IO controller must not take place at the same time.
- Changes will be effective immediately and are saved with mains failure protection.
- The currently used parameter values are shown in codes C13010 / C14010 (IP address), C13011 / C14011 (subnet mask), and C13012 / C14012 (gateway address).

How to set the IP parameters via the PROFINET configurator:



1. Execute the menu command **Online → PROFINET configurator / EtherNet/IP addresses ...**.

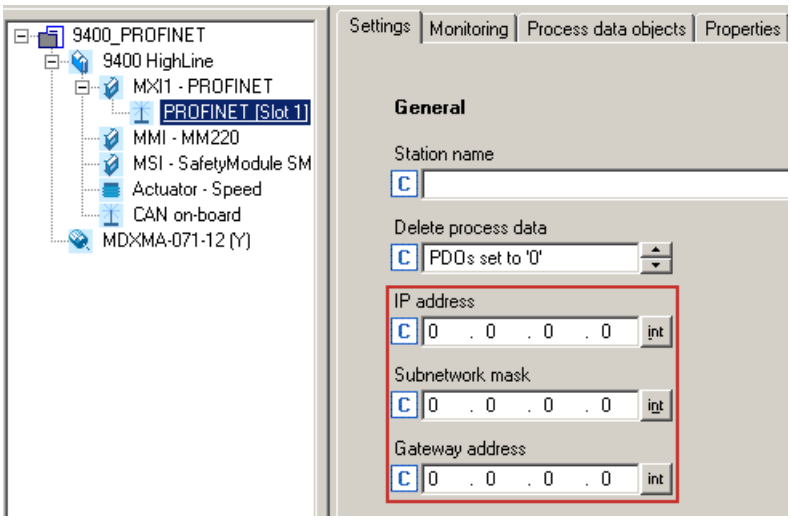
The "Assign IP addresses" dialog window is opened and all Lenze PROFINET nodes connected are listed.

2. By double-clicking on the individual IP parameters, you can set the IP configuration for each PROFINET node in the 'Configure nodes' dialog window.

3. Click the **Transferred** button.
   - The IP configuration is transferred to the corresponding PROFINET node.
   - Changes in the IP parameters will become effective immediately.
   - The IP parameters are written to codes C13000 / C14000 (IP address), C13001 / C14001 (subnet mask) and C13002 / C14002 (gateway address).

Tip!

By clicking the **Find device** in the 'Assign IP addresses' dialog window (see step 1) you can check whether the configuration has been transferred successfully.



With device command **C00002 = "11: Save start parameters"** , the current IP configuration is saved non-volatilely in the memory module.

6.4.2 Setting via codes in the »Engineer«

Note!

- The IP address must only be allocated manually in the »Engineer« if the PROFINET network is not operated on the IO controller yet (IP address has not been allocated by the IO controller yet).
- While setting the IP parameters in the »Engineer«, PROFINET communication with the IO controller must not take place at the same time.
- The currently used parameter values are shown in codes C13010 / C14010 (IP address), C13011 / C14011 (subnet mask), and C13012 / C14012 (gateway address).

In the »Engineer« under the **Settings** tab you can set the IP parameters manually via code.

The IP parameters are written to codes C13000 / C14000 (IP address), C13001 / C14001 (subnet mask) and C13002 / C14002 (gateway address).

How to activate changed settings in the »Engineer«:

1. Execute the device command **C00002 = "11: Save start parameters"**.
2. Carry out a "Reset node" of the node, or switch the voltage supply of the communication module off and then on again

Decimal representation of the IP parameters

By clicking the **[int]** buttons on the right next to the input fields, the IP parameters are shown as a decimal value.

In the case of the decimal representation, the byte sequence is inverted.

Example: IP address 192.168.0.1

C13000 / C14000 = 16820416 [binary: 00000001.00000000.10101000.11000000]

Byte 3								Byte 2								Byte 1								Byte 0							
1								0								168								192							
0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0	0	1	1	0	0	0	0	0	0
C13010/4 C14010/4								C13010/3 C14010/3								C13010/2 C14010/2								C13010/1 C14010/1							

IP address

Valid IP addresses are defined in accordance with RFC 3330.

The IP address is set/changed in C13000 / C14000.

In C13010/1...4 / C14010/1...4 the currently used IP address is shown.

Example: Display of the IP address 192.168.0.1				
Code	C13010/1 C14010/1	C13010/2 C14010/2	C13010/3 C14010/3	C13010/4 C14010/4
Value	192	168	0	1

Subnet Mask

The subnet mask indicates which part of the IP address is evaluated as net ID or host ID.

Valid subnet masks are defined in accordance with RFC 1878

The subnet mask is set/changed in C13001 / C14001.

In C13011/1...4 / C14011/1...4, the currently used subnet mask is shown.

Example: Display of the subnet mask 255.255.255.0				
Code	C13011/1 C14011/1	C13011/2 C14011/2	C13011/3 C14011/3	C13011/4 C14011/4
Value	255	255	255	0

Gateway address

The gateway address is valid if the network address of the IP address and the gateway address are identical.

If the gateway address and the IP address are identical, gateway functionality is not used.

DHCP is not supported.

The gateway address is set/changed in C13002 / C14002.

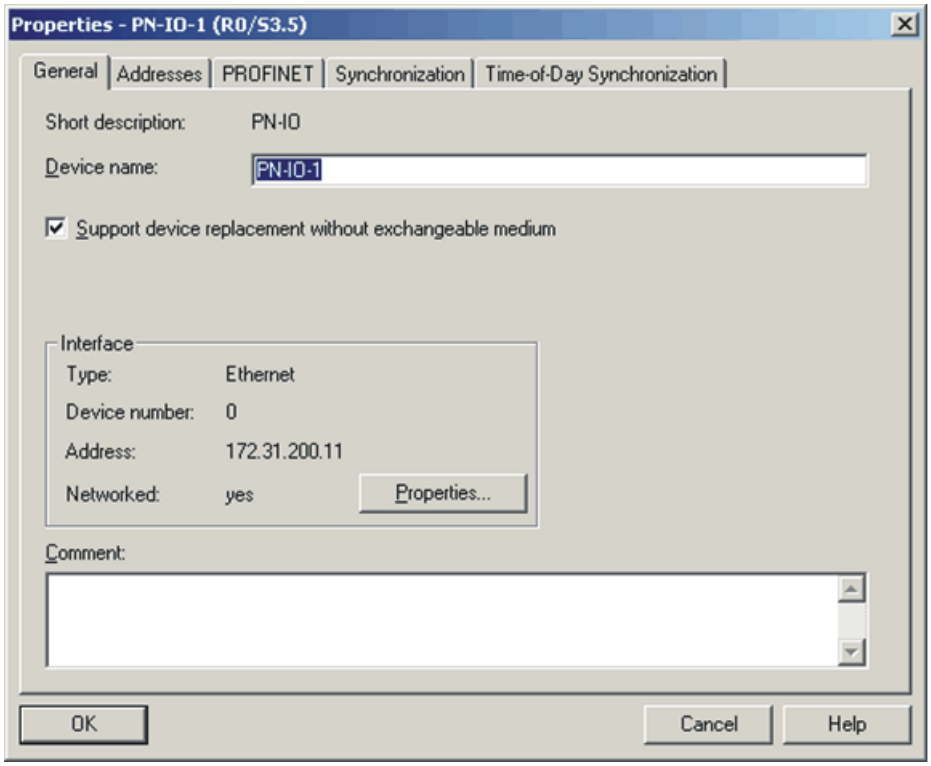
In C13012/1...4 / C14012/1...4, the currently used gateway address is shown.

Example: Display of the gateway address 192.168.0.1				
Code	C13012/1 C14012/1	C13012/2 C14012/2	C13012/3 C14012/3	C13012/4 C14012/4
Value	192	168	0	1

6.4.3 Setting via Siemens »STEP7« (»HW Konfig«)

Note!

- Changes will be effective immediately and are saved with mains failure protection.
- When the IO Controller is connected to the network, the IP address – which has been allocated in the Siemens »HW Konfig« – is set automatically by the IO Controller in the communication module when the network starts up.



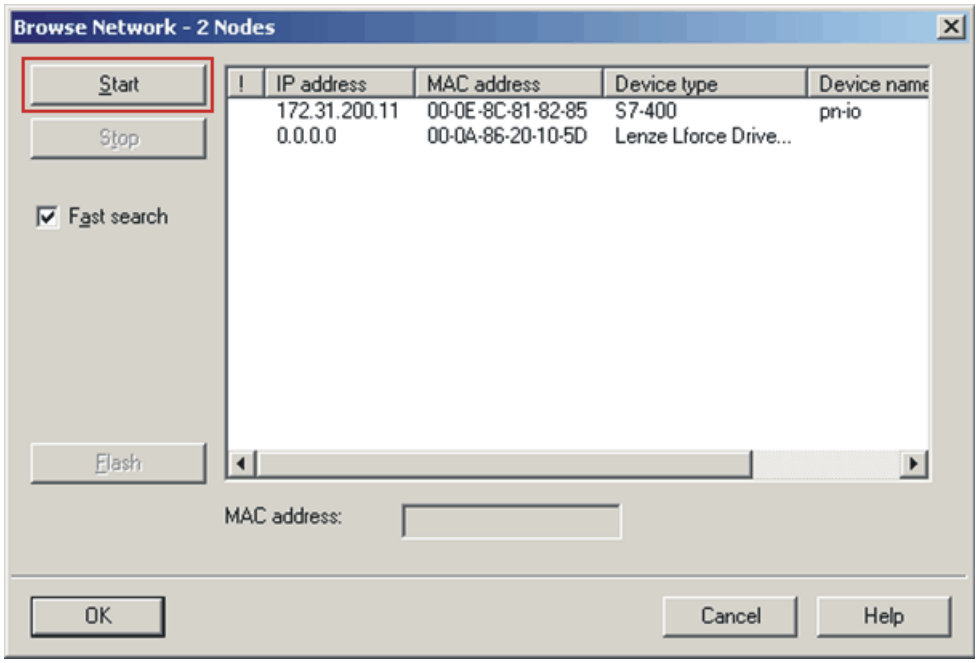
How to allocate the IP address via »STEP7« (»HW Konfig«):

1. Create a »STEP7« project with an IO Controller.

   If the Siemens »HW Konfig« software is used for creating an IO Controller, you are automatically prompted to allocate an IP address for the IO Controller.

   For this purpose, the I/O controller and the communication module must be connected to the PROFINET network and an online connection between your PC and the I/O controller must be established.

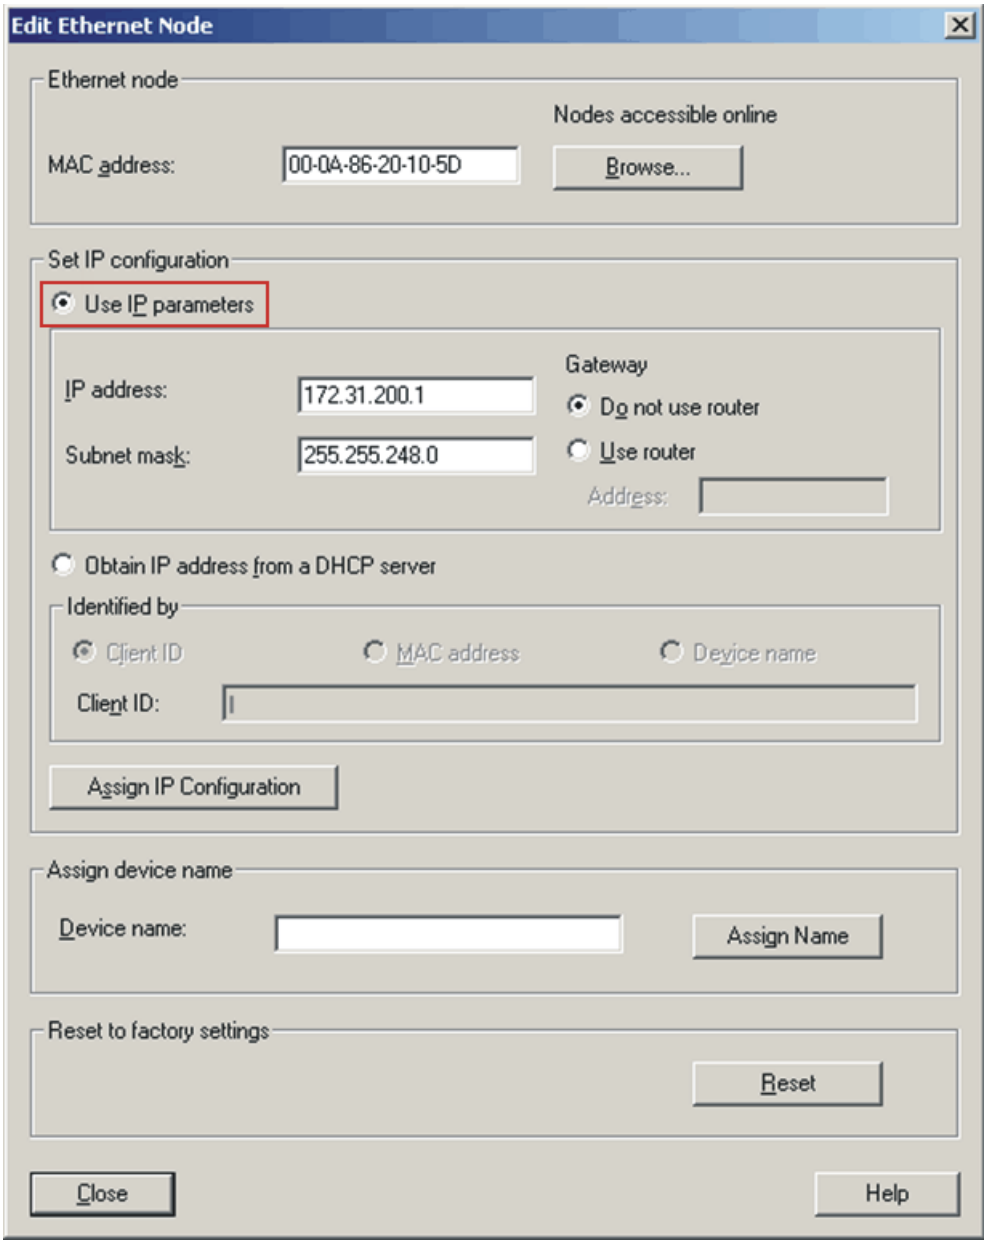
   In our example, IP address 172.31.200.11 has been allocated to the I/O controller.



2. Open the corresponding dialog via the **Target system → Ethernet → Edit Ethernet Node** menu command.

Click the **Browse** button to open the "Browse network" dialog.

3. In the "Browse network" dialog, click the **Start** button to search the network for PROFINET nodes.



In our example, one Lenze PROFINET node was found that does not have an IP address yet (entry 0.0.0.0).

Definite allocation without an IP address is also possible via the MAC address.

For this purpose, select the PROFINET node without an IP address (highlighted in blue) and close the dialog by clicking the **OK** button.

4. The MAC address of the selected PROFINET node has been accepted.

Go to the "Set IP configuration" section and activate **Use IP parameters** and enter the IP address.

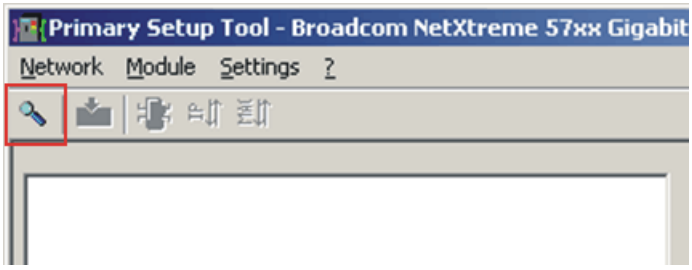
In our example, IP address 172.31.200.1 has been allocated to the Servo Drive 9400 with MAC address 00-0A-86-20-10-5D.

Tip!

Another search via the **Browse** button can be started to check if your IP address allocation has been successful.

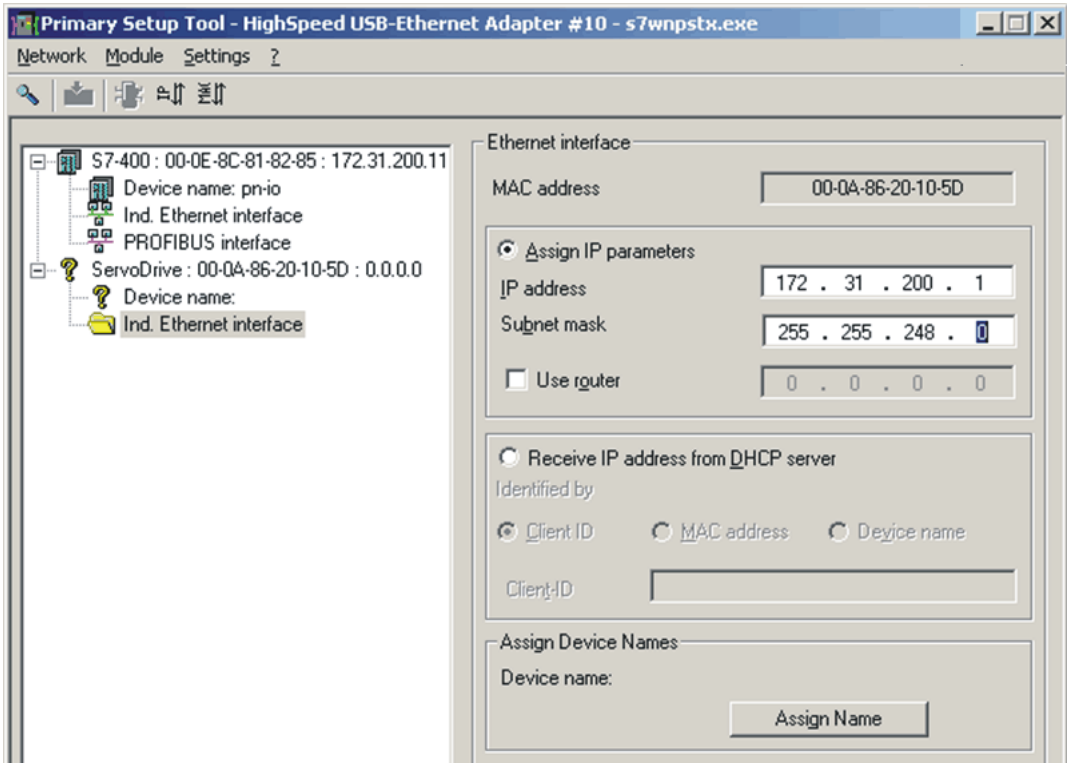
6.4.4 Setting via the Siemens »Primary Setup Tool«

The Siemens »Primary Setup Tool« serves to carry out the IP address allocation if the system lacks an IO Controller (PLC). The software can be downloaded free of charge from the Siemens "Automation & Drive" homepage in the support area:



http://support.automation.siemens.com

Note!

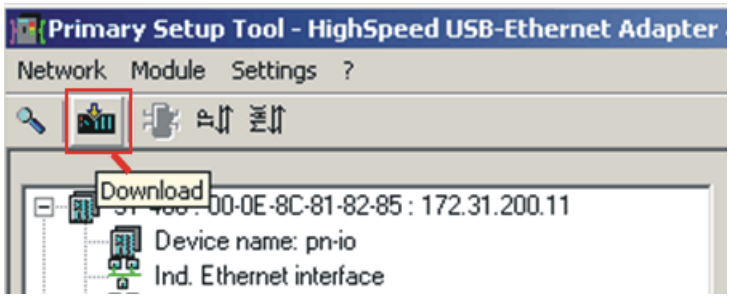


Changes will be effective immediately and are saved with mains failure protection.

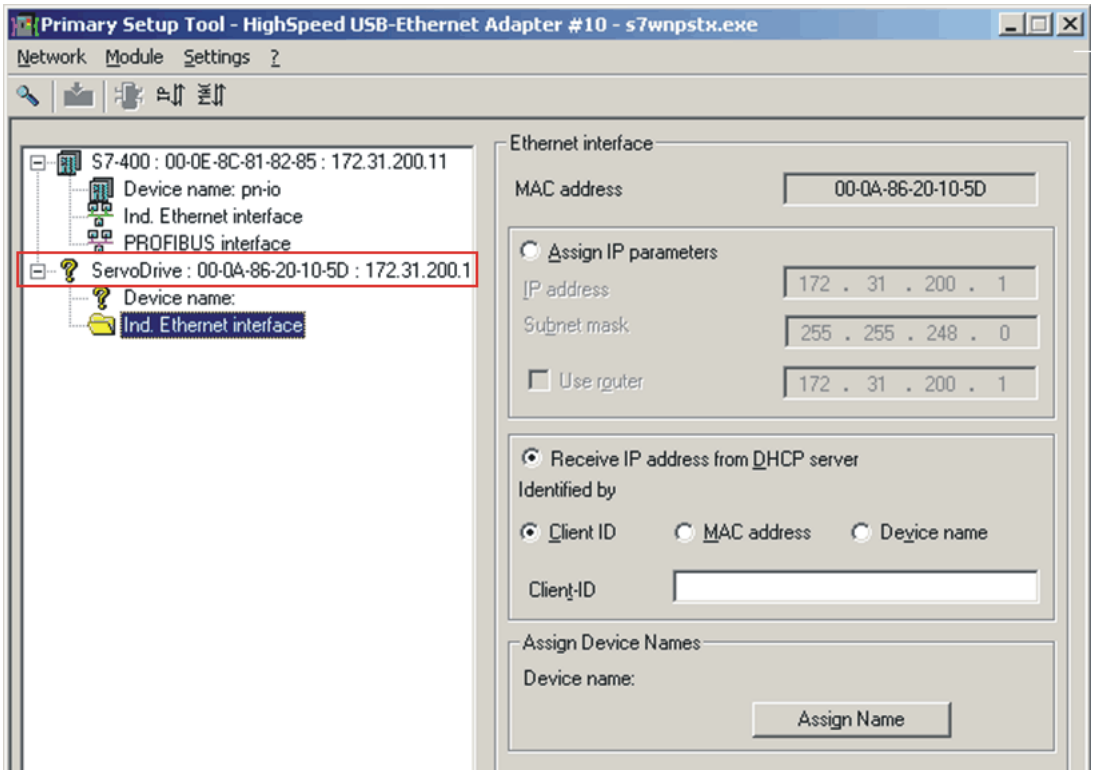
How to allocate the IP address via the Siemens »Primary Setup Tool«:

1. Start the Siemens »Primary Setup Tool«.
2. Click the **Browse** button to search the PROFINET network for nodes.

3. The PROFINET nodes found are displayed.



In our example, one Lenze PROFINET node was found that does not have an IP address yet (entry 0.0.0.0).

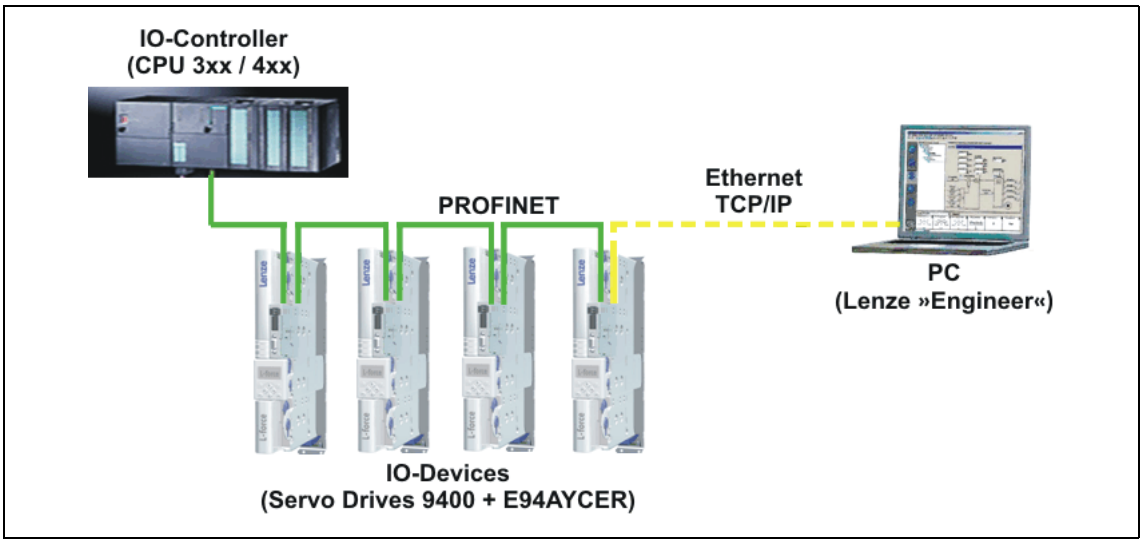


Here, activate **Assign IP parameters** and enter the IP address for the node that lacks an IP address.

4. Click the **Download** button to transfer the assigned IP address.

   Every IP address must be transferred individually to the corresponding IO device via the **Load** button.

In our example, IP address 172.31.200.1 has been allocated to the Servo Drive 9400 with MAC address 00-0A-86-20-10-5D.

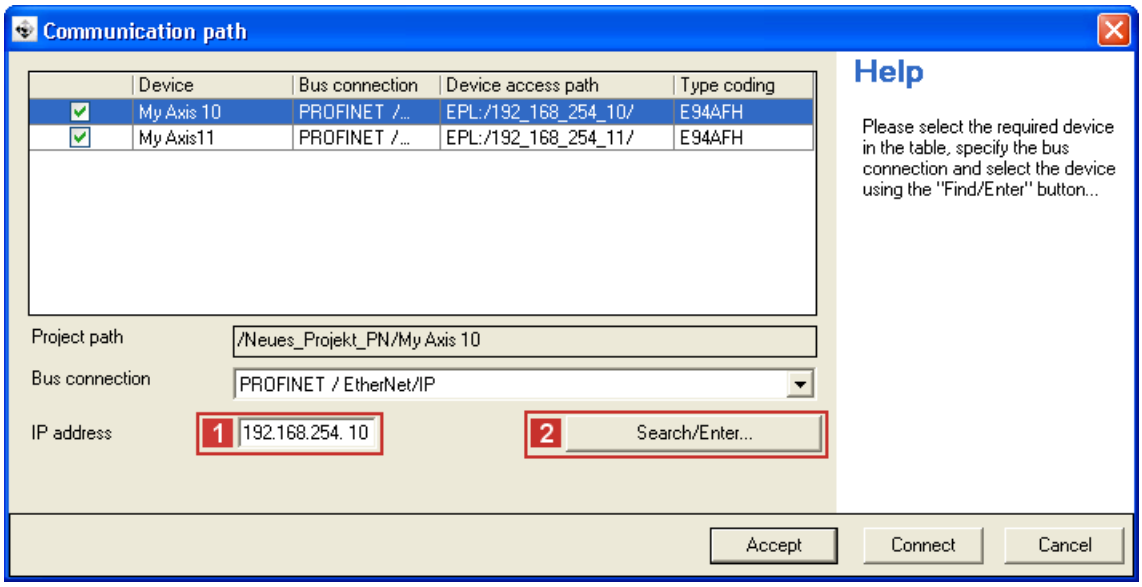


6.5 Establishing an online connection via PROFINET with the Lenze »Engineer«

This functionality will only be supported **from software version V01.30.05 onwards**.

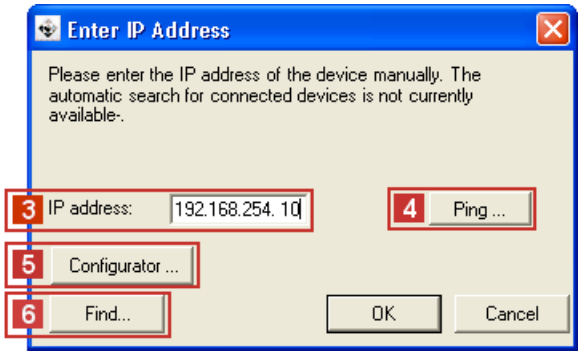
Note!

To ensure perfect operation of cyclic PROFINET communication, online access with the »Engineer« must be effected via a PROFINET switch.



The PROFINET switch integrated in the communication module can execute cyclic PROFINET communication prior to normal TCP/IP communication. In the case of PROFINET this is effected via the VLAN identification in the Ethernet frame.

[6-1] Online connection via PROFINET with the Lenze »Engineer«



In order to establish an online connection between the »Engineer« and the inverter, the inverter has to have an IP address (see Setting the IP configuration (📖 37)).

In the »Engineer«, you can use the **Online → Set communication path and go online** menu command to select the PROFINET communication path. The previously configured PROFINET nodes are shown in the "Communication path" dialog window:

If the device access path is not configured correctly, the 1 IP address of the inverter selected in the display field can be entered manually here.

Via the 2 **Search/Enter** button, you can establish a connection to devices which have not appeared in the display field. Corresponding settings for this can be made in the "Enter IP Address" dialog window that will appear:

Here you can enter an 3 **IP address** manually or execute the following actions using the buttons:

- Execute the console command 4 **Ping**.
- Assign the IP address via the 5 **Configurator**.
  ▸ Setting via the PROFINET configurator of the »Engineer« (📖 38)
- Select the device access path to the desired inverter by clicking 6 **Find**.

After having established the online connection, you can continue work with the »Engineer« as usual.

6.6 Initial switch-on

Documentation for the standard device

Observe the safety instructions and information on residual hazards.

Note!

Establishing communication

In order to establish communication via an externally supplied communication module, the standard device must be switched on as well.

For further communication of the externally supplied module it is not relevant whether the standard device is switched on or not.

Protection against uncontrolled restart

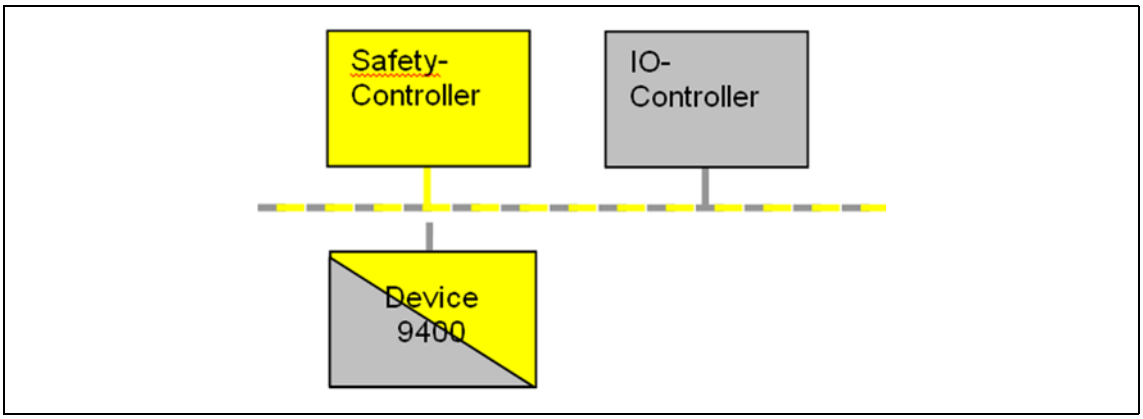
After a fault (e.g. short-term mains failure), it is sometimes undesirable or even impermissible for the drive to restart.

In the Lenze setting of Servo Drives 9400, the restart protection is activated.

The restart behaviour of the inverter can be set via **C00142** ("auto restart after mains connection"):

C00142 = "0: Inhibited" (Lenze setting)

- The inverter remains inhibited (even if the fault is no longer active).
- An explicit controller enable causes the drive to start up in a controlled manner: LOW-HIGH edge at digital input X5/RFR.



C00142 = "1: Enabled"

- An uncontrolled restart of the drive is possible.

6.7 "Shared Device" function

This function is available from SW version 2.10!

The "Shared Device" function of PROFINET IO provides the opportunity to access an IO device with two Controllers. The Lenze application for "Shared Device" is the easy assignment of data to a safety controller and an IO controller (in fig. [6-2] the separation of the grey and yellow area).

[6-2] "Shared Device" function

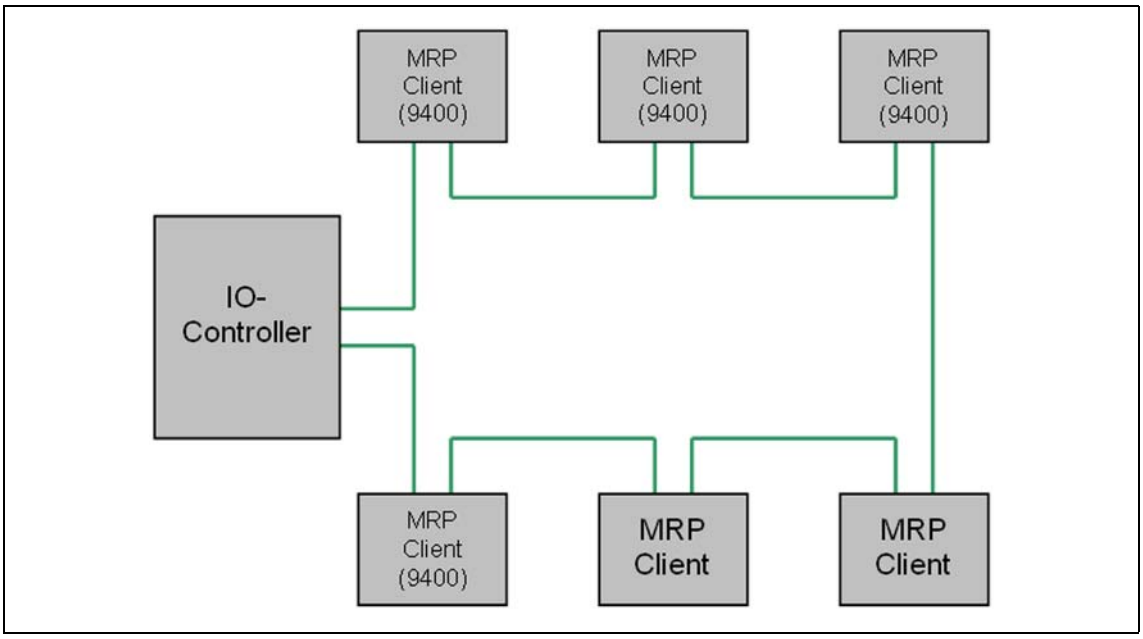
In order to use the "Shared Device" function, import the GSE file "GSDML-V2.3-Lenze-9400PN200-20130424.xml" into the PROFINET configuration tool of the respective controller manufacturer.

The IO data or safety data is permanently assigned to the data slots.

- Slot 1 is always the grey area (IO controller)
- Slot 2 is always the yellow area (safety controller)

Note!

The data assignment to the corresponding Controller is carried out in the configuration tool. For this purpose, follow the descriptions in the documentation of the tool.



Settings in the E94AYCER communication module are not required.

6.8 Media Redundancy Protocol (MRP)

This function is available from SW version 2.10!

The "Media Redundancy Protocol" (MRP) increases the node accessibility. The MRP ensures that all nodes on the fieldbus can continued to be accessed in case of a simple network downtime. For this purpose, the line topology is interconnected to a ring.

- All nodes of the ring have to support the MRP.
- One node (e.g. IO controller) assumes the role of the redundancy manager
- The other nodes in the ring are redundancy clients.
- The E94AYCER communication module from SW version 2.10 can only assume the role of a redundancy client.

[6-3] Ring topology for the "Media Redundancy Protocol" (MRP)

The engineering of the media redundancy is exclusively executed via the redundancy manager (e.g. Simatic hardware manager).

7 Data transfer

PROFINET transmits parameter data, configuration data, diagnostic data, alarm messages, and process data between the host (I/O controller) and the inverters that are part of the fieldbus (I/O devices). Depending on their time-critical behaviour, the data are transmitted via corresponding communication channels.

Communication channels

The process data channel transmits process data.

- The process data serve to control the inverter.
- The transmission of process data is time-critical.
- Process data are transmitted cyclically between the I/O controller and the I/O devices that are part of the fieldbus according to the Provider/Consumer model (continuous exchange of current input and output data).
- The I/O controller can directly access the process data. In the PLC, for instance, the data are directly assigned to the I/O area.
- Up to 32 process data words (64 bytes) per direction can be exchanged.
- Process data are not saved in the inverter.
- Process data are e.g. setpoints, actual values, control words, and status words.

Note!

Please observe the direction of the flow of information!

Process input data (Rx data):

- Process data from the inverter (IO device) to the IO controller

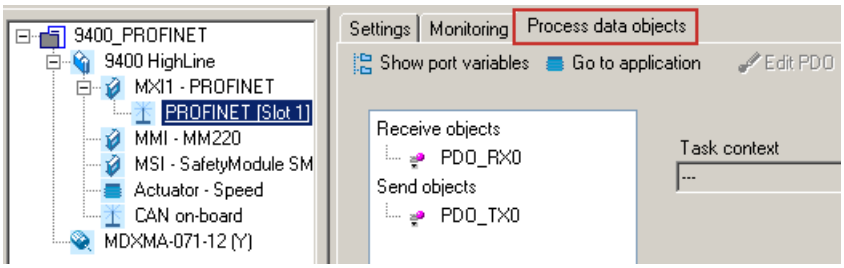
Process output data (Tx data):

- Process data from the IO controller to the inverter (IO device)

Parameter data are transmitted via the acyclic channel.

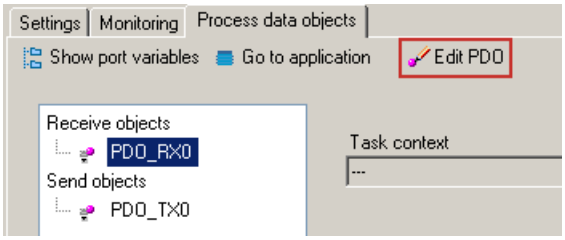
- The transmission of parameter data is usually not time-critical.
- The access to the parameter data depends on the PROFIdrive profile.
- Examples of parameter data are operating parameters, motor data, and diagnostic information.
- The acyclic channel provides access to all Lenze codes.
- Parameter data changes must be saved via code **C00002** of the Servo Drives 9400.

8 Process data transfer



PDO mapping

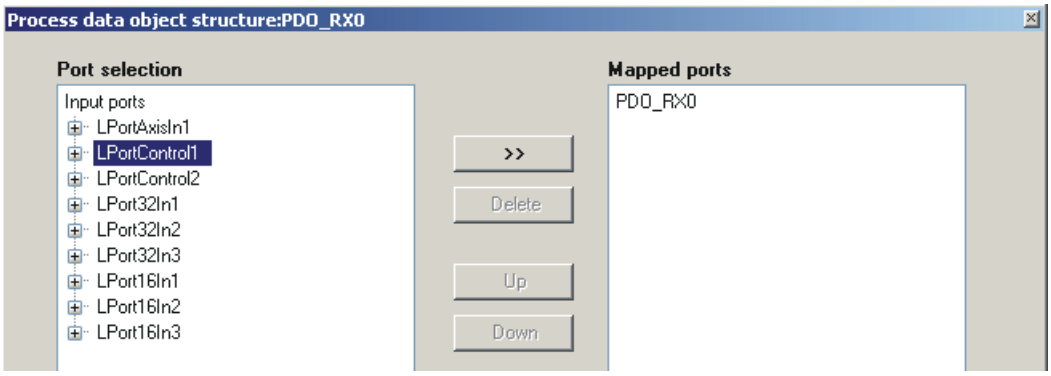
The Servo Drives 9400 enable the individual mapping of process data. For this purpose, the »Engineer« is provided with a port configurator.



In the following, you can find a description of the steps required to implement a process data communication with a host (PLC, IO Controller), in which a control word/status word and a 32 bit setpoint/actual value are exchanged.

How to set the PDO mapping with the »Engineer«:

1. In the »Engineer«, the mapping of the process data is carried out under the **Process data objects** tab of the respective fieldbus communication module:



2. Select the receive object **PDO_RX0**:

3. Click the **Edit PDO** button.

   The selection window for editing the process data object is opened:

   Here you can map the individual ports from the **Port selection** to the receive PDO "PDO_RX0" by clicking the **>>** button.

   The **Up** and **Down** buttons serve to shift the sequence of the ports within the PDO.

Note!

Port mapping is no configuration which can be carried out online for the Servo Drive 9400. This always requires an update of the »Engineer« project and a subsequent download of the application.

In the following example, the ports "LPortControl1" and "Lport32In1" have been mapped into the receive PDO "PDO_RX0" and the ports "LPortStatus1" and "LPort32Out1" have been mapped into the transmit PDO "PDO_TX0":

4. Confirm the selection by pressing **OK**.
5. Repeat the steps 2. to 4. for the transmit object **PDO_TX0**.
6. Now link the ports to the application signals in the selected technology application.

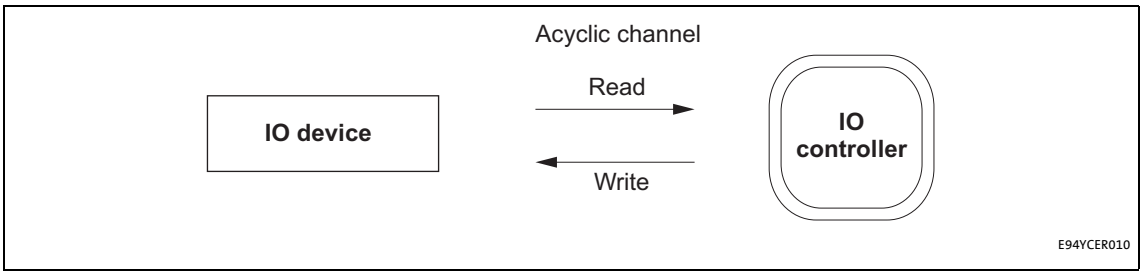
   Activate the »FB Editor« via the multiplexer codes (> C03000) if this has not been done yet.

   If the »FB Editor« is activated, the multiplexer codes (> C03000) are no longer available. In this case, you must carry out the interconnection directly in the »FB Editor«.

9 Parameter data transfer

9.1 The acyclic channel (PROFIdrive profile)

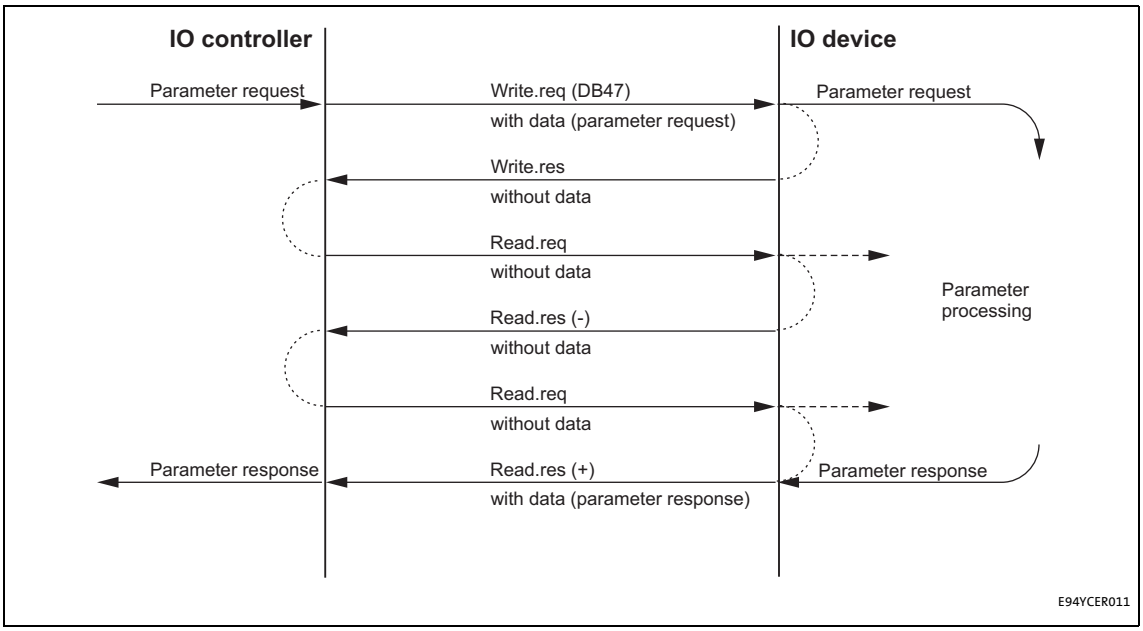
An optional service extension is the acyclic parameter data transfer.



Cyclic and acyclic PROFINET services can be operated simultaneously in the network.

Product features

- There is always only one parameter request in process (no pipelining).
- No spontaneous messages are transferred.
- There are only acyclic parameter requests.
- Profile-specific parameters can be read independently of the I/O device state.



9.1.1 Connection establishment of an IO Controller to an IO device

An I/O controller can always be used to request parameters from an I/O device if the I/O device is in the "Data_Exchange" state.

[9-1] Data communication via the acyclic channel

9.1.2 Acyclic data transmission process

[9-2] Data communication via the acyclic channel

- A "Write.req" is used to transmit the data set (DB47) in the form of a parameter request to the I/O device.
- "Write.res" confirms the receipt of the message by the I/O controller.
- The I/O controller requests the response of the I/O device with "Read.req".
- The I/O device responds with a "Read.res (-)" if processing is not yet completed.
- After parameter processing, the parameter request is completed by transmitting the parameter response in the form of a "Read.res (+)" to the I/O controller.

9.1.3 Structure of the PROFINET data frame

Dest Addr	Scr Addr	VLAN Day	Type 0800H	RPC	NDR	Read/Write Block	Data	FSC
6 bytes	6 bytes	4 bytes	4 bytes	80 bytes	64 bytes	64 bytes	0 ... 240 bytes	4 bytes

[9-3] PROFINET data frame

In the "Read/Write Block", the initiator specifies the access to data set "DB47". The data which are written to this index or read by it contain a header and the parameter request or the parameter response. The read data or the data to be written are contained in the "Data" field.

The following subchapters describe the parameter request and the parameter response in detail.

PROFINET specification

Here you will find detailed information on the PROFINET data frame.

Assignment of the user data depending on the data type

Depending on the data type used, the user data are assigned as follows:

Data type	Length	User data assignment				
		Byte 1	Byte 2	Byte 3	Byte 4	Byte ...
String	x bytes					
U8	1 byte		00			
U16	2 bytes	High byte	Low byte			
U32	4 bytes	High word		Low word		
		High byte	Low byte	High byte	Low byte	

9.2 Reading parameters from the inverter

Note!

- When a read request is processed, no parameter value is written to the I/O device.
- In the case of a multi-parameter read request, parameter attribute, index, and subindex are repeated "n" times, "n" being the number of parameters requested.

Request header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices

Field	Data type	Values
Request reference	U8	This value is specified by the I/O controller.
Request identification	U8	0x01: Request parameters for reading
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter attribute

Byte 5	Byte 6
Attribute	Number of subindices

Field	Data type	Values
Attribute	U8	0x10: Value
Number of subindices	U8	0x00 or 0x01

Index and subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte

Field	Data type	Values
Index	U16	0x0001 ... 0xFFFF (1 ... 65535)
Subindex	U16	0x0001 ... 0xFFFF (1 ... 65535)

9.2.1 Response to a correctly executed read request

Note!

- Responses to read requests do not contain parameter attributes and indices/ subindices.
- When a multi-parameter read request is transmitted, the parameter format and the parameter value are repeated "n" times, "n" being the number of parameters requested.

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x01: Parameter has been read
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter format

Byte 5	Byte 6
Format	Number of values

Field	Data type	Values
Format	U8	0x02: Integer8 0x03: Integer16 0x04: Integer32 0x05: Unsigned8 0x06: Unsigned16 0x07: Unsigned32 0x09: Visible string 0x0A: Octet string 0x40: Zero 0x41: Byte 0x42: Word 0x43: Double word
Number of values	U8	• 0x01 • Number of requested subindices. (If there is more than one subindex, only the parameter value is repeated.) • In the case of string codes, the number of characters is entered here.

Parameter value

Byte 7	Byte 8	Byte 9	Byte 10
Value			

Field	Data type	Values
Value	String	Any
	U8	0x00 .... 0xFF
	U16	0x0000 .... 0xFFFF
	U32	0x0000 0000 .... 0xFFFF FFFF

9.2.2 Response to a read error

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x81: Parameter has not been read • The data in the bytes 7 + 8 must be interpreted as an error code.
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter format

Byte 5	Byte 6
Format	Number of values

Field	Data type	Values
Format	U8	0x44: Error
Number of values	U8	0x01: Error code without additional information 0x02: Error code with additional information

Error code

Byte 7	Byte 8	Byte 9	Byte 10
Error code		Additional information (if available)	
High byte	Low byte	High byte	Low byte

Field	Data type	Values
Error code	U16	0x0000 .... 0xFFFF ▸ Error information (error) (📖 73)
Additional information (if available)	U16	

9.2.3 Frame example: Read request

The heatsink temperature of the inverter is to be read.

- Code to be read: C00061
- Heatsink temperature: 43 °C

Parameter request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices
0xXX	0x01	0x00	0x01
	Request parameters for reading		

Byte 5	Byte 6
Attribute	Number of subindices
0x10	0x00
Value	No subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte
0x5F	0xC2	0x00	0x00
Index = 24575 - code no. = 24575 - 61 = 24514 = 0x5F C2		No subindex	

Parameter response to a correctly executed read request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices
0xXX	0x01	0x00	0x01
(mirrored)	Parameter has been read	(mirrored)	

Byte 5	Byte 6
Format	Number of values
0x43	0x01
Double word	1 value

Byte 7	Byte 8	Byte 9	Byte 10
Value			
High word: high byte	High word: low byte	Low- word: high byte	Low word: low byte
0x00	0x00	0x00	0x2B
Read value = 0x00 00 00 2B = 43 x 1 (internal factor) = 43 [°C]			

Parameter response to a read error

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices
0xXX	0x01	0x00	0x01
(mirrored)	Parameter has been read	(mirrored)	

Byte 5	Byte 6
Format	Number of values
0x44	0x01
Fault	Error code without additional information

Byte 7	Byte 8
Error code	
High byte	Low byte
For the meaning see the chapter "Error information (error)" (📖 73)	

9.3 Writing parameters to the inverter

Note!

- When a multi-parameter write request is processed, the parameter attribute, index, subindex, and then the parameter format and parameter value are repeated "n" times, "n" being the number of parameters requested.
- A parameter request must not exceed the maximum data length of 238 bytes.

Request header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices

Field	Data type	Values
Request reference	U8	This value is specified by the I/O controller.
Request identification	U8	0x02: Write parameter
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter attribute

Byte 5	Byte 6
Attribute	Number of subindices

Field	Data type	Values
Attribute	U8	0x10: Value
Number of subindices	U8	0x00 or 0x01

Index and subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte

Field	Data type	Values
Index	U16	0x0001 ... 0xFFFF (1 ... 65535)
Subindex	U16	0x0001 ... 0xFFFF (1 ... 65535)

Parameter format

Byte 11	Byte 12
Format	Number of values

Field	Data type	Values
Format	U8	0x02: Integer8 0x03: Integer16 0x04: Integer32 0x05: Unsigned8 0x06: Unsigned16 0x07: Unsigned32 0x09: Visible string 0x0A: Octet string 0x40: Zero 0x41: Byte 0x42: Word 0x43: Double word
Number of values	U8	• 0x01 • Number of requested subindices. (If there is more than one subindex, only the parameter value is repeated.) • In the case of string codes, the number of characters is entered here.

Parameter value

Byte 13	Byte 14	Byte 15	Byte 16
Value			

Field	Data type	Values
Value	String	Any
	U8	0x00 .... 0xFF
	U16	0x0000 .... 0xFFFF
	U32	0x0000 0000 .... 0xFFFF FFFF

9.3.1 Response to a correctly executed write request

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x01: Parameter written
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

9.3.2 Response to a write error

Note!

In the case of a multi-parameter request, correct and possible faulty messages are summarised in one frame. They have the following data contents:

- Correct message
  - Format: 0x40
  - Number of values: 0x00
- Faulty message
  - Format: 0x44
  - Number of values: 0x01 or 0x02
  - Error code without additional information (number of values = 0x01) *or*
  - Error code with additional information (number of values = 0x02)

A faulty access to a parameter "n" is indicated at the nth position in the response frame of a multi-parameter request.

Response header

Byte 1	Byte 2	Byte 3	Byte 4
Request reference (mirrored)	Response identification	Axis (mirrored)	Number of indices

Field	Data type	Values
Request reference	U8	Mirrored value of the parameter request
Response identification	U8	0x82: Parameter has not been written • The data in the bytes 7 + 8 must be interpreted as an error code.
Axis	U8	0x00 or 0x01
Number of indices	U8	0x"n" (n = number of parameters requested)

Parameter format

Byte 5	Byte 6
Format	Number of values

Field	Data type	Values
Format	U8	0x44: Error
Number of values	U8	0x01: Error code without additional information 0x02: Error code with additional information

Error code

Byte 7		Byte 8		Byte 9		Byte 10	
Error code				Additional information (if available)			
High byte		Low byte		High byte		Low byte	

Field	Data type	Values
Error code	U16	0x0000 .... 0xFFFF ▸ Error information (error) (📖 73)
Additional information (if available)	U16	

9.3.3 Frame example: Write request

In the inverter, the deceleration time for quick stop is to be set to 50 ms.

Code to be written: C00105

Parameter request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Request identification	Axis	Number of indices
0xXX	0x02	0x00	0x01
	Write parameters	Axis 0	1 index

Byte 5	Byte 6
Attribute	Number of subindices
0x10	0x00
Value	No subindex

Byte 7	Byte 8	Byte 9	Byte 10
Index		Subindex	
High byte	Low byte	High byte	Low byte
0x5F	0x96	0x00	0x00
Index = 24575 - code no. = 24575 - 105 = 24470 = 0x5F 96		No subindex	

Byte 11	Byte 12
Format	Number of values
0x43	0x01
Double word	1 value

Byte 13	Byte 14	Byte 15	Byte 16
Value			
High word: high byte	High word: low byte	Low- word: high byte	Low word: low byte
0x00	0x00	0x00	0x32
Value to be written = 0.05 [s] x 1000 (internal factor) = 50 = 0x00 00 00 32			

Parameter response to a correctly executed write request

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Response identification	Axis	Number of indices
0xXX	0x02	0x00	0x01
(mirrored)	Parameter has been written	(mirrored)	1 index

Parameter response after write error

Byte 1	Byte 2	Byte 3	Byte 4
Request reference	Response identification	Axis	Number of indices
0xXX	0x82	0x00	0x01
(mirrored)	Parameter has not been written	(mirrored)	1 index

Byte 5	Byte 6
Format	Number of values
0x44	0x01
Fault	Error code without additional information

Byte 7	Byte 8
Error code	
High byte	Low byte
For the meaning see the chapter "Error information (error)" (📖 73)	

9.4 Error information (error)

Error code	Meaning	Description	Additional information
0x0000	Impermissible parameter number	Access to unavailable parameter	-
0x0001	Parameter value cannot be changed	Change access to a parameter value that cannot be changed	Subindex
0x0002	Lower or upper value limit exceeded	Change access with value beyond the value limits	Subindex
0x0003	Faulty subindex	Access to unavailable subindex	Subindex
0x0004	No array	Access with subindex to non-indicated parameter	-
0x0005	Wrong data type	Change access with value that does not match the data type of the parameter	-
0x0006	No setting permitted (only resettable)	Change access with value unequal to 0 where this is not permitted	Subindex
0x0007	Description element cannot be changed	Change access to a description element that cannot be changed	Subindex
0x0008	Reserved	(PROFIdrive profile V2: PPO-Write requested in the IR is not available)	-
0x0009	Description data not available	Access to unavailable description (parameter value is available)	-
0x000A	Reserved	(PROFIdrive profile V2: Wrong access group)	-
0x000B	No parameter change rights	Change access without parameter change rights	-
0x000C	Reserved	(PROFIdrive profile V2: Wrong password)	-
0x000D	Reserved	(PROFIdrive profile V2: Text in the cyclic traffic cannot be read)	-
0x000E	Reserved	(PROFIdrive profile V2: Name in the cyclic traffic cannot be read)	-
0x000F	No text array available	Access to unavailable text array (parameter value is available)	-
0x0010	Reserved	(PROFIdrive profile V2: Missing PPO-Write)	-
0x0011	Request cannot be executed due to the operating state	Access is not possible due to temporary reasons not specified here	-
0x0012	Reserved	(PROFIdrive profile V2: Other error)	-
0x0013	Reserved	(PROFIdrive profile V2: date in the cyclic traffic cannot be read)	-
0x0014	Value impermissible	Change access with the value that is inside the value limits but not permissible for other permanent reasons (parameters with defined individual values)	Subindex
0x0015	Response too long	The length of the current response exceeds the maximum transmittable length	-
0x0016	Parameter address impermissible	Impermissible or non-supported value for attribute, number of subindices, parameter number, or subindex, or a combination	-
0x0017	Format impermissible	Write request: Impermissible or non-supported format of parameter data	-
0x0018	Number of values not consistent	Write request: Number of values of the parameter data do not match the number of subindices in the parameter address	-
0x0019	Reserved	-	-
...			
0x0064			

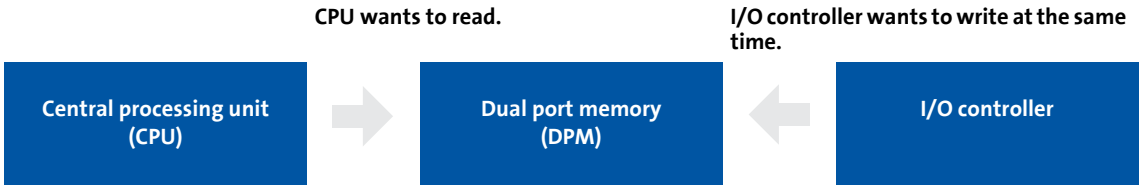
Error code	Meaning	Description	Additional information
0x0065	Manufacturer-specific	-	-
...			
0x00FF			

9.5 Consistent parameter data

In the PROFINET communication system, data is permanently exchanged between the host (CPU + IO Controller) and the Servo Drive 9400 via the plugged-on communication module. The IO Controller and the CPU (central processing unit) of the host access a joint memory: The dual port memory (DPM).

The DPM permits a data exchange in both directions (write/read):

It could happen that a slower I/O controller writing would be overtaken by a faster CPU reading within a cycle time without any further data organisation.



In order to avoid such an impermissible state, the parameter data to be transmitted must be marked as "consistent".

Data communication with consistent data

With consistency, either "reading" or "writing" is possible when the I/O controller and the CPU simultaneously access the memory:

- The I/O controller transfers data only as a complete data set.
- The CPU can only access completely updated data sets.
- The I/O controller cannot read or write data as long as the CPU accesses consistent data.

The result becomes clear from the example below:

1. As the I/O controller can only write when the CPU is not reading, the I/O controller has to wait until the data are completely read by the CPU.
2. The I/O controller only writes a complete data set into the DPM.

Configuring consistent data

Note!

Consistency is achieved by an appropriate Configuration of the IO Controller.

Information on the issue can be found in the documentation of your configuring software.

10 PROFIsafe

PROFINET enables the transfer of safe information via the PROFIsafe protocol in accordance with the "PROFIsafe - Profile for Safety Technology" specification, version 2.0.

Note!

A safety bus system (PROFIsafe) can only be operated via the upper module slot (MXI1) of the Servo Drive 9400.

- The PROFIsafe message is sent in the second slot of a PROFINET frame.
- One bit of the PROFIsafe data is always used to control specific safety functions.
- The structure of the PROFIsafe data is described in the PROFIsafe profile.
- If the SM301 safety module is used, the length of the PROFIsafe data (also called PROFIsafe message) always is 8 bytes.
- If the SM302 safety module is used, the length of the PROFIsafe data (also referred to as the PROFIsafe message) is always 16 bytes (from SW version 3.00 onwards).
- The Servo Drive 9400 forwards the PROFIsafe message to the safety module for a safe evaluation.

Documentation for the SM301 (E94AYAE) / SM302 (E94AYAF) safety module

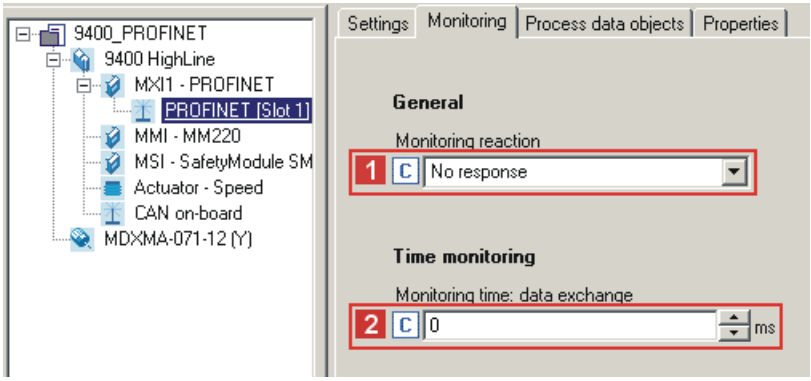
Here you can find some detailed information on the PROFIsafe connection.

11 Monitoring

11.1 Interruption of PROFINET communication

An interruption of PROFINET communication in the "Data_Exchange" state, e.g. by cable break or failure of the I/O controller is recognised by the I/O device.

The response to the interruption of communication is controlled via the following settings:



1. During the initialisation of PROFINET communication, the watchdog monitoring time specified in the IO controller (C13882 / C14882) is transferred to the IO device.

   If the IO device does not receive any valid process data in the "Data_Exchange" state, the process data are treated according to the setting in C13885 / C14885. (Like this the data that were sent last by the IO controller can be used or set to zero.)

   After the watchdog monitoring time has elapsed, the IO device changes to the "No_Data_Exchange" state (C13861 / C14861) and the red LED **BE** is activated (Fieldbus status displays (📖 81)).

   There is no response in the I/O device.

2. To trigger a response in the IO device, the »Engineer« has to provide an additional **Response of the Servo Drive 9400** 1 (C13880 / C14880) under the **Monitoring** tab.

   In order to delay this response, you can set a **monitoring time** 2 (C13881 / C14881).

   - In the Lenze setting "0 ms", this monitoring is activated.
   - With the setting "65535 ms", this monitoring is deactivated.
   - A change of monitoring will be effective immediately.
   - The monitoring time elapses when the "Data_Exchange" status is exited.

   After the response delay has elapsed, the response set is executed with the error message "PROFINET: "Data_Exchange" status quit [0x00c88131]" (📖 90).

11.2 Interruption of internal communication

The response to a communication error between the communication module and the Servo Drive 9400 can be set via these codes:

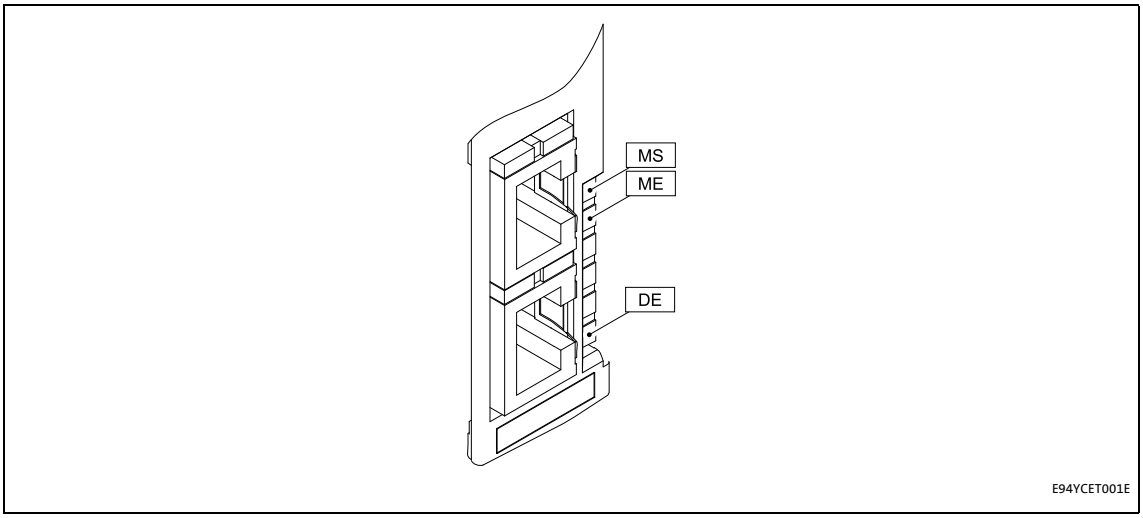
- C01501 | Resp. to comm. error with MXI1 (📖 92) (module in slot MXI1)
- C01502 | Resp. to comm. error with MXI2 (📖 92) (module in slot MXI2)

12 Diagnostics

For purposes of fault diagnostics, the communication module is provided with the LEDs on the front. Furthermore, you can carry out the Diagnosing with the »Engineer« (📖 83).

12.1 LED status displays

Note!

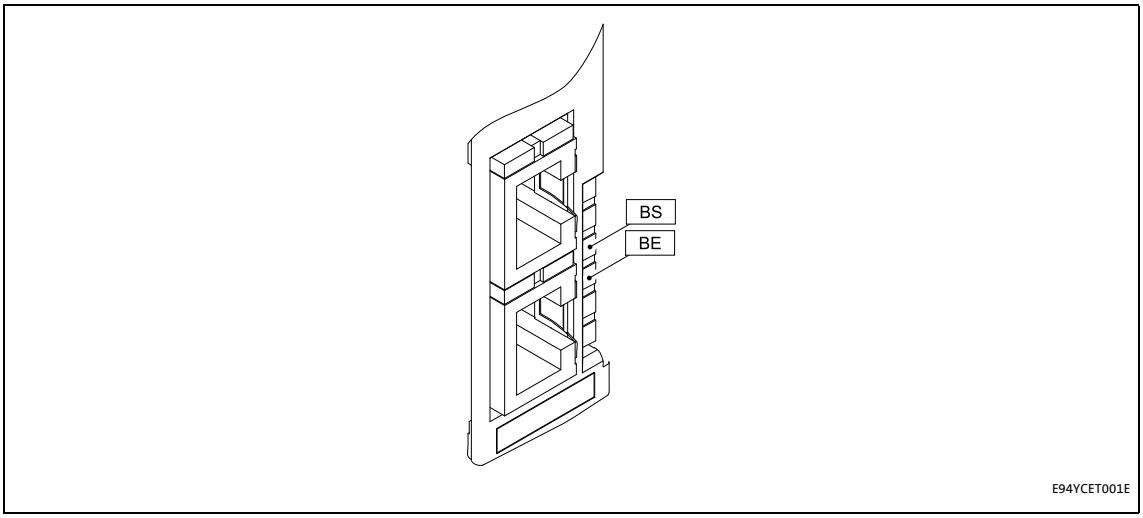


During normal operation ...
- only the LEDs **MS** (📖 80) and **BS** (📖 81) should be lit permanently.
- the green LED on the RJ45 sockets X241 and X242 must be lit or blinking (📖 81).

The following status displays are distinguished:

- Module status displays (📖 80)
- Fieldbus status displays (📖 81)
- Status displays at X241 and X242 (📖 82)

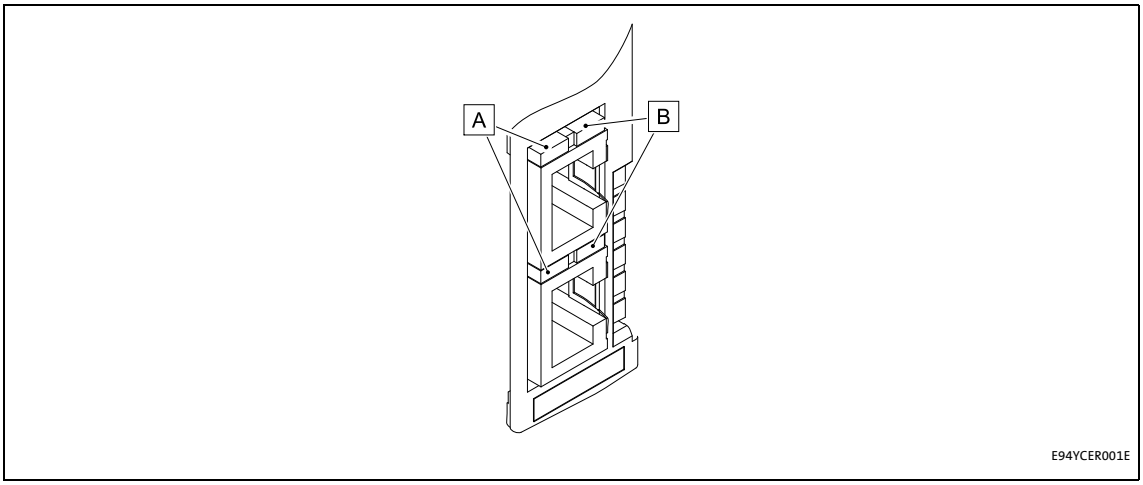
12.1.1 Module status displays



Module status displays are indicated by the LEDs **MS**, **ME**, and **DE**.

Pos.	Colour	Status	Description
MS	Green	On	The communication module is supplied with voltage and is connected to the standard device.
		Blinking	200 ms 200 ms The communication module is supplied with voltage, but is not connected to the standard device. (Standard device is switched off, in the initialisation phase, or not available.)
ME	Red	On	An error has occurred in the communication module.
		Blinking	200 ms 200 ms The "Node blinking test" PROFINET function is activated by the I/O controller. The blinking LED serves to identify/localise accessible I/O devices.
DE	Red	On	The communication module is not accepted by the basic device or the basic device is not active (see notes in the documentation relating to the basic device.)

12.1.2 Fieldbus status displays



Fieldbus status displays are indicated by the LEDs **BS** and **BE**.

LED	Colour	Status	Description
BS	Green	Off	The communication module is not active at the fieldbus.
		Blinking	 The communication module is in the "Data_Exchange" status.
BE	Red	On	 Bus error/fault is active (e.g. Ethernet cable not connected). The communication module is in the "No_Data_Exchange" state.
		Blinking	 Impermissible settings: • Invalid station name • Invalid IP parameters The communication module has been initialised and continues to work internally with the respective standard values.

12.1.3 Status displays at X241 and X242

The LEDs at the RJ45 sockets X241 and X242 display the PROFINET connection status.

LED	Colour	Status	Description
A	Green	On	A physical PROFINET connection is available.
B	Yellow	On *or* Flickers	50 ms Data are being exchanged via PROFINET.

12.2 Diagnosing with the »Engineer«

Querying the current bus status

In code C13861 / C14861, the current PROFINET bus status is shown:

Assignment			Meaning	
Bit 15	...	Bit 6	Reserved	
	Bit 5	Bit 4	PROFINET bus status	
	0	0	Init	After the initialisation, the I/O device waits for a communication partner and a system start-up.
	1	0	Data Exchange / Process Data Valid	The "Data Exchange" state has been reached. • After the system start-up, the IO device with the IO controller goes to the "Data Exchange" state to exchange cyclic process data. • Process data that are identified as valid (IOPS is "GOOD") are received from the IO controller as well as alarms and acyclic requirement data.
	0	1	Data Exchange / Process Data Invalid	From SW version 3.00 onwards: The "Data Exchange" state has been reached. • After the system start-up, the IO device with the IO controller goes to the "Data Exchange" state to exchange cyclic process data. • Process data that are identifed as invalid (IOPS is "BAD") are received from the IO controller, typically when the PLC is in the STOP state, as well as alarms and acyclic requirement data.
	1	1	No Data Exchange	The "Data Exchange" state has been exited (see chapter [11.1]). Up to SW version 2.10, the following applies: Process data that are identifed as invalid (IOPS is "BAD") are received from the IO controller, typically when the PLC is in the STOP state, as well as alarms and acyclic requirement data.
Bit 3	...	Bit 0	Reserved	

12.3 Diagnostic data

- The I/O device sends an alarm message to the I/O controller to signalise the diagnostic data below.
  The precondition for transmitting alarm messages is the configuration of process data words in slot 1 of the PROFINET frame (see Configuring the PROFINET IO controller (📖 33)).
- Errors and warnings in the Servo Drive 9400 and the plugged-in modules are sent to the I/O controller as extended diagnostic messages.
- With code C13887 / C14887 the transmission of an alarm message can be suppressed for specific error messages.
- The diagnostic data are shown in code C13867 / C14867:

Bytes	Information
0	Slot
1	
2	Subslot
3	
4	Error code
...	
7	
8	Slot
9	
10	Subslot
11	
12	Error code
...	
15	

Reference manual/»Engineer« online help for the Servo Drive 9400

Detailed information on the error codes is provided here.

13 Error messages

This chapter supplements the error list in the reference manual and in the »Engineer« online help for the Servo Drive 9400 by the error messages of the communication module.

Reference manual / »Engineer« online help for Servo Drive 9400

Here you will find general information on diagnostics & fault analysis and on error messages.

13.1 Short overview of the PROFINET error messages

The following table contains all error messages of the communication module in numerical order of the error numbers. Moreover the preset error response and - if applicable - the parameters for setting the error response are specified.

Tip!

If you click on the cross-reference in the first column, you will get a detailed description (causes and remedies) of the corresponding error message.

Error number		Name	Response (Lenze setting)	Adjustable in
hex	dec			
0x00c85531	13129009	PROFINET: Memory: No access	6: Information	-
0x00c85532	13129010	PROFINET: Memory: Read error	6: Information	-
0x00c85533	13129011	PROFINET: Memory: Write error	6: Information	-
0x00c86010	13131792	PROFINET: Restart by watchdog reset	1: No Response	-
0x00c86011	13131793	PROFINET: Internal error	1: No Response	-
0x00c86100	13132032	PROFINET: Internal error	1: No Response	-
0x00c86101	13132033	PROFINET: Internal error	1: No Response	-
0x00c86110	13132048	PROFINET: Internal mapping error	4: Warning locked	-
0x00c8641f	13132831	PROFINET: Invalid parameter set	1: No Response	-
0x00c86420	13132832	PROFINET: Error: Lenze setting loaded	1: No Response	-
0x00c86430	13132848	PROFINET: Invalid module configuration	6: Information	-
0x00c86501	13133057	PROFINET: Invalid READ.request during parameter access	4: Warning locked	-
0x00c86502	13133058	PROFINET: Invalid WRITE.request during parameter access	4: Warning locked	-
0x00c86503	13133059	PROFINET: Data output status bad	4: Warning locked	-
0x00c86532	13133106	PROFINET: Station name error	1: No Response	-
0x00c86533	13133107	PROFINET: Invalid IP parameters	1: No Response	-
0x00c86610	13133328	PROFINET: Safety communication timeout	4: Warning locked	-
0x00c86611	13133329	PROFINET: Safety parameter timeout	4: Warning locked	-
0x00c86612	13133330	PROFINET: Safety init error	4: Warning locked	-
0x00c86613	13133331	PROFINET: Safety connect error	5: Warning	-
0x00c86650	13133392	PROFINET: Internal error	6: Information	-
0x00c88131	13140273	PROFINET: "Data_Exchange" status quit	0: No Response	C13880/1 / C14880/1

13.2 Possible causes and remedies

In this chapter, all error messages of the communication module are listed in numerical order of the error numbers. Possible causes and remedies and responses to the error messages are described in detail.

PROFINET: Memory: No access [0x00c85531]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Access to memory was not possible.	Download application again (including module) If this happens repeatedly, send the communication module together with a description of the fault to Lenze.

PROFINET: Memory: Read error [0x00c85532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be read.	Download application again (including module) If this happens repeatedly, send the communication module together with a description of the fault to Lenze.

PROFINET: Memory: Write error [0x00c85533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Parameter could not be written.	Download application again (including module) If this happens repeatedly, send the communication module together with a description of the fault to Lenze.

PROFINET: Restart by watchdog reset [0x00c86010]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

PROFINET: Internal error [0x00c86011]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Communication module is defective.	Send communication module together with a description of the fault to Lenze.

PROFINET: Internal error [0x00c86100]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error	Send communication module together with a description of the fault to Lenze.

PROFINET: Internal error [0x00c86101]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Internal error	Send communication module together with a description of the fault to Lenze.

PROFINET: Internal mapping error [0x00c86110]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The selected PDO mapping is invalid: • An object not supporting the required properties has been specified. • More than 64 bytes of data have been mapped.	Repeat PDO mapping (📖 55).

PROFINET: Invalid parameter set [0x00c8641f]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
No active parameter set could be loaded.	Download application again (including module) If this happens repeatedly, send the communication module together with a description of the fault to Lenze.

PROFINET: Error: Lenze setting loaded [0x00c86420]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
The access to a parameter set in the memory module via the Servo Drive 9400 was not successful.	Download application again (including module) If this happens repeatedly, send the communication module together with a description of the fault to Lenze.

PROFINET: Invalid module configuration [0x00c86430]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
A module or submodule does not comply with the configuration of the Siemens »STEP7« project.	Check/correct configuration.

PROFINET: Invalid READ.request during parameter access [0x00c86501]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
• During the parameter access to data set 47, the controller has sent an invalid READ.request. • When reading back the data, the IO Controller has requested a data length (number of data bytes) that is to small.	Check/correct configuration.

PROFINET: Invalid WRITE.request during parameter access [0x00c86502]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
• During the parameter access to data set 47, the controller has sent an invalid WRITE.request. • When reading back the data, the IO Controller has requested a data length (number of data bytes) that is to small.	Check/correct configuration.

PROFINET: Data output status bad [0x00c86503]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
Output data invalid. Connection to the Siemens Controller has been interrupted.	• Check cables and terminals. • Plug in the network cable on the PROFINET terminal X241/X242.

PROFINET: Invalid station name [0x00c86532]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Station name is not PROFINET-compliant.	Use a PROFINET-compliant station name. ▸ Setting the station name (📖 35)

PROFINET: Invalid IP parameters [0x00c86533]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☒ **Fault** ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☐ Information	

Cause	Remedy
Incorrect IP parameters (IP address, subnet mask, gateway address).	Correct IP parameters. ▸ Setting the IP configuration (📖 37)

PROFINET: Safety communication timeout [0x00c86610]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
Communication to the SM30x safety module is disrupted.	Check if the SM30x safety module is plugged in and supplied with voltage.

PROFINET: Safety parameter timeout [0x00c86611]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
The SM30x safety module does not respond to a PROFISafe parameterisation frame within a given time interval (200 ms).	Check if the SM30x safety module is plugged in and supplied with voltage.

PROFINET: Safety init error [0x00c86612]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☒ **Warning locked** ☐ Warning ☐ Information	

Cause	Remedy
Communication to the SM30x safety module could not be initialised correctly.	Check whether the user data length configured in the PROFINET IO controller for the PROFIsafe data matches the SM30x safety module used. ▸ Configuring the PROFINET IO controller (📖 33)

PROFINET: Safety connect error [0x00c86613]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☒ **Warning** ☐ Information	

Cause	Remedy
Communication to the I/O controller is disrupted.	Check if the SM30x safety module is plugged in and supplied with voltage.

PROFINET: Internal error [0x00c86650]

Response (Lenze setting printed in bold)	**Setting:** not possible
☐ None ☐ System fault ☐ Fault ☐ Trouble ☐ Quick stop by trouble ☐ Warning locked ☐ Warning ☒ **Information**	

Cause	Remedy
Internal error	Send communication module together with a description of the fault to Lenze.

PROFINET: "Data_Exchange" status quit [0x00c88131]

Response (Lenze setting printed in bold)	**Setting:** C13880/1 / C14880/1 (☑ Configurable response)
☒ **None** ☐ System fault ☑ Fault ☐ Trouble ☑ Quick stop by trouble ☑ Warning locked ☐ Warning ☑ Information	

Cause	Remedy
The data exchange via PROFINET has been terminated. Also see the chapter "Interruption of PROFINET communication" (📖 77).	• Check cables and terminals. • Plug in the network cable on the PROFINET terminal X241/X242.

14 Parameter reference

This chapter supplements the parameter list and the table of attributes contained in the reference manual and in the »Engineer« online help for the Servo Drive 9400 with the parameters of the E94AYCER (PROFINET) communication module.

Reference manual/»Engineer« online help for the Servo Drive 9400

Here you will find general information on parameters.

14.1 Parameters of the standard device that are relevant to communication

In this chapter communication-relevant parameters of the Servo Drive 9400 are listed in numerically ascending order.

C00615

Parameter | Name: **C00615 | Resp. to imp. device conf.**		Data type: UNSIGNED_32 Index: 23960 = 0x5D98
Response to impermissible device configuration		
Selection list		
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
6	Information	
0	No response	
Subcodes	**Lenze setting**	**Info**
C00615/1	0: No Response	Reserved
C00615/2	1: No Response	Resp. to imp. module in MXI1
C00615/3	1: No Response	Resp. to imp. module in MXI2
C00615/4	0: No Response	Reserved
C00615/5	0: No Response	Reserved
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00636

Parameter | Name: **C00636 | Resp. to new module in MXI1**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response for the case where a new module has been plugged into slot 1 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C00637

Parameter | Name: **C00637 | Resp. to new module in MXI2**		Data type: UNSIGNED_32 Index: 23939 = 0x5D83
Response if a new module has been plugged into module slot 2 of the standard device.		
Selection list (Lenze setting printed in bold)		
1	Fault	
6	Information	
5	Warning	
4	**Warning Locked**	
3	Quick stop by trouble	
0	No response	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01501

Parameter | Name: **C01501 | Resp. to comm. error with MXI1**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 1 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

C01502

Parameter | Name: **C01502 | Resp. to comm. error with MXI2**		Data type: UNSIGNED_32 Index: 23074 = 0x5A22
Response to a communication error between an "intelligent" module in slot 2 and the standard device		
Selection list (Lenze setting printed in bold)		
0	**No response**	
1	Fault	
3	Quick stop by trouble	
4	Warning Locked	
5	Warning	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer		

14.2 Parameters of the communication module for slot MXI1

This chapter lists the parameters of the E94AYCER communication module (PROFINET) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

Note!

PROFINET command "Reset to Factory Defaults"

If the "Reset to factory defaults" PROFINET command is executed by an IO supervisor or an I/O controller, only the following PROFINET-related parameters of the communication module will be reset to standard values:

- C13000 | IP address
- C13001 | Subnetwork mask
- C13002 | Gateway address
- C13010 | Active IP address
- C13011 | Active subnetwork mask
- C13012 | Active gateway address
- C13864 | Active station name
- C13899 | Station name
- C13910 | I&M1 system designation
- C13911 | I&M1 installation site
- C13912 | I&M2 installation date
- C13913 | I&M3 additional information
- C13914 | I&M4 signature code

C13000

Parameter | Name: **C13000 | IP address**			Data type: UNSIGNED_32 Index: 11575 = 0x2D37
Setting of the IP address ▸ Setting the IP configuration (📖 37)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13001

Parameter | Name: **C13001 | Subnetwork mask**			Data type: UNSIGNED_32 Index: 11574 = 0x2D36
Setting of the subnet mask ▸ Setting the IP configuration (📖 37)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13002

Parameter | Name: **C13002 | Gateway address**			Data type: UNSIGNED_32 Index: 11573 = 0x2D35
Setting of the gateway address ▸ Setting the IP configuration (📖 37)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C13003

Parameter | Name: **C13003 | MAC ID**	Data type: OCTET_STRING Index: 11572 = 0x2D34
Display of the MAC-ID	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13010

Parameter | Name: **C13010 | Active IP address**			Data type: UNSIGNED_8 Index: 11565 = 0x2D2D
Display of the active IP address The active IP address may differ from the contents of code C13000, depending on whether the station name was changed via the fieldbus or the parameter(C13899).			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13010/1			Active IP address.1
C13010/2			Active IP address.2
C13010/3			Active IP address.3
C13010/4			Active IP address.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13011

Parameter | Name: **C13011 | Active subnetwork mask**			Data type: UNSIGNED_8 Index: 11564 = 0x2D2C
Display of the active subnetwork mask The active subnet mask may differ from the contents of code C13001, depending on whether the station name was changed via the fieldbus or the parameter (C13899).			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13011/1			Active subnetwork mask.1
C13011/2			Active subnetwork mask.2
C13011/3			Active subnetwork mask.3
C13011/4			Active subnetwork mask.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13012

Parameter | Name: **C13012 | Active gateway address**			Data type: UNSIGNED_8 Index: 11563 = 0x2D2B
Display of the active gateway address The active gateway address may differ from the contents of code C13002, depending on whether the station name was changed via the fieldbus or the parameter (C13899).			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13012/1			Active gateway address.1
C13012/2			Active gateway address.2
C13012/3			Active gateway address.3
C13012/4			Active gateway address.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13850

Parameter | Name: **C13850 | All words to master**			Data type: UNSIGNED_16 Index: 10725 = 0x29E5
Display of the process data words which are transmitted from the communication module to the I/O controller. In the subcodes 1 to 32, all process data words to the I/O controller are displayed. However, only the configured process data words are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13850/1			
...			
C13850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13851

Parameter | Name: **C13851 | All words from master**			Data type: UNSIGNED_16 Index: 10724 = 0x29E4
Display of the process data words which are transmitted from the I/O controller to the communication module. In the subcodes 1 to 32, all process data words from the I/O controller are displayed. However, only the configured process data words are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13851/1			
...			
C13851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13852

Parameter | Name: **C13852 | All words to standard device**			Data type: UNSIGNED_16 Index: 10723 = 0x29E3
Display of the process data words 1 ... 32 that are transmitted from the communication module to the inverter.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13852/1			
...			
C13852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13853

Parameter | Name: **C13853 | All words from standard device**			Data type: UNSIGNED_16 Index: 10722 = 0x29E2
Display of the process data words 1 ... 32 that are transmitted from the inverter to the communication module.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C13853/1			
...			
C13853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13860

Parameter | Name: **C13860 | Settings**			Data type: UNSIGNED_8 Index: 10715 = 0x29DB
From SW version 3.00 onwards Display of current configuration data			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13860/1			PROFIsafe • 0: not active • 1: active
C13860/2			Number of process data words
C13860/3			Reserved
C13860/4			Number of PROFIsafe words (0, 4 or 8 words)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13861

Parameter | Name: **C13861 | Bus state**		Data type: UNSIGNED_16 Index: 10714 = 0x29DA
Display of the current bus status ▸ Querying the current bus status (📖 83) (representation of the bit-coded display)		
Display list		
0x0000	Init	
0x0030	No Data Exchange	
0x0020	Data Exchange / Process Data Valid	
0x0010	Data Exchange / Process Data Invalid	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT		

C13862

Parameter | Name: **C13862 | Data cycles per second**			Data type: UNSIGNED_32 Index: 10713 = 0x29D9
Display of the data cycles per second (independent of data changes) **Note:** This code will not be supported anymore from SW version 2.10 for reasons related to the system.			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13864

Parameter | Name: **C13864 | Active station name**	Data type: VISIBLE_STRING Index: 10711 = 0x29D7
Display of the station name actively used by the inverter. The active station name may differ from the contents of code C13899, depending on whether the station name was changed via the fieldbus or the parameter (C13899). ▸ Setting the station name (📖 35)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13865

Parameter | Name: **C13865 | Display: Last safety PRM data**	Data type: OCTET_STRING Index: 10710 = 0x29D6
Display of the F_parameters sent last. • These data are only valid if PROFIsafe is activated. • The coding of the F_parameters is described in the PROFIsafe profile V2.0.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Bytes	Information
0	Slot
1	
2	Subslot
3	
4	RecIdx
5	
6	Accepted length
...	
9	
10	F_parameter
...	
24	

C13867

Parameter | Name: **C13867 | Display: Most recent diagnostic data**	Data type: OCTET_STRING Index: 10708 = 0x29D4
Display of the diagnostic data sent by the inverter most recently. ▸ Diagnostic data (📖 84)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Bytes	Information
0	Slot
1	
2	Subslot
3

...	
7	
8	Slot
9	
10	Subslot
11	
12	Error code
...	
15	

C13879

Parameter | Name: **C13879 | Bus error**			Data type: UNSIGNED_32 Index: 10696 = 0x29C8
Display of the error currently detected on the fieldbus.			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

Value	Meaning
0	No error
3481402629	The PROFINET communication link has been interrupted.

C13880

Parameter | Name: **C13880 | Monitoring Reaction**			Data type: UNSIGNED_8 Index: 10695 = 0x29C7
The action set in subcode 1 is executed when the node detects that it is no longer in the "Data_Exchange" state. • Please also observe the notes provided in code C13881. • A change in the monitoring response becomes immediately effective. ▸ Interruption of PROFINET communication (📖 77)			
Selection list			
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**	**Info**	
C13880/1	0: No Response		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13881

Parameter | Name: **C13881 | Response time when exiting "Data_Exchange"**			Data type: UNSIGNED_16 Index: 10694 = 0x29C6
If the "Data_Exchange" status is exited, the response parameterised in C13880 is activated after the time set here has expired. • A value of "65535" in this code deactivates the monitoring function. • A change in the monitoring response becomes immediately effective.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13882

Parameter | Name: **C13882 | Display: Monit. time: Watchdog**			Data type: UNSIGNED_32 Index: 10693 = 0x29C5
Display of the watchdog monitoring time specified by the IO controller **Note:** This code will not be supported anymore from SW version 2.10 for reasons related to the system.			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C13885

Parameter | Name: **C13885 | Clear process data**	Data type: UNSIGNED_8 Index: 10690 = 0x29C2
This code is used to set the process data which the I/O device is to process in order to maintain the internal communication when the fieldbus has exited the "Data_Exchange" status.	
Selection list (Lenze setting printed in bold)	
0 | Use of most recent master PDOs	
1 | PDOs are set to the value 0'	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13887

Parameter | Name: **C13887 | Suppression diagnostic message**	Data type: BITFIELD_8 Index: 10688 = 0x29C0
This code serves to inhibit the transmission of alarm messages to the IO controller. By this, errors of a specific type can be systematically suppressed. All errors are furthermore entered in the logbook.	
Value is bit-coded:	
Bit 0 | Fault	
Bit 1 | Fault	
Bit 2 | Quick stop by trouble	
Bit 3 | Warning Locked	
Bit 4 | Warning	
Bit 5 | Reserved	
Bit 6 | Reserved	
Bit 7 | Reserved	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13899

Parameter | Name: **C13899 | Station name**	Data type: VISIBLE_STRING Index: 10676 = 0x29B4
The station name must be assigned in accordance with the PROFINET specification. In the standard setting a deleted name is displayed. The name is also deleted if the "Reset to factory defaults" command is executed by an IO supervisor or an I/O controller. ▸ Setting the station name (📖 35)	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT	

C13900

Parameter | Name: **C13900 | Firmware Product Type**	Data type: VISIBLE_STRING Index: 10675 = 0x29B3
The code contains a string with a length of 8 characters. The identification code "E94AFCER" is displayed.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13901

Parameter | Name: **C13901 | Firmware Compilation Date**	Data type: VISIBLE_STRING Index: 10674 = 0x29B2
The code contains a string with a length of 20 characters. The software creation date ("MMM DD YYYY") and time ("hh:mm:ss") are displayed (e.g. "Mar 21 2005 12:31:21").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13902

Parameter | Name: **C13902 | Firmware Version**	Data type: VISIBLE_STRING Index: 10673 = 0x29B1
The code contains a string with a length of 8 characters. The identification code is displayed (e.g. "01.10.09").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13910

Parameter | Name: **C13910 | I&M1 system designation**	Data type: VISIBLE_STRING Index: 10665 = 0x29A9
Input/output of the I&M1 plant identification code The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13911

Parameter | Name: **C13911 | I&M1 installation site**	Data type: VISIBLE_STRING Index: 10664 = 0x29A8
Input/output of the I&M1 location identification code The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13912

Parameter | Name: **C13912 | I&M2 installation date**	Data type: VISIBLE_STRING Index: 10663 = 0x29A7
Input/output of the I&M2 date of installation The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13913

Parameter | Name: **C13913 | I&M3 additional information**	Data type: VISIBLE_STRING Index: 10662 = 0x29A6
Input/output if the I&M3 additional information The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C13914

Parameter | Name: **C13914 | I&M4 signature code**	Data type: OCTET_STRING Index: 10661 = 0x29A5
Input/output of the I&M4 signature The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

14.3 Parameters of the communication module for slot MXI2

This chapter lists the parameters of the E94AYCER communication module (PROFINET) for slot MXI2 of the Servo Drive 9400 in numerically ascending order.

Note!

PROFINET command "Reset to Factory Defaults"

If the "Reset to factory defaults" PROFINET command is executed by an IO supervisor or an I/O controller, only the following PROFINET-related parameters of the communication module will be reset to standard values:

- C14000 | IP address
- C14001 | Subnetwork mask
- C14002 | Gateway address
- C14010 | Active IP address
- C14011 | Active subnetwork mask
- C14012 | Active gateway address
- C14864 | Active station name
- C14899 | Station name
- C14910 | I&M1 system designation
- C14911 | I&M1 installation site
- C14912 | I&M2 installation date
- C14913 | I&M3 additional information
- C14914 | I&M4 signature code

C14000

Parameter | Name: **C14000 | IP address**			Data type: UNSIGNED_32 Index: 10575 = 0x294F
Setting of the IP address ▸ Setting the IP configuration (📖 37)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14001

Parameter | Name: **C14001 | Subnetwork mask**			Data type: UNSIGNED_32 Index: 10574 = 0x294E
Setting of the subnet mask ▸ Setting the IP configuration (📖 37)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14002

Parameter | Name: **C14002 | Gateway address**			Data type: UNSIGNED_32 Index: 10573 = 0x294D
Setting of the gateway address ▸ Setting the IP configuration (📖 37)			
Setting range (min. value | unit | max. value)			**Lenze setting**
0		4294967295	**0**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT			

C14003

Parameter | Name: **C14003 | MAC ID**	Data type: OCTET_STRING Index: 10572 = 0x294C
Display of the MAC-ID	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14010

Parameter | Name: **C14010 | Active IP address**			Data type: UNSIGNED_8 Index: 10565 = 0x2945
Display of the active IP address The active IP address may differ from the contents of code C14000, depending on whether the station name was changed via the fieldbus or the parameter (C14899).			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14010/1			Active IP address.1
C14010/2			Active IP address.2
C14010/3			Active IP address.3
C14010/4			Active IP address.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14011

Parameter | Name: **C14011 | Active subnetwork mask**			Data type: UNSIGNED_8 Index: 10564 = 0x2944
Display of the active subnetwork mask The active subnet mask may differ from the contents of code C14001, depending on whether the station name was changed via the fieldbus or the parameter (C14899).			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14011/1			Active subnetwork mask.1
C14011/2			Active subnetwork mask.2
C14011/3			Active subnetwork mask.3
C14011/4			Active subnetwork mask.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14012

Parameter | Name: **C14012 | Active gateway address**			Data type: UNSIGNED_8 Index: 10563 = 0x2943
Display of the active gateway address The active gateway address may differ from the contents of code C14002, depending on whether the station name was changed via the fieldbus or the parameter (C14899).			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C14012/1			Active gateway address.1
C14012/2			Active gateway address.2
C14012/3			Active gateway address.3
C14012/4			Active gateway address.4
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14850

Parameter | Name: **C14850 | All words to master**			Data type: UNSIGNED_16 Index: 9725 = 0x25FD
Display of the process data words which are transmitted from the communication module to the I/O controller. In the subcodes 1 to 32, all process data words to the I/O controller are displayed. However, only the configured process data words are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14850/1			
...			
C14850/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14851

Parameter | Name: **C14851 | All words from master**			Data type: UNSIGNED_16 Index: 9724 = 0x25FC
Display of the process data words which are transmitted from the I/O controller to the communication module. In the subcodes 1 to 32, all process data words from the I/O controller are displayed. However, only the configured process data words are valid.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14851/1			
...			
C14851/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14852

Parameter | Name: **C14852 | All words to standard device**			Data type: UNSIGNED_16 Index: 9723 = 0x25FB
Display of the process data words 1 ... 32 that are transmitted from the communication module to the inverter.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14852/1			
...			
C14852/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14853

Parameter | Name: **C14853 | All words from standard device**			Data type: UNSIGNED_16 Index: 9722 = 0x25FA
Display of the process data words 1 ... 32 that are transmitted from the inverter to the communication module.			
Display range (min. value | unit | max. value)			
0		65535	
Subcodes			**Info**
C14853/1			
...			
C14853/32			
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14860

Parameter | Name: **C14860 | Settings**			Data type: UNSIGNED_8 Index: 9715 = 0x25F3
From SW version 3.00 onwards Display of current configuration data			
Display range (min. value | unit | max. value)			
0		255	
Subcodes			**Info**
C13860/1			PROFIsafe • 0: not active • 1: active
C13860/2			Number of process data words
C13860/3			Reserved
C13860/4			Number of PROFIsafe words (0, 4 or 8 words)
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14861

Parameter | Name: **C14861 | Bus status**			Data type: UNSIGNED_16 Index: 9714 = 0x25F2
Display of the current bus status ▸ Querying the current bus status (📖 83) (representation of the bit-coded display)			
Display list			
0x0000	Init		
0x0030	No Data Exchange		
0x0020	Data Exchange / Process Data Valid		
0x0010	Data Exchange / Process Data Invalid		
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14862

Parameter | Name: **C14862 | Data cycles per second**			Data type: UNSIGNED_32 Index: 9713 = 0x25F1
Display of the data cycles per second (independent of data changes) **Note:** This code will not be supported anymore from SW version 2.10 for reasons related to the system.			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14864

Parameter | Name: **C14864 | Active station name**	Data type: VISIBLE_STRING Index: 9711 = 0x25EF
Display of the station name actively used by the inverter. The active station name may differ from the contents of code C14899, depending on whether the station name was changed via the fieldbus or the parameter (C14899). ▸ Setting the station name (📖 35)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14865

Parameter | Name: **C14865 | Display: Last safety PRM data**	Data type: OCTET_STRING Index: 9710 = 0x25EE
Display of the F_parameters sent last. • These data are only valid if PROFIsafe is activated. • The coding of the F_parameters is described in the PROFIsafe profile V2.0.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Bytes	Information
0	Slot
1	
2	Subslot
3	
4	RecIdx
5	
6	Accepted length
...	
9	
10	F_parameter
...	
24	

C14867

Parameter | Name: **C14867 | Display: Most recent diagnostic data**	Data type: OCTET_STRING Index: 9708 = 0x25EC
Display of the diagnostic data sent by the inverter most recently. ▸ Diagnostic data (📖 84)	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

Bytes	Information
0	Slot
1	
2	Subslot
3	
4	Error code
...	
7	
8	Slot
9	
10	Subslot
11	
12	Error code
...	
15	

C14879

Parameter | Name: **C14879 | Bus error**			Data type: UNSIGNED_32 Index: 9696 = 0x25E0
Display of the error currently detected on the fieldbus.			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

Value	Meaning
0	No error
3481402629	The PROFINET communication link has been interrupted.

C14880

Parameter | Name: **C14880 | Reaction on communication fault**			Data type: UNSIGNED_8 Index: 9695 = 0x25DF
The action set in subcode 1 is executed when the node detects that it is no longer in the "Data_Exchange" state. • Please also observe the notes provided in code C14881. • A change in the monitoring response becomes immediately effective. ▸ Interruption of PROFINET communication (📖 77)			
Selection list			
0	No response		
1	Fault		
3	Quick stop by trouble		
4	Warning Locked		
6	Information		
Subcodes	**Lenze setting**	**Info**	
C14880/1	0: No Response		
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14881

Parameter | Name: **C14881 | Response time when exiting "Data_Exchange"**			Data type: UNSIGNED_16 Index: 9694 = 0x25DE
If the "Data_Exchange" status is exited, the response parameterised in C14880 is activated after the time set here has expired. • A value of "65535" in this code deactivates the monitoring function. • A change in the monitoring response becomes immediately effective.			
Setting range (min. value | unit | max. value)			**Lenze setting**
0	ms	65535	**0 ms**
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14882

Parameter | Name: **C14882 | Display: Monit. time: Watchdog**			Data type: UNSIGNED_32 Index: 9693 = 0x25DD
Display of the watchdog monitoring time specified by the IO controller **Note:** This code will not be supported anymore from SW version 2.10 for reasons related to the system.			
Display range (min. value | unit | max. value)			
0		4294967295	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT			

C14885

Parameter | Name: **C14885 | Clear process data**	Data type: UNSIGNED_8 Index: 9690 = 0x25DA
This code is used to set the process data which the I/O device is to process in order to maintain the internal communication when the fieldbus has exited the "Data_Exchange" status.	
Selection list (Lenze setting printed in bold)	
0 | Use of most recent master PDOs	
1 | PDOs are set to the value 0'	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14887

Parameter | Name: **C14887 | Suppression diagnostic message**	Data type: BITFIELD_8 Index: 9688 = 0x25D8
This code serves to inhibit the transmission of alarm messages to the IO controller. By this, errors of a specific type can be systematically suppressed. All errors are furthermore entered in the logbook.	
Value is bit-coded:	
Bit 0 | Fault	
Bit 1 | Fault	
Bit 2 | Quick stop by trouble	
Bit 3 | Warning Locked	
Bit 4 | Warning	
Bit 5 | Reserved	
Bit 6 | Reserved	
Bit 7 | Reserved	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14899

Parameter | Name: **C14899 | Station name**	Data type: VISIBLE_STRING Index: 9676 = 0x25CC
The station name must be assigned in accordance with the PROFINET specification. In the standard setting a deleted name is displayed. The name is also deleted if the "Reset to factory defaults" command is executed by an IO supervisor or an I/O controller. ▸ Setting the station name (📖 35)	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☑ COM ☐ MOT	

C14900

Parameter | Name: **C14900 | Firmware product type**	Data type: VISIBLE_STRING Index: 9675 = 0x25CB
The code contains a string with a length of 8 characters. The identification code "E94AFCER" is displayed.	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14901

Parameter | Name: **C14901 | Firmware compilation date**	Data type: VISIBLE_STRING Index: 9674 = 0x25CA
The code contains a string with a length of 20 characters. The software creation date ("MMM DD YYYY") and time ("hh:mm:ss") are displayed (e.g. "Mar 21 2005 12:31:21").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14902

Parameter | Name: **C14902 | Firmware version**	Data type: VISIBLE_STRING Index: 9673 = 0x25C9
The code contains a string with a length of 8 characters. The identification code is displayed (e.g. "01.10.09").	
☑ Read access ☐ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14910

Parameter | Name: **C14910 | I&M1 system designation**	Data type: VISIBLE_STRING Index: 9665 = 0x25C1
Input/output of the I&M1 plant identification code The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14911

Parameter | Name: **C14911 | I&M1 installation site**	Data type: VISIBLE_STRING Index: 9664 = 0x25C0
Input/output of the I&M1 location identification code The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14912

Parameter | Name: **C14912 | I&M2 installation date**	Data type: VISIBLE_STRING Index: 9663 = 0x25BF
Input/output of the I&M2 date of installation The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14913

Parameter | Name: **C14913 | I&M3 additional information**	Data type: VISIBLE_STRING Index: 9662 = 0x25BE
Input/output if the I&M3 additional information The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

C14914

Parameter | Name: **C14914 | I&M4 signature code**	Data type: OCTET_STRING Index: 9661 = 0x25BD
Input/output of the I&M4 signature The Lenze setting shows an empty string.	
☑ Read access ☑ Write access ☐ CINH ☐ PLC-STOP ☐ No transfer ☐ PDO_MAP_RX ☐ PDO_MAP_TX ☐ COM ☐ MOT	

14.4 Table of attributes

The table of attributes contains information that is required for communication with the inverter via parameters.

How to read the table of attributes:

Column		Meaning	Entry	
Code		Parameter name	Cxxxxx	
Name		Parameter short text (display text)	*Text*	
Index	dec	Index under which the parameter is addressed. The subindex for array variables corresponds to the Lenze subcode number.	24575 - Lenze code number	Is only required for access via a bus system.
	hex		0x5FFF - Lenze code number	
Data	DS	Data structure	E	Single variable (only one parameter element)
			A	Array variable (several parameter elements)
	DA	Number of array elements (subcodes)	*Number*	
	DT	Data type	BITFIELD_8	1 byte, bit-coded
			BITFIELD_16	2 bytes, bit-coded
			BITFIELD_32	4 bytes, bit-coded
			INTEGER_8	1 byte, with sign
			INTEGER_16	2 bytes with sign
			INTEGER_32	4 bytes, with sign
			UNSIGNED_8	1 byte without sign
			UNSIGNED_16	2 bytes without sign
			UNSIGNED_32	4 bytes, without sign
			VISIBLE_STRING	ASCII string
			OCTET_STRING	
	Factor	Factor for data transmission via a bus system, depending on the number of decimal positions	*Factor*	1 = No decimal positions 10 = 1 decimal position 100 = 2 decimal positions 1000 = 3 decimal positions
Access	R	Read access	☑ Reading permitted	
	W	Write access	☑ Writing permitted	
	CINH	Controller inhibit required	☑ Writing is only possible if controller inhibit is set	

Table of attributes

Code	Name	Index		Data				Access		
		dec	hex	DS	DA	Data type	Factor	R	W	CINH

FEEDBACK

Your opinion is important to us

These instructions were created to the best of our knowledge and belief to give you the best possible support for handling our product.

Perhaps we have not succeeded in achieving this objective in every respect. If you have suggestions for improvement, please e-mail us to:

feedback-docu@lenze.com

Thank you very much for your support.
